Increased output of the 550 hp Leonides engine was maintained throughout the period under review. A large proportion of these engines was delivered against Ministry of Supply contracts to meet the needs of the Hunting Percival "Provost" in Flying Training Command. This requirement has now largely been satisfied and in consequence production of the Leonides at a reduced level will swing more towards the fulfilment of commercial orders. It is gratifying that this engine, used so extensively by the Royal Air Force, the Royal Navy, and also by the Army, is making its contribution in military services overseas. Among these are the Air Forces of Australia, Belgium, Burma, Eire, France, Iraq, Italy, Rhodesia, Sweden and Thailand.

Our larger engine, the fourteen-cylinder Leonides Major, is progressing steadily through the development stage, but its effect on turnover will not be appreciable before 1956-7.

As an augury for the future it is of interest to record that sixteen Alvis engines were incorporated in ten types of aircraft which took part in the Society of British Aircraft Constructors' Flying Display at Farnborough in September. Among those aircraft shown for the first time were the four-engined Handley Page "Herald" Airliner, and the Westland "Whirlwind" Helicopter, both powered by the Major, and the Scottish Aviation "Twin Pioneer" powered by two 550 hp Leonides. The well-proven 3-litre car will be continued with improvements in chassis design and with special bodywork.

Arrangements are now in hand for the production in the United Kingdom of a sports saloon with coachwork styled by Carrosserie Graber, of Bern. Models shown at the recent Paris Salon and Earls Court Motor Show have evoked considerable interest.

Since last year the "Saracen" Armoured Fighting Vehicle has been exported to Dominion countries and continues to give excellent service. Additional orders have been received and there is reason to believe that production will be maintained on a satisfactory scale. Further developments of the basic suspension and transmission layout have enabled us to obtain a production order for a quantity of chassis to be used as the basis for a new design of Royal Air Force Fire Tender and Crash Rescue Vehicle, which operates at a total weight of 12 tons. Its unique cross-country properties and speed enable it to outclass anything else which is known to be available. The Report and Accounts were adopted.

THE BRITISH IRON AND STEEL FEDERATION

Invites applications for the following posts:

1. **ECONOMIST** with good Honours degree in economics and postgraduate experience of industrial economic problems or cognate academic or research experience.
2. **ASSISTANT** in Economics Department. Desirable to have economics and good statistical background preferred but consideration given to applicant with degree in statistics and good grounding in economics. Salary in both cases according to qualifications and experience. Write, giving full particulars, to the Establishment Officer, Steel House, Tottill Street, S.W.1.

CO-OPERATIVE WHOLESALE SOCIETY LIMITED

MARKET RESEARCH DEPARTMENT

The Department has a small full-time consumer research team, a section specialising in the study of retailing practices, and a library and commercial information unit. It is seeking to reinforce its staff, particularly in the retail trade research section. Vacancies available range from trainee to fully qualified research assistant.

Fully qualified Research Assistants must have a suitable background of business experience (not necessarily in market research); a degree (or equivalent qualification); and a good knowledge of co-operative methods and organisation.

The trainee positions are open to recently qualified graduates, or to others who have suitable business experience, and have made some progress in studies leading to a degree in economics, commerce, or statistics (or in other appropriate courses of study). Knowledge of co-operative organisation or of market research would be particularly valuable, though not essential.

One vacancy (primarily concerned with collection of information from retail co-operative societies) may occur in London; apart from this all successful candidates will be required to reside near Manchester. All candidates must be prepared to travel as required.

Persons who feel they are suitable for appointment as a trainee, or as research assistant, or for an intermediate position, are invited to apply to the following address, giving full details of age, education, experience, etc., and stating salary required.—Co-operative Wholesale Society Ltd., Central Labour Department, 1 Balloon Street, Manchester, 4, endorsed "Market Research Department."

DIVISIONAL SALES MANAGER

Applications are invited by Chappie Limited, leading manufacturers of canned cat and dog foods, for a position as one of its Divisional Sales Managers. The Divisional Sales Manager will be responsible for the sale of Chappie's products and will be responsible directly to the General Sales Manager for:

1. Trade Sales (both Wholesale and Retail) and merchandising of the company's products on the domestic and export markets.
2. The continuing field-sales and merchandising efficiency of all personnel under his control.
3. Contributing to the formulation of company sales policies.

The post will carry a competitive salary of not less than £2,500 per annum plus generous non-contributory sickness, life assurance and pension benefits under the company's Social Security Plan. Applications are invited from men up to forty years of age with wide experience of sales training and sales management. Further particulars and applications forms may be obtained from the Chief Personnel Officer, Chappie Limited, Melton Mowbray, Leicestershire. Letters should be endorsed: "Divisional Sales Manager." All correspondence will be treated in the strictest confidence.

MANAGING DIRECTOR—An internationally known Pharmaceutical and Chemical company of highest standing is looking for a man of proved and outstanding ability. He is probably aged between 35 and 45 and holding a similar position with a smaller company or is just below this position in a large company in the same field. Essential qualities include a complete understanding of salesmanship, backed by strong administrative abilities. He will have a strong personality, imagination and drive, yet will be able to delegate responsibility and inspire and command the respect of his staff. He must have a wide knowledge of the pharmaceutical industry and applications, which will be treated in strictest confidence, should be sent by letter only, to Austin J. Wright & Co., Solicitors, 116 Victoria Street, London, S.W.1.

PERSONAL ASSISTANT required by Director of Metal Development Association in London. The successful candidate should be aged 22-28, a university graduate, with good administrative and writing ability. A knowledge of French and German would be useful, but not essential, as the Association has wide international contacts. A good salary will be paid according to qualifications and experience.—Write, with full particulars, to Box 372.

A LARGE MANUFACTURING CONCERN, based in London, with world-wide interests, requires a male graduate with a good degree in Economics or the Humanities and preferably two or three years' general industrial experience. Applicant to work in the Information and Statistics Division concerned with day-to-day study of economic events, their interpretation and application to the business of the company and their bearing on future trends. Age 25-28.—Write, quoting Reference 1311, to Box 310, D. 4324, A. K. Adge, 212a Shaftesbury Avenue, London, W.C.2.

A MAJOR OIL COMPANY operating in the MIDDLE EAST requires SENIOR METHODS PLANNER to organise and supervise the operation of its administrative methods overseas. The entire accounting system, stores administration, are being based on a central modern punch-card system and procedures will therefore have to be designed to take the fullest advantage of such a system.

Applicants must have extensive experience in Methods Planning in large-scale industrial operations, not necessarily in oil, or have handled extensive planning problems with a large organisation of business consultants. Previous experience with punch card methods is not essential provided applicant thoroughly understands basic principles and has ability to re-organise administration procedures accordingly.

The position affords a real challenge to inventive faculties of a Methods Planner and work should be really interesting. Initial tour of duty would be for two years with very attractive remuneration and benefits. An early start in January with passages available. Write, giving brief details of age, experience, etc., to Box E.445 c/o 191 Gresham House, E.C.2.

A WORLD-WIDE industrial organisation has vacancy for a young man or woman (aged 23-28) initially to undertake research into commercial, industrial and fiscal statistics and subsequently on other general statistical work. Candidates should possess recognised qualifications in economics or statistics, and should preferably have had experience in extracting and tabulating data from government publications. The salary, which will be not less than £600 per annum, will be in accordance with qualifications and experience. These should be fully stated in written applications to be addressed to Box N.861, Willing's, 362 Gray's Inn Road, W.C.1.

ACCOUNTANTS with personal experience of the operation of up-to-date methods of Financial Control, Profit Planning and Costing are invited to apply for an important appointment with an Industrial Company of repute. A generous commencing salary is offered and the prospective candidate will have the opportunity to gain experience in addition to maintaining liaison with the heads of various departments. Candidate selected will be expected to initiate the preparation, through his Advertising Agencies, of advertising which will be outstanding in a highly competitive field. Salary commensurate with position. Our staff have been informed of this appointment.—Box 323.

MANAGER required for the Lutton Chocolate and Cocoa Factory of the English and Scottish Joint Co-operative Wholesale Society Limited. Applicants should write to the Secretary and Executive Officer of the Society at 100 Leaman Street, London, E.1, setting out their qualifications, technical and managerial experience, and the salary required.—December 31, 1955. The post is pensionable.

MATHEMATICIAN with sound statistical training required by The United Steel Companies Ltd., as assistant in Mathematics Section of the Research and Development Department. Duties will involve the use of statistics in statistics or mathematics and be interested in application of statistical techniques to industrial problems. Apply Assistant Director of Research, The United Steel Companies Ltd., Swindon Laboratories, Moorcraft, Rotherham.

ECONOMIST aged 30 to 35, with first or second class honours degree and with experience in Power Plant Economics and Market Surveys, is required in the Industrial Atomic Energy Group of The General Electric Company Ltd. This is a senior appointment, offering good opportunities and an interesting career.—Apply to The Personnel Manager (A.E.D.), Fraser & Chalmers Engineering Works, Erith, Kent.

THE UNIVERSITY OF MANCHESTER

Applications are invited for the post of **LECTURER IN SOCIOLOGY** in the Department of Social Anthropology. Candidates should have held experience in studies of industry. Salary on a scale £650-£1,350 per annum; initial salary according to qualifications and experience. Membership of F.S.S.U. and Children's Allowance Scheme.—Applications should be sent not later than January 20, 1956, to the Registrar, The University, Manchester, 13, from whom further Particulars and forms of application may be obtained.

THE UNIVERSITY OF MANCHESTER

Applications are invited for the post of **ASSISTANT LECTURER IN SOCIAL ADMINISTRATION**. Salary not less than £550 per annum with membership of the F.S.S.U. and Children's Allowance Scheme. The person appointed will be required to undertake research and to assist in the supervision of practical work as well as in the ordinary teaching duties of the Department. Applications should be sent not later than January 18, 1956, to the Registrar, The University, Manchester 13, from whom further particulars and forms of application may be obtained.

THE UNIVERSITY OF HULL

Applications are invited for an **Assistant Lectureship in Psychology** with special reference to Industrial and Occupational Psychology. Salary scale £550 x £50 to £650 with F.S.S.U. and family allowances. Duties to commence if possible, not later than mid-February, 1956, failing which on October 1, 1956.

Further particulars may be obtained from the Registrar with whom applications (5 copies), together with two testimonials and the names of two referees, must be lodged not later than December 31, 1955.

LEIGHTON PARK SCHOOL, READING

Seven Scholarships and Exhibitions, including Music and Art, will be awarded on the result of an examination to be held in February 1956. One of maximum value £225 p.a., others up to £140 p.a. Age limit for Scholarships 14, for Exhibitions 16.—Application forms from the Headmaster.

OFFICE methods and clerical work study: Ford Motor Company Limited, Dagenham, have a vacancy for a man with experience of this type of work, preferably but not necessarily with some accounting knowledge. Knowledge of office and clerical training would be useful. Prospects of advancement to a man of ability will be exceptional. Write to Salaried Personnel Department, Dagenham, quoting reference C.C.D.

MARKET INFORMATION—The export company of a large organisation in the engineering industry (Midlands) is extending its information services. An imaginative Economist accustomed to following and analysing home and export trends, and with a flair for lucid presentation, is required. A university speciality in the knowledge of British and European economic conditions is essential. Prospects of advancement to a man of ability will be exceptional. Write to Salaried Personnel Department, Dagenham, quoting reference C.C.D.

RENOULD CHAINS LIMITED has a vacancy in its Marketing Research and Intelligence Department for an experienced man to undertake the compilation of reports of a routine and original nature. Reports are based on data in whose classification and analysis the successful applicant will be intimately concerned. Applicants should be of high intelligence, have alert minds, sound judgment and able to evaluate the reliability of information encountered. A University Degree and an interest in the mechanical processes of industry are essential. Some experience of export marketing problems is desirable. Conditions of employment are excellent. The post is pensionable and qualifies for advancement. The successful candidate will receive a competitive annual holiday and other attractive amenities. Attractive commencing salary.—Please send full details to Employment Manager, Renould Chains Limited, Renould House, Withenshaw, Manchester.

FUEL OIL SALES MANAGER, Top Grade, good knowledge European market for Heavy Fuel Oil, required by Swiss firm. Good salary and all expenses paid. Address applications to P.O. Box 1071, Zurich 22 (Switzerland). State experience, qualifications and present occupation.

MANAGEMENT, I believe, is essentially judgement, tact, and the ability and determination to get things done. If your organisation requires a man, age 35, with public school background, sound engineering training and wide experience (including management consultancy), who now wishes to enter upon his settled career with scope for ambition and achievement.—Write to Box 329.

AMERICAN LAWYER, LL.B., J.C.S.D., age 30, both academic and practising experience, also trained as an economist, now at an English university, seeks position in Britain or Europe commencing summer 1956.—Box 325.

BANK EXECUTIVE, age 49, with many years' experience of banking in England and India, with particular knowledge of South East Asia, seeks position of responsibility which calls for first-class administrative ability and a detailed knowledge of the intricacies of foreign exchange and foreign trade.—Box 326.

SUCCESSFUL TUITION FOR THE B.Sc.Econ. DEGREE

Wolsey Hall (established 1894) provides successful Postal Courses in a wide range of subjects for the two examinations for the London University Economics Degree (three if Entrance is included). Very reasonable fees. Installments. Over 1,000 Wolsey Hall students have secured this degree since 1925.—Prospectus from C. D. Parker, M.A., LL.D., Director of Studies, Dept. P.16, WOLSEY HALL, OXFORD.

CANADIAN PACIFIC RAILWAY COMPANY (Incorporated in Canada with Limited Liability). Dividend Notice. Ordinary Capital Stock.—At a meeting of the board of directors held today, a final dividend of seventy-five cents per share on the Ordinary Capital Stock was declared in respect of the year 1955 payable in Canadian funds on February 29, 1956, to shareholders of record at 3.30 p.m. on January 6, 1956.—By Order of the Board, FREDERICK BRAMLEY, Secretary, Montreal, December 12, 1955.

CANADIAN PACIFIC RAILWAY COMPANY (Incorporated in Canada with Limited Liability). Dividend Notice. Preference Stock.—At a meeting of the board of directors held today, a final dividend of two per cent on the Preference Stock was declared in respect of the year 1955 payable on February 1, 1956, to stockholders of record at 3.30 p.m. on December 30, 1955.—By Order of the Board, FREDERICK BRAMLEY, Secretary, Montreal, December 12, 1955.

ESCAPE TO SUNSHINE IN MADIRA—Do you look forward with dismay to the long days of cold and frost that lie ahead in Britain's winter? Do you shudder at the thought of the cold nights and dismal skies that must enshroud these isles for many months to come? Then why not forget it all for a while under the blue skies and in the warm seas of MADIRA? Your holiday can be gay, restful, business as usual, swimming, dancing, golf, tennis, but above all you will find the sunshine that will fortify you against the chills of the winter months that remain after you return. There are excellent hotels at rates as low as £1 per day inclusive. A regular air service by luxury Flying Boats of Aquila Airways takes you there in a few hours, or if you prefer sea travel, many ships serve the island. Contact your Travel Agent now for details, or enquire CASA DE PORTUGAL, 20 Lower Regent Street, London, S.W.1, or DELEGACAO DE TURISMO DA MADIRA, Funchal, Madeira.

WISE INVESTMENT follows today reading the *Investor's Chronicle* is the best giving sound advice to investors. Two free issues from 30 I.C. House, 11 Grocers' Hall Court, London, E.C.2.

GREYSTOKE HOTEL, Canford Cliffs, Bournemouth. The gracious friendly atmosphere of a yacht club. The comfort of a family home. Own Swimming Pool. The late Lord Lyle's mansion overlooking Sandbanks and sea. Brochure.

SPANISH Intensive Course in London, January 2-6. All grades. PORTUGUESE/SPANISH Evening Classes from January 9th.—Educational Department, Hispanic Council, 2 Belgrave Square, S.W.1. SLO 7186.

PERSONALITY IN A CIGARETTE—Smoke Grosvenor Tipped and double your smoking enjoyment. Boxes of 20 for 3s. 6d.

EXPERT POSTAL TUITION For Examinations—B.Sc.Econ., LL.B., and other external London University Degrees: Law Society; Bar; Accountancy; Banking; Secretarial; Civil Service; Commercial; General Certificate of Education; etc. Also Advanced non-examination courses in business subjects. Write today for free prospectus and/or advice, mentioning examination (if any) or subjects in which interested, to the Secretary (G. 9/2).

PHONE:

- ◀ increase work output
- ◀ reduce costs
- ◀ benefit workers

Torque Converter Drive (optional) eliminating gear-changing. Smoother, faster manoeuvring. Less stress on truck and driver. Longer life.

Power-assisted Hydraulic Steering providing unique ease of driving control. Finger-tip wheel movement.

High Safety Factor—the greatest reserve stability of any diesel fork truck on the market. Minimum 70% safety factor at mast-forward laden.

Sky-zone Aspiration—air intake for the engine, and exhaust outlet are at sky-level via the overhead canopy supports for rapid dispersal well above heads of workers or drivers.

Prolonged Life—specialised design based on 10 years fork truck experience, at all points where endurance factors must be exceptional.

Planned Serviceability—Every service and maintenance job studied, and planned for quick access, overhaul or replacement. Less truck-out time.

Essential for the

◀ **Materials Handling Scheme**

which aims to keep
up-to-date.

These new "SKY-ZONE" Models will be exhibited at BRITISH INDUSTRIES FAIR Castle Bromwich April 23-May 4, 1956 and The MECHANICAL HANDLING EXHIBITION, Earls Ct. May 9-19.

Stenorette DICTATING MACHINE

The Stenorette is designed to give a complete dictation and transcription service. It measures only 11½ by 9½ inches and weighs under 12 lbs. It is a miracle of compact, foolproof electronic brilliance.

Using magnetic tape, the Stenorette records 25 minutes of dictation; takes down conference minutes verbatim; can record, by means of a small, easily attached accessory, both sides of important telephone conversations. The same tape can be used and re-used indefinitely. An automatic volume control suppresses unwanted background noises and maintains the recording at the ideal level for transcription. Play-back is immediate; erasure automatic.

At a basic cost of **35 gns.**

With tape, spool and dust cover. Dictating Outfit (microphone and dictation pads) 6 gns. Transcription Outfit (earphone and foot switch) 6 gns.

Stenorette'S

The 'S' model is a de-luxe version. In addition to the many advantages of the Stenorette it has facilities for automatic back-spacing. Controlled from the hand microphone it enables the user to make on-the-spot corrections of words or phrases.

At a basic cost of
37 gns.

With tape, spool and dust cover. Dictating Outfit (Back-spacing microphone and dictation pads) 7 gns. Transcription Outfit (earphone and foot switch) 6 gns.

future imperfect

Wild animals depend for their food on what they can find.

It is a hand-to-mouth existence. Man, having evolved the idea of agriculture, sows to reap. He cozens nature, making her amenable,

to produce his food *when and where he wants it*.

He asks only health and strength to work his fields,

peace to enjoy the fruits of his labour and a stable economy

to ensure that he can sell and buy and exchange.

The main product of the Fisons business has for a hundred years

been chemical fertilizers, to enrich the soils of farms and gardens.

But they make chemicals for medicine and industry, too.

Fisons contribute to Britain's harvests, health and wealth.

FISONS LIMITED • HARVEST HOUSE,
FELIXSTOWE • SUFFOLK.....
.....Fertilizers • Heavy Chemicals

Fisons are also among the largest manufacturers in Great Britain
of pharmaceuticals, medicinal food preparations and fine chemicals
for industry. Many of Fisons products in these fields are household names.

it's all in **FISONS** field

The Shuffle

THE reorganisation of the Government, which has been talked about for so long, has made a mixed impression now that it has finally arrived. For some things in it the Prime Minister deserves full praise. He has made a real effort not only to bring new blood in but also to give the able young men of his party their chance in office. He is also to be congratulated on some of the changes he has not made; Ministers who are doing well have been left alone, conspicuously at the Board of Trade and the Colonial Office. But it is the reshuffle among the senior posts that matters most, and there the verdict must be rather different. Only a Prime Minister can know all the elements of the problem to be solved in Cabinet-making, and it is right to give him the benefit of any doubts in the arrangement of his team. But when all allowance has been made for Sir Anthony Eden's perplexities, there are still a number of apprehensions about the changes that need to be voiced.

The first cause of anxiety is the change at the Exchequer—though it should be said at once that it is not the coming of Mr Macmillan that is disturbing so much as the going of Mr Butler, and not his going in principle (for he has had a long innings and has a right to feel tired) so much as his going at this precise juncture. For it will be widely interpreted, both at home and abroad, as a confession of the failure of his policy. And in this there are grave dangers. It is true that nobody at this moment can put his hand on his heart and avow that Mr Butler's policy is an unmitigated success. The manifest facts of the present—the knife-edge equilibrium of sterling, the still merrily revolving spiral of domestic cost inflation—themselves deny it. But the best course is still to press on with the policy of monetary restraint and give it time and scope to do its work. It is essential to give the whole commercial world the confidence that the Government will find the resolution to persevere—and to make what looks like a confession of failure is hardly the way to do that. If Mr Butler had to leave the Exchequer, it is a thousand pities that his departure could not have been delayed until his policies had received the vindication that is still to be expected.

Moreover, there is an external danger. Among foreign observers, and foreign holders of sterling, Mr Butler has built for himself a strong reputation as the guarantor of its value. In his speech at Istanbul in September, which stopped a slide against the pound, he gave his pledge that whatever needed to be done inside this country to assure the stability of sterling would be done. If he now goes, the Continent will wonder whether the pledge goes too, whether perhaps Mr Butler's colleagues have found its implications politically too inconvenient. Foreigners, of course, do not understand the doctrine of collective responsibility. But can even a native observer feel absolutely sure that a new Chancellor, whose personal colours are less completely nailed to the mast of virtue, will steer the same course? The rumours of the change have already disturbed the foreign

exchange market, and the actuality may possibly bring another adverse turn in the tide of confidence. It was a hazardous thing to do.

In point of fact, however, if these psychological clouds hanging over his advent can be dispersed, Mr Macmillan may well make an excellent Chancellor of the Exchequer. He is a man of wide knowledge and firm views, and when he wishes can show great moral courage—he is both a thinker and a successful administrator. The only doubt one feels about him is whether his eyes are not a little too widely open to the main political chance. No one who set about building 360,000 houses a year with such gusto and success, fully knowing the whole time what harm he was doing to the national economy, can be regarded as quite the ideal man to do the unpopular thing just because it is right. But these are suspicions which, like the interpretations of policy that will be put on Mr Butler's departure, Mr Macmillan will have plenty of early opportunities to dispel.

★

The second cause of anxiety about the new arrangements is the scope of the new duties to which Mr Butler is going. He is (rightly) eschewing the title of Deputy Prime Minister and he is (still more rightly) not being set up as the overlord of any department of the Government's policy. His duties will apparently be almost entirely political rather than administrative. He is to lead the Commons; he is to re-establish contact with the rank and file, to encourage initiative while counselling patience to ambition; he is to look after the party machinery; he is to go back to his old job of ideas man of the Tory party and protector of its back room boys. These are all things that need doing and that have been neglected since the Conservatives returned to office four years ago.

But are they not, most of them, the Prime Minister's job? And when anyone other than the Prime Minister tries to do them all at once, does he not get into a painful dilemma—either he is given too little backing and authority to do the job properly (Mr Morrison could give evidence on that) or else he does it too well and divides the leadership. Traditionally, and actually, it is a very risky thing for a senior minister to accept an office that carries responsibility without power. It may be said, of course, that Mr Butler ought to know what he is doing and that it will be his own funeral if he slips up. But he is as clearly the heir apparent to Sir Anthony Eden, and with as little challenge from any one else, as Sir Anthony himself was to Sir Winston Churchill, and so long as that is so, it cannot be to the party's advantage—or, so long as the party is in office, to the country's—that he should be devalued.

A third complaint relates to the Ministry of Defence. It is now to have its third new Minister in fourteen months. This is not the way to treat an office where continuity of policy and a firm hand in applying it are

more vital than anywhere else. Moreover, to move into it a Minister who—charming and able as Sir Walter Monckton is—has for months been in indifferent health and complaining of the ardours of the Ministry of Labour is to treat the portfolio of Defence as if it were a sort of rest cure. It has long been said that Sir Walter's heart is really on the judicial bench. It will be unforgivable if there has to be still another change at the Ministry of Defence in the rest of this Parliament's life.

★

But the worst apprehensions that are aroused by the changing of the guard are those that concern the Foreign Office. It is no derogation from Mr Selwyn Lloyd's eminent ability—indeed, it is an expression of sympathy with him—to say that he is obviously intended to be the Prime Minister's mouthpiece. If there had to be a new Foreign Secretary after only eight months, there is in Lord Salisbury a man who, when he performed the duties of the office (without the title) two summers ago, showed himself to have the qualities of a great Foreign Secretary. There is no reason to suppose that Lord Salisbury is not now available, or that his sitting in the Lords would be a fatal handicap.

The passing over of the best man available strengthens the impression that one gets of the whole series of changes—that the dominant motive was not (as has been represented) Mr Butler's impatience to leave the Treasury—such a sensitive politician, however impatient, would hardly choose to leave under a cloud—so much as the Prime Minister's determination to run foreign policy himself, without a strong and independent politician at the other side of Downing Street. If this is so, then it is a great mistake. It would be a mistake with almost any Prime Minister at almost any time. But there are two reasons why it is a special mistake now. The first is that Sir Anthony, though he has made an astonishing recovery from his operation two years ago, cannot be wise to overstrain his strength. The other is that, in the present state of the world, it is very doubtful whether he really is such an indispensable guide for Britain's foreign policy. No one doubts his enormous experience and great tactical skill. But what is needed now is to think out a firm policy, based upon first principles, and then to stick to it—not rigidly indeed but with hard consistency through thick and thin and despite all the wayside temptations to quick and easy deals. This does not come easily to the *ad hoc* mind, to the experienced operator revelling in his technical skill, or to the man who instinctively prefers negotiation to policy. It would be as ridiculous as it would be impertinent to suggest that Sir Anthony has not been a good Foreign Secretary. But he is not the only one available, and it cannot but do him, his government and the country harm if he persuades himself that he is.

Frenchmen's Choice

NEXT weekend Frenchmen will have to devote unusual thought to politics in making their New Year resolutions. On January 2nd they will go to the polls to elect the National Assembly that is to rule France for the next five years. Over 5,000 hopefuls—not all of them very serious contenders—have entered the electoral stakes. Alliances between parties have been signed or spurned, tempers are rising, and in spite of the Christmas mood the campaign is rapidly gaining in bitterness as polling day approaches. The outside world needs to watch the twists and turns carefully, for both France's policies and its status in world affairs are once more at stake in this electoral battle.

France's friends and neighbours are naturally concerned less with the intricacies of the party struggles than with the strength, stability and colouring of the governments—the plural has to be used here—that are likely to emerge during the lifetime of the next Assembly. Three questions were framed as soon as early elections were placed on the parliamentary agenda. Would the loose right-wing majority lately presided over by M. Faure automatically consolidate its shaky position? Was there any prospect that M. Mendès-France and his Socialist allies might gain the upper hand so decisively as to give France a parliament of a kind it has never elected before? And could the Communists escape from their isolation and revive the popular-front fashion in Europe? As far as it is possible to see through the tangle of alliances and gauge the mood of the electorate, the answer to all three questions may well prove a negative one.

It is now certain that the Communists will go to the polls alone. With a single exception, local Socialist organisations have obeyed the orders of their headquarters and rejected the blandishments of M. Thorez. The "Republican Front" of Socialists and Radical supporters of M. Mendès-France will not be swept to power with Communist support. But chastity is a virtue which involves sacrifices in politics as in other spheres, and their rejection of Communist advances may have cost them their only chance of electoral success.

★

If they nevertheless won, France would come nearer than ever before to "Butskellism." M. Mendès-France, for all the bitter charges levelled at him from the Right, would probably, if he were campaigning in Britain, be described as a progressive Tory with a weakness for state controls. Unfortunately for him, French conservatism, with its many rural strongholds, has a preference for Blimps. Besides, he is cut off from potential allies among progressive Catholics by the question of subsidies for church schools (which his

Radical party traditionally opposes) and by the "European" issue. In spite of the signing of the Paris agreements on Western Union, the part he played in the outgoing Assembly's rejection of the European Army plan has not been forgiven him by the MRP and others, who regard his lack of zeal for close European integration as an insuperable barrier to political teamwork.

★

M. Mollet, the Socialist leader, for his part, could not bring as a dowry for the Mendèsiste-Socialist nuptials the votes of the industrial workers and the poorer peasants, since the greater part of these go to the Communists. Indeed, the "Republican Front" alliance probably depends for success on some degree of mutually accepted unfaithfulness on the part of both partners, on an understanding that one should seek out additional support on the left, the other on the right. An attempt has, for instance, been made to broaden the Front so as to include "progressive" Gaullists. This, however, need not have worried the anti-clerical stalwarts; no more than a handful of local alliances with Gaullists has been garnered. It seems that only an unprecedented swing, an extraordinary change in Frenchmen's deep-rooted party allegiances, could give French "Butskellism" a parliamentary majority.

M. Mendès-France has, however, done well enough in these unpromising circumstances to darken the outlook for his opponents. He has gained control of the Radical party and ejected from it some of his enemies, including M. Faure, the outgoing premier. Despite the conservative tinge of many of the remaining Radical candidates, M. Mendès-France has imposed enough discipline on them to prevent, with only a few exceptions, the concluding of local electoral ties with the right-wing coalition led by M. Faure, M. Pinay and M. Teitgen. His success has been a bitter blow to the parties of the Right. In many districts it will prevent them from winning the jackpot of the *apparentement* system—the capture of all the seats in a constituency with scarcely more than half the votes. As the *Poujadistes*—the lunatic fringe of the Right—ought also to prove capable of capturing some votes throughout the country, the maintenance of the old electoral system is unlikely to bring the Right the expected dividends. Proportional representation, which is resorted to where no party or *apparentement* wins a clear majority of votes, may become the rule rather than—as in 1951—the exception. Paradoxically, the Communists will gain most from it. They were the main victims of the newly devised *apparentements* in 1951, losing 60 to 80 seats through them. Even if there is a fall in their share of the total poll, they should now recover some twenty seats.

The next Assembly may therefore prove even more ungovernable than the present one, over whose grave few tears are being shed either in France or abroad. The patchwork right-wing coalition of which M. Faure was the last premier (perhaps one should say prisoner) can expect, at best, to return to power only with a much reduced majority. The narrowness of such a majority would make *immobilisme* more than ever the price of governmental survival. Each coalition partner would be able to exploit its indispensability. The Gaullists, in particular, though they will be weaker in numbers, may threaten to upset the apple cart every time reforms in North Africa or new steps towards European integration are proposed. A deadlock, however, is even more likely, with neither the Right nor the "Republican Front" gaining a clear majority in the Assembly. The Communists would be well placed in such a situation. M. Duclos would certainly use it to woo the Socialists afresh; fear would blur divisions at the centre, and an observer of the parliamentary scene would get a strong impression of what psychologists call the *déjà vu*.

But the electoral equation still contains three unknown factors. The *Poujadistes* are one. Their movement, born out of the often genuine grievances of small shopkeepers squeezed between official bumble-dom, taxes, and competition, has rapidly lost its original character. Its political techniques are now strongly reminiscent of the prewar fascist leagues, its funds are unknown (and its treasurers secretive), but it has managed to present lists of candidates in over 60 districts. The size of its poll, and that of similar smaller groups, including some Vichyite revivals, will provide a useful measure of the fascist potential in France. And, even if its candidates are everywhere rejected, it may considerably affect the final appearance of the Assembly,

for in many constituencies a handful of votes may decide whether one of the major rivals wins all, or only half, the seats.

More than a million new voters registered since 1951 are the second unknown factor. And the third is not unconnected with them. It concerns the impact of M. Mendès-France's personality on the young voter in particular and on the public in general. In the summer of 1954, this dynamic prime minister certainly captured many Frenchmen's imagination, both by his brusque liquidation of old dilemmas and by his positive programme for the future. It remains to be seen how far this highly personal pull will be translated into votes for local candidates more than a year later. The question may be broadened: who will benefit from the popular discontent provoked by the catastrophe of Dien Bien Phu, the sending of reservists to Algeria, and all the parliamentary antics of past months? How strong and lasting will such feelings of indignation prove to be in a period of relative prosperity?

But if there is no dramatic electoral swing, the Palais Bourbon may soon provide a queer sight. For weeks the politicians have been busy drawing a line across the centre of the French parliamentary scene. They have talked of it in deadly earnest, calling it a Rubicon never to be crossed, a rigid division between the forces of the Right and those of reform. But a deadlock might soon force the contestants to move, however surreptitiously, across this line. It may lie abandoned, unimportant, like lines drawn in chalk on the pavement, once the children have decided to change the game. It will not be easy to cross the line after all the pledges, the insults, exclusions and anathemas. It is often, however, the fate of New Year resolutions to be forgotten by spring-time.

Members for Malta

FIFTEEN members of the British Parliamentary delegation to the Malta Round Table conference have agreed that Malta should be offered an "Ulster solution" to its problems and discontents; only two members, both Conservatives, have opposed this. The majority of the delegation has proposed that the island should send three members to Westminster elected on the British system, not on the Maltese method of proportional representation. It has accepted the contention of Mr Dom Mintoff, Prime Minister of Malta, that this "practicable and reasonable" plan is the only way of reconciling Malta's demand for equality of status with the economic and strategic realities of its position as a Portsmouth or Chatham mounted on a heap of rocks in the Mediterranean. The delegation has rejected the proposal that Malta should instead become an independent Commonwealth country—as put forward by the Maltese opposition, the Nationalist party led by Dr Borg Olivier.

To propose to create another, and this time Roman Catholic, Ulster is no light decision. And as British parliamentarians would have to make the arrangement work at Westminster, it was for British MPs (of all parties) to find out if it was workable at all. They think it is, and the Government was shrewd in making it a Parliamentary decision. The report amounts to an offer from the House of Commons for the Maltese to accept or reject. It will thus not be a party issue at Westminster, and it is unlikely to stir strong feelings in the British electorate.

But the British—and the Maltese—people should realise just what the deal, if it comes off, will amount to. Having lost part of its Empire through insisting on taxation without representation in the eighteenth century, Britain is trying to save another bit by generously agreeing to representation without taxation in the twentieth; eventually the Maltese may pay United Kingdom income tax, but the report specifically

proposes that this issue should be left "in abeyance." There is, therefore, a great difference between this plan and Mr Mintoff's original proposals: the essence of which was that the Maltese would shoulder the same burdens as the British, fiscal as well as defensive, in return for additional British financial aid to give the island the same social services as Britain, comparable wage levels and treatment as a "development area," like Jarrow or South Wales. The Select Committee recommends that Britain should put up the money for raising the Maltese standard of living and improving the social services, and that it should somehow foster industrial development (behind protective tariffs). But "integration" has been dropped.

The original proposals, of course, had a great deal of economic nonsense in them. Mr Mintoff has himself come to see that no decree by any Parliament could raise Maltese living standards to parity with British until Maltese productivity rises to parity too; and that, so long as Maltese productivity is lower, a lower Maltese wage level is the only inducement to British firms to set up branch plants in the island. But, in return for dropping the unworkable part of his original proposals, Mr Mintoff has been offered some handsome political concessions. The proffered scheme would give Malta far more, not less, local political control over its own affairs, as well as control over the budget buttressed by British subventions. The Maltese parliament would be made more sovereign, not demoted towards the level of a county council. The arrival of Maltese members in Westminster would coincide with less control from Whitehall departments over Maltese administration. Malta would, of course, retain its own law and the supremacy of the Roman Catholic Church; this has always been intended and the British MPs found it necessary to reassure the Archbishop of Malta specifically on this point. But, in order to allow Malta to retain its special customs, the delegation evidently considers that it will be advisable to increase the powers of the Maltese parliament and cabinet, to remove the Governor's discretion to overrule his local ministers, and to reduce the list of "reserved subjects" to be transferred from the Governor to Westminster.

★

This is not necessarily wrong, but it should be recognised that Britain is not only proposing to accept—and, one hopes, to welcome—three Maltese MPs at Westminster. It is also taking a calculated risk that it will not get the necessary voluntary co-operation from the Maltese. Malta's past discontents have arisen from the fact that the island has had two governments, often in conflict. In theory, the Maltese parliament legislated on local affairs and Whitehall made rules only on matters affecting defence; but as defence is interwoven in Malta's life, the Maltese chamber found it hard to move without crossing Whitehall's lines, and Whitehall found it equally hard to administer defence matters without

interfering at almost every turn with Maltese domestic affairs. Under the new arrangement, it might have been expected that most Maltese legislation would have full legal force unless it came into conflict with law made on defence matters by Westminster—in which the Maltese members would participate—when the Westminster legislation would override it. That would have been the normal federal provision. But, very surprisingly, the Select Committee has carefully avoided this arrangement, and proposes a somewhat mysterious *modus vivendi*: under this, while Westminster would normally legislate on defence, it may "devolve" the power to do so to the Maltese parliament at its discretion. This is evidently intended to ensure that the Maltese should themselves voluntarily clear up "borderline" cases where conflict arises; and the report recommends that a series of consultative committees should be set up to advise when this is necessary.

In other words, it is presumed that, once there are Maltese members at Westminster, the Maltese of their own free will will co-operate happily on the subject where there has hitherto been so much friction. This means that British MPs will deal with Maltese affairs only in so far as they legislate for Malta directly, on clear cut defence or foreign issues which would be administered in Malta by some undefined agency coming under the Home Secretary. But the Maltese members, besides participating in this field of common interest, will also vote and debate on purely domestic British issues. They will have their say about British purchase tax schedules, teachers' pensions and white fish.

★

This is a one-sided arrangement. But the British MPs have decided to accept it on three grounds: first, because there was no other way of making the Maltese members full and equal members of the House of Commons; secondly, because some British domestic issues—such as budgetary or economic policy—may affect Malta; thirdly, because three Maltese MPs should not make much difference to Britain anyway. Probably, this last point is true. It would not have looked so true during the Parliament of 1950-51, but one can only hope that the narrow Government majority then was an electoral fluke. It also would not look so true if there were any risk that Malta might become a precedent for many other colonies. But, as all the large colonies—even Singapore, also an island city-fortress—prefer the "Gold Coast solution," the list of possible additional colonial constituencies is at most three or four.

On balance, therefore, the plan is a fair gamble for the House of Commons. Should it also be accepted by the British and Maltese electorates? Many people in this country who have always felt that the citizens of Malta should be given at least equal political rights with the citizens of Britain may be a little shaken to

discover that the Maltese are now to be given even greater rights than we have. But, now that the offer has been made, it would be a great mistake for Parliament to try to whittle it down. Malta is vital to the defence of the Mediterranean in the cold war. Its contentment and co-operation must be obtained; and the price in constitutional concessions and money, now that a generous bid has been publicised in this manner, will need to be paid.

Whether the Maltese will accept it is to be decided by a referendum. In large constitutional changes a two-thirds majority is conventionally con-

sidered to be necessary; and it is clear that Mr Mintoff will have to increase his present narrow margin of support to this extent if he is to prove that, in the words of the report, the Maltese people do "clearly and unmistakably" accept the offer. The chances are that they will. On any analysis it is a good offer; the Nationalist opposition can hardly brand it as "integration," much less as "absorption." But it leaves the onus with the Maltese not only to accept it, but, having accepted it, to make it work responsibly and smoothly at the Maltese end. The British offer certainly seems to carry the spirit of Christmastide.

Turning Point in Turkey?

AMONG its Nato partners Turkey has rightly earned the reputation of being a reliable ally. In a notoriously troubled region it is looked upon as a solid bastion against Communist expansion, prepared both to defend its frontiers and to persuade its neighbours to guard their own. But the recent political upheaval in Ankara has drawn attention to internal strains and stresses, both economic and political, which have already begun to jeopardise Turkey's prosperity and democratic development, and, if not firmly dealt with, could also undermine its ability to play its full part in the defence of the free world.

The government's authoritarian tendencies have been causing almost as much concern as the results of its economic policies, but it was the latter that sparked the political flare-up three weeks ago. There is, however, nothing new about the economic difficulties which caused the deputies of Mr Menderes's own Democratic party to rise up in wrath, force the resignation of his whole cabinet and accord him personally only a grudging vote of confidence. For years, foreign experts have been begging the Prime Minister to reconsider policies that were plainly leading to an appalling burden of short-term foreign debt and to domestic shortages and serious inflation. What is new and heartening is the way the representatives of the Turkish people have themselves forced Mr Menderes to think again. Last week, with his cabinet reformed, he presented to the Grand National Assembly a programme which should meet much of the present criticism.

The basic complaint is not that the government is making for the wrong goal, but that it is trying to get there much too fast. It is trying to turn Turkey from the backward country that it was thirty years ago into a modern state equipped to exploit its rich resources so that it can both pay its way in the world and afford a steadily rising standard of living. A great deal has in fact been done. But Mr Menderes has set his sights so high that he has risked defeating his own ends. He has not, it is true, fallen into the common Communist error of neglecting agriculture; since 1950, agricultural

investment has risen faster than any other type of investment, and a real transformation of the countryside has been carried out. It is also true that Turkey must invest heavily in capital equipment if it is to grow out of its excessive dependence on imported goods.

But Turkey is being dotted with hydro-electric projects, cement factories, sugar factories, every sort of factory, at a pace which is both unnecessary and unwise. There seems to have been no serious attempt to lay out the country's scanty foreign exchange to the best advantage; and there has been a tendency to waste resources through lack of co-ordinated planning or through too great anxiety to reap political dividends. In some places, factories have sprung up where there is no sound economic reason for them to be; in other places factory buildings have been built and opened with a flourish of trumpets and then the machinery for them has failed to materialise. Until quite recently, the restrictions on imports have not been nearly severe enough, credit has been easy to come by, and expansion at all costs has been the order of the day.

Mr Menderes seems to have believed that if only the Turks could hold on for a few years until their various chicks were hatched, everything would be all right; and, alternatively, that if things got too difficult the Americans would be bound to bail them out. But last summer a request for a loan of \$300 million over and above the ordinary American aid that the country is getting was turned down by Washington. Americans argue that as long as the Turks fail to put their economic house in order they cannot expect to get any really large new injections of foreign aid.

The economy is certainly sadly out of order today. The trade deficit has swollen; during the first seven months of this year, imports rose by 1.5 per cent, exports dropped by 8.5 per cent, and the deficit amounted to TL 365.1 million, compared with TL 307.5 million in the corresponding period of 1954. The current commercial debt is estimated at around \$450 million. The value of the Turkish lira on the free market has fallen to one-third the official rate and the

soaring cost of living, the empty shop-windows and recurrent shortages of such necessities as sugar, tea and coffee are causing growing exasperation. Most observers agree that, whatever their origin, the Istanbul riots last September would probably not have swollen into such an appalling orgy of destruction if the "have-nots" had not seized the chance of aiming a blow at the "haves." And the discontent is not confined to the towns. Among the villagers, the chief beneficiaries of Democratic rule, there is growing dissatisfaction at the high prices and shortages of such humble necessities as sugar, nails, and spare parts for farm machinery.

Pure bad luck has, it is true, contributed to these troubles. Last year the harvest was a disastrous failure; instead of having a wheat surplus for export, the government was forced to import around 500,000 tons, and in the first six months of this year cereal exports were worth only TL 25 million, compared with TL 145 million in the first half of 1954. It is also true that the Turks have paid off some of their commercial debts and that the government has made some efforts to draw in its horns. Some import controls were re-introduced as long ago as early 1953 and in that and the succeeding year imports did fall by 9 per cent, although they began to rise again during the first part of 1955. Recently import controls have been drastically tightened, and the Golden Horn, where five years ago it was difficult to find berths for incoming vessels, is today an eloquent witness to the comparative stagnation of trade. The government also stepped up the bank rate from 3 to 4½ per cent at the end of May, and the Agricultural Bank, which eighteen months ago was handing out credits with what seemed to many people to be reckless abandon, is much more tight-fisted today.

But until this month's crisis, Mr Menderes did not attempt to get to the heart of the matter. He refused either to coordinate or to prune the government's capital investment programme, and he baulked at the thorny problem of the agricultural subsidies. Last week, he promised not only measures to reduce the trade deficit and a coordinating economic council, but also a halt to any new economic developments. He said nothing, however, about the agricultural subsidies, which speed up the inflationary spiral by putting extra cash into the peasants' pockets when there is little to spend it on. This problem is politically explosive, but it will have to be tackled sooner or later.

The critics of Turkey's primrose path have been found at home as well as abroad; and an unhappy aspect of the scene during the past eighteen months has been the government's intolerant reaction to criticism, which, if sometimes grossly partisan, has often been both well informed and constructive. A press law, so heavily weighted on the side of the powers that be that it caused a split in the Democratic party last month, has landed about a score of journalists in gaol and caused the suppression, for varying periods, of a number of newspapers. Even the independence of the universities and judiciary has been threatened. Turkey, which in recent years has been held up as a

shining example of how to make a peaceful transition from autocracy to democracy, showed grave signs of faltering in its democratic progress. It is, therefore, encouraging that Mr Menderes has promised to amend the press law and carry out other political reforms.

In Turkey, however, as everywhere else, the proof of the pudding is in the eating. It is clear that Mr Menderes is seriously impressed by the opposition he has aroused; it is not so clear that he is genuinely convinced that the measures he has now promised are really necessary. But at this stage it would be churlish not to give him the benefit of the doubt or not to hope that he can find men who are both honest and able to help him govern. No doubt the progress of Turkey's democracy—like that of many countries with far older democratic traditions—will have further ups and downs: no doubt its economic development, even if it is directed along wiser paths, will still be handicapped by inexperience, lack of trained personnel, and climatic hazards. But the events of the past few weeks have shown that the politically conscious Turk (and his numbers have grown enormously in the last ten years) is not prepared to put up with bad government.

Commonwealth of Nations

We cannot escape from the obligations and responsibilities of our position as members of the great commonwealth of nations on any plea either of incompetency or of false humility. We can discover what we ought to do, if we will really study and inquire with a single mind. We can do whatever we wish to do, if only we will bind ourselves to it with a resolute and uncompromising will. If we have made many blunders and perpetrated many wrongs in times past, it has been from want of an enlightened conscience and a high principle of action. . . . If we, as a nation, once clearly know and once boldly announce in what line our sympathies lie and to what goal our endeavours shall point—what we will systematically discountenance and what we will cordially encourage . . . without a single proceeding which even arrogance could stigmatise as unwarrantable meddling, without being called upon, except in the rarest instances, to take up arms in quarrels not rigidly our own—we should still be able constantly to succour oppressed right and to baffle aggressive wrong, and gradually and powerfully to guide the destinies of Europe towards the consummation which we have at heart. It will suffice for other States to know clearly and to know beforehand what under any given circumstances will be the wish and conduct of Great Britain, to modify their whole plans and purposes. It is because hitherto neither peoples nor sovereigns have been able to foretell this—because we ourselves have never known it—because it has depended . . . on the uncertain temper of Parliament, on the accident of the Minister or the Party who chanced to be in office—that we have so perplexed our foes and disappointed our friends, that we are charged by despots with disaffection and by patriots with perfidy, and that we have been on many critical occasions so powerless, and at almost all times so unpopular. We are now in a position to take up a line of policy at once consistent, dignified, and efficacious.

The Economist

December 22, 1855

Notes of the Week

The Cabinet's Recruits

THE simplest summary of Sir Anthony Eden's Christmas shuffle is that it involves five major changes, two other elevations to the Cabinet, six new Ministers not of Cabinet rank, and twelve junior appointments. Four of the five major changes—involving Mr Butler, Mr Macmillan, Mr Selwyn Lloyd, and Sir Walter Monckton—have been discussed in the leading article of this issue. The fifth really important change is Mr Macleod's promotion to the Ministry of Labour. Mr Macleod is the sort of man who would be a major television star if he had not had the bad luck to be in the Government for the past few years. He has been by far the best and most informed answerer of departmental questions in the House of Commons. It remains to be seen whether he can show not only the continuing tact but also—and more important—the entirely novel sense of economic purpose that is needed to make a great Minister of Labour at this juncture. One of his difficulties may be that it is hard for a man to risk unpopularity when he goes to a new post with an unmitigated reputation for success. It is unfair to say that Mr Macleod has yet shown signs of falling in love with his own brilliance, but as Minister of Labour he may find it a disadvantage that he has got a lot of past brilliance to fall in love with.

The two other elevations to the Cabinet are appointments of useful committeemen. Lord Selkirk moves into Lord Woolton's old post of Chancellor of the Duchy of Lancaster, and Mr Buchan-Hepburn (the former Conservative chief whip) is to bring his knowledge of Government business to the Cabinet's aid while carrying the title of Minister of Works. If this last appointment means that managing the Ministry of Works is now to be regarded as a spare-time occupation, it will be a mistake; for there are reforms that are urgently needed in this neglected Ministry. When Mr Buchan-Hepburn arrives at his desk he should compare his new Ministry's costing techniques with those used in private industry or even in more up-to-date Government departments; he may get a quite a shock if he does.

Below the Summit

SIR ANTHONY'S changes among Ministers not of Cabinet rank and among the under-secretaries are notable principally, but not entirely, for the promotion of youth. Among the Ministers set in motion it is not quite clear whether Mr Boyd-Carpenter has moved up or down to the

Ministry of Pensions; in any event, the chief interest of this change is that his old job as Minister of Transport is taken over by Sir Walter Monckton's former assistant, Mr Harold Watkinson. It has been generally assumed that Mr Watkinson could not succeed Sir Walter at the Ministry of Labour because the Opposition, scenting the possibility of his succession some time ago, has made a dead set at him in Parliament; but at least part of Mr Watkinson's new duties at Transport will have to do with labour problems (the other important part will have to do with roads). There is a smooth streak of unexpected fanaticism about Mr Watkinson, and one suspects that he is not going to be a Ministerial mediocrity; that may mean that he is going to be a very good Minister or a much-criticised one or perhaps (but not necessarily) both.

The other new Ministerial appointments are Mr Birch at the Air Ministry, Mr Turton at Health, Mr Hare as Mr Lennox-Boyd's Ministerial assistant at the Colonial Office, and Mr Aubrey Jones at Fuel and Power. Mr Jones's abrupt promotion from the back benches to full Ministerial office is the most interesting development here. Although there is no doubt of his ability, he becomes the first Conservative Minister to owe the rapidity of his promotion to the useful political circumstance that he is the son of a miner. It was being said in Westminster on Wednesday that the quickest passports to promotion in the Conservative party are now either to wear an Old Etonian tie or else to carry the badge of coal or some other former depressed industry most proudly upon one's escutcheon.

There is little to say about the new under-secretaryships. Some are promotions on merit; others are reshuffles to aid senior Ministers who are under, or are likely to come under, criticism. Three of the ablest Tory intellectuals—Mr Powell, Mr Carr and Mr Alport—are likely to be given stern baptisms of fire as assistants at the Ministries of Housing, Labour and the Post Office respectively. And Mr Deedes goes to the Home Office; it is almost impossible not to make a pun about that.

Atlantic Argument

ABOUT once a year the Atlantic Council and those responsible for Nato affairs within its member governments look again at the woolly but well intentioned second article of the treaty of 1949 and wonder what to do about it. This is the article that commits members to economic collaboration and the further development of "friendly international relations." Last week the council ended its ministerial session with another inconclusive discussion about it.

This annual agitation about Article Two arises not from the lack of an international organisation to deal with economic questions—most Nato governments would probably agree that this field is already uncomfortably crowded—but from an uneasy feeling that Nato will lose the sustained public support which a democratic alliance requires for survival unless it can shed its military label, or add a new one.

But is this the real trouble? In no country is the necessity for a national defence ministry questioned, or the suggestion made that it be given extraneous functions simply to enhance its attractions to the taxpayer. Within a national government, however, defence is accepted as an ingredient of the total policy of the country, and is discussed and supported, or rejected, in that context. Nato has so far failed to match in the political field the planning and co-ordination that exist on the military side. The alliance already has highly integrated defences on land and sea, and last week took a long overdue decision to co-ordinate air defences. But it is only just beginning to have a foreign policy in even the most limited sense.

Saturday's communiqué was a surprisingly, and commendably, forthright statement on the two most difficult questions that face the allies at present: Soviet opposition to the unification of Germany, and the well-baited hooks that Russia is now casting over troubled waters. And the political discussions in the council which led to the conclusions expressed in the communiqué were found by small and large countries alike to be more than usually helpful. This is a good beginning, but there is still a short-sighted disposition to exclude altogether from Nato the discussion or even explanation of questions which are a source of embarrassment among partners.

Admittedly, Nato meetings can usefully continue to provide the opportunity for miscellaneous discussions on the sidelines. But if questions which concern the alliance as a whole are also consistently relegated to the corridors in an effort to leave the Atlantic Council itself unruffled, Nato will suffer in the long run. There is also a danger in too much playing down of the differences of view which arise in the course of its discussions; only "agreed views" are normally revealed to the public. This is not a plea for the public airing of squabbles. But it is agreement born of the right to differ which sets Nato apart from the bloc it confronts, and an occasional glimpse of the democratic process at work would do nothing but good.

Damaged Package for Tokyo

IT was hardly surprising that the official Japanese observer at the United Nations described his fellow countrymen as feeling "severe disappointment" after last week's events. To wait on Uno's threshold in reputable company, sharing one's impatience with states such as Italy, Ceylon, and Austria, is one thing; to see the doors open to admit the others, and then to find oneself alone on the draughty step with that highly hypothetical sovereign polity, Outer Mongolia, is another. The Japanese feel that they have been

singled out for this humiliation; and so they have. They were very carefully singled out, by Russia.

The Russians' aim was transparent and threefold. First, they selected Japan as a sacrificial victim because it still recognises the Chinese Nationalists, but hankers after Peking's friendship too. They wished both to teach it the unwisdom of dealing with Chiang Kai-shek, and to arouse its anger against him, for it was his veto, cast against Mongolia, that destroyed the original "package deal" under which Japan would have entered the United Nations. Secondly, they rejoiced in the chance Chiang gave them of keeping Japan's entry into Uno as an ace that can still be played during their protracted and poker-faced negotiations over a Russo-Japanese peace treaty. Thirdly, they hoped that anti-American feelings in Japan would be inflamed by the belief that the country's misfortune had been brought upon it by "the United States puppet, Chiang."

In this third respect, however, they do not seem to have been as successful as in the others. Perhaps the Formosa regime's arrogant treatment of the Security Council, and General Chiang's rejection even of personal pleas for compromise from Mr Eisenhower, made it clear, in Tokyo as elsewhere, that the Nationalists are much too troublesome to their friends to be classed as mere puppets. Moreover, the Japanese naturally followed the detailed course of the UN debates closely, and did not fail to note either the naked Soviet discrimination against them or the repeated American efforts to circumvent it. Reports from Tokyo suggest that the press and public have quickly recognised where the real responsibility for their exclusion from Uno lies. If this is so, it is both a tribute to Japanese level-headedness, and a warning to the Russians that their cynical tactics of exploiting every chance to arouse anti-Americanism can sometimes be overdone.

The Saar Edging Into Germany

THE result of last Sunday's elections in the Saar might have been worse. It had been expected in Bonn that the Christian Democratic Union would have gained more than it did from its opposition to the "European statute" during the October referendum campaign. The People's Party, it was thought, would be tainted as a French puppet and obliterated; and nobody imagined that Herr Hoffmann would save it by resigning the premiership after the referendum and deciding not to stand in the election. In the event, the CDU, though the leading party, with 14 out of 50 seats, is only one seat ahead of the People's Party. This result justifies the view that there might well have been a majority for the "European statute" in the October referendum if Western European Union had produced a genuine European solution and backed it to the hilt. As it was, the Saarlanders "voted for Germany" in October because they were convinced that the only alternative was not "Europe" but France.

The comparative success of the moderates last Sunday should not obscure the fact that the right-wing Democratic party gained third place with 12 seats. Its leader, Herr

Schneider, may become a nationalistic force to be feared in German politics. Much depends upon the government which is formed in January. If the Catholic bishops' expressed wish is fulfilled, the two moderate groups—the Christian Democrats and the People's Party—will join forces, leaving Herr Schneider in the opposition; but at present, it seems more likely that he and the Christian Democrats will form a team, with the Social Democrats, under a neutral premier.

In any event, the next government will probably cancel the essential part of the 1947 constitution, which lays down that the Saar is politically detached from Germany and economically attached to France. True, the pro-German parties did not obtain the three-quarters majority needed to make the change, but the few extra votes needed may well be provided by members of the People's Party—which is too afraid of being branded as separatist to oppose the popular demand for a return to the German fold.

The Saar is inevitably edging its way back to Germany, and the success of the moderates means only that the French will not be flouted by a sudden move. They will be offered economic concessions and a gradual loss of the Saar limb, which the Germans hope will be less painful than a sharp amputation. But it seems inevitable that when fresh Franco-German negotiations take place after the French elections, the incorporation of the Saar into the Federal Republic in some form will be proposed from both Bonn and Saarbrücken. If German reports are not too optimistic, the French are now facing the fact that a final settlement is urgently required because Saar heavy industry will continue to be starved of capital until investors know its future. As there can be no return to the *status quo*, and no "European solution" is in sight, the return of the Saar to Germany seems only a matter of time.

Commons in Congestion

PARLIAMENT breaks up at a moment of unusual political change, but also of usual mid-session congestion. Mr Butler, in his new role of Leader of the House, should have a busy time just after Christmas working out how to untangle the mess into which his last Budget threatens to plunge the Government's Parliamentary programme. Admittedly the Government has left itself a little more elbow room than usual. The session opened at the beginning of June and will run until the end of next July at least, if necessary into the autumn. The Queen's speech foreshadowed no more than a normal amount of legislation, so that, if all had gone smoothly, the Government would have had an easier timetable than for some years.

But much has gone wrong. The autumn Budget was awkward enough in itself, but Labour's hostility forced the Government to devote a quite disproportionate amount of time to the Finance Bill. This bodes no good for next year's Finance Bill, which, because of last April's pre-election scramble, will be the first full one for two years. It is therefore bound to be a monster; indeed, it is to be hoped that it will be one of the longest Finance Bills ever,

for many of the recommendations of the Royal Commission on Taxation urgently require enactment.

The Government has also had to bring in two other unexpected Bills, one to leave the Transport Commission with more lorries and one to improve compensation for slum clearance; and Ministers are having trouble both with the Teachers' Pensions and the Housing Subsidies Bills. Still to come from the Lords is the Copyright Bill, which is complex and ought to be controversial. Finally, just over the horizon is the Monopolies Bill. This is going to need a lot of time, and it is already overdue. Indeed, it is so long overdue that there have even been suggestions that, if the Government gets into difficulties with its timetable, some ministers might be tempted to suggest that this Bill should be shelved for another session. That suggestion should be slapped down before it is seriously uttered; and it should be Mr Butler's job, in his new office, to do the slapping.

A Voluntary Freeze?

THE example set by the cement and plasterboard industries, in announcing that they will not raise prices until the end of next June at least, has not yet been followed by other industries. But it has been enthusiastically welcomed by a section of the press; and General Spears, the chairman of the Institute of Directors, has written to *The Times* to urge that "a very substantial part of British industry" should co-operate to start this snowball of restraint rolling.

This is a basically unsound suggestion which nevertheless deserves encouragement in the unfortunate economic circumstances of the present time. It is basically unsound because any long-standing freeze on prices and wages—applied equally to those industries in which the demand for products and labour is growing as to those in which demand is declining—would be a recipe for long-term industrial stagnation; General Spears even suggested that the nationalised railways and coal mines should give a lead, which means that he wants the railways to allow their huge current deficit to grow even larger. It is impossible to build up a sound economy on distortions of this sort; moreover, even in the short term, the public should warily take note that some industries with central price-fixing bodies might

PARKINSON'S LAW

This article, which appeared in *The Economist* of November 19th, has been reprinted as a pamphlet, price 6d. including postage.

Special prices for bulk orders: 1 dozen, 5s.; 6 dozen, 27s.; 12 dozen, 48s.

THE PUBLISHER,
THE ECONOMIST, 22 RYDER STREET, LONDON, S.W.1.

have a rather sinister reason for wanting to make central price-fixing look temporarily respectable just now.

But beggars cannot be choosers, and the woolliness of this proposal should be forgiven—indeed welcomed—if there is really any chance that it might help to break the wage-price spiral that is the greatest current threat to the stability of the pound. If the initiative is to be realistic, however, the unions must play their part. Unfortunately, the reaction of certain union leaders, as quoted in the *News Chronicle* this week, was significant. "Get this round [of wage increases] out of the way," they said, "and then it may be possible to talk." On the contrary: if they maintain that attitude, there is no real point in talking about the proposal at all.

Accomplished Fact in Khartoum

SUDANESE politicians have recently acquired a reputation for having second thoughts—about the benefits of union with Egypt, about ousting and then reinstating their prime minister, about taking the final decision on independence by parliamentary methods or by plebiscite. But it may reasonably be assumed that there will be no second thoughts about the decision that the House of Representatives in Khartoum took on Monday. Once a country has formally proclaimed itself free amid scenes of rejoicing, it does not change its mind. The Sudan's former co-dominion, Britain and Egypt, already somewhat breathless from the effort to keep up with the veering intentions of the Khartoum parliament, may reflect a little ruefully that the careful plans they hammered out two years ago to ensure the Sudanese a genuinely free choice as to their future have gone slightly awry. But that is not to say that this week's choice was not freely made. Ismail el Azhary, the prime minister, may have short-circuited the elaborate arrangements prepared for his country's emancipation, but if he had instead been content to go through all the prescribed motions, would the result have been substantially different?

The cause of close integration with Egypt, which the prime minister and his party themselves formerly championed, has long appeared lost. The Sudanese are feeling their oats, and fully confident that they can stand on their own legs. They have lost no time in devising a kind of presidium to take over the functions of the retiring Governor-General. If this five-member body proves as firmly above party as its proposed composition suggests, it ought to provide a sensible, even if only interim, replacement for a British official whose position had become that of a helpless target for xenophobic attacks. Ismail el Azhary has startled Egypt into bringing Major Salah Salem, its former minister for Sudan affairs, out of a four-months' obscurity, and he has sped south like a greyhound released from its trap, perhaps with some urgent questions about the high Aswan dam project. The prime minister has also, by his dramatic move, strengthened, at least for the moment, his own shaky parliamentary position; he has publicly acknowledged the federalist inclinations of the southerners, though he may yet have trouble in satisfying them; and, by cutting a Gordian knot to which he himself had admittedly contributed a few twists, he has at all events replaced uncertainty, which in a country like the Sudan breeds fear, by the

simpler outlines of a *fait accompli*. The omens are not, then, unpropitious at the moment when the Sudan joins the comity of sovereign nations.

Agenda for Singapore

MR DAVID MARSHALL, Chief Minister of Singapore, returned home this week in a cheerful mood. He arrived more than a little suspicious of the Tories in general and the Colonial Secretary in particular; but he found everyone ready to accept his own conception of the scope of the agenda for the constitutional discussions in London next April. There is to be no hanging back. The conference is to hammer out a definition of internal self-government, and Mr Marshall will put forward his own view that, while external defence must remain Britain's responsibility, internal security is a local matter. A date for introducing internal self-government is also to be set, and Mr Marshall's target is January 1, 1957. He will have proposals for enlarging the present Legislative Assembly of 50, which is too small to provide a cabinet, a government back-bench, and an opposition as well (although some territories admittedly manage with less). He also hopes to eject the officials from the chamber, and certainly the ex-officio ministers from the cabinet, and to relegate them to being departmental heads under ministerial control.

The difficulties will obviously revolve round the relation of external defence and affairs and domestic matters. On such issues as admitting Malay and Chinese as official languages there need be no argument, though there may be plenty of inconvenience and expense in regard to interpreters. But Mr Marshall has a lively awareness of his own handicaps. The first is that while he must bring back concessions to bolster his none too strong position in the House, he dare not be too cordial with the "colonialists" if emotion is not to carry the day in that emotional chamber. The second is that he lacks able lieutenants, at least in the numbers needed. The third is that he faces a determined opposition with probably a better party organisation than his own and a group of Chinese politicians whose deepest feelings are that they must place themselves in a position to "get on" with the Chinese Communists if necessary. He is confident that he can survive; and he is determined to take the large powers that, if placed in the hands of an extremist successor, would be fatal to freedom in Singapore. He insists that Britain must take this calculated risk.

Twilight of the Territorials

THE Government's reorganisation of the territorial army and reserve forces is designed to meet the realities of thermo-nuclear attack. On the supposition that at the outset the ports will be "taken out" by atomic bombs, it is no more than sensible to regard two divisions, with their supporting troops, as probably the largest forces which, with luck, Britain would be able to send overseas in support of Nato commitments. Nor is it surprising that non-divisional artillery units are to be disbanded; their role has already

largely been taken over by close-support aircraft, although these aircraft themselves do not always conform particularly well to modern conceptions of mobility for ground forces in atomic warfare. In future, therefore, some artillery functions will be performed by the armoured units to be attached to infantry divisions; the conception of the independent armoured division (which was itself the outcome of weakness in armour in the last war) is to be abandoned. More startling than these radical but long-foreseen changes is the decision to reduce the airborne division to a parachute brigade of four or five battalions. It is stated that this has no foreseeable future role as a division. Not in hot wars, perhaps, but what about in warm ones?

With this drastic streamlining of British forces for use abroad goes the frank acceptance of the real role of reserve forces at home. This is twofold. First, the reserve forces will guard against airborne landings; these might either be direct attempts to seize or cripple the country (even after an exchange of "massive retaliation" the enemy might still consider Britain a worthwhile target for invasion), or they might merely be attempts to supplement aerial attacks by sabotage. Secondly, the reserve forces are in effect the most important branch of civil defence in this country; they would be called upon to "maintain the life of the nation"—by operating in disciplined formations to organise survival after atomic and other forms of what is still politely called "unconventional" attack. It is only logical, on that basis, to stand down the home guard and the Army emergency reserve; their place is taken by the eight or nine infantry divisions of the reserve. This reorganisation may also achieve some financial savings, which can be put into research and new weapons; it marches in step with the accelerated scrapping of naval vessels. Perhaps the main question to be asked is whether the British plan does not somewhat anticipate the full-scale atomic era. But the answer must be that, as the country cannot be prepared for every eventuality, it will do best to be prepared for the most likely one.

A Fishy Story

THE Government was roughly handled in the debate on the white fish subsidy last Monday. It deserved to be. The essence of its revised scheme—even as amended in response to pressure from the inshore fishermen in the last week before the debate—is that it is cutting back the subsidy to the middle water motor vessels by £40,000 a year and that to inshore boats by £135,000 a year; but it is giving away more than the whole of this to steam fishing vessels, whose subsidy will rise by about £325,000 a year. There will therefore be no net economy in the subsidies. There will be an actual increase in them.

Members representing fishing interests, who were about the only members who spoke in the debate, did not, of course, object to that. But nearly all of them criticised the changes as simply transferring a part of the burden of maintaining the obsolete steam vessels to the relatively more efficient middle water and inshore fisheries and to the small man who operates a small boat. The Minister agreed that the smaller men have re-equipped energetically in the last few years, and so helped to keep their costs down; but he quite rightly said that this was the whole object of the subsidy scheme, and that he was glad to be able to feel that the smaller men could now more nearly stand on their own feet. Unfortunately, he had to admit that his estimates of their present profits were based on inadequate data. Representatives of the fishing ports all insisted that his figures were not merely inadequate, but plain wrong.

It was, however, in the Minister's references to the increased subsidies to steam vessels that the mistakes in this subsidy scheme were most glaringly revealed. The Minister justified these increases on the grounds of higher operating costs, particularly the cost of coal; but he could give no figures to show the extent to which the subsidy, which has been operating since 1950, has really promoted the replacement of steam trawlers by modern vessels. It is hard to see why the principle of helping steam trawlers when they make losses should encourage their replacement. The Government has announced that it intends to introduce yet another new scheme in a few months. It should concentrate the subsidies on re-equipment grants only, particularly for re-equipment of vessels from coal to oil. This is the only real justification for subsidising the fishing fleet now.

Missiles for Nato

THERE seems to have been a singularly inept muddle over Britain's offer to supply Nato countries with guided missiles. This offer was made by Mr Selwyn Lloyd, in closed session, at the meeting of the Nato council in Paris. The story as it has appeared in the newspapers would be a first-rate one, since it would carry the welcome implication that Britain was producing missiles and to spare—at least for practice purposes. But, of course, this is not true. Britain has, at the most, prototype guided missiles; and quantity deliveries of them are not expected until 1958. It is unlikely that Nato countries could hope to receive

supplies until later than that. This news is not likely to excite them. America is already sending Nato countries, for experimental purposes and without an atomic warhead, supplies of the "Corporal"—its ground-to-ground missile of 20 to 25 miles range. The United States is technically about two years ahead of Britain in this difficult field of research, but it is still far from producing a satisfactory tactical weapon.

All that Mr Selwyn Lloyd was in fact able to offer was technical advice on missiles and possibly on other modern weapons. This is a very different matter, and is more in accord with present scientific and financial realities. Britain, like its allies, is having to choose between research and the upkeep of the existing stock of conventional weapons (and of the manpower that handles them). Mr Selwyn Lloyd may have offered to supply missiles "in due course." Exactly how long "in due course" means is uncertain; but the period of waiting is likely to be fairly lengthy, and it will be largely determined by whether Britain is able to spend more on research and development in the next two years.

New Move on China Trade

WHEN Sir Anthony Eden goes to Washington in January he will make a determined effort to get the Americans to agree to a revision of the controls on exports of strategic goods to Communist China. It has always been the British contention that it is illogical to try to maintain a double standard of controls on strategic trade; exports to Communist China and North Korea are subject, under the United Nations embargo imposed in 1951, to greater restrictions than those applied by western countries to exports to the Soviet bloc in Europe. Britain wants to unify the two systems. But, understanding American susceptibilities on anything touching Communist China, the British Government has not, up to now, advertised its feelings.

On purely commercial grounds, a good case can be made out for easing—as against abolishing—the controls. But in taking a decision such as this political considerations must come first, and, moreover, Britain, having voted for the UN resolution of 1951, must abide by its international obligations. The real question is whether, on balance, pruning the strategic controls would strengthen or weaken the position of the whole free world. On the one side must be weighed the economic advantages. Many countries in the free world, particularly Japan, would welcome the chance of selling more to China, though hopes of substantial gains should be discounted. On the other side is the strategic argument. The anomaly of two different control systems enables Peking to obtain strategic machines and materials banned under the UN embargo simply by ordering them via its Communist allies in Europe. The extra cost and strain imposed by this roundabout supply route should not be underestimated; but the balance of advantage probably lies in reducing the China control list to conform with that applied to other Communist countries.

Whether the time is ripe for a frontal assault on the China embargo is a very different question. The free nations have not so many cards in their hand that they can afford to throw any away without extracting concessions from the

other side. The Americans might well argue that nothing should be done that might undermine the position of their representative in Geneva, Mr Johnson, who has been patiently and successfully bargaining for the return of American civilians imprisoned in China. Britain, too, might be rash to lose the opportunity of trying to secure some settlement of its property claims in China. And the wider question presents itself: once economic restraints are cast aside, what means would the free world retain of discouraging any fresh adventures on which a now heavily armed and militant China might embark, other than war?

An Unmoral Story for Christmas

LAST week a Labour MP asked if Sir David Eccles would please show "more tact" in writing his speeches; in other words he asked if the Minister would please dissemble his mind, which means would he please tell lies about what he thinks. The questioner was referring, of course, to that now famous speech at Leamington, in which Sir David opined that teachers were being rather "silly" in making such "a song and dance" about their pensions. Newspapers of all persuasions, politicians of all parties, and teachers of all types have joined in assaulting the Minister for this forthrightness; and, as a result, the word is being passed round Whitehall that prevarication is the better part of policy. This is a terribly unmoral story for Christmas.

A newspaper like *The Economist*, which has consistently supported the Superannuation Bill, is less well-placed to defend the principle involved in this plain speaking than a newspaper that has opposed the Bill would be; one looks less disinterestedly chivalrous riding out to oppose eternal untruths when one is riding there on one of one's own hobby horses. But even those who agree with what Sir David said should defend to the death his right—nay his duty—to say it. It was Dr Johnson who said that to be polite to an adversary is to give him an advantage that he does not deserve; and politicians who have to deal with pressure politicking should remember this. To oppose strike action with frank words as well as with frank actions does not "exacerbate feelings"; at the most, it gives the pressure group concerned something to talk back about, and thus adds to the gaiety of occupations. The

teachers have not been the worst offenders in this matter; the worst offenders have been those newspapers who, in their editorial hearts, agree with what Sir David is doing, but who think that they can show what broad-minded organisations they are by attacking him for saying what he thinks. They should remember that this is the wrong season, and the wrong stage of British political history, in which to encourage humbug.

The Lorry Drivers' Coffee Break

THE case for raising the legal speed limit applicable (one cannot say applied) to heavy lorries was argued afresh in the House of Commons last week, when Mr Nabarro moved a new clause to the Road Traffic Bill which would substitute a 30 mph maximum for the existing 20 mph. Mr Boyd-Carpenter agreed that on "the bare merits" of the matter the change was desirable. In the Minister's guarded words, however, the question is "whether and when it could be carried through with the genuine goodwill of those in industry."

"Those in industry," in this context, are the lorry drivers. The point of the present "legal" limit is that, although it applies strictly to lorry drivers' schedules, it applies not at all to their performance on the road; on any open level road a lorry doing twenty or less is a much more surprising sight than one doing forty. The combination of low scheduled speeds and high actual speeds leaves, of course, plenty of elbow room both for contingencies and for uncovenanted breathers in cafés. The principal reason for changing the law should not be to cut down these breathers. Drivers much less rested and refreshed than they are now might be a menace on the roads; and drivers racing along at fifty, in order to conform to schedules based on a notional speed limit of thirty, would certainly be much more dangerous than drivers cruising along at forty, in order to conform to schedules based on a notional speed limit of twenty. But when a new Road Traffic Bill is due to be

enacted, there should surely be a limit to parliamentary (and police) hypocrisy.

The proper course will clearly be to raise the limit, to amend drivers' schedules so as to give them adequate covenanted (instead of uncovenanted) rest periods, and then to ensure that the new limit is enforced no less strictly than other road regulations. So far as speed limits in general are concerned, this is saying precious little; indeed the whole question of speed limits needs realistic reconsideration. But there is no excuse for conceding to lorry drivers, by reason of their organised power, not only a standing dispensation from conforming to the law, but also a special law that is kept in being precisely because it is known that they do not conform to it.

More Babies Live

THE graphs at the bottom of this page are based on tables in the second part of the Ministry of Health's annual report (Cmd. 9627). The graph on the left shows how the gap between the infant mortality rates of individual countries has narrowed in recent years. The approximation of the rates in "advanced" countries prompts the question whether the fall in infant mortality (that is, death in the first year of life) has now been carried so far that little further improvement can be looked for.

The right-hand graph answers this question. Deaths of infants aged one week and over in England and Wales have reached a very low level; in the course of the next few years they can hardly be expected to fall much farther. Where considerable improvement is still to be looked for is in stillbirths and deaths in the first week of life. These are now grouped together as "perinatal mortality," since it is often a matter of chance whether a baby is born dead or dies shortly after birth. The most important single factor in perinatal mortality is prematurity. Thus, if a successful attack can be made on prematurity, it will be reflected in a renewed sharp decline in the infant mortality rate as a whole.

PROSPECT of PROSPERITY

Our conception of prosperity being completely opposed to the natural order of things; the success of any attempt to achieve and spread that prosperity depends not so much upon our plans, as the means we possess for diverting and adapting the earth's resources to our own ends. Thanks to the mechanical excavator, which has been so fully developed by Priestmans during the past three-quarters of a century, it is now possible to complete within months projects which otherwise would be a lifetime's task... to impose our civilization upon vast areas of the globe which previously have contributed nothing to man's prosperity.

The powered hum of a Priestman excavator is the sound of civilization on the march.

PRIESTMAN

Manufacturers of earth-moving equipment for seventy-five years.

PRIESTMAN BROTHERS LIMITED, HOLDERNESS ENGINEERING WORKS, HULL

DEPENDABLE

Wise Assurance, too, is something a man can depend upon... to safeguard him in emergencies, provide for his future and that of his family. The Scottish Mutual offers all the elements that make up dependability: sound traditions, prudent management, practical benefits for today's needs—together with a sense of helpful, friendly service that is no less welcome. The Society provides, too, the benefits of the well-tried *mutual* principle, whereby all profits are shared among the participating policyholders themselves.

Have a word with the Scottish Mutual about Assurance. Whether you do it on your own behalf or for others, you could not take a wiser step.

THE HOME AND SOCIAL STATUS.
By Dennis Chapman.

(The International Library of Sociology and Social Reconstruction.) Routledge and Kegan Paul. 318 pages. 35s.

BY its very nature sociology has been saved from some of the pitfalls that beset economics in its correspondingly adolescent days. The massive simplifying fiction of economic man finds no single counterpart in the younger discipline, and the dangers both of public misunderstanding and of surreptitious identification with reality are consequently lessened. Other figures, however, do to the lay eye seem to make a rather similar transit from hypothesis to assumption. Group Man, as beset by a yearning to "belong" as ever was Economic Man by acquisitive passion, is one such; his cousin Status-seeking Man, forever scrabbling his way up the pecking-order, is another. It is this latter character who populates Mr Dennis Chapman's statistical universe. "The Home and Social Status" includes a short and practical study of the measurement of "convenience" in location, a mass of technical directions for the appraisal and statistical use of evidence, and much shrewd and valuable good sense about the functions of the home and its component rooms; the conventions of "upstairs" and "downstairs," the provision for children (with whose interests those of the "home" as conventional artifact often conflict), the role of "sentiment-invested" objects, and the influence on family living patterns of different heating techniques.

But this factual and objectively discussed matter is shot through with moonbeams from the larger lunacy of Mr Stephen Potter. "The cultivation of relatively obscure plants in living-room gardens," for instance, like "the collection and display of objects" in general, provide a host with "a topic of conversation and a point of vantage in his status relationship with his guest." Electric light fittings are "an expression of status competition by housewives." So are "elaborate heating and cooking apparatus" and washing machines. On the hypothesis that the various indices of status, from accent to the cultivation of "various obscure plants," all move together, a scale of marks is established by which field workers may rapidly diagnose social standing from the decorations and contents of the living-room, reducing to a science what Miss Marghanita Laski

and Mr Kingsley Amis practise as an art.

"The survey results," says an appendix, "agree extremely well with the census figures." The lay reader, taking on trust the horripilating mathematics which support this conclusion, may accordingly agree that Mr Chapman has forged a handy tool of social research. He may still feel that the author's confusion between evidence of status and means to status—or rather, the dogmatic and unsupported insistence on status as ruling motive—is both unscientific and, in its implications for the value of consumers' freedom, politically unpleasant.

But "The Home and Social Status" has other and brighter possibilities, apparent to anyone studying Mr Chapman's marking system. Has your living-room a fitted ("or high-quality Chinese or Persian") carpet? Score eight marks. A rag rug? Down to two. Score seven points for standard or table lamps, nine for wall lamps. An extra two points for a pelmet, as against a mere valance, on the windows. Ten points for a grand piano, nine for the telly (surely this assessment is out of date already?); a humble upright ranks with no piano at all, both getting, however, a positive mark of four—which seems as odd as three points awarded for "no books." ("Over six feet" of filled bookshelf rates seven points, regardless of the excess.) Painted walls get eight points, distemper only two; an umpire's decision seems to be needed on emulsion-covered surfaces. And so on. (To mark one's own living-room on Mr Chapman's scale can be a chastening experience.) Few serious works of sociology can have provided what can be so justly described as an entrancing parlour game.

Prophet of Egyptian Nationalism

WINGATE OF THE SUDAN.

By Ronald Wingate.
Murray. 283 pages. 21s.

THIS book just crosses the Great Divide between the scramble for Africa and the first flowering of African nationalism. Sir Reginald Wingate died only two years ago, but his operative years were those between the occupation of Egypt and the end of the first World War. His working life therefore spans an era the shortness of which baffled almost all the colonial powers—the bare

THE ECONOMIST, DECEMBER 24, 1955

forty years between the "Darkest Africa" of Stanley and the first sparkings of Zaghulul.

The dark Africa was the simpler to handle, and Sir Reginald excelled in just the qualities that made Englishmen so good at doing it. A multiple linguist and superb intelligence officer, he had the patience and talent for probing African minds, and the knowledge for devising the kind of management they would understand. His monument is the order wrought out of chaos in the Sudan during his Governor Generalship.

But a working life insulated by distance and desert from interference and hurly-burly fitted him ill for the arena into which he was pitched when he became High Commissioner for Egypt in 1917. The job was daunting; the protectorate had never been defined; ambition for self-government was rampant; if Anglo-Egyptian friendship was to survive, a moment's attention paid to it by the overwrought British statesmen in Paris was imperative. Wingate insistently reported as much and, finally, rushed home to tell what he knew. But nothing short of shove, temper, overstatement, and the use of the elbow would have budged the weary world he tried to jostle. A younger Curzon, writing from Persia, and even India, had been alive to the rumblings of nationalism. ("What is the origin of the mistakes made at the other end? It is that men are standing still with their eyes shut and do not see the movement here"). Possibly a subtler man than Wingate could have struck a chord of recollection or played on vanity; possibly by 1919 Curzon was too Olympian to remember the Orient from the Oriental end. Whichever is the explanation, the weight of Wingate's knowledge disappeared into files and he was steam-rollered into impotence and thirty years of retirement. Unthanked and in the silence enjoined by a nineteenth century upbringing, he watched the events which proved how right he had been to recommend meeting Egyptian nationalism half-way.

Possibly he was temperamentally unfitted for the hateful job of pestering and fighting superiors, but the book offers little clue to the enigma of temperament. Surely a son writing from the voluminous papers of a man who "kept everything since his commission in 1880" could have extracted from them, or from his own memory, a little more about his father as a person. Were there no letters catching likenesses, uttering criticisms, complaining, laughing or indulging in any of the foibles that are part of every man? Is the diary wholly confined to facts, such as the hour of a battle or who was on the train? Only a very occasional snapshot livens the bare bones of incident; there is not a single lively portrait of a Sudanese. Most of the people who will read the book are already acquainted with the history, and would have liked more of Wingate's "life" and less of his "times."

THE ECONOMIST, DECEMBER 24, 1955

Marxism Criticised Anew

DEMOCRACY AND MARXISM.

By H. B. Mayo. Foreword by Walter Bedell Smith.
Oxford University Press. 375 pages. 32s. 6d.

THE critical literature of Marxism, largely quiescent, apart from political tracts, since the early days of the century, resumed its flow a few years ago and still continues in full flood. At one time in the care mainly of economists, it has been especially enriched in recent years by contributions from philosophers and historians. In this book, a political scientist goes over the increasingly familiar ground. Professor Mayo's effort does not show the philosophical depth or intellectual incisiveness of Professor Acton's recent work, nor the historical range of Mr Carew Hunt's two books, nor yet the wide knowledge of continental politics and political philosophy that inspired that of Dr Plamenatz. It also lacks, by the author's deliberate choice, an analysis and critique of Marxian economics. This is a serious deficiency in a book explicitly devoted to assessing the social rather than the epistemological claims of Marxism. Another weakness is the author's style, which fluctuates disconcertingly from the colloquial (and almost journalese) to the abstruse (and almost stilted).

Nevertheless, this is a useful book. It will give those readers who find it difficult to cope with, say, Mr Acton's rarefied analysis a good conspectus of the main issues that divide Marxists—especially the modern, Russian-dominated variety—from thinkers who have remained in the true tradition of rationalism, and a solid foundation for an effective critique of Marxism. Mr Mayo follows, moreover, the best tradition of scholarship in treating his subject, even when it is intellectually least impressive and practically most distasteful, with the tools of logic rather than passion. This is not to say that the book lacks warmth. In his account of what democracy stands for (for example the excellent description on page 271 of the "positive" state, or his consistent plea that anti-communism must not be allowed to degenerate into anti-democratic hysteria) he shows that he possesses faith and courage.

The following deserve mention as particularly good features of the book: the demonstration that the Marxian "class struggle" is by no means unique as a source of possible social conflict; the crushing critique of the theory of the dictatorship of the proletariat; the excellent analysis of the role of the historian; the exposure of the fallacy of "historical necessity"; the illuminating account of the relation between propaganda and "scientific method" in Marxism; and the comparison of Marxism and religion.

The last chapter gives the whole book its title. It shows the author as a spirited defender of democracy, who skilfully compares the two systems he

has analysed and conclusively shows the hollowness—and worse—of Marxism. The chapter is, however, only 50 pages long and leaves the impression of a separate essay rather than of a drawing together and summing-up of the book.

Too Many

STANDING ROOM ONLY.

By Karl Sax.

USA Beacon Press. 206 pages. \$3.00.
POPULATION AND PLANNED PARENTHOOD IN INDIA.
By S. Chandrasekhar.
Allen and Unwin. 120 pages. 12s. 6d.

A CLOSE season might well be declared for the production of books on the population question. Since the 1930s, and especially since the war, there has been an unending spate of writing, some good, much bad, on the theme of world population pressure, soil erosion, exhaustion of mineral resources, the threat of famine, and so forth. The question is important enough, certainly; the apocalyptic global approach to it, even if it deals in limiting cases corresponding to no economic or political reality, has a certain shock value; but the returns, in public awareness, to each successive powerful invocation of the laws of arithmetic diminish as inexorably as ever did Malthus's returns of corn to successive pairs of hands.

If Dr Sax's book stood alone one could readily acclaim it, like the American reviewer quoted on its dustcover, as "a succinct and challenging presentation of a problem we dare not ignore." It is a shapely and businesslike statement; its tone is sensible, its projections are cautious, and it performs some salutary critical jobs, notably on Dr Josué de Castro's egregious "Geography of Hunger." But the ground which it covers is so well trodden that one wonders why it should have been written.

Dr Chandrasekhar's study, while not in any absolute sense vastly superior, falls into a much more useful class; it treats, at once thoroughly and in non-technical language, a theme hitherto only dealt with either far too generally or on a level accessible only to experts. India, long cited as the *locus classicus* of unmitigated Malthusian pressure, is now qualifying to offer a different sort of example; for India is the one country where family planning enjoys, however cautiously, active government support backed by government funds. Dr Chandrasekhar gives, against a succinctly stated and up-to-date background of demographic facts and their social and economic determinants, a brief estimate of the medium-run possibilities of agricultural and industrial progress, reaching the inevitable conclusion that these cannot provide sufficient relief in a sufficiently short time. The long-run remedy of mass migration which, in "Hungry People and Empty Lands," he prescribed for overpopulated Asia in general, is here dismissed as politically unrealistic within the relevant future.

He then settles down to his main task:

an assessment of the prospects of the birth control movement from the point of view of its compatibility with the chief Indian creeds (a fascinating chapter for the uninformed westerner), of the suitability of various techniques to Indian conditions, and of the administrative and human difficulties to be overcome. While his purpose is primarily to rouse and form the educated opinion of his own country, much of what he writes applies to any community caught up in that "demographic explosion" which follows a successful attack on primitive death rates, and some is valid for any community whatever. For Dr Chandrasekhar never forgets that the demographic aggregates in which he deals are made up of individual human beings with emotional and spiritual as well as physical needs; and this truth is independent of geography.

Shadowy Counsellor

LORD CREWE: the Likeness of a Liberal.
By James Pope-Hennessy.

Constable. 222 pages. 21s.

AFTER serving as an assistant private secretary to the amiable Lord Granville, Robert Milnes was just about to contest a parliamentary election when, in 1885, peerage descended upon him. He was then 27 and had sixty years of life ahead of him. He was Viceroy of Ireland in Mr Gladstone's last Government, held a variety of Cabinet offices during the Campbell-Bannerman and Asquith regimes, 1905-16, being for the greater part of that time leader of the Liberals in the House of Lords, and finally was in 1922 appointed by Lord Curzon British Ambassador in Paris, a post which he held for five years.

It is very difficult for one whose whole political career is passed in the House of Lords to create a distinct impression on the public mind. Rosebery succeeded in doing so; but he was a brilliant platform orator, a sensationally successful racing man, and altogether a flamboyant and exotic figure. Perhaps Lansdowne succeeded; but more by reason of three sensational failures than by any of the successes of his painstaking career. Crewe was not the man to make a distinct impression: he was an admirable aristocrat, a charming person in private life, but publicly aloof and reserved, and a poor speaker. Yet Asquith has recorded that throughout the long harassing years of his premiership he regarded Crewe as his wisest counsellor, and more recently Lord Samuel, a junior minister in those days, has emphatically confirmed this impression, writing of his "unique position," his "uncanny soundness of judgment."

A satisfactory life of Lord Crewe would make plain to us the source of this wisdom, and how, when, and where it influenced the course of events. It may be that the materials for such a revelation do not exist. Mr Pope-Hennessy's book certainly achieves nothing of the kind. There is, of course, some interesting information in it, but

it is a fragmentary and superficial performance. One gets the impression that Mr Pope-Hennessy neither knows nor cares very much about the political battles of those days. Lord Crewe was always an august and dim figure; august and dim he remains. The quotations from his memoranda and retrospective essays strike one as undistinguished.

Indo-China, Act II

THE STRUGGLE FOR INDO-CHINA CONTINUES.

By Ellen J. Hammer.
Stanford University Press. London: Cumberlege. 40 pages. 8s.

DR HAMMER'S book, "The Struggle for Indo-China," which was reviewed in *The Economist* of December 11, 1954, is the most authoritative work on the subject in English. The only serious criticism that could be made against it was that it stopped too soon: there was an air of unreality about the last chapter, which covered events up to the eve of last year's Far Eastern conference at Geneva, which brought the Indo-China war to an end. This supplement to the original work, which is subtitled "Geneva to Bandoeng," fills in the gap; although, so long as the fate of Vietnam remains undecided, Dr Hammer will have to hold herself in a semi-permanent state of readiness to produce yet another sequel.

There is little to say in praise of this additional chapter that has not already been said of the original book. Dr Hammer's lucidity and intelligence are matched only by her accuracy. There are signs that the American policy of wholehearted support for Mr Ngo Dinh Diem, now President of the non-Communist Republic of Vietnam, may, after all, yield dividends. But it is by no means certain that these dividends will be those that might have been desired; and even at this stage the American policy-makers might do well to ponder the significance of Dr Hammer's verdict that "the experience of the United States with Ngo Dinh Diem has demonstrated the importance of using the American presence in the south to encourage unity round a specific programme of action, rather than identifying American policies with any single individual, whoever he may be." The essential truth of this observation will not be diminished even if Mr Diem does succeed in preserving his half of the country from Communism.

Scholar and Critic

ALL IN DUE TIME.

By Humphry House.
Hart-Davis. 306 pages. 15s.

THE late Humphry House combined great and rare qualities. He was a scholar of unrelenting exactitude, second to none in his knowledge of nineteenth-century England. He was an editor whose delicacy of perception illumined the notebooks of Gerard

Manley Hopkins and whose uncanny penetration of an age would have triumphantly presented the great mass of Dickens's letters. He was a critic, fastidious and ironic, and never afraid of approving the manifestly excellent. But, above all, his was a mind searching out that complex line where literature touches concrete experience, and there could be no better introduction to Humphry House's achievement than "Peterloo II," first published in this posthumous volume of essays and broadcasts.

In this essay Humphry House discusses the "magnificently rich" literature that grew up around the Peterloo massacre. Throughout, he compares Shelley's "Mask of Anarchy" with immediate accounts and the cross-examination of one John Jones, fustian-cutter. It is splendidly characteristic of House's way that he prefers Jones to Shelley and goes on to remark that all of Shelley's poetry suffers for a lack of direct idiom. The same distrust of the contrived and conventionally admired informs a brilliant paper, "Are the Victorians Coming Back?" In it, House argues that in the present Victorian revival, in the sophisticated zeal to be with Mr Betjeman against the recent times, we are reviving much trash and ignoring Matthew Arnold's warning that his age was a critical one and should be critically approached.

This is a rich book, in many moods. There are swift ferocities in it. There are important papers on Hopkins, Dickens, Tennyson and George Eliot. There is a delightful eulogy of the national grid on maps, and House's affection for the evocative exactitudes of topography is characteristic. But there is much here that extends beyond scholarly criticism and has the central vision of critics like Arnold and Taine. Reflecting on Peterloo, House wrote:

If Peterloo, because of its famous nickname, remains in every schoolboy's memory, it should remind him always in after life that an executive which is not submitted to severe and informed criticism in every move it takes verges towards both incompetence and tyranny.

Few literary scholars would have felt moved to write that.

Ripe for Development?

HIMALAYAN BARBARY.

By C. von Furer-Haimendorf.
Murray. 241 pages. 21s.

IN 1944 the author and his wife undertook the exploration of the country lying between the Assam valley and the borders of Tibet to the north of the main Himalayan range. Their terms of reference were to establish friendly political relationships with the more or less unknown and mutually hostile tribes of the region on behalf of the Government of India. Professor Haimendorf is an authority on the ethnology of India. He has made a specialty of the attractive and picturesque head-hunters of the Naga

Hills. As the present book shows, he is also an indefatigable and resourceful explorer, a kindly diplomat, a tolerant connoisseur of custom and of the unconventional in personality, and a superb photographer. A better choice for the journeys of persuasion and reassurance here recorded could hardly have been made. Did Professor Haimendorf and his wife enjoy and believe in their official roles or was their true interest in the incredible scenery, the majestic mountains and rivers, the delightful Apa Tanis and their impetuous neighbour-enemies, in short, in the geography and ethnology of this region? Although this book is intended for the general public and not for the scholar, enough comes out to make one suspect that there were frequent struggles in the professor's heart between the ethnologist face to face with exciting new material and the political envoy introducing the thin end of the wedge of irrelevant law and precarious order.

We can see this in the book. The author is at his best revelling in the descriptions of the Arcadian life and habits of the Apa Tanis and a sparkle creeps into the otherwise flat narrative when he stops to discuss how these tribes have managed to maintain so rich and satisfying a way of life without benefit of either Hindu or Western civilisation. They fight and feud, they keep slaves—who, however, often refused the offer of "liberation"—they have what used to be called the religious beliefs of savagery; yet they also have extraordinary skill in producing food, building houses, keeping livestock, and so forth. "The romantics," Professor Haimendorf says, "may feel satisfaction that somewhere in the world there are still unsophisticated and picturesque peoples who persist in their traditional ways of life. . . ." He goes on to make it quite clear to anyone who can read between the lines that he has a very strong affinity with these romantics. When, taking cover, he quickly intones the Unesco creed that " . . . particularly the introduction of such basic measures as fundamental education, medical aid and above all instruction in improved agricultural methods" are "benefits" these lovely peoples might "derive from closer contact with the outside world," he sounds unconvinced and unconvincing. It is only when he is making such concessions to the "trend" that the author's pleasant and informative style lapses into clichés.

Transforming the Villa

THE CONVERSION OF OLD BUILDINGS INTO NEW HOMES FOR OCCUPATION AND INVESTMENT.

By C. Bernard Brown.
Batsford. 232 pages. 45s.

WHETHER the old saw "fools build, wise men buy" can be safely amended to "wise men convert" may be debatable; but it is certain that anyone considering the conversion of a

house will be wise to read what Mr Brown has to say about it. He appears in this book as the architect everyone would like to have: not only expert in ways and means of remaking an old house into a modern dwelling, but infinitely thoughtful on the subject of finance and location, and the real needs of various types of client. Most houses, however dilapidated or inconvenient, can be converted at a price; Mr Brown is interested in the possibility not only of saving architectural gems (such as the Paragon in Blackheath) by converting them into modern flats, but also, and particularly commendably, in finding the cheap property in an unfashionable but rising district which by conversion can provide the most economical fully modern dwellings available today and which may yield perhaps the greatest capital appreciation of any form of investment.

By dividing a large house into flats one can get one's own flat freehold completely free as well as the head lease of the others sold after the conversion. But everything, of course, depends on getting a readily convertible property relatively cheaply. Mr Brown instances a suburban villa let at a ground rent of £18 a year (so bad was its condition) which, when converted to four flats, became worth £9,700 with a ground rent of £93 a year. With the aid of a local authority grant two charming flats can be hollowed out of an old house at a cost to the converters of £475 apiece; which is cheap indeed. Converting for investment probably requires more capital and skill than the unwary realise; but for partial occupation as a means of providing a family with a modern home economically by converting and selling the freehold of the unwanted flats, it is very much a way of combining home-building and entrepreneurship. If enough people made a success of this method the vast capital stock of all-too-solid Victorian houses, now so ill designed to modern living and social conditions, yet so costly to replace except by blocks of subsidised council flats, might become a far greater national asset; and as Victorian mansions and villas are transformed into modern homes, the sprawl of cities might be alleviated and rotting districts steadily reclaimed. Here and there the reversal of the usual tendency of once fashionable middle-class districts to go down can be witnessed in London: it is possible to find working class streets (as well as mews) becoming the prerogative of the intelligentsia with modern windows and painted fronts on the outside, and, within, modern sanitation, constant hot water and sweetness and light, often achieved by spiral staircases and glass bricks.

Mr Brown illustrates these devices and many more; he is above all helpful on the points on which the inexperienced slip—the sort of layout which does not lend itself, the problem of roofs, the right way with basements. He examines thoroughly the question of selling leaseholds of flats, a growing practice in England (it has been common

in Scotland for years) and the apparently difficult question of organising repairs under a system of ownership in tiers; and he explains the position of local by-laws. He shows the house-converter how to use his experts intelligently—surveyor, architect, lawyer, and above all that sometimes slippery but generally essential intermediary, the house agent. He gives examples of many types of conversion from Victorian villas to agricultural cottages, and the book is admirably illustrated with photographs, plans and architects' thumbnail sketches. It is, indeed, a book which should send many despairing home-hunters off on a new type of search, inspired by new ideas of profit and reclamation.

Shorter Notices

THE ROOSEVELT FAMILY OF SAGAMORE HILL.

By Hermann Hagedorn.
New York and London: *The Macmillan Company.* 435 pages. 35s. \$5.00.

The belief that the family life of a President of the United States is necessarily of consuming interest, while perhaps natural to the citizens of a republic, is less widespread amongst the subjects of a monarchy. And while it is true that Teddy Roosevelt, that engaging and puzzling blend of Sir Winston Churchill and the late Kaiser Wilhelm II, is better "copy" than any other President since Lincoln, it is still doubtful whether 400 pages devoted to the President in his family circle would hold the interest of any but the most devoted idolisers. Mr Hagedorn has done a good job, with competence rather than any particular psychological insight, and the picture that emerges has a certain period charm. But one cannot pretend that it tells us as much about Roosevelt, the President, as would a few well-selected quips of Mr Dooley.

THE CYCLE OF AMERICAN LITERATURE.

By Robert E. Spiller.
New York and London: *The Macmillan Company.* 333 pages. 33s. \$4.75.

This book will disappoint many of its readers. In somewhat Spenglerian terms it sets out to show that there are "cyclical patterns" in American literature, the one beginning along the Atlantic seaboard and culminating in Melville and Whitman, and the other starting on the western frontier and producing, rather incongruously, both Mr Eliot and Mr Faulkner. This view is founded on the assertion that "life is organic" and that the literary historian must adopt "an organic view of history." If this means that he must consider literature as related to historical circumstances and as showing complex analogies with the phenomenon of growth, maturity and decay found in other domains, it is not very original. If it means something more mysterious, as is suggested by Professor Spiller's reference to "basic rhythms" and "symbolic illumination," it is too cryptic an assertion to prove of much use.

In fact the book is a somewhat pedestrian account of American literature with names, dates, places and quick marks of approval or criticism as the titles are recited. The more advanced student will continue to find the great "Literary

History of the United States," which Professor Spiller helped edit with such distinction, indispensable.

*

THE OXFORD HOME ATLAS.

By the Cartographic Department of the Clarendon Press.
Oxford University Press. 140 pages. 15s.

The Oxford University Press has added one more to the list of atlases, general and specialised, which it has offered to the public in recent years. The Oxford Home Atlas has a number of points of technical interest that distinguish it from other atlases. The most striking, perhaps, is the effective technique that is called "hill shading," which in many of the maps has been preferred to the customary layering. This hill shading not only gives a very good impression of relief, but is also aesthetically very agreeable. The majority of the maps are on a fairly small scale, which is inevitable in the 10-in. by 7½-in. format, but the range of subjects covered is extremely wide. Population, physical, vegetation, and climatological information is provided throughout the world, and there are some useful maps dealing with sea and air communications. In the space of a short review it is impossible to list the wide range of topics dealt with, but it is right to say that at 15s. this new atlas is very reasonably priced.

*

A SIMPLE GUIDE TO SHAREHOLDING AND COMPANY ACCOUNTS.

By John Wood.
Putnam. 130 pages. 9s. 6d.

This is a useful little guide for the uninstructed ordinary shareholder. He should, however, understand what it does and what it does not contain. It shows the way round company balance sheets and profit and loss accounts, and includes just a little about Stock Exchange prices and the cost of dealing. It does not deal with investment policy at all—when to buy and when to sell and when to hold ordinary shares and when fixed interest stocks. Indeed, it deals with nothing except ordinary shares. And when the author goes into detail, he sometimes makes omissions. He fails, for example, to allow for the profits tax attracted on full distribution when he works out the dividend cover. "The ordinary dividend of £30,000 is paid out of an available £40,000. It can be said to be covered 1.3 times." It can, but it should not.

Correction

HORATIO BOTTOMLEY.

By Julian Symons.
The Cresset Press.

IN our review of this book, which appeared in our issue of November 26th under the heading of "The Blackguard," we said it had "one or two glaring inaccuracies—not important in themselves but bad enough to make the reader wonder how much care has been given to checking other facts that really do matter." We have now come to the conclusion that the adjective "glaring" was too strong, and in one of the matters that our reviewer had in mind Mr Symons's account was not inaccurate and our review was mistaken. We offer our apologies and regrets to Mr Symons for the mistake.

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Star-Spangled Santa Claus

Washington, D.C.

THE Ford Foundation was hailed as a veritable Santa Claus when it announced last week the gift of \$500 million to improve services and salaries in more than 4,000 American colleges, universities and hospitals. This piece of private giving was, according to the *New York Times*, "the largest lump sum of gifts in the history of philanthropy"; and in truth it was a considerable lump. Yet it left the Ford Foundation at the top only of its own league. There is another and much bigger league whose Santa Claus bestrides the narrow world like a colossus. His friends call him Uncle Sam. The benefactions which the United States government has come to dispense all the year round seem to be an eminently suitable subject for contemplation at Yuletide. Nobody should be put off by the thought that Uncle Sam is a tall, rather stringy figure, far removed from the overweight cherub behind the airborne reindeer. You cannot tell by appearances.

He would be a well-satisfied Chancellor of the Exchequer who could bring Britain's gold and dollar reserves up to the sum which Uncle Sam paid out to support the prices of the American farmer's crops in the last fiscal year. At the last accounting, the British vaults contained some \$1,100 million less than the United States government spent between July 1, 1954, and June 30, 1955, on maintaining the incomes of American farmers from maize, wheat, cotton, rice, tobacco, peanuts, tung nuts, wool, mohair, dairy products, grain sorghums, soya beans, barley, oats, rye, turpentine and resin, cottonseed, flaxseed, dry edible beans and honey. Some of the money is recovered, of course, when government-owned surpluses are sold. Still, 1954-55 was a year when the American farmer had good reason to sing in his bath; though there is no real information on what he was singing, the fact that honey was on the list of price-supported crops might have made "where the bee sucks, there suck I" a good tune to start with.

The experts then got to work on a system to prevent the farmers from producing so much; as a result farmers' incomes have not been rising so fast, lately, as have those of the city-based millions. And nothing is now frightening the Republican party so much as the dreadful pre-election bowl of the men who are due, in the current fiscal year, 1955-56, to receive only \$2,200 million from price support operations, well over one and one-half times the estimated cost of building the High Aswan Dam and its related projects over the next eighteen years.

Jingle bells, jingle bells—and next Uncle Sam reaches into his sack for presents for two groups who have perhaps

not been thought of as engaged in a struggle with poverty and want. The publishers of the magazines and newspapers in the United States get an annual handout which amounted to \$250 million in the 1954-55 fiscal year. Another gift goes to those who send advertising material through the mails. They were supported during the year with \$150 million worth of Uncle Sam's money. It costs the United States Post Office 11½ cents to handle one pound of magazine or newspaper mail, but the publishers pay only 2½ cents of this. The elected representatives of the American taxpayer have gravely accepted the argument that newspapers and magazines should be subsidised because they are necessary to the cultural and economic life of the nation. They have accepted just as gravely the thesis that direct mail advertising—much of which is thrown away without being read—earns its subsidy because it stimulates business in general and assists in particular small enterprises which cannot afford to advertise in the newspapers or magazines. It is some time since either of these arguments has been examined with any thoroughness and, indeed, a lot of political dangers can be avoided simply and effectively by keeping on paying up.

In the 1954-55 fiscal year Uncle Sam slipped more than \$150 million into the stockings of American shipowners and shipbuilders. The gentleman in the tall star-spangled hat, not the employers, is providing 75 per cent of the wages paid to American seamen. This, of course, is to enable the shipping lines to meet competition from maritime nations who can run their ships more cheaply. When a ship is built in an American yard it costs the operator only what a foreign yard would have charged for it; the rest comes from the federal government. Uncle Sam's benefactions to airlines, in the form of subsidies for carrying the mails, are due to come down to \$48,500,000 in the current fiscal year. The big domestic airlines are demonstrably doing nicely for themselves; it is only some of the smaller companies and certain services to places outside the continental United States which are still entitled to a present from the government.

When the review of the 1956 Budget was produced last summer it was estimated that Uncle Sam's veterans would require \$383 million more than in 1955. They would require, in fact, \$4,839 million. The recipients of this bounty are not, as their name might suggest elsewhere in the world, old gentlemen tottering about on walking sticks.

They are ex-servicemen of any age and there are well over 32 million of them. Only part of the vast annual outlay is spent on the ill and disabled or disbursed in compensation and pensions. From end to end of America, college campuses are echoing to the tread of veterans in their twenties who are educating themselves and supporting their attractive wives and small children on government money. A married veteran of the Korean war with one child, for instance, can draw \$160 a month under one of the generous education and training schemes. Since the end of the last world war more than 9 million have taken one or another of these grants; some 700,000 are being sustained at present in colleges and schools, on farms, and in job-training centres. When a veteran wants to buy a house or a farm or a business, Uncle Sam helps him with an insured loan.

Next year Congressmen seeking re-election will be men who have voted for these federal benefactions, and have themselves been in receipt while on Capitol Hill of the most remarkable variety of subsidies ever conceived, from free summer trips abroad to free haircuts at home. One of the few safe predictions is that many of them will refer cordially in their speeches to the competitive free enterprise system which, they will add, has made America great.

Arms Account

AFTER a long week-end of confusion, Mr Dulles has clarified the Administration's plans for foreign aid for the 1957 fiscal year beginning next July. But he has given no satisfactory explanation of why congressional leaders, only a few days before, at a formal meeting with the President, had received the firm impression that about the same amount would be requested for the mutual security programme next year as was appropriated this year—\$2.7 billion. This figure had even been mentioned officially. Yet it now appears that almost \$5 billion is in fact to be requested, although plans can still be changed. It is difficult to believe that such an increase could have been conceived and agreed within such a short time, especially when most of the Cabinet members concerned were away at the meeting of the North Atlantic Treaty Organisation. Members of Congress naturally feel aggrieved and there is every reason to expect that, when the foreign aid programme is debated, their sense of injury will take the form of a refusal to give the Administration as much as it wants.

The official explanation of the misunderstanding is that actual spending was confused with appropriations: next year the former will run at about the same level as it has this year—\$4.2 billion—but appropriations will, if Congress agrees, go up sharply. Much of the money being spent comes from the backlog of funds from previous years, appropriated for future use in order that military equipment, such as tanks and aircraft, which take a long time to produce, could be ordered in advance. Last year Congress refused to replenish this backlog by as much as the Administration had hoped. This is one reason why this year's request for appropriations is going up; another is that much of the military equipment provided for America's allies when the present series of deliveries began some years ago is now either worn out or obsolete; moreover, today's more complicated replacements are more expensive.

As the result of all this, to keep the supply of arms flowing at the present rate, the Administration proposes to ask Congress for \$3 billion in new funds for military aid for the 1957 fiscal year; three times as much as was provided for 1956; much of this money is to be spent in later years. It thus becomes obvious that, whatever the reason for the recent confusion, it did not arise out of a sudden decision to outbid Russia by a substantial increase in economic aid to underdeveloped countries. Admittedly, slightly more is also being asked for the Middle and Far East, but the total of \$1.9 billion planned for economic aid is only \$100 million more than was asked last year, and \$200 million more than was granted by Congress.

Democratic Colours

MR ADLAI STEVENSON is no longer alone in the paddock for the 1956 presidential Derby. He was joined last week by another challenger from the Democratic stables as Senator Estes Kefauver of Tennessee surprised no one by announcing that he was a runner. Mr Stevenson has said repeatedly that he would prefer to save his strength for the race itself when he will be attempting to defeat the Republican candidate. But Senator Kefauver has left him no choice and Mr Stevenson must now show his form in a series of strenuous preliminary heats against one or several fellow Democrats. These races are the primaries—extremely complex elections in which Democrats and Republicans in nineteen states express their preference among potential presidential nominees from their respective parties. A series of victories in these primaries may—but frequently does not—ensure that the successful candidate will be chosen by the national convention; a series of defeats, however, puts a man out of the running.

Mr Stevenson has, so far, decided to enter primaries in Minnesota, Illinois, Pennsylvania, Florida and California. In Minnesota, where the primary takes place on March 20th, and in Pennsylvania, a month later, Mr Stevenson is expected to romp home comfortably, as the Democratic organisations in both states are solidly behind him. The same should hold true of Illinois, which is, after all, Mr Stevenson's home ground. But in Florida in May and in California, on June 5th, it may prove a close race. Mr Kefauver is by no means the choice of professional Democrats in either state, but in the rank and file of the party he has many supporters. Mr Stevenson has refused to jeopardise his chances by entering the earliest of all primaries, in New Hampshire on March 13th. In that small state, which sends only eight delegates to the Democratic convention, Mr Kefauver is somewhat of a legend; he claims to have shaken the hand of every Democrat in New Hampshire, and it was there that he began his spectacular campaign for the nomination in 1952 by defeating President Truman.

Neither candidate has, as yet, decided to enter the Ohio primary on May 8th. The reason is that the Democratic Governor of the state, Mr Frank Lausche, has decided to enter his name in the contest as the state's "favourite son." This does not necessarily mean that he has hopes of winning the presidential nomination, but it does mean that he

wishes to keep Ohio's 56 delegates under his control at the Democratic convention. Mr Lausche is phenomenally popular in his state and will probably go unchallenged. In the meantime, Governor Harriman of New York is standing outside the paddock ostensibly studying a form sheet. Oddly enough, however, he is wearing boots and spurs and that large animal behind him looks remarkably like a horse.

Cause Célèbre

MANY members of the Administration will be looking anxiously up their chimneys on Christmas night not in the hope of seeing Santa Claus but in the fear that the stout ghosts of Mr Dixon and Mr Yates will be coming down to haunt them. For the frustrated contract between the Atomic Energy Commission and these two gentlemen's Mississippi Valley Generating Company has turned into a political nightmare now that the AEC has been warned that it seems to have been illegal in the first place. To the Democrats, on the contrary, the Dixon-Yates affair is a Christmas gift which appears to substantiate their incessantly-repeated charges that Mr Eisenhower's government is inclined to put private enterprise before the public weal and that the Administration is riddled with self-interested businessmen.

The original Dixon-Yates contract, concluded in November, 1954, provided for the construction of a generating plant to supply electricity to the Tennessee Valley Authority to replace power being diverted to atomic installations. The Democrats denounced this scheme as an attempt to demolish the cherished TVA and as a sacrifice of the needs of rural users to the profits of private business. President Eisenhower cancelled the contract in July, since alternative arrangements made locally meant that the Dixon-Yates plant had become unnecessary. At first the AEC indicated that it felt it was liable to pay a cancellation fee. Last month, however, it reversed its position and the Dixon-Yates group then filed suit against the government, claiming \$3,534,778 in expenses. It may turn out, however, that for the government far more than this sum is at stake.

The AEC was advised that the contract was illegal because Mr Adolphe Wenzell, a vice president of the First Boston Corporation, was an unpaid consultant to the Budget Bureau on the Dixon-Yates question at the time when his firm became financial agent for the Dixon-Yates groups. This would constitute a violation of the "conflict of interest" statutes which bar anyone from officially advising the government on a matter with which he is privately concerned. Mr Wenzell has testified that the possibility of such a violation worried him and that he had been reassured by Mr Strauss, the chairman of the AEC. Before a congressional committee last week, however, Mr Strauss denied any knowledge of Mr Wenzell's double role. The matter will now go to the courts and the shadow of an accusation of perjury hangs over several of the parties involved. From being an instance of the conflict between publicly and privately financed hydro-electricity, the Dixon-Yates affair may become the *cause célèbre* of the businessman in government.

Christmas in the Money Market

THE Administration is feeling the squeeze of its own tight money policy. At the end of November it had to postpone the issue of a number of short-term housing loans because of the unusually high rates of interest prevailing. A little later it found, in connection with the \$12.2 billions' worth of government securities falling due on December 15th, that an unexpectedly high proportion of the holders wanted cash, even though the Treasury offered to refund the maturing issues on generous terms, well fitted to the current structure of short-term interest rates. This was explained by the general shortage of money for borrowing. To find the necessary cash the Treasury had to borrow \$500 million more than it had intended and it almost hit the ceiling of \$381 billion on the national debt. It was saved from bumping its head by the central bank's Open Market Committee, which supported the refunding by buying some of the new certificates offered by the Treasury in exchange for the maturing notes.

As a result it is being said, without any direct confirmation from the Federal Reserve authorities themselves, that the Open Market Committee has turned away from the policy of strict neutrality towards the Treasury's financing operations which was laid down in 1953. It remains to be seen whether there is any more to this change than a temporary willingness to follow Scrooge's example during the festive season. The committee had already, since the beginning of the month, been buying government securities in order to supply the banks with extra funds with which to meet the Christmas demand for ready money.

★

Another and probably more permanent relaxation of credit restrictions has been in the housing field, where the Home Loan Bank Board is once more allowing the saving and loan associations which belong to it to borrow, in order to expand their mortgage lending; this had been forbidden since September. It is also expected that before long the maximum period during which government guaranteed mortgages can be repaid will return to thirty years; it was reduced to twenty-five last July. These concessions seem, in part at least, to be the result of complaints from politicians about the unfortunate effect such restrictions have had on the housing industry; in November new housing starts again declined more than is usual at this season, although the total still remained high in comparison with other years.

There is little evidence that the restrictions have had much effect on mortgage lending, which went up by \$4.4 billion in the third quarter of the year, a rise which had been exceeded only in the previous quarter. Nor does the squeeze on money seem to have had much influence on hire purchases and consumer borrowing, which continued to mount in October, although less sharply than during the earlier months of the year. Indeed, the most that can be said for the credit restraints is that they have prevented borrowing going up as fast as it might otherwise have done during the present boom. But the result has been to accumulate a backlog of demand for money which is likely to check the seasonal decline in lending which usually develops after Christmas.

The Music Makers

IN the next few days Christmas cantatas and arrangements from such seasonal scores as Mr Menotti's *Amahl and the Night Visitors* will most probably be included in concert programmes all over the United States. In more than 1,000 communities, moreover, the audience will be listening with mingled pleasure and civic pride to a symphony orchestra which they have helped establish and maintain. Where the United States possessed only ten symphony orchestras in 1900, it today supports more than 100 times that number and of these some 300 have been founded in the last four years alone. From Charleston, West Virginia, to Wichita, Kansas, and from Rochester, New York, to Chattanooga, Tennessee, symphonic ensembles and full-scale orchestras have been chiming and to many communities today a symphony is as important a symbol of prosperity and cultural achievement as was a clock tower in false Gothic at the close of the nineteenth century.

In a country where museums are excellent but widely scattered and where first-class drama is concentrated in one or two cities, live and recorded music has become the high-road to culture. This has been made possible, above all, by the generosity of private enterprise and it is as if today's American capitalists were trying to make good the neglect with which their European ancestors treated many of the great composers of the past. Most symphonic orchestras can cover only a small part of their annual budget by the direct sale of tickets; local firms and businessmen make up the difference—and their reward is a mention on the programme, a sense of civic achievement and, one hopes, enjoyment of the music.

Budgets vary widely: thirty-one major orchestras will spend some \$15 million this year. The Dallas Symphony, a truly distinguished group, has an annual budget of \$300,000, whereas the Atlanta, Georgia, orchestra requires only a third as much. But whatever the figure, business funds are playing an increasing role in meeting it: in Minneapolis last year firms contributed \$135,000; in Rochester, the Eastman Kodak Company handed the orchestra \$100,000 to erase past deficits; 120 business houses banded together to bring symphonic music to Chattanooga. The orchestras, in turn, are taught by the American Symphony Orchestra League Incorporated how they should use the money, how they can increase the participation of the community in their affairs and just how to treat the demands of visiting virtuosos. Little wonder, therefore, if players rise at the close of their Christmas concerts, turn to their patrons and intone "God rest ye merry, gentlemen."

President Hagerty

Gettysburg, Pennsylvania.

IN a basement annex of Gettysburg's one hotel Mr James Hagerty, the President's clever and highly regarded Press Secretary, is presiding over a fascinating operation. The sheer electronic magic that has taken place in this

small town is impressive. Even before Mr Eisenhower had arrived to convalesce at his lovely farm three miles south of Gettysburg, buildings began to sprout a forest of antennae, while in the basement of the annex a swarm of technicians installed telegraphing machines, wirephoto equipment and radio gadgets. With their help Mr Hagerty can address the thirty-odd press and wireless representatives, who are covering this temporary capital, by microphone twice daily. He has arranged for a full transcription of the briefings and the subsequent question periods to be available shortly after they end. One result has been that a deluge of verbiage about the President pours out of Gettysburg almost each day, much of it reaching front pages all over the United States.

★

This in itself is fascinating, for the amount of really useful news that emerges is minimal. The President meets someone or travels to his mountain headquarters, Camp David, 25 miles away, between Gettysburg and Washington, to confer with the Cabinet or the National Security Council. Nothing is announced of what was decided, and sometimes not even of what was discussed. But somehow, Mr Hagerty, with the aid of the nation's editors, makes it all seem terribly exciting. On those days when absolutely nothing happens at Gettysburg, Mr Hagerty has shown a genius for filling in the gaps. One Sunday he even arranged a visit to the Eisenhower farm, which is normally out of bounds to the press, for the presentation of a new tractor to the proud squire. Monday's papers, confronted with the usual dearth of news, blossomed with pictures of a grinning, and presumably healthy, President inspecting his new machine.

The President spends his mornings in a small office in the local post office but his staff stays in Washington which is only 25 minutes away by helicopter. This too furthers Mr Hagerty's purpose, which is to make news about the President. Each visit from someone in the President's entourage, let alone a Cabinet member, becomes a legitimate occasion for a speculative story on what Mr Eisenhower is discussing and, presumably, deciding that day. For example, the Secretary of Defence arrived one day with the Director of the Budget to discuss defence expenditure for next year. Had the President been in Washington this would have been a routine affair. Moreover, nothing new emerged from the meeting. But, with appropriate pictures, the story received attention comparable in some papers to that bestowed on the threatened war in Palestine.

The traditionally cynical reporters stationed at Gettysburg scarcely blame Mr Hagerty for "using" them but do feel that the entire operation, built on the sound conviction of editors that people want to read about the President, is calculated to convey the impression that Mr Eisenhower has resumed full control of the government. Whether it is the truth or not, Mr Hagerty has wanted to make it seem so. With the aid of geography and the editors, he has succeeded brilliantly.

But a change of pace set in, after the President's doctors suggested on December 10th that he might be overworking. Now that the word is "rest," Mr Hagerty's operation has slowed to a circumspect crawl, for he would scarcely like to create the impression that the Administration is putting too great a strain on its chief. This has given the little corps of journalists from Washington more time to absorb the deeply historical aura of Gettysburg itself.

Destiny's Ditch

FROM A CORRESPONDENT IN CHICAGO

AS the principal transfer point between the St Lawrence Seaway and the Mississippi Waterway to the Gulf of Mexico, Chicago is hoping to become one of the great ports of the world. City leaders have a vision of a harbour that will handle the vast agricultural and industrial trade of the Midwest; and they see 15,000 acres of additional lands in the harbour area being used for industrial development and thus creating 600,000 new jobs. The realisation of this bright future depends on three waterway projects which are expected to be completed by 1960. They are the St Lawrence Deep Seaway, Chicago's Lake Calumet Harbour and the Cal-Sag channel.

Of most immediate concern to Chicago is the development of Lake Calumet and the Cal-Sag channel, or "Destiny's Ditch," as it is known in maritime circles.

Since much of Chicago's famous lake-front has been devoted to recreational activities, the sheltered harbour of Lake Calumet, 20 miles south of the city's business section, was designated for port development; it was connected to Lake Michigan by a 6-mile stream. The Lake Calumet site, moreover, is near one of the world's great centres of steel and heavy industry around the southern tip of the lake.

Improvements to this harbour will cost \$24 million; they include dredging to accommodate larger ocean-going vessels, and the construction of new docks, grain elevators and transit sheds. Calumet will be served by more than a score of trunk line railways reaching out to the entire Midwest and by two major highways for lorries. Its transit sheds and storage units with their mechanised handling installations will permit the rapid transfer of freight between incoming trains and lorries and the waiting ships.

But to achieve the most economical communication with the markets of the Midwest, which account for 40 per

cent of America's foreign trade, it will be necessary to use barges on the Cal-Sag channel, which leads from Lake Calumet harbour to the Mississippi Waterway. In order to eliminate a narrow bottle-neck, work has been started on the widening of this channel to 225 feet at a cost of \$102 million; this cost will be borne largely by the federal government. When it is completed, multiple tow barges with ten to fourteen units each will transport fuels, grain, chemicals, ores and finished products at cheap rates.

But the railways, aware of their difficult competitive position, are insisting that toll charges be imposed on the barge carriers so that the cost of the waterway projects will be placed on a self-liquidating basis. Barge line officials are naturally vigorously opposed to such charges, which would drive up the cost of the services. They accuse the railroads of being shortsighted and remind them of the tremendous traffic brought to them by barges in the past. Shipowners argue that the natural growth of the area, which is expected to increase shipments in the Cal-Sag channel alone from the present four million tons annually to more than nine million tons by 1960, will provide more revenue. The issue is still undecided, but the barge lines appear to have a slight advantage.

Chicago has already been making some modest bids to handle an increasing portion of America's foreign trade through its port. Approximately 300 European ships, of 2,000 tons or less, have called at Chicago this year. In 1954, the port handled exports of 96,350 tons and imports amounting to 69,095 tons. These totals, however, are expected to increase greatly when the St Lawrence Seaway makes it possible for ocean-going merchant ships of up to 10,000 tons to berth at Lake Calumet harbour. Shippers will then take advantage of the greater economies offered by a shorter, all-water route to north European ports. Liverpool, for example, will be 168 miles closer by this route than by the combined rail and water route via New York. Exporters will then save 17 per cent on automobiles shipped to Rotterdam and nearly 25 per cent when shipping a tractor to Sweden, while the cost of bringing jams from Britain will be 10 per cent less, and on Scotch whisky the saving will be 24 per cent.

In its struggle with New York for the dominant commercial position among American cities, Chicago has never been able to match the shipping facilities which have given its eastern rival pride of place. Chicago has watched New York flaunt the skyscraper before the world as its symbol, remembering that the first experiments in this type of construction were made on the shores of Lake Michigan. Now, with a port development of its own of international scope, Chicago feels it has another round with destiny, and this time the dice might roll westward.

SHORTER NOTE

Wheat, maize, rice and dry beans have been added to the commodities which may be released from the government's surplus stocks to be given away abroad by relief agencies. Hitherto this programme has applied only to perishable commodities and leaders of church and other welfare organisations have long been pressing for its extension. The actual amounts that they expect to be able to handle during the coming year is only about 14 million bushels—very little compared with the large surpluses the government holds.

The World Overseas

Assembly Line Jammed

TEN, many parents say, is a difficult age for growing youngsters. The Assembly of the United Nations has certainly made no easy transition into its second decade. The tenth General Assembly scrambled to an undignified closure this week just in time for those of its members who enjoy turkey and plum pudding to get to the table, but leaving them little opportunity for Christmas shopping. Heartening valedictions were uttered, as usual, but few among the jaded delegates can have felt that the debates that had occupied them since September had served much purpose.

They had, admittedly, at last managed to enlarge their club, adding sixteen new members to the former sixty. This particular "spirit of 76" was, however, sullied by the surrounding atmosphere, and especially by the last-minute obstruction of Japan's entry (which is further discussed on page 1093). The Chinese Nationalists, wielding their vestigial veto like a fool's bladder, led several previously friendly delegates to reflect that the sooner this weapon was taken gently but firmly away from them the better. Mr Lester Pearson's delicate balancing of eighteen candidates on the point of a needle was disrupted. Russia's tally of vetoes reached 77 just as Uno's membership rose to 76. Nevertheless the sixteen fortunate candidates, ranging from the Irish Republic to Laos by way of Portugal, Hungary, Jordan and Ceylon, were in; and representatives of most of them slipped into their seats in time to vote on an even more vexed question—the filling of the Security Council seat which Turkey will vacate at the New Year.

The Assembly's inability to decide this simpler issue had already been more damaging to its reputation than the horse-trading over new members. Three dozen ballots had given neither Yugoslavia nor the Philippines the two-thirds majority required. The president of this year's Assembly, Sr Maza, had made the suggestion—no less undignified than all the vain voting, and much more practical—that he should draw lots between them, on the understanding that the winner would yield the seat to the loser halfway through the two-year term. The candidates were willing, but at first the Assembly, racked with tantrums, was not. Meanwhile the new members moved in, and promptly discomfited the many prophets who had announced that an enlarged membership would automatically increase the "anti-American" vote, by giving the Philippines a lead of twelve votes. Finally, on Tuesday, the Assembly accepted the result of Sr Maza's lucky dip, voted Yugoslavia in, and scurried home.

The cynic may well ask whether it greatly matters who

sits on a Security Council that has reminded the world of its ineffectiveness so vividly in recent weeks by issuing vain appeals to scuffling Arabs and Israelis. But in the Assembly's cloistered halls, the air so efficiently kept free from bacteria and city dust is all the thicker with illusions; and delegates will fight like tiger cats over the phrasing of a resolution which is most unlikely to have the slightest effect, or even to attract attention, in the real world outside the glass. This phenomenon has been unusually marked at the Assembly of 1955, whose long Odyssey through a sea of paper has passed almost unnoticed, except when its pronouncements aroused anger or derision.

It has been particularly sad to see this happen, for this Assembly set sail in fair weather, with the "summit" sunshine still warm enough to prevent its opening debate from becoming a slanging match, and in the comforting afterglow of the "atoms for peace" exhibition, held at Geneva in the previous month under UN auspices. Peaceful atomic co-operation, and new disarmament projects such as Mr Eisenhower's aerial inspection offer, looked like promising material for constructive debate. There were, admittedly, pessimists who foretold from the start—and rightly—that Mr Molotov's encounter with his fellow foreign ministers at the end of October would set the barometer back to the "stormy" position. But the Assembly had a clear month's start on the foreign ministers, and might have made some useful hay before the summer sun went down.

Instead, it drew a cloud over itself at the start by insisting on its right to debate Algeria, and so provoking a French walkout. In late November, it coaxed France back again by resolving without a division that it was "no longer seized" of the undebated item on Algeria—a compromise for which Mr Krishna Menon had worked tirelessly among Arab and Asian delegates. The South Africans, who walked out in November, were not, however, lured back to their seats—but in their absence, paradoxically enough, the UN commission investigating *apartheid* was extinguished by the failure of a motion to extend its life. A debate on the abstract right of self-determination for all peoples kindled much heat without casting any light. Familiar formulae, or subjects ranging from Korea to the granting of financial aid to poor countries, were adopted with the familiar feeling that they would alter nothing. The plan for an international "atoms for peace" agency was adopted, but in an atmosphere vitiated by Russian objections; the disarmament debates ended with a resolution, carried in committee by 53 votes to the Soviet five, commending the Eisenhower inspection plan as a valuable first objective, but the Russians

made it clear that they were as uninterested as ever; unanimity was, however, achieved over a project for the investigation of the effects of atomic radiation.

Good sense reared its head here and there. Indonesia decided to take the New Guinea question away and discuss it privately with the Dutch. Despite some voluble but obscure protests from Liberia, the Assembly endorsed its own mission's proposal that the people of British Togoland should decide their future by plebiscite next spring; only the Soviet bloc votes were cast against this experiment in self-determination. And the much discussed project for revision of the UN Charter eventually took the diaphanous shape of the appointment of a committee to consider how and where a conference might some day be held to discuss the advisability of a review of the Charter. The Soviet bloc, with the engaging ferocity of a man tearing up a newspaper article of which he does not approve, solemnly declared that it would boycott even this timorous undertaking. The Russians proclaimed, in the manner of Dr Pangloss, that the Charter was the best of all possible Charters, and required no amendment. (This was a few days before Mr Khrushchev had told India that it should be seated among the great powers, and that only imperialist intrigues prevented it from being so seated.)

It is certainly difficult to see how any improvement in the Charter can be seriously contemplated as long as any proposal in that direction is doomed to run into a Soviet veto. There is, moreover, little enthusiasm for revision among any of the major powers at present. But the increase in Uno's membership undoubtedly makes it more difficult to describe a Security Council of the present size as adequately representative, or an Assembly of the present cumbrous character as efficient. Certain stirrings in the undergrowth suggest that an effort may yet be made to tackle specific problems of this kind without recourse to a full-scale conference on Charter revision as a whole. And it may be hoped that one of the aims of this will be to relate the Assembly's duration and cost rather more closely to its effectiveness.

Jordan under Pressure

FROM OUR CORRESPONDENT IN CAIRO

THE political pressures of the Arab world fall so heavily on troubled Jordan that it has little choice but to cower in neutrality between Egypt and Iraq. Geographically, it is in the triangle of the bilateral pacts extended by Egypt to Syria and Saudi Arabia, but economically it lives on British money and Britain supports the Iraqi defence policy.

In terms of popular sentiment, Jordan is almost certainly with Egypt and Syria and against Iraq on the defence issue. It is this sentiment which has been roused in protest against the mission of General Sir Gerald Templer. First reports of public disturbances were grossly exaggerated, but there can be little question that the proposal to join the Baghdad pact was not favoured by the people. In a small country obsessed by fears of Israel, it was inevitable that an arrangement which is part of the western defences against Soviet Russia should have little appeal beside the Egyptian-Syrian alliance which is primarily directed

against Israel. It is widely admitted in Jordan that the country's security largely depends on the Anglo-Jordanian treaty, but that is as far as the people desire to go with the West, which is far from being trusted otherwise to sustain the Arabs against the Jews. For Britain to strengthen the Arab League is one thing. For Jordan to join a system which drives a wedge between it and Egypt is another; and Colonel Nasser's policy, with his Czech arms deal and his ultimatum to Israel, is the policy that most Jordanians want in their hearts, even if their minds boggle at the risks involved.

It was known in Damascus, Beirut and Cairo that Said el-Mufti's government could not survive a move to join the Turco-Iraqi pact. He expressed himself in private in a manner which showed him to be right in the middle of the road, convinced that Jordan's security against Israel depended on Britain but that nothing should be done to impede the evolution of Egypt's policy. He is reported to believe that Egyptian forces should have the right of transit through Jordan to Syria if that became necessary, an arrangement which would have involved Jordan in any

troubles arising from the Syrian-Egyptian defence agreement. This suggests a sympathy for the agreement even though he refused to offend Iraq by agreeing to join Egypt's bilateral pact system.

Some political elements in Jordan want to join the Baghdad pact on condition that sufficient guarantees are given against danger from Israel, and that economic contributions are made to Jordan's own defence system. These elements are opposed to a commitment to Egypt because they regard the oil revenues of Iraq as the one potential source of assistance that could reduce the country's dependence on Britain. As this policy is most strongly supported in the Court, notably by Fawzi el-Mulki, the Court Minister and Bolijat Talhouni, the Chief of the Royal Cabinet, there was good reason to think that it could be accepted. The fact that Hazza Majali, who also holds these views, was ready to form a government suggested that it was still believed that the policy would prevail. His resignation, however, and the dissolution of parliament, have thrown the whole issue into the melting pot.

The outright opposition against this policy comes from the Ba'ath party, elements of the National party led by Soliman Nabulsi, and, naturally, the Communists. They are not of much consequence in the political structure of Jordan but their capacity for making trouble on this issue is clearly enhanced by popular sentiment. In circumstances such as these, Jordan would normally turn to a strong prime minister such as Tewfik Aboul Huda or Samir el-Rifae, but

these lean towards Egyptian policies and are at best neutral in any conflict of policy between Cairo and Baghdad. They have been useful in the past because they are right-wing politicians strongly opposed to the extremists and not averse to using the strong hand against Communists or fellow-travellers. But they are of no value in this situation.

If King Hussein is prepared to go ahead with the policy, it would be possible for a strong government to carry it through. The Majali sector of opinion urges that British aid should be a direct contribution to the Jordan exchequer and not to the Arab Legion, and that the Legion should be commanded by a Jordanian instead of Glubb Pasha. This would mean a revision of the Anglo-Jordanian Treaty. Nevertheless, if concessions of this nature could be offered it may be that the policy could eventually succeed.

Whether it is wise to press the issue now is as much a question for Britain as for King Hussein and his advisers. Whatever the military benefits for Britain and the "upper tier" defence system of Jordan's adhesion to it, there would also be political disadvantages, since the Arab peoples, most of all the Jordanians, would believe that Britain imposed the decision on the King—and at a time when Russia and its satellites are offering arms and economic aid "unconditionally" and "purely commercially." Nor would Jordan's adhesion influence other Arab states; rather would it harden the division in the Arab world.

The neutralism of the older politicians in Jordan expresses the general condition of the Arab world. If, as a result of western aid for Egypt's High Dam and initiatives in regard to Israel, Britain's prestige rises again and Russia's declines, it will no longer be necessary for Jordan to be neutral between Iraq and Egypt, the two countries which represent the conflict over relations with the West. To press the issue on Jordan now is like selling Britain on a low market and presuming that its stock will not rise for a long time.

Indian Afterthoughts

FROM OUR CORRESPONDENT IN INDIA

THE Russians came. The Russians were rude. India is still neutral. The real victory of Moscow has been won not in Delhi but in Washington. And the victory has been won at India's expense. The effect of the Russians on India's masses was small; as one minister put it: "Everyone likes to see a circus, but nobody wants the elephants"; and the more Mr Khrushchev attacked colonialism, Western imperialism and Western warmongering, the more Indians, including Mr Nehru, felt uncomfortable. It is no accident that Mr Nehru reiterated his beliefs in ends never justifying the means both in Calcutta, under Marshal Bulganin's very beard, and in Madras while the Russian team was in Burma. Indeed, most significant of all is the special affection Mr Nehru expressed for the Commonwealth in the parliamentary debate on the Indian Citizenship Bill—a debate which was pushed forward by a full week, as if in answer to Russian mud-slinging at the West.

Russia's support for India's case over Kashmir has not been received with unqualified enthusiasm. India is naturally pleased to see somebody big on its side, particularly somebody on the Security Council, but since India is officially still committed to holding a plebiscite one day,

its pleasure is not increased by the inevitable effect in Karachi of Russia's vicarious declaration of cold war. India had not planned the visit to Kashmir and the price of the ticket is high: a Pakistan clinging fervently to the lifebelt of the Baghdad Pact.

Even over Goa, Russia's support has been a curse in disguise—this time thanks to American ineptitude. It certainly pleased every Indian to have a big power recognise Goa as part of India, but recognition of India's stand has not altered the fact that Goa is not yet part of India. Mr Nehru has restated, after Mr Khrushchev's speech, that India would not resort to force. The West, it is felt here, does not appreciate the amount of self-imposed restraint that not taking Goa represents. Indians know that they can walk into Goa, that nobody will interfere; most Indians want a police action. Mr Nehru, however, is sticking out for those principles of negotiation and peaceful means he so freely preaches to others, not because departing from them would lose India face—Mr Nehru is too cynical not to have learnt the lesson of Hyderabad—but because his example might be followed by others, at the risk of starting a third world war. So, when Mr Dulles fell straight into the Russian trap by seeming to back Portugal's position in Goa, India exploded with emotion. Had there been no Russian visit, Mr Nehru would have lashed out at America; but in present circumstances he does not want to allow even Mr Dulles' gaffes to tilt his neutrality into becoming anti-American. So Mr Nehru, for once, has said nothing beyond informing parliament that he was inquiring into the matter through diplomatic channels. But Mr Dulles has been worth more than ten Khrushchevs in Moscow's wooing of India. India is allergic to the hammer speech techniques, and Mr Khrushchev had gone much too far; Mr Dulles, however, using the most cautious and polite language, has drawn much more fire.

Mr Nehru's Dotted Line

To Indians it seems that the Americans are making a totally disproportionate amount of fuss about the visit. As seen from India, the reason for the disproportion is that there is between the Indians and the Americans a deep disagreement on how to deal with, and contain, the Russians. Mr Nehru says that bad though the Russians may be, one must befriend them in the hope of making them better, and one must never criticise them directly because that would make them shy and unresponsive. On the other hand the Americans say: Russia is bad and to treat it as if it were good is monstrous, what is needed is a moral boycott of the bad so that badness cannot spread. From Delhi it appears that America has entered into a crusade for the moral even more than the strategic encirclement of Russia. Delhi, on the other hand, sees itself as working for a moral *détente* even more than a neutral belt around Russia. Each country sees in the other's methods an insufferable challenge to its own most treasured beliefs.

What the Russian visit has achieved is not to swerve India from its neutrality, but to bring this fundamental disagreement between India and America once more into the open. And, in a way, that could become serious. Thus most Indians regard the joint communiqué issued at the end of the visit as a document in which the Russians have signed on Mr Nehru's dotted line. They have been correspondingly astonished that the Americans have been reported to take it to imply that India has leaned over to Russia's side.

It is too early to say what the final result of the Russian visit will be. The crowds, the cheering and the insults will be forgotten. Russia will now be judged on how it behaves, on the friendliness it shows and the help it gives. It began well by accepting India as a great country and not lecturing Indians on what they ought to do in their own interests. It has followed that up by letting twelve non-Communist nations into the United Nations, on Mr Nehru's plea, and agreeing to supply one million tons of the steel India needs so badly and cannot buy elsewhere. But, by becoming real and known, instead of vague and remote, the Russians have entered into a competition, a competition in friendliness, help and freedom that the West should have no difficulty in winning. The Russian visit can only be a real success if the Americans scratch because the Russians have entered.

Finland's Wider Windows

BY A CORRESPONDENT LATELY IN FINLAND

THE last months of this year have been eventful ones for Finland. The Russian base at Porkkala is being evacuated, and Finland has secured entry to the United Nations and the Nordic Council. The exact date for the formal handing over of Porkkala has still to be announced, but there is already considerable speculation about what will be found there. In the past, it has been suggested that the Russians were installing everything from rocket launching sites to local radio jamming stations, but recent indications are that nothing more spectacular than an airfield, the remains of a submarine base, some barracks and a casino will be left behind. The Finns have just been given their first chance to get a glimpse of what really is now to be found in Porkkala, since from last Thursday the Russians have dropped their insistence that all Finnish trains running through the base should have shuttered windows.

The Finnish government committee appointed to study the problems of taking over the area has let it be known that it will be spring before the former inhabitants, who numbered over 7,000, are allowed to return. When they had to evacuate their homes and farms, the Finnish government offered them compensation which most, though not all, accepted. In spite of this, however, their moral right to their former property has been recognised, although the legal and financial terms on which it will be returned have still to be defined. One airfield and some barracks, on former farmland, will probably be left intact by the Russians and these the Finnish government may wish to retain.

There will inevitably be some individual hardship, or, at least, disappointment, for the many delightful summer villas in the area will hardly have been maintained up to Finnish standards during the eleven years of occupation. Nevertheless, there is deep satisfaction that this part of Finland is again Finnish. When the first news of the return reached Helsinki, there were some fears that a price higher than that of the extension for twenty years of the 1948 Treaty might be demanded. There were rumours, for example, of pressure on Finland to recognise the East German government. It turned out, however, that Russia was ready to give up the base without demanding such concessions.

Although the most spectacular, this is not the only recent example of Russian magnanimity towards Finland. In the

past, the Soviet government has reacted strongly through the press and radio against any suggestion that Finland should link itself more closely with its northern neighbours, even for the most peaceful purposes. But soon after the return of President Paasikivi and the Prime Minister, Mr Kekkonen, from Moscow, the latter revealed that the question of Finland joining the Nordic Council had been amicably discussed there, and he recommended that Finland should seek membership. The Diet unanimously approved, and when the Council meets in January, a Finnish delegation, representing all parties in the Diet, including, of course, the Communists, will be present. The effect of this will be to strengthen Sweden's neutral voice in the Council. Indeed, Russia's whole policy of good-neighbourliness towards Finland has an effect in Sweden, which is always sensitive to changes of pressure on Finland. Russian policy seems to be designed to create confidence in Finland, and in the North generally, by establishing relations on, to quote a phrase used by President Paasikivi, "a sensible and matter of fact basis."

From the Finnish point of view, these recent events have been proof of the rightness of the "Paasikivi line" in foreign policy. This has been to establish good relations with Russia by the scrupulous observance of obligations, but at the same time to avoid all subservience in internal affairs, and to maintain trade and cultural ties with the West. This has often demanded a cool head in the management of Finnish affairs, and membership of the United Nations, although welcome, will obviously bring new problems.

Mr Diem and Democracy

WHEN nearly six million Southern Vietnamese voted last October to depose Bao Dai as chief of state, they gave the new President of the Republic, Ngo Dinh Diem, a mandate to "establish a democratic regime." It is still too early to reproach him with not having fully established "democracy"; but the latest actions of his government do not encourage the hope that democracy—in the western sense—is among its objectives. Some of these actions appear at first sight to be merely part of his untiring anti-French campaign, but when put together with other actions affecting Vietnamese nationals, they take the shape of a general policy of authoritarian rule.

The expulsion in November of two well-known French newspaper correspondents—Lucien Bodard of *France-Soir* and Max Clos of *Le Monde*—was thus not merely an anti-French gesture, but also an expression of this general policy. Both M. Bodard and M. Clos, who had lived in Saigon for many years, were expelled after they had paid a short visit to Hanoi, and in each case after they had declared their intention of leaving Saigon, where official opposition made it difficult for them to do their work. The Vietnamese government rejected a strong protest by other foreign correspondents and added that it had no need to give reasons when expelling a journalist.

Repressive measures have also been taken against the Vietnamese press, already closely censored. Last month, the newspaper *Anh Sang* ("Light") the last "Cochinchinese" organ in the south, was closed down, ostensibly because it had changed its editor without official permission. On

December 9th, the weekly *Cai Tao* ("Reform") was suspended. Early this month, the government passed a decree banning all independent radio stations. This was aimed not only at the French-owned *Radio France-Asie*, and the French army post *Radio-Hirondelle*, but also at the various Vietnamese anti-government stations, most of which, however, operate from clandestine quarters.

The government has, for some months, been announcing at intervals that general elections would be held in the south before the end of the year. There is now little doubt that these elections will indeed be held, but probably not until next February or at the end of January. On November 28th, President Diem signed a decree setting up a committee charged with planning a constitution. The committee, which is now functioning, has not yet disclosed its deliberations, but the majority of its members are said to favour a one-chamber legislature, with a separation of legislative and executive powers.

As for the elections, only pro-government parties have been allowed to campaign so far. These include the Rally of Citizens, a party formed in November, 1954; the Party for the Dignity of Workers, a kind of Christian Democratic group controlled by Mr Diem's brother and principal adviser, Ngo Dinh Nhu; and the Movement of the National Revolution, of which Mr Nhu is also a co-leader. Opposition parties are either banned, like the old nationalist party Dai Viet, or barely tolerated, like the new Republican Party of Dr Phan Huy Dan.

Clash with the Church

Mr Diem's methods have certainly gained him much vocal support; and indeed, in the face of continuing armed insurrections in the south-west and centre, there may be little possibility of uniting southern Vietnam by democratic methods. It would be naïve to expect Mr Diem to subject his administration to the whims of a sovereign chamber. But public discussion in an elected assembly could do much to moderate the tendency towards extremism.

If some of Mr Diem's methods are at least understandable, it is harder for an outside observer to admit the necessity of his recent clash with the Roman Catholic Church—a body with which public opinion expects him to be on good terms. By opposing the nomination of Monsignor Nguyen Van Tien as Bishop of Saigon, on the ground that he was "pro-French," Mr Diem undoubtedly created for himself an unnecessary source of opposition. That he feels strongly about the matter was demonstrated by the fact that he sent two of his brothers, Bishop Ngo Dinh Tuc of Vinh Long, and Mr Ngo Dinh Luyen, his roving ambassador, to the Vatican with orders to try to persuade the Holy See to rescind the nomination. The Pope, however, stood firm and Bishop Tien was duly consecrated in Saigon on November 30th. President Diem refused to attend the ceremony, although he had been invited, and ordered invitations to the diplomatic corps in Saigon to be intercepted. Since then Mr Diem has recognised Monsignor Tien as Apostolic Vicar of Saigon, and has himself been recognised by the Vatican as President of Vietnam.

The Tien episode may have the merit, in the eyes of the Diem family, of demonstrating that they are not "puppets." But it may be doubted whether the benefits of asserting their independence in this way will offset, in the long run, the injury to their reputation among influential supporters in the United States.

"Thoughtcrime" in Budapest

THERE has been serious trouble in Hungarian literary circles. It had evidently been simmering for some time, and came to a head over a month ago at a stormy meeting of the writers' association in Budapest; but it was only made public when the latest issue of the writers' official organ, *Irodalmi Ujsag*, published a stern resolution of the central committee of the Communist party against "right-deviationist manifestations in literature." From this it appears that at the Budapest meeting a number of writers made an organised revolt against the interference of the party in literary matters. Some resigned ostentatiously from the presidium of the writers' union, thus "breaking the elementary requirements of party discipline." Others drew up a memorandum which is said to be a "frontal attack" against party and state leadership, and actually went round collecting signatures for it from amongst party members. This was certainly carrying things rather far; it is one thing to have collective leadership of the party, but quite another to have collective action against the leadership by the led.

The whole affair was plainly a reflection of the struggle within the party between the supporters and opponents of Mr Rakosi, but it is hard to say whether it has any serious political implications. There were, rather surprisingly, some tried and trusted Communist writers among the leaders of the revolt. But whether they were really as black (from a Communist point of view) as they were painted may be doubted; in these internal party struggles it is usually considered advisable that those who lose should be hung from the highest possible gallows. It is possible that these men, who under the Nagy regime had enjoyed some illusion that they had minds and souls of their own, simply felt that Mr Rakosi's new intensification of mental restrictions was more than they could take. But to Mr Rakosi such an attitude is a political crime, not just an ebullition of the artistic temperament, and it will no doubt confirm him in his attitude that it was a cardinal error ever to give the artistic gentlemen their head at all.

THE BUSINESS WORLD

What Do Airports Cost?

ON the day that the Queen officially opened London Airport, the Select Committee on Estimates published a 300-page report on the general administration of the civil airfields under the control of the government. This is the first time that the taxpayer has been given the detailed facts on how much airports cost to run—whether a major international airport like London or a minute airport like Machrihanish. The Ministry's airports do not publish separate trading accounts; indeed, the Ministry of Transport and Civil Aviation does not, even for its own internal purposes, record more than the day-to-day running expenses and gross capital outlay on the 30 civil airports under its control. Allowing for interest on capital invested and for the cost of administration, the committee estimated that these 30 airports fail to meet their outgoings by about £6 million a year.

The airlines that carry passengers to Britain are getting an essential service, without which they could not fly, at roughly one-quarter of the true cost—airport revenue being £2.3 million against outgoings of £8 million all told—and the rest is being made good by the taxpayer. In a strictly literal sense, this amounts to a concealed subsidy for civil air transport, domestic and foreign; the deficit is not budgeted for in the accounts and estimates presented to Parliament. When the Select Committee began to take evidence last March, it seemed simple enough to suggest that charges at the airports should be raised to an economic level. Parliament had made provision to make good any trading losses of the two nationalised British air corporations; and indeed any government aid that they receive should be in the form of an open subsidy.

As the hearings went on, the committee began to understand why so many of the witnesses who were questioned appeared to regard the country's airports more as a public service than as trading concerns. For this attitude the airlines themselves are largely

responsible. They are forceful negotiators, conscious of the huge scale of their operations and since they operate within a framework of fixed fares that are not easily altered, they keep on guard against anything that might raise their operating costs. They pay the airport a landing fee calculated on the weight of the aircraft wherever it touches down, but no fee on taking off. They also pay parking fees for aircraft, and rent for hangar and office accommodation. For this, the airport authorities provide runways of adequate length and strength; lights and navigational aids; radio services to guide the pilots; radar systems of varying elaborateness; terminal buildings for passengers; Customs buildings; car parks; restaurants and staff canteens; hangars and maintenance areas. Constant improvement and modernisation are needed to keep these services up to standard, but the airlines strongly resist any increase in charges. When the lives and safety of passengers are so directly involved, no major airport dare skimp on technical expenditure. The result of this dual pressure to improve airport services and at the same time to maintain the level of airport charges is that, despite the steady increase in air traffic, British airports are still well in the red.

The present scale of landing fees was laid down in 1948. It is based on 5 per cent of the revenue that would be earned by each specific type of aircraft, assuming that it was two-thirds full. There are rebates for aircraft flying only short distances and surcharges on long flights. Receipts from landing fees amounted to £850,000 in 1954-55 and are expected to bring in almost £1 million during the current financial year. This sum covers the costs directly involved in the take-off and landing of aircraft with a little to spare.

But although landing fees cover the cost of handling the aircraft at the airports, they do not cover the cost of handling the aircraft's passengers. To cover these expensive people would have needed a 50 per cent

increase in landing fees; any such move was strongly opposed by the airlines, who argued that London's fees were already the highest in the world and that if they were increased, other countries would follow suit and traffic would by-pass London. This argument did not impress the Select Committee, whose researches revealed that the cost of night landings with the runway lights operating was substantially lower in London than in most European airports. The Select Committee was sceptical about the influence of London's landing fees on those of other countries, or on the airlines that fly to London, and concluded that the Ministry's policy was rather too soft on the airlines and hard on the taxpayer.

The device that was ultimately used by the Ministry to bring in more income was the unpopular passenger charge, a levy of 5s. on every passenger leaving the country. This is yielding just short of £300,000 a year and is intended to make a contribution towards the cost of handling passengers. The charge was introduced in 1952, and the Ministry believed that the airlines would immediately add it to the cost of their tickets. But the airlines could not add to their standard fares at will, for these matters are decided by the International Air Transport Association. Equally, they had no intention of paying the 5s. from their own pockets. So the puzzled passengers found themselves buying a ticket, and then being asked at the start of their journey for the Ministry's 5s. It has taken nearly three years to persuade the airlines to collect this charge when they sell the ticket—for which service, incidentally, the Ministry pays them a fee. For rents and services to its tenants, the Ministry expects to get in about £1.3 million during this financial year, and a further £160,000 from the lease of concessions and from the public enclosure. Both these figures are a deal higher than those for the current year.

Witnesses told the committee that the difficulty of running an airport on business lines was that the facilities had to be provided whether or not the traffic was there. The committee's members wondered what

steps had therefore been taken to attract traffic, and were told that this was not regarded as one of the functions of running an airport. Sir Gilmour Jenkins, the Permanent Secretary to the Ministry of Transport and Civil Aviation, summarised this attitude neatly when he said: "The aerodrome must be the servant of air policy, I think. . . . It is not the policy of this Government or of its predecessors to try to attract as many aircraft of foreign lines as is possible to London Airport for the purpose of making London Airport self-supporting." This has not, however, been the view of those responsible for running Manchester's municipally-owned airport. Manchester's vigorous drive for traffic, foreign or British, has sometimes provoked the British operators, but the traffic has gone up from 65,000 passengers in 1948 to 265,000 last year. The airport still costs Manchester £36,000 this year and a probable £50,000 next year, the equivalent of a 1½d. rate.

★

The responsibility for providing airport facilities, and for making the right guesses about the airlines' future needs, is onerous. London airport is a textbook case. By the time the first stage is complete, £26 million will have been spent at Heathrow, which is considerably more than the original estimate. For this sum, the Ministry will have provided a star-shaped network of intersecting runways and technical services capable of sending off 30 aircraft an hour. In the centre of the star will be a group of terminal buildings which will really cater only for the short-distance European traffic that came to London when Northolt was closed to civil traffic. Long-distance passengers, queueing in crocodile through the huts on the north-east side, are as far as they have ever been from being properly accommodated. It is ironic that the air passenger who spends least on his ticket gets the most luxurious reception at London airport. Plans for buildings for long-distance passengers are only now being discussed

AIRPORT COSTS, 1954-55

	Running Costs (excluding Technical Services)	Technical Services	Revenue	Net Operating Costs	Capital Expenditure to 31st March, 1955	Interest on Capital at a notional 4%*	Future Capital Programme	Passengers	Freight (short tons)	Staff

To these figures should be added £3 million for the cost of administration, but it is not possible to apportion this among the different airports * Not included in Ministry estimates.

and cannot materialise before 1960. At this stage London should begin to pay its way, but it will also have grown too small and Gatwick will be called in to supplement it.

What comes out of the committee's exhaustive investigation is a picture of technical energy and efficiency shadowed by some administrative complacency. Many airlines regard London Airport as the most efficient in the world, and that is no mean praise. But should this be provided as a public service at the expense of the taxpayer, or should it be a self-supporting trading service? Plainly, little attempt has been made to put it on a business-like footing. There is no allowance in the Ministry's internal accounting for interest on capital invested, although the municipal airport at Manchester and the privately-owned airport of Silver City at Ferryfield are both costed by their owners on a normal accounting basis. No allowance, either, is made for the £3 million of administrative overheads. No attempt is made to attract traffic, although it must be admitted that the airlines are difficult customers to please.

The Select Committee felt strongly that better trading accounts could and should be presented, both to give information to Parliament and incentive to the individual airports. It recommended higher landing

fees and possibly a higher passenger charge; brushing aside the dubious case—proposed by the airlines and accepted by the Ministry—that this would lead to loss of traffic and a spiral at other airports. It asked for a review of Treasury control of capital expenditure and held that it was imperative to conclude the negotiations to purchase the land—having found that a section of London Airport is still, after all these years, the property of the Fairey Aviation Company.

It was also suggested that a serious experiment should be carried out to increase the revenue from "amenities," that is, from sightseers and concessionaires catering for them. Many big airports get 40 to 50 per cent of their revenue from these sources, which more than compensates for low landing fees. But is London airport happily placed for a development of this kind? It might be able to draw support from the surrounding suburbs, but it seems optimistic to look on it as a serious competitor to the West End. What the committee did not touch was the heart of the matter. If the airports should be run as trading concerns, are they best administered as a section of a government department? Is there a case for establishing them under some separate corporate form? This is a question not mentioned in three hundred pages of evidence, but it might bear investigation.

Design for Accounting

IS the company accountant simply a steward? The 1948 Companies Act, by insisting on a mass of information in the accounts of public companies, put the emphasis on stewardship—on the duty of those who enjoy the privilege of limited liability and employ the investor's money to give a "true and fair" picture of their activities. The Act is demanding in all its requirements, and that is as it should be. It has brought a welcome consistency and uniformity to company accounting, but this is a gain won at the considerable cost of complexity. Accounts now are not likely to be misleading, but too often they are some way short of being comprehensible. It is not fair to blame this on the accountant. In designing a company's accounts he is faced with a conflict. Above all, the requirements of the law must be satisfied. But should the report be designed to quench the analytical thirst of the expert investor, or should it aim at the simplest statement that can be reconciled with the law and, at the same time, with the understanding of a lay shareholder?

Those who are always handling accounts are usually willing to put up with complexity so long as a full as well as a "true and fair" view of the company's affairs emerges. Indeed, they would like (and sometimes they get) more detail than the Companies Act requires. They think that more companies should publish sales

figures and a gross trading account. They become inquisitive about the margin of profit on this product and on that. They want to know what the assets are really worth. Their desires, "like fell and cruel hounds," are voracious; yet they can be satisfied only at the expense of more figures and of more complex and costly reports. Is this what the ordinary bulk of ordinary shareholders really want?

The answer, unfortunately, is that it is not. But compromise is possible and, fortunately, many companies are beginning to recognise the different needs of the professionals and the amateurs. One possibility is to relegate all the detailed accounting to the back of the report, along with the arcane implications of the necessary notes on the accounts and auditors' reports. This leaves the first few pages for those who are more at home with simple figures and narrative a statement from the chairman or the board, the essential figures of assets and profits and, perhaps, a simple table or illustration. Many great British companies, to say nothing of their counterparts in the United States, have shown that in ways like these it is possible to interest and enlighten the layman as well as to satisfy the most exacting analyst. That is one line of improvement in communication and understanding between shareholders and the companies they own.

Understanding is easiest to obtain when the figuring, however detailed, can be digested painlessly. The accountant must always be allowed some scope to express his own ideas and fancies on what is digestible. But there is a job of design, presentation and typography that, for all the improvement in company accounts, is far from complete. The eye has to perform before the brain, and the average shareholder does not usually have the trick of forming photographic images of figures that the skilled figure-man performs so easily. For the amateur, tabular accounts are probably clearer than double entry documents. For him, too, a detailed profit and loss account running down from sales to dividends gives a real content to the figures he studies. And he would be less mystified if the balance sheet were framed, not necessarily to show a "sources and uses of funds" statement in full detail, but at least to show where the money came from and where it has gone to.

★

Intelligibility and the requirements of the Companies Act are not closer than second cousins. Is a more radical reform needed? Radicalism in accounting could not go much further than one suggestion made at the summer course of the Institute of Chartered Accountants during a discussion on Mr E. H. Davison's paper on "Financial Enlightenment: the Simplification of Accounts." This suggestion was that all a company needed to do was to send out a simple statement setting down in the space of a postcard the salient facts of the year's results, together with a business reply card indicating a wish to receive a copy of the full report. No doubt this would be enough for many shareholders, and it would save trouble and expense. But it has its dangers; for one thing, it could easily become a dangerous doctrine if essential information about a company's affairs was something to be released only on special request.

At the best, it could be only a partial answer, for it would still leave the problem of how the accounts should be simplified and the purpose that simplification was presumed to serve. The starting point must be that shareholders are primarily interested in the income they receive and in the factors which are likely to affect that income in the future. Dividends, earnings and the cash in the kitty to pay dividends are the shareholder's first interest. It was on this commonsense peg that Mr E. H. Davison hung his paper.

His first imperative was that some of the detail which clutters company accounts must be removed. Secondly, he argued, part of the jungle of comparative figures should be hacked down, so that the essential relative movements stand out. Thirdly, he would discard the holding company's balance sheet (now required by law) and would rely solely on the consolidated figures. Fourthly, the auditor's report should be replaced by his signature (with any qualifications he has to make) on the face of the accounts. "Sensible and practical"

is the immediate reaction to these ideas, but doubts soon appear. How many trees can be cut down before there is no forest? Some holding companies' balance sheets, notably where the trade of the parent is different from that of its subsidiaries or when subsidiary holdings change from year to year, are indispensable. The auditor's report is often cumbersome, but it is a report that he makes on his personal responsibility; it is easier to talk about simplifying it and discarding the ambiguities of "true and fair" than to find a way of doing it without exposing the auditor to unfair risks. Right at the outset the road to improvement is beset by a fog of qualifications.

Further along the road Mr Davison pleads for a consistent definition of the word "profit":

Fundamentally, the profit available for dividend is the amount of the greatest interest; if this were properly arrived at, no other information "above the line" is very valuable, and if omitted would hardly be missed.

Logically he takes the further step that the current value of the assets entered in the balance sheet should be shown somewhere in the report, and that in round terms "the percentage which the profit for the period bears to the total investment" at current values should be estimated. Commonsense again urges approval. But how far is detail to be sacrificed for simplicity? It matters to the ordinary shareholder, for instance, to know not only the earnings available for his dividends, but also the gearing to which the earnings are subject. For that he must have at the least information about debenture interest and preference dividends. Would simplification be complete if it robbed the shareholder of the chance of judging adequately the investment merits of his holdings?

Education as much as enlightenment seems to be the aim of Mr Davison's most striking proposal. He suggests that both in the profit and loss account and in the balance sheet the artificial distinction between capital and revenue reserves (which the Companies Act fails to spell out in full) should be eliminated. He would prefer to call reserves "savings" or "retentions," even though it might seem to be straining language to call a share premium account or a reserve arising from revaluation a "saving." Mr Davison would like to divide "retentions" between those which are "essential" and those which are not. The "essential savings" are depreciation, additional depreciation to make up the difference between historical and current costs and money held back against possible losses on stocks. The remainder is money set aside for expansion, for dividend equalisation, for financial prudence or simply for building up liquid resources. It is money, in fact, which if the directors chose they could distribute without harming the fabric of the company. One can sympathise with the view that the law's distinctions between the capital and revenue reserves are of no real importance under modern conditions. But the distinction between "essential" and "free" reserves still leaves room for argument. What sum must be provided

against losses on stocks? It is a question of opinion, not of fact, and the opinion of the managing director will normally decide. Mr Davison tries to get round this difficulty by suggesting that the auditors should pass judgment on the "essential" nature of the appropriations. Mr Davison's view of reserves has one outstanding merit: it would put the onus of defending a dividend policy where it rightly belongs—on the directors.

Mr Davison's suggestions should at least set accountants and company secretaries thinking. Not

Business Notes

Sterling After Butler

EVEN the rumour of the departure of Mr Butler from the Exchequer had started some sizeable selling of sterling. It came from New York on the first two working days of this week and required some appreciable support from the Exchange Equalisation Account. But for this support the slide in the sterling-US dollar rate would have been greater than the movement from \$2.80½ to \$2.80¼ which actually occurred. After the news of the ministerial general post was confirmed, selling of sterling became heavier and more widespread. On Wednesday morning sterling was being sold against almost every continental currency, and rates were moving against London, notably in the case of Swiss and Belgian francs, guilders and marks. These developments suggest that the end-of-year gold and dollar figures will reflect to the full the \$176 million paid on the United States and Canadian loans, and the further \$7,400,000 paid in gold to the European Payments Union in respect of the November deficit.

This selling of sterling reflects the general bewilderment at the Cabinet changes and in particular at the Treasury switch. Mr Butler had become identified since the Istanbul speech with the last ditch defence of the \$2.80 parity. Until his successor repeats these intentions unequivocally, foreign bankers and merchants will be tempted to believe that the change of Chancellor may also mean a change of policy. The sooner uncertainty on this point is removed the better it will be for sterling. Mr Butler had also become identified with the policy of solving the balance of payments difficulties by such overall measures of control as dearer money and a general restriction of credit. He was so committed to this that he could not have resorted to more specific measures such as new restrictions on imports. It may be significant that the new Chancellor of the Exchequer in his last appearance as Foreign Secretary, namely, as guest of honour at the annual dinner of the French Chamber of Commerce last

every accountant will agree with them; but the argument for improvement would be sterile if controversy were absent. Some of his suggestions would require a change in the law. Most of them have been made with the interests of the general body of shareholders in mind. If the purpose were to design accounts for the analyst, or the economist or employees a different approach might be necessary. But the enlightenment of shareholders must come first. The modern accountant should be prepared to be an educator as well as a custodian.

Tuesday, said: "We have perhaps gone too fast in our policy of trade liberalisation." He added that he would profoundly dislike ordering a retreat on this road, but apart from this expression of personal distaste he left the door wide open for a fundamental change of policy on this particular point. This is another issue on which the earliest possible declaration of intent from Mr Harold Macmillan is needed.

A Fairly Lucky Dip

THE ordinary shares of Consert Iron Company provided the brightest spot of the pre-Christmas share markets. Lists for the offer of 10 million £1 shares at 25s. 6d. were heavily oversubscribed though not quite so heavily as some tipsters had expected. They seemed disappointed that a paltry 65 million shares were applied for. In consequence there were more prizes in the lucky dip than the experts had foreseen. All preferential applications from former shareholders and from employees received an allotment. Such applications were met in full up to 300 shares, while for the larger amounts the general basis was about two-thirds of the amount applied for with a maximum of 10,000 shares and a minimum of 300. Among applications from the general public, all applications for 700 shares and upwards received about one-sixth of the amount applied for, with a minimum of 100 shares and a maximum of 2,500. Only the small public applications up to and including 600 shares went to ballot, and 20,000 successful applicants drew 100 shares each in the draw.

Hambros Bank excelled itself in dealing quickly with the flood of applications. The directors worked with the staff through the night and it was possible to get letters of acceptance and regret posted during the weekend even though lists had only closed on the Friday. Dealings started on Monday morning, although many allotments were still

in the post. The premium on the shares 10s. paid was not enormous, precisely because a fair proportion of the would-be shareholders had received an allotment. The shares started at 1½d. premium, and rose over the succeeding three days to 9d. premium bid. That will not pay for many Christmas parties, but it is good enough in a dull market to promise well for the further share offers that the Iron and Steel Holding and Realisation Agency hopes to make in the new year.

It is still likely that the first of those will be South Durham Steel and Iron to be sold for a sum of between £10 and £15 million. It is possible, but now unlikely, that a small selling operation may be sandwiched in ahead of South Durham.

Investment Plans Slacken?

MACHINE tool orders and Board of Trade approvals for new factory buildings have fallen off from the high peaks reached in the summer, but it is a little premature to read into this any marked slackening of industrialists' plans for new investment. Recent trends might be no more general than just the inevitable consequence of the placing six months ago of a few immense investment orders. Even if they do mean more, the slackening will hardly be really significant for production capacity before 1957. A great number of factories are now being built under plans conceived last year, and more might have been started had steel supplies not been a hindrance; and the machine tool industry has sold its output until well into 1957.

This industry received the last of the long deferred orders from motor firms, for their own expansion programmes, by May, and some decline in the flow of new business was to be expected, if only as a reflection of its lengthening delivery dates. Between July and September its home customers ordered £17.7 million worth of new tools, as against £20.2 million and £18.5 million in the two previous quarters. This was still £3½ million more than in the third quarter last year and twice as much as in 1953. The September total was, however, closer to last year's figure. The size of new factory schemes has been showing a similar drop. Here again, the total for the April-June quarter was inflated by four gigantic schemes, including one of over three million square feet in the motor industry. Total floor space approved in these three months was 29.6 million sq. ft. In the first quarter, the total was 24 million sq. ft., and in the third quarter it fell to 20½ million sq. ft. There are signs that new plans approved in the current quarter will be about the same as a year ago—about 20 million sq. ft. But this will still be twice as much as towards the end of 1953, when most of the new factories completed this year were first put on paper.

November's Bigger Deficit

THE details of British overseas trade in November do not reveal any substantial changes in the composition of imports or exports, but even minor changes can upset the balance of trade. Last month exports fell by little more

than two per cent, to £262.2 million fob; shipments of metals, non-electric machinery, road vehicles, ships and boats were somewhat lower than in October, and more than offset an increase in shipments of arms and ammunition, aeroplane engines and petroleum products. Re-exports, too, were down to £10 million from the exceptionally high total of £12.8 million the previous month. Imports, on the other hand, rose—again by little more than two per cent—to £341.5 million cif, partly because of a seasonal rise in arrivals of foods and beverages and raw wool. The effect of these marginal changes, however, was an increase, anything but marginal, of nearly one-third in the gross visible trade deficit, which was £16.4 million higher at £69.2 million.

Imports in fact returned to the high level that prevailed in the first quarter of this year, and the total value in the first eleven months of the year rose to £3,552 million, 16 per cent higher than in the same period of last year. Imports of manufactures (including semi-manufactures) were £200 million higher than in the first eleven months of 1954; food imports were up by £118 million, basic materials by £95 million and fuels by £71 million. Nor can higher prices be blamed for much of the increase, for four-fifths of it reflected a rise in volume. Last month, however, a rise in import prices of certain foods was mainly responsible for a rise of one point to 104 (1954=100) in the composite index of import prices. The export index for engineering products rose to 105, the highest point this year, but the composite index of export prices remained unchanged. Hence the terms of trade moved one point against this country to 101, still well below the level of the early months of the year.

At first sight, the rise of 9½ per cent in exports in the first eleven months of this year seems a respectable achievement, even though it fails to match the growth in imports. But a direct comparison with 1954 is misleading, because exports—unlike imports—were swollen this year with cargoes delayed by the dock strike of October, 1954. After attempting to allow for that distortion, the Board of Trade estimates that the real increase in British exports this year is only about six per cent.

United Steel in Line

THE general pattern of trading results from the denationalised steel companies has been much bigger profits and moderately higher dividends. United Steel's results conform exactly to this pattern. Its ordinary dividend has been raised from 10 per cent (which was 1 per cent higher than the original prospectus estimate) to 12½ per cent. Its profits, after charging loan interest, depreciation and appropriations to replacement reserves, have risen by just under 40 per cent. This is in line with all the other steel companies' results except Stewarts and Lloyds, which reported only a small advance in profits.

United Steel strikes its net income after making appropriations to stock reserves as well as replacement reserves. Even on this conservative reckoning these profits have risen from £3,253,372 to £3,684,304, an increase which more than covers the additional payment in dividends. The repeated 8 per cent dividend from Dorman Long unsettled

the market in steel shares; this market was so nervous that immediately before the United Steel announcement its £1 stock units were marked down to 45s. 1½d. The increase in the dividend made the jobbers more confident and the stock was at once marked up to 47s. 9d., a net gain of 7½d. on the day, so that the stock offers on the new dividend a yield of

	Years ended Sept. 30	
	1954	1955
<i>Consolidated earnings:—</i>		
Trading profit.....	11,171,476	15,353,864
Depreciation.....	2,034,980	2,550,207
Profit after depreciation.....	9,136,496	12,803,657
Non-recurring credits.....	...	368,147
Loan interest.....	133,635	209,962
Replacement reserves.....	1,000,000	1,500,000
Profit before tax.....	8,002,861	11,461,842

Net income.....	3,253,372	3,684,304
Ordinary dividends.....	770,003	1,006,250
Retained profits.....	2,253,766	2,419,661

* Includes provision for equalisation (1954: £390,000; 1955: £383,000) and investment allowance reserve (1954: £320,000; 1955: £462,000).

5½ per cent. But the dividend did not occasion a general rally in steel shares for the Dorman Long statement made it clear that the costs of capital development, in which United Steel along with many other steel companies is still actively engaged, are rising.

Caution from Turner and Newall

MR W. W. F. SHEPHERD, the chairman of Turner and Newall, is habitually cautious. But he speaks for a group which serves many industries and markets, notably the building and motor trades, and his suggestion this week that demand may be less strong in the future is bound to carry weight. Hedged round with reservations, his words hint more at caution than at blunt warning. In his statement accompanying the accounts for the year ended September 30th he says:

... while the conditions in the early part of our current financial year remained favourable, there are, here and there, indications that the strong demand which is now being experienced may not be maintained throughout the whole of this financial year. ... Accordingly, our expectation is that for the first half of the current period we shall remain highly prosperous but, so far as the second half is concerned, we can only hope that this condition will be maintained.

His reservations are that demand at the moment is "very satisfactory" and that in particular the overseas companies have "momentarily" got over the difficulties they were experiencing a year ago. The statement certainly cannot be called prophecy but, when he speaks of the demand for asbestos cement, it is the credit squeeze that Mr Shepherd singles out as the factor most likely to affect it. What also calls for thought is that Turner and

Newall touch so many other enterprises as a supplier. The doubts that Mr Shepherd expresses may be a warning to some of them.

Have stockholders in Turner and Newall any cause for concern? It would seem not. In the past year they witnessed a further rise in trading profits (from £14.9 million to £15.6 million); the dividend was raised from 22½ to 25 per cent and the directors are not given to proposing dividends that they do not expect to maintain. Massive earnings cover the dividend and the group is amazingly rich—perhaps too rich—in liquid assets. Over £3 million was spent on fixed capital in the financial year, yet the total sum held in investments, tax reserve certificates and cash went up from £26.6 million to £29.2 million. Turner and Newall has always been financially conservative; this year, for instance, a review of fixed assets revealed that £2 million had been over-provided for depreciation in the past and, accordingly, this sum has been transferred to replacement reserves. The customary note to the accounts that no "excess" depreciation had been provided has now disappeared. The group, admittedly, faces a big replacement problem—the directors say that the £11.5 million held in replacement reserves is substantially less than "estimated requirements"—but £29 million still seems a big sum to keep in liquid form out of a balance sheet total of nearly £72 million. The dividend of 25 per cent cannot be in danger.

Two Kinds of Liquidity

MOST building societies, just clear of an abnormal rush of withdrawals by investors and still experiencing a demand by mortgage borrowers that far exceeds lendable resources, are anxious to maintain a high degree of liquidity. The big societies are aiming at higher liquid ratios than they have previously maintained and the Building Societies Association has been weeding out the few members who have failed to observe the minimum liquidity requirement of 7½ per cent—which itself seems small enough. Moreover many societies have seen the wisdom of nudging their investment portfolios towards the shortest dated stocks. Treasury Bills are enjoying an unusual popularity.

But what is the proper view to take when a high proportion of a society's liquid funds is held not in gilt-edged but as unquoted loans to local authorities? About £100 million of the liquid assets of the movement are on loan to the local authorities. At present local authorities cannot raise mortgage loans for periods of less than seven years (though some of them accept money against receipts for shorter periods). In mortgage loans some building societies have sought to include a "stress clause" allowing them to give six months' notice to withdraw in case of necessity. Such stress clauses are familiar in trustee savings banks' lendings to local authorities, but follow in the case of the savings banks from legal requirements imposed on them.

The appeal of a local authority loan that does not depreciate when gilt-edged stocks are falling is natural. A comparison of the balance sheets of the two big societies that closed their financial years on September 30th—the Woolwich Equitable and the Leeds Permanent—illustrates it. The Woolwich society with liquid assets of £17.8

million has to show a depreciation on gilt-edged stocks of £2.0 million though, as the chairman pointed out at the recent meeting, the Society had on September 30th funds of over £5 million available without needing to incur a loss on realisation. The Leeds society with liquid assets of £13.1 million shows a depreciation of only £80,000. But that society holds £10.5 million (80 per cent) of its "liquid" assets as loans to local authorities while the Woolwich society has invested only £73,000 (less than 1 per cent) in that way.

But freedom from market depreciation has its price. Loans to local authorities are not fully liquid. A few "stress clauses" have been unusually widely drawn, so that a society might reasonably claim repayment without admitting that it was under dire need; but in general "stress clauses" are not invoked, nor is it at all certain that the government would look with favour on any general attempt to use them. Certainly the local authorities at present engaged in scraping the bottom of the mortgage market's barrel would detest it. The obverse of the greater depreciation that the Woolwich society has suffered is that for a substantial period in the summer the Leeds society almost stopped mortgage lending—a brave decision but an unpleasant one.

Perhaps there is no single investment that is ideal for all building societies. The big societies can arrange their local authority lending on a time schedule so that there is always something near to maturity. That spreads the risk, but does not remove it. The lesson that too much lending on local authority mortgages could be bad—that the local authorities which are also in the housing business are likely to be short of cash at the same time as the societies are short—is sinking slowly in.

Dunlop in Malaya

THE Dunlop Rubber Company may not have been surprised that its decision to produce general purpose synthetic rubber in Britain was taken as indifferent news for the natural rubber industry and, indeed, for Malaya, where the group has great plantations. This week the company was at pains to correct that interpretation. The general manager of Dunlop Plantations announced that the group was spending £4½ million on the replanting programme that was begun in 1950 and is to be completed by 1962. By then all the 72,500 acres under rubber will be planted with high-yielding stock in various stages of maturity. Another £1 million is being spent on buildings and ancillary services, bringing the new investment on a total of 80,000 acres to about £70 an acre. That, the Dunlop spokesman said, should be sufficient evidence of Dunlop's confidence that more natural rubber will be needed, as well as more synthetic. That confidence is also reflected in the recent decision to open up 10,000 acres to natural rubber in eastern Nigeria; in moving to this new area the company can claim to be doing no more than spreading its risks. The land is selected but not yet bought, and the company cannot give an estimate of the expenditure involved. But if clearing and planting costs no more than £100 an acre the investment would be £1 million. When all these plans are completed Dunlop

hopes to be self-sufficient in natural latex; at the moment it buys about one-quarter of its latex and all its supplies of sheet rubber.

Last Lap in Lorry Sales

THE last chapter in the two years of road haulage denationalisation opened last week with the publication of the Disposal Board's fifth six-monthly report and the introduction of the new Transport (Disposal of Road Haulage Property) Bill. Since the former Minister of Transport decided last July to let British Road Services keep its trunk haulage fleets—which the present bill will authorise—and nearly 19,000 other state lorries have now been sold back to private hauliers, there are few loose ends remaining to be tied up. The interesting, and new, parts of the bill are the arrangements it makes for these tag-ends—the parcels and meat fleets and the BRS vehicles operating on contract hire—and they may still prove troublesome. The abolition of the transport levy in a year's time, when it will have collected £12½ million to compensate the Transport Commission for losses in disposal, is the logical, and expected, result of halting the sales.

Fleet when disposals started	36,776
Less: Non-runners and net replacements...	1,577
	35,199
Retained fleets:—	
Special vehicles.....	1,222
General haulage.....	7,750

Meat fleet.....	498
Contract hire.....	1,982
	6,586
	19,043
Sold	18,837
Still to be sold in normal sales.....	186

The bill will remove the obligation to sell shares in road haulage companies "in one parcel"; it will now be possible to offer these shares in the normal way—and loan capital as well. There is still a month to go before tenders must be in for the parcels fleet, but it has never seemed likely that single bids of £10 million or more would be forthcoming for this organisation. The meat fleet has been offered twice and two separate bids of just over £500,000 from Mr George Dawson have both been rejected. Once the bill has been passed it should be more easy to sell these companies; but it may be some time before the board offers the securities. What will happen if the commission were to be left with some shares, or loan capital, still on its hands? Would this mixture of private and public capital be acceptable to the Government?

The board have put one interesting table in their report, giving an analysis of the lorries they have sold by age and size. This is presumably designed to meet the argument of hauliers that the commission has retained most of its newest and largest vehicles. There has never been much merit in the hauliers' argument, but it will not be scotched until British Road Services makes available a similar breakdown of the fleet it is being allowed to keep.

Only a *man* can tackle this job!

There's fierce competition between the fishing fleets of the nations today to get the best fish at operating costs which will ensure a low price for the consumer. If the British Distant Water Trawler Fleet is to remain the most efficient in the world, and ensure that the British people shall continue to enjoy their birthright—the cheapest first-class food that money can buy—its equipment must be absolutely the most up-to-date that engineering genius can provide.

The cost of building a modern trawler is six times higher than it was in 1939, and outdated ships *must* be replaced. Already this year five new trawlers, costing £1,000,000 have joined the British fleet of 270 ships. Yet these fine new ships, equipped with many electronic devices and the latest wonders of radar can avail nothing without the skill and courage of the seamen. Here indeed is a calling where Man remains the Master and the Machine his servant.

The trawlerman knows that his job is one of the toughest on earth. He chose it freely and he gets well paid for it. He has in addition the quiet knowledge each time he leaves his family, for three weeks at a time, in all seasons and weather, that his skill, experience and fortitude provide one of the reasons why fish—one of Britain's staple foods—remains the cheapest first-class food that money can buy.

BRITISH TRAWLERS

Hull / Grimsby / Fleetwood

THE BRITISH TRAWLERS' FEDERATION LIMITED

Freights at the Tribunal

THE Transport Tribunal has now been sitting for twenty days on its inquiry into the new railway freight charges scheme, and when it resumes the hearings on January 11th it will be passing from the Transport Commission's case for the scheme, and the examination of its chief railway officers, to the evidence and witnesses submitted by the objectors. This is not the occasion for detailed comment on the objections, nor for a summary of the proceedings. But some interesting points have emerged so far, mainly in the examination of the Commission's witnesses.

The objections appear to fall into two groups, apart from those made at the outset of the hearings that parts of the draft scheme were *ultra vires* the Transport Act. The Tribunal has already rejected those objections, apart from one that may be a matter of drafting, on which it has postponed its decision. First among the remainder are the objections that arise from the novelty of the scheme: that maximum charges do not tell a trader what his actual costs are going to be, and that there ought to be some further classification of charges other than by weight and loadability. This, the Commission argues, is hankering after the old system of rates, and could mean continued substantial cross-subsidisation between traffics.

The other group of objections are aimed at the way in which the scheme has been designed. The maximum charges are said to be too high; this is for the Tribunal to decide—they are based, according to the Commission, on the outer range of adverse (but not extreme) operating costs, and do not make any allowance for prices after mid-1955. The criterion of loadability comes in for much criticism. It is argued that this is not the only factor in

costs—the Commission say it is the dominant one—and that it is wrong to base it upon a 10-ton wagon of certain dimensions of which there are few in existence. How is the trader to know the loadability of his goods? The Commission's answer to this point is that it is merely a standard way of fixing the maximum charge, again taking adverse costs, and that in practice actual charges below the maximum will be negotiated directly with the trader or will be based upon rate books supplied to goods stations. Only for casual consignments charged near to the maximum will the question of loadability in fact arise, and suitable arrangements can then be made. The central aim of the new scheme is to give flexibility to railway freights, so that charges can be based more upon the actual costs of haulage. This plainly calls for a considerable breakdown of railway operating costs; but the evidence of the Director of Costings shows that the Commission have been making impressive strides forward in this far from straightforward field.

No Respite for Union-Castle

THE rejoinder from the chairman of Union-Castle Mail Steamship company to the shareholders who have requisitioned a meeting for January 5th and will propose the removal of himself and the majority of his colleagues from the board, is good debating—so good that it is a matter of surprise that it was decided not to send it to the press. The most telling point is the holdings of the requisitioning stockholders on October 3rd, the day of the first announcement of the proposed merger with Clan Line and on November 21st, the day on which the requisi-

tion was deposited. On the first date the requisitioning stockholders held £134,600 nominal of stock; Mr Jack Billmeir had £125,000 of it and the large majority of the requisitionists including most of the companies with which Mr Harold Drayton is associated, had no holdings. On the second date the requisitionists mustered £1,418,651 stock (still far from a majority of the 8,220,000 votes that could be cast at the meeting); Mr Billmeir had not varied his holding but Mr Drayton's group had bought enormously. The argument is pure debating: the shareholder is entitled to the same consideration and the same voice whether he was registered yesterday or twenty years ago, but it enables the chairman, Sir George Christopher, to say that the meeting is not directly concerned with the merger (which is a matter for the individual shareholders) but an attempt by a section to secure control of the board.

It appears that the chairman's circular is to be followed in the near future by a further rejoinder from the opposition. If that is good debating too it will be a pity. Debating while the sands of time run out cannot produce the best outcome for Union-Castle. It would surely be best that the two sides should work for compromise. Clan Line, and the Cayzer family that controls Clan, can provide good management and effective control is the price for which they ask. Mr Drayton, Mr Adeane and Mr Billmeir apparently want control too and if that were their main objective there would be nothing for it but a race for control ending presumably in a photo finish. But is control really Mr Drayton's sole objective? He and his associates now have over £2 million tied up in Union-Castle shares, nearly all of it money found since early October, and it is presumably money which the group could employ in its other varied interests if it were free. If would be surprising if they would not welcome an opportunity of lightening their holdings—at a price.

Airways, Aircraft and Airwork

THE debate in the House of Commons on Tuesday on the accounts of the British Overseas Airways Corporation and British European Airways passed off more quietly than expected. It turned to a large extent around the buying policy of the two corporations. The government was able to point to still larger orders for British-built aircraft from British European Airways, 16 additional Viscounts and 20 Vikings, and to a healthy business in feeder-line machines. The Minister of Supply restated his case for writing off the half-completed Vickers V. 1000 and his confidence in the Britannia and the Comet IV. In the process, the interests of the two corporations were somewhat overlooked. Both have achieved a precarious balance in their accounts. It is critical to their financial outturn that each should possess the types of aircraft most suitable for their operations and it really is time that those who discuss these matters should recognise that such aircraft are not always or automatically found in British factories.

Both Mr Profumo and Mr Beswick, speaking for the government and opposition respectively, referred obliquely to the bitter comments made a week earlier by Airwork Ltd. when that company stopped its air freight service across the North Atlantic after nine months' operations. Airwork maintained that government policy has killed all hope that

the venture would ultimately pay its way, and Mr Profumo's statement that the government "wish this company and its colleagues in the independent field good fortune in the future, for we wish to see them prosper and endure as a permanent feature in our national effort" leaves a good many of Airwork's contentions unanswered.

Liberia Waives the Rules

ALTHOUGH shipping people have been aware for some time that more and more ships were being transferred to registration under flags such as Panama, Liberia, Honduras and other traditionally non-maritime countries, few can have imagined how far this has gone within the last twelve months. The publication of statistics from Lloyd's Register Book for July, 1955, has opened their eyes. Within the course of one year, ships registered under the flag of Liberia have increased in tonnage by 1,616,000 tons gross to a total approximating to 4 million tons, displacing the fleet of a similar non-maritime country, namely Panama, from fourth to fifth place in the hierarchy. Only the United Kingdom (19,357,000 tons gross), the United States (26,423,000 tons, including about 14 million tons laid up in the inactive "reserve" fleet) and Norway (7,249,000 tons) now exceed in tonnage the merchant ships on the high seas which now fly the national flag of a small West African republic that scarcely ever sees a merchant ship of any size at all.

It is doubtful whether a single Liberian dollar is invested in any of the ocean-going ships that now form the fourth largest merchant fleet in the world. Most of them are owned either by American companies attempting to evade the restrictive legislative regulations that were primarily intended to protect the American-flag merchant fleet against competition from the wicked outside world, or by international shipowners who wish to avoid the fiscal burdens that attach to registration in the United Kingdom, Norway—or even Greece.

Only two elements in operational cost on the high seas differ according to flag. These are the rates of wages paid for national crews and the standards of national taxation. The legislative and fiscal policies of most of the traditionally maritime nations have succeeded in expanding the merchant marine of Liberia, for example, from something like 250,000 tons gross in 1950 to nearly 4 million tons in 1955. More than 500,000 tons of the merchant shipping tonnage under construction at the moment is destined for Liberian registry; and nearly half of the total Liberian fleet is under 10 years old.

The Bottle Boom

GLASS bottles, as well as parcels, are opened on Christmas Day, so the preceding months are an even busier time for bottlers and container makers than the months leading into the summer. A hot summer this year, and a spending spree not confined to Christmas alone, have combined to give the glass container industry their best year ever. Yet a record production of 27 million gross of containers, which

Industry's Appetite for Materials

ONE measure of the heightened demand by British industry for its main raw materials is provided by the Board of Trade's indices of wholesale prices. These show that with few exceptions, the prices that industry pays for its materials and charges for its manufactures have risen fairly steadily in the past twelve months. The sharpest increase has been in materials used in electrical engineering, the index for which has risen by 15½ per cent to 192.8 (June 1949=100), mainly because of the steep increase in copper prices. The index of basic materials (excluding fuel) has risen by six per cent in the past year. Prices of manufactures have not been much less sensitive to inflation. The index of all manufactures, excluding fuel, food and tobacco, has risen uninterruptedly in the past year; last month it reached 131.7, an increase of 4½ per cent over the year. Iron and steel products have risen by seven per cent. The Board of Trade's price indices of the output of broad sectors of industry now covers all products of the food

manufacturing industries. This index, published for the first time this month, reflects market prices and it is intended to publish later an index which takes the

subsidies paid to food manufacturers into account. Another index, covering food for human consumption only, is also being prepared.

cannot have left much room in the industry's capacity on a 168-hour week, and a hefty clearance of factory stocks, have still left some breweries and soft drink firms clamouring for more bottles—new ones or returned empties. This prosperity, however, does not mean that all firms in the industry will be reporting such bumper profits as came from Redfearn last month; that threefold jump in earnings was a special case and reflected the reorganisation of the firm's plant layout and a new furnace.

Where has this year's big demand come from and will it continue? These are crucial questions for the industry, which is so highly mechanised that its break-even point comes high and makes companies wary of over-expanding their capacity. Their higher output has come partly from faster throughput, as a result of research; but new furnaces have also been built to keep abreast of their customers' orders. Although the improvement has been widespread throughout the food and drink industries and also from medicine and drug firms, this year's notable advances have been made by the soft drink and mineral water bottlers. Those drinks may not enjoy such a good summer selling season next year; and bottle makers may also justifiably be anxious about the possible effects of cuts in consumption upon household grocery and chemist bills. But even though beer output is declining a rising proportion of it is bottled, and the self-service store is another development that means much for glass containers.

Air Freight to Australia

SILVER CITY AIRWAYS, the car ferry company, has just celebrated its tenth anniversary with the claim to have become the world's largest air freight carrier and with a scheme to extend its operations through to Australia. The parent company of Silver City, the British Aviation Services Group, lodged an application a year ago for a freight route to Australia, with intermediate stops at Basle, the Middle East, Karachi, Columbus and the Cocos Islands. The application has met with a good deal of opposition, but the outcome should be known in a few weeks. Much now turns on the attitude of the Australian government, whose permission is required for such a service to be operated.

The route is an attractive one for a freight service, for it holds promise of adequate freight in both directions. The one all-freight service flown by the British Overseas Airways Corporation, known as a sceptic about air freight possibilities, is to the Far East. This is operated for the corporation by the independent carrier Skyways as far as Singapore

and then by the Australian airline Qantas on to Australia. The P and O line have an interest in Silver City, which presumably means that P and O experience and facilities would be there to back the freight service. It is the group's second attempt to establish a link with Australia: some time ago another subsidiary, Aquila Airways, lodged an application to fly freight to Australia by flying boat, but this was not pressed very hard.

All In Equities

THE best time to start an investment trust is at the bottom of a market slump. This ideal hardly obtained in the first formative months of the new investment trust, North Atlantic Securities Corporation, which belongs to the same stable as the Anglo-American Debenture Corporation. But the trust bought most of its 332 investments after Bank rate had been raised to 4½ per cent so that it was not floated off at the worst of all possible times, the peak of a market boom. Indeed, on September 30th these investments showed an appreciation of £87,405 in market value, equal to just over 7 per cent above the book value of £1,227,782.

All the investments are in equities and the geographical distribution on September 30th was 41.9 per cent in British stocks, 14.9 per cent in Canadian stocks and 43.2 per cent in United States stocks. The trust is not indissolubly wedded to this particular distribution but, as its name implies, its portfolio is always likely to contain a high proportion of North American common stocks. It is an advantage that the present holdings were mainly bought while the premium on dollar stocks in London was negligible. At the moment the portfolio is backed by an issued ordinary capital of £1,500,000 in 5s. units, but at some time in the future a debenture issue may be made. Then the leverage on a portfolio of ordinary stocks would be big. The implied risk in supporting a debenture service on nothing but ordinary stocks would also be big.

This, perhaps, was one of the factors which attracted the 1,017 original buyers for the 5,700,000 ordinary shares placed privately at par this year; the Anglo-American Debenture group of trusts took up the remaining 300,000 units. Most of these investors will be firm holders and only a few of the shares will come into the market in this week's introduction. In first dealings the stock was expected to command a premium of between 3d. and 6d. An interim dividend will be paid for the current year. The total dividend for the year is still a matter of guesswork but

"Motor Business"

The December issue of this quarterly research bulletin for the motor and allied industries includes:

The Industry's Development Programme Reviewed and the Outlook for 1956.

The Australian Market for Vehicles and Tractors.

B.M.C., Standards and Routes: A Financial Assessment.

The Bulletin is fully illustrated by charts, amongst which are Price indices of used cars and vans, new registrations in Great Britain and the hire purchase share of the market.

For full particulars of this Bulletin, apply to:

THE ECONOMIST INTELLIGENCE UNIT,
22 Ryder Street, St. James's, London, S.W.1.
Whitehall 1511. Ext. 49.

something in the region of 4½ per cent to 5 per cent is the market guess. The trust is not fully invested; on September 30th there was £313,033 in cash at the bank.

Cocoa Becalmed

THE days when raw cocoa prices fluctuated wildly at a high level seem long past. For several months cocoa has been between £245 to £260 a ton and a considerable volume of business has been done. Yet as always it is the future—not the present—that interests the market. What price will cocoa be in 1956? At the moment there seems little reason to expect a radical change. World production in the 1955-56 season is likely to be somewhat smaller. The final estimate of the main crop in the Gold Coast, the world's largest producer, had not been announced when *The Economist* went to press, but it was expected to be below that of last year, and the crop in Brazil is smaller than the record crop of 1954-55. World consumption, on the other hand, is recovering under the stimulus of lower prices, and may well surpass the rate of production in the spring.

The question is whether the recovery in consumption will take prices up with it. Three things will help to check any advance in prices. First, manufacturers' stocks,

cocoa for distant delivery. Thirdly, manufacturers would switch back to substitutes for cocoa butter if cocoa prices rose much above £300 a ton. Hence any advance in prices seems likely to be modest rather than marked.

Strength in Metals

ALL four non-ferrous metals traded on the London Metal Exchange are closing the year at prices at or near to the highest points of 1955. Copper, the most buoyant of them all, has touched a new peak of £404 a ton for cash, and closed last Wednesday only a little lower at £396 a ton. Tin recently touched £840 a ton for cash, the highest price for two-and-a-half years, before dropping back to £830 a ton. Lead is now at the highest price since the market reopened in October, 1952, with prompt metal at £115 a

ton, and zinc is not far behind; prompt zinc closed on Wednesday at £99 a ton, only slightly below its best. The strength of the metals reflects primarily the resurgence of American demand at a time when industrial production in Western Europe shows little sign of abatement. The credit squeeze in Britain and in other countries may have restrained consumer demand, but its full effect has evidently still to come. Indeed, if consumers have been obliged to reduce their stocks, credit restriction may at times have accentuated a rise in prices of prompt metal, since the consumer without a reservoir of stock has little latitude for choosing his time for buying in a narrow market.

The individual commodities have drawn strength from different sources. Production of copper is still plagued by strikes; the latest rise in prices was caused by yet another strike in the American-owned mines in Chile. In the United States the customs smelters are again charging 49 cents a lb (£392 a ton), compared with the producers' price of 46 cents (£368). The shortage of tin persists. American buying has increased further and one of the two Malayan smelters has closed down for overhaul. It is a piquant—though perverse—thought that American interests, which have never been slow to complain of "price-gouging" in tin, could find a culprit this time in their own government's "strategic" purchases which, coming on top of commercial consumption, are taking too much tin out of the market. Lead and zinc prices are being helped by the fairly widespread belief that American prices will be raised again, and behind both metals stands the American government, ready to take the surplus into the stockpile should industrial demand fall off. The metals, in short, in contrast to agricultural commodities like cotton and wheat, seem to have things all their own way at present.

George Dobie Takeover

IN an industry composed mainly of giants the small man faces a struggle. Tobacco is an industry of big units and one of the few remaining small units—George Dobie and Son—is to lose its independent existence. The announcement of the bid of 35s. per share from Robert Benson Lonsdale and Company on behalf of Godfrey Phillips and Company contains only one element of surprise—that Godfrey Phillips and not one of the still bigger and stronger groups is the buyer. Shareholders of George Dobie have since early October had repeated hints that negotiations were in progress and since then the £1 ordinary shares of George Dobie had risen from 16s. 6d. to 33s. and they rose further to 34s. on Wednesday after the announcement.

On a dividend recently cut from 10 per cent to 4 per cent the Dobie shares could hardly stand at 35s. so that shareholders will have no difficulty in agreeing with their directors that the price offered is much better than what might be expected if the company were to continue in independent existence. There remains the third possibility. What would shareholders get if the company went into voluntary liquidation? There the figuring is less conclusive, but, including compensation payments to directors and long service employees, the offer will cost Godfrey Phillips about £1.38 million and the directors are evidently satisfied that the return on liquidation would be smaller.

SHORTER NOTES

The revised scheme for rearranging the capital of Hoover and getting rid of the specially high gearing attached to the "A" ordinary shares has been announced. Holders of the 1s. "A" shares are now offered in 135 new 5s. (non-voting) "A" shares and ten 5s. ordinary shares for each 100 present "A" shares held. In the scheme that was withdrawn in September it was proposed to give 115 new "A" ordinary shares and ten ordinary shares for each 100 existing "A" ordinary shares. In the new scheme the ordinary and "A" ordinary shares rank equally for dividend, so that the present holders of "A" ordinary shares will on their new holdings rank for 23.67 per cent of distri-

buted profits, instead of for a variable proportion. Their rights on liquidation will also be improved. It is estimated that for the current year distributable profits will be £3.75 million (against £4.58 million) and that the total dividend for the year will be between 60 and 70 per cent (against 70 per cent).

★

Leadenhall Investments and Finance has disclosed the identity of its client who is bidding against Rootes Motors for the stock of Singer Motors. It is George Cohen and Sons, parent company of the "600" group of engineering companies, and the bid for the ordinary stock has been raised to 5s. per unit in cash.

Company Notes

ARTHUR GUINNESS. For the third successive year on the present ordinary capital of £12,500,000 Arthur Guinness is to pay a higher dividend. The dividend has been raised from 23 to 25 per cent. There is a touch of mystery about this dividend. Has it been increased because the profits from the sale of the company's bottled stouts have gone up? Or was it because profits from "interests unconnected with brewing" have risen? Lord Iveagh and his co-directors have not yet revealed what these interests are. It is time they did, for these interests are making a substantial and, apparently, a growing contribution to profits.

The company's total profits before tax in the year to September 30th advanced from £5,682,496 to £6,371,199. Within this total the earnings of the mysterious non-brewing interests rose from £517,122 to £786,241; that advance alone is enough to cover the increase in ordinary dividend payments. The increase in Guinness's brewing profits by about 8 per cent is in line with that reported by Bass, Radcliff and Gretton, though Bass, because of rising costs, was content to leave its dividend unchanged at 43 per cent. Both groups in the last few months of their financial years must have received some benefit from the increases in prices announced last July and both will enjoy a full year's benefit from them in the current trading period.

After tax Guinness's net profits have risen from £2,451,976 to £2,934,931. This increase and the dividend decision did not move the 10s. ordinary stock units, for the dividend was in line with market estimates. At the current price of 44s. 6d. the stock yields 5½ per cent.

LANCASHIRE COTTON CORPORATION. The preliminary report of Lancashire Cotton for the financial year ending on October 31st shows that profits before tax have fallen from £4,346,094 to £2,804,120. Taxation, too, is down (from £2,065,000 to £1,330,000), so that net profits have only

fallen from £2,312,370 to £1,583,511. Effectively the ordinary dividend is left unchanged at 12½ per cent for the year, so that the fall in the price of the £1 stock units from 28s. 7½d. to 28s. (to give a yield of 9 per cent) can be attributed to the decline in earnings.

What lay behind the decline of about 35 per cent in the gross profits of this horizontal combine of spinners? There seem to be four main reasons:

(1) Stocks of yarn and cloth were run down in the summer in anticipation that raw cotton would become cheaper.

(2) The actual fall in raw cotton prices may have forced Lancashire Cotton to write down some of its stocks. Presumably the Corporation tried to keep its stocks down to the minimum, but that could have been no easy task when the merchants themselves were carrying little stock.

(3) The Corporation is heavily, though not exclusively, engaged in the coarser, cheaper end of the trade, which bore the brunt of the competition from imports of cheap Indian cloth.

(4) The recession in Lancashire in the second half of the year brought a reduction in profit margins.

There are now signs of recovery in Lancashire, but doubts about the future are reflected in the high yields on cotton shares. The yield offered by the Lancashire Cotton units is smaller than most, but then the Corporation has pursued an intensive programme of re-equipment since the war and its reserves and liquid resources are strong.

RANKS. The year to September 3rd was exciting for Ranks, the flour millers, but the company's preliminary report for that period lacks colour. It was the second year of freedom for the millers and it witnessed a struggle between the millers, particularly Ranks and Spillers and their biggest customer, Allied Bakeries. The struggle is now over with neither side emerging as a clear victor but while it was maintained it seems

to have hurt the profits of Ranks. While Allied Bakeries was importing flour, the big millers had to put some mills on short time working and in retaliation they began to buy up bakeries. The effect of this drop in production, pushing up, as it did, overhead costs, can be seen in the fall in the gross trading profits of Ranks from £5,165,000 to £4,775,000. This may not be the whole story for the profits are struck after unspecified charges for depreciation and "reserve against the excess initial cost of postwar construction." Moreover, freedom itself may be adding to costs in the sense that the millers now have to go out to sell their flour, and stocks are carried on the millers' finance instead of on Government finances.

To the year's profit is added £467,000 from non-recurring credits, which brings the net profit after tax to £2,381,000 (compared with £1,936,000). If the special credits are excluded net profits show a slight fall (from £1,936,000 to £1,914,000) and this has occurred in spite of a fall in taxation (from £3,229,000 to £2,861,000). Nevertheless, the directors have raised the ordinary dividend from 19 to 20 per cent, which, net of tax, absorbs £789,267. The fact that the agreement between Allied Bakeries and Ranks and Spillers should have a beneficial effect on the current year's earnings may have some bearing on the latest dividend decision. The 5s. ordinary stock units are now quoted at 19s., offering a yield of 5½ per cent.

THOMAS FIRTH AND JOHN BROWN. The Dorman Long dividend, which brought the rally in steel shares to an abrupt halt, overshadowed the preliminary report of Thomas Firth and John Brown for the year to October 1st. Had it not been for the disappointment from Dorman Long, this report no doubt would have been numbered among the factors making for confidence in steel shares. Thomas Firth and John Brown followed the example of Colvilles and Stewarts and Lloyds by declaring an ordinary dividend higher than was forecast in the prospectus on which the shares were sold back to the public last March.

Then the directors foresaw a dividend of 8 per cent. In the event they have declared a dividend of 9 per cent on a capital of £5,500,000.

In the prospectus, too, the directors estimated that the profits after depreciation but before taxation would be in the region of £2 million. The profit estimates in the steel prospectuses have always leant towards caution. How far this caution went is shown by the fact that the profits before tax of Thomas Firth and John Brown came to £2,635,743 (compared with £1,921,528). The increase of 37 per cent in profits is more comparable with the advances reported by Conssett and Colvilles than with the

£1 ordinary stock at 30s. 3d. yields £5 19s. per cent.

small rise reported by Stewarts and Lloyds. The ordinary dividend after tax takes only £284,625 from a net profit of £1,243,856 (shown after charging tax, depreciation and the replacement reserve appropriation of £370,000). But any comment on the big earnings cover must immediately be qualified by the statement that Thomas Firth and John Brown has not yet completed its development programme. In the prospectus it was estimated that the three-year programme would cost about £1,800,000 (all of which was to come from the company's own resources) and as the statement from Dorman Long showed the cost of capital development is still rising.

HAWKER SIDDELEY GROUP. The full accounts of the Hawker Siddeley Group cannot cause a fraction of the excitement in the stock markets that the group's preliminary results (which were discussed in these columns on December 17th) aroused. But they form an interest-

ing tailpiece to the year's profits. The emphasis in the full report is upon the group's Canadian interests which the directors now vaguely describe as "very large." The group owns 1,600,000 of the npv common shares of A. V. Roe Canada and options to subscribe for 90,000 more shares at \$10 each have just been given to the executive directors of the Canadian company, including an option to the chairman of 50,000 shares. Such options are common in the United States and Canada and might have been more widely adopted over here had not the Inland Revenue established that gains arising from the exercise of share options would be taxable.

Just after the close of the financial year on July 31st the group acquired the whole of the issued share capital of Canadian Car and Foundry. The consolidation of the assets of this concern will not become apparent until the next balance sheet is published, but in the latest document a

£1 ordinary share at 71s. 4d. yields £4 19s. per cent.

commitment of £8,099,000 is entered in respect of the purchase price of the Canadian company. A further commitment is for £3 million to be spent on fixed assets. The group's cash balances have risen sharply in line with the ploughing back of heavy sums into reserves; with profits flowing into the kitty from current production the group should have no difficulty in meeting its outstanding commitments. Indeed, the balance sheet as a whole provides a strong backing for the advance in profits (from £11.2 million to £15.5 million before all charges) and for the increase in the ordinary dividend from 10½ to 17½ per cent. It is little wonder that investors refuse to regard the 100 per cent free scrip issue simply as a book-keeping transaction.

LONDON STOCK EXCHANGE

Next Account begins: January 4th
Next Contango Day: January 4th
Next Settlement Day: January 10th

THERE was a seasonable contraction of business in Throgmorton Street this week. The appearance on Monday of stags in Conssett Iron who had been lucky in both the ballot and the post caused a stir in the steel section. The volume of selling was necessarily irregular, but a premium of 8½d. was later established. British Funds, which were firm at the end of last week, weakened slightly on Monday and more pronouncedly on Tuesday. It was not until Wednesday afternoon that an appreciable rally developed. In quiet trading industrial shares eased and several of the recent favourites were checked by profit-taking: Plessey eased 1s. 3d. to 83s. 9d.; Holders Investment fell back to 45s. after their swift rise last Friday. There was a fair amount of activity in the new scrips of the giants Unilever and Bowater; Unilever old and new receded to 71s. and 72s. 6d. respectively, but Bowater rose in first dealings on Monday, the old to 54s. 3d. and the new to 55s. 3d. before easing slightly.

Electrical stocks drifted back a little and motors were again depressed on Tuesday; A.C.V., however, rose to 63s. following the report. De Havilland rose to 26s. 6d. on rumours of a substantial order for Comets. Hoover "A" advanced to 53s. on the new capital reorganisation proposals, but returned to 51s. unchanged on the week, after profit-taking. Cottons and rayons weakened once more, Lancashire Cotton falling to 27s. 9d. following the report. British Celanese fell to 20s. 9d. and Courtaulds to 42s. Dorman Long were sharply lowered after the dividend announcement. They lost 2s. 7½d. to 32s. 10½d. on Friday and contributed to a general fall in steel stocks. Stewarts and Lloyds fell to 72s. 6d. and Colvilles to 37s. 4½d. on Tuesday.

Oil shares were mixed, British Petroleum losing 1s. 3d. to 105s., while Shell rose ¼ to 7½ xd. British Borneo rose to 45s. 7½d. on favourable reports of tests in the Jerudong oilfield. Kaffirs improved slightly, but copper shares were easier.

EXCHEQUER RETURNS

For the week ended December 17th there was an "above-line" deficit (after allowing for Sinking Funds) of £17,943,000 compared with a deficit of £33,538,000 in the previous week and a deficit of £21,696,000 in the corresponding period of last year. Net expenditure "below-line" last week reached £26,903,000, bringing the total cumulative deficit to £742,885,000 (£571,303,000 in 1954-55).

Financial Statistics

THE MONEY MARKET

The offer at the Treasury bill tender yesterday comprised £280 million of 91 day bills only. The offer of 63 day bills at the seven preceding tenders reached a total of £380 million, which will swell the maturities in the phase of greatest seasonal stringency; by early March, the Exchequer accounts normally revert to deficit.

The offer at the tender on Friday last included £60 million of 63 day bills; the market reduced its bid by 1d., to £99 5s. 10d. per cent; this raised the discount rate to just over 4½ per cent, and re-established a margin above the rate on the three months bills (which remained at just over 4¼ per cent). Total applications for the shorter bills rose by £17.4 million, to £78.6 million, and the market's allotment fell from 80 to 75 per cent; but applications for the 91 day bills slumped by nearly £75 million to £286.4 million, so that despite the cut of £20 million in the offer, to £220 million, the allotment at the minimum rate rose from 50 to 69 per cent. The market's allotment of both maturities together rose from 56 to 71 per cent.

Credit in Lombard Street was in abundant supply before the week end but in the first three days of this week the surplus of funds disappeared. The Bank made small special purchases on Monday and Wednesday, but on Tuesday market supplies of credit were adequate.

Sterling has weakened slightly in the past week to close at \$2.80½ on Wednesday.

The man who can't save money

That's the man in the bowler. "Can't save a penny," he says—and believes it; though he is, in fact, one of Britain's most stalwart savers. Because of a simple decision he made some years ago, he is saving and buying security almost without knowing it—he is buying Life Assurance.

The greatest method of regular saving in this country is through Life Assurance—both personal policies and pension schemes. In this way Life Assurance acts as an important anti-inflationary influence. It also provides much-needed capital for the equipment of British industry, on which depend our standard of living and our ability to compete abroad.

COMPANY MEETINGS

HEENAN GROUP LIMITED

(Formerly Heenan and Froude Limited)

YEAR OF EXPANDING TRADE

EXCEPTIONAL LEVEL OF NEW ORDERS

MR CHARLES L. HILL REPORTS CONTINUED PROSPERITY

The fifty-third annual general meeting of Heenan Group Limited was held on December 19th at Worcester Engineering Works, Worcester, Mr Charles L. Hill (the Chairman) presiding.

The following is the statement by the chairman which had been circulated with the report and accounts for the year ended September 3, 1955:

It is said that behind every peak there is a valley but since your Company was made public in 1936, the valleys in the net profits have been few and then very shallow as is indicated by the gradual rise from £23,000 in 1936 to this year's Group net profit, before taxation, of £449,485 which compares with £395,657 last year. Taxation takes £232,449 against £228,429 and, after deducting outside shareholders' minority interest of £27, the net profit of the Group is £217,009 which, at the same level, compares with £167,199 in 1954. The proceeds of the sale of a trade investment, previously written off, of £15,000 have been carried direct to Appropriation Account.

It has been a year of expanding trade with the value of goods delivered by the Group surpassing all previous records and new orders reaching an exceptional level; at the close of the year the Group order books stood at £5,750,000, an increase over last year of £1,450,000. With activity at this level, it has not been possible to maintain the improved cash position of last year, credit balances having been reduced from £247,322 to a net £39,429.

WAGES AND DIVIDENDS

Having regard to the continued prosperity of your Company and to the recent comparisons which have been made between increases in wages and dividends on a national scale, it is relevant to record that the average weekly wage paid by the Company in 1954-55 represented an increase of 181 per cent over that paid in 1938-39. If the 1954 Ordinary Dividend of 17½ per cent were repeated this year, the corresponding increase, allowing for bonus issues, would be 40 per cent, but your Board is recommending a final payment of 15 per cent, making 20 per cent for the year, which represents an increase of 61 per cent over 1939 and at that still only one-third the rate of the wage rise. The disparity is emphasised by relating these figures to the fall in the purchasing value of the £ since 1939, the worth of 20s. then being about 8s. 8d. today, or to put it another way, the wage increase means that for every 20s. pre-war the employee now receives the equivalent in purchasing power of 24s. 4d. compared with the shareholders' equivalent of 13s. 10d.

It is pertinent to add that Group wages, salaries and other payments for the benefit of employees during the year under review amounted to £1,603,185. Gross dividends on Preference and Ordinary Shares total £122,207.

On January 1, 1955, a non-contributory Works Pension Scheme was introduced for

the benefit of male Works employees in the Group. The Scheme, which provides a form of benefit supplementary to the State pension, is a contribution towards the security and well-being of employees.

COST FACTOR AND FOREIGN COMPETITION

Your Directors are in no way against high wages, on the contrary they recognise the right of all to an improved standard of living; as businessmen, however, they must also recognise that overseas buyers are not going to help in providing that standard if they can buy cheaper from foreign manufacturers. Already some overseas contracts have been taken by subsidiaries at prices below cost to beat competition, but it is obvious that there is a limit to this kind of trading and many orders have been lost because of price. If prewar price levels of imports and exports stood in the same relation to each other today we would indeed be living in a land of plenty, but it is not sufficiently appreciated that a fundamental change has taken place in our postwar world trading in that we must export a far greater volume of manufactured goods to obtain the same volume of imports.

The financing of the increased cost of production and the high replacement cost of machinery and plant and other assets have increased working capital requirements which, in the long run, can only be met either by issue of new capital or by retention of profits. The issued capital of your Company has increased substantially since 1939, mainly to cover the acquisition of other companies and it has been the policy of your Directors to meet the annual need for additional working capital by relatively high appropriations of profits to revenue reserves. The record level of orders, a large part of which is in long-term contracts, and the need in certain countries to offer not less favourable credit terms than foreign competitors, will make heavy demands on the Group's resources during the next few years, and your Board has therefore appropriated £150,000 to General Reserve. The Supplementary Pension Reserve of £30,000 is no longer required for that specific purpose and has been transferred to General Reserve, bringing the total to £710,000, which, with the carry forward on Profit and Loss Account, represents 90 per cent of the total issued capital.

SUBSIDIARIES

All the operating companies in the Group have had a good trading year and without exception much thought and effort has been given to the further development and improvement of existing products and to the search for additional products suitable for manufacture within the Group.

Heenan and Froude Limited.—The Engine Test Plant Section has again been heavily engaged in the design and development of plant outside the normal range, including a high performance dynamometer rated for a

maximum duty of 10,000 HP at 10,000 RPM, a special plant for the testing of aeroplane wheels and brakes and a Chassis Dynamometer Test Plant capable of carrying out research on a wide range of vehicles. A new type dynamometer for testing small powers at exceptionally high speeds has also been introduced and the prototype has operated satisfactorily up to 47,000 RPM. Hydraulic and Dynamic Dynamometers in the standard range have been delivered in substantial numbers to home and overseas customers, together with a wide range of equipment for testing aircraft engines.

The demand for *Eddy-Current Couplings* continues to expand, orders again being 30 per cent up on last year. These couplings are being widely adopted by manufacturers of all kinds of plant and for new industrial processes. To cater for fractional powers, the "Heenatron" system of electronically controlled DC Motors operated from AC supply has been introduced successfully.

Sales of *Industrial Coolers* in the Heenan range have been maintained at a high level and eleven sizes in the Heenan-Marley range of Cooling Towers, to which I referred last year, are now being marketed.

In the *Automatic Machine Section* last year's improved trend in sales has been maintained.

The value of the contracts received in the *Municipal Engineering Division* during the year was an all-time record, ranging from small industrial incinerators to large-scale refuse incinerators and screening and handling plants for Municipalities.

HOME AND OVERSEAS SALES

The balance of the large Russian orders placed with *Fielding and Platt Limited*, referred to in my Statement last year, together with a considerable intake of other home and export orders, has resulted in a most satisfactory production output. It is particularly encouraging to note that during the year a substantial order has been received from USA, and prospects in Canada are also hopeful in the face of strong American and Continental competition. Considerable orders have also been received from Australia, covering both manufacture at home or by the Company's Australian licensees. The Management is alive to the fact that the trend towards automation calls for close study, and considerable development effort has been directed towards improvements in the range and reliability of such of the Company's products which come under this heading. Research into more fundamental problems continues with the aid of leading scientific consultants, and results in several directions are promising. Every effort is being made to strengthen the technical staff, and the apprentice training scheme continues to give useful results in providing a flow of fielding-trained young engineers on whom the Company's future will largely depend.

The plant at *Court Works Limited* has

been fully employed throughout the year and a record output was achieved. Although this foundry is already partly mechanised, steps are being taken to improve and extend the mechanisation as far as practicable to off-set the shortage of labour in the industry.

DIESEL LOCOMOTIVES

In common with other members of the locomotive industry *W. G. Bagnall Limited* finds it increasingly difficult to obtain foreign orders for steam locomotives and the traditional overseas markets are fast being lost to foreign manufacturers on price. The re-entry to the Diesel, mechanical locomotive market some two years ago has been successful, however, and orders for this type now represent about one-half the total order book.

The trading of *Industrial Waste Eliminator Limited* in a complete range of abattoir

and animal by-products plant and equipment continues to expand, largely as a result of extensive foreign travel by senior executives, and a record value of orders has been booked. The strength of this subsidiary's position in its own sphere is emphasised by its appointment during the year as Consultants to the Yugoslav authorities charged with construction of a programme of new abattoir and bacon factories throughout that country.

Morton Machine Company Limited, for long specialists in the manufacture of mixing machines for the food trade, has in recent years extended its interests to the mixing trade generally and has benefited from the larger market. Its activities have been further widened by the production of jigs, tools and prototype machines for customers and by taking up a licence to manufacture mixing machines for the chemical and plastic trades.

Associated Locomotive Equipment Limited has had a successful year, there being an increasing demand for the Company's precision equipment during the period under review, particularly for the export field in meeting the requirements of overseas railways. Following the outstanding success on British Railways with equipment of the latest design, a substantial repeat order is at present in hand. In view of the future motive power requirements of railways, the Company has been closely engaged on development work.

The results for the year reflect great credit on the management, staff and works employees of the Group Companies and I know it would be your wish to join the Directors in conveying to them our appreciation of their efforts. Our thanks are also due to the Agents of the Group throughout the world for their support and co-operation.

The report and accounts were adopted.

TURNER & NEWALL LIMITED

VERY SATISFACTORY RESULTS

INCREASED DEMAND FOR PRODUCTS

MR W. W. F. SHEPHERD'S REVIEW OF OPERATIONS

The Annual General Meeting of Turner & Newall Limited will be held on January 10, 1956, at the Chartered Accountants' Hall, Manchester, when it is expected that Mr W. W. F. Shepherd, the Chairman of the Company, will preside.

Mr Shepherd's Statement to the Stockholders has been circulated to them with the Report and Accounts and, after dealing with the accounts of the Company, it contains a detailed review of the Company's operations during the year to September 30, 1955, both at home and abroad.

The following are extracts from the Statement:

Demand for most of the basic asbestos textile products of Turner Brothers Asbestos Company, Limited, has continued at a high level throughout the year. Some additional capacity has already been brought into commission at the Rochdale factory under the long-term modernisation scheme, but this has not proved sufficient to meet steadily increasing requirements. It is expected, however, that the position will be largely relieved by further plant installations during the current year, principally at Rochdale, but also in the new textile and plastics factory at Hindley Green, the construction of which is now well advanced.

The existing factory at Hindley Green for the manufacture of belting products has operated at full capacity in practically all sections, the most noteworthy feature being the successful completion of the initial programme of plant installation and modification in connection with the manufacture of fire-resisting conveyor belting for underground use in collieries. Further technical improvements are under consideration in this field, and also in the manufacture of V-section transmission belts. Good progress has also been made with the new manufacturing unit for the production of belting ducks, which is now well established. The results achieved so far encourage the belief that substantial commercial and technical advantages will be derived from the progressive development of this unit.

ASBESTOS TEXTILE PRODUCTS

Production of asbestos textile products and of treated fibres for use as Sprayed

"Limpet" Asbestos has been well maintained at the Leeds factory of J. W. Roberts Limited, and further steady progress in the latter field should be made possible by recent technical developments. During the year, this Company took over responsibility for the "Ferobestos" range of technical plastics from Ferodo Limited, opening temporary offices for the purpose in Bolton. These are adjacent to the intended site of new premises, construction of which will commence early in 1956.

A substantial increase has been achieved in the trading activity of Glass Fabrics Limited, the recently acquired subsidiary company in Northern Ireland concerned with the manufacture of glass textile products, but attention has been chiefly concentrated on laying solid technical and commercial foundations for future expansion. It is believed that this will bear fruit progressively during the ensuing year.

FERODO LININGS

During the past year Ferodo Limited has continued to experience increased demand for brake and clutch linings and other friction materials, and the volume of sales was the greatest ever recorded. The higher turnover relates to both home and export markets—the latter in spite of particularly intense competition and dock strikes. The substantial addition to the Chapel-en-le-Frith factory, to which I referred last year as being in progress, has been completed, but this additional capacity was hardly sufficient to enable production to keep pace with the growing demand. Further expansion of output is planned during the current year as the Company proceeds with the installation of significant additional and replacement plant. In parallel with this investment in plant, new production techniques are being developed which will result in increased efficiency and offset difficulties arising from shortage of labour.

A new distribution and service depot has been built and opened in Sheffield to provide our motor, engineering and other trade customers in the area with greater facilities than could be extended when the district was served from the Company's Leeds Depot. Reference has already been made

to the fact that responsibility for the "Ferobestos" range of technical plastics has been transferred from Ferodo Limited to J. W. Roberts Limited. This will enable greater concentration to be given to the marketing of the other products of Ferodo Limited, as well as permitting fuller and separate attention to the growing possibilities in the plastics field.

ASBESTOS CEMENT COMPANY

The experience of Turners Asbestos Cement Company Limited during the year confirms the encouraging prospects to which I referred a year ago; there has been an active demand for the Company's products for all types of building both at home and in the developing countries overseas, and although conditions generally were strongly competitive, results achieved are very close to the records established in the previous year. The excellent reputation of "Everite" asbestos cement pressure pipes continues to be of great assistance in the expansion of export markets, and the present year promises well, both at home and overseas. Last year I referred to a welcome improvement in demand for the products which are supplied to the electrical industry under the trade marks, "Sindanyo" and "Siluminite"; our hopes that this would be maintained were well founded as the improvement continued throughout the year.

Research and development work continues to be most rewarding, not only in the evolution of new products, which have been well received and are selling in increasing volume, but also in the achievement of greater economy in the use of raw materials and, what is perhaps still more important under today's conditions, in the employment of labour. Satisfactory progress continues to be made in the Company's programme for the modernisation of plant and buildings. Although intensive competition continues, prospects for the coming year are good; at home, however, the position will be influenced by the effects of the credit policy of the Government, but subject to this the Company is likely to continue to operate at a high level of activity for some time to come.

WASHINGTON CHEMICAL COMPANY

The demand for the products of The Washington Chemical Company Limited during the year under review continued at a satisfactory level. While there were signs of a slight easing in the demand from certain specialised fields of consumption, the development of special forms of magnesia for industrial uses has taken place, with the result that the Company's total volume of sales, both at home and overseas, reveals a gratifying increase on the previous year's figures. Contracts completed by Newalls Insulation Company Limited in heat, cold and sound insulation have exceeded the record figures reported last year.

Despite a diminution in the construction of large passenger ships, the Marine Contracts Department of the Company has been fully employed on oil tankers and cargo vessels, etc. Land contracts carried out included the insulation of power stations and important chemical plants throughout the country. Newalls' well-known 85 per cent Magnesia and Asbestos insulations are predominant in this type of work. Export business in insulation materials continues to develop favourably, and visits of officials to several overseas territories have assisted in consolidating the position previously established.

SATISFACTORY VOLUME OF EXPORTS

The total volume of export business from our United Kingdom factories during the past year showed an increase over the satisfactory figures of the previous year. This increase would have been greater except for the effects of the dock strikes, and consequently I think we can regard our position in the export field as very satisfactory.

This year your Board recommend a final dividend of 20 per cent on the Ordinary Stock, making, with the interim dividend of 5 per cent already paid, a total distribution of 25 per cent for the year. This compares with last year's total distribution of 22½ per cent, and your Directors consider it to be satisfactory. Trading profits are not basically different from those of a year ago, nor does the charge against such profits for taxation vary greatly, but changes in both these items are in the right direction and, after due consideration of prevailing National Conditions, your Board have felt justified in recommending the modest increase in question.

THE OUTLOOK

In my statement of last year I indicated that while we could not expect continuously to be able to report increasing profits, we considered ourselves well equipped to take our full share of whatever business was available at home or overseas. This proved to be the case during the past financial year and I consider its results to be very satisfactory.

Dealing with the future, however, we cannot see very far ahead, and while the conditions in the early part of our current financial year remained favourable, there are, here and there, indications that the strong demand which is now being experienced may not be maintained throughout the whole of this financial year. At present, however, the demand is very satisfactory and our overseas companies in particular appear momentarily to have emerged from the trough which was their portion a year ago.

Accordingly, our expectation is that for the first half of the current period we shall remain highly prosperous but, so far as the second half is concerned, we can only hope that this condition will be maintained.

THE BRITISH MOTOR CORPORATION

TARGET FIGURE EXCEEDED

NEW MODELS AND DEVELOPMENTS

The fourth Annual General Meeting of the British Motor Corporation was held on December 15th at Longbridge. Sir Leonard Lord, KBE, Chairman and Managing Director, presided.

The following extracts are from the Chairman's Statement which has been circulated to Shareholders:

This is the Golden Jubilee year of the Austin Motor Company. If you look round the factory today you will see that we are still installing masses of new machinery and will notice considerable building activity. I hope you will regard this as a good augury for the future. From the accounts no doubt you have drawn the conclusion that the year has been a good one.

The range of models now on sale from the British Motor Corporation reflects the development which is taking place. We have kept well up to the schedule we set. At the moment we are ahead in what is called "Automation," but new methods of production are continually being introduced all over the World.

During the year under review the production of the Corporation was 418,705 Vehicles, against 353,834 for the previous year, an increase of 18 per cent. Increased output necessitates increased sales effort, particularly abroad. We must export to live and Motor Vehicles are among the most important of British exports.

Can the planned expanding output of the Motor Industry be sold and, if the Home Market contracts, can the Export Market take the balance? As far as this Corporation is concerned I believe the answer is "Yes," but we have to contend with the growing strength of foreign competition and the adverse effect of rising costs of wages and materials. Any further increase of wages anywhere in this Country must be accompanied by an equivalent increase in efficiency and output. Rising costs have forced many manufacturers to increase selling prices.

We have decided to maintain present levels as long as possible. This means that the savings made by improved methods and high production machinery are passed to our customers. We know that we offer better value for money because of the excellence of our manufacturing equipment, the volume of our production and the extent of our purchases.

During the year we introduced a range of new models all of which have been well received. They comprise BMC Diesel Engines, a new MGA Sports car, the Morris "Isis," and a complete range known as the "Series III" Commercial Vehicles, both for Morris and Austin. In addition an automatic gear box is now fitted on the "Austin Princess" and Overdrive as an extra on some of the smaller models.

Home Market saturation will not come because of lack of demand. It is more likely to arise from the irritations caused by delays on our archaic roads and the inescapable effect which such delays have on the costs of every industry in Great Britain.

COMPETITION MORE SEVERE

Competition has become much more severe, and will continue to do so. Maintaining our selling prices at their present levels could mean reduced profits. Therefore, whilst I have little doubt that we shall be

able to sell our output it would be unreasonable to expect profits in the current year to be higher than for the year under review. In fact, despite increased turnover, they could be lower.

Our objective is always efficiency coupled with the maximum rate of production. This enables us to offer the lowest possible selling prices consistent with high quality and dependable design and construction.

We believe that your Company has already embarked on Profit-sharing in its best possible form. Last year a further Non-contributory Comprehensive Scheme was introduced to benefit check employees on death or retirement at an approximate cost of £400,000 a year. This brings the Company's total contribution to Pension and Benefit Schemes to over £800,000 a year.

This money can be regarded as tax-free income in the hands of the employees and is guaranteed to the recipients before shareholders receive anything at all. A simple calculation shows that it is more than the shareholders would receive from a 4 per cent distribution on the Ordinary Shares.

The criticism of lack of spares abroad certainly is not true in the case of BMC. We have never opened a new market nor shipped new models abroad, without sufficient spares to give service within 24 hours. The production of both current and obsolete spares is rapidly increasing, and a much more ample supply of spares of every kind is now available. Extensive new buildings have been put up at Cowley to cope with the extra volume, and additional staff is being engaged both in the factories and on the sales and distributive side.

The report and accounts were adopted.

DICTOGRAPH TELEPHONES LIMITED

HOME AND EXPORT SALES EXPANSION

The nineteenth annual general meeting of Dictograph Telephones Limited was held on December 15th in London, Mr Philip V. Summer (the chairman) presiding. The following is an extract from his circulated statement:

During the year under review further progress has been made by your Company both in home sales and in the export trade.

The Consolidated Profits of the Group before Taxation amount to £166,502, against £160,065. An amount of £86,725 is reserved for taxation, leaving £79,777 net profit, as compared with £68,692 last year.

Our principal product is the world-famous Dictograph Loudspeaking Internal Telephone System. The Dictograph System has of late years been combined with automatic dialling equipment under the name of Dictomatic. This has proved very popular with our users, and sales of this type of equipment were doubled in the year under review.

In addition, your Company also sells or rents Loudspeaker Staff Location Systems for Offices and Factories. Your Company also markets Clock Systems, and these in turn are frequently coupled to Time Recorders and Job Costers. We are thus able to offer a very complete communication service to all organisations. Grampian Reproducers Limited does a considerable home and export trade in high quality Loudspeakers, Amplifiers, Radio Units, Microphones, etc.

Your Company's reputation is second to none, and its prestige has never stood higher than at the present time.

The report was adopted and a total distribution of 20 per cent approved.

BRITISH OVERSEAS MINING ASSOCIATION

The tenth annual general meeting of the British Overseas Mining Association was held on December 19th, at 49, Moorgate, London, E.C.

Mr J. Ivan Spens, President of the Association, who was in the chair, said:

During the past year, the Association maintained its usual close watch over all developments likely to affect the overseas mining industry.

In January, 1955, the Association addressed a letter to the Chancellor of the Exchequer making various suggestions for tax reforms designed to give much-needed assistance to the industry but decided, having regard to the atmosphere created first by the General Election and later in the year by Government pre-occupation with national financial difficulties, that further representations in pursuance of those suggestions should be postponed until more favourable conditions developed.

ROYAL COMMISSION'S REPORT

In June last the Royal Commission on the Taxation of Profits and Income issued its final report. The Association had made submissions to that body, both in writing and in the course of oral hearings, regarding the urgent need of more enlightened tax treatment to assist United Kingdom mining companies in holding their position with companies in other countries where there are more favourable systems of taxation.

After careful study of the Royal Commission's final report, the Association recognises that it represents a considerable effort to remove anomalies from the present tax system in general. We welcome in particular the Royal Commission's realistic analysis of the profits tax and its recommendation that the differential rate of profits tax on distributed profits, with all its absurd complexities, should be abandoned in favour of a flat-rate tax. We hope that the Chancellor's recent decision to increase the differential tax on distributed profits to the highest level ever set is no more than a temporary expedient and that he will in due course give effect to the Royal Commission's recommendation that the differential be abolished.

We are greatly disappointed, however, that, in spite of our urgent representations, the report fails to recommend any specific solution of the more important problems peculiar to the overseas mining industry, to which we drew attention in our submissions.

We regret the outright rejection by the Royal Commission of our claim for a percentage depletion allowance similar to the allowances which have been incorporated in the tax systems of Canada, the United States of America, Rhodesia and Australia to the great benefit of the mining industries of those countries. We are sorry, too, that the Royal Commission could not see their way to accept our plea for the more elastic treatment of depreciation allowances which, in our opinion, is justified by the special circumstances of our industry.

We regard it as particularly unfortunate that the report fails to recommend a broadening of the double taxation relief system to allow relief for special types of overseas taxes, such as royalties or export duties, which are levied in many countries on mining enterprises. The inflexibility of the system in this respect bears very hardly on a number of member companies of our Association. One of these companies, for instance, quoted figures at a recent general meeting which show that its total profits after taxation over

the last four years would have been higher by about 80 per cent if the principal tax levied by the country in which it operates had been a tax on income, and as such admissible for double taxation relief, instead of an export duty.

"OVERSEAS TRADE CORPORATIONS"

The Association has examined with great interest the Royal Commission's recommendation that United Kingdom companies operating entirely abroad should be classed as "overseas trade corporations" and exempted from United Kingdom taxation in respect of their undistributed profits. This recommendation goes some way towards satisfaction of the claims put forward by the Association in oral evidence to the Royal Commission that overseas profits should be entirely exempted from United Kingdom taxation or, if complete exemption was impracticable for the time being, that there should be a differential tax rate for profits earned overseas.

There is no likelihood in the present fiscal climate of any further expansion of the overseas mining industry through new mining companies registered in the United Kingdom; this statement is underlined by the fact that since the end of the war, during a period of great activity in world mining, only one such company has been incorporated here.

The Association thinks, however, that the introduction of the idea of "overseas trade corporations" might encourage the establishment of companies in this country for the operation of mines overseas, although the success of this innovation would be more certain if it were accompanied by other tax reforms on the lines suggested in the Association's submissions to the Royal Commission. It is hoped, therefore, that legislative effect will be given at the earliest possible date to the Royal Commission's recommendation for the establishment of "overseas trade corporations" and that, in defining such corporations for the purpose of legislation, the Chancellor and his advisers will take the broadest view of the advantages, economic and otherwise, that would be gained by effective stimulation of this country's overseas mining industry.

METAL STATISTICS

Before closing, I would like to refer, as my predecessors as President of the Association have done, to the work of the British Bureau of Non-Ferrous Metal Statistics, the value of which has been enhanced during the year under review by the expansion of its monthly Bulletin to include tables showing world smelter production of copper and zinc; the prompt statistical information given in the Bulletin is greatly appreciated in many quarters.

Every effort is being made to reduce the net cost of the Bulletin but, in the meantime, the Association, which participates actively in the administration of the Bureau through membership of its Council and Advisory Committee, considers its work of sufficient importance to justify continued financial support.

The report and accounts were adopted.

Mr S. E. Taylor was elected President and Mr A. M. Baer Vice-President of the Association for the forthcoming year.

The meeting terminated with votes of thanks to the President, the Secretary Mr R. A. Alldred, and to the Taxation Committee for their services during the past year.

CALOR GAS HOLDING COMPANY LIMITED

INCREASED PROFITS

MR W. L. M. O'CONNOR'S SPEECH

The seventh annual general meeting of Calor Gas Holding Company Limited, was held on December 16th, in London, Mr W. L. M. O'Connor, CBE (chairman of the company), presiding.

The following are extracts from his statement, circulated with the report and accounts for the year ended July 31, 1955:

The profits, after charging £20,000 for cylinder maintenance to the provision made in a previous year, amount to £543,187, an increase of over £82,000. The circumstances in which the £20,000 was so charged were similar to those obtaining in the previous year.

During the year to July 31, 1955, the cost of new cylinders amounted to £276,199, making the total expenditure during the seven years to July 31, 1955, £2,544,000; the charge for depreciation on cylinders and other assets amounted to £374,328, as compared with £341,325 for the previous year.

Taxation on the profits for the year amounted to £271,951, and includes provision for the additional Profits Tax on distributed profits imposed by the Autumn Budget, in so far as it affects the Company in respect of the dividend recommended for the year to July 31, 1955.

The Directors have transferred £24,187 to Special Reserve in respect of the Investment Allowances. The Directors have also transferred £175,000 to General Reserve, and this, together with the transfer to Special Reserve, and taking into account the increase in the Profit and Loss balance carried forward, namely, £2,410, makes a total of £201,597 retained in the business out of the year's profits.

TURNOVER AGAIN INCREASED

The Chairman last year informed you of the reduction in our cylinder hire charges on June 1, 1954, and our turnover has again increased. The Scottish Company's business has continued to expand, and good progress has been made in Northern Ireland and the Republic of Ireland.

The transfer of £175,000 to General Reserve brings the General Reserve Account up to £350,000, and a final dividend of 25 per cent is recommended, making, with the interim, a total of 37½ per cent for the year.

Turning to the Consolidated Balance Sheet, you will see that current assets have increased by over £100,000, and that they exceeded current liabilities and provisions by £340,836, against £196,057 at July 31, 1954.

With regard to the current year, I have the following comments to make. Our new Filling Station at Millbrook, near Fawley, is expected to commence operations in April, 1956.

We have introduced a new lightweight cylinder of 10 lb capacity to our existing range of cylinders. This cylinder is very easily transportable, and has been specially designed for use with blow torches, gas pokers, a portable fire unit and a picnic stove. We are confident that there will be a ready demand for it.

In the absence of any unexpected change in Trading Conditions, I anticipate that we can again look forward to another satisfactory year.

The report was adopted.

KENDALL & GENT (Machine Tool Makers)

A SATISFACTORY YEAR'S TRADING

MR F. C. MOSLEY'S REVIEW

The Annual General Meeting of Kendall & Gent, Limited, was held on December 16th at the Company's Office, Victoria Works, Gorton, Manchester.

Mr F. C. Mosley (Chairman and Managing Director) who presided, said: This is our 109th Annual General Meeting. I am happy to welcome you to it. The last year was no exception to any preceding it in so far as there were the usual number of difficulties to be overcome, but I feel sure you will all agree that the results for the year are very satisfactory.

As I told you last year the yard was having a roof put on; this has now been completed and those of you who have had time to look round will appreciate the advantages of this very valuable additional floor space. No more structural alterations have been undertaken during the period, but all necessary repairs have been carried out.

As I pointed out last year, we were no longer enjoying a "sellers'" market in overseas countries, and that we were meeting with greater competition in those markets. We are, however, members of a large selling organisation, which is most ably represented in all overseas countries, and no stone is being left unturned to help us to improve the position.

Next year in June, 1956, there will be another international exhibition at Olympia, London, and your firm is busy preparing new machines for the stand. We are all looking forward to this exhibition, especially with

regard to the large number of important overseas visitors who usually attend this event.

The good results for the past year have only been possible because of the order book we started the year with. While I stated last year that the orders "on hand" were considered to be satisfactory, I told you that the large output for last year had exceeded the intake of orders for the same period, though only by a small amount, and I went on to say that I was glad that since the close of the year we had received some very nice orders. To-day I am more than glad to be able to say that the influx of orders was well maintained during the year and has again been quite satisfactory since the close of the year.

As you all know we have been very conservative in dealing with our profits for a long number of years and have built up very good reserves. We have also spent a large amount of money on plants, which is today right up to date, and we have an excellent lot of skilled workmen.

The net profit for the year (including investment income and after charging management and all other expenses and directors' fees) amounts to £135,557. This sum is slightly less than last year due to increased costs of labour and materials. All necessary repairs have been carried out and more new machinery has been installed during the year—£6,468 and a further amount of machinery is ordered for this year costing £16,282. The amount required for depreciation this year is £15,722 against £16,822.

The net profit is £119,835 against £139,836. We are again making full provision for taxation by reserving the sum of £63,000. This figure is the full provision covering all our taxation liabilities including income tax and profits tax. This year your directors have decided to recommend placing

£20,000 to general reserve fund and have increased the carry forward by £10,000.

With regard to the subsidiary company we are glad to report another successful year. During the year all necessary repairs have been carried out and the new crane has been installed. The figure at which this company stands in our books is £60,000 which is considered by your directors to be a very conservative one.

Now we come to the capital reserves. During the year we have taken £50,000 from this figure and have distributed the amount as a bonus of "one share for three" making a total issued capital of £200,000, but with the £20,000 we have placed to general reserve account and the dividend equalisation reserve, the total reserves still remain at £150,000 and we shall have a "carry forward" of £58,311. You are aware the same interim dividend of 5 per cent was paid on the old capital, but a final dividend has been maintained at 10 per cent with a bonus of 10 per cent making 20 per cent on the whole of the new capital less income tax.

The capital of the company was increased in 1953 by a bonus of £30,000 and this year again we have distributed a bonus of £50,000. I am sure you will all agree that it is a great achievement to pay a large dividend on the increased capital. From the balance sheet you will see that the current liabilities and provisions are £25,871 more. Current assets £43,918 greater. Cash in hand at bank £11,234 more. Stocks of materials down by £27,608. Debtors and payments in advance greater by £60,292.

As in the past I am most anxious to place on record my profound thanks for the very splendid loyal services which have been rendered to your company, not only by the executive staff but by everyone who is on the payroll of this firm. The report and accounts were adopted.

THE STRAND HOTEL LIMITED

The forty-eighth annual general meeting of The Strand Hotel Limited was held on December 20th in London, Mr S. I. Salmon, the Chairman, presiding.

The following are extracts from his Statement, which had been circulated with the Report and Accounts for the year ended September 30, 1955:

This year the balance from the Trading Account shows little change compared with the previous year, but due to variations in other items in the Profit and Loss Account, principally an increase in the amount of interest received and a lower charge for income tax, the profit for the year is £6,304 higher, at £69,266.

For some years the balance available has not permitted any increase in the dividend on the Participating Preferred Ordinary Shares, but this year the Board is pleased to be able to raise the dividend from 12 per cent to 14 per cent, which was the rate just before the War.

We have continually emphasised the difficulties which beset the hotel and catering industry, and we make no apology for referring to them again this year. Operating costs, particularly wages, continue to rise. Increased efficiency can go some way towards meeting such a situation, and no new or improved technique is being neglected, but this obviously has its limits, and in the long run increased charges to the customer are inevitable. Even so, we have no doubt that our tariff represents as good value as can be obtained anywhere.

The report and accounts were adopted.

THE MIDLAND TAR DISTILLERS LIMITED

YEAR OF STEADY PROGRESS AND DEVELOPMENT

MR STANLEY ROBINSON ON BOARD'S POLICY OF MODERNISATION

The thirty-third Annual Meeting of The Midland Tar Distillers Limited was held on December 16th at Oldbury. Mr Stanley Robinson (the chairman) presided and in the course of his speech said:

The trading profit for the year at £391,864 shows an increase of some £60,000 compared with the profit of the previous year. The charge for depreciation at £214,879 is £53,500 higher than last year, an increase which inevitably follows the increased capital expenditure during recent years. It will be noted that although our trading profits have increased by £60,000, the charge for income tax has been reduced by £7,000 to a figure of £163,364 compared with £170,493 last year. This is partly due to the reduction in the standard rate of tax, but more particularly to the interesting point to which reference is made in note 3 on page 11 of the accounts. The 1954 Finance Act gave an investment allowance in respect of capital expenditure on new assets incurred after April 6, 1954, and during the current year the taxation charge has been reduced by £30,000 in respect of this allowance. The allowance was given by the Chancellor as a direct incentive to industry to modernise its plant, and we have thought it right to recommend an increased appropriation to the reserve for obsolescence and increased replacement costs, which means that the benefit of this allowance will be carried to a capital reserve.

Your directors further recommend that an appropriation of £50,000 be made to general reserve, and these appropriations, together with the dividend of 10 per cent less tax on the ordinary shares, leave the balance of unappropriated profit carried forward to next year almost exactly the same as the figure brought in at the beginning of the year.

I do not think that there are any special features about the balance sheet to which I should draw your attention.

In spite of the expenditure of about £350,000 on fixed assets during the year, the total of our current assets shows a slight increase, and we still have over £500,000 on loan to local authorities and at the bank. I think you will agree, therefore, that our liquid position remains very satisfactory.

CAPITAL EXPENDITURE

The year has been a good one of steady progress and development all round. We have spent a lot of money on improvements and extensions, and it is gratifying to note that the expenditure is beginning to bear fruit. One of these improvements which will interest you is that we are now generating our own electric power, both at Four Ashes and Oldbury, in agreement (of a reciprocal nature) with the Midlands Electricity Board.

As you will have noted on the balance sheet, we have capital commitments amounting to £250,000, which is good reading, for it means progress and further development. I think you would be interested in a breakdown of this figure, which falls under three main headings:

I. Expenditure, mostly of a non-revenue nature which is supplementary to the original capital programme. The new works at Four Ashes was erected as speedily as possible and

everything which was not absolutely essential was postponed until the process plants were in operation. Some of these delayed items have now been found to be necessary and have been constructed. An example of this type of expenditure is the widening and curbing of works and approach roads.

II. Expenditure on additional plant to provide increased capacity on established processes or, alternatively, in order to give greater flexibility, thus enabling a wider variety of products to be manufactured.

III. Expenditure on plant for new processes arising out of work done by the company's Research and Development Departments.

Your board would be failing in its duty if it did not stress that as time goes on many of your plants will become obsolete or, for one reason or another, will have to be replaced. We have approximately £3,500,000 invested in plant and sundry equipment, and although we have gone some way in the provision of funds (in the form of depreciation), we must supplement this out of our own taxed resources. That is why we must continue to build up our obsolescence and increased replacement costs reserve.

An example of what I mean has actually occurred this year, as we have closed and dismantled Birkenhead and Wolverhampton works, each for a different reason. Tar has been distilled on the Wolverhampton site since January 12, 1857. Obviously one does not like taking such a step, but the works had become obsolete, and modern plant capacity had been provided, designedly, at Oldbury and at Four Ashes.

TRADING ACTIVITIES

As I have said, the year has been one of steady progress and development. The intake of crude tar has been a record and, generally speaking, the prices of our products have been steady throughout the year.

Our subsidiary in the United States of America is well established, and the sale of tar acids in that country is considerably up on last year's figures. We are now delivering in bulk to the States, which shows considerable advantages.

Our deliveries of creosote to Imperial Chemical Industries Limited over the year have been somewhat reduced, due to certain internal difficulties experienced in their works.

Sales of coal tar fuels and of refined tar for road purposes have increased, and it would seem that we are benefiting in some small degree from the recent road grants.

Export pitch, due to the reasons I gave you last year, is a declining market.

Reverting to the question of research and development: we are spending large sums on research which, as already indicated, is beginning to show returns. Our main research activities are carried out at Four Ashes. We have a first-class team, ably led. One should never be optimistic about the forthcoming results of research, but I'm afraid I am!

The report and accounts were adopted and a dividend of 10 per cent on the ordinary shares was approved.

CORONATION SYNDICATE (Incorporated in the Union of South Africa)

The Fiftieth Annual General Meeting of Coronation Syndicate Limited was held on December 5th in Johannesburg. The Chairman, Mr J. H. Mitchell, OBE, presided, and in the course of his speech said:

During the year under review your Company has continued to make most satisfactory progress. Total mine working profits this year amount to £191,561, in comparison with £162,049 for the previous year and £158,910 in respect of the year before that. I think you will agree that this is a most satisfactory record of improvement.

During the year under review your Directors decided to introduce the practice of paying an interim dividend and accordingly, a dividend of 7½ per cent was paid last August. I am glad to say that your Directors consider that the financial position and prospects of your Company justify a final dividend of 12½ per cent. I think you will agree that a total distribution of 20 per cent for the year is a reasonable reflection of the progress which has been made in the earning capacity of your Company's assets.

Arcturus Mine: Operations at the Arcturus Mine continued satisfactorily throughout the year.

The working profit for the year was £37,918 in comparison with £39,212 during the previous year. The slight drop was due to the cost of extra development footage accomplished. The rate of working profit since the end of the financial year has increased to approximately £5,000 per month. It is anticipated that this level will be maintained until the new plant comes into operation towards the end of 1956 when further improvement in profits can be expected.

Muriel Mine: The new reduction plant is crushing and treating over 3,000 tons monthly and metallurgical results are very satisfactory. 38,453 tons were crushed and treated during the year, in comparison with 28,912 tons for the previous year. A working profit of £10,000 monthly has been maintained.

During the twelve months to June 30, 1955, 338 tons of copper were produced and in addition 4,458 fine ounces of gold were recovered from the copper concentrates shipped overseas.

Development results have been very satisfactory.

Tebekwe Mine: You will remember in my address to you last year I said that it was anticipated that a monthly profit of around £1,000 could be expected for the coming year. This rate of profit was exceeded, resulting in a working profit for the year of £16,332, compared with £29,948 for the preceding year.

Since June the Mine has continued working at the same rate of profit and it is hoped that it will be maintained until all available ore underground has been exhausted.

The ore reserves at June 30, 1955, were calculated to be 19,020 tons valued at 3.48 dwts. per ton, showing a decrease of 29,990 tons on the estimate at June 30, 1954. The considerable reduction in the ore reserves shows clearly, I regret to say, that the life of the Tebekwe Mine is drawing to a close.

Butterfly Mine: At the Butterfly Mine operations continued on a small scale and a gross working profit of £1,437 resulted.

Vubachikwe Mine: After negotiation this Mine was sold to the tributors for £25,000 which, I think you will agree, was a very satisfactory price.

The report was adopted.

CROWN ZELLERBACH CORPORATION

(Incorporated in the State of Nevada, United States of America)

MANUFACTURERS OF PULP, PAPER AND ALLIED PRODUCTS,
LUMBER, PLYWOOD AND OTHER FOREST PRODUCTS

CONDENSED SUMMARY OF CONSOLIDATED RESULTS FOR SIX MONTHS ENDED OCTOBER 31

	1955	1954 (as amended)
Net sales	\$169,579,000	\$154,044,000
Income before taxes on income	\$33,749,000	\$29,369,000
United States and Canadian taxes on income	\$14,945,000	\$13,164,000
Net income	\$18,727,000	\$16,135,000
Dividends declared	\$9,573,000	\$7,920,000
Earnings retained in the business	\$9,154,000	\$8,215,000
Additions and improvements to properties	\$16,509,000	\$14,721,000
Shares of common stock outstanding October 31	11,072,131	10,933,023*
Per share of common stock outstanding:		
Income before taxes on income	\$2.99	\$2.63*
Net income	\$1.63	\$1.42*
Dividends paid to common stockholders	\$0.80	\$0.67*
Retained in the business	\$0.83	\$0.75*
Production:		
Paper and paperboard—in tons	603,669	549,008
Lumber—in thousands of board feet	79,718	83,442
Plywood—in thousands of square feet	35,681	27,220

* Giving effect to common stock split-up in September, 1955.

Copies of the quarterly report to October 31, 1955, may be obtained from the London Transfer Agents, The British Empire Trust Company, Limited, 3, Lombard Street, London, E.C.3, on application.

Residents in the British Isles, whose shares are not registered in their own names, and other interested parties who wish their names placed on the mailing list for future communications, should notify the London Transfer Agents accordingly.

THE LIVERPOOL WAREHOUSING COMPANY LIMITED

60th ANNUAL GENERAL MEETING

CHAIRMAN'S STATEMENT

The Sixtieth Annual General Meeting of The Liverpool Warehousing Company Limited was held on December 20th in Liverpool.

The following statement by the Chairman, Mr W. Milligan, was circulated to the stockholders prior to the meeting:

The Profit and Loss Account depicts quite clearly the results of the year. In brief, it shows a trading profit of £99,173 which includes a Dividend from our Subsidiary, The Sandon Motor and Engineering Company, Limited. After the various adjustments set out in the Directors' Report have been taken into account and the carry forward from the previous year brought in, there is a disposable amount of £213,723, which has been appropriated as follows: £15,000 to General Reserve, £79,889 for payment of Final Dividends and £118,834 to be carried forward.

You will note that the Company's Capital and Reserves now stand at £2,887,246, which is £51,613 higher than the previous year. The book value of our quoted investments shows no material change, but there was an increase in the market value at the Balance Sheet date.

Plant, Transport and Equipment, after providing for depreciation, shows a net increase of £122,520, which is largely attributable to additions to the Company's fleet of road haulage vehicles.

The trading results for the year under review will, I am afraid, be a disappointment to you. A drop in profit as substantial as that which we have suffered, coming after the particularly satisfactory figures we have had for the last six years, is, to say the least, disconcerting.

The possibility of a reduction in the demand for warehouse accommodation has been anticipated by us for some time past. Our views were based largely upon Cotton stocks, which we felt sure would diminish under existing trading conditions. In this respect our forecasts have proved correct. The quantity of unsold Cotton stored in Liverpool at the present time is much below what it must be if the Liverpool Cotton Exchange is to regain its former position as one of the leading Cotton Markets in the world.

I would remind you that the Company was originally founded largely upon the handling and storage of Cotton. Indeed, at one time, it contributed 75 per cent of the Company's revenue. We have the premises and the men to deal with a very large quantity of this commodity, and it is to be hoped that events will, before long, bring about a renewal of a substantial stock in Liverpool.

We were prepared, as I have indicated, for less favourable trading conditions, but we actually encountered something that could not be foreseen. I refer to the disastrous results, not only to our business but to the business of the country as a whole, brought about by the two strikes which occurred on the docks and the strikes of railwaymen and of tugmen. These four labour disturbances caused a rapid outflow of stocks from warehouses to keep the factories going and the population fed while supplies direct from the port were disrupted. Ships which were bound for Liverpool were diverted to other ports and this prolonged the period during which a number of our warehouses remained empty. At one time, in order to reduce expenses, and more particularly the very high

local rates that are levied on our premises, we were obliged to close over 70.

I should like to take this opportunity to draw attention to the modern transit sheds we have constructed in the immediate vicinity of the docks. These premises offer the most up-to-date facilities for the temporary storage of import and export cargo, and at the same time make a useful contribution to the lessening of costly delays to ships and road transport caused by congestion on the quays.

As you will have gathered from the remarks I have made in previous years, an object we have constantly in mind is the provision of revenue additional to the basic one of warehousing in order to stabilise the Company's earnings.

The enlargement of our fleet of road vehicles was embarked upon with this end in view, and I am glad to say that we are making good progress in this field. In the first year, there have been heavy charges to absorb in respect of depreciation and repairs to the vehicles we acquired from the British Transport Commission, but the whole fleet is being profitably employed and we look for steadily improving results.

The Sandon Motor and Engineering Company, Limited, has maintained its higher earnings, and if the Motor Manufacturers we represent had managed to fulfil all the orders we have obtained for goods and passenger vehicles, we should have done much better.

I would again like to record our appreciation of the loyal and satisfactory manner in which all our employees have fulfilled their duties.

The Report and Accounts were adopted.

HILLS (WEST BROMWICH)

CONTINUED PROGRESS AND EXPANSION

The twenty-second annual general meeting of Hills (West Bromwich) Limited was held on December 16th at West Bromwich, Mr John MacNish, CA (the Chairman), presiding. The following is an extract from the Chairman's circulated statement:

The Accounts for the year to July 31, 1955, indicate the continued progress and expansion of the Group. The balance on Trading Account shows an improvement from £231,138 to £262,351. The profit before taxation of £73,413 (£87,160) is £171,274 (£143,097), leaving an amount available for distribution of £97,861 (£55,937).

We have added the sum of £64,975 (£25,608) to our reserves, making a total of undistributed profits to be carried forward of £130,625 (£65,650).

The demand for our Presweld system of building construction, and all the products associated with it, has continued throughout the current year, and our order book is sufficient to maintain production at existing levels for the next two years.

The Company's future level of output depends, however, on the receipt of balanced and adequate supplies of steel and other raw materials. The supply position has been and still is very difficult. Coupled with this are the serious and continuing inflationary tendencies in the building trade, which result in forcing up costs. These problems, with the associated one of finance, are receiving the constant attention of your Directors, and they have successfully faced and overcome these same problems in the past.

Subject to any unforeseen circumstances, I feel confident that we can look forward to another successful year.

The report was adopted and a total distribution of 22½ per cent was approved.

J. GLIKSTEN AND SON (Timber Producers & Importers)

SUBSTANTIALLY INCREASED TURNOVER

The fiftieth annual general meeting of J. Gliksten and Son Limited, was held on December 16th in London, Mr S. G. Gliksten (chairman and managing director) presiding.

The following is an extract from his circulated address:

The Revenue from trading of the Group amounts to £964,475 as compared with £846,129 a year ago. The net profit after Taxation is £356,671 and your Board recommend a total Ordinary Dividend of 35 per cent, as last year.

Consolidated Balance Sheet: Current assets exceed current liabilities by £2,212,311. There are noticeable increases in the value of stock holdings and the total of sundry debtors. This is partly due to a substantial increase in the overall turnover of the Group and to increased production.

We have been able to finance our expansion and developments from available resources although a further factor has arisen which again changes the financial situation—I refer to the Government restrictions designed to combat inflation. Whilst we welcome proper steps to achieve these ends, those taken fall with particular severity on the Timber Trade which by tradition, in view of its seasonal nature, is always financed by bank loans. The credit squeeze has resulted in reducing the demand from some consumers; in requests from customers for longer terms of credit and in requests by the banks for a reduction in the overall facilities granted. Timber importers have always to buy at least six to twelve months in advance of the goods becoming available for sale in this country and, therefore, when the credit restrictions were first announced purchases had already been made to cover the expected requirements of trade during the ensuing twelve months. The Trade as a whole therefore finds itself at the moment somewhat overstocked in comparison with current demand and some time must elapse before this situation is remedied.

In common with other industrial concerns we are faced with higher operating costs which we are unable to pass on to our customers. They can only be absorbed by achieving higher turnover of goods and greater efficiency. During the past year we have increased our turnover considerably and our efficiency has also improved. To this end our plant and property are kept in the best possible state of repair.

During the past year visits have been made by executives to the Americas, the Far East, Africa and the Continent, and once again export turnover has substantially increased.

Since the close of the Accounts turnover has been maintained and, having regard to current trading, results are satisfactory.

One of the important features of the timber industry is that in the more common and prolific species the growing timber has only a potential value—its ultimate value lies in getting it from the place where it grows to the place where it is required for consumption, in the form in which it is required. The major part of the cost of wood, therefore, lies in transport and handling, and it is our aim to handle and transport our goods with the utmost mechanical efficiency. This is achieved with a variety of mechanical devices and by their use we aim to reduce still further our costs and increase our efficiency.

The report was adopted

S. SMITH AND SONS (ENGLAND) LIMITED

INCREASED GROUP TURNOVER

The forty-first annual general meeting of S. Smith and Sons (England) Limited, was held on December 14th in London, Mr Ralph Gordon-Smith, chairman and managing director, presiding.

The chairman, in the course of his speech, said: The group turnover has increased compared with the previous year by 13 per cent and the various companies now employ a total of approximately 17,000 people. The total floor space occupied by our activities has also increased by 14 per cent.

Notwithstanding the increase in our total turnover and the improvements in factories, our profit this year has decreased, as I envisaged a year ago. This has been due to some contraction in aviation and marine business, but the main reason is that higher costs resulting from increased wages and material prices have not been passed on to our main customers. This applies particularly to the motor accessory division.

THE ACCOUNTS

The group profit for the year before tax is £2,635,000, compared with £2,854,000 last year, but thanks to the elimination of EPL, the benefit of investment allowances and the reduced rate of income tax, the consolidated net profit after tax and after adjusting for minority interests is £1,345,000.

The net profit before taxation is after charging £558,000 for depreciation, which is an increase of £114,000 over the previous year and reflects the expenditure of £1,039,000 on fixed assets during the year. The annual contributions to pension schemes for employees amount to £178,000.

The consolidated balance sheet also reflects the expansion of turnover and production capacity. After depreciation, the fixed assets of the group show an increase of £598,000 over the corresponding figure of the previous year; stocks have increased by £1,070,000; debtors by £756,000; creditors by £410,000; and, as a result of these movements, cash resources have decreased by £1,282,000. The Board recommend the same final dividend as last year, namely, 12½ per cent, making a total of 17½ per cent for the year on the Ordinary shares.

It is calculated that at least 35 per cent of the group's turnover is exported, directly or indirectly. Markets generally are becoming more and more competitive and it is necessary, as far as we are able, to keep down export prices in order to maintain and expand our direct export business.

PRODUCTIVITY AND COSTS

While the turnover and productive efficiency of the group have been increasing over the last few years, this increase and rate of progress are no longer sufficient to offset any further rise in costs. Therefore, as we have also reached the point where we must strive to maintain our present level of profits in order to meet our large expansion programme and to finance the additional working capital required for the increased turnover, it is obvious that any further increases in costs will in part at least have to be recovered. As in the national interest we must not jeopardise our export business, this means that increased costs will need to be absorbed largely by the home market.

We are now starting to derive benefits from our long-term plans of modernisation and mechanisation, and I am confident that increasing productivity and economies will arise and these, combined with the new

products we are developing, will greatly improve our organisation and long-term prospects.

It may well be that our present expansion plans in this country and those in Australia will call for the raising of additional capital in the future, particularly if the new products under development prove to be the success we anticipate.

The report and accounts were adopted.

THE PERUVIAN CORPORATION LIMITED

MR W. H. WHITE'S STATEMENT

The sixty-fifth annual general meeting of The Peruvian Corporation Limited, was held on December 15th, in London, Mr W. H. White (the chairman) presiding.

The following is an extract from his circulated statement:

ACCOUNTS

The gross revenue from Railways, Steamers and other assets for the year (when converted into Sterling at the rates mentioned in the Accounts) amounted to £3,566,726 as compared with £3,561,035 in the immediately preceding year. At the same time, expenditure fell from £3,331,730 to £3,138,165. These Sterling figures are substantially affected by the rates of exchange used for converting currency receipts and payments. Both receipts and payments, in terms of currency, rose during the year when compared with the preceding year. The surplus of receipts over expenditure is £428,561, which compares with £268,144 in the previous year. In both cases the figures are arrived at before debiting debenture service £339,914 (same as last year) and United Kingdom taxes paid and accrued during the year £108,443 (£215,357 last year).

DEBENTURES

Two Coupons on the Corporation's Debentures (due April 1, 1949, and October 1, 1949) were paid during the financial year under review, and one due April 1, 1950, was paid since its close, namely, on October 1, 1955. This means that the equivalent of a year's Debenture Interest was paid during the year and consequently unpaid debenture interest arrears have not increased, but interest on unpaid interest has increased to £1,434,965.

PROSPECTS

Peru is enjoying great industrial and trading prosperity and growth; consequently the Corporation's prospects should be good. There are, however, factors which might preclude a full participation in that prosperity. One is that tariff increases lag behind increases in operating costs, i.e., wages, fuel oil and other materials. Another is that participation in Peru's growth and development depends upon the Corporation's ability to finance additional and more efficient locomotive power, rolling stock, coaches and other equipment to handle not only the traffic offered, but also to handle it more efficiently and at lower cost.

In this way competition by road transport can be better met, in the expectation that diversion of traffic from rail to road may be halted. If the Scheme of Arrangement is adopted, the Corporation will become credit-worthy, and needful additional funds to meet essential expenditure may be capable of being raised to the advantage of the Corporation's interests which could not be done in the present financial situation.

The Report and Accounts were adopted.

BROWN BAYLEY'S STEEL WORKS

MR J. W. GARTON'S STATEMENT

The thirty-seventh ordinary general meeting of Brown Bayley's Steel Works, Limited, was held on December 16th at Sheffield, Mr J. W. Garton, JP (the chairman), presiding.

The following is an extract from his circulated statement:

The negotiations with the Iron and Steel Holding and Realisation Agency have been completed and Brown Bayley Steels Limited was acquired from the Agency on June 9, 1955.

The re-acquisition is of great value to the Group, as it will ensure a continuance of special steels which are required for the manufacture of bearings by The Hoffmann Manufacturing Company Limited and gives Brown Bayley's an outlet for a large proportion of its output for which it has laid down special facilities.

An essential part of the reorganisation of the Group was the sale to Brown Bayley Steels Limited of your wholly owned subsidiary Brown Bayley's (South Africa) (Pty.) Limited. This Company was sold on the valuation of its net assets and the purchase price of £182,683 was applied to the payment to the Agency of a part of the purchase price for Brown Bayley Steels Limited. Brown Bayley's (South Africa) (Pty.) Limited is a selling organisation in South Africa for Brown Bayley Steels products and as such its correct place in the organisation is as a subsidiary of Brown Bayley Steels Limited.

As you know, an offer was made to the Shareholders of this Company to purchase half of the share capital in Brown Bayley Steels Limited on the basis of four shares in that Company for every share held in Brown Bayley's Steel Works, Limited. The success of this operation was assured by the Shareholders in this Company taking up all but 13,376 shares of the 1,200,000 shares offered to them. The Company then purchased 2,000 shares in order to retain control.

As the negotiations with the Agency were only completed in June, your Board has not been able to consider fully the possibility of a scheme to reorganise the Company's capital.

It is the intention of your Board to distribute to its Shareholders the dividends received from its holdings in The Hoffmann Manufacturing Company Limited and Brown Bayley Steels Limited.

The Profit and Loss Account after tax shows a balance of £68,451, to which is added £26,084, being the excess taxation provision from previous years, giving a total of net profit available to Shareholders of £94,535. Your Directors recommend that £78,750 (5s. 3d. per share) be paid as Ordinary Dividend for the year, out of which an interim Dividend of £30,000 has already been paid.

The Accounts of The Hoffmann Manufacturing Company Limited show very satisfactory results. During this year the capital of this Company was reorganised, your Company's holding now being 2,400,000 Ordinary Shares of 5s. each.

Brown Bayley Steels Limited became a subsidiary on June 9, 1955, but as the Annual Accounts have not yet been prepared it is not possible to give a more accurate forecast of the profits than that published in the Prospectus issued in June of this year.

No Dividends were received from Farnley Housing Association during the year, but since the end of the year £150 of the interest free loan to this Association has been repaid.

The report was adopted.

HECTOR WHALING LIMITED

IMPROVED RESULTS

The twenty-seventh ordinary general meeting of Hector Whaling Limited was held on December 15th in London, Mr R. de B. Trouton (the chairman) presiding.

The following is an extract from his circulated statement:

Our overall financial position again shows improvement. Liquid assets exceed current liabilities and outstanding commitments for capital expenditure by £1,823,172. As foreshadowed last year, our expedition was financed without seasonal assistance from our bankers. This year we should again be self financing.

The Consolidated Profit and Loss Account shows that the trading profits for the year increased by about £387,000 as compared with a year ago. This increase is mainly attributable to two factors—an increase in overall production of about 8 per cent and an increase in the average price for all our products of about 6 per cent.

Our outgoings for the year show a small increase, while the off-season operations of our tankers again failed to contribute to our net earnings largely owing to the very poor rates of a year ago. At the moment of writing tanker freights are better than they have been for the last two years.

Our revenue surplus has been increased by approximately the same amount as the transfer of £179,500 in respect of taxation provisions no longer required. We again propose to allocate the sum of £70,000 to Fleet Replacement Reserve and we are recommending the repetition of last year's dividends of 20 per cent for the year on the Ordinary Shares and a total of 11½ per cent on the Preferred Shares, leaving a balance of £446,247 to be carried forward.

Production last season showed an overall increase on the previous year as follows: Whale and Sperm Oil 31,400 tons (28,700 tons), Frozen Meat 5,600 tons (5,600 tons), Meat and Liver Meal 5,350 tons (4,900 tons), Meat Extract 380 tons (290 tons) and Liver Oil nil (25 tons).

SALES

A year ago the bulk of our 1954/55 production of whale oil was sold at an average of slightly more than £75 per ton. The balance of the production remains unsold in store as we believed that the price would advance above the level ruling when "Balaena" returned from the Antarctic. At the time of writing this has proved to be the case. The only sales as yet completed by us for the coming year are those of frozen meat of which we have sold the entire 1955/56 season's production at substantially better prices than those secured last year.

CURRENT OPERATIONS

In the 1955/56 Antarctic whaling season there will again be 19 floating factory expeditions operating. One large new factory ship will be replacing a smaller and older vessel so that the effective productive capacity of the industry will be slightly increased. The number of Blue Whale Units permitted for the pelagic floating factories as a whole has been reduced by International Whaling Regulations from 15,500 to 15,000. The baleen whaling season will again start on January 7th but the taking of blue whales is delayed until February 1st (last year January 21st).

The report was adopted.

THE INDUSTRIAL CREDIT COMPANY, LIMITED

At the Twenty-second Ordinary General Meeting of The Industrial Credit Company, Limited, held in Dublin, on December 13th, the Chairman, Dr J. P. Beddy, said: The Gross Profit, at £135,472, is greater by £11,285 than that of the previous year.

Net Profit has increased by approximately the same amount as Gross Profit. There is a decrease in Bank Interest because of the reduction in the Company's Bank overdraft. Bank interest accounted for over 60 per cent of the total Administrative and General expenses. Your Company's temporary borrowings are at present at too high a level and careful consideration is being given to the appropriate balance to be struck between permanent Share Capital and such borrowings.

After providing for Income Tax there remains £48,250, to which should be added £28,150 brought forward making a total of £76,400 available for allocation. Your Directors recommend payment of a dividend of 4 per cent which would absorb £43,750 net after tax, leaving to be carried forward to the next Account £32,650 as compared with £28,151 last year.

As to the present, we are committed to the underwriting, in due course, of Capital Flotations amounting in all to over £1 million and we are aware of additional underwriting commitments which we will be asked to undertake. We hope that conditions will be such as to make it possible for us during the present financial year to sponsor some Public Flotations of Capital and, in particular, to offer to the public some of the shares taken up by us during the formative years of industrial Companies which are now at a dividend-paying stage.

RIM (MALACCA) RUBBER ESTATES

DIVIDEND OF 20 PER CENT

The forty-fifth annual general meeting of Rim (Malacca) Rubber Estates Limited was held on December 20th in London, Mr E. G. Estall (the chairman) presiding.

The following is an extract from his circulated Review: The combined crop harvested for the year under review amounted to 1,798,000 lb as against the estimate of 2,015,000 lb. The combined crop estimate for the current year is 1,930,000 lb.

With regard to replanting and new planting, the Board have decided provisionally on their policy up to 1960 and priority is being given to planting up the reserve areas of Rim Estate. During 1955 an area of 43 acres has been completed, and a further 150 acres authorised for 1956.

The profit before taxation is £85,327, which compares with £27,039 last year, but in that year replanting and immature areas upkeep to the extent of £11,695 was charged to revenue. The Board recommend a dividend of 20 per cent, less tax, which will absorb £21,852. The excess of current assets over current liabilities is £81,622, which shows a strong financial position.

Addressing the meeting, the Chairman said: The crop for November was 162,000 lb, making a total of 724,000 lb for the first five months, not up to the estimate, but we can hope that the crop will improve as the year goes on.

Reports from the Manager show that the 1955 new planting is in good order.

The report and accounts were unanimously adopted.

ATKINSON-OATES LIMITED

(Incorporated in the Union of South Africa)

A SUCCESSFUL YEAR

The twenty-seventh ordinary general meeting of Atkinson-Oates Limited was held on December 9th in Cape Town, Mr A. R. Callow (chairman of the Board of Directors) presiding. The following is an extract from his circulated review:

The Profit earned by the Company for the year ended June 30, 1955, amounted to £916,176, which is reduced to £796,048 after providing for taxation. This is an increase of nearly 10 per cent over last year which was not unexpected in view of the additional allocation of exchange received and the ready market which existed for all vehicles imported. Bearing in mind, however, that the Company is committed to heavy capital expenditure during the current financial year, your Directors considered it prudent to conserve resources and declared an unchanged final dividend of 60 per cent making 80 per cent in all for the year.

Landed Property shows an increase of £317,972, which consists mainly of the balance of the cost of construction of our property in Pretoria and the amount expended to date in erecting our new assembly plant at Elsie's River, Cape. Sydney Clow and Company Limited commenced business in the new premises in Pretoria during March. The erection of the new assembly plant is progressing very satisfactorily. It is intended to start the assembly of vehicles there to a limited extent before the end of 1955. The plant has been planned for an output of fifty vehicles per day and can readily be extended if the need arises. The capital outlay on the building and equipment during the financial year just ended amounted to £216,000 and an estimated amount of £340,000 will be needed to complete the project which is being financed from the Company's own resources. Much thought and planning have gone into the scheme and your Directors are convinced that the large expenditure is fully justified in that it will enable the Company to keep pace with the advancement of the motor industry in this country.

Trade Debtors also shows an appreciable increase, namely £336,709, due to the greater volume of business transacted during the year. The major portion of the asset is secured by Hire Purchase Agreements, the financing of which forms a profitable part of the Company's business.

Stock in Trade at £1,309,320 has increased by £416,337. This is a very valuable asset as all stock has been paid for and the greater part of it consists of a bank of CKD vehicles awaiting assembly.

SOUND CASH POSITION

The cash position is still very sound at £1,027,119 although lower than last year. The decrease is accounted for by heavy capital expenditure together with the fact that trade debtors were higher and stocks considerably larger than was the case at the end of the last financial year.

The prospects for the current financial year are encouraging as trading results for the first quarter have proved well up to the standard set in the corresponding period of last year. The Motor Industry anticipates receiving at least the same quota of exchange as was granted last year in which case I see no reason why the Company should not enjoy another successful year.

The report and accounts were adopted.

JOHN HOLROYD AND COMPANY

A YEAR OF STEADY PROGRESS

SATISFACTORY EXPORT TRADE EXPANSION

The fifty-third annual general meeting of John Holroyd and Company Limited was held on December 15th at Milnrow, Lancashire.

Mr E. O. Liebert (the chairman) presided and said: Another extremely busy year for the company and its subsidiaries ended on September 30th, and once again I am able to place before you the results of our year's working.

Compared with last year the profit of the parent company including income from investments but before taxation, fell by £31,478, from £418,352 to £386,874, but the combined profit of the four subsidiaries increased by £39,284, from £116,211 to £155,495 so that the group profit increased by £7,806 before taxation, and after taxation by £19,049.

PROFIT SHARING SCHEME

Our dividend last year of 10 per cent was more than five times covered by the group profit so your Board has decided this year to recommend a dividend of 12½ per cent, which is still more than four times covered. This automatically increases the amount to be distributed under the employees' profit sharing scheme, which is tied to the dividend we pay. It will be our sixth annual payment under the scheme and in all we have distributed £107,500. It is interesting to note that in the first year we paid away £10,000 and this year we are paying £31,250. This, together with the ever improving conditions and facilities afforded to our employees has in no small way helped in maintaining the excellent team spirit which, to my mind, is one of the advantages we enjoy, giving us a stability that is not the lot of every company today.

It has been a year of rising costs, some of which have been borne by us and not passed on by way of increased prices, of greater production due to improved and swifter machines and methods, and I think of steady progress.

TRIBUTE TO DIRECTORS AND STAFF

I wish particularly to thank my co-Directors for their efforts in so many directions, not only in the day to day running of the several companies, but for all they have done to develop and expand the business for the future. Their task and mine was made possible only by the loyalty and hard work of our very excellent and trusted staff and workpeople, so many of whom are long served. I am sure you will wish me to record your very special thanks to them.

I referred earlier to development and expansion. I think that the past year has seen building work either started or in the process of being finished at our six factories. Much new plant has been installed and again you will notice that our capital commitments at £189,000 for the group are of a fairly high order. I am quite sure, however, you will appreciate that it is only by your Board's constant policy of keeping our factories up-to-date and improving working conditions, that the results which I am able to place before you today have been achieved, for there is no doubt in my mind that the trend of business has been for some time now, and will be in the future, for reduced profit margins. Consequently if we are to

maintain our profit it is apparent that our turnover will again have to be expanded. This can be done only by producing better goods at lower cost, for competition, which is the spice of our business life, is getting keener and keener.

WORLD-WIDE SALE OF PRODUCTS

I think that two matters stand out as having been achieved in the past year. The first is that our export trade has again expanded most satisfactorily, so much so that our products are sold in practically every corner of the world. Secondly, it has been a year of developing new designs and processes for machines, gears and bronze, some of which have yet to be placed on the market. I have no doubt that the progress we made last year will pay for itself in times to come.

You will I know want me to say my usual

NEW ZEALAND LOAN AND MERCANTILE AGENCY COMPANY

MR MICHAEL G. H. BROWN'S SPEECH

The sixty-first annual general meeting of the New Zealand Loan and Mercantile Agency Company Limited, was held on December 20th, in London. Mr Michael G. H. Brown, the Chairman, presided and, in the course of his speech, said:

You will see from the Accounts and Review that, overall, we have had a better year than last time. Unfortunately, a very large part of our increased revenue has been absorbed in increased expenditure, the biggest increase in expenditure being under the heading of Salaries and Wages. In a business such as ours this is inevitable, because our product is efficient service.

I devoted several paragraphs of the Review to our Staff and Employees, because they are the most important asset we possess. I hope that we have your endorsement to our policy, not only of remunerating them on a fair basis for the excellent work they do, but also of our expenditure on training of all sorts to ensure that in ten, twenty and thirty years' time we shall continue to be well served.

Eighteen months ago we increased our resources by approximately £500,000 to meet the essential commitments we then foresaw for increased business. We know that this was unlikely to be sufficient to last for long, but we felt it right to increase the Ordinary Capital before re-arranging our power to finance ourselves to a greater extent.

Since then our expansion and improvement programmes have developed still further, with a commensurate increase in the business we are handling. This trend should continue with the increasing primary production of Australia and New Zealand.

If negotiations now in progress are successful, we hope shortly to be able to make a substantial Debenture issue. As our negotiations are not entirely concluded you will, I hope, not expect me to go into further details at the moment. We have obtained the consent of the Capital Issues Committee to the proposals we have in mind.

To be successful in the current year, we need reasonably good climatic conditions. No Management can avoid the effect of bad weather. We hope, however, that even if we are unlucky with the weather, we can minimise its effect and that, if we are lucky, we can show you reasonable results, if perhaps not quite so good. To date, the reports we get indicate that weather conditions in most

cautious words about the future. I think we can look forward with confidence to the coming year's activities. There is one matter however which is giving us the greatest concern and that is the shortage of steel. It is now admitted, I think, that the expansion in engineering caused by better methods and swifter production has outstripped the growth of the steel industry of this country, so much so that as a nation we look like being short of steel and dependent upon overseas supplies for some considerable time. In turn steel is dependent upon coal, and these two basic industries, which have been the subject of so much political harangue, may prove, for some time at any rate, to be the limiting factor in what might have been a great surge forward in the productivity of British engineering. Let us hope that this position will be alleviated to some degree by permitting our steel industry to function as it should, outside the cockpit of political ideologies. The report was adopted.

of the regions we serve are good, and should carry livestock through well for two or three months. The report was adopted.

LILLYWHITES LIMITED

CONTINUED PROGRESS

The twenty-second annual general meeting of Lillywhites Limited was held on December 16th in London, Mr H. J. Benedictus, ACA, the Chairman, presiding.

The following is an extract from his circulated statement:

The Consolidated Profit and Loss Account shows an increase in net Profits before taxation of just under £10,000. This figure would have been even greater had it not been for a steady rise in overhead expenses, which at the present time show few signs of having reached stability. In this connection, there is one particular item of expense to which I must refer. From next April, new rating assessments will be in force, based on current 1956 values, and it is certain that they will be much higher than in the past.

I would like to say a few words about Purchase Tax. As far as retailers are concerned, the incidence of this tax is most unfair. In the first place, the tax has to be paid when the goods are bought from the manufacturer, which means that a great deal of additional money is locked up in stock unsold on the shelves. Secondly, if such stock fails to sell within a reasonable time, and it is thought desirable to offer it at a reduced price, there is no provision by which the retailer can recover any part of the tax already paid. And, thirdly, whenever there is a rise in the rate of tax, the retailer is expected to sell his existing stock at the old price, but when the rate of tax falls, he is forced by competition to mark down his stock to the new prices without delay; again, without the possibility of any rebate on the tax already paid.

The net profit before taxation is £63,320 against £53,651. The amount required for taxation is lower by about £1,000, due chiefly to the reduction in the standard rate of tax.

Consolidated balance-sheet.—Stock is higher by £59,000, reflecting the expansion of the business, and cash balances are down by £37,000. The excess of assets over liabilities is £12,755 higher than last year at £370,862.

It is proposed to pay a final dividend of 20 per cent making 30 per cent for the year, together with a tax free distribution of 5 per cent.

Up to the date of writing, the sales at all our branches show an increase over the figures for the corresponding period of last year. The report was adopted.

KENNINGS LIMITED

ANOTHER SUCCESSFUL YEAR

The Twenty-fifth Annual General Meeting of Kennings Limited was held at Sheffield on December 16, 1955, the Chairman, Sir George Kenning, JP, presiding.

The following is an extract from his statement.

It is again with great pleasure that I have to refer to another successful year's trading and to record results.

The Group's trading profit amounts to £689,461 compared with £521,129 last year. The net profit after tax attributable to the Group is £224,662 (compared with £164,202 last year), of which £55,387 represents net profit retained by subsidiaries.

Subject to your approval, your directors propose the payment of a final dividend of 17½ per cent making 25 per cent for the year. The ordinary dividend takes £79,566 compared with total increases in reserves attributable to the Group of £132,769.

A higher dividend might have been justified on the results, but, bearing in mind the Chancellor's call for restraint, the continuous increase in costs which seems to be accelerating, the need to attempt to keep salaries in line with wages and for conserving our resources in view of the impending issue of capital, your directors have thought it prudent to recommend the same dividend as last year.

Referring to the Balance Sheet, current assets of £3,056,318 exceed current liabilities by £1,119,078, an increase of £366,961 over last year. Reserves, excluding future taxation reserves of £402,479, now total £763,864.

ACQUISITION OF NEW SUBSIDIARIES

In January the Company acquired a controlling interest in the Paragon Group of Companies which operates in Hull, Bridlington, Goole, Scunthorpe and Wetherby. The main business of Paragon is the distribution of Nuffield Products in East Yorkshire.

SIR GEORGE KENNING
(Chairman)

In May a controlling interest in Andrews Garage (Derby) Limited was acquired. Your directors are confident that these acquisitions will be valuable additions to the Group.

George Langley Limited of Bedford is included for the first time in the Group's accounts for a full year and has had a satisfactory year's trading.

MOTOR BUSINESS

By far the most important activity of the Group is the distribution of cars and commercial vehicles and most of its activities are ancillary and complementary to this. We have had a good year in this respect and I am glad to say that since the end of the financial year sales of vehicles have increased. While at the present time we have the usual seasonal fluctuation in demand, I feel that prospects for the future are encouraging. The new and excellent BMC range of commercial vehicles has been well received by our customers and we have booked substantial orders. The ground-work we have put in with our fleet owners, both car and commercial, during the period of shortages is reaping its reward.

PETROL AND OIL BUSINESS

We have worked in close co-operation with Messrs Shell-Mex and BP Limited for many years both in the wholesale and retail distribution of petroleum products. We welcome their drive for better service, and have found that it pays us both in customer relations and in sales, which we have increased considerably in excess of the national average.

At the launching by Lady Kenning of the Shell tanker *Hinea*, Mr C. M. Vignoles, Managing Director of Shell-Mex and BP Limited, said that "Kennings are the oldest and biggest—and indeed the closest—of all the Associates of my Company in this country, and we regard them as part of the family. Our relationship with them is unique."

STORES AND SERVICE

We are constantly improving our service facilities and are carrying out a programme of modernisation and extension. This is to keep

us in line with the policy and expansion in output of the manufacturers whose products we distribute.

With the increasing redundancy of prewar used cars, the problem of obsolescence of spare parts is one which we have constantly in our minds, and we have made the necessary provisions. The Training of Apprentices Scheme which we introduced shortly after the war is providing us with a useful and, indeed, invaluable inflow of skilled mechanics.

TYRES

G K Tyre Services has kept its place as one of the leading independent tyre distributors. The Monopolies Commission Report reveals that tyre trading is highly competitive but we are satisfied with our share of the market and the profitability of our business. We have now fourteen specialist tyre depots throughout the country and are opening new branches and also expanding our retreading activities.

FISK TYRES LIMITED

This company ranks as a Tyre Manufacturer and was formed as a wholly owned subsidiary during the current year. The name of Fisk is well known in the tyre industry throughout the world, and we have every reason to believe that the early success we have achieved will be maintained. Our policy is to distribute these tyres through the motor trade, a natural channel of distribution through which to offer service to the public.

ISSUE OF CAPITAL

As has already been announced, your directors have decided to offer to Ordinary Shareholders £585,991 in Ordinary Shares at the price of 16s. per share, and to offer to the Preference and Ordinary Shareholders £600,000 5½ per cent Unsecured Loan Stock 1970/75 at £97 per cent.

The estimated proceeds of these two issues after all expenses will amount to £1,021,073. This new capital is required to meet the expansion of the Company's business.

I am glad to say that our relations with manufacturers continue to be excellent, and we thank them and our suppliers for their co-operation during a difficult period.

In conclusion, I am sure you would like me to thank our employees for their contribution to these excellent results.

The Report and Accounts were adopted.

declared during the year, and your directors now recommend the payment of a final dividend of 1s. 6d. per share.

The ore reserve at July 1, 1955, was estimated at 3,714,000 tons, averaging 4.76 dwt per ton. The tonnage milled during the year was 731,609 tons, averaging 4.74 dwt per ton. There has been during the same period a progressive reduction in the cost per ton of ore treated.

Two or three shareholders have recently suggested that the domicile of the company

should be transferred to Australia for the purpose of avoiding the incidence of the very heavy UK taxation which our profits suffer. The real difficulty lies in Section 468 of the Income Tax Act, 1952, the general effect of which is that if a change of domicile results directly or indirectly in the avoidance of liability to income tax or profits duty, the transaction is unlawful unless carried out with the consent of the Treasury.

The question which has been exercising the minds of the directors for a long time

past, therefore, has been what arguments they can put forward to the Treasury to counter-balance the undoubted loss of revenue which would result from the transfer of domicile.

In replying to a question, the chairman stated that the issued capital of the company was held as to 5.7 per cent in Bearer Shares, 5 per cent by shareholders on the Australian register, and 89.3 per cent by shareholders on the London register.

The report and accounts were adopted.

HECHT, LEVIS & KAHN
(Merchants in Raw Rubber and other Commodities)

STEADY IMPROVEMENT

The thirtieth annual general meeting of Hecht, Levis & Kahn, Limited, was held on December 20th in London, Sir Walter Fletcher, CBE (the chairman), presiding.

The following is an extract from his circulated address:

There is a Group Trading Profit for the year ended March 31, 1955, of £286,865 as compared to the previous year's figure of £209,715. The Trading Results are in line with the view that I expressed on the last two occasions on presenting the accounts, in that they show a gradual but steady improvement. Trading was more active, but the same difficulties arising from market disparities and periods of stagnation were encountered, but in a lesser degree.

By the process of "trial and error," we have come to certain conclusions as to the best way to pursue our announced policy of diversification and altering our business to

fit in with changed conditions. By and large we have discarded the idea of the main change in our business to lie in increased activity in commodities other than rubber because we have found that our accumulated knowledge of dealing in rubber is of little use to us in trading in other commodities where specialised knowledge is so essential. Over the past years we have learnt our lesson and where it became necessary we made full provision for any loss entailed. Conversely we have opened up fresh connections in rubber at the consuming end in new areas.

CONSOLIDATED PROFIT AND LOSS ACCOUNT

The Net Profit of £131,279 is an improvement on last year—£103,442; and the Net Profit dealt with in the accounts of the Parent Company, £59,237, is noticeably better than that shown for the year 1954 of £42,187. We recommend for your approval a dividend of 15 per cent on the Ordinary Capital. We propose altering in form the division of the total of £758,899 of Revenue Reserves by transferring £125,000 to General Reserve, which will then stand at the half-million (£500,000) mark, leaving the Dividend

Equalisation Fund at £100,000, and carrying forward £158,899.

Since the date of the Balance Sheet under review there has been a greater change in the world's rubber situation and markets than I can remember in my thirty years of experience; what appeared to be a position in which "turning on the tap" of synthetic rubber must inevitably be the death-knell to plantation rubber, has proved on the contrary that the enormous increase of demand is capable of absorbing all rubber coming from the tree, wherever it is planted, and the man-made substitute as well. Fortunately this greater activity has vindicated in a most notable fashion our policy as regards our staff, and profits in every part of our Group have been gratifying since March 31, 1955.

There are signs that this market condition may continue for some time, but we are watching it with the utmost care, knowing from experience that though the rocket goes up, the stick always comes down.

We are resuming the payment of interim dividends and have declared an interim dividend of 5 per cent for the year commencing April 1, 1955.

The report was adopted.

WANTED

One Chief Accountant—for Steel Rolling Mill—Must be member of Institute of Chartered Accountants of either England or Scotland, or of the Society of Incorporated Accountants and Auditors. Should have at least five years accounting experience preferably in Steel Mills. Should be able to set up and operate an efficient system of cost accounts.

Also
Two Chief Accountants—for two Sugar Mills—Must be members of either Institute or Society named above. Should have at least five years accounting experience preferably in Sugar Mills. Should be able to set up and operate an efficient system of cost accounts.

Also
One Chief Accountant—for Jute Mill—Must be member of either Institute or Society named above. Should have at least five years accounting experience preferably in Jute Mills. Should be able to set up and operate an efficient system of cost accounts. A three year Contract in the first instance, renewable by mutual agreement. Terms are: salary £1,500 per year (will be increased for exceptionally qualified person), leave with full pay at 1/11 of the time spent on duty, round trip passage and free housing. Replies fully stating education, practical training, business experience, age, marital status and dependants, should be sent to—

Director-General,
Government of the Union of Burma,
Industrial Development Corporation,
53 Halpin Road,
Rangoon, Union of Burma.

The application should reach the above address not later than January 16, 1956. A copy of it should also be forwarded to the Embassy of the Union of Burma, 19A Charles Street, Berkeley Square, London, W.1, U.K.

A
AMERICAN LAWYER, LL.B., Jur.Sc.D., age 30, both academic and practising experience, also trained as an economist, now at an English university, seeks post either in Britain or Europe commencing summer 1956.—Box 325.

NEW ZEALAND MARKET

A well-established, keen and experienced importing firm, with first-class trade credentials and offices in Auckland, Wellington and Christchurch, desires to expand its activities. We seek exclusive agencies from manufacturers. Can we discuss the sale of your product in New Zealand? References Bank of New South Wales, London. Write direct to Mair and Co. (Importers), Ltd., P.O. Box 1477, Christchurch, N.Z.

TAILOR-MADE! The new flat 10's cartons of Grosvenor Tipped cigarettes at 1s. 10d. are ideal for handbags and dress pockets.
GREYSTOKE HOTEL, Canford Cliffs, Bournemouth. Own Swimming Pool, sea view. Brochure.

SELF-DRIVE CARS BY AUTOHALL. Get around more quickly and efficiently in one of our 200 1955 cars, all expertly maintained for trouble-free motoring for business or for pleasure. Special discount offers, contract rates and full free maintenance. Reduced rates from mid-September to mid-May. Repurchase scheme, and special new attraction of self-drive package tours—Write for all information to Autohall, Dept. 2, 302-6 King Street, Hammersmith, W.6. Riverside 2881. Cables, Autohall, London.

For Examinations—B.Sc.Econ., LL.B., and other external London University Degrees: Law Society; Bar; Accountancy; Banking; Secretarial; Civil Service; Commercial; General Certificate of Education, etc. Also many non-examination courses in business subjects.—Write today for free prospectus and/or advice, mentioning examination (if any) or subjects which interest you, to the Secretary (G-92).

METROPOLITAN COLLEGE, ST. ALBANS

Or call at 30 Queen Victoria Street, London, E.C.4.

LINES BROTHERS LIMITED

GROUP'S OPERATIONS EXPANDING

The thirty-seventh annual ordinary general meeting of Lines Brothers, Limited, was held on December 14th in London, Mr Walter Lines, chairman and joint-managing director, presiding.

The following is an extract from his circulated statement:

The proceeds of the new Ordinary Share Capital and Unsecured Loan Stock brought into the Balance Sheet in April, 1955, have been used to pay for further investments in Australia, South Africa, the USA and Great Britain, for higher cost of heavier stocks of raw materials, and for increased working capital due to expanding trade. The operations of the Group are growing and will grow still further and profitably, if not adversely affected by events beyond our control.

To extend our activities abroad by assembly and manufacture inside the barriers raised against trade by high tariffs, embargoes, heavy freight costs and meagre licences is, in our opinion, the only sound method, taking a long term view of world trade and Great Britain's exchange position. In those overseas countries where we have assembly and manufacturing plants we are able to set up first-rate selling and service organisations, not only for our locally made articles, but also for the sale and service of the much larger variety of goods we produce in Great Britain.

The sales of our home produced goods in all overseas countries where we have factories have increased considerably.

During the year under review we have set up our own showrooms in Fifth Avenue, New York, and our selling staff travels large areas of the USA—not an inexpensive operation, but nevertheless much more likely to attract dollar sales than by having our fine manufactures in the hands of local wholesalers. In Canada we have our factory at Montreal, our own showrooms in Montreal, Toronto and Vancouver, and warehouses in Montreal and Vancouver. Orders obtained are heavily up, but costs are very high and at present the results unremunerative.

SUBSIDIARIES' PROGRESS

In Australia, Cyclops & Lines Bros. (Aust.) Limited will shortly become a 100 per cent subsidiary, we having purchased the outside holders' Ordinary Shares. Cyclops is making good profits and it was decided that the considerable profits shown in the Cyclops Accounts should be retained in Australia. Our subsidiary, Lines Bros. (NZ) Limited, has had a good and profitable year, and we hope shortly further to extend its manufacturing activities. Our factories in South Africa, one at Johannesburg and the new one at Durban, are busy, and I am confident that they will give a good account of themselves. The Durban factory commenced production in March, 1955, and the volume of its manufactures and sales is increasing

steadily. In Great Britain our Rovex Scale Models Limited new factory at Margate has had to be doubled and the extension is just coming into production.

Our Export Trade is now running in excess of last year, as is also the Home Trade. Export Trade can only be built on a sound low cost production Home Trade, and to secure minimum costs large expenditure on modern plant is essential.

We endeavour to make each year one of fresh achievement and we believe there are always more fields to conquer. Assisted as we are both at Home and Overseas by many able executives, many good foremen and operatives, and with well equipped factories, we look to the future with quiet confidence.

The report was adopted.

LAKE VIEW AND STAR

The forty-fifth annual general meeting of Lake View and Star, Limited, was held on December 15th, in London.

Sir Joseph Ball, KBE (the chairman), in the course of his speech, said: There was a decrease of £50,806 in the revenue from mining and retreatment operations for the year ended June 30, 1955, as compared with last year; but the effect of this was offset to some extent by a reduction of £36,371 in total working costs, including development. An interim dividend of 9d. per share was

GAMBIA OILSEEDS MARKETING BOARD

Applications are invited for the post of Assistant Accountant to the Gambia Oilseeds Marketing Board.

Applicants must be between 25 and 35 years of age and must have had at least five years accounting experience in a large commercial undertaking—preferably in the United Kingdom.

The appointment will be for one tour of not less than eighteen months nor more than twenty-four months residential service in the first place, but, subject to satisfactory service, the successful applicant will be offered pensionable appointment on the permanent staff of the Board.

The salary attached to the post will be in the scale £900 x £20 to £1,000, and the successful candidate will enter according to experience and ability. In addition, a gratuity of £25 for each three months of residential service in the Gambia will be paid. Passages, quarters, and leave of absence will be granted in accordance with normal Government practice.

Applications in the candidate's own handwriting, giving full details of age, education, accounting experience, etc., should be forwarded to—

The Managing Director,
Gambia Oilseeds Marketing Company Ltd.,
5 Buckingham Gate,
London, S.W.1.

MARKET INFORMATION.—The export company of a large organisation in the engineering industry (Midlands) is extending its information services. An imaginative Economist accustomed to following and analysing home and export trends, and with a flair for lucid presentation, is required. A university speciality in the theory of international Trade is desirable. Experience in the application of economics in industry is essential. Salary commensurate with qualifications and experience.—Box 324.

MARKETING RESEARCH.—Leading Food Manufacturer requires male Research Assistants aged 23-27, with or without experience. Applicants must be of good personality and education, be willing to travel throughout the country, and possess the ability for accurate figure work. Apply, in writing, giving full details of age, education and past career.—Box 330.

FUEL OIL SALES MANAGER. Top Grade, good knowledge European market for Heavy Fuel Oil, required by Swiss firm. Good salary and all expenses paid. Address applications to P.O.B. 1071, Zurich 22 (Switzerland). State experience, qualifications and present occupation.

ACCOUNTANT

A young Chartered Accountant, not over 28 years of age, is required by a leading industrial company. The successful applicant will be expected to undergo a period obtaining the experience necessary to undertake duties of a responsible nature. In addition to professional qualifications a University Degree would be considered an advantage although not essential. An adequate salary will be paid during the preliminary period, but the prospects of the appointment are outstanding, including remuneration of £2000 per annum within five years of being confirmed in the appointment. Thereafter further advances may be expected as increased responsibility is assumed.—Send details of qualifications and experience to Box 327.

ECONOMIST, aged 30 to 35, with first or second class honours degree and with experience in Power Plant Economics and Market Surveys, is required in the Industrial Atomic Energy Group of The General Electric Company Ltd. This is a senior appointment, offering good opportunities and an interesting career.—Apply to The Personnel Manager (A.E.D.), Fraser & Chalmers Engineering Works, Erith, Kent.

Petroleum Charts a Continent's Course

A plentiful supply of petroleum products is vital to a nation's industrial and agricultural growth and to its national security. In Australia, a major step toward self-sufficiency in refining capacity is a new refinery at Kwinana. This refinery is owned and operated by Australasian Petroleum Refinery Limited, a subsidiary of the British Petroleum Company. Planned now to meet almost half of the continent's 45,000,000 barrel annual goal, Kwinana is already helping attract new capital and labour to Western Australia, and promises to have a marked effect on the continent's over-all economy.

As in the case of many other important refineries around the world, the over-all

engineering and construction of the Kwinana refinery was assigned to the Kellogg International Corporation and its parent company, The M. W. Kellogg Company—even to the extent of off-site installations including roads, docks, and loading, storage and housing facilities.

The Kellogg organisation is proud to have placed Australia's largest and most modern refinery in operation three months ahead of schedule. This record was achieved through the co-operation of British and Australian equipment manufacturers and construction subcontractors as well as through the hard work of the hundreds of men on the engineering staffs and construction crews.

Elementary: put your advertisements where they get READ

Advertisements work very well indeed in
THE READER'S DIGEST

—a magazine strictly for *reading*, which has achieved a *million* sale. This means *several* million readers—responsive and intelligent people, men and women well worth selling to.

try these keys *

* Actual size of keys on all Facit models. The other illustrations show the Facit NTK, one of the hand machines in the Facit range of ten-key calculators.

business machine

Why not try your hand at calculating... on a Facit ten-key calculator. Nothing could be simpler. With only ten-figure keys to use, any member of your staff can become a proficient operator *after a few minutes' instruction*. Think what this means—all the routine multiplication, division, addition and subtraction in every part of your business, can be handled by any clerk. Essential figures can be computed at a moment's notice. Tedious, time-wasting figuring becomes high-speed, machine-perfect calculating... without special departments, trained staff or reorganisation. You can also use *FACIT* for on-the-spot calculating and figure checks. Your Director can use *FACIT* on his desk for rapid reckoning. Your Accountant can use *FACIT* to speed the routine of his department. Your Secretary can use *FACIT* on the figures in Company control. Anyone can use *FACIT* to save time and labour, wherever there is more than a half hour's figure work a day. There is a complete range of *FACIT* hand and electric models... each one a precision-built item of equipment for the modern office. Let us send you a *FACIT* to use on your own work for a day or two... or write first for full details to: **Block & Anderson Limited**, 58-60 Kensington Church Street, London, W.8. Tel: WESTern 7250. (10 lines)

FACIT ten-key calculators

There's always another use for gas...

Pipe bending

... for heating metals

Gas-fired furnaces are used in most heat treatment processes. Whether at 20 deg. C. or 2,000 deg. C—or any particular temperature in between—the flexible gas flame can be controlled to give you precisely that.

Infra-red grilling

... for cooking

Free from smoke, soot, dust, ash and dirt, gas ensures the highest possible standards of hygiene in the preparation of every kind of foodstuff. It also gives full value per therm.

Consult your area gas board

Make all you use . . .
OXYGEN
. . . use all you make

When you install a Butterley Oxygenator you can be certain of two important benefits from the word "go."

First is that you gain complete independence of supply.

Secondly, you can't help noticing an immediate saving in your total oxygen/nitrogen consumption.

That's because you can make "on site" just the amount of high purity oxygen/nitrogen you need and at the right pressure. All you make is used, none is wasted and production flows.

A Butterley Oxygenator takes up very little floor space and is easy to maintain. Write for comprehensive brochure demonstrating in detail how a Butterley Oxygenator can benefit your works.

Resolutions for the Chancellor

EVERY Chancellor of the Exchequer since the war has done better than his immediate predecessor. It is certain that Mr Butler has done, but also that he leaves plenty of scope for Mr Macmillan to continue the progress. At the beginning of his period in office Mr Macmillan should therefore take stock of the ground that he will be required to retain if he is to be a tolerable Chancellor, and of the new ground that he should aspire to win if he is to be a great one. Perhaps this is the right moment to suggest three New Year resolutions to him.

He should make quite sure that he understands the ground that he has to retain first. The essential achievement of Mr Butler's Chancellorship has been Britain's advance from reliance upon compulsive controls to reliance upon a free market economy. There may be a temptation to suggest that the workings of this free economy—although they helped to raise the British workers' standard of living between 1951 and 1954—have shown their weakness during the past year. In fact, however, it is only during the last year that the free economy has shown its real strength. Mr Macmillan can do no better initial homework at the Treasury than to ponder what would have happened in 1955 if Britain's problems had been tackled with pre-Butlerite weapons.

The old sort of controlled economy would have been a grave misfortune in 1955. If Bank rate had still been inoperative as it was before 1951, then the rise in commodity prices during the past year would have been much greater and the terms of trade would have turned sharply against Britain. If Britain had entered 1955 with its raw materials still subject to import controls, and subject to the distortions of stockholding habits that went with them, then the dock and railway strikes of the early summer would have brought the economy rapidly to its knees; certainly the strikes would have had a far more serious effect on British living standards than that much milder previous interruption to supplies, the cold weather snap of 1947. And if there had still been an apparatus of price controls in being this year (with all the encouragement which they give to consumption), as well as a tradition of resorting to import licensing at times of external deficit (with all the incentive which that gives to traders to hurry forward their purchases at the first sign of trouble), then there is every reason to suppose that the near-crisis of 1955 would have gone at least as far as the full crises of 1947, 1949 and 1951.

Of course, it may still go as far; the situation may still deteriorate. But, at the moment, it does not look as if it is doing so. Thanks to the shock absorber of the free economy, Britain's all-too-familiar "odd year" economic disturbance seems, this time, to have been limited to the status of an autumn jolt. Mr Macmillan will be a tragic failure as a Chancellor if, by the time that the next external buffet comes round, it is found that he has failed to maintain the shock absorber intact.

This should be Mr Macmillan's primary New Year resolution. But he should not only wish to avoid falling behind Mr Butler's example as a Chancellor. He should wish to improve upon it. How can he do so? The first possibility with which one naturally tends to link the name of an ambitious new Chancellor is that of tax reform. There is not very much that can be said at this stage about the general level of taxation. It is, of course, far too high, and Mr Macmillan should not allow any special interests—such as the farmers—stand in the way of a determined and early drive to reduce it. But, in the long term, the only real way to bring it down will be to get production up; and that objective can be helped forward by changes in the distribution, not merely in the level, of the present burden. Mr Macmillan should turn his attention first to the particular taxes which weigh most heavily as disincentives to production, and which should be brought down even if other taxes have temporarily to be put up in compensation.

One can be quite specific about which these worst taxes are. They are income tax, surtax on earned incomes, and profits tax. This is a very awkward list, but its awkwardness is not really surprising. If the tax reforms that are needed were not awkward, then not only Mr Butler, but also his three Labour predecessors, would have embraced them long ago. It is probably asking too much of Mr Macmillan that he should embrace them with early enthusiasm; but the yardstick by which to judge any tax changes in his Budgets will be whether he recognises the need for reform—whether his constant aim is to seek to set productive energies free. His second New Year resolution in his new office should be to determine to do so.

★

The third resolution that may be suggested to him is even more awkward, and must be put forward much more tentatively. But if Mr Macmillan and those who presume to advise him are going to be tentative, let them at least try to avoid being hypocritical. Everybody knows what are the principal remaining defects in the British economy: they are the perennial increase in prices, the constant threat which this holds to the exchange value of the pound, and the immobility of labour and other resources. Everybody knows the reason for these ills, just as everybody knows the reason for the increased incidence of sick headaches on New Year's morning. In this week of all weeks many people may admit that certain pleasurable excesses lead them to intermittent fits of disturbed health; if they do not want to give up those excesses—and they have every right to refuse to do so if they are ready to bear the consequences—then they must go on suffering from disturbed health. The pleasurable excess to which the British people has been particularly attached all through the postwar period has been its extreme definition of full employment.

The most cursory comparison between Britain, on the one hand, and America and Germany, on the other, provides the proof of this. All three countries enjoy full employment, but only Britain insists on its employment being brimfull, pressed down and running over. Public opinion in the other two countries is content with an employment ratio of 96 or 97 per cent, with some real bargaining room and space for movement in industry. That, more than any other reason, explains why America and Germany have succeeded, broadly speaking, in maintaining full employment and price stability at the same time, while Britain has failed and is failing. If the British public wants greater price stability and steadier economic progress, it will have to reconcile itself—not, indeed, to mass unemployment as it has been known in past decades, but to employment that is merely full, and not overfull.

There are some people who will deny that any increase in unemployment, however fractional, however widely distributed, will do any good. They will point to 1952, when a slight rise in unemployment was associated with declining production and a brake on productivity. These are, indeed, the inevitable impact effects of any small degree of disinflation. But no one who knows the present state of the labour market and what goes on in it can doubt that a more significant and lasting reduction in the total pressure (always provided that it did not give rise to fears of a real slump coming) would after a few months act as a tonic throughout British industry.

★

The policy of the credit squeeze, if it has any meaning at all, is aiming at providing just such a tonic. Mr Butler has often said that it is not aimed against the policy of full employment; but it should be aimed at substituting a new and more moderate definition. Whether a new definition can be found that will be both acceptable and effective remains to be seen. Economists, who think in percentages, would probably agree that 97 per cent full employment is about as far as an economy can go without immobility and inflation. But politicians have to think in hundreds of thousands of electors; and 97 per cent employment means about 700,000 unemployed at any one time (though not, of course, 700,000 individuals each out of work for a long time). It is just possible—but only just—to hope that the smallest percentage of unemployment that will do the economic trick will be no larger than the biggest total of unemployed persons that the politicians can be persuaded to tolerate. Whether the two ends of the problem can be brought together in this way, nobody knows. It should be Mr Macmillan's third New Year resolution to find out. If he can succeed in this, too—which is the only way of stopping the steady rise in the cost of living, which is, in its turn, the only way of saving the pound—he will be enough of a hero in three years' time to repay manifold any unpopularity he may fall into meanwhile.

Police in the Pillory

THE Home Secretary's recent refusal to hold "a roving inquiry into the general conduct of the metropolitan police" was justified. A private police inquiry into the discipline of a handful of officers in the West End was misreported last month as the uncovering of widespread bribery and corruption, and naturally drew from the Commissioner of Police, Sir John Nott-Bower, a forceful denial; less fortunately, a London magistrate used his court as a platform for associating himself with Sir John's remarks, although the appearance of an alliance between the police and the magistrates is precisely one of the things that is exciting suspicion. But the rumpus came at an awkward moment for the police, as an officer was on trial on charges (subsequently proved) of conspiracy to pervert justice; and this stirred public memories of a number of occasions recently in which police handling of evidence in court cases has been open to reproach. Sir John wisely took the public into his confidence and declared that action was being taken to deal with black sheep in his force, and that he welcomed sensible newspaper criticism as the touchstone of a healthy relationship between police and public.

This latter statement is worthy of special note. There are few countries, even with democratic governments, in which the press dares to criticise the police. They constitute a power which, if not uncontrollable, is felt to be best left alone. This attitude of caution is usually coupled with the conviction that the police are, to a greater or less degree, corrupt. It is peculiarly a British boast that their policemen are not as other policemen are: an unarmed, civilian force within and in no way above the law, the police are assumed to be above taking bribes or misusing their power—whatever their pay, working conditions or temptations. The rare exceptions are held to prove the rule, as indeed they do if the figures of officers dismissed or required to resign for misconduct, given in the Commissioner's annual report for the metropolitan police, are an accurate index of police integrity. For they amount to a score or less a year in a force of 15,000.

★

This is a high standard to set, and perhaps the real question is whether the community expects more of its police than it deserves to get. The principal task of the police is to prevent crime and to bring criminals to justice. But a large proportion of their time is taken up with handling laws that are unenforceable either because they are hypocritical laws, or else because strict enforcement would make petty criminals of a quarter of the population. The laws relating to vice, betting and drinking come into the first category; the law dealing with motor traffic into the second. The evil influence of

such laws lies behind much recent public disquiet; for they breed contempt for the law among the public and cynicism about the public among the police.

The police know that they cannot enforce these laws strictly. They know that the community does not want them to. Their job is to keep an unworkable situation going somehow: to keep vice and street betting down, not by enforcing the whole law, but by making examples—so that the fines imposed amount, in a sense, to licensing fees; and to keep the traffic moving, not by booking every motorist who gets on the wrong side of the law, but by warning and persuading and finally making examples. This worsens relations between police and public in a new way. Because magistrates know perfectly well that the police bring as few cases as they can as a general matter of policy (and of the limits to the courts' time), they tend to assume that when a case does come up the police must be right—or at any rate that they must be supported. In either event the public has received the impression that to plead not guilty to a motoring offence is merely to ensure the doubling of the fine, that police and magistrates are in league, and that law has no place in the process at all.

★

It is this problem of overloading and of arbitrary selection of court actions that lies at the bottom of most of the real reasons for present public concern about the police. The analysis shows, of course, that some of the public's traditional suspicions are nonsense. It just is not true in this sort of situation that a policeman who piles up a big bag of motoring convictions will be well placed for promotion; he is more likely to be ticked off by his superiors for unnecessarily overworking the courts and making himself a nuisance. But there may be more fire behind three other smoke clouds of suspicion:

First, the police, believing in their hearts that they bring only the guilty to court, may be less careful at times in handling suspects or court cases than they should; even a few incidents, such as there have been recently, give the public rather easily the impression that the police are less scrupulous than they used to be; and this impression tends to be strengthened when instances in which police evidence is roughly handled in court are not followed by explanations or, if need be, dismissals.

Secondly, the fact that the police have been lax about some laws that the public does not really want to be enforced may have led them to be lax about some laws which the public does want to be enforced. For example, it would not have been as difficult as the Home Secretary has made out to secure more convictions of organisers of illegal rings at antique auctions.

Thirdly, there is the question of the general level of crime prevention. Here the police can properly point to

the fact that last year the crime rate for the metropolis for the first time dropped below the level of 1938. This was achieved despite the fact that the metropolitan police are still some 4,000 short of an establishment fixed as far back as 1935, and in the teeth of all the other distractions. Clearly full employment and the disappearance of the black market with rationing has much to do with this showing; but it is probably not unfair to say that mechanisation (especially motorisation) and the advance in scientific methods has merely offset the reduction in police manpower sufficiently to restore the prewar rate of crime prevention.

There are sufficient grounds for concern here to suggest that the community must choose: either it must increase the size of the police force (both metropolitan and county), or it must lighten their task.

*

It will not be easy to increase police recruitment. Police pay has just been substantially increased, but pay is not the only problem. The greater problem is one of conditions and promotion. Two-thirds of the men recruited cannot expect to rise above the rank of constable, which means that their pay, now initially favourable, rises by only £3 a week by the end of twenty-five years of service. All entry is at constable level; and almost the whole of the impact of the manpower shortage is visited upon the men on the beat, since the CID and special branches cannot be starved of brains. Overtime and impossible hours are often the rule from the beginning. This is a serious deterrent. Recruitment to the metropolitan police is in fact running at the rate of 1,300 a year compared with 1,000 before the war, but wastage after the first few years of service (which admirably fit men for many other better paid careers) completely offsets this gain.

At the same time changes in the educational system make the police force less attractive as a career; grammar school boys, for example, expect quicker promotion and better ultimate prospects than are offered in the force, where a man must pound the beat for four years before he takes his examination for sergeant, however bright he may be. Thus though police work is undoubtedly—and fortunately—a vocation for some men (and women) it threatens to become for the majority increasingly an unattractive and relatively untechnical profession, comparing poorly in pay and prospects with other walks of life. The danger grows of a short-service police force, manned by inexperienced and heavily overworked constables; this inevitably frustrates the good work of the senior ranks of the force. The public, seeing only the police notice on the wind-screen and reading only that 70 per cent of burglaries are never solved, asks what the police are doing. The policeman sees the public more concerned with its wage claims or its pleasures than with facing unpleasant facts; and far less law abiding than it should be.

This is a bad situation; and the country is fortunate that prolonged neglect of it has not made it worse than

it is. The responsibility in the first instance lies with the Governments that have neglected it. They have shirked the thorny issues of the traffic problem and of the vice, betting, drink and other laws. They have failed to develop the parking lots, to improve the roads, and to devise a simpler method of enforcing traffic regulations less prodigal of the time of the police, the courts, and the offending though often inoffensive citizen. The Government continues to hide behind the police in its fear of the pressure groups which form various unholy (and holy) alliances to keep the law in its present disreputable condition. The police play no part in these. (They may be one of the forces that are persuading the Government to be inactive about capital punishment, but that is a different story.)

Until politicians are prepared to brave these electoral bogies, and the public shows that it will support any Government that does so, it will be idle to assume that the police can by occasional pay increases be made fully efficient, or that its relations with the public will be satisfactory, or that there will not be temptations in the path of the police to which some officers will sometimes succumb. But before getting excited about the mote in the policeman's eye, the public and the politicians should try to become conscious of the beam in their own.

Prevention of Crime

The reformation of criminals is a congenial occupation at this period of the year, and we are rather pleased than surprised to find in the journals another long account of the Reformatory Establishment at Mettray, and notices of more than one county reformatory, with numerous letters and leading articles on the subject. At all times, too, as well as at Christmas, the prevention of crime excites the deepest interest and occasions much intense discussion. It is now within a few years of a century since Beccaria successfully attracted the attention of Europe to the injuries which severe punishments inflict on society. . . . In the period, social improvement, the extension of discussion, the deeper interest we have all learnt to take in matters of general welfare, and the increase of population giving a corresponding magnitude to the increase of crime, have all combined to excite continually the sympathy of the philanthropist and the activity of the practical politician. No year of the present century—scarcely a month in the long period—has elapsed without some painful event having occurred to fix the public mind for a season on the annoyance we all suffer from crimes and on the means of preventing them. But hitherto these investigations, though not wholly fruitless, have not led to any certain and definite conclusions. The Legislature has sometimes repealed severe laws, and sometimes again had recourse to the principle of such laws; and the public mind is now in a condition of greater doubt and anxiety on the subject of penal laws than before it was disturbed by a suspicion that the unsparing use of the gallows or the sword might not be the best means of securing the virtue and happiness of society.

December 29, 1855

The Tree That Grew in Norway

THERE could be no more apt symbol for Norway than the giant Christmas tree which, by a now annual tradition, has stood in Trafalgar Square during these weeks, a Yuletide gift from the people of Oslo to London. Austere of outline, unchanging of foliage and impervious to even the coldest wind from the east, it represents the qualities that make Norway one of Britain's steadiest friends and give its domestic scene such remarkable stability. This year the Norwegians have been celebrating the fiftieth anniversary of the dissolution of their union with Sweden. The whole of Norway's modern existence as an independent country has been spanned by the reign of a single monarch, the veteran King Haakon VII; one party, the Labour party, has been in power since 1935, and is so deeply entrenched that its leaders now take turns to rest between spells in office; and the recent transport strike was the first major industrial stoppage since before the war. With change so rare, it is small wonder that observers abroad sometimes find it difficult to detect any movement at all.

This year, however, there have been some stirrings in the fjord-side forest. Last month the prime minister, Hr Gerhardsen, became the second in the procession of Scandinavian premiers to visit Moscow (Dr Kekkonen of Finland went in the autumn, and Hr Erlander of Sweden and Hr Hansen of Denmark have been invited to go in the spring). It was thought in the West that Mr Khrushchev might use the occasion to try to undermine Norway's loyalty to Nato and to foster Russia's ambition of a Baltic "zone of neutrality." If he did, he made no impression on Hr Gerhardsen. The Norwegians, whose frontier touches the Soviet Union in the far north, had a number of comparatively minor matters they wanted to discuss with the Russians, and the negotiations seem to have been confined almost entirely to this practical level. A three-year commercial agreement was signed, but this will not materially alter the volume of business between the two countries, and Russia will still account for less than three per cent of Norway's foreign trade. It was also agreed to hold joint discussions about the development of water power along the common frontier in the far north; a Russian delegation has been invited to study the Norwegian fisheries; and the Russians were induced to return at least one Norwegian whom they had held prisoner since the end of the war.

Apart from this, Hr Gerhardsen reaffirmed, in response to a Russian request, that Norway would not allow foreign bases to be set up on its territory unless and until it was threatened with an attack. This is precisely the same assurance as the Norwegians gave on entering Nato in 1949, and its reiteration is unlikely to cause many heartaches among western defence planners. A nation of only three millions, Norway may

offer only a small contribution to western strength, but it is one of the firmer links in the Nato chain. Its defence expenditure, now running at £45 million a year, takes a fifth of the annual budget; and only last year the Norwegians raised their period of military service to its highest level since the war.

They are well qualified to judge the rewards of resolution; the dove-like politenesses of *Pravda* during Hr Gerhardsen's visit contrasted strongly with the barbed notes that travelled from Moscow to Oslo both in 1949 and at the time, a little later, when the Russians alleged, without the least justification, that Spitzbergen was being prepared as a foreign base. And Norway's present constancy is all the more notable when it is remembered that its ruling Labour party was once a member of the Comintern, and throughout the 1930s was wedded to the strictest neutralism.

*

In one respect, however—in economic policy—this anniversary year has seen a certain irresolution. By the end of last winter the enormously heavy investment programme needed to repair wartime damage and to expand Norway's late-growing industry (investment has been running at almost a third of the gross national product) had produced—together with the burden of defence and social services—a serious danger of inflation. In particular, the trade gap widened enormously last year, and even when the rich earnings of Norway's merchant fleet were taken into account there remained a payments deficit of £55 million—a seventh of the total import bill. To counter this, the government took a number of measures in February. Some of these measures—such as the tax on imported cars, the levy on contracts for new ships, and legislation (now being reinforced) to restrict credit—were fully in Scandinavia's socialist tradition of direct action; but, significantly, the government also followed Denmark's plunge into monetary controls and, abandoning the cheap money policy it had pursued ever since 1946, raised the bank rate and launched a comparatively high interest state loan.

It is not yet clear how effective these steps have been. The minister of trade, Hr Skaug, estimated in October that in 1955 the balance of payments deficit will be cut to £35 million; but, if this happens, it will be due almost entirely to the spectacular rise in the earnings of the merchant fleet, which the president of the Norwegian Shipowners' Federation recently put at £20 million above last year's level. Helped by an improvement in the terms of trade, visible exports (especially iron, steel, aluminium and fish) have also risen in value, and have recently beaten the record of the 1951 "Korean" boom; but they have no more than

matched the rise in imports, which, although checked to some extent by the restrictions imposed in February, were nevertheless up by eight per cent in the first ten months of the year compared with 1954.

Norway's next move may well be influenced by the success or failure of Britain's present economic policies. Hr Mons Lid, the minister of finance, has said that he does not consider another increase in bank rate to be "practical politics at the present time," but a further drain in the meagre reserves of foreign currency may force him to choose between a return to Norway's old reliance on selective controls and a new experiment in monetary orthodoxy.

Whether or not further measures are needed depends chiefly on two things: the government's success in avoiding a budget deficit this year, and the result of next spring's wage negotiations. Hr Lid, who has budgeted for an exact balance, said in February that this must be achieved if his policies were to be successful. Since then, upwards of £10 million has been added to state expenditure by a salary increase for civil servants and by compensation paid to farmers for their losses in the summer's drought. Some of this will be made good by additional taxes which are to be imposed from January 1st; it remains to be seen whether the rest will be covered by the "bonus" tax yielded, in excess of the minister's expectations, by the rapid growth in personal incomes. Investment continues high; but the new steel works at Mo-i-Rana in the north are now beginning to justify themselves, and

other capital construction is being financed partly from abroad.

No democratic government is more comfortably settled in power than Hr Gerhardsen's. Norway is a psephologist's nightmare, a country where the ruling party has been steadily increasing its share of the poll ever since 1945. But in industry things are less settled, and the recent transport strike is not the only omen of restlessness. The vice-chairman of the Norwegian TUC, Hr Mentsen, forecasts that all the unions will terminate their wage agreements in the spring, and that there will be "one of the most comprehensive revisions of wage payments we have ever experienced." The last general rise in earnings occurred in the spring of 1954; since then the cost of living has moved up by a few points, but has recently been held stable by Hr Lid's restrictive measures.

No doubt the government will point to this fact in urging restraint, and it also plans to extend the scope of the national health scheme as an encouragement to the unions not to press wage demands too hard. Norway stands by its concept of the welfare state as firmly as it stands by its membership of the western alliance. But it is discovering, as other western democracies have, that there is a conflict between this and the inflationary threat that overhangs them all. Norway's case is especially hard, for the balancing of its books largely depends on the highly variable earning power of its great merchant shipping fleet. The next few months may show how the government hopes to resolve the conflict.

Notes of the Week

Algeria and the French Voter

THE guerrillas have secured the Algerian problem a central position in Monday's French elections. The noise of their guns makes a mocking contrast with the government's assurances that no more men will need to be mobilised to restore order. The general belief in Paris is exactly the reverse, and it is widely rumoured that at least another 60,000 troops will have to be sent to Algeria in the very near future. This grim eve-of-the-poll warning may prove a blessing in disguise; for it is a reminder that to find a solution for Algeria will be one of the main tasks of the next National Assembly, and that, if it fails to find it, the strain of a long guerrilla war may prove too much for French resources.

Because events in Algeria have involved the recall of conscripts to the colours, they have become a major issue of domestic politics. On the other hand, the division between

the French parties on the issue is not easy to define. Was not M. Soustelle, the Governor-General who has been carrying out the policy of the Faure government, appointed by M. Mendès-France? The basic views of the two leaders on the problem are probably not very dissimilar. Neither of them has explained very clearly how he would resume negotiations with the nationalists, what offers he would make and how these could be reconciled with the interests of the French community in Algeria. But the deciding factor may well be the fact that any policy will need the support of a parliamentary majority; and any majority which M. Faure is likely to muster is bound to contain deputies flatly opposed to reconciliation.

Paradoxically, while the rift thus grows between France and a vital part of the French Union, it is the deputies from outside France who may hold the key to the future balance of parliamentary power. If the elections produce anything like a deadlock, the votes of the 53 "overseas" deputies and of the 30 from Algeria may prove decisive. Elections,

however, cannot be held in Algeria yet, because of its "exceptional circumstances." This very fact ought to explode the myth that Algeria is an integral part of France, and hasten the search for an alternative policy for it.

Parliament's Christmas Box

PARLIAMENT is always apt to look like a boarding school when it breaks up for the Christmas holidays. This year the analogy was more obvious than ever. The names of the new prefects were announced. There were an unusual number of *valetes* to be said, to which the New Year's Honours List may still add. And one of the main subjects of conversation in the last few days before Christmas—sometimes it appeared even to supersede discussion of the Government changes—was a strictly domestic matter: the prospect of a definite improvement in living conditions next term.

It now seems fairly clear that MPs' pay will be raised again during the coming year. The Government is believed to be prepared to raise MPs' "sessional allowances" from £2 to £3 a day (a figure it also wants to offer to peers), and to make the allowances payable for all five sittings days a week. This would raise the total emoluments of a member of the Commons to £1,500 a year; MPs would therefore at last reach the figure that was recommended by a Select Committee last year, but by the back instead of the front stairs. Labour members want more than this. Just before Christmas they decided that they would approach the Government in the New Year with a proposal for linking MPs' pay with some unspecified civil service rate. This plan would carry some very odd implications about the status of an MP; but Labour's argument is that it would take the whole embarrassing issue out of politics. Conservative members say that that is exactly what is wrong with it.

The Tengku Acts Tough

UNLESS Chin Peng and his lieutenants, after consulting with their supporters in the jungle, have last-minute thoughts—which are not unusual in oriental bargain-technique—the anti-terrorist campaign in Malaya goes on. The Chief Minister of the Federation, Tengku Abdul Rahman, will have had the last word—"We continue fighting." But Chin Peng's own last word was clever, and may prove embarrassingly memorable. It was that the Communists would surrender when the British relinquished control over internal security. It remains to be seen whether the whole parley was engineered by the Communists mainly to get this message across to the war-weary and lethargic peoples of Malaya; or whether it was a desperate last fling, because the Communists are defeated and know it.

The Communists faced a strong Malayan team across the table: two chief ministers, one of whom will soon be prime minister of an independent state and able to command the forces now under British authority; the other soon

to be prime minister of a self-governing city-state enjoying what will amount, probably, to treaty relations with Britain. The Communists "confessed" to their error in regarding the Tengku and Mr Marshall as stooges, and quickly found them inflexible on terms for ending the revolt, now directed against their elected governments. The Tengku declared before the talks that he felt strong and was therefore prepared to be lenient, but so far he has wisely interpreted this as simply a promise to spare lives and require a change of heart, not to permit the upsurge of a rival to his authority. The reports of the proceedings suggest that he knows well the value of the amnesty clauses which give him the power to deport, to restrict the freedom of action of those lately under arms, and to put them through rehabilitation courses. He made an effective point when he said that the ideologies which the Communists want to be allowed to propagate freely were associated in his peoples' minds with war, bloodshed and suffering.

But if the fighting goes on, the Tengku will need to live up to his pledge to mobilise Malaya against the terrorists with a single-mindedness which has hitherto been lacking, and take the sting out of Chin Peng's anti-British slogans. He seems more confident of late that he can do this, with Chinese as well as Malay support; and he will have supreme military control in prospect after the London talks. It may yet fall to him to win the war by arms, as well as Malaya's statehood by negotiation and statesmanship.

Peers and Pipedreams

THE discussion last week in the House of Lords on the approaching prospect of a visit by Mr Khrushchev and Marshal Bulganin can hardly be said to have strengthened the peers' claim to be a reflective assembly. Lord Hailsham expressed the hope that the Soviet rulers would be infected with freedom if they once saw Britain plain. Lord Pakenham apparently thought that the visit would speed the day when the iron curtain might be broken down and intimate friendship created between the Communist and free worlds. Lord Henderson begged the Government not to deny the Russian leaders an opportunity of learning about the British people. And Lord Reading, replying for the Government, declared that the invitation still stood. He seemed to place a curious emphasis on the fact that it would not be a state visit (it would be strange indeed if it was, as neither of the prospective guests is a head of state).

Other voices were, admittedly, raised in a much more sceptical tone. But on both sides of the House the illusion evidently persisted that a conducted tour of this country would open Mr Khrushchev's eyes to the virtues of democracy; and Lord Henderson committed himself to the opinion that the Soviet rulers would abstain from using London as a platform from which to launch jibes at friendly countries. Any member of the Indian Upper House could, by now, enlighten their lordships on these matters. Six weeks ago, it was possible to hope that travel would broaden Mr Khrushchev's mind; and at that time, few Indians imagined that their visitors would overstep the bounds of good behaviour so grossly as to embroil their hosts with other countries. But they did.

They insisted on going to Kashmir, and thrust their fingers firmly into its affairs with scant regard for the famous pledge of non-interference enshrined in the *Panch Shila* (their excursion to Mid-Ulster ought to be a lively weekend too). They perpetrated fantastic slanders about other countries (one could almost draw up now the list of nations, ranging from the United States to Germany, Israel, Pakistan and South Korea, which Mr Khrushchev will attack when he addresses the British-Soviet Friendship Society). Bourbon-like, they learned nothing; on the last day in India, they assured their hosts that India's parliamentary parties would be automatically swallowed up by the Communists in due time. And their bland praise of the Burmese army for its brave struggle against the young republic's enemies (who are mainly Communist guerrillas) amply demonstrated their talent for hypocrisy.

If the Government intends to proceed with its invitation the British public should at least not be pap-fed by politicians with any illusion that the Soviet rulers may be converted to democracy when they come here. And if the aim of this visit is the wholly admirable one of developing friendship between the Russian and British peoples, we have invited the wrong Russians. The ordinary Russian, whom it would be a pleasure and a gain to entertain here, cannot yet visit these shores freely—and responsibility for that was readily shouldered by Mr Molotov at last month's Geneva conference.

Loose Ends for Labour

LABOUR has settled its leadership problem during 1955, but little else. It went off for Christmas still trailing behind it a cluster of loose ends. The first problem for the New Year will be the deputy leadership. It still seems that the man most likely to succeed Mr Morrison is Mr James Griffiths. The main argument put forward in his favour seems to be that the party, having launched an apparent assault upon Victorianism, must now show that it only intended to do this by halves.

Whoever becomes deputy, two new men will move up into the Shadow Cabinet—Mr Kenneth Younger and Mr

Tom Fraser. Both will be useful young acquisitions, bringing with them some much needed specialised knowledge of foreign and Scottish affairs respectively. They were only squeezed out in June by the party's predilection for some right-wing hatchet men. Much more complicated will be the position on the National Executive. There, too, the leader and deputy leader sit *ex officio*. But so does the party treasurer. The last few days before Christmas brought no clarification of the rules about what should now happen to Mr Gaitskell's treasurership. One suggestion is that it should revert to the runner-up at the last ballot, which means to Mr Bevan; another suggestion is that, in order to avoid this, the Executive should try to keep the post on the shelf until the next party conference. The Executive could not, however, do this to the seat in the constituency section that Mr Griffiths would leave vacant if he became deputy-leader. That would have to go to the nearest runner-up; and this runner-up, who now seems likely to emerge as an unexpected junior member of Labour's high command, was Mr Sydney Silverman.

Changes in Union Leadership

CHANGES of great importance in industrial relations could shortly take place in the leadership of Britain's two largest trade unions. First, the death last Tuesday of the general secretary of the Transport and General Workers' Union (1,300,000 strong) leaves vacant the most powerful throne in the trade union world. It was only seven months ago that Mr Arthur (Jock) Tiffin succeeded Arthur Deakin in the office that was once Ernest Bevin's; he had been Deakin's chosen Crown Prince as Deakin was Bevin's, and had shown every sign of carrying on his predecessor's work with equal clear-sightedness and possibly more finesse.

The man whom Mr Tiffin had chosen as his own Crown Prince, and now the most likely successor to his office, is Mr Frank Cousins. It was Mr Cousins who declared recently that wages must rise, and that he does not accept the principle that wage increases must be related to higher productivity. This might suggest that, if Mr Cousins does succeed, the TGWU will cease to be a bulwark against economic and political extremism. But when Mr Cousins spoke—although no newspaper could say this at the time—the sad fact of Mr Tiffin's incurable cancer was already known; and many of those who saw Mr Cousins in obvious alliance with the Gaitskellites at Margate obstinately believe that he spoke last month less from his heart than with an eye to the election for a new general secretary. If these were indeed his tactics, they may well have been successful; for Mr Charles Brandon—who in last summer's election came second to Mr Tiffin, and whose views are rather more left-wing—has now decided not to stand against Mr Cousins.

More disturbing than changes in the leadership of the TGWU is the fact that a Communist, Mr L. J. Ambrose, has just been elected, in the usual very low poll, to the executive of the Amalgamated Engineering Union. This gives the Communists two members on an executive of seven, as well as one member who casts what they must regard as a useful vote at times; moreover, it is already known that Communists will oppose at least two members

Finance for Industry and Commerce

ICFC provides finance in the form of long-term loans on fixed terms, or share capital, to industrial or commercial enterprises established in Great Britain. Amounts range normally between £5,000 and £200,000.

During the present period of credit restrictions, the Corporation will only consider applications for capital from firms concerned in work of national importance. Consideration may also be given to new ventures which are soundly conceived and adequately sponsored.

Well-padded Cell

Senior executives condemned to spend long hours sitting on committees should consider this new Heal chair, especially designed for conference and boardrooms. The well-padded arms and well-sprung seat will see you through even an all-day meeting in a very high degree of comfort indeed. There is a choice of covering materials—though we particularly recommend hide for long wear—and a special high-backed version to preserve the dignity of the Chair. Come and try out this chair in our Contracts Showroom, where you can always see a wide selection of Heal furniture for boardrooms and offices. Your visit will show you just why so many of today's leading and most progressive companies—both in Britain and abroad—bring their furnishing and decorating problems to Heal's. If you cannot call, please tell your secretary to write for our booklet, *Furniture for Special Needs*.

who are up for re-election to the executive this year. It would be serious indeed if control of the major union concerned in the defence programme, with nearly a million members, were to fall into such hands.

Gold Coast Turning Point

THE publication of Sir Frederick Bourne's constitutional proposals brings the Gold Coast to a very critical point in its advance towards independence. The Gold Coast government (led by Dr Nkrumah and his Convention People's Party) has broadly accepted the proposals; so far, the opposition (the National Liberation Movement, which wants a federal constitution and more powers for the chiefs) has refused even to discuss them with Sir Frederick. If the opposition continues this negative and unconstructive attitude, then Dr Nkrumah may want to force a new constitution into operation against the NLM's will. This would almost certainly lead to bloodshed. Already, a number of Ashanti CPP members of the Legislative Assembly, elected with large majorities in 1953, dare not show their faces in their constituencies—and indeed spend their time urging a show of strength on the Prime Minister. The attitude of the opposition is "come and get us—and see what happens." This is a challenge, and it may have to be met if the NLM and chiefs do not see sense.

★

What chance is there that they will? Sir Frederick has flatly turned down their vague demands for a federal state, let alone a constituent assembly. Instead, he proposes "regional assemblies"—probably they could better be called "regional committees"—which would be formed jointly of members of the Legislative Assembly and of local councils. These bodies would have no powers of taxation, little of executive function, and none of sovereignty. But they would be designed to air local grievances; and to the chiefs Sir Frederick offers the considerable concession that no measure affecting their privileges should go before the Legislative Assembly without prior consultation with them, and a free vote thereafter. If Dr Nkrumah really accepts this, it is a long cry from his revolutionary days, when his programme demanded the early liquidation of the whole chiefly order.

Unfortunately, the NLM has found it so easy to say "no" without formulating a constructive alternative that its compliance at this stage would require a big change of heart. Yet it should consider where its present intransigence is leading. The CPP has held its hand a long time—so long that it risks being regarded as culpably weak in African eyes. It may have to act and so may the British: it may be wisest to accept Sir Frederick's proposed compromise and get on with independence. Even now the CPP would probably win a general election easily enough, except in parts of Ashanti. If transfer of full power to the CPP government leads to fighting, the NLM, which is feebly led, should remember the fate of the Southern Sudan.

Khrushchev's Switchback Budget

THE Soviet budget for 1956, which has been presented earlier than usual, is designed to yield a surplus of about 23 billion roubles (nominally about £2 billion), revenue and expenditure remaining almost unchanged at 597.9 and 568.8 billion roubles. The biggest change on the expenditure side is a cut of nearly nine per cent on defence, from 112.1 to 102.5 billion roubles. The familiar difficulty of measuring Russia's military strength by the appropriations for defence revealed in the budget is further complicated this year by a reduction in wholesale prices. But, unless prices have been specially rigged in its favour, the arms effort should not benefit from this reduction more than other branches of the economy. And a genuine decline in defence expenditure would be a natural complement to the much publicised demobilisation of 640,000 servicemen.

Share of Defence in the Soviet Budget (per cent)				
1952	1953	1954	1955	1956
23.6	20.8	17.8	19.9	18.2

The new budget thus marks some return to the pattern of Mr Malenkov's premiership. Last February Mr Khrushchev and his supporters deposed Mr Malenkov, and, to an accompaniment of bellicose noises, increased the published defence estimates by about 12 per cent. This aroused some fears in the West lest it was the prelude to an acceleration in the arms race. But it now seems that the "alarmists" did not win a complete victory in February.

The Soviet leaders' decision is now presented as a "move to relax international tension" (was the February move intended to heighten tension, then?). But it also clearly reflects the needs of the home economy. How big manpower problems alone are emerges in the revelation that the government has dropped its axe even more heavily on the civil service than on the army; it is announced that 750,000 officials have been sacked. The forthcoming five-year plan may answer another question that was raised at the time of Mr Malenkov's fall—how Russia's leaders plan in the long run to divide their country's still scarce resources between defence, heavy industry, the needs of the restive consumer, and the foreign "aid" which they have been promising so lavishly.

Butterfingers in Ottawa

IT is hard to believe that the Canadian government was taken completely by surprise when New Zealand recently lodged a strong protest in Ottawa about subsidised sales of butter to Czechoslovakia; for Canada itself has been a vocal and frequent critic of the United States for making precisely the same sort of deals. A question of principle is at stake, and if Canada intends to keep up—as it is perfectly entitled to do—its demands that the Americans should stop unrestricted disposals of subsidised commodities on world markets, it will be wise to stick to the rules of the game itself.

Canada has accumulated a stock of about 12 million

pounds of butter, thanks to the price supports extended to the farmers. The farming interests, which naturally fear that the supports might be cut away from under them, have been putting pressure on the government to get rid of the surpluses abroad. Some seven million pounds were disposed of earlier in the year to East Germany through commercial channels. The latest sale of a million pounds to the Czechs is at a price 19 cents below that given to the farmers. The New Zealanders complained that they were being undercut, but they have now accepted Canada's explanation and reassurances.

This incident, however, was a very clear illustration of the difficulty of prescribing rules for disposing of government-held surpluses on foreign markets which will be regarded by all parties as equitable. Even the apparently acceptable formula that subsidised sales are justifiable if they lead to additional consumption, and do not merely displace other suppliers, is not foolproof. Established suppliers are, naturally, never reluctant to claim long-standing connections with markets threatened by subsidised competition; and it is difficult to distinguish the greater consumption caused by the supply of low-priced surplus commodities from the natural increase in consumption which might have taken place anyway. If, then, it is impossible to lay down a simple set of rules governing the disposal of surpluses, the only practical alternative is to have maximum consultation between governments. Fortunately, the machinery for this is available in GATT and the Food and Agriculture Organisation (FAO); it is essential that it should be fully used.

Peking and Pankow

A NEW grouping in the Communist world has taken shape with the visit of Herr Grotewohl, the East German prime minister, to Peking, on what he called a "political mission of the first importance." He and Mr Chou En-lai have concluded a pact to "strengthen the intimate political, economic, cultural and other relations" between the two countries. A link already exists between them, for Soviet German heavy industry is an important supplier of China's needs; indeed, the Ruhr, too, is constantly being tantalised by the prospect of a share in the Chinese market if Bonn would recognise the "German Democratic Republic" and reject the United Nations restrictions on strategic exports to China.

The joint communiqué issued by the two premiers was a masterpiece of political *famille rose*, in which interference in practice jostled theoretically "non-interventionist" co-existence. They denounced the "United States aggressors" on Formosa, berated the Americans with "their puppet, Chiang" in connection with the admission of new members to Uno, and proclaimed support for "the just demand of India for the return of Goa, the demand of Indonesia for the return of West New Guinea and the struggle of the North African peoples for independence." The East German government, it was added, would welcome the normalising of relations between China and the German Federal Republic with an eye to the reunification of Germany "as a peace-loving and democratic state."

Herr Grotewohl also issued a joint declaration with the

premier of North Korea, Kim Il Sung, demanding that all foreign troops should leave Korea and Germany and allow "their peoples" to arrange reunification—a tidy formula which confirms the belief that the Communist rulers have one uniform policy for all divided territories.

Though Herr Grotewohl's trip was doubtless made with Soviet blessing, to show that his state is worthy of recognition, Moscow may not have been altogether happy about its exclusion from the East German-Chinese rapprochement. It was not the first time that Mr Chou had ignored Russia in his public dealings with the Soviet Germans; he did so when visiting East Berlin last year. And the Chinese have more than once claimed a leading part as champions of "liberation movements" in Africa as well as Asia and other areas. The new pact may give a certain impression in the Communist world's eyes that the Pankow "Democratic Republic" is being released from the position of a purely Soviet puppet only to become a partly Chinese one.

When an MP Should be an MP

THE Attorney-General has announced that the Government will accept the recommendation of the Select Committee on Elections that no steps should be taken to validate the "election" of Mr Charles Beattie as Unionist member for Mid-Ulster. This decision by a Conservative Government to give up a Conservative seat may seem magnanimous, but the recommendation is nevertheless a mistake. Critics of the decision should be careful to explain why. It is quite true that, if the local Unionists and Conservatives had been sensible, neither Mr Beattie nor Mr Grosvenor (the member for Fermanagh-South Tyrone) would have come to Westminster at all. Once the two constituencies concerned had decided that they wanted to be represented (or rather not to be represented) in Parliament by two Sinn Féin gunmen currently in Belfast gaol, the Unionists should have let sleeping dogs

COMMODITY PRICE INDICATOR
1952 = 100 MID-MONTH FIGURES

lie. But the Select Committee was not concerned with this point; it had no power to comment on the court actions in which the election of the Sinn Feiners was overthrown, and Mr Grosvenor remains MP for Fermanagh-South Tyrone. The recommendation the committee sent to Parliament about Mr Beattie was based on quite different grounds.

These grounds are that at the time of his election Mr Beattie, like some other MPs whose membership of the House has since been validated by special machinery, was a member of certain national insurance tribunals which constitute potential—although not actual—offices of profit under the Crown. Moreover the committee considered that Mr Beattie had special opportunities to discover that he was technically disqualified. His "election" took place in August, after some of the committee's own recent reports had been published and while a widespread debate about the technicalities of Parliamentary disqualification was raging. The committee believed that "Mr Beattie and his advisers should have more carefully examined Mr Beattie's own appointments."

No doubt they should. No doubt his advisers were rather inefficient in this respect. But two awkward questions surely arise. First, would the Select Committee, but for what it calls the special "circumstances" of the Mid-Ulster election, have decided that a man with an inefficient organisation should not be allowed to take his seat in Parliament? Secondly, in future disputes, perhaps in marginal seats and in more narrowly divided Parliaments, will partisans in the House remember that special "circumstances" obtained in this case? Even if the present House of Commons Disqualification Bill is improved, as the Select Committee suggests that it needs to be, it is a fair guess that there will still be some involuntary disqualifications at future elections. Parliament should consider very carefully before, in understandably irritated reaction to this complex Irish comedy, it allows what could be a dangerous precedent to be set up.

No Junior College for Croydon

FOR the last twelve months a special sub-committee of Croydon Borough Council has been considering a proposal to establish a special and separate Junior College for the 300 sixth form boys and girls now scattered in Croydon's five small grammar schools. Just before Christmas the council, in a whips-on debate, decided to abandon this project. This was, on the whole, the right decision; it would have been a mistake to sweep out of the corporate life of the schools not only the top pupils, but also the best teachers. Yet the difficulties that gave rise to the proposal remain, and as a microcosm of a national problem.

At present, three-quarters of Croydon's grammar school staff are receiving "special allowances" for taking certain periods of sixth form work with a group of pupils who only amount to one eighth of their grammar schoolchildren. Inevitably, this means that some teachers are taking tiny groups of two or three children, following a specialised course at advanced level. This may seem to be a fine thing for those children. But, obviously, the extent to which schools can afford this sort of thing is limited. Sometimes, therefore, a grammar school pupil today cannot undertake

his first choice in an advanced course; and in some areas pupils are being prepared for university scholarships by teachers who plainly would not be capable of winning those scholarships themselves.

One obvious remedy for this is to increase the emoluments of the best teachers in grammar schools; it has long been clear that there is an overwhelming case for a substantial increase in teachers' salaries at the top, whether or not there is also a case for raising them substantially at the bottom. But that could not be the whole cure. Some education authorities are already arranging co-operation between their schools in handling sixth form work; and Mr M. L. Jacks, whom Croydon consulted, has suggested that they should do the same. There is surely a case for more swapping of children between schools at the sixth form stage, if their parents want them to take special courses, and for children in one school to make special journeys to another school for certain periods in the week. In not all areas would this involve the children spending an inordinate time on buses.

Kenya's Unhappy New Year

THE news that the government of Kenya has banned a new African political organisation, to be called the African National Congress, is not surprising; but it is not a happy omen, as a new year opens for the colony with Mau Mau almost crushed and an election in prospect. It came, moreover, in a week when the same government in Nairobi banned a book about the trial of Jomo Kenyatta, even after certain required expurgations had apparently been made; and also in a week when the Colonial Secretary, in an acrimonious exchange about Kenya with Mrs Barbara Castle, got decidedly the worse of the political tussle. Mrs Castle made use of her knowledge of the lamentable Kamau Kichina case to direct a general attack on the Kenya administration. Much of her attack was reckless, but it will have done good if it has reminded the Colonial Secretary how risky for him it is not to keep the closest watch on a colonial government with such a propensity for perpetrating embarrassing political *bêtises*. He needed the reminder at this stage, for there are disturbing signs that Kenya may be putting on political blinkers again.

Almost any book about Jomo Kenyatta would be unsettling to its African readership just now; and certainly any pan-African movement called a National Congress would be dangerous, carrying, as it does, overtones from the West Coast, from Nyasaland, and indeed from India. But what is more important is to consider why it is dangerous. It is dangerous simply because it would get a great deal of support. Mau Mau is almost finished, and the rehabilitated Kikuyu are filtering slowly back to society and their families from the training centres. The multi-racial government has had nearly two years of office—two years in which to win the loyalty of the population. The publication of the Coutts report—on measures to give Africans a more direct control over their representatives in the legislature—is imminent. The government has itself agreed that Africans must become more active politically, though it thinks that this should be on a district (i.e., a tribal) basis. It is clear that the scene is set for political change in Kenya; but it also looks as if the government does not believe that

the Africans can be trusted to make any sort of constructive contribution. This is a bad sign. The obverse of the emergency was supposed to be better political education for Africans. Has it had so little effect?

Guatemala Still Close-Hauled

IN only a very special sense can last week's election in Guatemala be called "free." The electors in this Central American republic had only two lists of candidates between which to decide. The first represented the National Electoral Alliance, the group set up and endorsed by President Castillo Armas's administration; the second the National Anti-Communist Front, which includes those "liberal" and anti-clerical elements which the government tolerates. Moreover, the electoral law passed in November made certain that only approved elements would be able to express their views freely. It provided that illiterates would not be allowed to vote secretly, and that in order to put itself forward at the polls a political party would have to present 5,000 signatures. This provision was designed to allow the government to obtain the names of its opponents and discover in advance the existence of any clandestine left-wing groups. The result, not surprisingly, was a victory for the government party but a very light poll.

Colonel Castillo would argue that, even with all these precautions, Guatemala's political stability is in danger. One thousand or more exiles are waiting just outside its borders to execute a counter-coup, and Colonel Arbenz, the pro-Communist president overthrown in July, 1954, has lately been travelling behind the iron curtain, seeking supplies and encouragement. In the country itself, many opponents of the regime are known to be in touch with the Communists, and to allow completely free elections might indeed be to invite the Communists back.

But other Guatemalans, and particularly the former participants in the left-wing but non-Communist administrations which preceded that of Colonel Arbenz, argue that the present regime is preventing democracy from taking root; that, by rigging elections and arresting the development of a genuine parliamentary opposition, President Castillo is driving his critics into the Communists' arms. The Independent Anti-Communist party has made itself the spokesman of these views and urged the people to abstain from voting. Although the elections have formally confirmed Colonel Castillo's hold, widespread dissatisfaction may force him to modify some of his more autocratic policies.

Boxing Day in Seoul

THE brief glow of Christmas good will that spread over the western Pacific last week seems to have faded. On December 21st, the text was published of a letter from President Syngman Rhee to a leading Japanese Christian, in which he expressed his sincere desire for peace and friendship between Japan and Korea, and suggested that

the long suspended talks between them be resumed—though he gave no hint that he was willing to compromise on his country's conditions. The moderate tone of the letter contrasted sharply with the shrill denunciations of Japanese policy that had marked South Korea's propaganda throughout the year, and which reached a climax a few weeks ago when its chiefs of staff threatened to open fire on any Japanese fishing vessels that crossed the "Rhee line."

On Boxing Day, however, normal hostilities were resumed. The morning before, Communist Chinese ships had fired on a South Korean coast defence craft and taken four prisoners; whereupon Seoul declared that the incident was proof that "China, North Korea and Japan were joined together in an aggressive plot to encircle South Korea."

But the week's events show that South Korean obduracy is not wholly impervious to conciliatory Japanese approaches. Dr Rhee's unprecedented letter was a reply to one in which a distinguished clergyman had apologised for Japan's misdeeds during its 40-year occupation of Korea. There is room for a little more such generosity on the Japanese side; the Ministry of Justice, for instance, might reconsider its refusal to free some of the Koreans detained at Omura—which the South Koreans seem determined to make a condition of the release of the Japanese fishermen they themselves hold captive. If the tangle of problems between the two countries—trade, fishing rights, the ownership of Takeshima island and the claims to former Japanese property in Korea—is ever to be unravelled, one side must make the first concession. The South Koreans seem in too hysterical a mood to do so. Mr Hatoyama and Mr Shigemitsu might well consider whether Japan's new democracy could not prove its good will (and earn high marks in the free world) by giving a little ground for the sake of friendship in the Pacific.

CHANGES IN EMPLOYMENT in GREAT BRITAIN

INCREASES OR DECREASES SINCE JUNE 1951 [THOUSANDS]

Books & Publications

Four Years of Foreign Aid

THE MARSHALL PLAN AND ITS MEANING.

By Harry Bayard Price.
Published under the auspices of the Governmental Affairs Institute.
Cornell University Press (London: Geoffrey Cumberlege). 440 pages. 40s.

IT is surprising that there is no good account of the most generous international act of the postwar world—the Marshall Plan. Mr Price has done something to fill the gap; but, perhaps through trying to encompass too much, he has narrowly failed to write a book that can stand as the definitive account of a remarkable achievement.

His study was prepared under the auspices of a private research organisation, the Governmental Affairs Institute, which had been asked by the Economic Co-operation Administration to prepare "an independent, objective history and evaluation of the ECA and the Marshall Plan." This coupling together of the histories of the Marshall Plan and of the government agency which was charged with administering the aid programme was a mistake, although presumably not one for which Mr Price can be held responsible. But the story, as he tells it, comes much closer to being an adequate history of the ECA than it does to being a satisfactory evaluation of the Marshall Plan, despite the contrary impression of his title.

The meaning of the Marshall Plan is not to be found in the lessons the administration of a unique foreign aid programme may hold for students of public administration, but in the depth of the co-operation among sovereign states to which it gave birth and in the revival of confidence and optimism in Western Europe which it nurtured. The interweaving of bureaucratic detail with the description of the evolution of a bold idea could not help but blur the outline. And the skimping of the European side of the co-operative effort, which the dual objective of the book perhaps made inevitable, results in a lop-sidedness in the total impression. The ECA lives; the OEEC (the European organisation which turned seventeen separate aid programmes into one, broke the shackles of bilateral trade, and was the instrument of a new co-operative approach to European problems) does not.

The importance of the issues that surrounded the establishment of the European Payments Union, the most imaginative and important achievement of the OEEC, would never be suspected from the abruptness with which the payments union is conceived and born in

Mr Price's pages. The relationship between the union and the sterling area, and all the soul-searching that preceded agreement, are dismissed in a footnote and a quotation, "There was a tough discussion with the British on this," recalled Harriman later, "but when Cripps came through, it was all the way." The book is at its best in reproducing, in a way that would be impossible for a later, or more objective, historian, the animus of the ECA. The enthusiasm, the tireless energy, the intelligence, the unbureaucratic disdain for red tape that characterised the ECA in its hey-day are all there. And so, too, is the impatience with the diplomatic niceties and the brashness that at times went with the enthusiasm.

Mr Price has sought to give life and eye-witness authenticity to his account by peppering it with quotations from three hundred interviews with participants on both sides of the Atlantic. This is a device that succeeds in spicing the story, but is used so frequently, and at times so indiscriminately, that the facts are occasionally in danger of becoming stifled by the personalities. And, although he has clearly sought a cross-section of opinion, those quotations he has selected to use in his text reflect some rather obvious biases.

But although some may feel that Mr Price did not achieve the objectivity for which he so clearly tried, the weakness of his book stems from its strength, his closeness to his subject. Future historians, and interested laymen, will thank him for having preserved in readable form a mountain of evanescent material, and above all for having caught the mood of exhilaration that made the Marshall Plan succeed.

Parade of Economists

THE GREAT ECONOMISTS.

By Robert L. Heilbroner.
Eyre and Spottiswoode. 320 pages. 28s.

THE lives and work of statesmen, literary men, explorers, scientists and many other types of notable have been treated by biographers, in the past, at all levels from the most solid and scholarly to the most chatty and popular. Those of economists have hitherto been regarded as of esoteric interest only. No one would call Mr R. F. Harrod's life of Keynes, for instance, dull; but no one, equally, would expect to find it in the hands of that lending-library public which eagerly peruses such books as Mr Paul de Kruif's "Microbe Hunters."

Mr Heilbroner's "The Great Economists" breaks into a new field; why, he has asked himself, should not economists be as fitting figures for popular biography as anyone else?

In that field he sets a standard not easy to beat, with a lightly-written, colourful and often penetrating account of the lives and ideas of a selection of economists, some great, some merely influential, from Adam Smith to Keynes and Schumpeter. He combines zest and fluency with a genuine capacity for hitting off the essentials of a particular line of thought, for the pithy presentation of successive historical situations and problems, and for the relation of different systems of ideas and angles of vision to one another. He has found his economists interesting, even fascinating, as individuals, and his successive thumbnail sketches, even if they have a touch of caricature, fairly wriggle with life; he has found the pursuit of economic truth as enthralling, and its motives as humanly important, as the tracking down of a virus or the opening up of a continent, and he communicates that enthusiasm.

That he is sometimes irritating and occasionally off the mark is hardly surprising. One's teeth are set on edge by the recurrent references to "Parson Malthus," and by an occasionally slapdash or slipshod or, more rarely, melodramatic style. There is some dreadful nonsense on colonialism—an economist really should know the difference between sovereignty and ownership. And, to quote Mr Heilbroner's own words, "some men of justly great fame to the professional economist have been cavalierly dismissed"—while Veblen gets as much space as Keynes. Though the choice, in a book addressed to the general reader without technical interests, is defensible enough, even the most general reader should not be left with quite the impression of relative magnitudes given here.

These defects, however, weigh light against Mr Heilbroner's achievement. For he really does put over the essence of Adam Smith's teaching, and Marx's, and Keynes's; of the controversy between Ricardo and Malthus; of the Utopian Socialists' ideas, and those of the later nineteenth-century heretics; of Schumpeter's sociology and of the current "state of debate" on the viability of capitalism. Refinements and qualifications may be lacking, and no one would go to Mr Heilbroner for an account of analytical progress; but the root of the matter—the contribution of each vividly-drawn idiosyncratic character to the world-picture of his time—is unerringly isolated and memorably, if often irreverently, recorded.

The two supplementary chapters for the English edition, on "Reformed Capitalism in Britain," by Mr Paul Street, are a pity. They do not key in either with the rest of the book or with one another and indeed read like matter quarried from two independently written (and frequently overlapping) essays.

The Female in Politics

THE POLITICAL ROLE OF WOMEN.

By Maurice Duverger.
Unesco. 221 pages. 12s. 6d.

WHEN Unesco decided to conduct a study of women's role in politics it did well to entrust its direction to Professor Duverger; as his book on "Political Parties" so well demonstrated, he combines political *sagesse* with a remarkable ability to squeeze the last ounce of significance out of skimpy statistics. For treating a topic so bedevilled with all the prejudices of the sex war and so poorly provided with reliable data these are useful qualifications. His most interesting report is a valuable addition to the thin stock of worthwhile literature on political behaviour.

Four countries were chosen for study. The choice is not explained, but Norway, as the only country which regularly publishes separate figures for men and women non-voters, and Germany and France, where certain towns and districts have counted separately, were obvious choices. Yugoslavia was, one suspects, selected for reasons that were political in a non-academic sense. But in fact the report takes little count of the behaviour of Tito's feminine followers; it is really a set of generalisations, or hypotheses directly valid only for the politics of Western Europe. Its findings, meticulously documented, are as follows:—Fewer women vote than men. They withdraw from political life rather earlier. Husband and wife appear to vote in the same way (though the report is cautious about asserting who influences whom). Nevertheless the feminine vote in total is more conservative and more "religious" than the male; this is thought to reflect a difference between unmarried men and women. Are women voters more unstable than men? The verdict is "non-proven." But they are probably more influenced by personalities, less wedded to one party and more inclined to make up their minds late in a campaign.

The report also re-examines the more familiar ground of women's part in public life or, as it puts it, in "political leadership." Here, too, the pattern in each country is broadly the same. Fewer feminine candidacies for office, elective or appointive; fewer successful candidacies; a greater concentration on certain "feminine" topics—the family, child welfare, etc. Is the reason masculine prejudice? Only rarely. More often woman's worst foe is woman. "It must be acknowledged that the small influence of women in state leadership is in large measure due to women's own inertia." M. Duverger somewhat dogmatically assumes both that this is a bad thing and that the criterion of women's success in politics is their ability to duplicate the role of men. This gives his concluding analysis a somewhat old-fashioned and at the same time despondent air. The trouble is, he concludes, with a sad bow in the direction of the obvious, "From birth women are involved in a system which tends to

make them think of themselves as feminine." Or, as Mr H. G. Wells more optimistically once observed, "The only difference between men and women is one of sex."

France in Ferment

BETWEEN TWO EMPIRES: A History of French Politicians and People between 1814 and 1848.

By M. D. R. Leys.
Longmans. 276 pages. 25s.

BY 1848 monarchy in France, both neo-Bourbon and quasi-constitutional, had failed: "the time for kings is past," said Thiers, looking to the conservative republic for the salvation of the men of property. Tenacious and fearful, the vested interests, created by the Revolution and consolidated under the first Napoleon, could accept neither Charles X's variations upon the *ancien régime* nor the smug, incompetent autocracy of Louis Philippe. Thirty-six years after Waterloo, a second Napoleon brushed aside the compromised republic and, amid widespread relief, re-established the Empire, the system which least dissatisfied most Frenchmen. Even Bonapartism could hardly survive Sedan, and the Third Republic—founded by dispirited monarchists, led by dukes—revived and perpetuated the restless, superficially unstable France of the Restoration and the July Monarchy.

Here, "between two Empires," lies an absorbing, complex problem in the relations of government and society. Politics were rich in scandal and manoeuvre, in every sort of experiment and absurdity. Under the eyes of the returned and envious *émigrés*, the *France bourgeoise* found itself; socialism and syndicalism were invented, as the masses stirred. The men of letters were never more brilliant or politically-minded. Posturing in and out of office, Chateaubriand personified romantic royalism; the *pays légal*, bullied by Thiers and lectured by Guizot, was depicted by Balzac; while Lafayette, Lamartine and the disciples of Saint-Simon outdid Stendhal's heroes in the ludicrous and extravagant. If France really became bored in these years, it is hard to see why.

Yet in this disappointing book Miss Leys almost succeeds in destroying the attraction of an excellent subject. The problems are half-posed; the suggested solutions talked round and abandoned. Concentrating upon the politicians, she relies upon a pedestrian chronicle, broken by digressions on some of the social questions and by anecdotes which can hardly fail to be agreeable. Analysis is sacrificed to narrative, and historical judgment to an intermittent search for parallels, surface resemblances to a later age. One is grateful for being reminded of a fascinating period in French history; but its interest and its significance are blurred. Far more of the reasons for the failure of constitutional monarchy appear in a few pages of Tocqueville's "Souvenirs" than in this laborious compilation.

A Professor in Fairyland

SURPRISED BY JOY: The Shape of My Early Life.

By C. S. Lewis.
Bles. 224 pages. 15s.

THE first part of the book is a captivating description of a boyhood, written in a prose that is at times distinguished. It is a delicate and wholly convincing portrait of a boy with a vivid imagination, with an appetite for the romantic, yearning after the fairy-tale and the saga without living in the fantasies which they evoked, filled with a sense of "passionate silent gazing at things a long way off." For him the revealing books, at different ages, were "The Tale of Squirrel Nutkin" and "Sohrab and Rustum" and "Myths of the Norsemen," until he grew into the young soldier who, without pretentiousness, could say when he heard the whine of his first bullet, "This is war. This is what Homer wrote about." The portrait is set off by picturesque miniatures of two rugged characters, his father who longed to be friendly but listened to no word that his son said, and the private coach who gave him the true education of his adolescence. For the adult professor, the child's yearning after the magic of Northerners was the instinctive, half-revealing, half-obscure inkling of the quest for the vision of God.

The last chapters contain a much plainer but still interesting account of his passage at Oxford from atheism to theism and then to Christianity by way of the idealistic philosophy still powerful in the early nineteen-twenties. In the middle of the book comes the one passage that wearies the reader. The author spent a year at a school which he decorously, but absurdly conceals as Wyvern. In order to be unhappy at a public school a boy should be intelligent, physically clumsy, and unsettled in his home life; probably any two of these qualifications together would be enough, but Professor Lewis suffered, in various degrees, from all three. His mother had died when he was young, leaving him an "urchin huddling for warmth in a bleak world"; his father was oddly remote; his thumbs possessed no sufficient supply of joints; and his one passion in life was reading. It is not surprising that he hated Wyvern. The trouble is that these descriptions of school life by disgruntled intellectuals read with a monotonous similarity, and this is the only boring part of a book otherwise studded with enchantments.

Sagas Retold

THE ULTIMATE VIKING.

By Eric Linklater.
Macmillan. 304 pages. 21s.

MR LINKLATER has had the idea of putting together the fruits of a long familiarity with the Icelandic Sagas to make a book. He provides a framework for his stories and his reflections by giving them a territorial centre in Orkney. From this centre he ranges

through the ages from prehistoric times to the late war, discoursing on the conditions of life of the Stone Age, elaborating a theory about the mysterious towers or brochs with which the islands abound, and discussing whatever else takes his fancy as he goes along. His history is quite uninhibited, for he claims an amateur's freedom of speculation, and many of his theories will probably not stand up to an expert scrutiny. But they are expressed with such freshness and good humour that they engage sympathy even when they do not enforce assent.

The main purpose of the book, however, is not to speculate about history but to recount the adventures of a long series of Viking rulers and visitors to the islands between the time of Ragnar Hairybreeks, "the first of the Norsemen known by name to come west-over-sea into Orkney" in the sixth century, and Sweyn Asleifson, who was killed in Ireland in one of the last Viking raids six centuries later. This last character, a man of the old northern virtues and vices in a rapidly changing Christian world, is the central figure in the book, and Mr Linklater writes of him with warmth and sympathy as of a man born out of due time. The stories of these adventurers are told in a robust and picturesque way, and the only criticism that can be made of them is that they are better, more memorably and inimitably told in the Sagas themselves. The effect, therefore, to anyone who knows the Sagas will be like that of holding a candle to the sun. But no doubt Mr Linklater will be content if his book introduces others to the literature which he loves, and which can in large part be found in readily accessible translations.

South Sea Islanders

FIJIAN WAY OF LIFE.

By G. K. Roth.
Oxford University Press. 192 pages. 21s.
CHANGING MELANESIA.
By Cyril S. Belshaw.
Oxford University Press. 207 pages.
17s. 6d.

THERE are several kinds of anthropologists. Some are exclusively academic, more concerned with cephalic indices and the groups of relationships within which people may or may not marry than with the things their subjects think and talk about and the things that make them laugh. Others are practical men and women—administrators, missionaries, teachers—who apply their anthropology to their daily work. Of the authors of these two books, Mr Roth's career lies in the Colonial Service and Dr Belshaw has had a few years of administrative experience in a part of the Melanesia with which he is here concerned. Both have thus been able to combine theory with practice.

Mr Roth is admirably qualified to describe the Fijian way of life, not only as for long a member (and now head) of the Fijian Affairs Department of the Government of Fiji but as having a considerable family tradition in cognate

studies. He is dealing with a virile and attractive race not so much in a state of transition as in the happy position of having been able to adjust its own civilisation—at once feudal and communal—to the modern conditions introduced by the white man and to the changes brought about by two world wars. His concise introduction gives a clear-cut "profile" of the colony's general characteristics. The chapter likely to have the greatest appeal to the general reader is the one dealing with the ceremonies that still play so essential and all-pervading a part in the highly ritualised lives of Pacific Islanders. Here the author's illuminating exposition and explanation of customs of such paramount importance to the people are particularly valuable. Not less illuminating are his accounts, free from the jargon with which some of the more theoretical anthropologists tend to obscure their texts, of the structure of Fijian society and the details of village life.

The illustrations brilliantly elucidate the letterpress and the book as a whole is not only an excellent introduction to those visiting this fascinating Pacific colony but an invaluable *vade mecum* for the newly joined Government official, who now has ready to hand the information and knowledge it would otherwise have taken him years to acquire.

Dr Belshaw's book differs from Mr Roth's in being concerned with registering and assessing change whereas Mr Roth's picture is that of a Pacific race that has happily found stability. The parts of Melanesia treated are the British Solomon Islands, French New Caledonia and the Anglo-French Condominium of the New Hebrides. His survey is a wide one: of all its aspects, the last chapter on practical considerations is probably the most valuable to the administrator, one of the categories to which the author addresses himself, and is full of sound appraisals and advice. Another chapter has an interesting analysis of the effects of Christianity on backward and isolated communities.

While Dr Belshaw's volume is somewhat more academic than Mr Roth's and therefore not quite so readable, it is analytical, critical, painstaking, the product of close, careful and worthwhile study. But for a printed book, of 200 pages, to announce itself as "a reduced form of parts of a thesis" conjures up a formidable vision of the powers of expansion which theses for research degrees have now apparently attained.

Shorter Notices

THE ENGINEER. Centenary Number. January, 1956. 15s. to non-subscribers.

The *Engineer*, which celebrates its hundredth birthday on January 4th, is a remarkable paper in many ways—since 1865, for example, it has been edited by one of the most respected dynasties in British journalism. The centenary issue that it produced this week is probably the

most handsome *Engineer* ever, if only for its quite delightful selection of wood engravings of nineteenth-century machines and feats of engineering. These lovingly-detailed illustrations, of which the paper proposes to publish further selections during 1956, and might well consider reproduction in some more permanent record, reflect a wholly different attitude to engineering from that of today—for instance, the remark of an engraver that a new pumping engine house "is of Gothic design, and is very handsome, and has not proved very costly. Many of the details have been studied from Ely Cathedral."

It must be added that they reflected nineteenth-century engineering a great deal better than photographs do today. Technical illustration suffered a blow from the half-tone process from which it has never recovered.

THE MONEY MARKET AND ITS INSTITUTIONS.

By Marcus Nadler, Sipa Heller and Samuel S. Shipman.
Ronald Press Company, New York. 331 pages. \$6.00.

This work by Professor Nadler and two of his colleagues is an admirable example of a book that is both a work of reference and a survey for the more advanced student. It examines the American money market, its connection with the Federal Reserve System and the Treasury and concludes with a valuable survey of New York's role in international finance. The bibliography alone would make it an extremely valuable addition to what is still a small shelf.

Books Received

INPUT-OUTPUT ANALYSIS: *An Appraisal*. Studies in Income and Wealth. Volume 18. By the Conference on Research in Income and Wealth. Princeton University Press. London: Cumberlege.

This book, which was reviewed in our issue of October 15, 1955, is now published in this country.

JUTE, CANVAS AND CORDAGE 1955-56: *Year Book and Directory*. British-Continental Trade Press. 252 pages. 20s.

INTERNATIONAL BIBLIOGRAPHY OF ECONOMICS: *Volume II*. Unesco, Paris. Her Majesty's Stationery Office. 384 pages. 42s.

BENN'S ENCYCLOPAEDIA OF HARDWARE 1956. Benn. 959 pages.

ROME AND CENTRAL ITALY. Edited by L. Russell Muirhead. Blue Guide. Benn. 650 pages. 42s.

THE HOSPITALS YEAR BOOK 1955-56. Edited by J. F. Milne. Advising Editor, S. R. Speller. The Institute of Hospital Administrators. 1,116 pages. 42s.

TARIFF PROCEDURES AND TRADE BARRIERS. By G. A. Elliott. Toronto University Press. London: Cumberlege. 306 pages. 48s.

This book, published under the auspices of the Canadian Institute of International Affairs and the Canadian Tax Foundation, is a study of indirect protection in Canada and the United States.

THE JAPAN ANNUAL 1955. Prepared by The Institute of World Economy, Tokyo. London: Bailey Bros. and Swinfen. 580 pages. 60s.

BON VIVEUR'S LONDON AND THE BRITISH ISLES. Andrew Dakers. 256 pages. 15s.

Letters to the Editor

How to Kill the Purchase Tax

SIR—Ever since you studded my (Merseyside) constituency with cotton mills I have been used to regular inaccuracies in your columns. As one of the not inconsiderable number of MPs who read *The Economist* from cover to cover every week because of its invaluable commentary on current events, I find it a pity to see inaccuracies on subjects one can check for oneself.

In your issue of December 17th I note that you dig out the hoary yarn that in my childhood "if he is to be believed, the things that only the rich were supposed to buy included shoes." These words would suggest that at some time I have made a statement to that effect. Could you kindly give me, in the interests of accuracy, chapter and verse for this suggestion?—Yours faithfully,
HAROLD WILSON
House of Commons, S.W.1

[The occasion on which we are supposed to have "studded [Mr Wilson's] constituency with cotton mills" was apparently in the *nuance*, although certainly not in the text, of an entirely accurate note called "The Anti-Monopoly Party" in our issue of March 5th last (see page 794 of that issue, and Mr Wilson's letter of complaint printed in the following week). The occasion on which we are supposed to have misinterpreted the *nuance* of Mr Wilson's own widely-publicised remarks about his contemporaries who went ill-shod to school was on page 1009 of our issue of December 17th. We are quite willing that anybody who reads these passages, and Mr Wilson's two letters, should act as judge between Mr Wilson and ourselves in comparing our relative senses of accuracy—and humour.—EDITOR.]

Calico Printers

SIR—Will you allow me, as director of a calico printing works until my family sold out in 1952, to comment on Mr Copley's letter in your issue of December 3rd? Mr Copley points out that the levy period of the redundancy scheme has still over four years to run. This conveys the impression that still more money must be raised to pay off the debt. In fact, so good were trade and the sales of plant that the debt was cleared by 1952.

It is up to industry to justify practices that are dangerous to trade in just the same way as, under the firearms law, it is up to an individual to persuade the authorities that he is a fit person to own a rifle. I think that the Calico Printers' Engraving Rental Scheme might pass the

test, but that intransigence on the main issues will not help the Federation.

Mr Copley regards the opinion of the Board of Trade in 1949 (in favour of the printers) as sacrosanct, and the recent decision as nonsense. Are not second thoughts often best?—Yours faithfully,
STEPHEN CAWLEY
Englefield Green, Surrey

Better Neighbours in the Pacific

SIR—Mr Kim's letter of November 26th may lead innocent readers to misunderstand the Japanese attitude towards Korea. *The Economist* suggested that Japan "tread quietly" on the principle of mutual understanding between Japan and her neighbours. Mr Kim observed, however, that to suggest that Japan "tread quietly" was just to urge Japan to hide her aggressive aims for the time being. People who know the real nature of the pacifism and "international co-operationism" now so popular in Japan will realise that the anxiety about Japan's aggressive intentions is unfounded. Nor is it easy to find a genuinely pro-communist trend among Japan's political forces, which are predominantly conservative, while its diplomatic policy is positively pro-western. Under the present Japanese constitution, there is little chance that any authoritarian or aggressive force will attain any substantial influence over Japanese politics in the future.

I agree with Mr Kim that it is unrealistic for Japan to claim 85 per cent of the assets of war-stricken Korea, and the Japanese government has often stressed the possibilities of settling the question in favour of Korea through political consideration. However, a somewhat strained theory of international law is the basis of the Korean claim for reparations from Japan. I am unable to accept the Korean theory, which runs counter to international law and the established principles of laws in civilised nations.—Yours faithfully,

H. SAKURADA,
Professor, Faculty of Law,
Kansai University
London, N.W.11

What Makes a Manager?

SIR—On the first page of your supplement (December 17th) there is a statement likely to mislead your readers. You write:

"Even before the war . . . the—still unorganised—profession of management consultancy made its appearance."

Before the war the profession of management consultancy was unorganised, but it is more likely that people would read that statement in parenthesis as referring to the present time, and this is hardly true.

I am a member of the Consultants' Registration Committee of the British Institute of Management, formed half of industrialists who have had considerable experience of employing management consultants, and half of elected consultants, and set up six years ago to examine the credentials of consultants practising in this country. It made independent reference to their clients, and inquired into the qualifications and experience of each member of their staffs—a much more searching test than is applied to any other register of professional people—and assured itself that for every special technique upon which the firm set out to advise there were men with suitable qualifications and practical experience to give such advice. The committee has held regular meetings since its inception and re-registers every year each consultant firm after an exhaustive review.

One can now say that there is an organised body of management consultants at the disposal of British industry, and that by applying to the BIM, any intending user of consultancy services can obtain a list of approved firms.—Yours faithfully,
J. SANDFORD SMITH
London, S.W.1

SIR—Your supplement (December 17, 1955) was most timely, arriving when the official scheme of management studies is under review. You point out, I believe rightly, that no scheme of studies can make a manager. Is it not correct, however, that unless a systematic appraisal of the "attitudes" and "tools" of management is undertaken, the manager still manages by hunches? If this is so the very large business organisation, with whose problems you mainly deal, may well be able to provide such an appraisal for the potential managers, but the smaller firm—which still constitutes the majority by numbers in the economy—has not the facilities to do so. For the smaller firm in particular the technical college provides this systematic approach and supplements training "on the job." It is not perfect and it will change, but it is essential.

This college is co-operating with the local branch of the Institute of Industrial Administration, in conducting a series of four weekend residential courses for managers and assistant managers. After the first two weekends, which dealt with the theme "Management and Supervision," thirteen out of the thirty attending replied "yes" to the question "have the courses corrected misconceptions which you held?" Here is proof, Sir, that there is room for a variety of approaches and that experiments are still taking place.—Yours faithfully,
JOSEPH LEVESON
Dundee Technical College

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Personalities for the Senate

Washington, D.C.

MR FRANK LAUSCHE, the Democratic Governor of Ohio, who has been regarded as a possible presidential candidate next November, has decided to concentrate, for the present at least, on trying to unseat Mr George Bender, one of Ohio's two Republican Senators. Mr Lausche's plans underline both the dynamic role of a State Governor, and the striking importance of personality in American politics.

The Governor's office is one of great dignity and, in most states, one of substantial political power. It has, however, a serious drawback: neither legally nor humanly can a Governor go on being re-elected. Some state constitutions forbid a Governor to succeed himself; in the remainder tradition and sentiment, surviving from the old jealousy of royal governors and from the principle of rotation of office, prevent a chief executive running for term after term, as do Senators and Congressmen. The American political system has thus accidentally evolved a mechanism which produces a group of men who, having tasted the sweets of senior office, must either get on, by breaking into federal politics, or get out of active political life altogether.

For the Democratic party in recent years the office of Governor has developed a special significance. It is only in statewide elections that the urban voter, who provides much of the Democrats' potential strength, can come into his own. In elections for the state legislatures and the United States House of Representatives constituency boundaries are often drawn in a way which favours the rural vote. In traditionally Republican states, therefore, the Democrats' best hope of raising themselves from the status of a permanent minority has been to capture the governorship and build on its facilities for patronage, publicity and political organisation. Mr Adlai Stevenson's sensational capture of the governorship of Republican Illinois laid the foundation for his rapid advance to national fame, while the classic example of this process has been that of Mr Mennen Williams, the young Governor of Michigan. After serving for two two-year terms as a lone Democrat among the elected officials of the state government, he not only brought off the unusual feat of being elected for a third term in 1954, but carried in with him a completely Democratic government and a virtually unknown Democratic candidate for the Senate.

Governor Lausche's record, also remarkable in its way, is ruefully contrasted by frustrated Democrats with that of Mr Williams. Defying all precedent Mr Lausche has been elected Governor of Ohio no fewer than five times,

while Republicans have been monopolising all other offices. Yet this astonishing man has fought all his campaigns as an individual, has not lifted a finger to help a fellow Democrat running for any other office, and has taken a peculiar pleasure in ignoring the local Democratic organisation when distributing the Governor's patronage. But now he has decided that it would be tempting providence to ask the Ohio voters to elect him Governor for a sixth time and that this year offers the best opportunity for taking the great gamble, for a man who obtains his votes on personality alone, of trying to carry his following with him when he switches to compete for a different office.

★

Mixed though Democrats' feelings are at the idea of so disloyal a son obtaining a major political reward, they cannot deny that he is the man most likely to win them an extra Senate seat; since the Senate is now divided 49 to 47 in their favour, this is something they cannot afford to despise. There will be at least thirty-three Senate seats in the balance next November, sixteen now held by the Democrats and seventeen now held by the Republicans. Eight of the Democratic seats are in the South and, with the possible exception of Kentucky, untouchable; five of the Republican seats are safe for that party. There remain eleven doubtful ones, where the personalities of the candidates may be just as important to the outcome as the general drift of the times.

The four Democratic seats the Republicans might win are in New York, Oregon, Washington and Nevada. Nevada is a very uncertain quantity; politics there are highly personal and the incumbent Democrat has just taken himself out of the race. In the others the Republican chances largely depend on whether three men are willing to stand—Mr Javits, the Attorney General of New York, a popular liberal Republican who would split the Jewish vote, which normally is overwhelmingly Democratic, and the Republican Governors of Oregon and Washington, Mr Patterson and Mr Langlie. None of them is forced to run for election this year by the expiration of the term of his present office; all three are more likely to risk their vote-getting reputations if the pulling power of Mr Eisenhower's name is on the top of the Republican list as presidential candidate. Mr Javits's chances would be greatly enhanced if Senator Lehman, now aged 78, decides to retire. The two Governors can expect no such luck. They would have to fight it out with Senators Morse of Oregon and Magnuson of Washington,

strong incumbents who will almost certainly win if they do not have this particular opposition.

But the seven states the Democrats might gain are even better examples of the importance of picking the right candidate. Apart from Ohio these are Maryland, Connecticut, Illinois, Pennsylvania, California and Idaho. Pennsylvania has in recent years been a success story for the Democrats, a case history of a minority party steadily capturing and consolidating successive bases of power. First in 1950 there was the city of Philadelphia, then in 1954 the governorship, finally last month the retention of Philadelphia in the mayoral election. Next year the Democrats will try to cap their success by putting up the retiring Mayor of Philadelphia, Mr. Clark, against the incumbent Republican Senator, Mr. Duff. By contrast Maryland is a horrible object lesson. Normally a Democratic state, the party there is eating out its soul in apparently unquenchable factional feuds that have now delivered both Senate seats and the governorship into the hands of the Republicans and will probably leave them there for some time to come.

But California, Illinois and Idaho are the most tantalising states for the Democratic strategist. There is little doubt that with strong leadership all three could be brought this year into the Democratic camp. But the astonishing fact is that in the whole state of California, where the Democrats have a majority of nearly a million among party members, no single Democrat with the authentic stuff of leadership can be found, so that it seems now as if the pedestrian and still almost unknown Republican, Senator Kuchel, will be re-elected. Meanwhile, in Illinois, the same people who returned the liberal Democrat, Senator Douglas, with a highly flattering margin in 1954, will be voting next November. The political climate is unlikely to move towards the Republicans, yet the odds are undoubtedly on the incumbent Senator Dirksen, a right-wing Republican of marked if oleaginous personality, unless the Democrats can produce some more inspiring figure than is at present under discussion. If the saying in a British election is that no candidate is worth more than 500 votes, the equivalent in the United States is that you cannot beat somebody with nobody; this remains true even if the somebody is not very much, no more for example than Senator Welker, the Republican who will presumably be running again in Idaho.

How Happy a New Year?

THE New Year is certainly opening well for the American wage-earners who in each of three consecutive months have taken home more money than ever before, as the result of high rates of pay and overtime. They have also been able to buy more with the money than ever before, since the average level of retail prices has gone up hardly at all, and is not expected to for some months. Nevertheless there may be more justification in 1956 than there turned out to be in 1955 for those trade union economists who are again predicting an increase in unemployment. At present it is running at around 2.5 per cent of the labour force, a practical minimum by American standards. But today there is none of the slack in the economy that there was a year ago, to enable the demand

for labour to keep pace with the ever mounting number of those wanting to work. Shortages of materials, especially of steel, and of credit are already hampering the continued growth of industrial production. This does not mean that a decline is coming, but only that in 1956 output is not likely to go on expanding at the almost unbelievable speed of 1955, the most prosperous year America has ever had in which the total gross national product rose to \$387 million.

There is one place in the economic picture where there is no sign of stringency, but unfortunately it is a place where plenty does not bring prosperity—the farm. The final crop report for the year shows that the number of acres planted was less than in any year since 1940 and that the wheat harvest was the smallest for twelve years. Yet output almost equalled 1948's record; when livestock and dairy products are brought into the calculation, 1955's total agricultural production was greater than ever before. The effects of the consequent fall in farm prices and incomes are now spreading through rural communities. There are other slightly ominous signs coming in with the New Year: automobile manufacturers are cutting back output; residential building is not rising as it was; new orders being placed with wholesalers have dropped somewhat.

But these changes are only disturbing declines when compared with rates of increase earlier in 1955; almost all statistical comparisons with a year ago show improvements, except where agriculture is concerned. And in spite of the now obvious danger of price inflation, forecasts for at least the first six months of 1956 are almost uniformly optimistic; after that political uncertainties make prophecy difficult—except in one respect. The fact that 1956 is an election year, and that a balanced budget is in sight, makes it almost inevitable that taxes will be reduced, at least for the lower income groups. There is plenty of argument about when and how, but little, in congressional circles, at least, about whether, this should be done. Lower taxes will encourage consumers to keep on spending and it is on their spending that 1956's prosperity mainly depends.

FOREIGN TRADE of the UNITED STATES
MILLION DOLLARS

House That Ford Built

IN preparation for the sale to the public of more than ten million shares of its common stock on or about January 18th, the Ford Motor Company last week filed a financial statement with the Securities and Exchange Commission. This eagerly awaited forty-page prospectus gave the outside world its first look at the secrets of an industrial empire which, in half a century, has grown from \$28,000 and an idea of genius to a vast enterprise with some fifty-five major plants and assets valued at nearly \$2.5 billion.

The prospectus goes back to 1946, the year in which the Ford Motor Company emerged from a brief postwar spell of heavy losses, was taken over by young Mr Ford and began a period of brilliant performance. Net sales

"Well, Heavens-to-Lizzie!"

in 1946 amounted to \$894 million; in 1953 they attained the record figure of \$4.2 billion, and if sales for the last quarter of the present year match those of the first nine months—which passed the \$4 billion mark—1955 will be the best year yet. For these first nine months of 1955, moreover, profits exceeded \$300 million and the prospectus shows why investors all over the United States are so anxious to acquire even a small lot of Ford shares, 3 million more of which are being sold than had been planned. They have a par value of \$5 and it is expected that they will be offered at a price of between \$70 and \$80 a share. Dividends in 1955 came to \$3.27 a share and the company has already announced its intention of paying a 60 cent dividend for the first quarter of 1956.

Without in any way detracting from the soundness of the

Ford empire or from its future prospects, it becomes possible to understand why the company and the Ford Foundation, whose stock is being sold, chose the present moment for the transaction. Had the prospectus been issued a year earlier the statutory obligation to list figures for the past ten years would have allowed the investor to look at a much less happy stage in the company's affairs. The last decade, in which net profits have amounted to more than \$1.5 billion, has been a uniquely brilliant one for the American automobile industry. Whether this pace can be maintained remains to be seen and even some of the more optimistic manufacturers frankly admit that 1956 may bring retrenchment. In view of all this, the Ford Company could not have chosen a better moment to show its books—and they are, indeed, exciting to read.

Teething Troubles

SODIUM FLUORIDE, a somewhat mysterious chemical which helps to develop teeth resistant to decay, is a burning social and political issue in many American communities. The benefits of fluorine were first discovered in 1928; sodium fluoride, added to drinking water at a rate of about 19 pounds in a million gallons, is at present being imbibed by some 22 million Americans in 1,123 towns and cities. Last week, moreover, results were published of a ten-year controlled experiment performed in two towns in New York State. In Newburgh, where there has been fluoridation, children between six and nine years old showed 58 per cent less dental decay than children of the same age group in neighbouring Kingston, with its untreated water. Among ten- to twelve-year-olds Newburgh's record was 52 per cent better. Thorough medical tests showed that those children who had been exposed to fluorine showed no ill effects whatever.

Ordinarily, such results might be expected to persuade the rest of the United States to follow suit. In fact, however, opposition to fluoridation is virulent and is founded on a series of arguments ranging from the scientific to the nakedly political. Despite assurances from the highest medical and dental authorities, many local physicians continue to preach the dangers of "fluorine poisoning." They are undeterred by the fact that chlorine, which is used to disinfect water supplies, is also a poison if given in sufficient doses, and they argue that ill effects may take longer than ten years to make themselves felt. In many town meetings, moreover, the level of scientific discussion is quickly abandoned and opponents of fluoridation simply denounce it as an example of "socialised medicine" and "state control" over the wishes of the individual citizen. If a red-blooded American does not wish to avoid dental cavities that, they say, is his constitutional right. In many communities those who are in favour of fluoridation are promptly classed with "left-wingers" and people who support Unesco and other "nefarious" causes.

In the long run good sense will prevail in more and more places. After hearing the results of the Newburgh-Kingston test, the board of health in New York City recommended that fluoridation be begun at once. Another 400 cities, including Chicago and Philadelphia, are preparing to do the same. But more than half of 231 communities in which the question has been put to a referendum have voted against

it and in some places fluoridation has been abandoned after being used for years. Sometimes a single wireless commentator or local politician, utterly ignorant of the medical facts, has turned the tide. Decayed teeth may be one of the tributes that have to be paid to the principles of popular democracy—but there is a way out: at least one major tooth-paste contains fluorine and statistics suggest that for adults this has even more effect than fluoridated drinking water.

No Dealer's Choice

IN its feverish efforts to sell seven or eight million new cars a year to a country which is already on wheels, the American automobile industry relies heavily on the retail dealer. That the dealer's lot is not always a happy one was suggested in the course of an inquiry into the General Motors Corporation which was conducted recently by a Senate sub-committee considering anti-trust questions. Originally, this inquiry was intended to study the effects on the American economy of the sheer size and ramifications of its largest industrial corporation, but attention soon focused on the relations between General Motors and its 17,000 dealers.

A number of them came forward to testify that they were being driven into unsound practices by the company's relentless injunction to sell more and more automobiles. They claimed that, to meet quotas set in Detroit, they had to extend fantastic credit to their customers, to offer ever-increasing prices for traded-in cars, and to cut their own profit margins to a bare minimum. Moreover, several dealers stated that General Motors was compelling them to accept expensive accessories with the new cars even though there was no demand for them. In spite of all this, they complained, General Motors simply suspends a dealer's franchise if his sales figures prove unsatisfactory.

Mr Harlow Curtice, the president of General Motors, and several of his senior colleagues stoutly defended their company's practices. They argued that selling automobiles was a fiercely competitive business and that dealers only lost their franchises if their performance was demonstrably falling below the national average. They pointed out, moreover, that since 1940 the investments of General Motors dealers in their businesses have grown from \$249 million to more than \$2.2 billion—largely from reinvested earnings. Nevertheless, in order to clear up "misunderstanding" created by the hearings, General Motors announced that it would henceforth offer its dealers five-year agreements to replace the present one-year contracts.

Senator Joseph O'Mahoney, chairman of the sub-committee, called this change "a step in the right direction," but urged General Motors to work out a less unilateral arrangement with the harassed men who sell its automobiles. Senator O'Mahoney is a veteran trust-hunter and it is curious that he should not have touched on the fact that nearly all of America's 40,000 automobile dealers are "exclusive" in that each works solely for a given manufacturer. Whether this arrangement does not constitute a restraint of trade is a legal question which hangs over the entire industry and which the Supreme Court may, before too long, be called upon to decide.

Museum Comes to Life

THE New York Museum of Modern Art commissioned its Calder mobile, the hanging construction of wire and gaily coloured metal plates which casts hovering shadows on the staircase wall, in 1939. It took fourteen years for mobiles to become a commercial proposition: 1953 was the year when every well-equipped nursery had a celluloid cow jumping over a plastic moon suspended on wires from its ceiling and every privileged débutante had rhinestones fluttering on silver threads from her ears. Now mobiles have been banished to the advertising doldrums of drug store displays. The latest thing in window-dressing in New York in 1955 was, it is reported, the Christmas story set in the familiar surroundings of the city's slums, in keeping with the recent return to realism in art.

That commerce should now be taking five instead of fifteen years to react to current artistic trends is a tribute to the influence of the Museum of Modern Art, although it does not deserve, or claim, all the credit. Glass walls in mass-produced houses, kitchen towels after Braque, bottles of perfume poised surrealistically on the seashore in magazine advertising pages, the Picasso on the wall which is now as valued a social and material asset as a diamond on the finger, all spring from postwar prosperity and competitive efforts to tempt the jaded consumer. But the war which cut off new ideas from Europe and sent European artists and art dealers to the United States forced American designers to seek inspiration at home. Together these developments have brought taste and discrimination—although often, it must be admitted, vulgarity as well—to the counters of luxury shops and super-markets alike.

When the war began the Museum of Modern Art, then only ten years old, in its new, contemporary building on 53rd Street, just off the most elegant part of Fifth Avenue, was ready not only to be an important source of ideas but also to make them respectable. It has arranged competitions for the best looking and most practical chair or electric fitting, with a manufacturer undertaking to produce the winning article commercially; in co-operation with Chicago's famous furniture centre, twice a year during the five years just ended, the museum has organised "good design awards" for household articles, often of the simplest kind—cutlery, for example—which are available to, and bought by, ordinary shoppers. The museum itself has been responsible for exhibitions of motor cars, of toys, and once of all the activities of an Italian firm, from workers' houses to the end product, typewriters, in order to show what can be done in these fields.

In applied design the museum frankly and with success tries to give a lead. In the other visual arts it only aims to introduce the visitor to modern movements, without necessarily giving them its approval. It has often included in its loan exhibitions of painting, sculpture and architecture the works of foreign artists when they were still considered rabid revolutionaries in their own countries. The museum shows photographs and films from its comprehensive collection, publishes scholarly books, has a lending scheme under which pictures can be rented from commercial galleries for private houses and institutions, holds art classes for amateurs of all ages, and provides a club room and cafeteria for its members. It is, in fact, a community centre,

but catering for a less specialised community than might be expected. The welcoming, lively atmosphere of this museum has drawn to it many people who go on coming even though they was at first, and perhaps still are, frankly appalled by what they found in its main galleries and its peaceful garden.

These contain the basic material of the whole enterprise, the representative collection of paintings, prints and sculpture, from Cezanne and Rodin to Mondrian and Reg Butler, a range that is fully described and illustrated in the admirable volume with which the museum celebrated its first stimulating quarter of a century.* Originally the museum, recognising the difficulty of assessing the lasting value of current works of art, and feeling that uninhibited experiment should guide the choice of exhibits, did not intend to establish a permanent collection. Works eventually thought worth keeping for ever were to go to other museums. But it has now been decided that a few exceptional pictures and statues, all produced since 1875, should be held permanently, to set the background for today's trends.

The selection which the museum is showing in London next week (at the Tate Gallery until mid-February), after a tour of other European cities, is from paintings and prints by American artists, one of the less known parts of its collection. This exhibition of work done since 1910, and almost entirely unfamiliar outside the United States, is part of the museum's latest enterprise, its international exhibitions programme, financed by a grant from a private foundation to enable the art of the United States to be shown abroad and work from abroad to tour the United States.

The museum has often before organised travelling exhibits within the United States. Indeed the rentals paid for these are one of its sources of revenue. Funds also come from payments for other services rendered, from the sale of publications, from individual and corporate subscriptions—the museum has 20,000 members—and from ordinary admissions; about 700,000 people visited the museum last year and some 25 shows are put on annually. Altogether the museum earns about two-thirds of its revenues; the rest comes from private contributions, sometimes in money, sometimes in work. Some members of the staff have been able to afford to give their services free, a system which is not without its drawbacks. Although it benefits from tax concessions, the museum receives no direct assistance from government funds, whether city, state or federal, except in connection with special duties which it sometimes undertakes. It has, of course, had many substantial benefactions; it was founded by three rich and enterprising women; the building, which is such an important asset to its work, was presented. But running expenses, and the cost of new acquisitions, are nevertheless a problem for this as for other museums.

It is not one, however, which is likely to defeat a project which was begun in 1929 and grew up in the depression years. Then Americans were generally artistically behind Europeans both in experiment and in experience. Today they are second to none in their appreciation of the arts, whether pure or applied. This is the measure of how the museum has, not without controversy, always with enthusiasm and imagination, achieved its purpose: "to help people enjoy, understand and use the visual arts of our time."

*"Masters of Modern Art." By Alfred H. Barr, Jr. New York. *The Museum of Modern Art*. Distributed by Simon and Schuster, New York. 240 pages and 356 plates. £5 5s. \$15.00.

SHORTER NOTES

The expert report on American agriculture from the Twentieth Century Fund, which was recommended in "Long Look at the Farms," on page 1030 of *The Economist* of December 17th, is published in New York by the Fund, at \$5, under the title, "Can we Solve the Farm Problem?" by Murray R. Benedict.

★

The Federal Power Commission has authorised the Pacific Northwest Pipeline Corporation to import natural gas from Canada to supplement the supplies it is bringing up from New Mexico and Colorado. There now seems no obstacle in the way of the provision, after years of discussion, of natural gas for Oregon and Washington, the last important area in the United States to be without this fuel. It is expected to be available next summer, although the Canadian supplies will not come in until 1957.

★

A trial, for murder, in Texas, has been televised for the first time. The camera was placed behind the jury, to protect their privacy, and the sound of its turning does not seem to have been disturbing. The audience was said to number about 200,000 and to include students in civics classes. From all reports the dignity of the court was not upset as the American Bar Association had predicted when it condemned the televising of such proceedings.

★

Eggs are to be sold in individual plastic packets instead of fragile shells; the new type of unbreakable packaging will be carried out by machines, not by hens, and the yolks and whites will be transferred to their new covering without being mixed, or touched by human hand. It is thought that the new looking eggs will be sold more cheaply than in their traditional form, since they will be easier to handle.

★

The Department of Labour has produced a study on productivity in manufacturing industry which puts the annual increase between 1947 and 1953 at an average of about 3.3 per cent, which is just about what it has been ever since 1909. A somewhat similar study by a congressional committee suggests that there has been a marked advance in the annual rate of increase in productivity during the postwar period in employment outside of factories and off farms.

★

A plan has been worked out for a double pipeline, for oil and natural gas, to be laid underwater off the Louisiana coast of the Gulf of Mexico. This would collect the output of the increasing number of offshore wells; at present barges are the only, and very expensive, method of bringing this oil and gas to dry land.

★

A shortage of pennies—one cent pieces—has forced the United States Mint to suspend production of all other coins—nickels, dimes and half dollars—and turn its thoughts only to pennies.

The World Overseas

Communist Undertow in Singapore

FROM A CORRESPONDENT IN SINGAPORE

THE Special Branch of the Singapore police began its battle with Communism in 1927. It is believed that one of the earlier gambits of the chief of the Branch was to introduce Loi Tak into the Malayan Communist party in 1934/35; he was subsequently gratified to learn of his agent's election as Secretary-General in 1939. As a move in the game, the selection of Loi Tak might be described as masterly. It represented, however, a higher standard of play than could well be maintained after Loi Tak's disappearance (with the funds) in 1947. The achievement of the police in G. K. Chesterton's novel—in which *all* the members of the Anarchist Council turned out to be detectives—has not been repeated in real life. The Singapore Communists are now to be numbered in thousands. Since the time when they tried to murder the last Governor but one, their methods have been outwardly peaceful. But that does not mean that they are inactive.

The crucial moment in a revolution is reached when the government of the day can or will no longer protect its friends. After a Strafford has been thrown to the wolves, the execution of Charles I is only a question of time. In that sense revolutions are caused by the power against which they are directed. The unrest in Singapore arises mainly from the British promise of self-government — to the Chinese-speaking a sign of weakness, to the English-speaking a mere betrayal. There is here a marked contrast with Hongkong, where the absence of unrest is due, at least in part, to the British decision to maintain direct rule. As seen on the map, Hongkong appears more perilously isolated than Singapore. But the local Chinese are less impressed by this than by the spectacle of the British flag apparently nailed to the mast. While it is immovable at the mast-head they can afford to be loyal to it. Once it begins to descend, if only by inches, they must look elsewhere for protection.

Logically, the position in Singapore and Hongkong is exactly the same. The flag was hoisted in both places before the population arrived. All who landed in either place stepped on to British soil, choosing to do so because it was British. If disappointed, they were (and are) perfectly free to go elsewhere or go home. They are not free to complain that the territory is under British rule, for they or their ancestors were perfectly aware of that when they chose to settle. This they would mostly admit. That Britain could not protect them against the Japanese in 1941-42, they apparently forgive. What they cannot do is support a regime which is intent on suicide.

Communism in Singapore, like patriotism in Hongkong, thus owes its strength to British policy. It owes its recruitment to the Chinese secondary schools and especially to four of them. Of the ill-paid and ill-qualified Chinese teachers, a fair proportion are Communist and a larger proportion intimidated by their Communist pupils. Of the pupils, a proportion are of the professional student type, with ages ranging up to twenty-two or more. Over pupils of this kind, no head teacher has any authority. Nor would he be supported against them by the terrified tradesmen of his School Board. Chinese businessmen dare not openly oppose the activities of those who may be ruling Singapore tomorrow.

Communism is a religion, and its religious opponents, Catholic or Methodist, would ordinarily rally to the British flag. These are free at least from the prevailing desire to be on the winning side. The non-Communist electorate should also be strengthened by the output from the English schools, more especially from about 1960. But the focus of loyalty—the Queen, the flag, the national anthem, revered as recently as 1950—has been virtually withdrawn. The elements of opposition to Communism exist but have lost their centre of positive allegiance. Can they find another? Is there time to create a local patriotism to replace the loyalty that is gone? For any such rallying of local sentiment, time is desperately short.

The likelihood is that no reaction against Communism will gather strength until more of the disadvantages of Communism have been experienced or at least perceived. The final objection to Singapore going Communist is that it would then cease to exist. Defence against Communism may rest ultimately not in the hearts and minds of the people but in the nature of the facts. For Singapore, depending as it does on trade with Britain and the United States, can no more afford to quarrel with these powers than it can afford to quarrel openly with China. For Singapore the motto should be that the customer is always right. This lesson may have to be learnt from the sagging graphs and empty bellies of a declining trade. The mischief is, however, that such a decline, effective as it may be as a warning, is easier to cause than to reverse. The lesson, when learnt, may be learnt too late.

For there is, after all, no particular reason why the dotted lines on the map should converge on Singapore. The oceanic ships might call instead at Sandakan, where the oil of Brunei is close at hand. The international airlines could

shift their routes and find a new centre at Labuan—they might do so in any case for reasons merely geographic. The Malayan exports of tin and rubber might reach the sea at Port Swettenham. The Straits Trading Company might decide to do its smelting at, say, Klang. Singapore might become so insignificant that no one would notice whether it was a red republic or not. It is to be hoped that its citizens will see the danger in time.

Atomic Co-operation

ON Wednesday the Organisation for European Economic Co-operation released a report on the possibilities for co-operative action in the development of nuclear energy. It is the fruit of six months of study and soundings in twelve European capitals, by a three-man working party of the organisation. During January the OEEC Council will decide what action to take on the suggestions which the working party has put forward.

The somewhat unusual procedure of releasing the report before it was considered by the Council was presumably adopted to gain a public hearing for a possible alternative to the "Euratom" proposals drawn up, practically simultaneously, by the group which has been meeting in Brussels under M. Spaak's direction in accordance with the Messina decision of "the Six." At one time it seemed probable that the Spaak committee would report to the foreign ministers of the Six before the OEEC had completed its study. But the fall of the French government interrupted its work and the two reports will now come up for decision at approximately the same time. Although the advocates of the more supranational "Euratom" undoubtedly hoped for a prior consideration of their proposals, there is much to be said for having the principal elements of an alternative scheme written down for all to see rather than lurking disturbingly in the background. And, in spite of the differences of view between the two groups on precisely how Western Europe should organise itself to exploit most efficiently the possibilities of the nuclear age, the OEEC document should do much to increase public understanding of why joint action is necessary.

Fissile or Fertile

The report of the OEEC starts off with a lucid summary of the steps in the production of nuclear energy which the layman must understand before he can begin to think intelligently about the problem of international co-operation. It describes what a reactor, or atomic pile, is and what it does. It also explains the difference between "fissile" materials which are directly usable in a bomb as well as for fuel in a reactor and "fertile" materials which must be processed before they become as efficient a fuel or usable in a bomb. The fissile materials are U-235, a constituent of natural uranium, and plutonium and uranium 233 which do not exist in the natural state but can be produced from the "fertile" materials U-238, the plentiful constituent of natural uranium (139 parts of U-238 to 1 part of U-235) and thorium. Natural uranium, although used in existing reactors, if "enriched" with U-235 by an extremely costly "separation" process becomes not only a far

more efficient fuel but also bomb material. The report thus clarifies what has too frequently been obscured—that an adequate programme for the production of nuclear energy for peaceful purposes inevitably means the production (in a reactor or in a separation plant) of "atomic bomb" material.

From this report, from the earlier OEEC study of the energy resources of Western Europe (the Armand report), and from what is known of the "Euratom" proposals there would now appear to be much common ground among the experts on the dimensions of the problem, and widespread agreement that Europe's industrial future may well depend on the development, without more delay, of an adequate nuclear power programme. There is also general agreement that the staggering capital expenditures, the potential rewards of more extensive experimentation than most countries can afford, and the security implications, all point to some pooling of effort.

The divergence of views arises over whether to rely essentially on co-operation among governments or to establish an atomic community to which governments would assign by treaty certain sovereign powers, as they have already done in the case of the Coal and Steel Community. The alternative proposed by the OEEC stops some way short of the supranational, or federal, solution urged by M. Spaak and M. Monnet, but contains proposals which, if adopted, would break new ground in co-operation among governments.

How much Control?

Briefly the scheme proposed to the OEEC Council by the working group calls for a high level Steering Committee for Nuclear Energy which would be set up by the Council and would be responsible to it; a Control Bureau, also within the organisation and responsible to the Council; and "joint companies" which would carry out certain types of production and applied research. National development programmes and investment projects would be submitted by the member countries and discussed in the Steering Committee with a view to eliminating duplication and avoiding serious gaps. The Steering Committee would also stimulate the establishment of joint companies, but once established these would be independent of it and the Council.

The report has only tentative suggestions to make as to whether the joint companies would be analogous to international joint stock companies or intergovernmental agencies, or a mixture of the two. And it becomes even more sketchy and tentative when it turns to the problem of the control of fissile material. The underlying principle is that control should be maintained over the output of the "joint companies" but not over other fissile material. Since the one thing that is completely clear is that the construction of a separation plant, the principal source of fissile material, would have to be undertaken by a joint company, this is probably a better principle than it at first appears, particularly since virtually all other fissile material is already covered by bilateral undertakings with the United States.

There are many loose ends in the report and it is far from being a definitive blueprint. In many respects the assumption that national responsibilities should not be impaired, from which the OEEC group starts, makes it more difficult to find adequate yet simple answers than does the more radical assumption from which the "Spaak

committee" starts. Both groups still leave room for ingenuity and invention. But it is already clear that when the definitive discussions among governments begin late in January the participants will realise that their task is to find the best means of co-operation, not simply to examine the question of whether anything needs to be done. The need has been amply demonstrated.

Echoes From Muscat

THE singularly bloodless desert operation (one shot fired, no casualties) carried out before Christmas in the sultanate of Muscat and Oman seems to have provided grist to a variety of propaganda mills. The Sultan can hardly have expected, when he sent a small force to assert his authority in the almost empty interior, that it would stir up international dust clouds as well as local ones. At its approach to the old fort of Nazwa, the Imam who had been trying to organise a separatist movement among some of the nomadic tribesmen found his followers melting away, and prudently made off by way of a window at the back. The local chiefs lost no time in protesting their loyalty to the Sultan, and that, it seemed for the moment, was that.

However, the echoes of that one shot reverberated as far away as New York, where Mr Abdel Rahman Azzam, the active and eloquent Egyptian who was formerly secretary-general of the Arab League, now appeared as an official spokesman for Saudi Arabia, and publicly accused Britain of having "invaded the independent state of Oman." The Sultan of Muscat and Oman certainly enjoys British protection and assistance, and there are British officers in his modest forces; but the "independent state of Oman" is an entity whose status and extent would be hard to define. Even its Saudi patrons do not appear to have maintained a diplomatic mission in its capital, wherever they think that was.

Quick on cue, the Soviet press and Moscow radio were busy last week linking this "aggression against Oman, on which Britain is trying to impose its domination," with the earlier affair at the Buraimi oasis, where a Saudi emissary who had moved in with armed escort and bulging money-bags failed to browbeat or buy over the local population and was eventually ejected. There is, indeed, a connection between the two affairs, but hardly of the kind the Russian commentators were thinking of. Recent prospecting in the hinterland of Muscat and the sheikhdoms to the west has quickened Saudi Arabia's interest in these small neighbours. Although their coffers are already bursting with oil revenues, the Saudis seem unable to bear the possibility of royalties from wells so near at hand going to others, and their obvious remedy is to push their frontiers forward, occupying an

oasis here, devising and sponsoring an "independent state" there. Their activities have enabled Moscow to talk gleefully of "the struggle between Britain and America" over Arabian oil. There is, however, a flaw in the Soviet commentators' simple picture: American companies are at work not only on Saudi territory, but also on that of the Sultan and the sheikhs.

Hard Choice for Israel

FROM OUR CORRESPONDENT IN TEL AVIV

THE Israeli economy has been spared sudden jolts during the last couple of years. The "new economic policy" introduced in 1952 fixed the exchange rate between the dollar and Israeli pound at a fairly realistic level. Imports of raw materials and machinery allowed factories and farms to work steadily. Ample supplies of finished goods made rationing unnecessary and kept prices steady. Production in agriculture and industry rose and even the balance of payments improved as exports expanded.

This improvement was due to several factors. First, as capital investments began to mature, a steady increase in supplies, both for the internal market and for export resulted; second, German reparation payments, in the form of capital goods, raw materials and consumer goods reached the market; third, mass-immigration, which earlier had made such colossal demands on the economy, came to a standstill. There remained, it is true, a good many people in transit camps and full employment was made possible only through emergency schemes. Moreover, the deficit in the balance of payments still amounted to more than \$200 million a year. Nevertheless the economic future seemed more promising than ever before.

But the Israeli economy now seems to be faced with another period of upheaval. The first storm signals appeared last July during the closing stages of the election campaign for the third Knesset. Prices, which had been fairly stable until then, suddenly began to rise and an energetic campaign for raising basic wages, which was carried on by the left-wing parties, Achduth Avodah and Mapam, created a restless mood among the workers. Immediately after the elections the government raised both the taxes on building-materials and the customs duties on a number of consumer goods. These measures caused an outcry and strengthened the Left's campaign for higher wages, but the government maintained that in order to avert inflation it must syphon off superfluous purchasing power.

Disquiet over Taxes

But that this was only one of its motives became clear when the Minister of Finance tabled a supplementary budget of £113 million. In addition, he asked for £23.5 million to buy shares of the Electric Corporation as well as the sum of £25 million which is now being collected by public subscription for buying arms. The ordinary budget for 1955-56 which amounts to £633 million, is, therefore, being increased by £161.5 million, and as most of the extra money has already been spent the Knesset will have no choice but to confirm the additional expenditure. This sup-

plementary budget showed that the government has in fact spent much more than it was entitled to do. Housing schemes have been pushed forward too quickly and emergency schemes have been launched to forestall unemployment. The Minister of Finance tried to silence his opponents by announcing that the supplementary budget did not require new taxes. But the public knows quite well that new taxes and customs had been introduced only a short while previously and it fears that the promises to ease taxation will not now be kept.

On top of the budget difficulties comes the demand for an increase in basic wages. During the last two years the Labour Federation, under the leadership of Mapai, has stuck to the principle that wages should be raised only if it could be proved that productivity had also risen. In spite of this, wages in many branches of industry have been adjusted by improving social services, by the introduction of overtime or in similar ways. The Minister of Finance has strongly denounced wage claims at the present juncture and although he has been supported by many fellow members of Mapai, some leaders of the party are afraid that a stand against wage claims will not be understood by the rank and file. Moreover they do not forget that Mapai lost a good deal of ground during the last elections.

The wage issue is complicated by the "revolt of the professions." Those members of the professions who are employed by the government, the municipalities or the Labour Federation have suffered heavily during recent years by the peculiar way in which wages and salaries are linked to the cost-of-living index. Since increases in the index are made good in full only for the lower wage-levels, differentials in wages and salaries have been seriously narrowed. Physicians, lawyers, architects, university professors, have fought strongly for decent salaries and have even on occasion gone on strike. A commission appointed by the government to study their grievances proposed a new salary scale. But when this was accepted by the government — with certain changes and after endless delays — Mr Moshe Sharret, who was then Prime Minister, also granted increases to the lower grades of government officials. And the Minister of Finance has, somewhat unreasonably, appealed to those in the higher grades to waive half of the salary increases promised to them so that it will be easier to fight wage demands all along the line.

Reckoning with the Left

Almost everybody, except the left-wing parties, are agreed that an increase in basic wages now would mean runaway inflation. But the matter will be decided on political not economic grounds. The Labour Federation in Israel is so powerful that nothing which it opposes will be carried out. The leaders of Mapai will try to delay a decision until the spring so that they have more time to work out a solution which will both avoid inflation and yet not give too much scope to left-wing propagandists. But they must certainly reckon with the latter. Achduth Avodah and Mapam today sit in the cabinet and nobody wants a government crisis just now. It is significant, however, that the Minister of Finance has got into touch with the General Zionists—although they are now in opposition—in order to secure their help in fighting wage demands.

In addition to heavy government expenditure and the threat of higher wage claims there is also the growing expenditure on arms and a new increase in immigration. This

year the number of immigrants will reach 45,000, mainly from Morocco, and some people even clamour for 60,000 immigrants a year. This means higher expenditure on transport, reception camps, housing, emergency jobs and settlement. It is doubtful whether the Israeli economy—in spite of help from abroad—will be able to bear this double burden of higher defence spending and increased immigration without sacrificing part of the development projects which are needed to absorb the immigration. Leaders of all parties continue to demand defence and immigration in the same breath as development. But sooner or later they will be forced to make their choice between these conflicting ends.

German Socialists Watch Their Ranks

ONE good result of Mr Molotov's blank refusal to allow free elections in all Germany, and Herr Ulbricht's threats to communise the whole country is to be seen in the German Social-Democratic party. Herr Ollenhauer, in the post-Geneva debate in the Bundestag, for the first time gave an unequivocal pledge not to accept Communist terms, and his party is now preparing to combat the steady infiltration of Communists into its ranks. This is part of a decision to concentrate on internal policy, which will be laid down at the next congress in January. The Social-Democrat leaders have reached a dead end in their demands for a "German plan" for reunion. They are continuing to press Dr Adenauer to take the initiative with the Russians, on the principle—so dear to German hearts—that "something must be done, even if we do not know what"; but long overdue thought is now being given to the role of the Socialists as a labour party which will probably join a new coalition government after the 1957 general election.

There is nothing revolutionary about the German Socialists' home programme, which is adjusted to the fact that Professor Erhard's liberal economy has been an

admitted success. In the eyes of even the right wing of British Labour, the programme is indeed decidedly conservative. It calls for a moderate dose of planning, with plenty of competition, and for the nationalisation of only the basic industries. In the sphere of social welfare, the Socialists will lead a much-needed campaign to clear up the jungle of different overlapping schemes, through which only a dedicated expert can at present find his way. And they will fire some bigger guns than hitherto in the traditional struggle against Catholic schools.

Efforts were first made to prevent Communist infiltration at the beginning of this year, when it became known that the East German leaders had ordered a renewed drive to capture the trade unions and the Social-Democratic party. At first, the SPD expelled members who went without permission on any of the innumerable Communist-organised visits to the Soviet zone. This sanction has had to be dropped, not least because it is harder to convince German workmen that they should ostracise their fellow-countrymen in the Communist zone, now that the Soviet leaders have been invited to Britain and President Eisenhower has publicly embraced Marshal Bulganin. Instead, an attempt is to be made to prepare the western trippers to meet Communist dialectics and showpieces, and also to convince any delegations from Eastern Germany which make a return visit.

The German trade union federation is also overhauling its defences against the Communists in the factories. A very healthy shock was felt at the news that a majority of Communists had been elected to the works council of a big steel plant, where the known party members are in a small minority. By British standards, this victory seems puny, but the Germans' reaction was not exaggerated, in view of the peculiar danger to which their divided country is exposed.

Uruguay's Economic Headaches

BY A CORRESPONDENT

URUGUAY, still the most stable democracy in South America, faces a new situation after the dramatic upheavals on the opposite bank of the River Plate. In one way, it can hope to gain from the change of regime in Argentina for, with the improvement in diplomatic relations between the two countries and the partial lifting of exchange restrictions, the once lucrative flow of tourist traffic from Argentina to the beaches of Uruguay will probably be resumed. But in another and more significant way the recent changes in Argentine policy will adversely affect Uruguay. The devaluation of the Argentine peso will increase that country's ability to sell its products in foreign markets and, as many of these products are directly competitive with Uruguayan exports, Uruguay, in the interests of its own export trade, may well have to follow suit.

During the immediate postwar years and again during the Korean war, Uruguay profited from high prices and sustained demand for its major exports. Recently, however, the position has changed. World prices for many agricultural products have declined, and the problem is often one of surplus rather than of shortage. The relative rigidity

of its prices and mistaken agricultural policies have increased Uruguay's difficulties and tended to price it out of world markets. Last season, for example, Uruguayan wool producers refused to accept the prices offered, with the result that at the end of the season, on September 30th, about one-third of the clip remained unsold, while much of the rest had to be disposed of at prices lower than those that had been rejected some months earlier. A belated attempt to promote sales of wool by conceding a more favourable rate of exchange for wool provided only a partial solution to the problem.

The major error in agricultural policy during recent years has been the encouragement, through the establishment of relatively high support prices, of wheat production at the expense of cattle raising. This has caused both a severe crisis in the livestock industry, and a substantial increase in official holdings of wheat, which at the present rate of exchange, can only be sold abroad at prices too low to cover the sums paid out to the farmers. The shortage of cattle has meant insufficient supplies to the home market, the inactivity over long periods of the meat packing plants, and discontent among employees in the meat trade. It has also caused Uruguay to take the unprecedented step of approaching Argentina to supply 60,000 head of cattle for processing. In view of Argentina's present position, such a move can only be explained as a gesture of friendship on the part of the new regime and, even if carried through, can only provide a temporary solution to Uruguay's difficulties. By lowering the guaranteed minimum prices for wheat, the Uruguayan authorities have shown their realisation of past unwisdom but it will naturally be some years before the livestock population can again be built up.

Threat of Financial Chaos

The declining export trade has not only led to a drastic pruning of imports but has also caused severe financial embarrassment to the government. Much of the revenue required to maintain the highly-developed welfare system and to provide a degree of protection for high-cost domestic industries was previously derived from duties upon foreign trade and from the operation of a multiple exchange system. The revenue from duties has, however, fallen along with the decline in foreign trade, and the profit from exchange operations has largely vanished as a result of the granting of more favourable exchange rates for a number of export products.

So far there has been no modification of financial policy to meet the changed circumstances. Nor has there been any attempt to correct the basically anomalous position in which the constant demands of the welfare state are largely met by revenue derived from foreign trade operations—revenue which is necessarily subject to repeated and at times substantial fluctuations. It has long been an article of faith in the Batllista party that a tax on personal incomes should not be introduced, but it is hard to see how the imposition of such a tax can be deferred for long without producing financial chaos. Meanwhile, although various measures have been submitted to Congress, no major increase in the level of indirect taxation has yet been sanctioned. Mounting deficits in the public finances have been met by a series of *ad hoc* measures, mainly short-term borrowing, and this, together with the increased price of imported goods, has led to a pronounced rise in the cost of living and to widespread labour unrest.

The case of *Blatella germanica*...

The cockroach has always sailed the seven seas, infesting ships' galleys and quarters, fouling food supplies, spreading disease and creating discomfort by its presence. Until a few years ago the control measures available rarely eliminated this very persistent pest, and had to be repeated at short intervals. But now, for the first time in history, seafaring cockroaches are being dealt with ruthlessly, by a revolutionary combination of insecticides and transparent lacquer.

The insecticides used in this remarkable development are aldrin and dieldrin, products of Shell, and much of Britain's great mercantile fleet is already 'de-cockroached' by dieldrin treatment. The surface layer of insecticidal crystals is constantly renewed from within the lacquer — even the friction caused by the movement of an insect over the surface has this replenishing effect.

However heavy the infestation, one lacquering with aldrin and dieldrin means 100% control — and a clean ship for at least two years.

Aldrin and dieldrin tackle insect pests with unrivalled effect and economy. Their surer kill is achieved with lower dosages. Their wider range includes many pests never before dealt with satisfactorily. Aldrin is fast becoming recognised as the best of all soil insecticides; dieldrin as the best control for weevils, beetles, flies, etc., on foliage. It is also extensively used as a residual spray against disease-carrying insects.

Have you a stubborn pest problem to be solved?

aldrin & dieldrin

aldrin and dieldrin are  insecticides for world-wide use

MORE POWER AT LOWER COST

The Deltic is the smallest and lightest diesel made, in relation to its power. This means higher speeds for naval craft and more cargo space in freighters. The facilities for 'overhaul by replacement' which are available to users of the engine mean a shorter lay up and more sea-time for all Deltic-powered ships.

The Deltic is a working example of the Napier principle: more power at lower cost.

Safety on the Rails

DISASTERS, it is said, often go in threes. British Railways have just spent a most unhappy Christmas in the shadow of three collisions in each of which a stationary train was hit by a following train. The collision at Woking on December 23rd could easily have become a shambles to match the Harrow catastrophe of 1952, but by great mercy only 14 were injured. At Luton on the previous day one passenger had been killed and 50 injured when a train delayed in the station was overtaken by a following train. And less than 24 hours before this crash, there had been another at Hellifield in Yorkshire of the very same kind, fortunately with only one person injured.

This series of accidents has alarmed the new Minister of Transport, Mr Watkinson, who spent Christmas Eve in urgent conferences with the British Transport Commission. It has alarmed the public too, for people were brooding unhappily about the possible causes of the two other serious accidents in the previous month—a derailment at Didcot (the second derailment in 1955 on a Sunday afternoon) in which 10 people were killed and 100 injured, and a particularly shocking collision at Barnes, early in December, in which an electric train overtook a goods train, killing 13 and injuring 35 people. In 1954, no passengers were killed and only two seriously injured in the 1,197 train accidents that occurred; this year nearly 50 passengers have been killed and over 200 injured.

This has been a black year for railway safety—so bad as to imperil the reputation of British Railways and to impair the confidence of the travelling public. The causes of this recent clutch of accidents will be investigated by the railway inspectors of the Ministry of Transport with their habitual thoroughness and fairness. It would be improper to attempt to prejudge the inspectors' reports; and it would be utter folly if the public were to run away with the idea that these accidents stem from some single vicious factor—"the

incompetence of the Commission" let us say, or "the indifference of the men." Safety does indeed depend on good equipment, good management, and unremitting attention to duty. If there have been defects under any of these heads, the inspectors' reports will certainly reveal them.

★

It is necessary, all the same, to strike a note, not of panic, but of proper public concern about the recent record on British Railways. A cluster of accidents does not mean that British Railways have suddenly become seriously unsafe; it may be little more than a kind of statistical mischance. But something of a common pattern does seem to emerge from this year's accident record. Derailments on Sundays, when diversions from fast running lines under repair are common, should not occur if drivers have committed to mind the railways' traffic notices and if they are thoroughly attentive to the lineside signals. The derailment at Didcot is the more perplexing since this stretch of line is protected by the Great Western form of automatic train control which repeats by bell and siren in the engine cab the "clear" and "caution" aspects of each distant signal, and applies the brake if the driver does not acknowledge the caution indication. If the inspector's report on the Didcot derailment should show that the integrity of this apparatus was unquestioned, it will demonstrate that absolute safety cannot be guaranteed (even though it is surely strengthened) by automatic train control.

Of the sequence of rear-end collisions, it is impossible to form any view in advance of the investigations, save that they suggest failures of the human element, in driving or in signalling, rather than failures of equipment. The causes, again, have still to be established, and no presumption can take the place of the inspectors' findings. There are occasions when minor mechanical

difficulty can distract drivers or signalmen during vital seconds and lead to accidents that haunt for the rest of their days men guilty of no more than a minor lapse that was blown up by a quirk of fortune into a major tragedy. Failures of that kind will occur so long as men, no matter how devoted to duty, remain fallible, and no man charged with duties less responsible than running railways should be slow to forgive them.

★

The cases that are less easy to understand are departures from rules of working on which safety completely depends. "It is difficult to explain this extraordinary lapse on the part of a driver with such a long record of trustworthy service and who had an intimate knowledge of all the characteristics of the route." That was Colonel Wilson's conclusion about the behaviour of the conductor driver who was responsible for the train that was derailed because of excessive speed at Sutton Coldfield last January. The regular driver should have been on the footplate with him, but was travelling instead in a compartment; the inspector found that he was thinking only of his personal comfort and did not accept the excuse that he put forward for leaving his post of duty. A senior signalman admitted during the recent enquiry into the Barnes collision that he had not set a very good example to younger signalmen by leaving his box 20 minutes earlier than the time booked in the records of the adjoining boxes.

Such conclusions about individuals in positions of high responsibility are painful, even when they are balanced by the many occasions for commendation—one occurs in a report issued this week about a derailment last summer: "the signalman was alert and acted promptly." All the prompt and clear-headed actions—and how many there must be—go unrecorded; if they had been late or confused, disaster might have followed. Yet the public is less confident than it ought to be about the state of morale and vigilance throughout the railway system. The signalman has always been regarded as the steadiest man in the railway community—one of absolute integrity with a working discipline ingrained in his mind and utterly dependable though alone and isolated in his wayside box. Social and economic changes may have done something to weaken that sense of dutifulness, not indeed to the point of making railways unsafe but perhaps to the disadvantage of the sense of dedication that some of the younger men bring to their work, and even of their adequacy in an emergency.

Colonel Wilson's annual reports for the past two years have praised the high standard of attention to duty by all grades of the railway staff, and that is surely the fair view. Yet the fact remains that in each of these years there were between 1,100 and 1,200 train accidents, and of these half were attributable to the human factor. Whether a lot of people are killed or injured

is almost capricious, for slight margins of time or of physical clearance may make all the difference between a narrow squeak and a dreadful calamity. The human element is still the condition of safety, even when the most elaborate mechanical and electrical safeguards are incorporated in signalling systems. Automatic train control, even of the most advanced types, has not wholly prevented accidents, on the Western system, on London Transport railways, or on certain American railways. The most foolproof signalling equipment with the most visible lineside indications affords no protection against an engine-driver who, for whatever reason, disregards their warnings. The signalman who departs from well-tested rules imperils his colleagues as well as the public. The factors that keep these responsible people alert are many; satisfaction in the job and a sense of personal fulfilment are among them. Something seems to have weakened them—and perhaps the inter-union troubles on the railways during the past year have led to bad blood and lower morale.

★

Any notion that the railways' development plan would promote a new sense of enthusiasm among the staff has certainly been so far falsified. The plan talked of the wide extension of power-operated signalboxes, one of which would replace several manual boxes. Such improvements can make a major contribution to safety (though they do not guarantee absolute safety, for the remarkable derailments at Bethnal Green in September, 1953, and at Thirsk in January, 1954, showed that the most modern equipment still suffers from its gremlins) and the railways' plan aims at spending £100 million on signalling and traffic control improvements.

But although this money is a long way short of spent, the immediate reaction among the men seems to be fear of loss of overtime money. They would show a more rational attitude by accepting the scheme wholeheartedly on the assumption that it ought to be capable of making the railways pay handsomely and then bargaining most strenuously for a satisfactory share of the gains. That, perhaps, implies such a radical change of view on the part of railwaymen as to make it inconceivable; indeed, if railwaymen were capable of such imagination they might be the less capable of working the railways as they now exist. Yet the acceptance of the major premise of the plan that main line speeds of 100 miles an hour will be secured rests on such a change of outlook, on the acceptance of wholly different standards of working, and on a real willingness to contribute towards—and fully to share in—positive prosperity for British Railways. That is a long-term chance. But in that high state of efficiency, British Railways should also enjoy a high degree of safety, for they would be run by a staff that was tense and on its mettle, stimulated by new methods and not relaxed in its vigilance through over-familiarity with old ways.

Money for Jams

ONE can easily argue that no sensible man now drives a car into the centre of London to work every day unless he has a garage booked to park it. If so, the main problem of London's traffic is to find the shortest way to deal with about 30,000 dissenters. London did not grind to a halt in Christmas week, as one gloomy observer had prophesied, but during the whole of December it was bad enough. And fairly or unfairly—the evidence is not quite conclusive, though few experts disagree—perhaps the biggest single share of blame for the thrombosis that is increasingly affecting London's traffic circulation is usually put upon the long-term parker. Today, at an informed guess, there may be 50,000 or so motor vehicles parked in streets in the "inner area" of London at any time in working hours of the five-day week—and surveys suggest that two-thirds of them stay parked for two hours or more.

The blame cannot be exactly allocated because no comprehensive survey of London's traffic and parking has ever been made. But the broad case against the long-term parker—who seems most often to be the person who commutes to and from work in London by private car—seems plausible. Major commercial deliveries into and out of London (for example to and from markets) affect internal traffic congestion, but generally avoid rush hours; buses run all day, but do not park in the centre of London; much of the through goods traffic is outside peak hours or stays outside the central area; and so far the shopper by car, who comes in after the morning peak but may go out with the evening rush, and parks a car for a short time, seems to play an insignificant part in London traffic.

Major or only a minor culprit, the long-term parker makes notable contributions to congestion in two of the major "flows" of London traffic—movement inside London during the day, when he converts huge areas of the London carriageway into a vast parking lot, and movement in and out of London during peak hours, when he uses road space on the main approach roads to London to less economical purpose in the transport of people than almost any other vehicle. London Transport's smooth advertising homilies last year upon the text "The buses must go through" were profoundly irritating, but there was some sense in the smugness. A bus at peak hours, which may be carrying about 60 people in about 200 square feet of driving space, is a far more efficient user of road space than the private car using about 80 square feet for its average load of less than two commuters, and at peak hours to go by Underground railway is often a faster way into London than going by car except for the shortest trips.

The car, admittedly, goes from door to door—or from door to where the driver finally manages to park—and conditions on the tube or the bus at peak hours

are not exactly such as to attract marginal customers with comfort and speed; but in terms of traffic congestion, the commuter by car who parks at the kerb all day has a good deal to answer for. He does not, of course, answer for much of it—which is part of the reason why he continues to come in and do his bit to jam traffic. He pays some part of this "social cost" he imposes by the sheer nervous strain of driving in peak traffic—or his chauffeur does—but he gets his parking free, save for risking a fine, when he finally secures his few yards of kerb. Opinion in this country is gradually coming round to accept that he should be charged for this by parking meter, to impose some disincentive. But at which kind of parker should the meter be aimed—and how much should it charge?

★

Most of the proposals made for installing parking meters in central London streets have been aimed at the short-term parker—the car shoppers who may multiply and the people who have to move about London making short stops. These proposals have usually been linked with plans to accommodate the long-term parker of today in new room off the street—in the garages that should be provided in each new office building, in commercial garages, but primarily in new garages to be subsidised by local or central authorities, under the London squares or on vacant sites in London streets. The prices charged at meters would be geared to those charged for this new off-street parking, and the charges in those new garages would be "such as would attract motorists."

Nobody has suggested that such attractive charges would make the proposed new garages pay; their advocates have recognised that subsidy would be required. But what has not generally been faced by these advocates is that their plans would at best merely ease congestion inside the inner area of London and would in no way alleviate the peak-hour congestion on London's approach roads. What seems highly possible, moreover, is that to provide subsidised parking for the long-term parker might suck yet more cars into London—even if meters were installed wherever parking is allowed on through streets inside the city, as logically they should be.

What is the alternative to subsidising extra parking space off the street in Central London? If one can assume that the present number of cars parked alongside kerbs throughout the inner area is as much as traffic flow can stand—and many people would say it is already more—the question of cost presents itself in fairly simple terms. The real cost of providing space to park an extra car in London would be the

cost of providing new parking or garage space there commercially and operating it at prices that would bring in as high a return as one could get from using the space in other ways—for example, by building the offices that are today using up more and more bomb-site car parks. At present, that return is of the order of £1 a year per square foot super—i.e., on each floor one builds.

Existing commercial garages in the centre of London get much less than this. Their prices amount to only about 6s. a year per square foot, based upon the historical cost of premises built before the war—and on the difficulties of competing with free parking on the streets. Such prices would certainly not justify the erection of new garages today. In parking room, paths and ramps a garage may need 200 square feet for each car space. To obtain the kind of return one can get from other buildings in London today one would need about £200 a year per car—something of the order of 15s. a day of the five-day week, three or four times the rate that commercial garages now charge.

If parking one's car beside a London kerb is now worth about £4 a week, it is not surprising that most students of the capital's traffic problem have thrown up their hands and plumped for a subsidy. But they may have given up too soon. All that such an estimate suggests is that until long-term car parkers in London are prepared to pay as much as that for all the parking space that a reasonable flow of traffic can allow, one cannot provide parking space off the street for them in Central London without a subsidy. But to swing from parking at full cost to parking at prices that disregard cost merely accepts false alternatives—and, incidentally, ignores the possibly greater significance of the commuter by car in helping to jam the roads in and out of London at rush hours.

For the present, surely, the price that should be charged for parking wherever it is allowed on the streets in London should be related not to the cost of providing space off the street in Central London, but to the cost of providing parking space off the street outside Central London and finishing one's journey by tube. This autumn London Transport has done one particularly useful service to London traffic; it has begun to provide car parks at a number of stations not too far outside the inner area where one can park cheaply and continue in by public transport. Extension of this system to provide parking room outside—but not too far outside—the central area would ease congestion both going in and out of London at peak hours and inside the central area during the day, if it succeeded in drawing off motorists. But it is not likely to succeed while parking remains free on the kerbs of the City and the West End.

If parking meters are not acceptable without the provision of garages, the garages should be provided—but first, at any rate, outside Central London. And the price to be charged at parking meters should be more than the cost of parking for a day in one of these

peripheral garages plus the fare by public transport into London. It would be wise to ignore the running cost to the motorist of continuing into London, since he probably hardly measures it and is at present content to pay it, plus considerable nervous energy, for the privilege of personal transport. Such a price might roughly correspond to those now charged by the commercial garage operators inside London; for a time, at any rate, the introduction of parking meters would probably liven up their business.

★

Such a system would leave the commuter who cared to come and park all day at this price free to do so. But it seems reasonable to suppose that the disincentive to come in and the incentive to park outside might at least thin down the number of long-term parkers for the moment. Car ownership is widening, and London Transport expects a continued shift from public to personal transport. So over the years the congestion inside London and at peak hours on the way in might well begin to seize up again. If it did, the answer would surely be to put the price up steadily—and when parking demand showed itself prepared to stand a price that would offer a reasonable commercial demand on garages in the centre of the city, to provide them there. Some students of London's traffic problem, muttering darkly about "people whose cars are paid for" in a new, nineteen-fiftish version of class prejudice, conclude gloomily that in the present tax situation the price mechanism could never make any impression upon some overriding and insatiable desire of people to have cars and drive them into London every day, like lemmings in reverse. That sounds unrealistic as well as envious: certainly it is no argument for refusing to try prices out.

There are also, to be practical, a few other elements that can be expected to improve in London's traffic straits. Eventually, road improvements even at the rate postwar governments carry them out must improve the capacity of the approach roads for peak-hour traffic. London Transport's projected new "Route C," now christened the Victoria Line, may in the fullness of time make a major if uneconomic contribution to easing traffic on many other routes and roads. But those are a long way off, and the problem is here today. The Road Traffic Bill now on its way through Parliament provides for the introduction of prices for street parking by meter. This sketch of a policy, of necessity over-simplified, suggests one way of using prices if prices are to be used. Some of the other hybrid solutions that have been proposed, such as improving approach roads and linking them to expressways, providing subsidised garages and charging low rates on parking meters in the streets, with the consequent huge possibility of sucking in yet more traffic, might well worsen the problems they have been devised to solve.

Business Notes

Muted Cheer from Markets

A RALLY in the markets in the few days around Christmas is not unusual, and this year the financial institutions had a special reason for welcoming the small rally that did appear. It makes the business of adjusting portfolio values to prices on December 31st just a shade less distasteful. So far as the gilt-edged market is concerned there has been no material change; the *Financial Times* index of government securities has fluctuated narrowly between 90.18 and 90.20. The significance is that the market seemed to encounter persistent—but certainly not official—support at the lower level. So evident has this become that the existence of a big buyer of gilt-edged has been widely rumoured round Throgmorton Street. And there seems to be a little truth in the report. The big buyers of gilt-edged are probably a few big industrial companies re-investing gradually the proceeds of their holdings of Serial Funding stock which was recently repaid. Over the past six weeks they have been imparting a firm undertone to the market, as they picked up various stocks, including substantially longer dates for a small proportion of the money.

In the industrial market the Christmas rally was more pronounced. In the week from December 21st to December 28th the industrial index rose from 196.6 to 199.7 in a narrow market. It was a cheering close to a year of excitement and later disillusionment for investors. But he would be a bold man who would trust it much further while sterling has still to regain confidence and while a new Chancellor, in office for a mere week, has still to make his impact on policy.

Banks and Gilt-Edged

FOR the banks and other financial institutions that make up their balance sheets at the end of the calendar year the normal tasks of end-year accounting are this year overshadowed by the problem of dealing with investment depreciation. At mid-1952, after the gilt-edged slump that followed the first increases in Bank rate, four of the "Big Five" banks abandoned the tradition of valuing investments in their accounts "at or under market value" and showed them instead at "under cost" and "below redemption price," but above the separately disclosed market values. The depreciation thus revealed was made good, however, by the rise in the market during the second half of 1952, so that no clearing bank has yet had to show depreciation in its annual accounts, though several Scottish banks have recently done so. Last June, after a much steeper fall in the gilt-edged market than occurred in the first half of 1952, the same four banks repeated the formula adopted then, but

the other clearing banks all contrived to write down their portfolios from inner reserves sufficiently to enable them to maintain traditional practice. Since then, instead of the hoped-for recovery in the market, there has been a further fall, and some at least of these other clearing banks—the National Provincial, the three northern banks and the smaller institutions—are now expected to show depreciation for the first time.

It will be surprising, indeed, if some banks do not reveal "uncovered" depreciation—in the sense that the disclosed difference between book value and market value is larger than the published reserve fund (that was true of the Midland Bank's statement last June). During the year even so short a stock as the 1957 Serial Funding has fallen by nearly 4 per cent; the 2 per cent Exchequer stock, 1960, placed in November, 1954, has fallen by over 8 per cent, and the 3 per cent Funding stock, 1966-68, placed at the same time, by no less than 15 per cent. The 1962-63 and 1963-64 stocks that were favoured when the market was rising have fallen by about 11½ and 13 per cent respectively (of which about 1½ and 2½ per cent has occurred in the past half-year). The only bank that has given a reasonably precise indication of the life of its portfolio during the year is the Midland, which said at end-June that the maximum life was ten years and the average life five years; the other three banks that work on the new formula have said that the majority mature within ten years—and sales of shorter stocks during the year must have tended to raise the average life. On the Midland's basis of a five-year average, it would seem improbable that the year's depreciation could be less than 7 to 8 per cent, which on the aggregate value of clearing bank portfolios as at mid-November would be equivalent to £140-£160 million.

Even in the absence of any further writing down, not all of any such decline would be shown as depreciation, because book values at end-1954 were certainly appreciably below the then market values. If the margin thus in hand at the outset were equivalent to half the year's actual depreciation, the amount remaining would still be equivalent to a high proportion of published reserves, which for the clearing banks as a whole stand at £87 million—excluding the balances on profit and loss account and also excluding inner reserves. In view of the traditions of bank accounting, it is natural that the City should be focusing upon comparisons such as these. But in fact they are not meaningful comparisons. Neither the book depreciation actually sustained nor any depreciation disclosed is a measure of the risk of loss that the banks may run. The risk depends upon the extent to which they may be obliged to sell securities before the market recovers—and that risk appertains to only a fraction of the portfolio. Even in this past year of abnormally heavy sales, it is doubtful whether total sales (as distinct from redemptions of bonds at maturity) amounted to as much as 10 per cent of the aggregate portfolios.

Cream off the Portfolios

A FEW days of stronger markets at the close of the year cannot alter the fact that 1955 has left the other financial institutions, particularly the insurance companies, with a substantial fall in the market value of their portfolios. They should have retained a modest net gain of about 8 per cent on their holdings of industrial ordinary shares, but they will have suffered a substantial depreciation approaching 14 per cent on their gilt edged portfolios and a smaller fall, possibly about 3 per cent, on the holdings of American government bonds that form an appreciable proportion of non-life funds of offices doing American business.

A rough guess can be made at the impact of falling market prices on the insurance assets of the 44 offices whose accounts are regularly analysed in *The Economist* Insurance Survey. Their total assets at the end of last year were shown at balance sheet values of £3,813 million, of which £2,737 million represented quoted securities. Making allowance for the different average composition of the life and non-life funds, and assuming no depreciation on the unquoted investments (chiefly mortgages, property and cash), the fall in market values of the total funds may have been of the order of 6 per cent (by roughly £225 million), on the basis of the year-end book totals of 1954. The growth of the funds during 1955 will conceivably add £300 million to the insurance offices' portfolios.

The impact of market changes will have differed for each individual office, according to the proportions of gilt-edged, industrials and unquoted investments, and according to the skill and adaptability of different investment management. Some offices for example may have suffered because they were heavily committed for calls on new issues in the autumn while prices were falling. One other generalisation is, however, permissible. It is unlikely that any insurance office has suffered a depreciation in excess of the reserves it had available to meet such a contingency. The offices started 1955 with substantial appreciations on their portfolios, so that the book figure of £3,813 million understated the true value of their holdings. What has happened during the year is that an appreciable part of that hidden reserve has run off.

The Coal Balance Tips

COAL output from the mines this year has probably fallen about five million tons short of what Britain has burned at home. In 1954, for the first time, the country's coal consumption almost exactly equalled production from the mines, about 213½ million tons, and though coal consumption is not likely to have risen by more than about 1½ million tons this year, mining output has fallen by about 3½ million tons. Statistics for the last fortnight of the year have still to come, but broad estimates for the rest of the coal balance can roughly be filled out. On the supply side deep-mined production of about 210 million tons has been supplemented by about 11½ million tons of opencast coal (output of which is well up on 1954) and something over 11 million tons has been imported at great expense from abroad. If inland con-

sumption has reached 215 million tons of coal, exports cannot have much exceeded 12 million tons or bunker supplies 2½ million tons. So the country's stocks of coal will have risen by about 3 million tons—last year they were reduced by nearly as much.

This has been a warmer year than 1954, but on the average not much warmer: in the first 49 weeks of the year, this year's average temperature was 49.4 degrees Fahrenheit, against 49.1 degrees for 1954 (both years were colder than the average of the 30 years 1921-1950). Industrial output has continued to rise, though not quite as fast as in 1954. Does this indicate that Britain has been using its coal more efficiently? It might: one of the things that it clearly does indicate is that British industry is now taking a growing proportion of the extra fuel it needs in the form of oil. That switch is certain to continue, and should take a little more of the pressure off coal during 1956. Coal exports next year, moreover, are to be cut in half. Imports of coal at roughly the current rate, therefore, would offer the British economy next year about five million tons more than it has burned in 1955—providing that output can at worst be maintained at this year's depressing level. Even that proviso, unfortunately, may be quite a large one.

Currency Expansion Slackening

TO judge from the Christmas increase in the note circulation, seasonal spending this year has been about the same as in 1954. The seasonal peak in the active note circulation is this time shown in the Bank return on the Wednesday following the holiday at £1,889.6 million. In the preceding six weeks the outflow of notes totalled £111.9 million, compared with £110.5 million in the five weeks before the peak was touched in 1954. The latest expansion, though the largest ever recorded, represents a smaller proportion of the total active circulation; it was equivalent to 6.3 per cent, compared with 6.7 per cent last year. The expansion in the note circulation from the low point last February to the Christmas peak amounts to £233.2 million, some £10 million more than in 1954; but proportionately the increase has been smaller, at 14.1 per cent against 14.5 per cent.

It should be noted, moreover, that part of this year's expansion has been attributable to an increase in the money carried by the commercial banks in their tills. In the first half of the year, it was evident that the exceptionally large outflow of notes from the Bank of England was in part attributable to the banks' fears of transport strikes; but right through the year the banks have been holding a larger proportion of their cash in their tills and a smaller proportion in balances with the Bank of England.

Exeter Benefit Building Society

THE Registrar of Friendly Societies has made an order under Section 11 of the Prevention of Frauds (Investment) Act of 1939 prohibiting the Exeter Benefit Building Society from inviting the public to subscribe for its

ON BUSINESS CREDIT

Every modern accounting department needs an efficient ledger posting system. Each customer's account must be instantly available, in a form that an executive can understand and act upon immediately. If you want to eliminate every trace of 'guesswork' from your credit arrangements, send for the Man from Remington Rand.

He'll explain, free and without obligation, how easy it is to base credit decisions on accurate, up-to-date facts.

* THIS IS VERTICAL VISIBLE

—the card ledger system that provides a running commentary on every customer's account. Easy to use, it speeds posting by permitting rapid selection of accounts: provides a graphic signal system for the effective control of overdues. It prevents mis-filing and clearly indicates any 'missing' card. Cards keep clean longer and remain completely legible. Vertical Visible is the system behind many of the world's largest ledger departments; it deserves a place in your office.

Send for the man from
Remington Rand

COUPON: I would like to know more about Vertical Visible.

Fly East at a fare to suit your pocket—by Air France 3-class Super Constellation, with Sleeper, First, and Tourist class accommodation. Air France is proud of the long tradition for comfort, cuisine and courtesy for which it is renowned, and its new Super Constellation through flight to Tokio proves

no exception to the rule. Leaving London on Wednesday or Sunday at 2 p.m., you can be in Pakistan or India the next day, in Bangkok within 36 hours, and Tokio the following evening. And of course, it is a service for the gourmet, for in 36 years of experience Air France has learnt to study the appetites and tastes of its clients. For comfort lovers in a hurry, Air France is best to the Far East...

THE *steel* AROUND YOU

Cycle and motor cycle parts, spanners, razor blades, typewriter key bars, telephone dial springs and a host of other everyday things are made from steel strip, which is just one of the hundreds of different forms in which steel is manufactured by the United Steel company. In making such a variety of steels for industry's specialised needs, United Steel find work for some 33,000 people; the continued employment so provided is both directly and indirectly a very important factor in the country's prosperity.

Visiting Australia?

SAIL BETWEEN FEBRUARY 1ST AND MAY 31ST
AND SAVE FROM £80 TO £140

You can enjoy that visit to friends and relatives in Australia and gain the benefit of a substantial financial saving by travelling under our special P & O Boomerang Trips plan. You take your first-class outward passage between the first of February and the end of May. You return homeward between September 1st and December 31st 1956 or 1957. Reduced first-class fares run from £230. *You save from £80 to £140.* That's the practical side of it. Once aboard a P & O liner—your home at sea—you can relax in an atmosphere of comfort which is the result of more than a century's experience of service. For full details see your local travel agent.

ONE WAY ONLY?

For passengers visiting Australia for an indefinite period, we offer our special P & O off-season terms. This means that during the months February to May you can have a wider choice of first-class accommodation for your money.

P & O BOOMERANG TRIPS

The cure for acute labour shortage

If you find it hard to meet demands for increased production, look at Hull, where the labour position is easy.

Hull can give equal satisfaction on sites, transport, public utility supplies, export and inland distribution, and offers the products of many industries including—

Solvents and plasticisers, pigments, chemicals, adhesives, chalk, cement, oils and fats, latex; grinding media, hydraulic, chemical, electrical and general engineering services; wood, grain and oilseed by-products; containers (metal, wood, card), printing.

securities, or inviting loans or deposits. The event has caused considerable unhappiness through the building society movement. Exeter Benefit had assets at the end of 1954 of £3.6 million; it is the first member of the Building Societies' Association to incur the Registrar's ban. The effect of the prohibition is that the society may not ask for money even to the extent of exposing its rates of interest on a wall in its office, but it may accept an investment unsolicited and freely offered. It may also continue to do its normal mortgage lending and repayment business to the extent that it has funds.

There are three grounds on which the Registrar usually bases his decision to issue such an order: unsatisfactory financial position; lending of the funds on doubtful security; and use of the society's funds for financing companies with which the directors are connected. He does not state on which of these grounds he now acts, but the impression is widespread that it is the second. Exeter Benefit has a fairly high proportion of its mortgage loans on business premises. But as the directors' statement points out there is no question of fraud. The order confirms an undertaking that the directors had already given not to seek business until the society has "consolidated its position."

The irony is that the registrar has felt reluctantly obliged to take this action and to risk shaking confidence among building society investors in consequence not of the present credit squeeze, but of a lending policy pursued some years ago. It happens at a moment when the newly appointed general manager and secretary, Mr S. Seddon Walker, has begun to tackle the society's problems. It is also to be regretted that the powerful members of the Association have not so far felt able to provide a solution for their fellow member that would induce the Registrar to revoke his order.

Ford's Margins Squeezed

ONE of the consequences of the forthcoming offer of some of the common stock of Ford Motor of the United States to the public is the publication in this country of the nine months' sales and earnings figures of the British company, Ford Motor. This company has already published six-monthly figures, and at that time the directors noted that profit margins were being affected by increases in the costs of materials and labour. A comparison of the six-monthly and the nine-monthly figures shows that the squeeze on margins tightened in the quarter to September 30th last:

FORD MOTOR SALES AND PROFITS
(£'000s)

	Three Months to Sept. 30th		Nine Months to Sept. 30th	
	1954	1955	1954	1955
Sales	29,337	36,135	91,916	114,115
Profit before tax	4,285	3,357	14,156	14,739
Provision against fall in value of Govt. securities	...	187	...	1,308
Taxation	2,270	1,594	7,062	5,831
Net profit	2,017	1,576	7,095	7,600

Sales were still rising but the climb in earnings was slowing down. In the first six months of this year the ratio of profits before tax to sales was 14½ per cent, compared with 15½ per cent in the first six months of 1954. In the September quarter this ratio had fallen to 9½ per cent, against 14½ per cent in the third quarter of 1954. One result was that Ford's net profits in the third quarter actually declined. The inference for the motor industry as a whole is plain: despite economies of large-scale production the rise in the price of bought-out materials and components and in wages (which is one of the biggest elements in the motor industry's total bill of costs) is trimming profits. The inference for investors in motor shares is also plain: it would be unwise to count on bigger dividends.

Delaying the Sugar Bill

BY an adroit display of Parliamentary gamesmanship the Opposition has delayed by several months the passage of the Sugar Bill. After six sittings the standing committee was still discussing the third of the bill's 36 clauses when it adjourned. The Opposition's ploy at times won the Government's admiration, as when Mr Harmer Nicholls said of Mr Bottomley's performance: "On an amendment of this limited character, to remain within the rules of order while discussing steel, wheat, rubber and communism calls for our respect. . . ." The committee resumes on January 26th, and the bill is unlikely to be passed before the end of March. This suggests that the appointed day on which the Sugar Board is to be set up and start buying fixed-price Commonwealth sugar on the Ministry's account may not be earlier than July.

Labour spokesmen have declared that they would nationalise the British Sugar Corporation, and they would make the taxpayer, rather than the consumer, bear the cost of supporting Commonwealth production. They have also made much of the uneasiness which they say the bill has created among colonial producers. The Colonial Secretary replied that colonial producers had been consulted, and had said that they were fully satisfied with the bill.

After Seventy-five Months of EPU

THE EPU settlements and the resulting payment or receipt of each member country tend to be regarded month by month with little regard to the cumulative status of the members. It is worth turning to the latest complete statement covering the fifteen member countries as they emerged from the November, 1955, settlement which comprises a cumulative review of operations from July 1, 1950, when the European Payments Union was launched. On November 30th Germany was much the biggest creditor among the 15 member countries. Germany had a credit of \$1,550.5 million, the second largest creditor being the Belgium-Luxembourg union with a cumulative net credit of \$839.6 million. The other creditors in

order are the Netherlands, Switzerland and Sweden. On the debtor side the lead was held by France with a net cumulative deficit of \$834.6 million, with the United Kingdom in second place with a net deficit of \$613.8 million.

A more relevant set of figures from the point of view of gold payments and credit operations within the Union is that showing the cumulative accounting status of each member country. These differ considerably from the cumulative net figures, because accounting has been affected by the initial balances with which each member was saddled or helped and by a number of other transactions, including the bilateral repayment of debts made between members as a result of special funding arrangements. These cumulative accounting positions show far greater contrasts and reveal why it has been necessary for certain quotas, notably that of Germany, to be extended by "rallonges" in order to meet an excessive creditor status. At the end of November Germany was shown to be a creditor for no less than \$2,189.3 million as against a basic quota for that country of \$1,200 million. In order to bridge the gap Germany has extended its facilities beyond its quotas by two "rallonges" amounting altogether to \$1,300 million. At the other end of the scale the United Kingdom is a cumulative debtor for \$1,354.8 million as against its quota of \$2,544 million. It is the changes in these cumulative accounting balances that are now settled as to one quarter in credit and three-quarters in gold.

Fresh Start in Wheat Futures

ALL the futures markets in Britain faced difficulties when they restarted business in conditions vastly different from those before the war, and it was to be expected that some would make quicker progress than others. Among them the wheat futures market in Liverpool has made no progress at all. Business has seldom been active, and in recent months it has come to a dead stop. Critics have argued that some of the difficulties lay in the contract itself, because it did not reflect the changed conditions of trading. Now, after months of discussion, a new contract has been approved and will come into operation on January 3rd; the first delivery month will be March.

The new contract should meet most of the criticisms. The contract unit, formerly 4,800 centals of 100 lb (about 214 tons) has been reduced to 125 tons. This quantity (costing perhaps £3,600 at present prices) should be more attractive to the speculator and the smaller trader, and it will fit in with the trade in wheat shipments which is conducted in units of 250 tons. Prices will be quoted in £s per ton instead of shillings per cental. Wheats tenderable at the contract price are American hard winter and spring wheat, Australian, Plate and Uruguayan. Canadian Manitoba, which formerly carried a premium of only 2d. per cental (3s. 9d. a ton) is given a premium of £2 a ton and red winter wheat a discount of £1 a ton, adjustable according to grading. It is thereby hoped to attract Manitobas, which now form a bigger proportion of Britain's imports, and to discourage red winter wheat, a less popular variety which was the only wheat tendered against the old contract. In one major respect the authorities have not met the critics; delivery will continue to be ex-store Liverpool, not cif.

The trade will wish the new contract well. It is not easy to re-establish a satisfactory futures market when so much of the world's wheat is sold by government agencies but the attempt is worth while. Selling by the Canadian and Australian wheat boards on a price-to-be-fixed basis does not remove the need for a hedging medium, and some smaller millers, at least, would like to use Liverpool futures as a source of wheat as well. It may not be possible for Liverpool again to exercise its prewar influence on world prices but it could still fulfil a useful purpose.

Lancashire Cotton's Year

LANCASHIRE Cotton Corporation is such a big spinning combine that its results must always reflect the fortunes of the industry as a whole. In the year ended October 31st the company's trading profit fell sharply by £1,542,000 to £2,804,000 and Mr R. M. Lee, the new chairman, attributes the fall entirely to conditions in the industry. Buyers held off in anticipation—rightly—that raw cotton prices would fall; imports of cotton textiles increased and exports declined. But for the spinners' minimum price scheme "yarn would have been sold at wholly uneconomic prices, and all hope of continuing re-equipment in the industry would have vanished." In fact the company, which has spent £6.3 million on its mills since the war, was able to put £500,000 to the replacement of fixed assets, bringing this reserve to £3.5 million; the general reserve was increased by £600,000 to £6.1 million and the stock reserve by £250,000 to £1.25 million. Mr Lee confirms that business is now improving and he hopes—perhaps it is not a very confident hope—that the instability of raw cotton prices will soon be resolved. He believes that if imports continue at their present level the cotton industry will have to contract still further, but in his view "these problems cannot be dealt with without some indication as to the extent to which the government will tolerate imports from low-wage countries."

Older Men at Work

THE committee that advises the Minister of Labour on the employment of older men and women has made two specific suggestions in its second report. It wants more firms to examine the "age structure" of their staffs, and it would like to see more industries promoting research into the problems of employing their own older workers. In its first report, issued just over two years ago, the committee eschewed government action—by enacting a special quota for older workers, or by setting up separate registers at employment exchanges—as this would give a special, and undesirable, aura to the employment of these people; the committee therefore felt that the onus should be placed upon industry itself. It now finds some comfort in the response to its views and earlier suggestions, though, as it recognises, the change in employers' attitudes to older workers may be partly explained by the acute labour shortage some of them are facing.

Nevertheless, the committee sees room for further improvement, and lists transfers between pension schemes, training—it suggests, rather surprisingly, less specialised training in youth as well as new courses later in life—and willingness to accept part-time older workers, as specific problems still to be resolved. But the main stumbling block is perhaps the desire of firms to maintain a balanced age structure in their staffs. The committee thinks that this age balance should be reviewed constantly as the proportion of older workers and retired persons in the total working population gradually increases. This need not necessarily block promotion if people nearing retiring age are eased into jobs with lighter responsibilities. But it will call for much more study by industry itself of the changes in intellectual and physical powers that come with old age, and of the tasks that men in their sixties and later can best perform.

Britannia and the Seven Seas

THE first two Britannia airliners out of the 33 ordered by the British Overseas Airways Corporation were due to fly from Bristol's factory at Filton on Friday morning to be handed over to BOAC at London Airport. The last formalities involved in the granting of a Certificate of Airworthiness had been completed; allowing several weeks for route proving trials, regular passenger services to South Africa with the Britannia should start in the early summer. This marks the end of a long and arduous period of development behind the Britannia, an exceptionally large aircraft with powerful and complex engines. How the aircraft develops in its first months of commercial service may well decide its future with other airlines, which remain impressed with the Britannia's technical achievement but reluctant to commit themselves to firm orders.

The Britannia's most serious competitor, the Douglas Seven Seas, made its first flight just before Christmas, eleven days ahead of schedule. The piston-engined Seven Seas is intended to cross the Atlantic non-stop all the year round, and has a projected range of 5,000 miles; 104 have been ordered. The first batch is due for delivery to Pan-American next summer and to BOAC in the autumn.

Industrial Platinum

AN intense industrial demand has recently characterised the platinum market and it has lifted the price quoted by the principal sellers to £32 10s. per ounce or about 2½ times the price of gold. The price quoted to approved regular customers by the Englehard group which handles the Canadian platinum, and by Johnson Mathey handling the South African production, does not measure the true relation of supply to demand. These regular customers include the oil companies whose demand for platinum in connection with certain processes of their refining is one of the main elements in the industrial requirements for this metal. But outside these official prices, there

is a free market in which platinum is now quoted at £42 to £42 10s. per ounce. And it is from the free market that demand for platinum by jewellers and commercial users not on the privileged list has to be satisfied.

The free market is fed by platinum scrap, supplies of which have been attracted by the high price. On balance it is probable that the jewellery trade has during the past year been a net seller of platinum. This free market is also supplied by such independent sources as the Russian government, whose sales were substantial in 1954 but have been small during the past year. The comparatively high price of platinum is stimulating production. As compared with an average of 630,000 ounces a year in 1949-52, the figure for 1953 was 750,000 ounces, for 1954 825,000 ounces and a further increase has probably taken place in 1955. The oil, chemical and electrical industries are much the biggest consumers. Indeed platinum has become much more an industrial metal and much less a jewellers'.

Taxes on Mines

SINCE the war, through a period of great activity in overseas mining of gold, non-ferrous metals, and other minerals, only one new mining company operating overseas has been registered in the United Kingdom. This striking fact was used by the chairman of the British Overseas Mining Association, Mr J. Ivan Spens, in a recent speech, to illustrate how the burden of tax upon the British mining company favours its foreign competitors. Mr Spens did not add, as he might have done, that in the same period big mining ventures have transferred their residence—some of them even their registrations—out of this country.

He was regretting the absence of any provision in the British tax system for a depletion allowance to correspond with the gradual exhaustion of a wasting asset and the absence in the double tax agreements that this country now has with so many other countries of relief in respect of taxes imposed overseas that are in form not taxes on income. For example royalties and export duties attract no double tax relief, and one member of the association has produced figures to show that its income would have been about 80 per cent higher if the main tax levied in the country where it operates had been a tax on income instead of an export duty.

Mr Spens recognises that he plays a difficult hand because the Royal Commission on Taxation has reported against either depletion allowances or broader double tax agreements, but he feels that the proposals to introduce "overseas trade corporations" with a measure of relief from British tax would, if eventually enacted, be a help.

Furs for Too Few

IN a prosperous world it is not surprising that the fur trade is also doing well. Prices of raw furs have been fairly steady this year and the new season has made a promising start. The first sales in London of new season mink were held just before Christmas; prices of standard mink

were firm and mutation mink was up to 15 per cent dearer than a year ago. Persian lamb has sold freely; prices were about 5 per cent higher than in November and over 10 per cent higher than a year ago. Those two furs remain the leaders of the market, but the more common types have not been neglected. The real test will come in February when the offerings in London are the heaviest of the season. Despite more competition from other centres London has retained its lead, and turnover has increased; more Persian lamb is being offered here and the Russians are making less use of direct selling contracts and more use of the London auctions.

The surprising fact is that the market for furs has failed to reflect the rise in living standards in the last fifteen years. Fewer furs are sold now than before the war, and fur prices have not risen commensurately with the general rise in commodity prices. There seem to be three main reasons for this. "Hard" consumer goods have won a larger share of the public's purse; social habits have changed, particularly in the largest market of all, the United States; and the fashion of fur trimmings has only recently revived. Many breeders' associations have realised that if fur is to compete with other goods it must be advertised extensively, and the success of the promotion campaign for mutation mink has proved the point. For some years the fur trade has discussed proposals for an international advertising campaign financed by a levy on auction sales, but agreement has yet to be reached.

SHORTER NOTES

The discount market expecting the year-end credit stringency to be especially severe, lowered its bid at the Treasury bill on offer on Friday of last week. The market's bid for 91 day bills was cut by 4d. per cent, to £98 19s. 4d. per cent. This represents a discount rate of just over 4½ per cent—a new peak for this maturity. No further two months bills are being issued for the present; but last week's tender included some 90 day bills, because of the incidence of Good Friday. For these, the market tendered at £98 19s. 7d. per cent. The average rate of discount on the whole £280 million of bills allotted was £4 2s. 9.13d. per cent, an increase of nearly 1s. 4d. per cent over the previous week.

Godfrey Phillips, the tobacco company, explains that the part of George Dobie and Sons that it proposes to buy if Robert Benson, Lonsdale and Company's offer is accepted, consists of the goodwill and trade marks, the shares held by George Dobie in its subsidiaries, with part of the tobacco stocks and certain other assets. It does not include the factory of George Dobie and Sons. The price to be paid by Godfrey Phillips will thus be substantially less than £1.38 million which is the total price to be paid by Robert Benson, Lonsdale and Company for the George Dobie undertaking.

In the leading article "Price Leadership in Tyres" published in *The Economist* of December 17th, it was incor-

rectly stated that Pirelli Ltd. was Italian-owned. The company is not: it is owned by Societe Internationale Pirelli S.A. of Switzerland, which administers all Pirelli interests outside Italy and is independent of the Italian company Pirelli S.p.a. Pirelli Milan does provide the British company with technical guidance.

When the ordinary shares of Colvilles were sold back to the public in January the directors estimated that the development programme due for completion in mid-1957 would cost about £22½ million. The company's full accounts now reveal that about £3½ million was spent on development in the year to September 30th and that capital commitments on that date came to nearly £14 million.

The World Bank has made its first loan to Honduras. It comprises \$4.2 million for highway maintenance and improvement; the loan is repayable in nine years and bears interest at 4½ per cent. Some \$872,000 of the loan is being provided by three United States banks, the Bank of America, the American Security and Trust Company, and the Whitney National Bank.

Whitbread is to put new money into Tennant Brothers, the Sheffield brewery with which it has already established "friendly co-operation and a close business relationship." Whitbread will take up to £50,000 worth of Tennant ordinary shares at a price based on market quotations over the last six months. A similar operation is contemplated in the next succeeding year and the two companies hope the operation will be repeated in subsequent years to cover a further sum of up to £150,000.

The final estimate of the main cocoa crop in the Gold Coast is 220,000 tons, the same as the preliminary estimate and the same as the final estimate of the 1954 crop. The trade generally had expected a lower figure.

The *Spyros Niarchos*, which was launched a few weeks ago at Barrow, has a rival for the distinction of the largest tanker now afloat. This is the *Sinclair Petrolore* which recently began its maiden voyage from the Persian Gulf to Santos in Brazil with a cargo of 51,330 tons of oil. The *Spyros Niarchos*, however, which has a deadweight capacity of 47,750 tons, has been built to carry oil alone whereas the *Sinclair Petrolore*, with a deadweight capacity of 55,000 tons, will carry either oil or ore, so the choice must rest on what is meant by an oil tanker. This other vessel was built at Kure, Japan, and left the yard three months after it was launched and only eight months after its keel was laid; it has a draught of 40½ ft. at full load, more than any other merchant ship including the "Queens." As it is to operate round the Cape of Good Hope this draught will only cause difficulty at discharging ports; but the *Spyros Niarchos* will go on the Suez Canal route. Here vessels up to 35 ft. in draught can be taken, with precautions, and it will be at least three years before dredging to 36 ft. has been completed.

Company Notes

RALEIGH INDUSTRIES. This company tried to hold its selling prices down in the face of rising costs. For a time it succeeded. With two minor exceptions prices were not altered between October, 1953, and July this year. But as a direct result trading profits in the year to July 31st declined by about 3 per cent (from £2,816,912 to £2,718,869) in spite of a rise in gross sales by about £2,500,000 to a new record figure. The improvement in sales, by pushing up stocks from £3,363,364 to £4,135,901 and debtors from £3,382,752 to £4,375,537 (including an increase from £806,652 to £1,611,669 in "gradual payments"), left the company short of liquid resources. Its bank overdraft of £524,842 on July 31st was much larger than its cash balance of £140,182.

The chairman, Mr G. H. B. Wilson, believes that the policy of holding prices down has enhanced goodwill. But with another wage claim on the way the policy has had to be abandoned and since the end of the financial year the prices of all the company's products have been raised. Is there now likely to be a recovery in profits? Further increases in costs are possible but the demand for the company's bicycles and cycling equipment is still strong—so strong that the company was unable to satisfy the home market and some of its principal export markets in full. Indeed the company is so busy supplying the market for pedal cycles that it has turned its back on the new market for motor assisted bicycles. It has also taken the view that the demand will persist and is actively engaged on a capital development programme (likely to cost about £4 million). It was the claims of this programme, rather than the decline in profits and in cash balances, that determined the directors to leave the dividend unchanged at 12½ per cent. The dividend yield of £5 3s. per cent on the £1 stock units at the current price of 48s. 6d. is unexciting but it seems to reflect staid prospects.

MUREX. Any prophecy based on the interim report of Murex, the metallurgists, is really an exercise in financial semantics. For the year to April 30th last, the directors paid an interim ordinary dividend of 6 per cent, a final dividend of 9 per cent and a cash bonus of 5 per cent, "making a total distribution of 20 per cent." They have now decided to raise the interim dividend from 6 to 7½ per cent. This decision is designed "primarily" to equalise the interim and final payments and does not, the directors are careful to add, necessarily imply any increase in the total distribution. To drive their point home they say that as earnings are likely to fluctuate considerably from year to year the "total distribution will tend to fluctuate accordingly."

The use of the word "primarily" and the distinction the directors make between "dividends" and "distributions" will not escape investors. They can hardly fail not to read into the statement the implication that this year's distribution will at least be maintained at 20 per cent. It is not simply the wording of the dividend announcement which encourages this guess. The directors state explicitly that the trading results for the six months to October 31st last have "shown a marked increase over the corresponding period of 1954 and so maintain the improvement achieved in the latter half of the last financial year." They add that:

1. Price fluctuations in the wolfram market, though frequent, have been smaller than in the previous year.
2. Sales of fire-refined copper have continued to be unremunerative and the copper refinery will be closed early in the new year.
3. Selling prices of low carbon ferro chrome have improved and immediate prospects are encouraging.
4. Supplies of rolled rod from the British steel producers have continued to be inadequate to meet the current demand for welding electrodes and the company has again had to import further quantities from abroad.

LONDON STOCK EXCHANGE

Next Account begins: January 4th
Next Contango Day: January 4th
Next Settlement Day: January 10th

BRITISH Funds remained firm around the holiday period and at the close on Wednesday the *Financial Times* index of Government securities was scarcely changed at 90.18—a striking fall from 103.33 at the close of last year but somewhat higher than the "low" of 87.05 reached during September. Trading in industrial stocks on Wednesday brought a gain of 0.9 to 199.7 in the index of industrial ordinary shares although dealing was again small. The index compares with 184.0 at the start of the year and the high point of 223.9 in July.

Bank shares improved a little on Wednesday, but remained generally close to their lowest points for the year. Discount shares remained at their exceptionally low levels, Alexanders Discount at 45s. being 18s. 6d. below their best for the year and Union Discount at 47s. 6d. being 12s. 9d. lower than their best. The hire-purchase finance houses were above their worst towards the close of the year. United Dominion Trust at 77s. compared with a lowest price of 67s. and best of 98s. Hire-purchase retailers were mostly at low levels. The warning accompanying the maintained interim of Canadian and English Stores caused a loss of 1s. to 14s. 10½d. on Wednesday—the year's lowest.

Electrical stocks improved; General Electric rose to 63s. 6d. and the high turnover of records helped a rise in Decca Record to 43s. 9d. and EMI to 34s. London Brick advanced 1s. 6d. on Wednesday to 60s. 9d. and Tube Investments 2s. 3d. to a peak of 67s. 6d. Motors were a better market, though generally remaining at low levels. Ford declined to 44s. on disappointment with the nine-months figures. Steel shares were active, Colvilles advancing to 38s. 7½d.

Oils were firm on Wednesday but declined slightly on Thursday, and copper producers advanced again. Kaffirs showed a considerable decline, but held steady on Thursday.

(1) This covers mining, manufacturing, electricity and manufactured gas with the following exceptions: Denmark and Greece exclude mining; Ireland and Sweden, electricity and manufactured gas; and Austria, manufactured gas. Germany excludes West Berlin. (2) Special trade (excluding re-exports) with the exception of Ireland which covers general trade with exports seasonally adjusted. Belgium includes Luxembourg. Italy includes Trieste. (3) New drachmas introduced May 1, 1954 (1 new drachma = 1,000 old drachmas). (4) Thousand million drachmas. (5) 1937. (6) 1936: estimated for territory corresponding to Western Germany. (7) Average for second quarter.

EXCHEQUER RETURNS

For the week ended December 17th there was an "above-line" deficit (after allowing for Sinking Funds) of £17,943,000 compared with a deficit of £33,538,000 in the previous week and a deficit of £21,696,000 in the corresponding period of last year. Net expenditure "below-line" last week reached £26,903,000, bringing the total cumulative deficit to £742,885,000 (£571,303,000 in 1954-55).

Financial Statistics

THE MONEY MARKET

THE money market has been dominated in the past week by preparation for the year-end stringency this weekend, which is expected to be particularly acute. On Friday last the market raised the Treasury bill rate to over 4½ per cent; and through the week discount houses have had considerable recourse to loans from the Bank at the penal rate. The offer at the tender comprised exclusively three months' bills, though those dated Friday of this week were at 90 days, owing to the incidence of Good Friday.

Credit supplies were very short immediately before the holiday (except at the brief Saturday session); the Bank gave a moderate amount of special aid on the Thursday, and on the Friday one or two houses took a very small amount of money at Bank rate. On both Wednesday and Thursday of this week a number of houses took loans from the Bank, for the customary seven days. The amounts involved were described as moderate; the Bank return shows an increase in discounts and advances in the week to Wednesday last of £26.6 million, to £37.7 million. This week's borrowing has been in part precautionary; overnight balances were available on Wednesday at down to 2 per cent, and by Thursday's close at 3½ per cent. But 4½ per cent has been paid for loans extending into January.

The Treasury bill rate in New York this week rose further above the official rediscount rate of 2½ per cent, from 2.618 per cent to 2.688 per cent.

COMPANY MEETINGS

THE NATIONAL BANK OF SCOTLAND LIMITED

FACTORS AFFECTING PROFITS—SCOTTISH INDUSTRY'S GOOD YEAR

EFFECTS OF CREDIT RESTRICTION

LORD ROWALLAN'S SURVEY OF NATION'S PROBLEMS

The One Hundred and Thirtieth Annual General Meeting of the Proprietors of The National Bank of Scotland Limited was held in the Bank's Head Office on December 22nd, the Right Honourable Lord Rowallan, KBE, MC, TD, DL, the Governor of the Bank, presiding.

The Governor said: I have to report with great regret the recent death of the Right Honourable Lord Inverforth, PC, who had been an Extraordinary Director since 1949. His Lordship, whose career was one of the romances of Scottish industry, was a good friend of the Bank and we shall miss him much. I am, however, happy to say that his son, the present Lord Inverforth, has accepted an invitation to join the Extraordinary Board, and later in the Meeting you will be asked to confirm this appointment, as well as that of Mr L. Harper Gow, who has also agreed to become an Extraordinary Director following his resignation on grounds of health from the Ordinary Board, of which he had been an esteemed Member since 1941. We all hope that he will derive benefit from the wider leisure he now enjoys. Last year I referred to the impending retirement from the position of General Manager of Mr J. Allan Brown, who had served in that capacity with marked distinction during the previous eight years. In accordance with their then expressed intention, the Directors have since appointed him to the Ordinary Board, where his wise counsels have been much appreciated.

SIR ANDREW McCANCE'S APPOINTMENT

To fill the vacancy caused by Mr Gow's resignation, the Directors were fortunate in securing the services of Sir Andrew McCance, DL, DSC, LLD, FRSE, Glasgow. Apart from his expert knowledge of the steel industry, Sir Andrew brings to the deliberations of the Ordinary Board a wide experience of men and affairs, and I have much pleasure in introducing him to you. In due course you will be invited to confirm the appointments of Mr Brown and Sir Andrew McCance. I must also refer to another loss which the Bank has sustained through the death of Mr William Carnegie which occurred on November 27th last, just after the Report and Accounts had gone to Press. Mr Carnegie joined the Bank at its Forfar Office in 1880 and rose to be General Manager, a post which he filled with distinction and from which he retired in 1930, since when he has continuously occupied a seat on the Extraordinary Board. While to many in the Bank's service today he is merely a name, he will be remembered with respect and affection by all who knew him.

THE BANK'S ACCOUNTS

At first glance, the Balance Sheet now presented might suggest a recession of business, for the totals are £7 million less than they were a year ago. You will, however, recall that in dealing with the 1954 figures I remarked that the Deposits, then £112,500,000, included certain moneys of a temporary character, and it is not in any

way surprising that for 1955 these Deposits should have fallen to £105 million odd: even so they are still £9 million above the 1953 figures. Notes in Circulation have again risen, this time by £400,000 to £11,900,000. On the other side of the picture, Advances and Bills Discounted, together £24,800,000, show a reduction of £5 million. Although some part of this reflects an initial response to the Chancellor's policy of Credit Restriction, in which connection I shall have more to say later on, the major proportion was effected through the repayment of borrowings by certain of the Nationalised Industries and through fluctuations in the normal course of business, and here I should tell you that in the light of future lending commitments, all fully justifiable in the national interest, it is doubtful whether the whole of the reduction now seen can be held during the coming year.

INVESTMENTS

Investments in British Government Securities stand at £51,300,000, which is only £2 million less than in 1954, but on this occasion you will observe we have adopted a new valuation formula which, having regard to the very heavy depreciation current on gilt-edged stocks, need not occasion any surprise. Neither need it cause anxiety, because all these investments have fixed maturity dates, and with more than half falling due within the next ten years it is a reasonable assumption that the deficiency of £1,900,000 or so will all be recovered in due time and in the ordinary course of business. You will, I am sure, agree that the risk of incurring substantial losses through forced sales is remote, and in this connection I would direct special attention to the fact that our cash resources, amounting to over £45 million, are more than 38 per cent of our liabilities to the public in the form of Deposits and Note Circulation. In the past, reference has been made to the part played by the Bank in the finance of international trade, and I would point out that Acceptances, Endorsements, Guarantees and other obligations undertaken on behalf of our customers still stand at the substantial total of £6 million.

It will not have escaped your notice that despite a welcome reduction in Income Tax the Profits at £336,000 are £6,000 down. This drop in earnings reflects first, the smaller funds available to the Bank during the year, the second, the increase in overheads, particularly in salaries, which following negotiations with the Staff Representatives were up-graded substantially with effect from April 1st.

THE DIVIDEND

Last year you were informed of plans to discharge the balance of the Uncalled Liability on the Consolidated Capital Stock, and the 10 per cent Dividend now proposed on that Stock is equivalent in amount to the distribution for 1954, in respect of which 8 per cent (actual) was paid on January 15, 1955, on the amount then paid up, namely

£1,250,000, and 5 per cent (actual) on July 15, 1955, on the paid-up amount as increased to £2 million by transfer from the Reserve Fund. Because of the lower rate of tax, the provision for Dividends requires £5,500 more than in 1954. The other allocations from Profits are: £130,000 to Contingent Fund and £75,000 to the Trustees for the Officers' Pension Fund, leaving the carry forward increased from £129,000 to £134,000.

TRADE CONDITIONS

Despite interruptions arising from disputes of one kind and another, Scottish industry as a whole has had a good year. With improved steel deliveries, which will be substantially augmented when new plant now under construction comes into production, shipbuilding and engineering concerns have been busy, and it is particularly encouraging that in face of the continued threat of foreign competition, which arises mainly from fixed prices and early delivery dates, there has been a revival of new orders for ships. A notable exception is, however, the Clyde, where shipping under construction is said to be at its lowest level for nine years, apparently because of the long series of local strikes. With regard to the textile trade, woollen manufacturers have no lack of orders, and despite labour shortages in some centres they are well on their way to establishing a new record for exports, while the Hawick knitwear industry continues to make a most important contribution to the nation's supply of foreign exchange. Jute production has also been high, although there have been uncertainties arising from questions of supply and price of the raw material. In flax, profit margins remained low owing to severe foreign competition.

As regards farming, the contrast between the 1954 harvest and the one just ended needs no elaboration. Suffice it to say that although root crops suffered from the drought in some areas, grains generally were ingathered in excellent condition, while the quick and early harvest ensured a minimum expenditure on labour and gave our farming friends a flying start with their necessary preparations for 1956. The fishing industry has not been so fortunate. The East Anglian herring fishing was a complete failure and most of our Scottish boats were unable even to cover expenses, while the curers, who come last in the queue for supplies, found it possible to complete only a negligible proportion of their substantial export orders. It is devoutly to be hoped that the West Coast fishings will make up some of the leeway, but the experiences of this year and of last demonstrate clearly that despite modern methods and up-to-date research, agriculture and fishing, which for long formed the backbone of Scotland's economy, are still very much at the mercy of natural forces.

FINANCIAL SITUATION

From this Chair, attention has in the past been directed to the dangers inherent in

national over-spending, but in boom conditions it is not always easy to recognise warning signals, particularly when recurrent crises are referred to merely as periods of embarrassment, and early in 1955 it became clear that a jolt to our complacency was overdue. The "amber light" of the increase of ½ per cent in the Bank of England Discount Rate announced on January 27th having failed to subdue optimism and arrest continuing inflation, the Government unmasked the red signal four weeks later through a further rise in the Bank Rate, this time by 1 per cent to 4½ per cent, a rate which had not been seen in this country since the dark days of 1931-2, although it is true that even higher rates were then temporarily in operation. There is no doubt that this second and larger increase, coupled with the imposition of restrictions on the hire purchase of a wide range of goods, served as a sharp reminder that despite apparent prosperity the country's economy was still suffering from a basic weakness stemming from excessive internal demands, which on the one hand tended to increase imports and on the other to reduce the volume of goods available for export. The second Bank Rate increase, with its immediate effect on an already depressed gilt-edged market, was a bitter pill for bankers to swallow, but taking the long-term view, it was accepted, if not gladly, at least with resignation, as the tried and tested specific for economic ills.

CREDIT RESTRICTION "MOST TRYING"

Not so did we regard the further measure which the Chancellor of the Exchequer found it necessary to take in July when he called for "a positive and significant reduction in the total of bank advances outstanding." It was with no little misgiving that we set ourselves to the unenviable task of translating this new policy into effect, and it will not surprise you to hear that of all the tribulations we have had to face during the past year, Credit Restriction has been by far the most trying. Great as was the amount of detailed preparation work involved, that paled into insignificance compared with the problem of actually imposing the proposed borrowing cuts on individual customers. You will, however, be glad to know that our customers, almost without exception, accepted the reduced limits that had to be enforced in a spirit which provided striking evidence of their goodwill to the Bank, and I should like to say how much we appreciate their co-operation. I should also like publicly to repeat what many of them have already been told privately, namely, that it has gone very much against the grain to interfere with old-established arrangements and to apply pressure that, at the very least, may well result in interruption of normal progress for many businesses which, though not perhaps directly connected with, for example, the country's defence needs or export trade, are nevertheless important to the economy of Scotland.

UNPLEASANT EFFECTS

It must, of course, be freely admitted that in face of the phenomenal expansion in bank loans, which continued and indeed increased even after the orthodox correctives of higher Bank Rate and contraction of what is commonly known as the "credit base" had been applied, Mr Butler had little option but to take the line he did. By the same token, it would have been quite wrong, even if it had been feasible, to propound one Directive for the Medes and another for the Persians by differentiating in favour of certain banks whose advances had climbed neither so fast nor so steeply as others. Similarly, it has been impossible for the banks themselves—except in certain well-defined and permissible cases—to exercise any option in favour of

particular customers. The effects have been unpleasant; they may be more unpleasant yet, but this Bank has played, and will continue to play, its part towards implementation of the Chancellor's policy of restricted lending. That policy is not, in our opinion, a panacea for all the country's ills, especially when advances which the banks feel obliged in the national interest to decline can apparently on occasion be obtained elsewhere. It is, however, an integral part of the various measures designed to place the nation fairly and squarely on its financial feet, and this prompts me to refer to two further points, interconnected and having an important bearing on the problems that face us.

GOVERNMENT SPENDING

The first is the nature and extent of Government spending, direct and indirect. For many years now a large and increasing slice of the national income has been diverted to schemes, some of which, no matter how desirable, are difficult to justify in present circumstances, and furthermore there is a suspicion that the enormous sums involved may not always be administered with what we would be wont to regard as normal business caution. The intimation of the Government's intention to curtail expenditure in various directions is therefore very welcome. Provided this is translated into action, it may yet prove to be a most potent factor in our struggle back to a position of economic stability. The second point relates to the notoriously slow settlement by Government and quasi-Government Departments, not to mention Local Authorities, of their liabilities under contract. All of these bodies expect, indeed they demand under the full majesty of the law, immediate payment of moneys due to them, but when it comes to loosening their own purse strings, generally speaking they move like the Mills of God. The "credit squeeze" would be much more easily applied and much more effective if bank customers could obtain timeous settlement of their just dues from these sources.

ENCOURAGING SIGNS

I should have liked to close this somewhat gloomy review of the financial situation on a note of cautious optimism, but although, following the measures referred to above and the latest Budget proposals, there are encouraging signs—as for example the reduced drain on the country's gold and dollar reserves and the relative firmness of sterling—we have yet a long way to go. In times past, there has been a tendency to plug with soap—and soft-soap at that—leaks in the economic vessel and it is high time we faced up to the true implications of the situation. The fact of the matter is that we have all got into the habit of expecting a standard of living that may not always be justified by national production, and we have got to change our way of thinking. I would not presume to discuss the rights and wrongs of the recent dock and rail strikes, but however impossible it may be to assess the ultimate repercussions, there is no shadow of doubt that they had an immediate and serious effect on trade and in particular on our export trade, which is the breath of our national life. In present circumstances, we just cannot afford the luxury of strikes. The financial abyss into which we have looked more than once in recent times still yawns threateningly before us, and I make no apology for appealing to everyone, employer and employee alike, to put his shoulder solidly behind the wheel that may ultimately carry us away from the verge.

STAFF

In conclusion, I desire once again to pay the tribute which we all owe to the officials

and staff at Head Office, London and Glasgow and throughout the branches for the continued loyalty and efficiency of their service to the Bank. This is all the more deserved on this occasion in view of the additional work involved throughout the whole organisation as a result of the Chancellor's Directive already referred to. In particular, I should like to take this opportunity of cordially acknowledging the marked ability with which Mr Alexander has guided the affairs of the Bank and upheld its prestige during his first and very difficult year of office as General Manager.

The Report and Accounts were adopted.

VOKES LIMITED

(Filtration and Silencing Engineers and Manufacturers of Aircraft, Motor and Industrial Accessories)

TRADING SURPLUS AGAIN SATISFACTORY

SIR IAN STEWART-RICHARDSON'S STATEMENT

The eighteenth annual general meeting of Vokes Limited was held on December 21st at the Lion Hotel, Guildford, Sir Ian Stewart-Richardson, Bt, chairman of the company, presiding.

The following is an extract from the chairman's statement circulated with the report and accounts for the year to June 30, 1955:

The Directors' Report and Accounts of the Parent Company and the Group for the twelve months ended June 30, 1955, show that the trading surplus for that year is again satisfactory. Due to the cessation of the Excess Profits Levy the charge for taxation is reduced but inclusive of profits tax still absorbs approximately 50 per cent of the trading surplus. The taxation liability of the Company in respect of its trading up to June, 1953, has now been agreed by the Revenue Authorities, which has resulted in our being able to release part of the taxation provision; and this has been credited to the Profit and Loss Account.

Approval was given by the members at the last annual general meeting for a scrip issue of shares and the nominal amount of this scrip issue has accordingly been deducted from the balance on Profit and Loss Account brought forward from the last account.

ANOTHER SCRIP ISSUE

The recommendations as to how the available surplus should be dealt with are set out in the Directors' report. It is recommended that a further sum be transferred to General Reserve Account but a proportion of this together with part of the balance on Profit and Loss Account will be utilised in a further scrip issue, of 1,500,000 shares, which you will be asked to approve at an extraordinary general meeting to be held immediately following the annual general meeting. This year the company introduced the payment of an interim dividend on its Ordinary share capital and it is the intention of the Directors, circumstances permitting, to continue this practice.

From the Balance Sheet it will be noted that there has been an increase in the fixed assets of the company due to the completion of the first stage of rebuilding and the purchase of new equipment. There has also been a substantial increase in current assets over current liabilities due to the taxation adjustments previously mentioned and to the increased net earnings. On the liabilities side both the loan capital and the Ministry of Supply Accounts have been reduced.

The company is committed to further capital expenditure for rebuilding and this expenditure will have to be made during the current financial year.

SUBSIDIARY AND ASSOCIATED COMPANIES

The reduction in the aggregate surplus earned by the subsidiary companies is due to adverse conditions overseas. However, it has again been possible to reduce the amounts advanced by the parent company and there has been no further investment in the subsidiaries during the year. It is anticipated that further investment for the acquisition of fixed assets will be necessary, possibly during the current year. The manufacture and sale of tobacco-processing machinery commenced last year in conjunction with the associated company has progressed and it is anticipated that the production of this type of equipment will assist the turnover of the Group in future years.

Factory Premises: The first stage of the company's rebuilding programme was then virtually complete last year and during this year the second stage of the rebuilding programme was commenced and is now well in

hand. It should be completed about June, 1956, the cost being met out of current resources.

TRADING RESULTS AND FUTURE OUTLOOK

As will be gathered from the results the trading of the Group has expanded and whilst there have been some fluctuations during the period it remains very satisfactory. The success of the company depends on keeping ahead in developments and technique applicable to its spheres of activity. The Development and Research Departments have been strengthened and in this respect much work has been done in connection with the use of atomic energy. Continuous examination of overseas developments is carried out with a view to applying these to our own products. Whilst the cost of all these activities adds substantially to overhead expenses, they are vitally necessary for continued progress.

Production costs have continued to rise, and have had to a great extent to be absorbed. If this rise continues it is difficult to see how a contraction in profit margins can be avoided, followed by a falling off in turnover affecting both our customers and ourselves.

BANK OF CEYLON

A YEAR OF PROGRESS

NEW BUDGET'S UNDERLYING THEME—"DEVELOPMENT WITH STABILITY"

MR H. V. PERERA ON NEED FOR OVERSEAS CAPITAL

The annual general meeting of the Bank of Ceylon was held on December 10th at Colombo.

The following is an extract from the statement by the Chairman, Mr H. V. Perera, QC, on the report and accounts for the year ended September 30, 1955:

In our own country 1955 proved to be a year of progress though not without occasional reverses in our external trade. The steady rise in tea prices during 1954 reached a peak at the close of that year, but the trend of prices in the first half of 1955 presented a very different and discouraging picture. Many tea producers watched market prices with anxiety as they fell to levels below their costs of production. The nadir of these depressed conditions was reached in May when prices recorded were the worst experienced since 1952. But, as we are now aware, the worst is over, and we look forward with hope to a more stable future for our tea industry and the country as a whole, for in our tea industry lies in large measure the future of our economy. The tea industry is our greatest national asset despite economic development in industrial and other agricultural fields, and still accounts for about one-quarter of the gross national product of this Island. With the removal of control over the import of tea in several consuming countries, strong competition must be expected from other producing countries, and it is vital especially at this time that the reputation which Ceylon has achieved for quality should be maintained and even enhanced.

It was indeed fortunate for Ceylon that just when tea prices began to decline the trend of rubber prices became favourable. The fears expressed last year by natural rubber producers of the growing threat of synthetic production appear to have been replaced this year by a feeling of buoyancy. But doubts are already being expressed whether this buoyant market condition will continue to last, and it is believed to be only a matter of

time before production of synthetic rubber expands and improves sufficiently to offer strong competition to the natural product. There is room for both products to co-exist at reasonable prices in a world that will demand more and more rubber for the expansion of existing industries and the development of new ones.

The declining trend in the market prices of the main coconut products during 1954 continued well into 1955, though some relief was offered by reductions in export duties in March this year.

Fortunately, production has expanded this year, and the total value of coconut products exported has not been adversely affected to any marked degree.

Our higher earnings from exports were more than sufficient to finance imports in 1955, and by the end of September Rs. 21 million more had been spent on imports than in the corresponding period of 1954.

DISTRIBUTION OF TRADE

The United Kingdom has again been the largest market for our exports as well as the chief source of our imports, but, due largely to the temporary diversion during the year of our sheet rubber exports from China to other countries, the United States of America has replaced China as the second largest buyer of Ceylon produce.

Trade with the dollar area has increased this year mainly as a result of sales of rubber to dollar countries. These larger exports have not only been able to finance increased imports, particularly of machinery, from the dollar area but have also contributed towards a larger dollar trade surplus.

Ceylon's trade with China on the other hand has met with practical difficulties in recent months. The diversion of sheet rubber from China to other countries and the supply of rice by Burma resulted in a substantial

Germany still appears to be more competitive in prices and deliveries.

RESULT OF PRUDENT POLICY

From the figures, shareholders will appreciate that the present employed capital of the Group, to which the surplus earned should be related, is greatly in excess of the issued capital; and the capital assets continue to expand. It is, therefore, with both these factors in mind that your directors put forward their recommendations for a substantial increase in the issued Ordinary share capital of the company. This course is only made possible by the prudent and conservative policy adopted over past years.

I will conclude by again expressing sincere thanks to all executives and employees of the Group for their efforts upon which members must largely rely for future results.

The report and accounts were adopted; the proposed dividend was approved and the remuneration of the auditors, Messrs Charles Comins and Co., was fixed.

At a subsequent extraordinary general meeting the proposed scrip issue was approved.

reduction in the volume of trade with China. The recent resumption of rubber and rice shipments in our trade with China will, however, show some improvement in our trade figures for this country by the end of the year.

BALANCE OF TRADE

It is gratifying to observe that for the second year in succession our visible balance of trade has been very favourable and it is our hope that when 1955 closes there will be as large if not a larger surplus than in the previous year. It may well be that if trade continues to be favourable the measure of our financial standing may exceed all records within a short time.

The new Budget, as we are aware, was in the main a very popular one not only because there was no major additional taxation but also because the underlying theme was development with stability. Incentives for the export of copra and cocoa in the form of reduced export duties and measures designed to encourage investment and savings in the private sector were other features appreciated by businessmen. The double-tax agreements now being negotiated with foreign countries will, when concluded, be an added incentive for the investment of foreign capital in local enterprise and it is our hope that every advantage will be taken by the overseas investor and every encouragement given by the Government to attract foreign capital into Ceylon.

A country desirous of encouraging economic development through private enterprise may well consider the feasibility of taxing expenditure rather than income and the Government may consider it worth while to examine this new development of economic thought which appears to be gaining increasing support.

I am sure we shall all welcome the extension of the Colombo Plan for a further period. The assistance afforded under the Scheme has proved invaluable to all under-developed countries in the past and this extension will enable their resources to be more fully developed and raise the standard of living of their peoples. The Ceylon Government has recently made a declaration of its policy with regard to foreign investment in Ceylon and every possible encouragement has been held out to overseas capital. Foreign capital would be welcome in many fields of investment and investors will be assured of fair treatment at all times.

I need hardly say that participation of local wealth with foreign capital is desirable in the establishment of business enterprises and though there are no rigid laws governing the entry of foreign capital into Ceylon, the Government expects that the objects of any enterprise should not be in conflict with national interests. The Bank of Ceylon will always support such regulated flow of foreign capital into this country. In an economy such as ours too great a bias towards industrial expansion at the expense of agriculture should be avoided, and trade and agriculture should develop along with industry. Much of our export trade has still to be Ceylonised and this Bank which was established with the primary object of helping Ceylonese is ever ready to assist financially any credit-worthy concern in the pursuit of that objective.

BANK OF CEYLON

The total deposits of all commercial banks rose in the course of the year under review from Rs. 741 million to Rs. 891 million; the total deposits of your bank rose from Rs. 271 million to Rs. 367 million. Your bank continues to control well over one-third of the total commercial bank deposits and its progress in this field is indeed gratifying.

Cash on hand and Balances with banks rose from Rs. 66 million to Rs. 92½ million; the ratio of Cash to Total Deposits is no less than 25 per cent. The ratio of Cash, Treasury Bills, and Loans receivable at Call to Total Deposits is 39.2 per cent and if Trade Bills and Investments maturing within one year are included the ratio is 48.6 per cent.

NETHERLANDS BANK OF SOUTH AFRICA LIMITED

EXPANSION TREND FULLY MAINTAINED

The Fifth Ordinary General Meeting of Shareholders of Netherlands Bank of South Africa Limited was held on December 20, 1955, in Pretoria, Mr J. P. Kakebeke (The Chairman) presiding.

The following is an extract from his circulated statement:

I should like to mention that the results for the financial year 1954/55 are entirely satisfactory. From the figures submitted in this year's report it is clear that the trend of a gradual development and expansion which was apparent in the past has been fully maintained.

POSITION OF THE BANK

The continual growth of the Bank during the last five years is clearly indicated by the gradual increase of the total assets from £17,700,000 when the Bank was established in January, 1951, to nearly £34 million at the end of September, 1955.

The expansion of the Bank necessitated the improvement of existing buildings and the erection of certain new premises. I am glad to mention that our main branch in Cape Town could occupy its new office in St. George's Street during September last, which provided a long-felt need and which will enable this branch to give improved services to its customers. Further progress was made in Southern Rhodesia, while our Office in London again showed a favourable development.

Our business with the Continent benefited by the expansion of our affiliation in Amsterdam, which amalgamated with the Amsterdamsche Goederen Bank NV and which now

As a result of the buoyancy of Government finances during the year the Government's need of short term finance was on a reduced scale and this is reflected in the reduction in the bank's holdings of Treasury Bills from Rs. 25 million to Rs. 14 million. This reduction is almost exactly offset by a switch to Government Securities, the holding of which has increased from Rs. 87 million to Rs. 98 million.

Credit extended to customers in the form of Loans, Overdrafts, Bills Purchased and Discounted rose from Rs. 93 million to Rs. 120 million.

There has been an appreciable increase in Balance Sheet total from Rs. 428½ million to Rs. 594 million. Deposits account for Rs. 96 million of this increase and credits and other accounts for Rs. 70 million.

Gross profit has increased by Rs. 1.2 million to reach the record figure of Rs. 9.6 million, but expenditure and transfers to Reserves have also arisen by approximately the same proportion. An interim dividend of 7½ per cent was paid on June 1, 1955, and your Directors have pleasure in recommending payment of a final dividend of 7½ per cent, making 15 per cent in all for the year.

On August 1, 1955, your Directors authorised the transfer of a sum of Rs. 3 million from Inner Reserves to a new reserve account styled "Other Free General Reserves." With the allocation of a further Rs. 350,000 which is recommended from this year's profits, this account will stand at Rs. 3,350,000.

The report and accounts were adopted.

operates under the style of "Nederlandse Overzee Bank NV."

The net profit figure was again higher than last year. Income from commission and exchange showed an appreciable increase, but on the other hand expenditure was also higher. During the year the salary scales of the staff in Southern Africa as well as in London were improved.

As customary, all additions to furniture, office equipment and stationery were written off.

Adequate provision was made for taxation, possible bad and doubtful debts, depreciation of bank buildings and for the usual strengthening of the Staff Pension Fund.

I am pleased to state that during November of this year our Bank established a branch in Windhoek (SWA) which will enable us to provide services also in that territory. A fourth office in Southern Rhodesia will be opened at Gwelo shortly.

Next year it is intended to establish branches in Pietermaritzburg (Natal) and at Klerksdorp (Transvaal).

With reference to your Directors' report, I wish to point out that in connection with the increasing business of the bank your Directors deem it advisable to recommend a strengthening of the Reserve by £100,000 which will then stand at £700,000.

In view of the improved profits your Directors consider it justified to recommend an increase of the dividend to shareholders from 7½ per cent (1s. 6d. in the £) to 8½ per cent (1s. 9d. in the £).

It is recommended that a special depreciation of £25,000 (last year £50,000) be made on bank buildings.

Although during the last few years trade conditions in the Union were favourable, a word of caution is not out of place and attention is drawn to certain restrictive measures which were taken by the authorities to maintain the stability of the Union's economy.

The Report and Accounts were adopted.

MOUNT ISA MINES

The Annual General Meeting of Mount Isa Mines, Limited, was held on December 6th at Brisbane, Mr G. R. Fisher (Chairman of the Company) presiding.

The Chairman, in the course of his speech, said: The net profit for the year ended June 30, 1955, was £3,307,250 compared with £2,096,204 for the previous year, and was struck after providing £800,000 for depreciation of buildings, plant and machinery and £941,250 for Income Tax.

DIVIDENDS

The Directors recommend a final dividend of 15 per cent. This is in addition to the interim dividend of 10 per cent paid on June 29th. The total dividend disbursement for the year amounted to £1,439,328.

The dividend policy has been dictated by the increasing need for substantial capital development both for existing operations and for the very substantial mine development which is being planned. The present policy is to finance these expenditures from profits and reserves.

Stockholders have been advised previously that the possibility of erecting a Zinc Smelter in Australia to handle production from Mount Isa Mines is being examined.

An examination is also being made of the possibility of constructing a copper refinery to treat blister copper from Mount Isa Mines.

ORE RESERVES

Estimated reserves of silver-lead-zinc ore as at June 30th last were 12,200,000 tons, of which 1,900,000 tons were classified as developed ore and 10,300,000 tons as prospective ore. This is an increase of more than 2 million tons over the reserve shown a year ago.

Exploration and development during the year also increased copper ore reserves by approximately 1,500,000 tons, bringing the total to 5,100,000 tons of 4 per cent ore.

URANIUM PROSPECTING

The Company has continued an active ground prospecting programme for uranium in the Mount Isa/Cloncurry area with the assistance of an airborne scintillometer. So far, no deposits of economic importance have been discovered by the Company and, consequently, no further action has been taken regarding the construction of a uranium treatment plant at Mount Isa.

THE OUTLOOK

At the present time world metal prices are extraordinarily high, but it is not anticipated that these prices, particularly that of copper, will continue at this level. Due to lack of refining capacity in Australia, it has been necessary for this company to export blister copper to the United States for refining and for us to bring the copper back to Australia to meet local requirements.

There has been a shortage of copper in Australia during the last year or so, and it has been necessary to import substantial quantities from overseas. In recent weeks there has been a marked decline in the consumption of copper in Australia, but it is anticipated that local consumption will increase in the near future and that all Mount Isa's copper will be marketed in Australia.

I would say finally that provided no unforeseen interruptions occur in our mining and smelting operations, shareholders can look forward to their Company having another successful year.

The Report and Accounts were adopted.

COMBINED ENGLISH MILLS (SPINNERS) LIMITED

DISRUPTIVE COMPETITION FROM FOREIGN IMPORTS

TRADE'S SALVATION LIES IN EVER-INCREASING EFFICIENCY

The twenty-sixth ordinary annual general meeting of Combined English Mills (Spinners) Limited was held on December 21st in Manchester.

Lieutenant Colonel Sir John Reynolds, Bart, MBE, JP (the chairman) presided. The following is an extract from his circulated speech:

The decline in Trading Profit to £532,004 as against £1,255,672 last year, and £875,310 the year before, will be commented on by me later in my speech. The net profit at £119,203 compares with £386,000 in 1954 and £286,000 in 1953.

BOARD'S DIVIDEND POLICY

The dividend policy of your Board has been guided by the primary importance of conserving funds if modernisation is to progress without endangering proper liquidity. Hitherto it has been possible to finance Capital Expenditure largely out of profits, but this year this is not the case. For this reason and because of the uncertainty overhanging the cotton market because of the enormous stocks of raw cotton built up in the United States, the Board have decided that they must reduce this year's Ordinary Dividend to 6 per cent with a corresponding reduction in the Preference Dividend from 7½ per cent to 6 per cent.

COMPETITORS' FAVOURED POSITION

A grave problem, but in my opinion only one of many, has been the extensive importations into the home market of yarns and cloth manufactured under wage conditions with which our own quite properly have no comparisons. Although our range of counts is seldom in direct competition with these imports, we are bound to feel the repercussions as other sections try to escape from the intense competition of their particular section—thus, all sections are interdependent. Direct but mainly indirect export subsidies in certain countries have aggravated an already difficult position, placing countries with whom we can normally compete on level terms in a favoured position in our home market and in our traditional export markets.

Disruptive though this competition would always have been it might have been of less consequence if world trading had not contracted sharply under the demoralising effect of a virtual breakdown in the price structure of our raw material. The American Government under various schemes of price maintenance has accumulated an unsold stock of American cotton equivalent to an entire year's crop, and has also encouraged the excessive production of cotton over a wide area of the world under the umbrella of its own price structure as a result of which world production of cotton has reached a higher figure than ever before. On the Liverpool Cotton Market which opened so hopefully in May of 1954, the fear of export subsidies has forced such discounts into forward positions as to make it impossible and impracticable to contemplate carrying spot cotton so essential to the full re-establishment of the market. The disentangling of the position is proving increasingly difficult, and the resultant confusion in prices has produced a market which is gravely discouraging to all traders.

This is the background to the year that we

have entered and until, and unless, some order is re-established in raw cotton values we are bound to proceed with caution and some anxiety no matter what action our own Government may decide to take on Lancashire's behalf. The measure of your Board's own confidence in the future is their steady expenditure of funds on reconstruction and modernisation. During the last eight years since the war we have spent on re-equipment an amount in excess of our issued Ordinary share capital. The day will come when the price of raw cotton is once again on a stable basis, and when that day does come we are confident that Lancashire will hold a reasonable share of world trade, particularly in speciality and high quality fabrics for which your Company caters.

On the all-important question of labour deployment a very real approach is now being made in negotiations with the Trade Unions on a change to shift working. However, shift working, necessary though it be, is no final solution unless the hours worked bear proper relation to the economical use of expensive new machinery. Double shifts on the basis of 3½ hours worked for 45 hours' pay as at present sanctioned by the Trade Unions are not economic, and whilst a 40 hours' basis would produce some advantage, even this would not be sufficient to place us on a full competitive basis. Three-shift working presents considerable problems to these sections of the trade which depend largely upon female labour.

The Yarn Spinners' Association has again prevented disorderly marketing of cotton yarn due to the very strict preservation of the scheme which provides a co-operative method of operational cost. There is little doubt that but for this substantial actual losses would have faced the spinning section to the detriment of all, including the labour force, which in the end depends on a trade that is solvent and with sufficient funds to keep its machinery up to date. The salvation of our trade lies in ever-increasing efficiency both as regards machinery and labour redeployment, but even greater strides in both these at considerable capital cost can be completely vitiated if markets are not available due to circumstances political and nationalistic beyond the scope of fair industrial competition.

It will be noted that our stocks have declined from £4,359,000 to £2,516,000, a reduction largely attributable to raw cotton. This reduction is partly due to the decline in values, but largely to the improvement in marketing facilities that have enabled us to operate on much reduced stocks, a position we have been anxious to achieve. I stated last year that no perfect hedge was available, and that a sharply declining market was bound to cause stock losses unless a long yarn order book could produce the best of all covers. Long staple hedge contracts have now been opened in Liverpool and Alexandria, but it is as yet too early to predict whether they will prove a satisfactory hedge. They have opened at a time of such difficulty that they have so far been unable to attract sufficient volume of business to make effective trading possible.

HIGH LEVEL OF RETAIL SALES

There is, however, another side to this somewhat gloomy picture which can be lost sight of under the stress of immediate

problems. First, retail sales of textiles continue high and full employment seems to preclude any serious setback in such sales. Secondly, the pipeline of goods behind the counter has been allowed to run down and few stocks are available to meet the demand which must inevitably come when confidence in prices becomes re-established. Thirdly, the sweeping away of the "D" Scheme will remove a great disadvantage to the Fine Trade (although the *ad valorem* tax replacing it favours cheap imported cloth in some measure).

THE FUTURE

It is undoubtedly true that the position could change very rapidly and a return of confidence could produce real shortage of yarn in a very short space of time as production cannot be increased overnight. It would, however, be pure speculation to anticipate such a change in the immediate future. The recuperative power of our industry is enormous, as our records show, and it is pleasing that we have been able to maintain our world-wide links throughout this trying period of re-adjustment of values. If these conditions can be expected to continue—and at the moment sales exceed production and stock losses are unlikely to be repeated due to stocks being lower both in value and quantity—then the coming year may well show some improvement, but the horizon is insufficiently clear for any confident prediction to be made.

Another uncertain year is anticipated with sales prospects still obscure, but we believe that we are approaching a more satisfactory price-base and hope that when that level has been reached and confidence restored our ever-increasing efficiency will allow us to earn a reasonable return on the capital employed, and also to provide cash resources for machine development.

The report and accounts were adopted.

CENTRAL AND DISTRICT PROPERTIES LIMITED

The twenty-first annual general meeting of Central and District Properties Limited was held on December 29th in London, Mr Russell L. Tillett, FCA (the chairman), presiding.

The following is an extract from his circulated statement:

The total of the book values of the Fixed Assets of the Group again shows an increase. This increase is, in the main, attributable to the reduction in the Mortgages.

During the year, a property was de-requisitioned and active steps are being taken to obtain satisfactory rentals. As a result of the Housing Repairs and Rents Act, 1954, your Company and its Subsidiaries are receiving increases in their rentals, amounting to approximately £10,000 per annum, which is some assistance in alleviating the burden of increased expenditure.

Further progress has been made in the rebuilding of the war-damaged property at Angel Hill Parade, Sutton, and it is expected that the shops will be ready for occupation this month.

During the year a property was sold which realised a substantial excess over its book value, and your Directors are aware of the desirability of increasing the revenue of the Group by the acquisition of further suitable investments.

Our carry forward is rather less than the amount brought in, indicating that the dividends paid during the year have somewhat exceeded the net revenue accruing to the Company. Having regard to the known improvements in our income, the Directors foresee no difficulty in maintaining distributions at the present level.

The report and accounts were adopted.

RALEIGH INDUSTRIES LIMITED

PRODUCTION AND SALES RECORDS BROKEN

MR GEORGE WILSON'S STATEMENT

In his statement to the shareholders, reporting the Company's record production and sales, the Chairman, Mr George Wilson, says:

The past year has been particularly notable for the continued expansion of our business at home and overseas, and sales of cycles and gears have increased by almost £2,500,000 reaching, for the ninth year in succession, a new record figure. In spite of this, however, we have been unable to meet the demands of some of our principal export markets or to satisfy the full requirements of the home trade.

Work on the new factories which we decided last year to build in order to meet these continually increasing demands is progressing well and we expect that they will be ready to begin production by the middle of 1957. We are still hopeful that we shall be able to finance these extensions out of our own resources although the position has not been made any easier for us by the Chancellor's policy of credit restriction.

PRICE POLICY

Our policy on prices over the past two years has been one of stabilisation. With two minor exceptions our prices have been held at October 1953 levels not only in export markets, where prices generally have been fairly stable, but also in the home market which has seen a considerable rise in

prices during this period. This, of course, has meant that we have had to absorb almost the whole of the very considerable increases in the costs of labour and materials which have occurred, with the result that our profit before tax is down by £131,483 at £2,192,593 compared with £2,324,076 last year. Due in the main to the elimination of the Excess Profits Levy and the reduction of sixpence in the standard rate of Income Tax, our net profit after taxation has increased by £174,254 at £1,211,157, compared with £1,036,903.

We are, however, entirely satisfied that this policy has been the correct one, for not only has it helped to increase the great goodwill which already exists between this Company and its distributors and dealers throughout the world, but—what is perhaps even more important—it has enabled us to play our part, however small, in the national effort to hold down the cost of living, on the successful outcome of which the prosperity of this country so largely depends.

With the best will in the world, however, there is a limit to which a policy of price stabilisation can be taken under these conditions. Faced with the prospects of a further drop in our profits on an expanded turnover during the current year, we have reluctantly been compelled to raise the prices of all of our products since the end of the financial year.

WAGE INCREASES

Quite the most disturbing feature of the engineering industry today are the continued and persistent demands for wage increases which now come round as surely as the seasons, bringing in their train not only additional labour costs but inevitably increased material costs as well.

It is my confirmed belief that any wage

increases in the future that are not matched by an equivalent increase in productivity cannot help but lead, sooner or later, to our being priced out of our traditional world markets, with unemployment in our industry as the inevitable result. I hope it will not be too late before this fundamental truth is appreciated in those quarters responsible.

PROFIT-SHARING

For some years it has been the Company's policy to reward our workpeople by bonus payments at Christmas for their efforts over the past year. We have now decided to replace this by a profit-sharing scheme in which the amount distributed to our employees will have a predetermined relation to the profit earned by the Company each year. This decision falls into line with the policy enunciated by the Prime Minister in a recent speech.

CYCLING SCHOOL

In an attempt to combat the mounting toll of road accidents of which children and young people are so often the victims, we have recently instituted a School of Cycling for children. It is perhaps a measure of the need for something of this nature that the Right Honourable J. A. Boyd-Carpenter, MP, the former Minister of Transport and Civil Aviation, himself came to open our first school in Nottingham, which we intend shall be the forerunner of many more to come throughout the country. Already in Nottingham alone, to the great satisfaction of their parents, over 600 children have passed their proficiency test, thus gaining the confidence and road sense necessary to enable them to take their rightful place on the highways of this country.

THE SCOTTISH AUSTRALIAN COMPANY LIMITED

A SOUND AND HEALTHY POSITION

MR J. NORMAN EGGAR'S REVIEW

The annual general meeting of The Scottish Australian Company Limited was held on December 22nd in London.

Mr J. Norman Eggar (Chairman and Managing Director) presided, and in the course of his speech said:

Our meeting this year is a week later than usual, as I only returned from my last Australian trip a week ago. I was able to visit 21 of the Company's stations, and to meet many of the managers of our other Queensland stations which my itinerary would not allow me time to visit. The whole of Australia has had an exceptionally good year; however, it is always well to remember the dangers of bush fires, all the greater when growth of pastures is abundant, and that a succession of good seasons must in the natural course of events be succeeded by some droughty periods. The movement of stock is becoming increasingly difficult in Queensland since railway employees have refused to work overtime, and that means that fat cattle for market or meat works are being held up everywhere and the risk of mortality is greater.

After a detailed review of his visit to the various properties, the Chairman said:

Proceeds from Wool and Live Stock: There were decreases of £131,301 and £15,220 respectively. Wool Clip taken to Profit and Loss Account was 9,463 bales, 887 more than the previous year, but the average price realised declined by £22 8s. 11d. per bale. Proceeds from Wheat and other Crops show a reduction of £15,976 on the previous year. 35,114 fewer bushels of wheat and 3,886 bushels of oats were harvested by the Parent Company.

After commenting on various other items, the Chairman continued: As stated in the Report, the amount available for distribution is £484,012. We have allocated £100,000 to General Revenue Reserve and £15,665 to Staff Bonus. Let me assure you that this bonus is tremendously appreciated by the staff in Australia and in London. I was deeply impressed by the great loyalty and enthusiasm of all concerned in Australia.

After payment of the dividends on the Guaranteed Preference Stocks and the interim and final dividend, if approved, on the Consolidated Ordinary Stock, we are carrying forward £204,881 as compared with £123,601 last year.

After a detailed review of the Consolidated Balance Sheet the Chairman said: Sheep numbers at June 30th were 341,977, a reduction of 3,346. Cattle increased by 6,813 and numbered 92,975 at June 30th.

I think you will agree that the Balance Sheet shows a sound and healthy position. As to the current year, I will just say this: Given normal rainfall I look for better revenues from our cattle stations. If wool prices hold at their present level, there should not be any great falling off in proceeds, for lambings have been good. The return from Wheat and other Crops will definitely be better. We all know the hazards attendant on our Industry, and any forecasts may be changed by weather conditions. I must repeat the warning in the Report about future dividends.

The report and accounts were adopted.

J. BROCKHOUSE AND COMPANY

FURTHER SUBSTANTIAL IMPROVEMENT

The fifty-eighth annual general meeting of J. Brockhouse and Company Limited was held on December 21st at West Bromwich. Mr J. L. Brockhouse, MA (chairman and managing director), presiding. The following is an extract from his circulated statement: The profit of the Group shows a further substantial improvement this year which is due in the main to the general increase in the engineering activity throughout the Country and subject to conditions remaining stable, your Directors see no reason why this improvement should not continue.

Throughout the whole Group the volume of orders continues at a very high level, and it is anticipated that production should show an increase during the next year, the greatest limitations being the availability of additional labour and the supply of raw materials, particularly steel.

In spite of the very high level of trade, there is a constant threat in the background which causes concern to all, that is the steadily rising costs of material and labour. Competition in export markets grows more and more severe and there is no margin to spare in the present prices.

As I see it, the continued soundness of our economy depends upon an increasing demand from the traditional markets, particularly the Dominions. For our own preservation, we must develop these markets as rapidly as possible.

The report was adopted and a total dividend of 7½ per cent on the Ordinary Stock was approved.

HERRBURGER-BROOKS LIMITED

LARGER PROFIT

The thirty-fifth annual general meeting of Herrburger Brooks Limited was held on December 22nd in London, Sir Louis Sterling, chairman, presiding.

The following is an extract from the Chairman's circulated statement:

There has been an increase of business which is reflected in the larger net profit. The results in the last few years have enabled the company to maintain a dividend at the rate of 1s. 6d. per share. Having in mind, however, the occasions when during trade depressions little or no dividend was possible the directors feel that a small extra payment is justified. They propose therefore a dividend at the rate of 1s. 9d. per share.

During the present year the whole of the business of the company has been well maintained but a recent large increase in rates of wages has necessitated price increases and it can only be hoped that the higher prices will not have any adverse effect on sales throughout the Piano trade, bearing in mind the overriding importance of Export Markets to the Industry as a whole.

In addition to the direct exports of the company, which have been increased by the business acquired from Etabs J. Herrburger of Paris, the greater proportion of the company's business is dependent on indirect exports as our products are incorporated in Pianos manufactured in this country. These are mainly devoted to Export Markets, and we can only hope that the export demand for British pianos will continue.

It is difficult to forecast the future but unless there is any depreciation of the general trade conditions your directors view the future with confidence.

The report and accounts were adopted.

SIR LINDSAY PARKINSON AND COMPANY LIMITED

(Building and Civil Engineering Contractors)

WIDE VARIETY OF CONTRACTS SECURED

The eighteenth annual ordinary general meeting of Sir Lindsay Parkinson and Company Limited, was held on December 22nd at The Criterion, Lower Regent Street, London, W.1, Mr A. E. Parkinson, chairman of the company, presiding.

The following are extracts from his statement circulated with the report and accounts:

The Accounts for the year 1954 show that the Group Profit applicable to the Members of the Parent Company after Taxation amounts to £74,918, as compared with £36,750 for 1953. The profit for 1954, however, includes a credit of £113,963 in respect of provisions for Taxation for earlier years no longer required.

The Group Profit and Loss Balance carried forward amounts to £103,921, compared with £56,854 brought in. After providing for the Dividends for the year, the balance carried forward on the Parent Company's Profit and Loss Account amounts to £64,051, compared with £111,254 brought in.

CONTRACTS

Work at home progressed satisfactorily during the year and during 1955 our speculative housing programme has been further expanded. The Company continues to secure a wide variety of Building and Civil Engineering contracts and contracts for the production of Opencast Coal for the National Coal Board.

Our Subsidiary Companies in Australia were faced with difficult conditions in 1954, but this current year has proved a little better.

Our incursion into the Canadian field has, I regret to say, proved unprofitable. In common with other Contractors, we have found the competition very keen and, generally, remunerative contracts have not been secured. These conditions continued in 1955.

The volume of work in Cyprus has been maintained and further substantial contracts have recently been secured from the War Office and from the Air Ministry. Excellent progress continues to be shown.

As I mentioned last year, the Tema Harbour contract on the Gold Coast, valued at some £8 million, is being carried out by Parkinson Howard Limited, an association of Messrs John Howard & Company Limited and ourselves. This work is likely to extend over the next four years.

The British Guiana contract is making satisfactory progress.

The Settlement in India referred to last year was duly ratified and as a result it has been possible to incorporate the trading results in India in the Accounts.

THE DIVIDEND

The Board has decided to recommend a Final Dividend on the Ordinary Stock of 6½ per cent (less tax), making a total for the year of 9 per cent (less tax). This dividend compares with 10½ per cent on the Ordinary Stock last year, before the Capital reorganisation.

The report was adopted.

AUCKLAND UNIVERSITY COLLEGE

(UNIVERSITY OF NEW ZEALAND)

Applications are invited for a Tutor/Organiser in the Adult Education Centre. The salary scale for the position is £881 7s. rising to £1,031 7s. by annual increments of £50. An allowance is made for travelling expenses. Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1.

The closing date for the receipt of applications, in New Zealand and London, is February 21, 1956.

STATISTICIAN, DEPARTMENT OF STATISTICS

FEDERATION OF NIGERIA

Candidates must possess a good honours degree in mathematics, economics or other appropriate subject. The appointment is either on probation for the pensionable establishment at an appropriate point in the salary scale, £624 to £1,380 per annum, or on contract terms at an appropriate point in the salary scale, £690 to £1,524 per annum, with a gratuity of £25 to £37 10s. for each period of three months' service, payable on termination of contract. In both cases additional emoluments are payable, ranging from £180 to £300 per annum, according to salary. Outfit allowance, £30 to £60 on first appointment. Taxation at local rates. Furnished Government quarters provided, when available, at a rental of 8½ per cent of basic salary (maximum £150 per annum). Free first-class passages on appointment and leave. Apply in writing to the Director of Recruitment, Colonial Office, Great Smith Street, London, S.W.1, giving brief age, qualifications and experience. Mention the reference number (BCD 59/14/02).

PRODUCE OFFICER required by the Government of the Northern Region, Nigeria, for one tour of 12 to 24 months in the first instance. Commencing salary according to experience in salary scale (including inducement addition), £780, rising to £1,680, with prospects of permanency. Outfit allowance up to £60. Free passages for officer and wife, assistance towards children's passages, and assistance up to £288 annually for their maintenance in U.K. Liberal leave, on full salary. Candidates must hold a University degree in Agriculture or Economics, or a National Diploma in Agriculture, or a degree in the handling of agricultural products, particularly grading inspection and storage; some knowledge of prevention and control of pest infestation of stored products; and ability to drive a car would be an advantage. Write to the Crown Agents, 4 Millbank, London, S.W.8, giving age, name in block letters, full qualifications and experience, and quote MIB/42896/EN.

RICHARD COSTAIN LIMITED

have a vacancy for an

ACCOUNTANT

to be in charge of internal audit work for the Group.

Under the Group Accountant, he will be responsible for seeing that Management Accounts are kept on approved lines and for verifying their accuracy. He will also be asked to report on the adequacy of internal checks, stores control and stocktaking.

Because of the widespread nature of the Group's activities, considerable travel will be involved, abroad as well as at home.

The starting salary will depend on age and experience, but will not be less than £1,800 per annum.

Write to: G. D. Latimer, Esq., Personnel Controller, Richard Costain, Ltd., 111 Westminster Bridge Road, London, S.E.1.

THE ROOTES GROUP requires the services of a fully qualified Works Manager to take charge of commercial vehicle machine and assembly plants situated at Luton and Dunstable, and employing over 2,000 operatives. The post presents a unique opportunity for advancement. Superintending scheme in operation. Applications must be in writing, and will be regarded as strictly confidential, should give information regarding previous experience, age, availability, etc., and should be addressed to The Secretary, Rootes Group (Manufacturing Division), Ryton-on-Dunsmuir, near Coventry.

YOUNG ASSISTANT, aged 23-27 (man or woman), required in the Market Research Department of London Company. Commencing salary, £550 per annum, according to age and experience. The successful candidate will possess initiative and the ability to handle and develop projects without close supervision. Responsibilities will include statistical analysis and detail supervision of surveys. University or Advanced Level education desirable for a permanent appointment which is pensionable. —Box 335.

COMMERCIAL MANAGER—An exceptional opportunity is open to a man with experience in purchasing and commercial management to join a large, successful and internationally known American manufacturing Company operating in the soft goods field. The successful candidate will be expected to play an increasingly important part in the management of the Company and be able to accept promotion. The Head Office of the Company is near Glasgow. Starting salary, £1,750, with initial prospects of £2,250, plus liberal Pension Scheme.—Reply, with brief details of career, including salaries earned, to Box 334.

STATISTICIAN REQUIRED to complete operations research team working on experimental design problems, quality control, operations research and linear programming. An experienced graduate who is seeking an application for theoretical knowledge, or a recently qualified graduate with a degree in the trade, etc., will be welcome. Good mathematics or statistics degree, or A.I.S. required. Salary £700-£1,000 per annum according to age and experience.—Apply Personnel Manager, Glacier Metal Co., Ltd., Ealing Road, Alpertown, Middlesex.

DUE TO THE EXPANSION of its activities, a nationally known manufacturer has vacancies in its Market Research Department for Research Officers, able to initiate and write reports on consumer and trade surveys of all kinds.—Write, giving brief details of career to date and qualifications held. All replies will be treated in the strictest confidence.—Box 333.

MARKET RESEARCH ASSISTANT—S. Maw, Son and Sons, Ltd., require Market Research Assistant to collate marketing data on branded products distributed through retail chemists. Duties include preparation of market report, investigation of new lines, a study of developments in the trade, etc., and experience and/or knowledge of Chemists' business preferable.—Please write, stating age, qualifications and salary required, to Marketing Officer, S. Maw, Son and Sons, Ltd., New Barnet, Herts.

YOUNG & RUBICAM, LTD., Advertising, invites applications from men or women for a senior post in the Research Department. Experience in social research, though not necessarily in market research, is essential. Preference will be given to those with good degrees in Psychology or Social Anthropology.—Please write to The Research Manager, 285 Regent Street, W.1.

MARKETING RESEARCH ANALYST—Applications are invited for a young man, aged between 24 and 30, in the Marketing Research Section of The General Electric Company at the London Head Office. Candidates should have at least two-three years of agency experience, preferably in consumer and retail surveys, and some knowledge of sampling techniques. Good starting salary and excellent opportunities for advancement in a growing Section.—Applications, marked (M.R.), and stating age and salary required, together with two references, should be sent to The Staff Manager, The General Electric Company, Ltd., Magnet House, Kingsway, London, W.C.2.

COST ACCOUNTANT required by a large industry manufacturing Paper Boxboards and Fibreboard Containers. Applicants should have passed the I.C.W.A. examinations and have first-class knowledge and experience of standard costing. The appointment will be on the senior staff of our Costing Department.—Write, giving full details of qualifications, experience and age, to Personnel Manager, Thames Board Mills Limited, Purfleet, Essex.

THE METAL BOX COMPANY LIMITED requires a Publicity Executive to work under the Publicity Manager with particular responsibility for press advertising. An appropriate salary will be paid to an experienced and well-qualified man.—Write, giving full particulars, to Head of Staff Division, The Metal Box Company Ltd., The Langham, Portland Place, London, W.1, quoting Reference PE/2.

THE UNIVERSITY OF MANCHESTER

SIMON FELLOWSHIPS

The University offers a number of Simon Fellowships for advanced study or research in the social sciences. This term is used in a wide sense to include not only Economics, Government, etc., but equally fields such as Education, Jurisprudence and Social Medicine. Values within the range £700-£1,100 per annum (Simon Research Fellowships), or within the range of £1,150-£1,500 per annum (Simon Senior Research Fellowships), according to qualifications and experience. They are open to members of the public services, as well as to persons with academic experience.—Applications should be sent by March 1, 1956, to the Registrar, the University, Manchester, 13, from whom further particulars may be obtained, and who will be pleased to answer any enquiries regarding the scope of the Fellowships.

MARKET RESEARCH: An opening exists in the Research and Development Division of a leading food manufacturing company, requiring a young man or woman with practical experience of Market Research, and offering an unrivalled opportunity to develop and broaden that experience.

The company has a very high reputation as one of the leading concerns in this country in the application of scientific method to problems of manufacture, marketing and distribution. The work of the successful applicant will be in the field of market investigation and assessment, and the planning of field surveys, consumer panels, etc., related to both existing and new products.

Candidates should be between 25 and 30 years of age, and have a good honours degree in Economics, Sociology or Psychology.

The company is more interested in obtaining the services of the right person than in initial salary, but this will be at a high level, plus non-contributory life assurance and pension cover.

Please write fully, giving details of age, education and career to date with salaries earned, to Box 312. Strict confidence will be observed.

IBM UNITED KINGDOM LIMITED require Technical Author to assume responsibility for writing instructional manuals on IBM punched card accounting machines and computers. These are not engineering or electronics manuals; their purpose is to teach users, in detail, how to set up or programme the equipment. A high standard of lucidity and precision is required. Experience of technical or manual writing essential. Some accounting and/or mathematical background very desirable. Comprehensive theoretical and practical training will be provided. Age not exceeding 35. Salary will be by arrangement.—Please write to Personnel Manager, 100 Wigmore Street, London, W.1, quoting Reference EAM/A/3.

WANTED

One Chief Accountant—for Steel Rolling Mill. Must be member of Institute of Chartered Accountants of either England or Scotland, or of the Society of Incorporated Accountants and Auditors. Should have at least five years' accounting experience, preferably in Steel Mills. Should be able to set up and operate an efficient system of cost accounts. Also

Two Chief Accountants—for two Sugar Mills. Must be members of either Institute or Society named above. Should have at least five years' accounting experience, preferably in Sugar Mills. Should be able to set up and operate an efficient system of cost accounts. Also

One Chief Accountant—for Jute Mill. Must be member of either Institute or Society named above. Should have at least five years' accounting experience, preferably in Jute Mills. Should be able to set up and operate an efficient system of cost accounts.

A three-year Contract in the first instance, renewable by mutual agreement. Terms are: salary £1,500 per year (will be increased for exceptionally qualified person), leave with full pay at 1/11 of the time spent on duty, round trip passage and free housing. Reps. fully stated education practical training, business experience, age, marital status and dependants, should be sent to:—

Director-General,
Government of the Union of Burma,
Industrial Development Corporation,
53 Halpin Road,
Rangoon, Union of Burma.

The application should reach the above address not later than January 16, 1956. A copy of it should also be forwarded to the Embassy of the Union of Burma, 19A Charles Street, Berkeley Square, London, W.1, U.K.

MANAGEMENT ACCOUNTANT

RICHARD COSTAIN LTD

have a vacancy for a

GROUP ACCOUNTANT

This is a senior and responsible position in which general management ability is as important as to be a first-class accountant.

Most of the time the work will be in London but an occasional trip overseas may be necessary.

Previous experience will be given to Chartered or Incorporated Accountants who have had some years recent commercial experience.

Starting salary up to £2,500 per annum, depending on age and experience. Write G. D. Latimer, Esq., Personnel Controller, Richard Costain Ltd., 111 Westminster Bridge Road, London, S.E.1.

PHILIPS ELECTRICAL INDUSTRIES LTD. requires at its London headquarters a **PENSIONS MANAGER**. Applicants should be over 40 years of age having had considerable group pension or associated experience together with a proved aptitude for dealing with people as individuals. An initial salary of not less than £1,000 per annum is envisaged with reasonable prospects of advancement.—Replies, in confidence, should be addressed to Mr William Bree, Personnel Officer, Ref. No. 787, Century House, Shaftesbury Avenue, London, W.C.2.

SALES MANAGER IN INDIA (35) is desirous of returning to the UK for domestic reasons. Post with responsibility and prospects required. Experienced in Import/Export. Public School. Available for interviews latter half of January.—Please write Box 318.

INTERNATIONAL LINOTYPE LIMITED

21 JOHN STREET, LONDON, W.C.2.

At a Board Meeting of this Company have declared an Interim Dividend of two and three-quarters per cent (£2 15s. per £100 stock), less Income Tax, in respect of the financial year ending March 31, 1956, which will be paid on January 20, 1956, to the Stockholders on the registers of December 22, 1955. C. LAST, Secretary.

SUCCESSFUL TUITION FOR THE B.Sc. ECON. DEGREE

Wolsey Hall (established 1894) provides successful Postal Courses in a wide range of subjects for the two examinations for the London University Economics Degree (three if Entrance is included). Very reasonable fees; instalments. Over 1,000 Wolsey Hall students have secured this degree since 1925.—Prospectus from C. D. Parker, M.A., LL.D., Director of Studies, Dept. F.16, WOLSEY HALL, OXFORD.

PORTUGUESE/SPANISH Evening Classes in London. All grades from January 9th. Educ. Dept., Hispanic Council, 2 Belgrave Sq., S.W.1. SLO 7186

PAINT IN OILS. Fascinating eight-lesson postal course with Hayward Veal as your personal tutor. Quickest, surest way to professional skill in painting.—Details from Pitman College of Art, 54 Pitman House, Godalming, Surrey.

THE POLYTECHNIC, 309 Regent Street, W.1. New Developments in Industrial Control. A series of five lectures will be held on successive Mondays from 6.30-8 p.m. on January 9, 16, 23, 30, and February 6, 1956, in the Fyvie Hall of The Polytechnic. Speakers: Dr Mark Abrams, Mr M. D. Callender, Mr J. R. M. Simmons, Mr E. D. Van Rens, Mr F. H. Perkins. Chairmen: Mr John Ryan, Mr Whitely. The Lord Tavitot.—Applications to the Registrar, Department of Management Studies, St. Katharine's House, 194 Albany Street, N.W.1. Fee £1 10s.

EXPERT POSTAL TUITION For Examinations—B.Sc. Econ., LL.B., and other external London University Degrees: Law, Society & Bus.; Commercial; Civil Service; Commercial; Civil Service; Commercial; General Certificate of Education, etc. Also many non-examination courses in business subjects.—Write today for free prospectus and/or advice, mentioning examination (if any) or subjects in which interested, to the Secretary (G.9/2).

METROPOLITAN COLLEGE, ST. ALBANS

Or call at 30 Queen Victoria Street, London, E.C.4.

INDIA—At Bombay's Santa Cruz Airport, a Caltex crew refuels one of TWA's sleek Constellations, a unit of the world's largest fleet of Connies and Super Constellations. Travelers depend on TWA for speed, comfort and safety... just as TWA calls on Caltex for fuels, lubricants and service that assure dependable engine performance and lower maintenance costs.

CALTEX serves the people of 67 lands

In 67 lands, across half the world, through such developments as these, Caltex supplies better fuels and lubricants for industry, for agriculture and for motoring millions. These require a continual investment of funds and skill, backed by a faith in a better future for free nations.

Petroleum Products

SERVING EUROPE • AFRICA • ASIA • AUSTRALIA • NEW ZEALAND

BAHRAIN—This modern service station is a busy "oasis" in the colorful Persian Gulf shajkhdom of Bahrain. Nearby, the Bapco refinery brings employment to many Bahrainis; assures a brighter economic future, produces petroleum products for markets halfway 'round the world.

ENGLAND—Big Ben is a familiar landmark in the world's largest city. Well known also is the lorry of the Regent Oil Company, Ltd. This Caltex affiliate in the United Kingdom supplies fine petroleum products so essential to progress.

Minimum Motoring

Overdrive in the Economy

DURING 1955 motor output has been booming more than the boom; motor factories have been paying the highest wages in the high wage economy; and home sales of motor cars have ridden the crest of the wave of inflation. Car output has been 16 per cent higher than last year, a faster rise than in almost any other major industry and total motor production may approach 1,200,000 units this year; the motor workers, grumbling as usual, have on average been earning not much less than £14 a week; and car sales in Britain are 25 per cent up on the all-time record set last year. Exports, too, are high. But the main upsurge of the motor industry has continued this year to be based upon a home market with plenty of money to spend, and upon selling new cars to more and more of the new middle class young that has most of the loose purchasing power in Britain. Many of these new motorists buy on time: so far at least hire-purchase restrictions seem hardly to have affected new car sales, though a recent collapse in used car values that seems more than seasonal may have its repercussions on new cars.

This expanding industry is not a massive employer; figures of its labour force understate its weight in the economy, and its growth in output is being achieved with a smaller growth in manpower. About 330,000 people are employed in what the Ministry of Labour calls "the manufacture of motor vehicles and cycles," which includes body builders and a large proportion of motor component makers,

and the cycle and motor cycle makers account for about 60,000-70,000 of them; the motor industry proper is probably employing only about 5 per cent more people than it had a year ago. The value of the industry's final output of road vehicles (excluding tractors) and spares has risen from about £500 million in 1954 to a rate of about £560 million this year. Census of Production figures suggest that the "motor vehicle and cycle manufacturing" group accounts for about a fifth of gross output in the engineering industries and about an eighth of net output—emphasising how much this assembly industry relies on putting together parts and materials that it has bought from outside.

Motor expansion, therefore, spells expanding demand for the industries that are geared to it—and those ramifications are wide. Primarily, of course, it means expanding demand for steel—this year expanding in various directions beyond what the British steel industry alone could produce, requiring expensive imports. As a rough rule of thumb, engineers sometimes say that a car weighs as much as the steel that is bought to build it; all the other materials that go in just about offset the amount of steel that is cut off as scrap in the successive processes of motor manufacture. Directly and indirectly, it seems likely that the motor industry consumes about an eighth of total steel deliveries in Britain; last year it may have taken about 1½ million tons of finished steel products, and this year its demands may not be far short of 2 million tons. That total includes

nearly a third of sheet and strip steel and perhaps two-thirds of the total tonnage of drop forgings; in addition, the motor manufacturers take 12-15 per cent of iron castings. It is the biggest consumer of rubber, a very big customer for glass and paint. The extent to which motor manufacturers "buy out" varies between companies: but their purchases are generally of the order of 50-65 per cent of the cost of the vehicles they make, as the chart on page 3 suggests.

It follows, though this is not always realised, that fixed capital in this industry is not as high as in many others, though its working capital and "loose tools"—for example, body dies—are fairly high. In spite of the large number of specialised machine tools that it employs—and the tendency to reduce labour costs by automation—the motor industry is able to achieve its current expansion with a fairly modest investment in capital equipment. In the current plans of the major companies, for example, Vauxhall is planning to double its output for a capital expenditure of

The Independent Fringe

CONCENTRATION has gone a considerable distance in the British motor industry. Apart from the Big Five—BMC, Ford, Vauxhall, Standard and Rootes—who between them make all but one-tenth of the cars built in Britain, and a small band of tiny firms whose business might be said, as the Royal Commission on Taxation said of some cheque-book farming activities, to "lack commercial inspiration"—there are twelve makes of motor car in this country. And only two of them, Jaguar and Singer, are independent firms for whom motor car manufacture is the main part of their existence. The others are all engineering firms for whom the motor cars form less than half their total business.

Three of these others, Rolls-Royce, Bristol, and Armstrong Siddeley (owned by the Hawker Siddeley group), are now dependent primarily on aircraft and aero engines for their livelihood. The larger part of Alvis's output is probably military vehicles and aero engines. Daimler and Lanchester cars are made by BSA, whose output of machine tools and of weapons is the bulk of its business. Aston Martin and Lagonda cars must be the lesser part of the business of the David Brown Corporation, which makes a wide range of products including gears and gear-boxes, agricultural tractors, and steel castings. Rover is clearly within the motor business—but its output of Land Rovers is much greater than its output of conventional passenger cars.

The total output of Rolls-Royce and Bentley cars, made now at Crewe, not at the original home at Derby, is probably greater than at any time in the history of Rolls-Royce, and might be guessed to be 50 units a week. That is not an inconsiderable turnover of vehicles that retail for between £2,500 and £5,000 each (before tax) and probably yields a satisfactory net profit. It seems less likely that the net earnings from car sales of the other eight makes that are part

The Jaguar 2.4 litre

about seven months' turnover, and the BMC expansion—which admittedly is reaping the advantages of the gradual integration of two huge companies—is probably being achieved even more economically in terms of investment. "Supporting investment," however, is required of the industry's suppliers—in particular, the steel industry has to decide whether it shall risk £100 million or so on a new ship mill to serve this voracious customer.

Motor expansion in Britain today, in fact, is being achieved with a surprising economy of labour and capital resources, at least within the industry itself. This derives partly from the nature of this assembly industry; partly from continued concentration into larger companies; but perhaps mainly from the fact that the industry is today in the fortunate situation where great advances in productivity—and considerable savings in cost—can be gained from sheer increase in the volume of output, both of components and of the mass-produced cars themselves.

of manufacturing operations in other fields are enough to give a reasonable return on the capital attributable to them.

Jaguar is a prosperous business, as a result of the application of a remarkable combination of qualities, very seldom found in association—a flair for sales, first class engineering, and manufacture that is as efficient as it is frugal. Jaguar's sales are probably of the order of 200 to 300 units a week. Until recently the majority of these have probably been the big Mark VII saloon, one of the few British cars that can meet the mass-produced American vehicles on their own ground for size and price—though in the United States the company is perhaps most famous for its fast XK sports cars. For this year's Motor Show the company has returned to the medium-sized car field with a 2.4 litre saloon of sleek and distinctive design. This has been skilfully priced to tap a level of the home market that Jaguar surrendered shortly after the war, and designed to produce a quite new car while using the minimum new investment in jigs and dies. The engine, though substantially changed, derives from the famous twin-camshaft overhead valve engine on which much of the company's success has been based since the war; some of the body panels, too, look to use dies that have earned their keep on other models.

With the exception of Singer, all the independent firms make cars which in price and, for the most part, in size, are well outside the range of the main products of the Big Five. They have a hard task to make and sell their products at a profit; for the best products of the Big Five offer

such a generous measure of what the customer wants—accommodation, quietness and refinement of performance, comfort—that the substantially higher cost necessitated by production in small numbers implies a modest return in terms of comfort or performance for the extra price.

The Big Five

THE largest motor manufacturer in Britain is the British Motor Corporation, whose total output of vehicles, including commercial vehicles and tractors (the latter quite modest in number) is now running at a rate of more than half a million a year. This total is probably nearly twice that of the largest continental manufacturers—Volkswagen in Germany and Renault in France—and much greater than that of the "independent" manufacturers in the United States—American Motors (Nash and Hudson) with an output rate of 120,000 a year and Studebaker-Packard with a rate of 160,000 a year. Thus BMC is the fourth largest automobile manufacturing organisation in the world. It competes most directly with the British offspring of the two largest of all—General Motors and Ford. BMC, Vauxhall and Ford probably make between them 70 per cent of British car output; as the table shows, they are significantly larger in output and capital than the remaining two big makers, Rootes and Standard.

BMC was formed in 1952 as an amalgamation of Austin and the Nuffield organisation, two organisations which were utterly unlike one another in structure. Austin had been built up on the basis of concentration of production at a single works at Longbridge, Birmingham, and concentration of sales effort on the single trade name of Austin; the strength of the company had always been somewhat more on the production than the merchandising side. Nuffield, on the other hand, had been more diffuse both in its production facilities and in the products it offered. The Wolseley and Riley names had been added to Morris by the purchase of these companies when they were in financial straits, and the MG by a separate creation of Lord Nuffield. To the parent manufacturing facilities had been added the engine factory established after the 1914-18 war at Birmingham by the French-controlled Hotchkiss company to make engines primarily for Morris, the Wolseley plant at Adderley Park, and the MG plant at Abingdon. Other acquisitions of Morris were the SU Carburettor Com-

pany, and, originally, a financial interest in the Pressed Steel Company, which was established in collaboration with the American Budd steel-pressing interests at Oxford; this financial interest, however, was liquidated some years before BMC was formed. In spite of this connection with Pressed Steel, the Nuffield group had established body-making facilities of its own, in which were built the bodies of the Morris Minor.

Much the most important development of BMC since it was formed was the acquisition at the end of 1953 of the capital of Fisher and Ludlow of Birmingham, building motor car bodies and other pressed steel products. The other principal customer of Fisher and Ludlow was the Standard Motor Company, which obtained from these the bodies for its high production models. The tie between Fisher and Ludlow and Standard was so intimate that it was only when the latter committed themselves to Pressed Steel for the production of the new Vanguard that has been unveiled at this year's show that Fisher and Ludlow felt free to sell out to Standard's competitors.

For BMC the purchase of Fisher and Ludlow was a logical step to secure adequate body-building facilities. In the same year Ford felt it necessary to purchase the whole capital of Briggs Bodies, though the Briggs factory at Dagenham was already mainly involved in building Ford bodies. Reliance by a major manufacturer on an independent source for supplies of bodies is part of a pattern that is fading out in this country and in America. The surprising thing is not that the leading British automobile makers should need to own their body-making facilities, but that they should for so long have operated successfully on a basis of independence. In America, General Motors acquired the Fisher Body facilities in 1919, at the beginning of their great expansion, and have since made for themselves the bodies for all their leading models. The American Ford company originally obtained the bulk of its bodies from Briggs, parent of the British company that its British associate has now

Out of £1,000 of Motor Output a Manufacturer Buys £500-£650 from Outside Suppliers

THE slices of this "pie" diagram give an impression—no more—of the way in which the turnover of a "typical" motor manufacturing company, making commercial vehicles as well as cars and a large amount of spares for both, may be divided between labour, capital, purchased materials and components—and taxation.

Obviously, no actual manufacturer is "typical"—each makes a differently mixed bag of products, and the amount to which the major companies "buy out" varies sharply. This national company, moreover, is shown as providing much more than normal depreciation, to cover replacement costs. The figures have been obtained from a variety of sources, and have some degree of error; but they show beyond error the heavy demands that this industry makes on the rest of the economy.

HERE TO JOIN THE FAMOUS MARK VII AND XK140 RANGE OF MODELS

JAGUAR

PRESENTS THE

Two-point-four
LITRE

TO THE already famous range of Jaguars exemplified by the Mark VII and XK140 models, comes the 2.4 litre Jaguar saloon, a brilliant newcomer in which will be found the embodiment of all the highly specialized technical knowledge and engineering achievement that have gained for the name of Jaguar the highest international repute. In its outward appearance the unmistakable Jaguar line of grace is seen with lesser, more compact overall dimensions than those of the Mark VII, yet the interior has been so skilfully planned that full accommodation for five persons is provided and further provision made for generous luggage accommodation. The 'Two-point-Four' is powered by an engine of 2.4 litres capacity and is the latest

development of the famous six-cylinder, double overhead camshaft, XK engine which is acknowledged to be the most advanced high efficiency production engine in existence. With a power output of 112 brake horsepower, and a power/weight ratio of 90 brake horsepower per ton, phenomenal acceleration is placed at the driver's command and, if desired, a maximum speed of over 100 m.p.h. reached with ease, silence and refinement. To those motorists whose desire for a car of compact dimensions is a matter of personal preference the opportunity is at last presented, not only for satisfying that desire, but for gratifying a natural wish to own a car the mere possession of which indicates insistence on owning nothing but the best . . . a Jaguar.

STANDARD MODEL: £895 (with purchase tax £1,269.0.10.) SPECIAL EQUIPMENT MODEL: £916 (with purchase tax £1,298.15.10.)

STAND 154 EARLS COURT

. . . a new Jaguar masterpiece

bought. But in the mid-thirties Ford established its own body facilities. Last year Chrysler bought from Briggs the whole of the latter's body-building plant, which had latterly been principally occupied in building bodies for Chrysler's Plymouth and for the Hudson company. The Big Three of the United States automobile industry, therefore, are self-contained in respect of the bulk of their body requirements.

So, too, are today the biggest three in Britain. No doubt the acquisition by the English Ford Company in 1953 of the whole capital of Briggs Motor Bodies arose partly from the difficulties of this relationship between the car maker and the body builder. The price Ford paid was a modest one, less than it would have cost to establish corresponding manufacturing facilities of its own. Thus Ford as well as BMC has become self-contained for its major body-building requirements; while Vauxhall has never relied to any substantial extent on outside sources for its bodies. There are, of course, irregularities in the pattern; for example, the

convertible bodies for Ford and other large manufacturers are built by Car Bodies Limited, using wherever possible the panels made by the parent for its saloon bodies.

The other two leading manufacturers, Rootes and Standard, rely on outside sources for part of their body requirements. Rootes owns British Light Steel Pressings and Thrupp and Maberly, but it draws the bodies for the Hillman Minx from the Pressed Steel Company, which makes some of the body shells for the group. Standard has no body-building facilities of its own, and relies on various sources. Fisher and Ludlow build the bodies for the Standard Eight and Ten; Pressed Steel will make the bodies for the new Vanguard; while Standard's van bodies are made by Mulliners of Birmingham. The latest concentration of ownership of body building may have its implications for the future structure of the industry. As output grows and the home market becomes more competitive, pressure on body building facilities will intensify.

The Rewards of Size

THESE five big manufacturers are today making fairly comfortable profits out of producing a fairly broad "main range" of good, conventional medium-sized cars extremely efficiently, and selling all they can produce—on the home market with ease, and abroad against growing foreign competition. From the Austin A30 and Standard 8 at the bottom to the Ford Zodiac, Vauxhall Cresta, and Humber Hawk at the top, this postwar range symbolises the British manufacturer's idea of what motorists in Britain and in the world overseas can be brought to agree upon buying—a moderate-sized, very comfortable and well-appointed car, with considerable fuel economy and a fairly lively performance, designed for production at low and decreasing cost. Without the extremes of standardisation on models that some zealots advocated just after the war, Britain's major companies have achieved a considerable degree of standardisation in engines and body pressings, to match standardisation by makers of fuel and electrical equipment—BMC's "B" engine, in its 1,500 cc version, goes into the Austin A50, the Morris Oxford and the new MGA, and in its 1,200 cc version into the A40 and the Morris Cowley, while Ford's 1,172 cc engine powers the "100E"

Anglia and Prefect, and in an earlier version goes into the sturdy Popular, that outstandingly cheap survivor of the company's prewar designs. In some aspects at least of its factory reorganisation and tooling for quantity production, this second largest car industry in the world is nearer to Detroit than any other country's.

Quantity production is profitable production. During the last few years labour and materials costs have risen much more than the car makers have put up their prices; but for the biggest three makers at any rate, unit and total profits have been rising too (though during 1955, the latest Ford half yearly report would suggest, not as fast as sales). On their 1954 reported results, Vauxhall was making nearly 20 per cent on sales and Ford about 15 per cent. BMC does not publish turnover figures; but unit profits (on mixed bags of vehicles, tractors and spares that of course vary sharply in composition for these three companies) were nearly £100 a unit for Vauxhall, about £65 a unit for Ford, and for BMC (over a period heavily affected by reorganisation which was not nearly complete) about £50 a unit. This year's sharper rises in labour and materials costs will have shaved those margins, but it is safe to bet that the

* Humber Ltd. has been taken as including the main motor manufacturing interests of the Rootes group—Humber, Hillman, and Sunbeam Cars, Commer and Karrier commercial vehicles. † Unamortised cost of tools is shown differently by the different manufacturers. These figures of Net Fixed Assets therefore include tools for Vauxhall Ford and Standard, but not for BMC and Humber. ** Excluding such assets as cash, tax reserve certificates, and liabilities such as tax, etc.

motor industry—while output increases—can weather them better than any other section of engineering. Ford and BMC both decided not to follow other makers in putting their prices up this autumn.

"Monopoly profits," some critical consumers would growl, "made on tinware." They would be quite wrong. At the top of this industry, competition is bitter; the net returns are not exceptionally high on the real value of the companies' capital; and throughout this year customers have been flocking to buy these desirable cars, tinny or not, an' ready in some cases to pay £50 or £60 over the listed prices for certain models to grey market dealers who have been unscrupulous enough to act like Economic Man. The companies can perhaps be accused of too conservative an assessment of what their mixed home and overseas market would take—they have held back, for example, from what might be called "minimum motoring"—the car of extreme austerity. They have certainly preferred not to pioneer technically—their efforts have been confined to making a conventional kind of car more cheaply than anyone else in Europe yet can, offering unexciting value rather than novelty for money, and they have left innovation, for the most part, to the Continent. Whether a newcomer could possibly break into this mass market today, remains to be seen: Mr Harry Ferguson, in coming months, may offer an object lesson. Neither the big five nor, more particularly, their suppliers, have yet, perhaps, quite mastered their chosen field of quantity production; in achieving this production volume certain standards of workmanship, particularly in bought-out components, seem to have slipped, and British inspection of mass-produced cars has not yet achieved the standards of Detroit.

These points, however, are all secondary; the primary

Export Anxieties

BRITISH car exports this year will probably top last year's total, and Britain ought to remain the world's largest car exporter; but 1955 has not been an altogether happy year for overseas salesmen of the British motor industry. It began well enough, with shipments twenty per cent up in the first four months. Salesmen, however, were already sending in reports of marked German successes in Western Europe and the United States. The port and railway stoppages in May and June did not make delivery promises easy to keep; shipments in the summer fell twenty per cent below the 1954 level. And within the last month has arrived news, not altogether unexpected, of import cuts in New Zealand and Australia. These are by far the industry's largest markets, taking between them one out of every six cars it makes. Moreover, they are, along with the more competitive market in South Africa, the only major outlets for cars in the Southern hemisphere—where the peak selling season comes in our winter and helps to offset fluctuations north of the equator. But if Australia and New Zealand take 35,000 fewer British cars during 1956 than this year, that will be less than 10 per cent of total shipments from this country, and only about 4 per cent of the industry's output. The setback need not be formidable—if sales elsewhere grow to offset it.

On the face of it, there is no reason why they should not.

fact about the British motor industry at the moment is that by concentration and standardisation it has reached a point where it is gaining extremely high returns in efficiency and cost from the sheer increase in output that its penetration into a new mass market for motoring in Britain is enabling it to sell. There is every sign that it is on a sharply rising curve of this virtuous spiral; the higher its sales go, the cheaper it can produce its standard car (cutting prices or offering more for the money). And for the present it is in the home market that its sales can most easily go higher. British motor exports depend most, perhaps, upon the price at which the conventional, comfortable British car can be sold abroad to meet technically more unusual competitors; and that price can be reduced if the volume of sales in Britain goes on rising at its current pace. At such a point in the cost-volume curve of car manufacture, technical adventurousness cannot be expected, though standards of mass-production workmanship are likely to improve.

In the booming, overdriven economy of Britain in 1955, the motor industry presents a peculiar problem. It is gaining major returns in productivity and profitability not by making major demands upon labour and capital, but largely from the inflation in consumption that any Chancellor today must be tempted to curb with "comprehensive measures." One has heard the claim, "Exports depend on our home market" too often to accept it whenever an industry wails: but this may well be a copybook case. In the wider context of the economy this autumn, resort to such an instrument as purchase tax might indicate a loss of nerve upon the part of the Chancellor (or his colleagues). For the motor industry—already taxed highly at home and beset overseas—it would be a mistake that might hamper or cripple its main competitive strength.

World trade in cars grew from a little over 530,000 in 1947 to more than 930,000 in 1954, and this year's total may reach 1.1 million. Up to last year, too, the major car exporting countries still largely served separate markets. Western Germany, France, and Italy shipped cars across their frontiers into other parts of Europe, and France also supplied her colonies; the United States industry served the two American continents; Britain served the Commonwealth and had useful shares of the foreign car markets in Europe and North America. As Western Germany came back into the trade from 1950 onwards the European market grew sufficiently rapidly to allow that industry's sales to expand spectacularly without squeezing other countries' exports.

But this year Germany has been selling vigorously on a world scale—in many places at the expense of Britain. In Europe the meteoric rise in the sales of German cars in Sweden is perhaps the inevitable result of the lifting of a tight quota on German imports; but the 50 per cent boost in sales to Austria, Holland, Belgium, and Switzerland, where there have been no such special circumstances, has been equally noteworthy. In all these markets Britain has lost or has only just about held its ground. This year, also, more German cars have been bought in the United States than British models; and they have made considerable

HUMBER *Super Snipe*

Saloon (£1095 plus p.t. £457.7.6d.), and Touring Limousine

Relax in the luxury of foam-soft seating, deep pile carpets and rich walnut fittings! Thrill to the flash-away performance of an engine that scarcely whispers at 90! This perfect combination of luxury and high performance is now available with OVERDRIVE (as an extra) for even more speed, lower petrol consumption and reduced engine wear.

Choice of attractive two-tone or single-tone colour schemes. White-wall tyres available as an extra.

HUMBER *for luxury and power*

New elegance with two-tone colour schemes

HUMBER *Hawk*

Saloon, (£715 plus p.t. £299.0.10d.),
Touring Limousine and Estate Car

Here's big car motoring at medium cost! Really roomy, smooth and exciting to drive! Now added to the range, the new all-steel luxury Estate Car with exceptional floor space and the same powerful o.h.v. engine, perfection finish and unique refinements. All available with OVERDRIVE as an extra.

HUMBER HAWK
Attractive two-tone
colour schemes,
white-wall tyres and
chromium trimfinishes
available as extras.

They're safe and fast-built to last!

Now we've seen them all...

GET ALL THE FACTS! When you choose a car on a calculated assessment of the *facts* you are bound to say "I'm going to have a Morris!" A Morris offers more for your money; more features; more roominess; more of everything that stimulates your pleasure in driving and your pride in ownership. And there's satisfaction in knowing that a Morris consistently returns a higher proportion of its price when eventually you decide to sell. Consider what every Morris has to offer: a lively O.H.V. engine for outstanding performance, sofa-wide seats, torsion-bar front wheel suspension, safety-glass all round, mono-construction body and chassis, superb styling and finish.

MORRIS ISIS

...we're going to have a "QUALITY FIRST"

c. 2298 (55)

headway in Asian and African parts of the Commonwealth as well as in Australia and New Zealand. Last year Western Germany beat the United States for the first time for second place amongst the world's car exporters; this year it may come perilously close to Britain.

What of the longer look? Britain's export chances in the next five years or so—during which its expansion plans should be completed—will depend on how fast car sales throughout the world now grow, and what share the British industry can get. In the last decade the world car population has been growing much faster than before 1938. By 1960, if the present rate of expansion is maintained, the car population outside the United States and Russia should exceed 30 million; at the prewar rate of growth the number would be only 21 million.

But if car registrations outside Russia and the United States should run to between 25 million and 30 million by 1960, the level of sales needed each year to reach these figures may not greatly exceed the present figure of nearly 3 million. Most of the cars on the world's roads are relatively new, postwar models; and though the average life of cars may tend to shorten, it would be dangerous to count much on this—outside the United States. Moreover, the greatest expansion in sales may be expected in countries that already produce vehicles, and the tendency amongst developing countries to foster their own vehicle industries shows no sign of reversal.

Whatever the trend of world trade as a whole Britain will not inevitably benefit in competition with other producing countries. By 1960 the output of the four main European car producers may well exceed 3 million. Britain will still possess the lion's share of that—about 1½ million cars apart from commercial vehicles. But this productive power—and the cost advantage it should still give—will have to be matched by selling efforts. The extent to which the British motor industry has built overseas distribution organisations since the war is sometimes overlooked; but the main effort has perhaps gone into the United States and the Common-

CAR EXPORTS: 1950-1955

BY SIX MAJOR EXPORTING COUNTRIES

wealth. The best scope for that selling effort may be the more competitive markets—of which Europe will perhaps be the fiercest. And it is here as well as elsewhere that the most formidable competitor will be Western Germany.

The German Competitor

THE menace of potential American competition in world automobile markets seems at present to be diminishing. Even if dollars became as available everywhere as sterling is, the character of American motor cars, designed above all for the North American market, makes them unfit for the mass market elsewhere. The only customers for them in Europe are mainly the small number of wealthy motorists—a proportion of whom in most countries, even now, can find ways and means to come by them. In some areas where size and riding rough are important, as for example Africa, they remain more powerful as a general competitor: but petrol extravagance is against them, and European cars are beginning to offer similar riding qualities. French competition is likely to be of some importance—particularly that of Simca which, having absorbed the French Ford Company, is showing a vitality that justifies Ford in having surrendered its French interests for a minority holding in Simca. But there is no doubt that it is from the German factories that the most serious competition for Britain will come.

That competition has developed rapidly during a period of German recovery that is now over—the period when labour was abundant and therefore cheap. German employers think they have already, in 1955, reached the fevered condition of full employment. That may seem exaggerated by British standards, but it may not be long before the German patient has a temperature as high as this country's was, say, in the middle of last year. With full employment the bargaining power of labour will be greater than it has been. How is that power likely to be used? Must it slow the German pace?

In Germany, trade unions are not as strong as in Britain, and the German worker is more strongly addicted to hard work than his British counterpart; it is more true to say of the average German than of the average Briton, as Dr Nordhoff said at the unveiling of the millionth Volkswagen, that man's chief desire is to escape from himself, and work gives that escape. On the other hand, the German, whether master or man, is more prone to insist on his rights, more unyielding in conflict, less ready for compromise, than we

are. Industrial strife could possibly become much more bitter in Germany than anything Britain has experienced recently.

If the German economy now develops in a way that leads to higher wage levels, even substantially higher wage levels, some British motor manufacturers hope that the British automobile industry will find German competition less severe. That may or may not be right. The prices of general engineering products, made singly or in modest batches, may certainly have to go up in rough proportion to wages. But the course of British motor car prices—and profits—over recent years shows to what a great degree, in mass production, increases of wages and material prices can be offset by improved manufacturing methods and other savings as volume increases. The increase of wages in Germany is not likely to lead to anything like a proportionate increase in motor car costs.

On the other hand, a rising standard of living could lead to a large extension of the potential home market for the German manufacturer. At present the British manufacturer can take comfort from the fact that the home market here is, and seems likely to continue to be, much bigger than in Germany. The penetration of UK sales of cars into the working class market has begun and seems

likely to continue with increasing momentum. In Germany the process has not really begun. The British manufacturer, with a much bigger home market and a partially protected Commonwealth market, is assured of a bigger throughput than his German competitor. American experience shows that the way to low automobile manufacturing costs lies on the path of increasing volume, not of lower wage levels. A generally higher wage level in Germany, indeed, may prove in the long run a factor making for lower prices of automobiles and mass-produced articles.

One particular factor may affect the German home market for automobiles. The Government exempt motorised cycles of less than 25 cc from tax, from licence formalities and compulsory insurance. This has led to high production of such vehicles—a total figure has been mentioned of more than 3,000 a day—to satisfy the desire for personal mobility on the part of the working classes. It might postpone the development of a mass market for cars, though eventually it could make that development both more certain and, when it comes, more universal.

Until recent months, a very high proportion of passenger cars sold in Germany have been sold to business users, for tax reasons similar to those with which Britain is familiar. This has misled observers in Germany, as a few years ago

Volkswagen versus Anglia

Two cars that exemplify the sharpness of British and German competition are the Ford Anglia and the Volkswagen, which it might be fair to call the two leading contenders for the world's markets in a price class somewhat above the minimum. Both cars are full of character and have a high performance, but they represent entirely different approaches to the international motorist.

The Volkswagen quite misses the target at which it was aimed. It was intended to be a car of the minimum possible production cost, which would bring the joys of motoring to the German working class. Its designer, Dr Porsche, was one of the most brilliant and versatile engineers in the history of the industry, with a mastery of every aspect of design except two—styling and production cost. In looks, therefore, the Volkswagen is sadly deficient, having a failing common in prewar Germany, in that most of its lines and curves are much too near to being circles. As a production job, while it reaps the harvest of technical economy, using material with great frugality and achieving great savings in space and weight, expensive light alloys are used, and expensive machining

operations called for, to an extent that a Detroit engineer would call lavish. But these defects do not deprive it of the title of a masterpiece.

The Ford Anglia, on the other hand, is a superlative example of the conventional solution by an Anglo-American team of the problem of a car to offer roughly the same capabilities and capaci-

ties. The Anglia has about the same passenger accommodation as the Volkswagen; decidedly more luggage accommodation; a more refined and silent performance; better looks by current standards of taste; and almost certainly a lower "natural" production cost. While it is likely to be found by most users a pleasanter car on the main roads,

on bad roads the Volkswagen will be much more at home. The Volkswagen will, in nearly all conditions, give rather better fuel economy—a saving of the order of 10 per cent. In the hands of the average driver, the Anglia will probably cost rather more to maintain. As time goes by, and development bears fruit, the difference will diminish, but the lightly stressed Volkswagen engine is always likely to enjoy a longer life between replacements—though a complete engine replacement on the Anglia is likely to cost quite a bit less than on the Volkswagen. In the hands of the exceptionally hard driver, or in especially arduous terrain, the Volkswagen will probably prove quite significantly more durable.

As a comparison of the figures in the tables on pages 12 and 13 will show, the acceleration times achieved by the Anglia and its top gear hill climbing performance are significantly better than the Volkswagen's. The latter, therefore, will call for a much freer use of the gear box; and the driver who shrinks from using his gear lever is apt to find the Volkswagen sluggish. On the other hand, this Ford car, like others, sticks to three gears; and the Volkswagen gear change is the pleasanter to use.

V makes history!

Those Internationally Tested qualities found in all Standard cars are now presented to you in a NEW Standard model—a car for this day and age, superb in its comfort and up-to-the-minute refinements. IT brilliantly makes motoring history once again!

Fitted with the famous 2-litre engine that has already proved its reliability in hundreds of thousands of Standard-made vehicles since the war, the new Vanguard III brings you such features as automatic entry lights to all doors; front doors that can be locked internally or externally as desired; roomy, deep cushioned comfort

for six; simplified, finger-light controls; perfect vision front and rear through wide glass screens; two tail and stop lamps and reversing light placed so that all are easily seen by following vehicles; handsome, aerodynamic body lines, plus these special safety features: doors hinged to open to the rear; dual purpose switches; electrically operated screen washer and air conditioning to avoid window misting, Dunlop tubeless tyres—putting this fine car magnificently miles ahead . . .

★ Overdrive can be fitted on 2nd and 3rd gears as optional extra.
PRICE £599 (P.T. £250.14.2) TOTAL £849.14.2

—the NEW Standard Vanguard III

A petrol consumption test of the new Standard Vanguard III, controlled, observed and supervised by R.A.C. engineers from London to Edinburgh, and back, a distance of 794 miles and at an average overall speed of 37.5 m.p.h. showed that the car returned 34.52 miles to the gallon.

observers in this country were misled, into underrating the prospects of sales to private users. But the recent reduction in the annual registration tax on motor cars led to a sharp and immediate increase in the proportion of new cars sold to private persons as distinct from business users—an increase quite out of proportion to the reduction in the tax.

An outstanding impression of the German scene is the high proportion of Mercedes cars on the road and, among them, the high proportion which are diesel-engined; many of these, on inquiry, seem to be a charge on business. The fuel economy of the diesel is offset by a very considerable sacrifice in acceleration; and while this makes little difference in journey times on the autobahnen, it delays the traveller on the ordinary roads substantially. The ordinary German roads, on which of course the mileage run must be much greater than on the autobahnen, are no more suitable for modern traffic than those of this country. They are no straighter; carriageways wide enough for more than two lanes of traffic are rarer; and steep cambers more universal.

Such road conditions, incidentally, provide an invigorating discipline for the motor car manufacturer. The autobahnen invite the driver to keep his engine turning at peak revolutions for hours on end, yet the condition of lesser roads must be more testing than those of the United Kingdom to brakes, suspension and transmission. The German manufacturer must expect a proportion of his cars to suffer a more arduous life than can readily be inflicted in this country—which may well fit his products the better for overseas markets, as was suggested in the recent Australian trial. The success of the Volkswagen abroad, for example, is to be attributed quite as much to the quality, and above all of the durability and low maintenance costs of the car, as to its price. For German cars, including the Volkswagen, show less of the reductions in cost that should come with high output than those of Detroit and even of Longbridge or Dagenham.

In most respects the Volkswagen lends itself excellently to low cost production. Some features in its design, however, are costly, in the light of modern manufacturing methods. The machine tool and press equipment of the Wolfsburg plant is excellent of its sort, but there is comparatively little use of transfer plant and other ultra-automatic installations of engine plants in Europe and America, where the work piece, once installed in a jig, is passed through a group of machining operations at a fantastically low cost in man-hours of direct labour. For the most part, machining operations are grouped in such a way as to reduce the amount of material handling: that is to say, a milling machine will be placed at the point in the flow of a work piece where a milling operation is called for, rather than among other milling machines. Thus the scope for cost-saving in material handling is less than it would be if the functional rather than the divisional principle had been followed in the location of machine tools; but scope there still is for reduction of cost in material handling and in the combination of machining operations.

After VW, the most serious German competitor in the world market is General Motors' subsidiary, Opel, whose output is likely before long to reach 1,000 units a day in the medium-weight market. Opel is obtaining an increasing

proportion of German home market sales, and is probably obtaining an increased share of the European market at the expense of British medium-weight cars.

A comparative newcomer whose competition may well become more formidable is the Borgward factory of Bremen, which produces on the one hand a car of extreme economy in the Lloyd, and on the other hand a medium-weight car of considerable attractions in the Isabella. The Lloyd has an engine of only 400 cc and very limited performance; it might be called the German counterpart of the Citroën 2 cc, except that the German product seems to disguise, as the French product seems to emphasise, that it is not as other cars are. The Isabella is a mare of different colour. It is as near to a full six seater as the leading English medium-weight models, but the kerb weight is nearly ten per cent less. Part of the weight saving comes from the use of only two doors, the disadvantages of which are minimised and the advantages enhanced, by thoughtful design. With its existing 1,500 cc engine, the Isabella's performance is higher than the British 1,500 cc cars and closely approaches that of the medium-weight cars with engines of 2,000 cc, or more; and it is understood that a model of higher performance will shortly be offered that will definitely outperform them.

In the mass automobile markets of the world, then, German competition is serious. It will become more serious if the working-class market develops in Germany as it may yet. Paradoxically, the very success of the Volkswagen may set a limit to this development. If it proves that the biggest market of all, outside America, is for the car of 10-12½ cwt kerb weight—the type of vehicle of which the outstandingly successful example today is the Fiat 600—German competition may not count for so much. The Volkswagen cannot be produced as cheaply—other things being equal—as the smaller type,

since its weight is 20 per cent greater, and in fact, with its characteristic engine, even its cost in pence per lb must be a little higher. But there are no water-tight compartments of price and specification in any given motor car market; and it would be a very bold German factory which would dare to put into production, under the shadow as it were of the Volkswagen, such a car as the Fiat 600. The other German factories, therefore, have to seek a substantial home market by building a car either of accommodation, performance and price considerably in excess of that offered by the Volkswagen—of which the Isabella is an example—or else one which is well below the Volkswagen, such as the Lloyd.

The British manufacturer, therefore, should be fully able to hold his own in world car competition if the utmost skill in design is exercised and the most economical production methods developed—and if the home market is permitted to develop freely, so as to ensure the low production costs of which a high volume of production is the most essential ingredient. The chances are that a similar development of the German mass home market cannot come so rapidly. German competition is likely to be most severe in the range of cars from the Volkswagen upwards. If British designers were to produce a car in a lower weight class of a specification as good as and of as low a potential cost as the Fiat 600, their German counterparts, overshadowed by the success of the Volkswagen, would probably be ill-placed to produce an effective reply to it.

Design Number 7409, 2-door, 4-seater convertible coupé on "S" series "Bentley" chassis.

An exactly similar body can be supplied and fitted to the "Rolls-Royce" Silver Cloud chassis.

Sports Cars Rebuild a Market

IT is not easy to find a stretch of road in Britain where one can both comfortably and safely maintain 90-100 miles an hour—but a car with such an extra turn of speed can comfortably and safely keep up high average speeds even on winding, narrow and congested roads. A high maximum speed is the emblem of such high performance—possessed by some roomy saloons, not only the fined-down two-seaters. But in practice it is much less important than the ability to accelerate rapidly from a traffic-crawl to high cruising speeds, of being able to stop quickly and safely when obstructed, and of going round corners and traffic roundabouts with far less instability and effort for the driver than their more staid counterparts. Business executives find that a brisk car saves them costly time on lengthy journeys along traffic-bound roads—and has, incidentally, some tax-free value in subtle advertisement.

Increasing traffic congestion has not, therefore, as some people feared, wiped out the demand for the faster car; this has indeed been increasing in the last few years. It gains some impetus, no doubt, from the emulation that has a good deal to do with all car ownership—it is very pleasant not only to be able to keep up with the Joneses, but to go a little faster than they can. Moreover, car snobbery in Britain is tinged with a national characteristic of making a sport out of every new activity—even, or particularly, getting from A to B. Since the war, there has been an astonishing increase in the interest taken in motor-racing and motor competitions generally—which can be gauged by huge attendances of spectators and the time devoted to race-commentaries by the BBC on TV and “steam radio”—has revived a considerable demand for true sports-cars in modern form. But the old ideal of a wholly specialised sports design has, particularly in the case of British manufacturers, changed to a policy of building such cars largely from suitably modified components of the standard car.

★

Reputable motoring historians have difficulty in agreeing about which was the original sports car. But there is not a shadow of doubt but that such cars were appreciated, and becoming established, well before the first world war. Some two years before the outbreak of hostilities the design of Grand Prix racing cars was offering a very high degree of automotive performance. Single and double overhead camshaft racing engines not exceeding 4½ litres in capacity were propelling the two-seater cars in which they were installed at well over 100 mph with commendable reliability. It was natural that from such motor-racing, at Brooklands and over the true road-circuits on the Continent, should spring a line of fast road cars for those who enjoyed driving.

The Prince Henry Vauxhall

The Bentley 3-litre

The Bugatti Type 43 "Grand Sport"

The Prince Henry Trials of 1912 and 1913 produced such noble motor-cars as the big Benz, the Prince Henry Austro-Daimler, the Prince Henry Vauxhall and a lightened version of the well-established 40/50 hp Rolls-Royce Silver Ghost. From the desire of a wealthy Englishman to set a new course record at the annual Shelsley Walsh hill climb in Worcestershire was born the first 30/98 Vauxhall, an early British sports car that has since achieved motoring immortality. These fine cars, at a time when, although labour charges (for maintenance) and petrol were cheap, tyres were prohibitively expensive, remained playthings of the rich. But during the same period the “New Motoring” movement, which fostered simple and inexpensive motor vehicles, was enlarging its influence. In their turn, fast GN and Morgan cycle-cars, and sporting versions of the Singer and Calthorpe small cars, arrived to challenge Vauxhalls and Austro-Daimlers.

With the Armistice of 1918 the demand returned many fold and the war had taught the technicians valuable lessons. Light alloys could be used for engines, reducing the weight of static and moving parts; the cooling of exhaust valves and lubrication of plain bearings were better understood; the way was clear for more reliable faster cars.

By 1930 nearly every manufacturer offered some form of sports model, even if it were merely the normal tourer in brighter colours and with sweeping mudguards. From the Bentley, Sunbeam and Vauxhall cars costing £1,000 and more to the little French Amilcars, Salmsons and Senechals priced at under £300 and the MG Midget at £185, the discerning enthusiast had a wide choice. In the early thirties an impressive string of racing trophies and records was considered valuable to court sales. But the policy was an expensive one, and meant that only the costlier standard sports cars could offer a performance closely approaching that of their racing versions. Bentley profited for a time from a string of victories at Le Mans, and by 1931 the standard 8-litre Bentley would do 100 mph. But within a few years—of deep slump—Bentley was absorbed by Rolls-Royce, and later in the thirties another great racing maker, Sunbeam, also disappeared in independent form.

It took some time after the second world war for production of sports cars to be resumed on any considerable scale. MG began again with its well tried “T” series of Midgets while Singer and Morgan produced similar small sports models. Aston Martin and Lagonda came back in the higher brackets. But the main emphasis in design was towards standardisation of a range of cars that could offer fuel economy comparable with prewar models, combined with the slightly larger size and higher performance.

Postwar development in the sports car field was therefore left at first to specialist designers who frequently utilised standard engines and components in specially built bodies,

Lovely to look upon—Thrilling to Drive—Wonderful to OWN

There must be very few who do not cherish an ambition to drive so impressive a car as the new Riley PATHFINDER. Its magnificent performance and the sweeping grace of its brilliant new styling make it a car that will be singled out and admired in any society.

How good it feels just to sit in the PATHFINDER! Everything about its interior spells—luxury. But the merit of the PATHFINDER goes deeper than superb design and refinement of detail. Above all, this is a car to drive. Ask your Riley Dealer for PATHFINDER literature. He will be delighted to go into the fullest details with you. You will find this car a joy to look upon, thrilling to drive and wonderful to own!

PATHFINDER

For Magnificent Motoring

RILEY MOTORS LIMITED, Sales Division, COWLEY, OXFORD
 London Showrooms: RILEY CARS, 55-56, Pall Mall, S.W.1 Overseas Business: Nuffield Exports Ltd., Oxford and 41 Piccadilly, London, W.1

At the wheel of the PATHFINDER you are always relaxed. Town traffic presents no problems. You glide quickly forward commanding instantaneous response to your every touch of control.

That same serene sense of poise stays with you on the open highway as you accelerate swiftly and safely towards a smooth mile and a half a minute and more.

The Cord

The Mercedes 300 SL

The new MGA

to produce fast cars for enthusiasts—thus the Healey began with the Riley engine while the Allard used the Ford V8. Some of these sports cars, however, achieved a penetration of the American market that rather surprised the British manufacturers who were having greater difficulty with their standard cars in that dollar market. The MG also continued to sell in large numbers, especially on the West Coast, and when Jaguar brought out its sleek XK sports models these, too, achieved a reputation and sales comparable with those of its big Mark VII saloon. The American motorist has only lately taken to the sports car—though between the wars there were a few notable exceptions such as the Cord.

This not altogether expected overseas demand, and the growing interest of young people in Britain in motoring as a sport, has been reflected in the attention that some of the British industry's big five are now showing in high performance cars—but not all. Austin now produce the sports Austin-Healey, using the Austin A90 engine and gearbox and a smart 2-seater body by Jensen, and BMC also build the 100 mph Riley Pathfinder saloon and the sports MG. Standard have the very successful sports Triumph TR2, also assembled from near-standard components. Rootes make the Sunbeam Alpine roadster which has won high honour in the Alpine Rally. Ford and Vauxhall remain aloof, though Ford encourages the entry of its saloon cars in rallies.

These modern British sports cars are competitively priced—the Austin-Healey at £750, the Triumph TR2 at £625 and MG at £595 (basic)—and provide a road maximum in

the region of 100 mph or more with fuel consumptions in the order of 30 mpg. With engines of 1½ to 2½ litres they out-perform the 3-5 litre sports cars of twenty years ago. Jaguar has, since the war, sold great numbers of the XK sports model, which was the pioneer of modern, sleek, beautiful over-100 mph 2-seaters in this country.

Much of the design that gives modern sports cars this performance comes from the "envelope" body styling in which Italy has been a leader. Its own models are now mainly beautiful closed fast cars on chassis of advanced design, such as Alfa-Romeo, Lancia, Maserati and Ferrari, comparable with the Aston Martin and Bristol saloons in Britain's higher-priced range. Germany continues her pre-war bias towards big engines in the Mercedes-Benz range, with the 300 SL coupé representing an extreme in price and performance. At the other end of the scale she has the compact, streamlined air-cooled flat-four Porsche, which appeals to the American market and is as fast as most.

The current trend in sports car design is to woo performance from low air-drag and to use normal engine designs giving a high power output by employing the good anti-knock properties of modern fuels to the best possible advantage. While racing flourishes and roads become ever more congested the high-performance car, which can be almost as economical as a heavier utility vehicle, may well continue to be in large demand—and it remains a field in which British and other European manufacturers ought to be able to keep ahead of Detroit, where specialisation on cars for any thin slice of the market is generally just not worthwhile.

The Motorist's Choice

IN overseas car markets, it has been suggested in an earlier article, British manufacturers are meeting the ubiquitous Volkswagen with cars such as the Anglia. But in the British market, as any motorist here may remark, they have no need to: the Anglia is nearly £90 cheaper than the standard Volkswagen, while the *de luxe* version with hydraulic brakes and synchromesh that VW generally exports costs more than a Consul or an Austin A50, cars "one size larger." The little Fiat cannot compete with the Austin A30 or the Standard Eight; it has to bear price comparison with the Ford Prefect or the Standard Ten. Britain today has the second largest motor industry in the world—which still enjoys a snugly protected home market.

It is never easy to decide just how much the 33½ per cent *ad valorem* duty that has existed in this country for nearly 40 years (there was one relapse into freedom in 1924, but it lasted less than twelve months) puts on the price of any particular imported car. The "landed price" upon which this duty is charged is highly confidential. The tradition of all motor industries is to set a price that will suit an overseas market, and if necessary (which it usually is) to "sub-

sidise" exports by covering most of one's overheads at home. But purchase tax is charged on the wholesale price, which for foreign cars is taken after paying duty; and distributive margins on a foreign car are not usually low. A car manufactured in Britain at the price for which the Volkswagen standard model has probably to be landed might retail closer to the price of the Austin A30 than the Ford Prefect; broadly speaking, the British duty and the extra purchase tax that it attracts must add between a quarter and the full third to the retail price of most foreign cars in this country.

Oddly enough, as an infant industry the British motor manufacturing trade was denied this protection; it was accorded only when war had cut off a growing and seemingly healthy child ere his prime. Britain entered the car manufacturing field a little late, and imported freely in the early days. At the turn of the century it was the French industry that held the lead, and was far enough ahead to cause the United States to impose a duty on car imports; but Britain did not. Over the first decade of this century, however, imports of foreign cars fell appreciably, though

imports of parts remained high—W. R. Morris, it may be remembered, originally began to build the famous Cowley from parts made in the United States.

But the first world war almost extinguished car manufacture in Britain—at a time when the industry in the United States was just reaping the benefits of quantity production. The British industry, conscripted, was able to equip the fighting forces with thoroughly reliable vehicles. But private customers in Britain were obliged to turn to American cars. Henry Ford was mass-producing his famous Model T, a simple yet powerful car made of excellent materials, to sell at a most competitive price, and Chevrolet was not far behind. These low-priced American cars sold well, even after the McKenna duty of 33½ per cent was imposed on imported cars and motor cycles in 1915. Following the Armistice there was a car famine; with used car prices sky-high the extra cost imposed by the duty meant little. In 1919 one could get a Model T tourer for £250, a Chevrolet for £375, a Maxwell for £435; in comparison, the Bean 12 cost £450, the newly-introduced Austin 20 cost £495, and the Morris Cowley cost £315.

What the import duty alone could not curb a new taxation rating that came into force in 1921 did most effectively. From that time onwards, though the actual rate varied, cars were taxed at about £1 per (peculiarly calculated) horse power. The small British cars thus cost about £12 a year, whereas the three American tourers cited above were taxed at about twice that figure. Petrol prices were rising, and Morris had begun his bold campaign of slashing prices; these factors combined to kill off competition here from the cheaper of the thirsty American cars.

Spares for foreign cars also bore the McKenna duty, which raised maintenance costs. Ford had begun to assemble the Model T here in 1911, only two years after he began making it at Dearborn and long before the British duty was brought in; progressively the company reduced the number of items on which it had to pay duty, until the car became completely British made. In the early twenties Citroen started to assemble cars in England and later partly to manufacture them at Slough, as it does to this day. And later the Imperial preference system—which brings the duty on an imported car down to 22 4/9ths per cent—induced a number of American manufacturers to set up factories in Canada, to export more easily to Britain and the Empire.

But by the middle twenties British cars had ousted the bulk of imported cars from their home market. Imports had been reduced mainly to specialised sports cars appealing to the wealthy individualist, plus American saloons in the middle price brackets that provided the spaciousness and aura of affluence of expensive British cars for a far lower outlay—without the finish or the longevity.

It was only in the mid-thirties that the foreign car of moderate price began to attract the more venturesome British motorist by reason of technical innovations that British designers did not offer. Citroen, for example, introduced in 1934 a revolutionary one-piece, all-steel saloon with a wet-liner four-cylinder engine, first of 12 and later of

15 hp, driving the front wheels. A few years later Fiat entered the preserve of British baby cars—made at the time by Austin, Standard, Morris, Swift and Triumph, etc.—with the 570 cc "Mouse," which achieved good passenger space by reason of a forward-mounted engine with the radiator behind it and, moreover, possessed independent front suspension and hydraulic brakes. The Lancia Aprilia, a small 11 hp saloon with independent suspension on all four wheels could achieve over 80 mph and 30 mpg as a matter of everyday motoring.

*

In comparison, British design remained conservative. The high horse power tax bred small-bore high-revving engines calling for frequent gear-changing to maintain power. These were of limited appeal in most overseas markets, where big cheap American cars with plenty of power at low speed and a fine top-gear performance, plus high clearance and more robust construction, held sway. This was incidental in both cases. The car that suited the United States then happened to suit most of the world; the car that suited Britain did not; but neither was particularly concerned with what the world wanted.

Since the war that balance has shifted radically. Export has been made the primary concern of the British motor industry; British requirements, at least in theory, a secondary consideration in design. At the same time, the American car, becoming bigger, lower, and softer sprung, in the last stronghold of cheap petrol, has left far behind what the rest of the

world can afford. Britain's horse power tax has been replaced by a flat rate that has freed its designers as to engine size; and though a high petrol tax still demands emphasis on economy, that is a fact of life for most of the world's motoring. British makers have turned to integral steel body-frame construction and developed highly efficient "square" and "over-square" engines. For the most part these technical advances have gone into refining and producing at ever lower cost cars slightly larger but not radically different from those they made between the wars.

Continental design since the war has veered the other way. Among European cars it is becoming rare to find a normal rigid back axle; rear engines are common and air cooling finds favour; and some Continental makers have successfully produced cars of smaller size and power than British. Some of these cars are attractive enough to sell in Britain even across the high tariff hurdle. The Volkswagen has a small but solid band of enthusiasts; Fiat's Topolino always had a following here, which the 600 should inherit; and the Renault 750, another rear-engined small car offering better fuel economy than any British car, plus four-wheel independent suspension, is fairly familiar on British roads. The new Citroen DS19, though it will cost some £1,400 here against less than £1,000 in France, pays less duty than cars made wholly abroad, and appears remarkable enough to attract many discerning motorists at the higher price. At higher prices, again, the 600 American

cars a year that since 1954 have been allowed in as commercial imports, still find buyers. A Chevrolet is a different kind of car from an Armstrong Siddeley Sapphire, but still has its own attractions at the same price; and even in Britain there are people who would prefer to buy two Cadillacs for the price of one Rolls-Royce.

It is in the medium range—the saloons of about 1½ to 2 litres, of which the British models sell, with purchase tax, in the price range from about £600 to £900—that the duty today effectively blankets much foreign competition. The major British manufacturers fill that range with a smooth succession of ever-improving conventional cars; they are excellent value for the money because for several years effort has been concentrated into cutting costs and providing better standards at unchanged prices. But those cars are also founded upon a conviction that the British motorist likes one particular kind of car and no other—and that the foreign motorist, providing his idiosyncrasies are looked after, likes very much the same kind of car. Part of that questionable conviction is being argued out in the world export markets; but the British customer who must always be a preponderant factor in British car design has not the free choice that some customers overseas possess.

The European cars that would, but for the tariff, be offered in that middle range—the Dyna Panhard, the Fiat 1100, the Peugeot 203 and 403, the DKW Sonderklasse, the Borgward Isabella and the Simca Aronde—often depart

Minimum Motoring

THE design of a car to carry four persons with the minimum dimensions, weight and cost is perhaps the most difficult problem in vehicle engineering. Britain, since the war, has hardly attempted single-mindedly to achieve it; its cheapest car, the Popular, is a residue of prewar design, while both the Austin A30 and Standard 8 have been aimed a little this side of austerity.

In Europe, the designers have been prepared to wring the utmost out of every centimetre of dimension, and to pare away every ounce of weight. The designer of the 4 cv Renault showed that fifteen years of progress made possible a considerable advance in such economies. The designer of the Fiat 600 has seen another decade's worth of distance run, and in assessing it the Renault is an admirable touchstone.

The Fiat takes a flying start with wheels of 3 inches smaller diameter. With an engine of lower torque and a wheel radius less by 1½ in, a smaller crown wheel is permissible, and a net half inch of ground clearance is sacrificed. The passenger seats are slightly more raked, and an inch of head room given up without falling below the standard accepted, for example, in the Rover body. With the two shafts of the

gearbox at closer centres, 5 inches are saved in the overall height of the body. The top cover of the slightly shallower gearbox is only 15½ inches above ground, and the greater length necessary for a four-speed box (against the Renault's three speed), and a hand transmission brake ahead of it, can thus be found beneath the seats of the rear passengers. The wheel-base is nearly 4 in shorter;

The Fiat 600

a slightly greater turning circle (28 ft against 26½ ft) permits a less sharp steering lock, so that—with 1½ in saved on the wheel radius—the track of the front wheels is reduced by 3 in without the wheel boxes encroaching on the space for the passenger's legs.

Using only two doors—against the Renault's four doors—the second window can be carried back behind the

in many features from the British designer's idea of what an everyday car should be. They are not, incidentally, cars that attract everyone who has a free choice; Britain's standards of interior comfort and finish, in particular, are often preferred. Britain's own cars, moreover, are successfully passing tariff barriers in many countries in the world. And the countries that make these competitive foreign exports have their own tariff barriers—30 per cent in France (with quota restrictions, too), 22 to 30 per cent in Germany, and 39.49 per cent in Italy; the United States charges only 10 per cent.

This is not the place to argue for free trade in cars—which in any case would be paying for the moon; and it does not seem likely today that even free trade would ever generate any very large trade in "taking in one another's washing" between countries where cars are manufactured. But in a survey recording the growth and strength of the British motor industry, and suggesting that any restraint upon the home sales of its main, unchallengeable companies would harm the country's industrial and exporting efficiency, it is fair to suggest that motor car duties are a suitable subject for tariff liberalisation when next that comes on the agenda. The technical leavening that might come from giving the British motorist a freer choice of those "eccentric" designs from the Continent is probably overdue and would at least be instructive; this could be the cheapest way to get it.

centre of the rear wheels; the Renault's second windows finish several inches ahead of the wheel centres. Thus the side lights of the Fiat, 12½ in deep, have a total area nearly 30 per cent greater than those of the Renault (involving, of course, a little extra weight and cost); and the Fiat can give effective ventilation with sliding windows in the door.

With a wheel-base almost 4 in less, the overall length of the Fiat is 16½ in less than the Renault. An overhang six inches shorter in front, plus the petrol tank under the bonnet, reduces the luggage accommodation. But compensation is given by nearly 3 cubic feet of space inside the body behind the rear seats. This is made available by mounting the radiator and fan to the side of the engine; in the Renault, the radiator and fan preclude any use of this space.

Overall, as a vehicle and as an example of brilliant body engineering, the Fiat deserves high praise. The power plant, however, might be improved. The cylinder dimensions are "oversquare" 60 mm bore by 56 mm stroke, giving 633 cc capacity, more modern than the Renault's. The smaller engine gives the same power, 21 bhp, at 4,600 rpm against the Renault's 4,100 rpm. In the outcome, the Fiat engine's power at low speed seems much lower than the Renault's, and the fuel consumption does not show the advantage that the smaller vehicle weight should secure.

THE NEW ROVER PROGRAMME

New high performance specification and new power-braking for the 90. Greater comfort in all three models:—the 60, 75 and 90.

THE NINETY

HIGH PERFORMANCE By increasing the compression ratio, the acceleration has become still more vivid. An optional overdrive ensures a higher maximum speed, exceptionally fast and silent cruising at low engine speeds and a useful saving in petrol consumption. Top gear flexibility, so valuable when driving in traffic, is unaffected.

EXTRA SAFETY To match this livelier performance, a new Servo-assisted braking system is introduced. This ensures impressive light-pressure stopping from high speeds and maximum safety under modern road conditions.

THE SIXTY, SEVENTY-FIVE AND NINETY

EXTRA COMFORT Rover cars have a fine reputation for driver and passenger comfort. There is now a choice of two styles in the front seating—a bench type seat or, as an optional extra, two individual seats independently adjustable. The deep hide upholstery is pleated to retain its shape and the rear arm rests have been redesigned for greater comfort.

Prices including purchase tax, '60': £1191.2.6; '75': £1297.7.6; '90': £1339.17.6. (overdrive, optional extra)

What Follows Equality?

IT is not surprising if Swedes sometimes feel ruefully that the world pays them less attention than they deserve. In a century when both good and evil are done on the grand scale, the limelight does not linger on a small country whose virtues are unspectacular ones: good order, a tidy social scene and a quietly persistent prosperity. And in the clash between the colossi of East and West it is tempting (though wrong) to think of the neutral Baltic as an uneventful and unimportant backwater of international affairs. This is the age of the ordinary man, but of extraordinary nations; and Sweden's ambitions are all of a modest and prosaic kind.

Occasionally it seems as if the Swedes get into the world's headlines only by their peccadilloes. One of the quirks of an otherwise formal and self-restrained race is a reputation for drinking too deeply when it has the chance; and the abolition of alcohol rationing on October 1st, ninety years after the first controls began in Gothenburg, has stimulated curiosity among foreigners anxious to see whether the fall of 1955 would find Swedes as tipsy as the French are supposed to be. This year has also yielded its quota of articles in American and British papers on morals and neuroses in Sweden, most of which have carried a heavy load of sensationalism on a fairly slender foundation of facts. Yet there are several much better and more

important reasons why Sweden deserves a close and sympathetic study—not least by nations like Britain, which share its ideals of social justice and democracy.

These reasons are essentially four in number. The first is that in one or two important matters, notably industrial relations, the Swedes have apparently found the answer to problems that are still vexing other western countries. It is worth remembering that their last major strike was in 1945; since then the number of workers affected by stoppages, including a few lockouts, has averaged only about 14,000 a year (in a nation of seven million), and the number of working days lost has been cut to one twenty-fifth of what it was in the chaotic 1920s. This is partly the effect of legislation; there was something inimitably Swedish about the

sight of 2,000 dockers marching in procession to the Labour Court in Gothenburg last year, shouting slogans of protest but quite ready to pay their fines for breaking the annual agreement with their employers. But at least as much is due to an entirely voluntary concordat between unions and employers, the aim of which is to prevent "lightning" strikes by imposing a due process of negotiation in all disputes. What has worked well in Sweden would not necessarily be a success elsewhere; but British newspaper readers might look with special favour on the agree-

What Follows Equality?
Grey Diamonds and Green Gold
Booms and Hiccoughs
Reluctant Lion, Twisted Tail
Sweden Goes It Alone

ment signed in 1937 between newspaper publishers and the technical unions, by which both promised to accept arbitration and to forgo strikes and lockouts.

One fallacy ought here to be exposed: the idea that strikes are forbidden by law in Sweden. Certain classes of public and municipal employees, including the police, customs

officials and some railway and Post Office staff, have in effect waived the right to strike in return for some compensating advantages (though Stockholm policemen recently found an ingenious way round this difficulty by reporting sick all on the same day). Otherwise, the annual agreements in each industry on wages and conditions of work have the force of contracts and breaches can be taken to the Labour Court which was set up under the Act of 1928. But in negotiating these annual agreements, and in dealing with matters other than those regulated by them, the contestants are free to resort to strikes or lockouts once the prescribed forms of discussion and mediation have been exhausted. The special lesson which Sweden has to offer is that a system of voluntary checks can, without removing the ultimate right of the worker to withdraw his labour, sharply reduce the number of cases in which he finds it necessary to do so.

On the international scene, too, Sweden's answer to the problems that face it calls for attention, though perhaps not for imitation. It is a crude and unsatisfactory classification of "neutrals" that puts it alongside countries like Indonesia, Burma or even India; for Sweden wears its neutrality with a difference. It does not pretend to make an ideology out of its own rather special status, nor do its statesmen stomp the world in the role of itinerant peace-makers. Since their abortive attempt in 1949 to create a pan-Scandinavian defence alliance, the Swedes have restricted their efforts for an "area of non-involvement" to either shore of the Gulf of Bothnia; here Sweden and Finland remain poised in a delicate see-saw balance, each side realising that if it quits the balance to move closer to one of the great power blocs it will most probably send the other slithering off into the opposition's arms.

Moreover, the Swedes are conscious that they are of the West, if not entirely with it. More than 95 per cent of their trade flows to and from the free world; and it is in the battle for Swedish markets that the third point of interest lies for many western countries, especially Britain. Last year the

two nations celebrated the third centenary of the trade and friendship treaty signed in 1654, and in 1954 Britain was still Sweden's chief trading partner. On Sweden's doorstep, however, lies Germany, and 1955 has seen a spectacular tightening of Germany's grip on the market. In one or two fields the decline in British fortunes has been severe—so severe that it is questionable whether they can be restored without extraordinary efforts.

But, as befits a small country, Sweden chiefly commands attention for the quality of its achievements on the domestic scene. And in foreign eyes that means two things: the twin phenomena of Social Democracy in office, virtually without interruption, for nearly a quarter of a century, and a society so far advanced toward equality that even its founders now sometimes seem to be in doubt what the next step should be.

In the terms of the French Revolution, the Swedes have achieved a degree of *égalité* unmatched outside Scandinavia and Australasia, and have yet managed to preserve *liberté* as conscientiously as most other European countries. (Perhaps only people with more gregarious tastes would complain—as they do among the English—of a certain lack of *fraternité*.) Their social superstructure has been built in a surprisingly brief time. The rise of modern Swedish industrialism dates from only 85 years ago; in 1905 less than 10 per cent of the population were entitled to vote. For a nation that is in most things slow moving and deliberative, it has been quick to import ideas and techniques from abroad. Not for Swedish socialism the long and painful struggle for birth; only a few years after industrialism began to spread, the Social Democratic party sprang fully-armed, like a Minerva of the Baltic, from the heads of Auguste Palm and Hjalmar Branting.

Again, although the Social Democrats have been in power so long, it would be a mistake to think of the Swedish welfare state as a time-weathered affair. Indeed, the last lick of paint are only now being applied. The national health service came into force last January (and that may prove to have been premature, since the full dental service is not yet in operation and the Social Board estimate that the total of 7,500 or more doctors needed to operate the medical scheme properly will not be available until 1970). Despite a sustained housing drive before and after the war,

Parties and Power

At present the 230 seats in the second chamber of the Swedish *Riksdag* are divided as follows:

Social Democrats	} in government {	110
Agrarians		25
Liberals		59
Conservatives		31
Communists		5

Except for a three-month interval in the summer of 1936, the Social Democrats have been in office ever since 1932. They have taken the Agrarians into alliance with them twice—in 1936-39 and from 1951 onwards; and during the war they joined in a national coalition which included all the parties except the Communists. The next general election is due in the autumn of 1956.

living space is still cramped by English standards, and there is an impatient waiting-list 100,000 long; and in a few minor points (the lack of a funeral grant, for instance, and the size of family allowances) officials admit to dissatisfaction with the system. And yet the total impression remains that there is not a great deal more that can usefully be achieved in the way of social levelling; what remains to be done is concerned less with the pursuit of equality than with the raising of standards over the whole of society.

This has not been brought about solely by redistribution of income. As the chart opposite shows, incomes, even before tax, tend to be concentrated more in the middle range than those in Britain. Visitors from England are always struck by the number of Swedes who pursue "middle-class" pastimes like weekending in the country and small-boat sailing. Education is far more egalitarian, because there is virtually no equivalent of the English public school, with its educational advantages for the pupil and its financial handicap for the middle-class parent. And there are no slums in the sense of the word that a Glaswegian or a Sheffielder would recognise.

History has conspired with the politicians to give Swedish society its special character. But the very comprehensiveness of the result has produced its own dilemma. As Per Albin Hansson, the second of the three leaders who have spanned the 66 years of the Social Democrats' history, said in 1946:

We have had so many victories that we are in a difficult position. A people with political liberty, full employment and social security has lost its dreams.

Sweden's place lies among the advance guard of the democracies which have chosen to follow the path of social equality and the welfare state. It offers an object lesson to countries which will have to pass the same way, for it suffers to a marked degree from the troubles that are likely to afflict them: among others, creeping inflation, an apparently perennial housing shortage, the draining of labour away from less attractive industries, and the loss of adequate incentives for professional and academic men. And, like all advance guards, it faces the problem of deciding where to go next. Can Sweden's future lie along the lines of its recent past?

It might be answered that the next stage is one of consolidation. This may be the answer of the Social Democrats themselves. It seems probable that the only major addition to the system they will propose at next autumn's *Riksdag* election will be a scheme of compulsory retirement pensions (and in this they have already been anticipated by the employers' federation). Although there is a section in the party in favour of nationalising the timber industry, it is unlikely that the other nationalisation schemes mooted at the end of the war will be revived. But the line between consolidation and apparent stagnation is a narrow one, and stagnation, as other Labour parties have learned to their cost, can be fatal at the polls.

Nor is it easy for an elector to discover a challenging programme among the opposition parties. One of the effects

of the uncharted terrain on which Swedish politics now find themselves has been to bring the parties bunching congenially together (with the exception of the Communists, always happy outriders on their own hobby-horses). Since a Stockholm newspaper poll discovered last year that Swedes preferred a cut in income tax to a variety of other suggested benefits, the parties have competed in suggesting different schemes of tax reduction. For the rest, the Liberals oppose their "social-liberalism" to "socialism," and suggest a reduction in housing subsidies and technical adjustments to the health service; while the Conservatives are critical of the "softness" towards juvenile delinquents, and are bolder in proposing a means test for the housing subsidy and a reduction in financial aid to mothers and schools.

In these conditions prophecy is rash. But the chief threat to Social Democratic power at the next election seems to be a twofold one. Other things being equal, the rise in the cost of living brought about by this year's heavy wage increases may well cost the party four or five seats (its strength has been slowly declining since 1944, when it lost the only absolute majority it ever had—a majority which it could not use because of the war). And the Agrarians, who at intervals uneasily share the Social Democrats' bed, freely admit that the present alliance is costing them votes to the Conservatives, particularly in Skåne, and that up to a fifth of their seats may vanish next year.

If both these things happen, the Agrarians may at last draw enough courage from their convictions to quit the alliance. Sweden's problem will then be to decide whether to attempt a four-party coalition, which the Conservatives seem to favour but which would confirm the country's political inertia; or to try a centre-right grouping, perhaps based on a minority government of Liberals and Agrarians under Hr Ohlin, the Liberal leader, with the Conservatives' support but without their membership. In any case, the present pernickety system of proportional representation makes it unlikely that more than a handful of seats will change sides; and this, combined with the fraternal solidarity of the parties on most issues, seems to diminish the chances of a change of policy even as radical as that which Britain experienced in 1951.

There is an engaging parallel between Sweden's politics and its rule of the road. At present, it is the custom for Swedish motorists to drive on the left in cars almost all of which have their steering wheels placed for driving on the right; while Swedish social democracy is geared to an economy based overwhelmingly on private enterprise. Now a committee of experts has recommended that drivers change over to the right in four years' time, but a public vote has roundly declared against their advice. No one seems sure whether 1959 will find Swedish cars on the right or left or (as often happens now) bowling happily down the middle of the road. The same uncertainty pervades the political scene. The Swedes seem to be edging their way towards a change of government; the test will be whether they notice the difference when they get one.

Grey Diamonds and Green Gold

SWEDEN is like some of its male inhabitants—long and gangling, all bone and no fat. A traveller who approaches by aeroplane sees the character of the country most truly: the golden, wheat-laden plains of the south cling like an invader to their precarious beachhead on the peninsula; a little further inland fields give way to timber, lumps of granite break gauntly through the soil, and the austere Nordic pattern of forest, rock and lake asserts itself. For every acre of cultivable land, another is covered with water and six with woodland; and the spine of mountains that runs along the Norwegian frontier is only the visible portion of the mass of stone that lies close beneath the surface. Yet out of this unpromising material the Swedes have found wealth enough to create an enviable prosperity.

North and south, Sweden stretches for nearly a thousand miles, as far as from New York to Palm Beach, or from Aberdeen to Milan. Within this range it encompasses a great diversity of scene; from the lunar landscape of the Lapland ore mines, through the bleak and undulating forests of Norrland, to the Kentish graces of the far south. The trim fishing villages along the Kattegat are as far a cry from the industrial towns of the

midland plain as these are from the lonely beauties of the Ångermanland mountains. But the most striking characteristic of the country as a whole is that it is more fertile and less frozen than its northerly position suggests; and for this Sweden can be doubly grateful to the sea.

The rich agricultural plains of the south-east and the south-west, as well as those round the central lakes, are formed from the bed of the sea that overran the area after the ice ages. The Gulf Stream, flowing down the western coast of Scandinavia, mellows the climate of Stockholm and makes places like Luleå and Kalix—on the latitude of Alaska and southern Greenland—bright with flowers in the summer. With these compensations in an otherwise rugged land, the Swedes manage in a good year to produce virtually all the essential food that their very high standard of life requires, and to have upwards of ten per cent left over for exporting.

This has been achieved by a vigorous policy of government support for agriculture, in the face of two major obstacles: a perennial desertion of the countryside in favour of the towns, and a tradition of small-scale land ownership that is inimical to modern methods of husbandry. When Disraeli and Derby were giving the vote to the English artisans, three Swedes out of four still earned their living on the land, and as late as 1938 more people were engaged in agriculture than industry; now the proportion on the farms is less than a quarter. The drift away from the land is proceeding at the rate of over 40,000 a year, according to one recent estimate, and the consequent rise in the urban population has been so rapid—40 per cent since the beginning of the war—that it has outstripped the building programme in the towns.

Nor is the diminishing rural population ideally deployed: seven out of ten Swedish farms have less than 25 acres apiece, and nearly a third of the total area of arable land is cultivated under this constrained kind of regime. Various attempts have been made by the government to expand the size of holdings, including the offer of loans to farmers who merge their properties, aid in draining new land, and an abortive attempt in 1948 to encourage a kind of "collective farming" on co-operative lines. But although some progress has been achieved since the war in central and southern Sweden, fragmentation is likely to be a serious problem for many years to come.

Yet productivity is high, and has risen by more than a third in the past decade. This summer's drought has spoiled what had been expected to be a bumper harvest, but the yield per acre of almost all kinds of crops in recent years has shown a substantial advance over wartime figures. One reason for this is mechanisation. Whereas at the beginning of the war there were 20,000 tractors in use, there are now more than five times that number; one of the incongruities of the Swedish countryside is the sight of a shining new Fordson or Ferguson working a plot of land hardly big enough for it to manœuvre in. In one way this has paradoxically increased Sweden's dependence on supplies from

Proud Symbol

This symbol of accuracy and perfection forms the proud background to every SANDVIK Steel Product. The unique qualities of Sandvik Steels are due to the raw materials used and the methods of production. High-grade ore of extremely low phosphorus and sulphur contents is melted in small easily controlled units using charcoal made from coniferous wood. The latest technical equipment and our steelmaking experience dating back to 1858 give Sandvik a meaning of rare quality in steel products.

The manufacturing
programme covers:

COLD ROLLED STEEL STRIP
STEEL WIRE
SEAMLESS STEEL TUBES
FINISHED TUBE PRODUCTS
COROMANT TUNGSTEN CARBIDE
SAWS, MACHINE KNIVES, ETC.
STEEL BAND CONVEYORS

SANDVIK STEEL BAND CONVEYORS LTD—Dawlish Road Works, Selly Oak, BIRMINGHAM 29—Telephone: Selly Oak 1113

The works at Sandviken in Sweden cover an area of approximately 400 acres and employ over 6,500 people.

abroad, for almost all tractor fuel has to be imported, as well as about a quarter of the large amount of commercial fertilisers used.

The state, which began to bolster agricultural prices in the depression of the early 1930s, now helps farmers partly by subsidies (chiefly on milk) and partly by manipulating import duties in such a way as to hold up prices at home.

One of the government's aims is to raise the rural standard of life, and both farmers' incomes and agricultural wages have risen markedly in recent years, though the gulf between city and village, as in most industrial countries, still yawns wide. At the cost of dearer food to the consumer (prices are 20-25 per cent above those on the international market) Sweden has made itself virtually independent of foreign supplies in case of war. Some of the good things of life have to be imported—coffee from Brazil is the most notable example—but it is estimated that more than ninety per cent of the country's calorie needs are supplied at home. And Swedes eat well; their daily calorie supply is among the highest in the world—as high as in Switzerland or the United States, and higher than in Britain or France.

Sweden's greatest wealth, however, lies not so much in the food it grows as in the resources that offer themselves for exploitation on and under its surface. These nature has bestowed liberally, if somewhat capriciously. Coal is not to be found at all, except for a sprinkling of third-rate stuff outside Hälsingborg; and the only mineral oil lies in the middle of the country in the shale deposits round Kvarntorp. But forests and metal-bearing rock provide the twin props of the country's economy—rich and abundant iron ore and timber, traditionally the "grey diamonds and green gold" of Swedish prosperity; and to these should be added what the French call *houille blanche*, "white coal," the vast resources of electric power in the lakes and rivers of the countryside. These three elements have between them directed the course of Sweden's economic history.

Most of the iron ore lies underground in two main deposits. In Sweden's far north, the Lapland mines at

Kiruna and Gällivare-Malmberget between them hold 2,500 million tons of ore with a high mineral content—not far short of 200 years' supply at the present rate of extraction; and the mines of the Bergslagen district—the iron band round Sweden's waist—are estimated to contain another 220 million tons. (There are also some deposits in the Skellefte field in Västerbotten, but the chief wealth of this area is rock

which bears a Heinz's variety of other minerals—gold and silver, copper, zinc, lead and iron pyrites.)

Bergslagen ore, most of which has an exceptionally low phosphorus content, has for centuries formed the basis of Sweden's own iron and steel industry; in the 18th century Sweden produced 40 per cent of the world's iron from this source. Extraction of the Lapland ore, which has a higher phosphorus content, did not begin until the turn of the century, when the Bessemer process had made it workable. But today Kiruna and Gällivare account for 70 per cent of Swedish iron ore production, and the vast bulk of their output is exported.

In 1951 Lapland yielded twelve million tons and Bergslagen four million (of which one million was processed at home); of the total of just over sixteen million tons, no less than fifteen were exported. The huge deposits still left in the Lapland field (which has hitherto been worked by an organisation owned half by the state and half by the private Grängesberg company) make it hard to accept the official explanation of the government's decision this year to nationalise the mines completely. This is that preparations must be made for the time when the ore will no longer be able to support the present labour force. A more plausible reason seems to be that the government hopes that nationalisation will add extra revenue to the exchequer.

Production is rising rapidly; it is hoped to increase the annual output of the Kiruna mine alone from nine to twelve million tons between now and 1963. This growing preponderance of the Lapland ore, with its higher phosphorus content, is reflected in the changing structure of the domestic steel industry. Sweden has long been famous for its high quality steels made from Bergslagen ore; but the

industry's postwar development has concentrated chiefly on increasing the production of merchant quality steels, and this process will be accelerated when the state-owned steelworks at Luleå come fully into operation.

It is forest products, however, accounting for two-fifths of Sweden's foreign earnings, that take pride of place as a source of income. Among European countries only Finland is more thickly covered with trees than Sweden; between the beechwoods of Skåne and the forlorn tundra of the Arctic lie vast expanses of woodland, in most of which only the occasional glitter of silver birch varies the expanse of spruce and pine. Sweden's standing timber is estimated at more than 10 billion trees; this is the

equivalent of 1,850 million cubic metres, and new growth each year adds another 61 million cubic metres.

Felling and replanting have for many years been subject to a precise discipline. During the recent war, however, when the forests were called upon to provide heat for homes, fuel for factories, charcoal gas for cars and tractors, and a host of other synthetic products, there was inevitably some over-cutting. And the forest imposes its own irregular rhythm of replacement; a lumber tree that needs about 90 years to mature in the south takes anything up to 180 years in the north, and in Norrland—where the pulp and sawmill industry is chiefly concentrated—timber ready for the saw is in short supply. But large increases in the south have made up for the temporary shortage in the north, and now regrowth once more exceeds cutting. Conservation schemes should make it possible eventually to raise the yield of the forests by a half; a recent estimate puts the increase in the sawmills' output during the next ten years at more than 100,000 standards.

There is more room for expansion where power is concerned. A generally accepted estimate puts the total of hydro-electric resources suitable for development at 80,000 million kilowatt hours a year, and if all this were exploited the country would have to import scarcely any fuel. Today Sweden's 1,400 power stations are generating something like 24,500 million kwh, and output is increasing by about eight per cent each year. At the present rate the resources will not have been fully developed until 1980, although 90 per cent of those in the south of the country are already harnessed.

No country in the world, save Canada and Norway, produces more hydro-electric power per head of population than Sweden. The pride of the system (until the even bigger station now under construction at Umeå is completed) is the great Harsprånget plant in Lapland, which King Gustav opened in 1951. It is set 250 feet down in the solid granite, like a vast subterranean cathedral to the river gods, and the eight years of work which went to its completion cost £20 million; yet only ten men are needed

to operate and maintain it. From Harsprånget a 380,000-volt system carries energy 600 miles southwards with only a seven per cent loss in transmission.

It is not yet clear how soon atomic energy will be available to supplement water power. Private industry, as well as the state, is showing keen interest, especially since the recent atomic conference at Geneva, and the technical adviser to the great Asea concern said a year ago (over-optimistically, in the event) that his company could build a station "within a year." In fact, progress so far is limited to one research reactor in Stockholm, operated by the official development organisation. A larger reactor, of 10-20,000 watt capacity, is being established on the coast near Nyköping, south-east of Stockholm, and the director of Atomenergi AB hopes that some electricity will be produced on an experimental basis within the next five or ten years. But it is likely to be 1970 or after by the time that atomic power flows through Swedish transmission lines in any volume.

One of the great social problems to be solved as Sweden develops its natural resources is the lack of balance between the two halves of the country. The nine counties of Norrland are the home of only a sixth of the population. Yet between them they hold nine-tenths of the country's iron ore and 85 per cent of its resources of electric power, as well as rich deposits of other minerals in the string of mines that stretch westwards from Boliden; and their forests contain the bulk of the still unexploited supplies of timber. Capital and skilled labour flow in from the south, and Norrlanders complain bitterly that profits roll back the same way. And it will be some time before the erstwhile farmers and woodsmen of the territory can adapt themselves to the techniques of industry; the initial losses suffered by the Luleå steelworks are blamed (apart from the high cost of

transporting steel to the midlands) chiefly on the inexperience of many of the new workers.

Norrland sometimes laments that the south treats it as a colony. Ultimately, the solution can lie only in an expansion of the north's own resources of capital and skill; and it is encouraging to see the growth of towns like Kiruna and Luleå, the latter with its spruce housing estates and its ambitious scheme for one of the world's biggest planned shopping centres. It is unlikely, because of the hard facts of geography and climate, that Norrland will ever be a major competitor with the industries of the centre and south; but there seems to be scope yet for a good deal of worthwhile development. The fiercely-criticised state steelworks at Luleå may prove to have been a vital contribution to opening up the area. Norrland is in the second stage of a frontier territory's growth. Exhortations to go north, young man, are no longer enough; the north needs encouragement and aid in building more of its own future.

Pile driving in Holland

Polishing in Sweden

Atlas Copco puts compressed air to work for the world

Pushing back the sea is a full time job in Holland. Aiding the Dutch in their age-old battle are Atlas Copco sheeting drivers at work sinking piles and sheetings on the vast Zuider Zee project. Doing a very different kind of job on the shores of the Baltic are Atlas Copco pneumatic polishing machines. Installed on the production lines of an ultra-modern automobile plant, these and similar small hand tools are playing an important part in Sweden's growing automobile industry. As in Holland and Sweden, so in almost every part

of the world—Atlas Copco is on the job wherever compressed air is working hardest.

Atlas Copco provides equipment for every conceivable application of compressed air. Atlas Copco compressed air equipment is manufactured or sold and serviced in 48 countries throughout the world by *The Atlas Copco Group*, which embraces companies trading under various names such as Atlas, Atlas Diesel, Atlas Polar, Atlas Copco, Copco, Delfos and Sampa. Atlas Copco companies include:

UNITED KINGDOM: The Atlas Diesel Company Ltd., Beresford Avenue, Wembley, Middlesex; SWEDEN: Svenska Tryckluft AB Atlas, Stockholm 1; FRANCE: Atlas Polar S.A., 29, Rue Marbeuf, Paris 8e.; HOLLAND: N.V. Holland-Atlas, P.O. Box 6056, Rotterdam; ITALY: S.A.M.P.A., Viale Marche 15, Milan; NORWAY: A/S Atlas Diesel, Postboks 94, Oslo; TURKEY: Atlas Copco Ticaret ve Sanayi. T.A.S., P.O. Box 490—Galata, Istanbul; SOUTH AFRICA: Delfos (Pty.) Ltd., P.O. Box 504, Benoni, Transvaal; CANADA: Canadian Copco Limited, Montreal, A.M.F., P.Q.; U.S.A.: Copco Pacific, Ltd., 930 Brittan Avenue, San Carlos, California; Copco Eastern Ltd., P.O. Box 2568, Paterson 2, N.J.; AUSTRALIA: Australian Atlas Company Pty. Ltd., P.O. Box 54, Auburn, N.S.W.; NEW ZEALAND: Atlas Copco (N.Z.) Ltd., Huddart Parker Building, Wellington, C.I.

The telephone above, now a collector's item, is of interest chiefly to industrial arts historians because from it is derived every modern handset in use today. To us, quite naturally, it is a source of modest pride. We made it, back in 1892, from a prototype designed ten years earlier.

Age is not always an asset. But in the complex business of telecommunications it helps to have been along from the beginning. It takes more than sophisticated engineering and high productive facilities to provide modern telephone systems. It takes well balanced judgment, born out of long experience, to estimate future requirements and to plan and design a communications network attuned to the economic and social growth of communities and nations.

This abstruse systems planning is part of the service rendered by The Ericsson Group. In addition to designing and manufacturing equipment to specifications laid down by mature administrations, The Group undertakes the development of new networks, on a local or nationwide basis. It will survey and plan, manufacture and install the facilities required. If necessary it undertakes the long-range financing, as well as the training and development of staff, from plant maintenance men to administrative officers.

The communications package delivered by The Ericsson Group is therefore not limited to high quality electrical hardware, it also contains the technical and administrative experience gained from service to some 70 countries, from the dawn of the telephone era.

Booms and Hiccoughs

ONE of Mr Ray Bradbury's imaginative science fiction stories tells of a man who, on a journey backwards through time, accidentally squashes a prehistoric butterfly; when he returns to his own century he finds that this apparently trivial variation in the course of nature has generated, over the intervening years, all kinds of subtle changes in the familiar world he had left behind. The geological accident which denied coal deposits to the Scandinavian peninsula has had the same kind of effect in Sweden. Lack of coal is the blessing in disguise that has helped to keep its towns so spick and span, preserve the fabric of ancient buildings and save Swedish housewives the washday agonies of their sisters in English cities. Less happily, it was also one of the factors which in the last century delayed the growth of Sweden's now bustling industry.

Until the development of electric power, the country had to rely for its sources of energy on wood, primitive water power and its ability to import coal and coke from abroad. The birth of modern industry dates only from the early 1870s; and the exploitation of the country's hydro-electric resources round the turn of the century, which helped markedly to lower the costs of production, was a decisive stimulus to development. In 1870 only 15 per cent of the population depended on industrial trades, whereas by 1950 (although the figures are not strictly comparable) almost exactly a half found their living within the categories of mining, manufacturing, transport and communications. And although an average of six million tons of coal and coke have been imported each year since the end of the war, and purchases of fuel oil and petrol have been rising sharply, electrification now provides by far the major share of motive power in industry. It became the most important method of driving machinery as early as the first world war; heavy industry now consumes roughly 65 per cent of the electric power produced each year in Sweden.

It is difficult to judge how far Sweden's neutrality in the last war helped to consolidate its present prosperity. The index of industrial production as a whole rose by a half in the decade 1938-48; a figure that less fortunate European countries might look on with envy. But some of the principal exporters, notably the iron ore mines and the wood pulp industry, found the war a major handicap; and industries which expanded to fill the gap in the home market (especially the woollen and clothing trades) found themselves working at a level which, in the face first of postwar competition and then of the "post-Korean" recession, was impossible to maintain. A more noteworthy feature of the economy is the way it has kept up its impetus since the war. World demand for the products in which Sweden specialises, plus a high level of prosperity at home, have kept production in most spheres, apart from a break in 1951-53, steadily on the increase. The rise was as high as six per cent in the first half of this year compared with the same period in 1954.

The picture is bright throughout the iron, steel, engineering and timber industries, which between them account for a half of Swedish manufacturing production. The only large patch of gloom is the condition of the textile industry, which makes up about a tenth of the whole. Its troubles are partly a reflection of a world-wide trend, and the woollen industry round Norrköping—Sweden's West Riding—has fared no better than its fellows abroad; though in the knitwear section, where the position is worst, there have been bitter complaints of German dumping. Tariffs were raised to an *ad valorem* level of 12 per cent in July, but it is not yet clear whether this will provide a strong enough shield. Two big bankruptcies recently may have cut away some of the excess productive capacity, but the industry still has a sickly look by comparison with the rosy cheeks of the rest of the economy.

Last year, out of a gross national product (at current

THE STATE'S SHARE OF INDUSTRY

market prices) equivalent to £3,150 million, the share of industry—including mining and power production—came to 41 per cent, compared with 12 per cent for farming and forestry. Within this figure much the biggest proportion—contrary to some hazy ideas abroad—should be credited to the workshops of private enterprise. Comparisons depend on how “industry” is defined, and this tends to vary with the definer’s point of view.

On the other hand, it is reasonable to say that the state’s chief economic role in Sweden lies outside manufacturing industry—in the railways (many of which were publicly owned from the start, for lack of private capital, and which are now almost wholly under state control); in the Post Office and the public utilities, including power supply; and in air transport and a certain number of country bus routes. Within industry proper, as an earlier table shows, the state companies (which are Sweden’s contribution to the technique of public ownership) have monopolies in sugar refining, tobacco and alcohol, but otherwise play an important part only in ore mining and one or two other fields. (Since the 1951 census, on which these figures are based, state influence has been extended by the decision to take over the whole of the Lapland iron ore mines and by the entry into full operation of the northern steelworks at Luleå, just below the Arctic Circle.)

A recent estimate from the side of private enterprise, which seems generally accepted, is that the state’s share of industry, excluding power and shipping, comes to about five per cent in terms of numbers of employees. Nor is that of the co-operatives any greater, although they have a virtual monopoly of the production of vegetable oil and a good share of the market in electric lamps and a few other things. The heroic age of the Swedish co-operatives as a manufacturer was thirty years or more ago, when they broke the margarine ring and brought down the price of half a dozen other commodities by going into business themselves. They now hold a useful watching brief on private industry, but they account for only a modest fraction of total production.

One of the characteristics of Swedish industry is the degree to which specialisation and the advantages of large-scale production have enabled a small number of very large firms to secure a dominating position. This is most obvious in electrical engineering, where L. M. Ericsson, of Stockholm, and Allmänna Svenska Elektriska AB (Asea), whose onion-domed headquarters look pontifically over Västerås, between them employ nearly half the industry’s total of technical staff. In their own fields—telecommunications and power plant—these two concerns account for about 66 and 80 per cent respectively of the national production. But the same feature is evident in other sectors. Perhaps the most far-ranging concern of all is Stora Kopparbergs Bergslags AB; this Proteus among firms, whose central offices perch over the vast crater of the ancient copper mine on the outskirts of Falun, controls the Domnarfvet steelworks (producing a quarter of Sweden’s rolled and forged steel), a paper mill (producing a third of the total output of newsprint), a large pulp mill and a factory making high-

quality steel, as well as power stations and tracts of forest covering a tenth of the province of Dalarna.

The Swedish tax system, which combines a stiff rate of extraction from companies with strong incentives to plough back profits, is also a powerful help to established big industries. Recently tighter conditions have been imposed on depreciation allowances, but this seems unlikely to change the pattern of development. From 1925 onwards, except for a slight hiatus during the war, establishments employing over 500 men have taken a bigger and bigger share of the industrial labour force—from 18.9 per cent in 1925 to 27.4 in 1950; while establishments with between 50 and

500 employees have equally steadily declined in importance. But until the end of the war there was also an interesting trend in favour of small concerns employing up to 50 men, including the tiny so-called “garage industries”; these have long flourished in Sweden, often with a very high proportion of capital equipment to labour, by supplying minor parts, suitable for small-scale production, to larger concerns. They also prospered during and just after the war by making up for vanished supplies of imported consumer goods; but recent figures seem to show that the return of foreign competition in this field is putting some of them out of business.

The same phenomenon of big business in a small country, which has caught the attention of Mr Graham Greene among others, is illustrated by the relationship between industry and the banks. It has been calculated that fifty directors of banks between them occupy ten times as many seats on the boards of industry, and it is sometimes suggested that this is the product of an obscure and illicit financial liaison between the two. In fact, since 1933, an amendment to the Bank Law has made it extremely difficult for the banks to acquire industrial shares. There is a more innocent explanation of the present undoubtedly close connection (the names of the brothers Wallenberg, of the Enskilda Bank, run like a refrain through company reports). For one thing, the banks have a close interest in a number of investment trusts; for another, Sweden’s is a small and neighbourly economy, where the banks act as brokers and, to a larger extent than elsewhere, as long-term lenders to their industrial clients. In such circumstances a fairly close degree of collaboration is only to be expected.

★

The keynote of Swedish industry, then, is a steady hum of closely organised activity. But in the last year it has been possible to detect behind the hum an occasional and disturbing whisper of inflation. All the symptoms of overstrained resources, so familiar elsewhere in western Europe, are there. At the end of the summer there were fifteen times more applications for building licences than there were licences available. In June, although 110,000 aliens are employed, the number of vacancies in industry had reached a figure nearly double that of the number of places filled. In the first half of the year wholesale prices rose 4 per cent and the cost of living index five. As a result, the last two

years have seen the phenomenon of the “wage slide,” as employers have been forced to increase workers’ earnings during the term of the collective wage agreements. And, after showing commendable moderation in 1953 and 1954, the trade unions at this spring’s collective negotiations won a series of wage increases which will probably add eight or ten per cent to the year’s wage bill.

Faced with this situation, and with a widening gap between imports and exports, the government took a number of steps in the spring which marked a radical departure from Sweden’s previous reliance on physical controls. After a Social Democrat suggestion for a compulsory savings scheme had met with widespread opposition, it decided to increase bank rate; to issue a new series of high-interest government bonds to tap off some of the funds of the capital market; and, most important of all, to call for a tightening of credit restrictions by the commercial banks. Proposals to restrain hire purchase buying have also been put forward. This decision to revive fiscal and monetary measures was belated enough, as the opposition has pointed out with zest, but it is at least a welcome sign of flexibility among the Social Democrats’ economic advisers; and there are signs that their unorthodox orthodoxy is beginning to work.

Between April and July this year grants of credit by the commercial banks fell by 609 million kronor, or about five per cent. (Indeed, the squeeze proved rather too effective for the health of the housing programme, and to save the government’s political face the *Riksbank* had to arrange with the commercial banks for a special release of credit for house building.) Although the big companies have probably been relatively untouched by the restrictions—because

they can finance expansion schemes out of their own reserves—this denial of credit must have had a chastening effect elsewhere, not least on importers; imports of machinery have fallen, and this has helped to lift the gloom felt in the spring about the year’s balance of trade. By Christmas, or at the latest a little after, it will be possible to judge how successful the new approach has proved.

Freedom from inflation will then depend chiefly on whether or not the trade unions are willing to exercise restraint at next spring’s wage negotiations. In July Hr Strand, the president of *Landsorganisationen*, the trade union federation, urged a period of slower wage rises; and the influential metalworkers’ union has also declared in favour of moderation. Fortunately, last spring’s collective agreements removed some of the complaints of the lowest-paid groups of workers. With luck and judgment, Sweden may now have a repetition of the wage truce that prevailed in 1948-50, and, to a lesser extent, in 1953-54.

If this is so, the Swedish system of once-a-year wage negotiations, conducted under the careful supervision of the trade union federation, may produce an interesting variant on a familiar condition. Where other countries suffer from creeping inflation, Sweden’s complaint seems to be hiccupping inflation: two or three years of rigid self-control by the unions, followed by a sharp upheaval as pressure from within becomes too much for them. Perhaps the Swedes have now completed their latest spasm. Sweden’s comparatively youthful prosperity does not depend entirely on its own actions, for, like every trading country, it lies partly at the mercy of world trends. But if this year’s disturbances are successfully overcome, Sweden’s boom looks as assured as any in Europe.

Reluctant Lion, Twisted Tail

WHERE the Goths and Vikings sailed a thousand years ago, the trade ships now ply. Hemmed in on two sides by mountains and Arctic wastes, Sweden deals with the world by crossing the seas; and for centuries the marauders and later the merchants have gone east and south across the Baltic and west through the Skagerrak. Eastwards the way is now blocked, as much by Communist aspirations to autarky as by the guided-missile stations along the heavily guarded Baltic shore, and only a trickle of trade passes to and fro. But with the free countries Sweden carries on a volume of business that puts it, for its size, among the world’s busiest trading nations. Of the total volume of goods and services produced each year, roughly one-fifth goes for export, and buys abroad a corresponding proportion of what is consumed at home.

At first sight it is surprising that Sweden does so little trade in the East, where the vast bulk of the Communist world, ever eager to give a neutral a good impression, looms so close at hand. Indeed, the Swedes have not always been

confident in the West’s ability to satisfy their needs. In 1946, when the postwar demand for imports far outstripped the ability of a devastated world to buy Swedish goods, they found themselves faced with an alarming drop in their holdings of gold and foreign currencies; and this, coinciding with acute and in the

event quite groundless fears that a depression was about to descend on America, led to the signing of the famous and virtually abortive trade agreement with Russia. Yet, although Dr Myrdal, the chief Swedish sponsor of the pact and now head of the UN Economic Commission for Europe, remains perennially hopeful of the prospects of East-West trade, Sweden has found that reviving western

economies can both fully absorb its exports (paying higher prices than the Russians offered) and offer all the imports it can afford to take.

Ultimately, the Russians made use of only half the 1,000 million-kronor credit made available to them in 1946. Now they provide a certain amount of fuel oil (about 70 million kronor worth last year), and take food, metals and machinery

in exchange; but even so this accounts for little more than one per cent of Swedish trade. Poland, which provides coal in return for ore and machines, has over the last few years been only a little more valuable as a partner. Business with the other Communist countries is insignificant; the whole

of the bloc has been steadily declining in importance in recent years, and now accounts for only four per cent of all Swedish commerce.

Sweden's highways of trade, then, run westwards, and the traffic that flows along them has a basic simplicity. The products of forest and rock—timber, pulp, paper and ores—make up half the value of all exports (four-fifths of those to Britain); and two-thirds of the rest is accounted for by the industries which are built on possession of the ores—primarily metal work, specialised machine-making and ship-building. In the other direction Sweden imports the coal, coke and oil it lacks itself (roughly one-sixth of all imports) and the kinds of steel and machinery that lie outside the scope of its own industry (about a fifth). For the rest, food and tobacco, motor vehicles and better class textiles and clothing—the amenities of a comfortable standard of life—account for a third of all imports.

It is difficult to see any serious threat to Sweden's principal exports on the horizon at the moment. Sales abroad naturally rise and fall with the economic fortunes of the West, and the last few years have shown once again that forest products in particular are vulnerable both to changes in price and to considerable variations in demand. Between

1950 and 1952—the period of the Korean war and the subsequent economic reaction—timber and allied exports first more than doubled in value and then fell sharply back by a third. But in the long run iron, forest products and skilled engineering are commodities that the world will continue to call for; it is estimated, for example, that the demand for paper alone is increasing by 400,000 tons a year as the once illiterate countries of Africa, Asia and South America begin to taste the pleasures of reading.

Eventually expansion will be governed chiefly by what Sweden can manage to provide. How much iron ore is left in the earth is accurately known, and to speed the rate of extraction would merely hasten the day when it will be exhausted. Similarly, the woodman must spare the tree if the forests are to replenish themselves for the benefit of future exporters. Therefore the main change in Sweden's pattern of exports in the next decade or two is likely to be a

growing emphasis on its high-quality steels and engineering products. Already the engineering industry has expanded its share of exports from 15 per cent before the war to practically a quarter. Last year Sweden took third place, after Britain and Germany, as a provider of ships; machines (notably rock drills), tools and office equipment have brought home an encouraging supply of dollars; and the producers of power plant and specialised engineering goods are finding a useful market in Europe.

The anxiety the Swedes felt earlier this year about their balance of trade was chiefly caused not by failure to sell their products abroad (as was the case in 1946) but by the excessive expansion of imports under inflationary pressure at home. Exports, indeed, grew by six per cent in the first half of 1955 compared with the same period last year; but this was far outstripped by a 17 per cent rise in imports, and Sweden's reserves sank to a dangerously low level. If, as the latest estimates suggest, payments will in the outcome be roughly balanced for 1955 as a whole, this is due at least as much to the autumn's bustling business in exports as to the check on imports imposed by the government's springtime credit restrictions. The balance of trade figures of the past few years emphasise that Sweden's most nagging problem at

SWEDEN

Manufacturing programme:

Electric generators, transformers, motors, converters and rectifiers of all capacities and for all purposes.
Electric switchgear and apparatus of all kinds for power installations.
Auto- and hand-operated equipment for remote and local control of power installations of all kinds.
Complete electric power installations for ships.
Relays, voltage regulators and surge protective apparatus.
Electric furnaces for metallurgical and ceramical processes.
Electric locomotives and motor railcars.
Tramcars, trolley-buses, electric lorries, trucks and tractors for local traffic.
Mining hoists and electric equipments for same.
Cranes, travelling cranes, lifts, hoists.
Precision gears and geared motors.
Electric machine tools.
Electric welding converters, resistance welding machines, welding transformers, automatic welding equipments and electrodes.

the moment is not to sell but to trim its demand for imports. Fortunately, a handsome yield from shipping and other invisible exports (which are no less substantial for being unseen) supplements the sale of tangible exports abroad; and the omens indicate that, with proper restraint at home, Sweden should be able to afford a steadily growing supply of foreign goods.

But who will supply the goods? This is the question that poses itself to the foreign observer, and if the observer is British the answer is a wry one. Traditionally, Britain and Germany are the giants that fight for Sweden's trading favours: Germany with the advantage of the short haul across Denmark or the Baltic, and a well-established influence in technical matters; Britain with a history of three centuries of amicable trading since Queen Christina's advisers signed their pact with the Lord Protector's government. After the last war, when German exports vanished altogether and Sweden could not afford dollars enough to buy freely from the United States, Britain had a heyday of selling. But then competition grew steadily keener as Sweden gradually liberalised its trade to the extent of 93 per cent from OEEC countries and 45 per cent from the dollar area. In the past four years the Germans have been rapidly closing the gap; and in the last twenty months, as conditions of more or less open competition have been restored, they have broken into the lead in several fields.

The accompanying charts show what has happened in four of them. The British reverse has been sharpest in motor vehicles, because until last autumn German competition was held at bay by one-sided Swedish import restrictions. When the Swedes finally lifted these, in the course of their trade negotiations with Germany, sales of British cars suffered an astonishing decline: in the first seven months of this year, for example, registrations of Austin cars fell to a half of what they had been in the same period last year, Morris cars to about 65 per cent, Standards to 39 per cent, Vauxhalls to 32 per cent and Hillmans to 29 per cent. At the same time registrations of Germany's Volkswagens jumped almost fourfold, those of Borgwards more than fourfold, and those of DKWs threefold—though many of these sales represented orders placed while imports were still restricted. British losses might have been greater if Sweden had not been still an expanding market (where there was one car for every twenty Swedes in 1950 there is now one for every ten, and it is expected that there will be one for every six by 1960).

Other commodities have also felt the wind. Sales of machinery suffered a decline last year, but recovered in the first half of 1955. Cotton goods and other textiles, except

for those with a powerful quality appeal, have lost ground steadily—to Holland and Italy as well as Germany—in the last few years. Coal, which accounted for a quarter of British exports to Sweden before the war, represented only one-eighteenth last year, and here the bottom has yet to be plumbed; by a National Coal Board decision (which extends to other European countries as well) all exports will cease at the end of this year, except for held-over deliveries.

There is another side to the medal, and what amounts to a defeat in a number of sectors should not be magnified into a general rout. The total value of British exports last year was in fact slightly higher than in 1953 (though the trend did not last into the first half of 1955); and for many commodities—among them petroleum, chemicals, iron, steel and other metals and electrical and scientific equipment—there is still a healthy and in some cases an expanding market. But what has happened is marked enough to be worth brooding over by British exporters.

What are the causes?

In the case of coal it is simply the inability of British mines to produce what the Swedes would be very happy to buy. In the case of cars, it is clear that British sales last year were unnaturally inflated, and that as soon as the products of the revived German industry were given equal access to the market they were bound to attract the Swedes, who have a well-known taste for the new and untried. But there are also a number of specific complaints—for instance, that British

springing often does not stand up to Sweden's rugged country roads, that British heaters do not provide enough warmth for Swedish winters, and that the finish of British cars does not compare with that of the Germans. The fact that something amounting to an unfair propaganda campaign has been waged against British vehicles in sections of the Swedish press does not altogether remove the sting

* Ratio of export to import prices; a fall is an adverse movement

from these charges. Similarly, the makers of many British textiles have been criticised for their failure to offer novel designs and for their complicated terms of payment dates.

But the comment most often heard in Stockholm is that British exporters do not pay close enough attention to the Swedish market. The British commercial colony in the whole of Sweden numbers little more than a score; the German, at a conservative estimate, is ten times as big. And by all accounts German exporting firms are far more diligent in visiting Sweden than their rivals, and are correspondingly more sensitive to the subtleties of Swedish taste and demand. True, the two countries are next-door neighbours, and in any case the Germans tend to concentrate on fewer markets than most British manufacturers; true, also, that representatives of some British firms are as conspicuous as could be wished. But in general it is fair to say that the agency system (through which most British goods are sold) needs more direct support from the manufacturers, including both visits by senior executives and centrally organised research and advertisement campaigns.

It is difficult to estimate what the effects will be of Britain's decision not to contribute a national pavilion to the recent St Erik's Fair in Stockholm. On the Swedish business men who went to the fair to look for something

specific the effect will probably be negligible, because they could find what they wanted in the appropriate trade section; but to the rank and file of casual visitors, observing the big German and American pavilions, the absence of anything comparable from the United Kingdom can scarcely have been an incentive to buy British. In the future, much will depend on the manufacturers' ability to adjust their product to make it more attractive to the Swedes. But in the end individual firms cannot escape their responsibility to keep closer liaison with the market.

Sweden, though small, is one of Britain's best customers. Last year only seven countries in the whole world (and only Holland on the continent of Europe) bought more British goods, and only Australia bought more cars. At the moment too few business men go there, and too seldom; and in the case of consumer goods it is too often assumed that what will sell in America or the Antipodes will sell in Sweden as well. The Swedes are among the world's newly rich; they are exacting and critical buyers, who will give their custom to the man who offers them novelties and who takes the trouble to satisfy the tastes they have recently become able to indulge. At the moment, in many things, that man appears to be a German; it is up to British traders to demonstrate that they can do as well as their competitors.

Sweden Goes It Alone

SWEDEN's determination to go it alone remains unshaken. Since the Swedish attempt to negotiate a pan-Scandinavian defence pact broke down in 1949, support for the government's policy of freedom from alliances in peace and neutrality in war has increased rather than diminished. The abortive project for a Scandinavian alliance marked a radical departure from traditional Swedish thinking; and when Denmark and Norway joined the North Atlantic Treaty Organisation it was with a feeling akin to relief that the Swedes withdrew into their customary isolation. Only a group of senior military officers, together with a section of the opposition press, continues to urge Swedish membership of Nato.

Swedish neutrality has deep roots. It was in 1814 that Swedish troops disengaged themselves from their last battle, against Norwegian forces; not since the Congress of Vienna has Sweden entered into a foreign alliance. It is not surprising that a policy which has kept Swedes out of trouble so often in the past should look rather like revealed truth to many of them. Over recent years Sweden, which in the 17th century was master of a Baltic empire, has cultivated an admirable humility in its dealings with its neighbours. In 1905, it accepted with good grace the dissolution of the union with Norway. With equal dignity, it bowed in 1921 to the League of Nations ruling by which the Swedish-speaking Åland Islands remained under Finnish sovereignty.

It was in 1940 that Sweden paid its highest price for peace. After the invasion of Denmark and Norway the country was completely isolated from the west, and with Russia and Germany still allied the Swedes felt themselves in acute danger. It was understandable, if inglorious, that they should have yielded to threats and bought their safety at the cost of two major breaches of neutrality. The "transit agreement" with Germany—by which the Swedish railways earned £8 million—lasted from 1940 to 1943 and permitted the transport of so-called "replacements" of troops on leave and war material to the German garrisons in Norway. In 1941, Sweden also allowed the Germans to transport what they claimed was one fully-equipped division to the Finnish front (people who watched it pass say it was the biggest division in the history of logistics).

The memory of these events still clouds Scandinavian relations. Yet there was another side to the picture. With the Swedish authorities' connivance, vital ball-bearings were regularly taken from Lysekil to be carried through the Skagerrak by British torpedo boats. A vocal section of Swedish opinion, led by that stalwart newspaper *Göteborgs Handels-och Sjöfartstidning*, consistently supported the allied cause, and many British and American prisoners of war found Sweden a pleasant resting place on the escape route home. Ultimately, too, Swedish neutrality proved a boon to its neighbours. No fewer than 400,000 refugees

were being housed, fed and clothed by the Swedes in 1945, who also supported international relief funds to the tune of more than £40 per head. Indeed, Swedish neutrality has never been passive. Unlike Switzerland, Sweden is active in the United Nations, and in Hr Hammarskjöld it has contributed a tireless Secretary-General who has, among other things, worked hard to improve relations in the Far East. Swedish mediators and observers have also played a valuable part in Palestine (where Count Folke Bernadotte lost his life), and more recently, though with growing reluctance, in Korea.

Today, all the four main political parties are united in two fundamental aims: freedom from alliances and the maintenance of a muscular defence force. Their solidarity was strikingly demonstrated this spring during one of the liveliest Riksdag foreign affairs debates for years, when Swedish adherence to Nato found only one speaker, a Liberal, to champion it. Only the five Communists in the chamber, together with a small group of about 15 Social Democrats with pacifist leanings, supported a proposal aimed at a reduction in the size of the armed forces. Government and opposition, however, hold widely divergent views on emphasis and method; in more than one debate there have been sharp exchanges on the pattern of defence.

Discussions in press and Parliament lately have centred on a report concerning the organisation, training and equipment of the armed forces in the next ten years, produced last autumn by General Svedlund, the Commander-in-Chief. This is a highly controversial document. It recommends a thorough overhaul of the forces and a gradual process of re-equipment after 1959, and strongly advocates that Sweden should either make its own tactical atomic weapons or buy a supply from abroad.

General Svedlund's plan would involve a relative reduction in the cost of the navy and army, including a 12 per cent cut in the number of infantry battalions, and a corresponding strengthening of the air force—in particular, a fifty per cent increase in the number of fighter-bombers. Current defence expenditure, which runs at 5.3 per cent of the gross national product, is already as high as that of several of the smaller Nato countries, and claims almost as much of the annual budget as the social services. General Svedlund suggests that during the next ten years expenditure should run at the same relative level, on the assumption that an expanding economy will meet rising costs. But the report's most important conclusion is its clear inference that Sweden cannot withstand a determined assault by a major power indefinitely without outside aid.

The pro-Nato press, which includes the largest daily, the Liberal *Dagens Nyheter*, was quick to exploit this admission, and in this year's foreign affairs debate the Conservative and Liberal leaders, Hr Hjalmarsson and Hr Ohlin, urged the government to open consultations with the other Scandinavian countries in order to co-ordinate defence in the event of simultaneous attack. But neither the Prime Minister, Hr Erlander, nor the Foreign Minister, Hr Undén, was to be drawn. Nor would the Minister of Defence, Hr Nilsson,

commit himself for the moment either to ordering the manufacture of nuclear weapons or to buying them from abroad. Indeed, although the Swedes claim they have the technical resources to make their own atomic arms, to do so would call for an initial expenditure of 200 million kronor; and to buy them from Britain or America would perhaps involve a reappraisal of Sweden's whole international position.

But even the present defence effort is a formidable one by any standards. The Swedish army consists of a nucleus of 15,000 regulars, training conscripts who serve 10½ months and are later recalled for three one-month refresher courses. Sweden's conscript force has been described as an army on indefinite leave; it could mobilise 600,000 men and put them in the field within a week. The air force, which ranks with China's as the world's fourth largest, is a remarkably efficient body. It has a front-line strength of 1,200 planes, of which a thousand are Swedish-made jet fighters and fighter-bombers, and the famous "Flying Barrel" fighter was said to be until recently the equal of any fighter in regular service; it is only now being replaced in part by Hawker Hunters from Britain. And the not inconsiderable navy includes three modern 8,000-ton cruisers, 21

destroyers, 21 submarines and 30 motor torpedo boats.

Nor is this all. A report on civil defence, complementary to the Svedlund report, recommends drastic and costly improvements. One of Sweden's paradoxes is that in so peaceable a country civil defence service is already compulsory for certain classes of citizens. The Swedes, who lead the world in the techniques of drilling and blasting, have burrowed deep into their

native granite to build vast shelters that would withstand anything but a direct hit by a hydrogen bomb. Hr Erlander has said that if war came three million Swedes—nearly half the population—would be evacuated from the towns, while an indispensable nucleus, working vital factories and operations centres, would remain in atom-proof security.

Despite the zeal of these preparations, a Western onlooker might want to make two critical observations. In the first place, the Swedes seem to have taken a gamble in concentrating a large part of their strength in the fortress area of Luleå and Boden, in the far north. This is no doubt a calculated risk, and might prove to be justified. But the tank-country of Skåne in the south, or the chain of lakes across the middle of the country, offers a tempting striking place to an aggressor who aims at a quick seizure of the Scandinavian peninsula. In the second place, will the Swedes have time to mobilise their army in the kind of war they might have to fight? In so sprawling a country mobilisation is bound to take several days to complete; and the Swedish plan involves, among other things, a complex scheme for commandeering transport which would be highly vulnerable to an attack using atomic weapons.

The Swedes' reply to this seems to be based on the premise that any future world war will open with a period of strategic nuclear bombing of a few vital objectives (among which Sweden does not number itself) which will give them time to arrange their defences. But it seems equally possible that a Russian *drang nach Westen* might try to

take in the Nordic countries on its right at the same time as it made its main effort in central Europe. It might even be argued that the addition of twelve German divisions to the Nato forces on the Continent will tend to make Scandinavia an even more attractive route than it was when the line of advance through Germany and France was less strongly guarded.

Indeed, for all its defences, Sweden has never been more exposed to the danger of involvement than now. With the shores of the Baltic Russian-controlled from Leningrad nearly to Lübeck, and with Norway and Denmark belonging to Nato, it seems almost inconceivable that luck or diplomacy could keep the Swedes out of a third world conflict. And the Swedes themselves admit that, alone and unaided, they could at best hold out for three months. Why then their persistent rejection of alliances?

★

At bottom, their attitude seems to be based on instinct rather than reason. When a country has twice been lucky in avoiding world wars, it is natural for it to see a kind of magic charm in neutrality, and to assume, even against the logic of the situation, that it is bound to be lucky a third time. The arguments which Swedes put forward, although some of them are persuasive, seem to be basically *post facto* rationalisations of this instinct. For instance, they declare that at the moment Norway and Denmark are Nato "deficit" areas, though when the twelve German divisions come into existence Scandinavia's prospects of getting outside help may be improved. If, ask the Swedes, by joining Nato they now increase their chances of becoming involved in Nato's wars, what can they expect in return? They assert that assistance, largely carrier-borne and amphibious, would be indecisive; and therefore conclude that the risk would outweigh the advantages.

The Swedes have also carefully considered the probable consequences to their Finnish neighbours of a step that would bring Nato forces within easy striking distance of Leningrad. They think Russian counter-measures inevitable; Soviet garrisons in the Kola peninsula and eastern Karelia might be reinforced, and the Russians would perhaps invoke the 1948 Soviet-Finnish treaty, demanding free entry for their forces into Finland. The Swedes and Finns are joined by ancient bonds, and Sweden declares that it is unwilling to do anything that might land old friends in such a predicament.

Janus-like, uncommitted to either bloc, Sweden faces both ways. But while the eyes turned eastwards have a

wary, watchful and faintly placatory expression, the others, though more aloof than some in the West might like them to be, carry the gleam of shared interests and ideals. The West sometimes looks askance at Swedish dalliances with Moscow—at Hr Undén's holiday-making near Moscow, and at his obvious desire to figure as a European Nehru, blandly umpiring between East and West. Yet Hr Undén represents an attitude that is yearly growing less influential. The Swedes are realists. Memories of the two unarmed Swedish aircraft shot down over the Baltic in 1952, and of the three Communist spy-rings uncovered since 1945, are not effaced by Marshal Bulganin's present gestures of good-heartedness.

They argue that their policy has helped to lessen tension round the Baltic. Since the war, important advances have been made in Scandinavian co-operation. Recommendations by the inter-Parliamentary Nordic Council have led to a common labour market in Scandinavia (including Finland), and the abolition of passport formalities. Progress has been made towards establishing a common market for certain commodities; and the Scandinavian Airlines System is a successful example of practical teamwork. The most interesting example of co-operation is the Trondheim project, by which a road and perhaps eventually an oil pipeline will link central Sweden to the Norwegian port, and the Swedes will have their own oil storage installations in Trondheim fiord. Although the Stockholm authorities have tried to claim that it is of only economic importance, the plan obviously leaves the Swedes with the embarrassing problem of protecting their link with Norway in the event of a war in which Norway is involved.

No exaggerated importance should, however, be attached to the Trondheim project. Sweden is unlikely in any foreseeable future to seek membership of Nato. The country's defences are strong; it is pledged to last-ditch resistance against an aggressor. Yet Sweden's Achilles heel remains the absence of liaison with its real friends, of logistic and technical preparation for that outside aid upon which the country ultimately counts. The opposition's plea for Scandinavian consultation on defence offers a faint hope of a remedy. It is possible that their voices will be heard in the government after next year's elections; if inter-Scandinavian consultations followed, might these not in time lead to a Scandinavian alliance? Although neutrality is now high fashion, the Swedes may ponder on the fact that Yugoslavia's adherence to the Balkan Pact, linking it with Greece and Turkey which are members of Nato, led not to Russian reprisals, but to solid economic and political concessions and the arrival of Messrs Khrushchev and Bulganin, caps in hand and beaming, in Belgrade.

"Stoking up to warm the crows" is a colloquialism commonly used in Sweden to denote inefficient heating. But inefficient heating is not merely a matter of the heating plant. The heat-retaining qualities of the building itself are also involved—in other words, how the structure is insulated.

Faced with a cold climate and having to pay extra-high prices for fuel, Swedes early discovered the importance of insulating buildings to keep heating costs down.

Hence the phenomenal growth in the use of wood-fibre building board in that country.

For even in a land of timber, fibre board is the least expensive of heat-retaining structural materials.

Now that Karlit board is freely available, why not look into *your* heating costs and see what remarkable savings can be effected? In many cases as much as three-quarters of the fuel bill has been found to be going to "warm the crows."

Karlit consultants will be glad to help you overcome your insulation problems—and advise you, too, on the hundreds of other uses for Karlit boards.

Manufactured in Europe's largest production unit, Karlit comes in a variety of forms suitable for endless applications—from kitchen cabinets to caravans, for flush doors and table tops, for floor underlays, for ceilings and interior wall coverings in all kinds of buildings, and for sound control.

In addition to its thermal insulation uses.

AUTUMN BOOKS 1955

Policy and the Economists

IN the economic interpretation of history one of the most tempting things to interpret economically is economics itself. One can indeed treat with something less than perfect seriousness the Marxist view that non-Marxist economists have one and all been lackeys or running dogs (whatever breed of dog that may be) of the capitalist class, concerned exclusively with making its malevolence respectable; one may still regard economic theory as the outcome of the practical preoccupations of the time, reflecting rather than forming current judgments both on the relative urgency of different questions and on the values underlying them. On such a reckoning even those economists who have most unmistakably altered the currents of thought, even the prophets, even the rebels—Karl Marx no less than Adam Smith, and Keynes no less than Walras—were what they were by reason of the age in which they lived and the problems with which the state of productive relationships confronted that age. They saw more deeply into the implications of those problems than did lesser contemporaries; they established new inter-connections and uniformities; but the starting points and essential nature of their thought were given by historical necessity.

To anyone not befogged by partisanship the black-and-white contrast between this view and the heroic or Great Man interpretation of history (intellectual or other) shades into a more complex reciprocity. If the economist, or any other type of thinker, is the product of his time, that "time," the environment which directs and shapes his thought, is itself shaped by the thought of his contemporaries and predecessors, and he himself contributes, more or less powerfully, to shape a "time" congenial or uncongenial to different types of thought or special preoccupations. The fact that A has seen a little further through a brick wall than anyone had previously managed to do is as much a part of B's and C's environment as the existence (or architectural style) of brick walls themselves; the devising of a new tool of thought—marginal analysis, the multiplier, or for that matter the labour theory of value—is as much an event in itself as the harnessing of a new source of power.

For one thinker—an Adam Smith, a Marx, a Keynes—who will shape their time and times to come, there will always be hundreds whose role appears purely passive, even

though, as critics, elaborators, interpreters or teachers, they play an essential part in the progress of their science. There is, however, one role in which the least original practitioner may be said to shape his environment and in which the environment binds the most creative intellect; the role, increasingly important today, of official adviser to government departments or to international bodies. The economist serving in such a capacity exerts a direct effect on policy decisions and on the events stemming from these; but the topics with which he concerns himself and the limits within which he works are laid down for him and arise from the preoccupations of practical administrators and politicians. He is paradoxically far better placed to influence policy in the short term, while less well placed to influence it in the long run, than his academic counterpart. His position demands a good deal of soul-searching. Some of his work—that of the economic statistician providing "the essential orders of magnitude of the things at issue" and "the working parameters of the system"—is straightforward and, from the point of view of value judgments, neutral. But the situation is changed when he must advise on the priority of economic objectives and the conflict of economic aims, or assess "the secondary effects as well as the primary and intended effects" of a given economic measure, or decide whether to take, as immutable data, "his value judgments from the political parties and pressure groups around him" or to state the case for his own aims.

The quotations are taken from Professor E. A. G. Robinson's foreword to a newly published book on "The Role of the Economist as Official Adviser."* This is primarily a study in methodology. After the manner of most of such studies, it is very dry and, in places, rather obvious. Yet there is practical value in the formal setting-out of the elements of a policy problem in which situation, aim or means may in different circumstances provide the best starting-point for thought; in the discussion of assumptions realistic or unrealistic, long-run or short-run, of the harmony or opposition of aims, and of the influence of the time-factor on inquiry. There is, too, a wisdom beyond formality in the authors' treatment of the delicate balance;

varying in different settings, to be struck between a passive acceptance of external value judgments and a considered presentation of one's own. They bring into the open, systematise and evaluate concepts and judgments which, however hazily, must form part of the mental background of every economist engaged in public service.

What they have to say is not, however, only of interest to this specialist public. It concerns the whole role of the economist in society. For while the problems which they consider affect most closely the official adviser, they cannot be dismissed by others—the academic, the populariser, the economic journalist or the consultant on the payroll of private business. Every science has on the one hand the aspect of intellectual adventure and aesthetic delight, on the other that of practical usefulness to men seeking mastery of their environment. In economics it is surely the second aspect which should predominate. It would be short-sighted indeed to condemn pure science because its fruits are not yielded this year or next. The error lies in acquiescing in a huge gap between the intricate and refined speculations of pure science and the day-to-day practical applications of scientific method. Economic concepts should be operational; economic analysis, the tool-kit of thought, should be fitted to the nature of its material.

Moralist and Novelist

D. H. LAWRENCE: *Novelist*.

By F. R. LEAVIS.

Chatto and Windus. 318 pages. 21s.

THE personality of Lawrence has been variously described. It seems certain that as a social being he was thoroughly unstable and constantly subject to sudden revolutions of feeling. He could be wholly lovable and charming; he could be infuriating and impossible. The dichotomy reflects itself in his writing, and in this there is perhaps one explanation of the hostility which his books have frequently aroused even in critics prepared to acknowledge the fact of his genius.

Lawrence is not in the least a merely intuitive or lyrical or rhapsodical writer; on the contrary, as Dr Leavis insists, he possessed high intelligence. But in art, as in living, he was not always aware of the point at which he ceased to give pleasure. The reader, for long enthralled by an imaginative vision of almost the first greatness, finds himself suddenly repelled by a voice turned hectoring and strident in the interest of some obscure evangelistic purpose. Moreover, what he is asked to agree to seems not disinterested; it is sensed as related with embarrassing intimacy to the private predicaments, the deprivations, and even the spleen of the writer. Well-bred and reticent persons are apt to hate Lawrence. It is so much the worse for them. But there it is. And they are the sort of persons, Dr Leavis would tell us, who had too much say in the making

The offer of razors for cutting grindstones and atomic balances for weighing road-metal is not merely wasteful but useless. Stressing this truth, the authors address themselves in effect to economists of all types.

Nothing but good can come of the mutual traffic between the levels of policy and pure analysis. That the economist should shape events by personally building himself up into a grey eminence is certainly undesirable. Yet he has a duty to shape them by exerting a constant pressure towards that rationality and consistency which so easily get lost in the activities of pressure groups and the department-mindedness of administrators; and that duty demands that he be more than a mere calculating machine churning out "neutral" answers relating to specific proposals. That events should shape the course of economic thought by restricting its scope to currently urgent problems would be lamentable; but if a concern with the eventual applicability of concepts and models prevents economic theory from evaporating into pure (or only slightly impure) mathematics and logic, there is undoubtedly gain rather than loss. No small part of that gain consists in the understanding, and the acceptance as underlying data, of those human characteristics with which politicians rather than economists are traditionally concerned.

and breaking of literary reputations during Lawrence's lifetime and immediately after.

Dr Leavis's main emphasis is upon Lawrence as the inheritor of a strong cultural and moral tradition. The novelist was, indeed, a miner's son, and he sometimes wrote about the wives of baronets without ever picking up the fact that they are not to be referred to as Lady Henry or Lady Arthur. Nevertheless, he is in the direct line of George Eliot, and, at the very least, a major social historian. His supposed snobbery is something chiefly discoverable by snobs, and when his ignorance is disavowed upon it is apt to be by expatriate Americans who would not know a Congregationalist from a Methodist. Dr Leavis has never been wanting in polemical inclination and power, and this aspect of his book is uncompromising and invigorating. But even better is his positive appraisal of the greatness of Lawrence's art. It is possible that in places he presses his case too hard. "The Captain's Doll," for instance, a brilliant improvisation upon the (for Lawrence) perennially fascinating theme of Lawrence *versus* Frieda, does not, as an achieved thing, seem quite to bear the weight here reposed upon it. Nor will many agree that "St Mawr" presents "a creative and technical originality more remarkable than that of *The Waste Land*." Nevertheless, Dr Leavis's is in the highest sense genial criticism, and his study is a worthy successor to "The Great Tradition."

In Honour of Trevelyan

STUDIES IN SOCIAL HISTORY: A Tribute to G. M. Trevelyan.

Edited by J. H. Plumb.

Longman. 302 pages. 21s.

IN planning this tribute to a great and versatile historian on his eightieth birthday Mr Plumb was wise to avoid the bulky *Festschrift* and to restrict it to eight essays on the single theme of English social history in the last four centuries. By this restriction Mr Plumb has not only been able to produce a very readable tribute to a very readable historian but also an effective manifesto. "Social History," Mr Plumb writes in his introduction, "is now a field of studies of incomparable richness and the one in which the greatest discoveries will be made in this generation. Its purpose has long ceased to be merely evocative." This purpose is to give greater depth and precision to our understanding of the past; and these eight essays are of value not only in themselves but also as illuminating the themes and techniques of social historians.

Almost all the contributors concern themselves with the ruling classes rather than with the ruled. There is a repeated emphasis on the importance of the family and family connections, "most important to the social historian," Mr Annan remarks, "when they reveal some caucus of power or influence." Tastes, sentiments, and beliefs provide another theme, though a difficult one; but, as Mr Kitson Clark remarks, "It is very bad history to ignore them." And there is a strongly marked interest in buildings, from Mr Hoskins's examination of the houses of sixteenth century Leicester, through the great houses of the late seventeenth and early eighteenth century to the "comfortable ugly houses in Kensington, Bayswater and North Oxford" which were the homes of the intellectual aristocracy examined by Mr Annan.

Three writers have taken a big general theme. Professor Notestein devotes an essay to "The English Woman, 1580-1650," examining the handicaps then imposed upon the sex and the ameliorating influences of the business world, London society and Puritanism. Miss Wedgwood, more content with the evocative than her editor, draws on the stage comedies of the reign of Charles I, partly as a source of social comment but chiefly, as she puts it, for "the incidental intelligence that they give us of the things of everyday life." In an ambitious and thoughtful essay on "The Romantic Element—1830 to 1850" Mr Kitson Clark describes and analyses the heavily charged emotional atmosphere of these twenty years.

The other five contributors employ the technique of the case-history. Mr Rowse has a sensitive study of a Cornish Catholic who survived imprisonment and the rack under Elizabeth to devote himself to compiling the lives of the

Cornish saints, an antiquarian work exhibiting an uneasy mixture of criticism and credulity. Mr Hoskins gives us a fascinating sociological study of sixteenth century Leicester, showing great skill in combining different types of evidence to show social changes in a predominantly non-industrial town. Both Professor Habakkuk and Mr Plumb, whose essays are of outstanding interest, deal with the establishment of a great family in the seventeenth and eighteenth centuries, and both emphasise the rewards of high office. Professor Habakkuk's subject is the building of Burley by Daniel Finch, second Earl of Nottingham, twice Secretary of State under William III and Anne. He traces with great care the progress and costs of this great operation, and relates it to Nottingham's changing fortunes, to the needs of providing for his family and to the motives which lay behind the building of the great houses.

Mr Plumb, for his part, has written a sparkling sketch of the more dramatic fortunes of the Walpoles: Colonel Walpole, the prudent, bookish, improving Norfolk landlord, and his son, Sir Robert, whose immense expenditure so blatantly advertised the profits of politics. From the accounts and bills which Coxe discarded when he wrote his life of Walpole, Mr Plumb has been able to reconstruct the extravagance and taste of Sir Robert. In 1733 his household consumed over eleven hundred dozen bottles of wine. Other expenses were on the same scale. Sir Robert pulled down his father's house at Houghton; and of the new creation Mr Plumb writes that "architecture, furniture, landscape, harmonise like notes in music," for Walpole employed Kent and Rysbrack, and hung the walls with masterpieces from France and Italy. Mr Plumb suggests that the width of the gap between such wealth and the pinched economy of the country squires is the key to some of the political bitter-nesses of the period.

In the last essay Mr Annan takes not one case history but many, using massed genealogies to trace the development and to exhibit the solidarity of the intellectual aristocracy of the nineteenth and twentieth centuries. This was the class whose Bill of Rights, as Mr Annan puts it, was the Trevelyan-Northcote report on the reform of the civil service and whose Glorious Revolution came in 1870-71 when restrictions on entry to the public service and the universities were abolished. Anyone interested in the ramifications of the great academic families of Oxford and Cambridge is sure to find Mr Annan's material fascinating. But his conclusions are sensible and necessarily tame: "families who rise from similar milieux and whose children receive the same upbringing and education will naturally intermarry. . . . their numbers are spread very thin over the crust of English intellectual life."

NELSON

The History of History

MAN ON HIS PAST.
By Herbert Butterfield.
Cambridge University Press. 253 pages.
22s. 6d.

THE Master of Peterhouse is a writer of romantic, not classic mould. He provides no ordered march through his theme, but a series of intellectual reconnaissances, which lead to some loss of direction, some tramping in swamp and fog, some repetitiveness and slack writing, but frequent rewarding *aperçus* over distant landscapes. These lectures on the history of history-writing were first delivered for the Wiles Trust at the Queen's University of Belfast. They begin with the rise of the German historical school at Göttingen in the generation before Niebuhr; continue with Acton's views on historiographical progress; jump back inconsequentially to Ranke, a lecture ending with two fine sections, unconnected with Ranke, on the notion of "the Renaissance" and the idea of Providence; and conclude with two illustrative lectures on the historiography of the origins of the Seven Years War and of the Massacre of St Bartholomew. There is little method here, but great richness of historical thinking. The book's unity is provided as much by Acton as by its explicit theme, for it is loaded with extracts from the Acton MSS in the Cambridge University Library, and at once takes an important place in the swelling bibliography of Actonian literature.

But it is Ranke, not Acton, with whom Professor Butterfield is most in sympathy. Ranke was the supreme exponent of "general history," which meant in practice a concern with the whole development of the European state-system, and rested in theory (so Mr Butterfield seems to argue) on the belief that an event cannot be explained without reference to the range of its remoter historical causes. The passages in the book that may be most interesting to the ordinary reader are perhaps those discussing the different ways of dividing general history into "periods," and Ranke's doctrine of "the primacy of foreign policy," which sees wars and inter-state relations rather than economic developments as the ribs of history's framework.

There are traces of an unresolved contradiction in Professor Butterfield's thought. He still suggests the possibility of a technical history, free from interpretation, whose results can be agreed by men of every belief; but he describes how far Ranke was from a colourless objectivity, and how a historical period acquires its shape and coherence in the historian's imagination. He does not admit that language is an instrument incapable of being used to discuss human affairs without cadences of interpretation and judgment. Though he quotes Renan's dictum that "impartiality is the delicate product of certain auspicious conditions, unlikely to flourish in a later

age," he does not ask why these conditions were given by the liberal phase of civilisation which is now passing. He goes deepest when he describes how Ranke "boldly confronted the paradoxes" of historiography; combining minute scientific research with the ambition of writing universal history, believing that historical science has developed, but that none is a greater historian than Thucydides, recognising that the average level of morality seems to have risen throughout history while later ages do not excel earlier ones in examples of moral heroism and spiritual depth. Many historians could have taken us on this cross-country march; very few can offer these glimpses of the tensions and harmonies "far more deeply interfused."

The Charm of Sherry

SHERRY.

By Rupert Croft-Cooke.
Putnam. 232 pages. 21s.

AS a few unhappy patterns for books on wine appear to have become established, it seems desirable first to say what this book is not. The reader will not be bored by anecdotes about so-and-so, "that prince of good fellows"; again, he will not be nauseated by references to "gay, virginal, peasant wines"; nor will he find himself faced with a dismal dictionary of names and technical terms. Some writers on wine have enthusiasm, some have knowledge, and some can write. Mr Croft-Cooke has all three qualifications and he knows how to avoid the pitfalls that have beset the feet of other writers in this field.

Mr Croft-Cooke has spent a lot of time in Spain examining the growing of the vines and the treatment of the wine. His descriptions of the vineyards and of the bodegas are complete and extremely interesting. He has interrogated a large number of the leading merchants in Spain and has set out the result of his researches in an easily intelligible manner. He starts by presenting the history of the wine, and after dealing with the details of its production and blending, provides an interesting section on the histories of the principal companies engaged in the sherry trade. He finally takes a brief look at South African and Australian sherries and makes some shrewd observations about these two competitors of Spanish sherry.

For most readers, the sections of the book that describe the treatment of the wine—from the crushing of the grapes, through the blending, racking, and fortifying of the wine, till the complexities of the solera system are explained—will prove to be the most informative. But it does not matter whether Mr Croft-Cooke is writing about corks or barrels or the mysteries of *flor*, he is always a pleasure to read. In addition, the descriptions of the countryside around Jerez, and of the people who live there, give a vivid picture of that unique corner of southwestern Spain.

"Pray for Time and Play for Time"

THE TRAIL OF THE DINOSAUR.
By Arthur Koestler.
Collins. 253 pages. 15s.

THIS volume is Mr Koestler's farewell, so his preface informs the reader, to political polemics. He has said all that he can say on the totalitarian threat of the mid-twentieth century, on the blindness of its half-conscious accomplices in the west, on the necessary strategy and tactics of a resistance debarred from using its adversary's weapons. The citadel is still besieged, but "Cassandra is hoarse, and is due for a change of vocation."

Roughly half the essays in "The Trail of the Dinosaur" are Cassandra's. They are for the most part addressed to the Left; they are the warnings of an ex-addict against a lethal drug, and Mr Koestler wrestles with its potential victims, using sympathy, "brotherly harshness," patient analysis and, on occasion, vitriolic scorn, as a doctor pitted against a literal narcotic uses on his patient every device from black coffee or strychnine to a slap in the face. For those readers who have never stood in danger of addiction a sense of repetitive boredom is only averted—but averted, one must add, by a wide margin—by sympathy with the human drama of the ex-addict's psychological plight and by the pleasure derived from seeing a job superlatively well done; a pleasure much enhanced, as one mentally places "The Seven Deadly Fallacies," or "The Candles of Truth," or "The Little Flirts of St Germain," in the hands

of selected readers, by the unworthy but potent gratifications of malice.

If Cassandra speaks in these essays and half a dozen more, it is hard to find a similar sobriquet for the Mr Koestler who wrote the less topical, more widely-ranging remainder. There is a splendidly courageous and honest-minded assessment of the Jewish dilemma, of whose practical realism it is not for a Gentile to judge. There are a couple of lively literary essays on "The Boredom of Fantasy" (science fiction) and "The Future of the Novel." There is an "Anatomy of Snobbery" (recently published in *Encounter*), shrewd, illuminating, and tolerant, in some ways the best thing in the book. There is a tribute to George Orwell. There is the title essay, also from *Encounter*, with its guess at "the spontaneous emergence of a new type of faith" pending whose development "we can at best hope for a reprieve; pray for time and play for time" until, by another such turn of the historical kaleidoscope as has often happened in the past, the threatening irreconcilabilities of today become unimportant.

Here, perhaps, is a foretaste of the new vocation towards which Cassandra is turning. With his particular obsession worked out and seen in long perspective Mr Koestler may find his place as a different sort of prophet; a philosopher or, more accurately, a *philosophe*. It is impossible to imagine him permanently renouncing, even where his ostensible subject is snobbery or the novel, the role of political critic.

Love and Friendship

THE FLOWERS OF THE FOREST.
By David Garnett.
Chatto and Windus. 251 pages. 21s.

"THE GOLDEN ECHO," the first volume of Mr Garnett's autobiography, was a memorable book. The second volume is even better. The charm of the first was his development to manhood in a number of strange and diverse situations; the second has more unity of theme. In it Mr Garnett starts as a student at the beginning of the first war; he makes the friendships of his life in the Bloomsbury circle; and the book ends in 1922, when he is happily married, his first son has just been born, and "Lady into Fox" has made him a successful author.

The two chief notes of the book are love for women and friendship in Bloomsbury. The author is a happy man: all his life he has loved and been loved, and has had for friends men and women far out of the ordinary who regarded friendship as really important. Bloomsbury, as a coherent group, no longer exists, but it is too recent and challenging a memory for impassive judgment. On the whole, the reaction is against it at present: it is thought fusty, or arrogant, or narrow and cer-

tainly it was very different from any group that could spring out of the humus of the fifties. But it would be hard to hold this desiccated view after reading Mr Garnett's book, which gives a wonderful account of a brilliant and happy set of talented people, linked by affection.

Mr Garnett's experiences during the war, which occupy much of the book, are in a way secondary to the note of friendship in Bloomsbury: he spent much of the war with his friends, and became a conscientious objector with them, on grounds which he now recognises to have been political rather than moral. Looking back, with the experience of the second war in mind, the issues of the first war seem to have been more doubtful to independent minds, and the toleration of dissent much greater. But even so, the strain of dissenting, not backed by religious certainty, was enormous; and by the end of the war Mr Garnett's emotions and character had suffered a most depressing attrition.

This delightful book is written with all the charm of style that one would expect, and with a constant glow of feeling that warms the reader. It lacks nothing, except an index.

Autumn Books

Voyage to the
Amorous Islands

Newton A. Rowe

An account of the discovery of Tahiti by Captain Wallis, in 1767, and of the islands' history and legend. Illustrated with contemporary engravings. *November 18.* 21/-

ANDRE DEUTSCH

Painter in Prose

THE HUMAN AGE: Books 2 and 3.
By Wyndham Lewis.
Methuen. 566 pages. 30s.

MR WYNDHAM LEWIS is not primarily a novelist; but he has occasionally tipped into prose fiction of one sort or another the overflow of those strong antipathies and hostilities that have floated him through a long polemical career as a social and aesthetic philosopher. "Tarr," his first novel, holds a significant place in literary history; when it appeared in 1918 it had the function of asserting with a harsh power that much in contemporary fiction must go; the impression, Mr Ezra Pound has adequately said, was of "a highly-energised mind performing a huge act of scavenging; cleaning up a great lot of rubbish, cultural, Bohemian, romantic-Tennysonian, arty, 'societish, gutterish.'"

In this image there is something to put us in mind of the greatest of the English satirists; and in "The Childermass," the first part of an immense eschatological fantasy, Mr Lewis may be said to have begun his own "Gulliver's Travels" not in Lilliput but in Glubb-dubdrib. The book would have won wider recognition had not its author, turning from Swift to Pope, almost at once produced in "The Apes of God" a modern prose "Dunciad" which left many of his most articulate contemporaries with very little personal inclination to celebrate his talents. Nearly thirty years later, Mr Lewis has advanced his grand design by adding to "The Childermass" the present volume. It consists of two books, "Monstre Gai" and "Malign Fiesta." The interval has seen the maturing of his powers, but one cannot help reflecting that it must have been uncomfortable for his hero Pullman (a satirist, it appears, while on earth) and for Pullman's ex-fag, Satterthwaite, who have been cowering out the years on the banks of their creator's private Acheron. At last they are across the river—to find the Dantesque amenities which have been so long awaiting them now enriched with some choice additions borrowed from Belsen and Mau Mau.

Neither Pullman nor Satterthwaite is at all agreeable, and perhaps we are a bit soft (and Mr Lewis abhors softness) if we feel them rather hardly done by. At least we cannot deny the power of the spectacle afforded us. To follow Mr Lewis through his city of Metapolis or his Punishment Centre of Dis is like entering the Strozzi chapel in Santa Maria Novella—or is akin to that experience as it must have been when Orcagna's tremendous Inferno, not yet faded, was as sharp and pristine as Mr Lewis's prose. The entire emphasis of the writing, indeed, is pictorial; and the meaning of the whole inheres, at present to a baffling degree, in the succession of images called up. It may be that with the final part of the work, "The Trial of Man," what is conceptual in

One of Michael Ayrton's illustrations for "The Human Age."

the organisation of all this plastic richness will more clearly emerge. At present we are chiefly reminded that this most versatile of contemporary artists is a painter before everything else—the creator of "Surrender of Barcelona" and "Inca and the Birds."

People's Laureate

RUDYARD KIPLING: *His Life and Work*.
By Charles Carrington.
Macmillan. 548 pages. 25s.

"DIABOLICALLY great" was the verdict that Henry James gave on Kipling's talent, and the two words could hardly confirm more succinctly Mr Carrington's remark that "Kipling's power lies in his ability to evoke love or hate, or love and hate together, in almost every reader." James's tribute was, not surprisingly, qualified by an expression of disgust at the way Kipling seemed to be, at that time, descending to ever simpler subjects, from people to animals and even machines. But it is notable that tribute was paid at all by the master of circumlocution to the master of brevity. Kipling's immortality is surely based on his unsurpassed economy in the use of words. One wonders how far this particular talent reflects his gruelling first experiences of adult responsibility, as sole assistant to the editor of the *Civil and Military Gazette* at the age of sixteen. Certainly the sub-editor's blue pencil remained in his hand throughout his life. "Let it lie by to drain as long as possible," was how he liked to treat his writing. "I have had tales by me for three or five

years which shorten themselves almost yearly." The ease with which he could express the thoughts of most of his fellow countrymen in swinging words which they found hard to forget was founded on this ruthless, but never austere, passion for terseness.

There have been almost as many books written about Kipling as he himself wrote, but there is every reason to welcome Mr Carrington's. Having access to all the extant Kipling papers and the full co-operation of the author's surviving daughter—who appends a delightful brief memoir to this book—Mr Carrington might have provided a surfeit for the reader. He has preferred to stand between his subject and the reader as little as possible; his pages are peppered and salted with quotations, and his handling of a mass of anecdote is crisp and lively enough to satisfy Kipling's own standards.

All of a long life is here. The childish agonies endured at the hands of a callous temporary foster-mother; the wealth of affection in the Kipling family itself; the twelve-year-old at school, already spectacled, moustached and critical of humbug; the young poet who, at nineteen, already knew how to boost sales of his first volume by quoting a hostile review; the fascination he found not only in India but in all things that caught his recording eye, lamas, locomotives, or elderly ladies; the transformation he could work on any material—newspaper reports and casual meetings, along with his own most intimate experiences, provided themes and details for the flood of stories, poems and novels; the years of triumph, the rejected OM, the "Recessional" saved from the wastepaper basket by Miss Norton, an American friend; the eager return to journalism on the Bloemfontein *Friend*; the long war with American copyright pirates; the long and happy marriage to a devoted American woman, who upheld him through years of painful and, in part, unnecessary illness; the variousness of his friends, from Mark Twain and Hardy to Baldwin ("Stanley is a socialist at heart") and King George V—who borrowed from him parcels of books (by Edgar Wallace).

Mr Carrington attempts no pontifical verdict. But the man who emerges from these pages is real and whole, neither saint nor ranting imperialist, but a humorous stoic, an inquisitive reporter with an uncanny eye, a realist perennially intrigued by the unseen, and a writer driven on, often at breakneck speed, by the power of his own pen. Sometimes the pen ran away with him. As Francis Adams put it, "The drop in Mr Kipling is always from the stars straight into the puddles." Mr Carrington rightly emphasised Kipling's remarkable tolerance of, sometimes his delight in, his critics' most barbed attacks. He would have liked, he said, to have written the famous lines "when the rudyards cease from kipling, and the haggards ride no more"; and indeed, in invention and felicity they were not unworthy of "the people's laureate."

African Flute

ISLE OF CLOVES.
By F. D. Ommanney.
Longmans. 243 pages. 18s.

NOT merely is this the best book yet written about Zanzibar, it is one of the few good books about any part of East Africa, worthy of a place beside Burton's volumes of African travel, Baroness Blixen's "Out of Africa," and that forgotten but even now not entirely out-dated masterpiece, Sir Charles Eliot's "The East African Protectorate." Dr Ommanney was sent to Zanzibar to improve local methods of fishing, but his interest in the place did not stop short with its fisheries. He writes of Zanzibar's long history, of the ancient Empire of Zinj, the coming of the European, and Britain's altruistic struggle for the suppression of the slave trade. Here he gives rather unexpected prominence to Sir Lloyd Matthews, and he does not make quite enough of the part played in Zanzibar history by the Universities' Mission. It is surprising, too, that his list of authorities should not include the books by Mr R. H. Crofton dealing with the British Consulate. It is also a pity that this first-class book should be marred by two obvious omissions: there is no adequate map of Zanzibar island; and, worse still, there is no index.

Coming down to modern times, Dr Ommanney describes the face of Zanzibar today and discusses its political and economic problems. He sees the Arabs as the heirs of its future; "nowadays it is among the Arabs that the new voices are raised and it is they who will shape the future of their ancient home in the years to come," a sentence which will encourage those who, during the inter-war period, sadly watched control passing from the Arab landowner to the Indian moneylender and merchant. It is even more encouraging to read that in this small corner of Africa the colour problem remains unknown.

But the essential truth of this book does not concern economics or history. "When the flute plays in Zanzibar all Africa as far as the Lakes dances"—so runs the Arab proverb. Dr Ommanney has heard that magic flute, and those who look back to Zanzibar with bittersweet longing will recognise in his writing the notes of that half-forgotten music. Here are the familiar sights and sounds and smells, the elink-clink of the coffee-seller's cups, "the curious, rhythmic chanting" of the men hauling the homali carts, the great carved doors studded with brass knobs traditionally but improbably designed as a defence against elephants, the sweet smell of cloves, the sickening smell of durian. Above all, here are the people, "fierce-looking Arabs, ebony Somalis, Africans, Indians, and women of many races, gaily coloured as flowers, making a constantly moving pattern that one could watch until the stars came out low over the earth and lightning flared over Africa." No one who knows Zanzibar could fail to recognise characters such as the cantankerous old lady with her

cow or Mvita, the gardener, whose *panga* was fatal to weed and flower alike. They are all old friends, infuriating at times, as doubtless they, too, found the white *Wazungu* infuriating, but always and forever, "something of yours and part of you." In all this profoundly truthful book no remark is more profoundly true than the simple sentence, "Mostly the love of Africa is the love for her black people."

The Talk of the Town

TEN FASCINATING WOMEN.
By Elizabeth Jenkins.
Odhams. 208 pages. 15s.

IT is intriguing to search for alternative adjectives to fit the specific fascinations of these women, all of whom enslaved men and most of whom repelled or antagonised women. In order of their appearance the appellations might be amazing (Martha Ray), formidable (Elizabeth Tudor), sensational (Sarah Churchill), wistful (Fair Rosamund), romantic (Elizabeth Inchbald), ruthless (Becky Wells), outrageous (Harriette Wilson), irresistible (Lady Blessington), terrifying (the Duchess of Lauderdale), and mysterious (Mary Fitton). All of them aroused a furore of gossip and speculation in their day and generation, but perhaps the greatest charm of this book is that it avoids sensationalism. Miss Jenkins presents her chosen characters meticulously through the medium of authentic letters, substantiated conversations, contemporary press reports, eulogistic poems or damaging lampoons—any documented evidence that reflects the opinion and sentiment of their contemporaries on the most talked about women of their time. From this evidence she recreates human beings three-dimensionally in their circumstances, and judges them from the standpoint of their difficulties, so that her book is no ephemeral titillation of the taste for scandal, but a human document to be read with pleasure.

Miss Jenkins sees beyond the triumphs and disasters and the often unenviable qualities of her characters and with generous insight underlines some detail that persists in the memory after more exciting episodes have become blurred: the fact that Elizabeth Tudor always wrote "Edward" when trying out a new quill; the pathos of Sarah Churchill's shorn hair; the poignant meeting of Becky Wells and her daughter on the Yorkshire wolds; or the revealing admission of Lady Blessington that "there are so few before whom one would condescend to appear otherwise than happy."

Interwoven with the biographies of these irresistible women are brief sketches of the men whose lives they involved. They are managed with such skill and economy that they never steal the main theme of the book, but provide a political and social background to the machinations of the rogue females.

Joan Evans

THE ENDLESS WEB

Dr. Evans has celebrated the 150th anniversary of the foundation of John Dickinson & Co. Ltd., by writing its history: her rich material will interest the general reader as well as students of papermaking. With 47 pages of photographs 32s. 6d.

JONATHAN CAPE

WINGATE OF THE SUDAN

Ronald Wingate

This is the first biography of one of the outstanding figures of our Imperial history. Wingate investigated personally the true facts of Gordon at Khartoum and the story is here told from an entirely new angle. Throughout the book runs the theme of three great men, Cromer, Kitchener and Wingate, through whom modern Egypt and the modern Sudan took their place as independent countries.

With Illustrations 21s. net.

FORGOTTEN KINGDOM

Peter Goullart

This is not strictly a travel book. It is the rare account of a realised affinity, an idyll whose charm is its realistic gusto. The author, an exiled Russian, went to Yunnan on business but was soon as enamoured of the delicious tempo of the high-spirited inhabitants of the ancient Naxi kingdom as he was enchanted by the fantastic mountain scenery.

With Illustrations 18s. net.

'ALICELLA'

A memoir of Alice King Stewart and Ella Christie 1861-1949.

Averil Stewart

This record of two daughters of a cultured Scottish Victorian family, includes, amongst much else of interest and entertainment, a remarkable account of travel in Central Asia, Tibet, the Far East and Africa undertaken by Ella after the age of forty. The two sisters corresponded with an admirably frank individuality.

With Illustrations 21s. net.

JOHN MURRAY

Behind the Battle Scenes

THE CAPEL LETTERS, 1814-1817.

Edited by the Marquess of Anglesey. Cape. 248 pages. 18s.

NO story of Waterloo is complete without the cavalry exploits of Lord Uxbridge, and the courage with which he bore the loss of his leg: no one who crosses the Menai Straits is unaware of the column that commemorates him as the first Marquess of Anglesey. He, rather than their unsatisfactory father, the Hon John Capel (though they were a united and affectionate family) was the chief hero of his sister's company of thirteen children; and it is from her and their letters, recently discovered in the Muniment Room at Plas Newydd, that the present Marquess has edited what Sir Arthur Bryant in an introduction rightly calls "this fascinating correspondence."

At the time when the burden of the father's debts and the growing expenses of living finally drove the Capel family abroad, on the news of Napoleon's first abdication, the mother (Lady Caroline) was forty-one and expecting her thirteenth child: of her elder children, Harriet (21), Georgiana (19), and Maria (17) were old enough to write home (and how well they wrote) to their "dear Grand Mama," old Lady Uxbridge. The party was made up by Horatia, Jane, Mary, Amelia, and Adolphus; Arthur remained at Eton, and Algernon soon returned to school in England. There was also a crowd of servants. "Ah! voici les belles anglaises" greeted their appearance in the Brussels streets; and they faced

the hardships of travel and horrors of war with equal courage and cheerfulness.

The story opens at the Ship Inn at Dover, in June, 1814, where every one is coming and going—Alexander ("horridly pink and pudding-like," "dear old Blucher," the King of Prussia, the Duke of Clarence; then Brussels, where their military acquaintances are in and out all day "like tame cats," and the girls strike up a special friendship with the young Prince of Orange. Dances alternate with *fêtes champêtres*, *grandes chasses*, and religious processions. Suddenly "the Monster" has returned; Louis has fled from Paris; and Wellington is preparing to defend Brussels. There are few more vivid accounts of the back scene of battle than Caroline's letter of June 18th; or more gruesome ones of the battlefield than Georgy's written seven weeks afterwards.

But within a month the new baby was born, and within a few weeks had died. Brussels became intolerable, and the family moved up the Rhine to Switzerland, finding life less easy than they had expected, but still getting the last ounce of excitement and humour out of it. Harriet has a passionate affair with a mysterious Baron Trip, which fills, a little out of proportion, the last chapter.

The letters seem to have been admirably selected; the prologue, epilogue, and notes add just what is needed to explain them. There is a complete genealogy, and charming portraits of Lady Caroline and her mother; one could wish the daughters were here, too.

Melting Pot in Japan

THE WORLD OF DEW: Aspects of Living Japan.

By D. J. Enright.

Secker and Warburg. 216 pages. 18s.

MR ENRIGHT'S title refers to "living Japan," but his perceptive book makes one wonder what aspect of that curiously ambivalent country deserves the adjective. Not, surely, the remnants of the old order, with its formalised and highly artificial codes of behaviour and its frigidly stylised culture; here are all the hallmarks of a society that has evolved its way almost to barrenness. Nor, even more emphatically, the imposed superficialities of the Americo-European way of life. In the past century (and especially in the last ten years of occupation and paternalism) the West has tried to clap an occidental mask on an oriental face, and has shown equal surprise and disapproval when the mask has refused to come to life.

With eighteen months as Professor of English Literature at a Japanese university behind him, the author has some depressing stories to tell about the tenuous hold that western education has on many of his pupils: the intense

young men and women who insist on thinking of western life as a compound of Kafka and the Waste Land, but whose regard for accuracy is so slight that they can name the "leading English poets of the 1930s" as "Owen, Spencer and Diluice" (Day Lewis in his own country). One of their difficulties, Mr Enright points out, is in translating the evasive ambiguities of Japanese into the much more down-to-earth English; but at least as much blame must lie with the American-sponsored education law of 1947, which "upgraded" many high schools to university status and made a university degree roughly as valuable as the GCE in England.

Japan is an unhappy melting pot for East and West, and it is still unclear whether the result will be assimilation by western ways, reaction from them (and towards the Communist mainland) or a fusion between the two. One of the best omens for a successful compromise is the postwar Japanese film, which treats Japanese themes and characters (especially the portrayal of the swordsman in "Seven Samurai") with a quite unJapanese realism.

Mr Enright has all the qualifications of a good commentator. He has been

in Japan long enough to have got his facts straight but not long enough to be seduced by the sort of romanticism that laid Lafcadio Hearn low. He knows something of the Japanese language, but not enough to be misled by its obliquities. He has both a poet's and a novelist's eye, and though his book does not claim

Fanfare for Elizabethans

THE EXPANSION OF ELIZABETHAN ENGLAND.

By A. L. Rowse.

Macmillan. 463 pages. 30s.

MR ROWSE'S second volume of his "The Elizabethan Age" brilliantly fulfils the high promise of its predecessor. There he analysed the structure of society and government; here he traces the sweeping expansion into the Celtic fringes and across the Atlantic. War against Spain followed with operational fronts stretching from the Netherlands to Ireland and naval actions ranging from the Channel to the Caribbean. The overseas voyages and the Armada campaign are familiar, but for the first time the whole story has been given a unity of treatment and told with verve, imagination and originality. By starting with the new deal which the Tudors gave to Wales, "the first example of the English genius for coaxing self-government out of other peoples," Mr Rowse gives a new perspective and longer vistas to the Elizabethan expansion. Ireland, however, "enjoying the amenities and outlook of an Anglo-Saxon heptarchy," refused to be absorbed. But Ireland pointed westwards. Those who established plantations in Ireland, such as the Gilberts, Grenville and Raleigh, were also the promoters of colonisation in America. Ulster had seemed to one Elizabethan "as inaccessible to strangers as the Kingdom of China." But it is the comparison rather than the pessimism which is revealing, for, as Mr Rowse notes, it was in Ireland that Gilbert wrote his "Discourse" on the North-West Passage to Cathay.

Welsh society in the Tudor period has never been depicted with such imagination and insight, nor the struggle in Ireland, with Tyrone caught in tragic ambivalence between two civilisations, been described with such sympathy and skill. Henry VII "remained always conscious of his Welsh ancestry and obligations." Welshmen were drawn to London by an appetite for culture and advancement. Whereas Owen Glendower had wanted a Welsh university, Jesus College in Oxford, founded in Elizabeth's reign, symbolised the new loyalties. Like the English gentry, the Welsh squires gathered like cormorants upon the pickings of the Church. In contrast, Ireland was held by the Counter-Reformation, and Tyrone, accused by Essex of caring "for religion as much as my horse," found in fanaticism a powerful leverage for unity. Fighting with "battle-axes that had been the latest thing in the Norse period" until Tyrone achieved some modernisation, the Irish, aided by terrain and

to be more than a series of personal impressions it is one of the most worth while written about Japan since the war. It is only a pity that at the end he should seem to lend his approval to the naïve idea that a Nehru-like "non-involvement" is the best line for Japan to follow in the future.

climate, did not surrender till the year of the Queen's death.

Sir Walter Raleigh wrote that "the ordinary argument and theme of history is war." Certainly war dominates this book. Armed with bills and bows, relying on an inefficient system of recruiting and dependent on a supply system choked by corruption, the Elizabethan army was fifty years behind those of the continent. Gradually the gap was closed, and Mr Rowse devotes some of his most telling pages to the campaigns in the Netherlands, where Sir Francis Vere emerged as one of our first professional generals. But despite the more professional approach to land warfare, illustrated by the volume of military treatises which came from the presses, mistakes were frequent and corruption remained. The war dragged on, partly because sea-power was only half deployed, partly because of financial stringency and because Elizabeth, disliking war, had, as even Mr Rowse concedes, no instinct for strategy.

The bold and simple construction of this book is strong enough to support the great weight of detail, ornament and flourishes its author delights in. Mr Rowse prefers detail to analysis, but it never obscures his theme. It is apparent that he has often left All Souls for the scenes he describes: for Valladolid, where there is a damaged Virgin, the Vulnerata, a casualty of the sack of Cadiz; and for Conway, where Robert Wynne's house is decorated with exotic plaster work with motifs of ostriches and elephants, suggestive of possible trade with Africa. He draws on unpublished sources and makes effective use of literary evidence. His own advertised position as a rational sceptic is understandable in a sixteenth century historian, but for some his tone may be tactlessly shrill. Needless and obtrusive comments often check the sweep of his narrative, and his quick sympathy can lapse into sentimentality. While he has a gift for writing swift and exciting prose he has been unable to resist or to prune some distressing vulgarisms. Expressions such as "pals" and "sticky ends" contrast oddly with Mr Rowse's admiration for Elizabethan English, "so fresh, so shining and full of life."

Mr Rowse's third volume is to be devoted to the energies of mind and spirit. It will be interesting to see whether he can show what he recognises in Shakespeare, "that extraordinary justice of mind that might so easily be confused with sceptical indifference to human folly," or whether he will maintain the view, also here expressed, that "humans take their absurd convictions too seriously."

The Great Crash 1929

KENNETH GALBRAITH

'One of the most engrossing books I have ever read, it is also tinged with grim humour.'—*Daily Telegraph*

'Short, lively and eminently readable... He tells his story remarkably well.'—*The Listener* 12s. 6d.

Inside Africa

JOHN GUNTHER

ALAN PATON (author of *Cry, the Beloved Country*) writes: 'What a task to undertake to write about this continent that is so enormous and is changing so fast! Does he do it well? He does it superbly. Does he know what is happening there? There can be no doubt of that.'

'Everything the ordinary intelligent reader wants to know about Africa will be found in the pages of this tremendous book. I myself read it with absorption from the first page to the last, and recommend it to every enquiring reader.'

Stormy Sunset

THE SUNSET OF THE SPLENDID CENTURY.
By W. H. Lewis.
Eyre and Spottiswoode. 320 pages. 30s.

SOME county libraries demand the payment of postage "on all books of a light or recreational nature such as biographies." This austere protection of the ratepayer against his own frivolity may be due to the influence of those professional historians who suffer from the disease Philip Guedalla called historians' English: they shun any period or topic that is exciting, and write with the academic detachment of a voice in the next room.

Mr Lewis is immune from this infection, for he is no academic historian and writes with a racy gusto that communicates to the reader his own enjoyment of the scene. Here he completes the picture he presented two years ago in the "Splendid Century" by telling the life story of the Duc du Maine against a lightly sketched background showing the rise, triumph and decline of Louis XIV, and the repercussions which followed on his death.

The Duke was the son of Louis by Madame de Montespan, who, gravely implicated in the witchcraft scandals of 1680, retired to a life of belated repentance in a convent. But he was unaffected by her absence, for he was de-

voted to his governess, the enigmatic Madame de Maintenon, whose story, from widowhood to royal wife, is sympathetically told. Unfortunately, du Maine was as weak in character as in physique: even during his short, but not discreditable, military career he seems to have felt a constant need for his late governess's approval; and it is not surprising that his marriage in 1692 resulted in the substitution of one dominant female for another.

Anne Louise de Bourbon-Condé, daughter of a semi-lunatic Prince of the Blood, exercised a disastrous influence on him. Mr. Lewis's description of her all-night fireworks and charade parties at Sceaux is vastly entertaining. But though his wife's extravagances brought the Duke near to bankruptcy, it was his inability to control her furiously insatiable political ambitions that eventually involved them in treason. And yet the word "treason" would be an unfair historical verdict upon what, the author emphasises, was a feebly melodramatic attempt to revive the Fronde.

"The Sunset" clearly illuminates that curious prologue to the French Revolution, the Regency of the dissipated but astute Orleans, who had to deal with discontents that rumbled ominously through the years until 1789. The after-glow is prophetically ominous with all the signs of a great storm.

Paradise Lost?

THE SUBURBAN CHILD.
By James Kenward.
Cambridge University Press. 142 pages. 12s. 6d.

MOST people, on reaching middle age, want to reflect on their childhood; hence the stream of authors' reminiscences. But Mr Kenward presents his nostalgia with a difference. On the face of it his childhood could hardly have been less interesting. He was an ordinary child in an ordinary family. He does not seem to have had even remote links with the eminent—though he did have a great-great uncle who was wont to take control of suburban trains out of the hands of the driver and abandon the passengers in the countryside of north Kent.

The beginning of that railway, asserts Mr Kenward, was the beginning of Suburbia, which reached its great days in his own childhood forty to fifty years ago. And he has written these reminiscences, for which Edward Ardizzone, as instanced on this page, is the ideal illustrator, as a challenge to those who look down in contempt on Suburbia and as a reminder to social historians that here is a new field of study.

How wonderfully evocative his reminiscences are. Anyone whose childhood coincided roughly in time with Mr Kenward's—however different its place—will feel twinges of delight as he recalls the ritual of the period (the daily departure of the breadwinner, the annual migration to the seaside); the

clothes (sailor-suits—navy for winter and blue and white stripes for best); the toys and the walks. If the reader lives in a suburb, particularly somewhere in the region of Mr. Kenward's (was it Eltham, Mottingham or Chislehurst perhaps?), he will be irresistibly compelled to make comparisons.

His Suburbia was essentially a middle-class community living in detached or semi-detached houses. His father would have moved on at the first hint of council housing programmes with their huge blocks of flats, which heralded Suburbia's decline and fall. But much that he recalls is relevant today. The modern counterpart of the dame school for seven-year-olds in people's houses,

which he attended, is the nursery school for the under-fives, also in private houses. Blackheath pond still sports huge sailing ships. The trains that Mr Kenward used to watch—and his great-great uncle to drive—are now electrified, but there is still a walk through buttercup fields to a railway bridge from which

three pairs of railway lines can be observed at the same time. Above all, children's tastes, their reading, their toys and their friendships, seem scarcely to have changed. Mr Kenward has done more than defend Suburbia as it was. He will make his suburban reader spring to the defence of Suburbia as it is today.

History Without Tears

STORY OF A YEAR: 1848.

By Raymond Postgate.
Cape. 286 pages. 21s.

IN the mathematics of dividing up the past, historians have never been very happy about the most effective unit of measurement. Routine has suggested the age or the century; technique and predilection have pointed to the trend period or the generation. Few historians have written good histories of particular years.

Mr Postgate has selected perhaps the most interesting year of the nineteenth century—1848—with no open purpose in view. His intention, he remarks in his preface, is merely to enable a reader to live through one Victorian year beginning on January 1st and ending on December 31st. "What reflections or arguments there are in it are only made in passing." The reader of his book is placed in a similar position to the reader of a series of contemporary newspapers. The events come and go, and the news flows in as smoothly as it flows into Fleet Street in 1955. It is true that February gets 32 pages and November only 8, but Mr Postgate has not at his disposal the pile of features and extras that make one day's newspaper as big as the next. He was no doubt relieved when the approach of Christmas helped him to be more generous in allocating space to December.

It would be difficult to make 1848 dull, and this sprightly exercise in history without tears is often extremely entertaining. Unfortunately, however, Mr Postgate is over-concerned to raise laughs. The men of 1848 are treated with scant respect; so too are some of the historians who have written about them. We are told of Lord Palmerston, for instance, that his over-fashionable carriage was the equivalent of a modern sports car and that "those who said his whiskers were dyed were suffering from the same bitter and hopeless jealousy that makes young women say their prettier friend wears falsies." Remarks of this kind—and they spatter the book—are irritating examples of Mr Postgate's irrefragable urge to write down to his reader. He seems anxious not only to place his reader in the position of a newspaper browser but to make sure that the newspapers are of the most popular variety. He is willing, too, to dismiss serious attempts to understand 1848, like that of Sir Lewis Namier, as "petulant" or "frivolous." The word "frivolous" seems far more applicable to his own writing.

The best parts of this book are those concerned with English everyday life

and the threat of Chartism; and the illustrations are uniformly excellent. One of the best comments made on the year at the time was that of Lady Franklin in an undelivered letter to her missing explorer husband. "Louis Philippe is dethroned and an exile in England, a fierce democracy ruling France, almost all the Kingdoms of Europe in commotion, England alone steady and erect." It needs more than the history of a year to give meaning to this most powerful contrast of 1848.

Royal and Ancient

A HISTORY OF GOLF.

By Robert Browning.
Dent. 248 pages. 25s.

MR BROWNING'S book will suffer a little unfairly by comparison with the history of golf by a symposium of distinguished writers which appeared three years ago. It is a graceful, witty and comprehensive study of the game, written from the author's background of forty-five years' editorship of *Golfing*, and blending his love of the game with affection for its personalities and respect for its history. There are good grounds for supposing that golf had its origins in the game of chole, which was being played six centuries ago in Flanders. Five centuries ago a succession of Jameses of Scotland were banning "golfe, or uther sik unprofitable sportis" because they were interfering with military training. And the foundations of the great clubs—the Honourable Society of Edinburgh Golfers, the Royal and Ancient, and Blackheath in the south—have a venerable antiquity of two hundred years.

There is plenty of history in the game, and one of Mr Browning's gifts is to set it as a friendly and scholarly background to the golfer's present-day experience. Within his memory, St. Andrews' links were open to all and free. No one could call the present green fees for the Old Course exorbitant, but the Scots have managed to hang on to cheap (or cheaper) golf much longer than the English. The expensive sets of matched clubs, the trolleys (the caddie almost extinct, and the electric buggy, thank heaven, not yet on the dollar import list) the balls at up to 4s. a time, and the general rise in club subscriptions—all these are formidable problems for the new recruit and the ingrained addict, as well as to club managements. Let us hope that they have something to spare for this book; they will be better golfers and better characters for reading it.

"Impregnable Fortress"

ISLANDS IN DANGER.

By Alan and Mary Wood.
Evans. 255 pages. 15s.

THIS is a glittering patchwork of quotations from existing official German and English documents, of conversations recorded "verbatim" after more than ten years, and of the testimony of members of the occupying forces recorded in Germany after the same long interval. Can this mixture, exciting though it is, be regarded as an authentic wartime history of the Channel Islands, the only British territory to be occupied by the Germans?

On the day of release from German occupation, there landed in the Channel Islands officials from Whitehall "armed with bowler hats and brief cases," say the authors; but they do not tell of the wild cheers and almost hysterical laughter which greeted this beginning of the return to normal. This warm welcome was significant, for it was confirmation of the islanders' intense loyalty to the Crown; neither threats nor rewards ever stopped them from proclaiming their belief in ultimate victory. Throughout the occupation, the character of the islanders did not alter. More emphasis could have been placed by the authors on this fact, though a reasonable raising of the highlights and darkening of the shadows has produced a truly enthralling account that is certainly the most colourful of all occupation records. Undoubtedly the most vivid of the many descriptions is that of the islanders' anguish of indecision, as the enemy

raced across France, whether to stay under Nazi rule or to risk the envisaged air-raids in English cities—if not actual invasion—without a home or means of livelihood.

We learn that Hitler had a personal interest in the islands; their future was discussed at his conferences and on his instructions they became "an impregnable fortress." The authors rightly give the impression that the behaviour of the German troops was with rare exceptions proper; the Gestapo, they say, were not there, and the islanders "were spared anything worse" than the secret military police. But it was bad enough. There are harrowing accounts of the fates of the foreign workers said to number 18,000 in the islands, and of certain islanders in the German concentration camps—for many showed their pugnacity; throughout the occupation there were escapes successful and unsuccessful, and suffering among those who had helped and remained. Perhaps the worst time for the people came after France was again in Allied hands, for then began near starvation and the rapid dwindling of medical supplies. The contents of the book will revive memories both terrible and amusing for those who "were there."

The reader should bear in mind that this exciting book may be a mixture of history and hearsay and if he feels so brave as to pass judgment on the islanders' reaction to the occupying forces, he should ask himself if he would have acted differently had the Germans occupied his own country.

In an Old Garden

FRUITS AND FLOWERS.

By Pierre-Joseph Redouté. Edited by Eva Mantering.

Ariel Press. 40 pages. 30s. Cloth bound 45s.

OLD CARNATIONS AND PINKS.

By C. Oscar Moreton. Colour plates by Rory McEwen.

George Rainbird. 62 pages. £3 3s.

THE process of adding the fourth dimension to present-day gardens is carried a step further by these two books. Both come from publishers whose recent publications have, by their researches into the history of flowers and flower-painting, stimulated the average gardener's awareness of time as distinct from seasons.

"Fruits and Flowers" contains twenty-four excellent colour reproductions chosen from Redouté's *Choix des plus belles fleurs*, first published in 1827. These exquisite paintings have an appeal so universal that no-one can look at them without a stab of pleasure, tinged, perhaps, with amusement at the occasional very bogus-looking dewdrops. Brief historical and horticultural notes accompany each plate.

The Reverend C. Oscar Moreton's book on "Old Carnations and Pinks" is the result of many years' affectionate research into the history of these two groups of the dianthus family. Every

known surviving example is described and there is a fascinating list of show carnations and pinks grown by the nineteenth-century florists, running into several hundreds, many of them with names linked with the events of their day, such as Blucher and Bellerophon and, later, Reform and Radical. Mr Rory McEwen has been remarkably successful in capturing the endearing character of these modest but sturdy flowers. His paintings, in consequence, are as beguiling as their subjects.

The book is beautifully produced and attractively written, with its talk of "bizarres," "flakes" and "picotees." While it may not appeal to the general public as much as the Redouté volume it will be of great value to gardeners and breeders. For it is not concerned only with the past, but is intended to stimulate breeders to discover anew some of the wonderful transformations of which these flowers are capable. This would be a real service, since the number of carnations and pinks in general circulation is small and those available from nurseries even more restricted. It is encouraging that several of the leading nurserymen have agreed to give serious consideration to a list being prepared by the Institute of Landscape Architects, of plants which professional designers would like to see in assured supply.

Boswell in His Stride

BOSWELL ON THE GRAND TOUR.

Italy, Corsica and France 1765-1766.

Edited by F. Brady and F. A. Pottle.
Heinemann. 411 pages. 25s.

BOSWELL has now reached the fifth lap of his long-distance race. The brilliant opening sprint, in the "London Journal," was followed by some uneven running in Holland, but with the second volume of the Grand Tour he has settled into his stride.

As Mr Brady points out in his introduction, Boswell's main concerns at this time were "sex, religion and politics." His attitude to all three subjects is full of vagaries. Approaches made (unsuccessfully) to an aristocrat twice his own age are followed by a more conclusive affair with an opera dancer; the colourful attractions of Roman Catholicism war with the austere Presbyterianism of his upbringing; and the strongly monarchical Tory laird is also the devoted correspondent of John Wilkes, who was actually outlawed at the time. But, after all, he was only twenty-four, and an unusually introspective twenty-four. His self-admiration is tempered by periods of merciless self-criticism, with admonitions for his shortcomings and good resolutions for his future behaviour. His pre-occupation with his own personality would amount to narcissism were it not that the face he sees reflected is far from unblemished, and he records it warts and all.

He is Everyman with a difference. The mirror which he holds up to nature reflects some qualities of all men, but his unbelievable lack of self-consciousness allows him to write things of himself that most men would try to banish even from their thoughts. This makes him a fascinating figure, but his lack of selectivity also makes him, as he is presented in this book, more suitable for sporadic than for sustained reading.

Nevertheless, he is usually sensible, and always interesting, and there is an occasional flash of prescience, as, for instance, when he wrote to Wilkes: "Could my feeble mind preserve but a faint impression of Johnson, it would be a glory to myself and a benefit to mankind."

The new volume shows Boswell's work in a variety of dress. Beginning with a long letter to Rousseau, it continues through memoranda and notes, letters to friends, and sections of journal fully written from his rough notes and jottings of conversations. A large section of the "Journal of a Tour to Corsica" is included, and the narrative ends with Boswell back in London and recording a characteristic conversation with Johnson and others at the Mitre. As usual, the editing has been carried out with meticulous care, so meticulous that we are informed that *sub umbra* means "in the shade" and that Adam Smith wrote "The Wealth of Nations." But Messrs Brady and Pottle are doing us proud, and there can be no serious complaint.

Mind of a Miler

FIRST FOUR MINUTES.

By Roger Bannister.

Putnam. 224 pages. 15s.

GREAT middle and long distance runners are of three kinds. There are the determined automatons who grind their stomachs into steel by incredibly hard training, a group to which the Iron Curtain runners and Gordon Pirie in this country belong. There are the gifted young men with equally gifted temperaments, whom Christopher Chataway typifies and represents. And, finally, there is the highly strung, thoroughbred racehorse type, the greatest examples of whom in our time have been the two miling medicine men, Dr Jack Lovelock and Dr Roger Bannister. In this book Dr Bannister tells his story, with astonishing maturity for a man still in his middle twenties and with only occasional prolixity to mar an intelligent literary style.

His schooldays, he frankly reveals, were of the sort that many of his admirers on the track had half suspected. "Until I was about thirteen," he writes, "the week often ended with a nervous headache and an attack of violent sickness"; life was just "one big blush." He took up running as a school-boy at least partly because it was socially necessary for a natural swot to find something to excel at beside class-work; and he believed that "industry and perseverance, without any great natural aptitude, bring greater success in athletics than is possible in ball games." This belief played an important part in his career, and in his training methods. Much of this absorbing book is taken up with describing the efforts he made to bring himself to peaks of mental fitness for his most important races, and particularly for his famous last lap pounce. Sometimes, when his nerves were under control, this "pounce" went smoothly. Thus, as the runners came up for the last lap of the final of the 1,500 metres at the 1954 European Games: "My mind remained quite cool and detached," writes Dr Bannister, "it merely switched over the lever, and well-worn channels carried to my body the extra

energy that my mind unleashed. As I came down the finishing straight I was running with all the speed I could possibly have mustered. . . . Sometimes, when something had happened to upset him, failure was as preordained as this triumph. The full tragedy of the 1952 Olympics, and of the last-minute change in semi-final arrangements that clearly drove him very near to the point of psychological breakdown, is revealed in a statistic that Dr. Bannister publishes here for the first time. Ten days before Helsinki he ran his last secret time trial, a three-quarter mile in the fantastic time of 2 minutes 52.9 seconds. British athletics fans will gnash their teeth in thwarted disappointment as they read of this time. It does not only mean that, but for the change in heat arrangements, Dr Bannister must have won the Olympic 1,500 metres; it means that then, but for the breakdown, he must already have had the four-minute mile at his mercy. The training effort that carried him to the Oxford Mile nearly two years later, and to his last great season of 1954, was merely a mental effort to build himself back into the peak condition that he had reached, but had been unable to make use of, at that time.

Is his thesis that great miling is mainly a mental process really right? Or is Roger Bannister merely a man who had certain exceptional physical attributes, which nervous disorders prevented him from utilising on all occasions to the full? On this, there can be two opinions. But there need be no two opinions that his belief makes this a much more absorbing book to read than the usual, and rather bovine, run of sporting reminiscences. If the most surprising people are to be seen walking around the streets of British cities in the next few months, pulling the most surprising faces, passers-by should know the explanation: the people behind the faces will be readers of this book, running in retrospect with Dr Bannister round the first three laps of his famous miles, summoning up in daydream the nervous energy for that conquering last minute pounce.

Amateur Jung in Africa

THE DARK EYE IN AFRICA.

By Laurens Van der Post.

The Hogarth Press. 159 pages. 8s. 6d.

"I WANT to suggest," Mr Van der Post told his audience at the Psychological Club at Zurich, where this lecture and discussion occurred, "that unrest in Africa, in all its aspects, European, cosmic, global and African, is plainly an extension of our own individual unrest." This quotation sums up Mr Van der Post's thesis; but it is very far from plain, at least to the reader unversed in, or unconvinced by, the Jungian view of life. He makes, for example, a distinction between time, linear, as the impoverished European intellectual thinks

he experiences it, and time, absolute, as a dimension of "primitive" African experience (the quotation marks are in deference to Mr Van der Post's sympathy, not misplaced, for the joys of the bushman's life). This baffled even a Jungian audience, and Mr Van der Post's further explanations frankly conceded that "time made meaningful in life" and not a mere measure of duration was a mystery, with which the fortunate African had not yet lost contact, but the over-cerebral European had. Hence much misunderstanding between the two races.

Mr Van der Post's use of the idea of projection may be a little easier to grasp. Within the white man, in accord-

ance apparently with the Jungian doctrine of "personas," lives a "dark brother," a fount of instinctive experience and reactions, but a counterpart to the intellectualised soul of the white man, a counterpart which he rejects increasingly. In rejecting it he finds, when in Africa, a convenient object on which to pin it and personify it, with all its hidden terrors and threats—the blackskinned native. Hence the white man thinks of the African as being everything that he rejects in himself. The African, however, is not equipped with a "white brother" in his dual psyche (so much for Blake's line "And I am black, but oh! my soul is white"). He too has a dark brother, and it is his compulsory suppression of this under European rule which is now driving him from time to time to such excesses as Mau Mau. Where, asks Mr Van der Post, do we think all the psychic energy that went into massacres, migrations and orgies, which in their turn kept the African from building toilsome civilisations in the days of his innocence, has gone to, under the Pax Britannica? Where, indeed?

Once the reader accepts Mr Van der Post's premises—that all men (and women) are dual, do project on to external objects the rejected traits of the unconscious, and are deeply at one with

their national myths—much of the argument is ingenious, and, here and there, distinguished by flashes of deep insight. But as an analysis of present discontents in Africa, it leaves us much where we were—a plea for a better understanding both of ourselves and the coloured races which could have been put more shortly. And Mr Van der Post's messianic idea that Africa was waiting for the white man some centuries ago, credited him at first with godlike powers and is now deeply disappointed in him is poetry rather than history or anthropology. In fact, as on one page Mr Van der Post says he experienced the first breathless hush of the white man's African reception himself, and on another traces back his ancestry to the first Dutch settlers at the Cape, it must be poetry if it is not to be called plain bunk. Mr Van der Post is a distinguished literary figure in his country (he denigrates South Africa's literary achievement rather unnecessarily; it is rather in other fields of western culture that the Union seems so sterile) but his friends and admirers will hardly feel that this book has enhanced his reputation. They will await the more eagerly another plain tale of exploration with overtones of spiritual adventure, the genre in which he excels and entertains.

For the Old and Infirm

THE ENGLISH ALMSHOUSE.

By W. H. Godfrey.

Faber. 95 pages + 48 plates. 36s.

THE growing number of old people in the population, and the difficulty of housing them, have revived interest in the almshouse, the community's time-honoured way of providing for its aged and infirm members. Mr Godfrey's book in no way attempts to give a history of the almshouse or to discuss how best those surviving today can be used in present circumstances. He has instead made an architectural study of them, emphasising the care with which they were planned and showing how the design altered to meet changing needs.

The earliest almshouses were essentially hospitals, from which some of today's great teaching hospitals have sprung; they provided shelter for poor travellers as well as caring for the sick and the infirm. The typical design was that of the monks' infirmary of a monastery: a large hall opening into a chapel at the east end. The aisles along each side of the hall contained the beds, leaving the hall itself free for those in charge and their furniture and equipment. But gradually the almshouse

benefactions acquired a new purpose: to provide a home of rest for a resident community of old people instead of temporary refuge for the sick and the weary. Thus even before the Reformation, examples, such as at Ewelme in Oxfordshire and St. Cross at Winchester, can be found of what later came to be regarded as the typical almshouse—the small separate dwellings grouped round a quadrangle. This is certainly the most picturesque design, but in fact most almshouses consist of a little row of identical cottages, perhaps with a small chapel in the centre, quite plain except for ornaments perpetuating the name of the benefactor or reflecting the characteristics of the beneficiaries—a ship, for instance, as a weather vane in an almshouse for fishermen.

England is particularly rich in almshouses, and Mr Godfrey has taken examples from all over the country. His text is straightforward and copiously illustrated by plans and drawings, mostly by himself (one of them, the fishermen's hospital at Yarmouth, is reproduced on this page). There are also nearly fifty excellent photographs. But presumably the book's appeal is too limited to justify a more reasonable price.

BENHAM'S ECONOMICS

This is a new fifth edition of a standard work on economics. Largely rewritten and forming virtually a new book, it discusses the various problems in their post-war setting. An invaluable work to anyone taking any of the examinations in the subject. 18/- net.
"... ever since its first appearance this book has been the sure standby of the first-year student of economics..."
—*Economist*.

A FIRST APPROACH TO ECONOMICS

By E. Victor Morgan, Professor of Economics, University College, Swansea. This work is for first-year students of economics in universities and all who are beginning a serious study of the subject. It is based on a course which the author has been giving to his own first-year students and which is designed to take them to a point where they can enter the honours school. 20/- net.

THE ECONOMICS OF INLAND TRANSPORT

By A. M. Milne, O.B.E., M.A., Lecturer in Economics, King's College, University of Durham. This new book applies general economic principles to the particular problems of road and rail transport. The author has organized his arguments so that the book will be of value not only to those specially interested either as users or operators of transport, but for the general reader with a rudimentary knowledge of economic principles as well. 25/- net.

ECONOMICS OF INDUSTRIAL ORGANIZATION

By A. Beacham, M.A., Ph.D., Professor of Economics and Political Science, University College of Wales, Aberystwyth. This is a new up-to-date third edition of this authoritative book which is designed to supplement the general economics textbook. The chapter dealing with the structure of British industry has been completely rewritten and the text has been revised wherever possible to take into account the more important changes that have taken place since the last edition was published. 16/- net.

THE TAXATION OF GIFTS AND SETTLEMENTS INCLUDING PENSION PROVISIONS

By Stamp Duty, Estate Duty, Income Tax and Surtax.
By G. S. A. Wheatcroft, M.A. (Oxon). 2nd Edition. 42/- net. "... this remarkable book... for there is no other single volume in which so much diverse information and guidance on the subject can be obtained..."
—*Accountants Journal*.

INTERNAL AUDITING

By A. C. Smith, C.A. This book, one of the few available on the subject, is a practical and comprehensive introduction to the audit of industrial management accounts and the procedure for verifying systems of administration control. Clearly written, this book is of value to all accountants. 21/- net.

Clash of Symbols

PAUL NASH.
By Anthony Bertram.
Faber. 336 pages. 42s.

"PAUL NASH'S work... will survive our poor attempts to explain its mystery." Mr Bertram prints these words of Sir Herbert Read's on his title-page, but he is not warned by them. He has an admirable subject: a painter of equal charm and talent, a born letter-writer and a lucid commentator of his own work. If he had been willing to marshal the ample evidence and to stand back modestly, giving more space to Nash and less to himself, he could have produced a most delightful book, given the thoroughness of his research and his talent for exposition. Unfortunately he is more ambitious: he aims both to paint a portrait and to stand well in its foreground. Even the narrative part of the book, which is clearly done, suffers from a rather pompous injection of the first person; small displays of learning and explanations of method scatter the pages, and distract as much as the wobbly shadow of a pointer on the screen.

But that is a small matter compared with Mr Bertram's analysis of Nash's pictures, which occupies more of the book than the narrative. Here he almost blots out his poor subject. He deploys a cumbrous apparatus of symbolic theory, based on Catholic authors from St. Thomas Aquinas to Maritain, into

which Nash (not a Christian at all, it appears) is squeezed willy-nilly. Supporting passages are quoted in several languages from Mr Bertram's (not Nash's) favourite poets. As the book proceeds, he gives more and more importance to the symbolic value of the pictures; at the end, where Nash's sensible comments on his own pictures conflict with Mr Bertram's theories, he is soundly scolded and told he is wrong.

It would have been better if Mr Bertram had not explained so much or so dogmatically. Why must Nash be saddled with esoteric significance at every point? His central passion was painting. Outside that he had a brilliant will-of-the-wisp mind, but never went very deep. Why should he? There were symbols, ideas and what-not; he was influenced, in choosing his subjects, by his reading; but the interesting thing was the picture that emerged, not the magpie collection of thoughts and objects which Nash used in its construction. To seek the main pattern of his life in the analysis of this collection is to ignore the building for the scaffolding. We can leave the last words to Nash:

Objects to me are all the same in the end, i.e. part of a picture, but primarily a pictorial part not merely symbolical.

The book is attractively produced, with reproductions of Nash's work; and its quotations from his letters are a delight.

Life of a Genius

PORTRAIT OF VINCENT.
By Laurence and Elisabeth Hanson.
Chatto and Windus with Secker and Warburg. 309 pages. 15s.

UNLIKE Mr Bertram's study of Paul Nash, this life of Van Gogh is purely a biography. The authors disclaim any attempt at art criticism as such, though clearly any biography of a painter must relate his work to his life as it was led at the time. And their specified aim—a non-technical biography of Van Gogh for those who love his paintings—has been extraordinarily well carried out.

Probably all that most of the people the Hansons have written for know about Van Gogh is that his genius was unrecognised in his lifetime; that he was consequently poor and despised; that at Arles he cut off his ear and went mad and was shut up in a mental hospital where he painted many of his most successful pictures; and that he eventually committed suicide at the age of thirty-seven. The Hansons paint a rich canvas out of this sketch. They show his slow groping for the means of expressing his genius; at one time he thought he was destined for a life of religious asceticism, and he did not begin to paint until he was twenty-seven, although he had spent his early youth working in art galleries. But after the revelation had come to him, he gave to

painting the same singlemindedness that he had previously given to reading and to his mission among the miners of the Borinage. He studied drawing with fanatical intensity, and in his last years painted as a man possessed, scarcely pausing to eat or sleep, pouring out his soul on canvases by day and in letters by night.

For Van Gogh's life is exceptionally well documented, and the Hansons have made full use of the complete edition of his letters. Yet, as they point out in an illuminating epilogue, although he puts all his feelings into his letters, he does not always reveal his true character in them. They sometimes make him appear reasonable and accommodating, anxious to please and misunderstood, whereas it is plain from the whole story of his life that he could not live with anyone without incessant quarrels and recriminations. The story of his persuasion of Gauguin—against the latter's better judgment—to share with him the little yellow house in Arles and the quarrel which led to the first mental breakdown is most sympathetically told.

Van Gogh is a fascinating character, and the fascination and speculation remain after this book is finished. What was the exact nature of the mental illness, into which he had considerable insight, but which eventually destroyed him? Must a genius like Van Gogh's always be self-annihilating, or can it be

protected against itself? If Van Gogh had been shown more kindness as a child, more tolerance later, would he have ended as he did? One fears so, for in fact he had one person who always believed in his genius, was always intervening for him, was his financial and moral prop all through his short life, and who died from the shock of his suicide. The real hero of this book is not Vincent, but his brother Theo; more than a mere Horatio—he himself had his share of the family neurosis—he was wise enough to see that if society is to have its geniuses someone must shoulder the burden of them and accept them as they are.

Etruscan Sites

THE BURIED PEOPLE.
By Sibylle von Cles-Reden. Translated by C. M. Woodhouse.
Hart-Davis. 248 pages. 35s.

GLANCE at the bibliography of this delightful book is instructive. It shows that the vogue for the Etruscans really began in the 1930s and has been growing rapidly. This suggests that we are at the very beginning of a long road and that the failure of Etruscology to advance very much beyond its point of departure is natural. Neither the vexed question of the origin of the Etruscans nor a satisfactory solution to the problems of Etruscan philology have evolved much beyond Ducati's study of 1938 or Pallottino's important summary in 1939. Theories are more sharply defined and partial readings of the Agram text seem better established, but the great mysteries remain and Frau von Cles-Reden's title, "The Buried People," is true in more than one sense.

Precisely because traditional methods of epigraphy and correlated chronology are extremely uncertain, the student of the Etruscans must rely above all on an intuitive sympathy with Etruscan art, on a delicate sense of the archaic. That is why men who have not been trained archeologists have felt drawn to Etruria and its gnarled hillocks, whose decaying medieval towns are set on Etruscan foundations. That, also, is why D. H. Lawrence's study of Etruscan sites is still the finest available introduction to Etruscology. Frau von Cles-Reden not only omits Lawrence from her bibliography but challenges him on his own ground. Like "Etruscan Places" her book is a study of the Etruscans seen through a series of visits to their various sites—Caere, Tarquinia, Vulci, Veii, Orvieto, Volterra and that mysterious region around Lake Bolsena.

"The Buried People" falls rather precariously between two genres, that of the guide-book and that of the archeologist's survey. It is marred, too, by occasional bursts of over-enthusiasm. And, surely, a book that relies so heavily on visual impressions should have plates of the things on which it dwells most lyrically, such as the Basilica of San Flaviano near Montefiascone. But there are small points to set against 81 superb photographs.

Around the Adriatic

THE ADRIATIC SEA.
By Harry Hodgkinson.
Cape. 256 pages. 21s.

WHILE climbing "frightful paths" through lentisk and arbutus behind Valona Bay on the Albanian coast, Mr Edward Lear recorded that he looked back on a scene "than which one more sublime... I do not recollect often to have noticed." But it is not only its exceptional natural beauties that distinguish the Adriatic and make Mr Hodgkinson's choice for a book such a happy one. The works of man scattered around the Adriatic coast are also extremely rich and varied. It possesses, moreover, greater unity, both historically and geographically, than most seas; yet its position, which for centuries, until the discovery of the Cape route, made it into a great international highway, has ensured that its connections are far-reaching and its affairs of much more than local significance.

The book is divided into two parts. The first and longer part is a survey of the history of those who have lived around the Adriatic and their relations with each other. In the second part, the reader is taken for a conducted tour right round the Adriatic coast and there is a wide—perhaps too wide—variety of diversions on the way, from the intricate details of Dalmatian national costume to the fortunes of Bari during the last war, from the achievements of Frederick II in Apulia in the thirteenth century to those of the poet-priest ruler of Montenegro, Peter Petrovic Njegos, in the nineteenth.

The historical survey is on the whole very well done, although the author does not always succeed in banishing that sense of confusion and ennui that potted history—however skilfully potted—seldom fails to arouse. But there are almost always compensations. Anyone, for instance, who finds the details of the naval manoeuvres in the Adriatic during the Napoleonic wars slightly tedious can always console himself with the gallant Captain Hoste, who sailed the Adriatic in his frigate *Amphion* in search of glory and "pewter" (i.e., prize money) and often found "pewterizing" a sadly unsatisfactory game. One of the most entertaining chapters describes the efforts of the great medieval cities round the Adriatic, like Venice, Ragusa and Bari, to boost their power and prestige by obtaining the remains of some suitably impressive and wonder-working saint. Indeed, the descriptions of these cities, throughout their history, and not only of their physical appearance but of their character, as the author sees it, is one of the best things in the book.

Mr Hodgkinson always writes with liveliness and great self-confidence (the ancient Romans with their "parasitic and overblown capital" are given a particularly sound drubbing), and this is refreshing even though it sometimes leads him into making judgments that are too sweeping and too slick. It is a pity that the excellent map and photographs are not completed by an index.

Monopoly in America

THE GOVERNMENT AS PROMOTOR
BY WALTER ADAMS & H. M. GRAY
A challenging book on the subject of "big business". The authors contend that government action in the U.S. has favoured the growth of monopolistic enterprises. Ready shortly. Prob. 19s net

The Future of American Prosperity

By P. J. WERNETTE

National Heritage

THE NATIONAL GALLERY, LONDON
 Text by Philip Hendy. 100 reproductions
 in full colour.
 Thames and Hudson. 194 pages. £6 6s.

THIS is a beautiful book, so beautiful that it almost defies review. Those who have not easy access to the National Gallery may well maintain that even a poor reproduction in colour is preferable to one in black and white. Those who have may think that only the best is permissible. Both classes should be satisfied by this book. The reproductions have been done with such care (it is interesting to note that the block-making as well as the printing was carried out in this country) that their first effect on the reader is startling.

It is only a pity that the care and time that have obviously gone into the plates have not been extended to the book as a whole. For there are signs that its completion has been rushed through, presumably to catch the Christmas market in this country and in the United States. The list of corrections, which includes simple misprints and a dropped line, implies scamped proof-reading. The lay-out of a book of this sort, where the main object must be to give pictures of varying shapes and sizes ample breathing room, is certainly difficult. But one wonders whether the

publisher's solution is always the right one, for it has the effect, in some instances, of making the text look unnecessarily cramped into the bottom of the page. The publishers might also have asked themselves whether the line drawings in the margins of the introduction do not defeat their purpose.

But these are criticisms of detail which are not intended to detract from the general impression of delight. Those who may be disappointed not to find their own favourite picture reproduced will realise from the introduction by Sir Philip Hendy, Director of the National Gallery, that a picture's condition—in particular, whether it is not distorted by old varnish—largely determined its candidacy for reproduction. His text accompanying the pictures themselves is altogether admirable. Looking at books like this, which stand or fall by their illustrations, the reader tends to think that the text is unimportant and that it is concerned only with dates and facts about acquisition. The facts are certainly there, but Sir Philip gives us a great deal more besides. Writing austere but lovingly, he brings a picture most vividly to life. His readers will look with fresh interest at pictures they thought they knew well. They will also be persuaded to seek out those they have hitherto passed by.

Spoof and Super-Spoof

COUNTERFEIT.

By Sonia Cole.

Murray. 216 pages. 15s.

TOWARDS few types of deception is it possible to entertain more widely different feelings, according to circumstance, than towards these collected in this volume under the general heading of "Counterfeit." The Dreyfus "bordereau" stands for the blackest and most unredeemed villainy; Van Meegeren's "Supper at Emmaus" rouses unholy joy and unending speculation on the relation between aesthetic value and authenticity; the Portuguese Bank Notes case (some of whose most hilarious features are omitted here) prompts the reflection that the perpetrators, however reprehensible their motives, did Portugal a very good turn according to the best Keynesian principles; for Thomas Chatterton one can feel nothing but compassion; for that juicy old rascal Flint Jack, who made a career out of faking prehistoric arrowheads and had a fellow-craftsman's profound respect for his predecessors, one has a warm affection; over the Piltdown Story, or that of the Browning first editions, one lingers in a state of not disagreeable psychological mystification. Miss Cole has cast her net wide. Glozel and Lübeck, Moulin Quignon and Calaveras, the "thirty thousand manuscripts" (including letters signed by Pontius Pilate and Cleopatra) palmed off on the unfortunate professor Michel Chasles in nineteenth-century Paris, are

treated at length; even impersonation, as in the Tichborne case, is included. She tells her necessarily complex story quite straightforwardly, without either pedantry or sensationalism; and it is hardly her fault if after a first reading one is not immediately qualified to summarise the evidence in the Piltdown case or the exact relationship between Malskat, the Lübeck muralist, and his almost unbelievable impresario Ley. Those who study to deceive are apt (unless they are as simple as Flint Jack) to weave a web quite as tangled as any unravelled by Mr Freeman Wills Croft's Inspector French; with the agreeable result that one can pleasurably go back and read the story all over again. A chapter on methods of detection should sufficiently discourage anyone inclined, after exposure to so massive a demonstration of human gullibility, to produce a few Missing Links, historic documents, or lost artistic masterpieces on his own account.

Two missing chapters cry out to be written. One—a delicate matter indeed—should deal with bogus religious relics; how many "pygges bones," one wonders, have been discreetly removed from public veneration since the days of Chaucer's Pardoner, and to the accompaniment of what muted but furious recriminations? The other should treat of spook-mongering in all its manifestations. On second thoughts, the Sludges deserve a book to themselves. Miss Cole should think seriously about bringing their story up to date.

The Economist

DIARY

THE BUSY MAN OF AFFAIRS requires a diary that is expressly designed to meet his needs. These needs have been carefully studied by The Economist, in association with the co-publishers Charles Letts & Co. Ltd., and the unique features of The Economist Diary are the product of this study. A diary and a complete reference book are combined in one volume (10in. x 8in.) which will lie open flat on the desk.

The day-to-day part of the diary is laid out so that appointments are arranged in chronological order and so that ample space is available for notes. Each double-page opening shows the day-spaces for a week, a complete calendar for the year, and calendars for the same season in the previous and succeeding years.

The reference section consists of 72 pages of information specially selected to be of practical value; quick, easy reference is achieved by means of thumb indexes down the outside margins of each page. The principal contents are:

Air line services and distances	Production: fuel and food
Banking: exchange rates	Production of manufactured goods
Basic statistics on 47 principal countries of the world	Statistical sources
British press	Statistics of world production: foodstuffs, textiles, fuel, minerals
Education: schools and universities	UK balance of payments
Election and by-election results	UK external trade
Hotels: London clubs and theatres	Weights and measures: conversion factors
Income tax, surtax, and death duties	World population
National debt and national savings	World trade
National finances and social services	

The diary is bound throughout in red leather, with the title blocked in gold.

UNITED KINGDOM (including postage and Purchase Tax) 41/-.
PRICES OVERSEAS: prices by air or by surface are shown in a schedule covering the principal countries of the world.

To obtain the illustrated pamphlet giving full details of The Economist Diary, merely write your name and address on the back of a postcard and send it to:

What Makes a Manager?

Are They Born or Made?

NOBODY knows exactly how many managers there are in British industry or commerce, or how many recruits are needed yearly, or what kinds. The Urwick committee on education for management thought there might be 400,000 to 450,000, demanding an annual replacement of 12,000 a year. But it offered no breakdown into top, middle (or departmental) and junior grades (certainly included in such big totals), or any analysis of the needs of large, medium-sized and small firms. As a "profession" surprisingly little is known of management, or its adequacy in quantity or quality for its professional duties.

For some years, however, the demand has been growing for better training and use of managerial talent. It is alleged that much British management is not good enough, and that unless improvement is planned now, the gap between British and American managerial proficiency will be almost unbridgeable in ten or fifteen years' time. Few business men can have succeeded entirely in stopping their ears to this plea. They are certainly aware of the growing difficulty of getting hold of "the right type of man"—especially when, as not infrequently happens today, it costs several thousands in advertising to fill a half a dozen vacancies. The demand for managers grows as production rises and mechanisation increases the proportion of managers to other ranks; as big business ramifies; as weak industries "man up" in administration to meet new conditions. The pregnant words "executive development" and "managerial succession" can be heard nowadays, if still a little tremulously, on the lips of chairmen and managing directors.

But of how many? What impact has the "managerial movement" really had? Or deserved to have? The market for managerial talent is a free one, and business men of the old school may argue that now, just as a century ago, it is for prosperous firms to bid high enough to cover their needs of men "of the right type" as for the other factors of production, and queer street take the hindmost. Is there, they ask, anything to plan—any problems beyond those of creating the conditions in which private enterprise thrives? The supply, on this argument, will respond to the demand in cash and career values—as in the nineteenth century when business had no need to organise the education of accountants, company secretaries or production engineers.

There is common sense in this view. But it ignores the family firm as the dominant institution for reproducing, incubating and multiplying the business elite in the past; and forgets that with the decline in the "family firm tradition" other arrangements may be necessary. It forgets, too, that if business is too far behind the times to create a market in new technologists or specialists, the universities may not be able to breed a large supply suddenly when it wakes up.

But whereas time has completely converted industry to the need to co-operate with universities, technical colleges, the Ministry of Education and even the schools in training technologists, the shortage of which business men regard almost as a national scandal, nothing like the same enthusiasm for training in management (whether for technicians or specialised administrators) is visible. Does this mean that industry does not believe managers can be trained; that it thinks that on the subject of business Shaw was as right as he was wrong about science or medicine when he said "those who can, do; those who can't, teach"?

★

If Shaw was right, a good many earnest reformers have been on the wrong track for a long time. Even before the war, the "management movement" was gaining momentum, importing its inspiration and some of its jargon and textbooks from America. A number of quasi-professional "institutes" of specialised management were formed, with letters-designate and voluntary examinations. A few universities began to experiment with courses modelled on Harvard Business School methods. The—still unorganised—profession of management consultancy made its appearance. Sales resistance among business men made its appearance simultaneously.

Upon these foundations, the postwar offensive was mounted, and carried the blessing, and a subvention, of the Labour government, which was learning about management in Tanganyika and elsewhere. The British Institute of Management took over the institutes and was made jointly responsible with the Ministry of Education for the Urwick scheme of what was rather carefully called "management studies" in technical colleges, a five year part-time course

leading to a diploma in "general management qualifications." The Administrative Staff College was started at Henley, and other residential, part-time and other courses in management were inaugurated. An unknown, but large, number of young and middle-aged men have taken courses of some kind over the past ten years. Some 1,500 students are taking the BIM/MOE management studies course and perhaps a further 1,500 other courses; American business schools produce 70,000 business degrees annually.

A fillip to the campaign was given by the Anglo-American productivity reports, many of which stated or implied that British management as well as technology lagged behind American; and the further inference (rightly or wrongly) was drawn by the Report on Education for Management which "was deeply impressed by the steps taken by American business to educate, train and develop its future business leaders," and was convinced that "these efforts have had . . . a vital bearing on American productivity."

A growing number of firms have sent their people on courses, joined the BIM and "shown willing." They include many of the names which are a byword for efficiency. Though a small minority, they are numerous enough to fill most courses that are offered by technical and staff colleges.

★

But even the lead given by some of the largest firms has not changed the ways of even a sizeable minority of British businesses; has no more than dented a widespread attitude of disbelief or indifference. Some of the reasons for this, as will be shown, lie with the training facilities and a fatal atmosphere of "uplift" which surrounds so many projects. But the bedrock reason lies in the questions: Are managers born or made? Is management an art or a science? The majority of British top executives are not convinced that the results to date have shown that managers can be made or that management is a science which can be swotted out of books and attested in examinations. The idea of a diploma is for them, mostly self-made men, the final absurdity. It is indeed quite possible that many of them would fail the final examinations, which range from functional factory organisation to higher cost control.

The reformers, on their side, have tried hard to coax the doubting industrialist over this *pons asinorum*. The Urwick report itself, they remind us, denied "that young men or women can be trained as managers . . . by following certain courses of study at Technical or Commercial Colleges." It is not worth recapitulating in detail arguments based on the use of so many undefined terms. They boil down to two:

- (1) Managers may be born so far as indispensable personal qualities of leadership and enterprise are concerned; but this endowment itself varies, and it can be supplemented and better directed by training in management.
- (2) Granted the exceptional man is a law to himself, industry has got to use a lot of second-class but valuable administrative talent, which certainly can be "made" to a great extent.

The reply amounts to this: that top managers, especially the great entrepreneurs, can do without formal teaching, but that departmental managers can be made, and, in fact, always *are* made by some sort of training, good or bad. They would be made more efficiently if the training were better. Furthermore, if the mantle of top management falls on them *faute de mieux*, they will rise to the job all the

better for having been well-trained departmental managers. A recent guide to "Training and Education for Management" issued for the steel industry and dealing with the interlocking of internal and technical college courses speaks significantly of "departmental management" only.

This is perhaps a sign of a growing conversion to the view that British middle management could be improved by more formal training in administrative method. There are cogent arguments to support this view. Specialists and technologists cannot run departments or co-operate in running them unless they have more grasp of organisation, and are able to get on terms with the firm's accountants, lawyers, planners and workers' representatives. For, like top management, middle management is getting continually more complex, and the job increasingly becomes one of organising "sub-specialists" as a team. The engineering institutions now nearly all require some "management subjects" for their final examination.

On the other hand, recruits to management nowadays have an independent approach. Increasingly they are men with university degrees, or with a specialised technological training, and they expect to be properly and progressively trained in the course of a business career, not pushed into one department, told the form, and forgotten, or left to sink or swim in the general maelstrom. So do public schoolboys. Most have served in the forces and have ideas of good organisation which they expect to adapt and apply. They expect an answer to the question "where do I fit in?" and some idea of the steps in the ladder upwards. These recruits enjoy a sellers' market and tend to take jobs where the promise of training make the promise of a career convincing.

★

Middle management is a critical sector. It is the training ground for the potential top executive, and it constitutes a field in which slow-maturing talent can be encouraged and spotted. If it is neglected, however, industry's loss is even greater than that inflicted by the poorer performance of its undeveloped middle managers. For it may give an impression of frustrated or dull third-rate people which frightens off the first-rate university minds which even die-hard top executives desire to attract into business.

But to suggest that it is in middle management that British business may be lagging, is not to say that any particular form of "executive development" programme is best; or indeed that any ready-made programmes are on the market. It does not imply that engineers or chemists who totally lack administrative ability can have it grafted on; or that a course of lectures in "human relations" will impart the highly prized managerial quality of "getting on with others" to a self-centred and unsympathetic personality. It is their grim awareness of this which makes so many top executives suspicious of anything "academic" even in middle management training schemes. But at the other extreme it is no less common sense to see that a man stuck for 20 years from the age of 16 or even 23 in one section of one firm in one town in one country may at the end of his "training" appear rather less capable of promotion and increased responsibility than he was at the beginning, even if he failed to storm the general manager's office during that time. The common experience of those doing work study is that it is often quite as hard to persuade the departmental manager as his supervisors and workpeople that changes would bring higher productivity and earnings.

Through T' Mill

YET the ironic fact is that the bulk of the effective management training above supervisory level done today is for top jobs. There are good reasons for this. On the one hand it is fairly easy to organise classes for foremen, of which there will normally be quite a number, and to decide what instruction they need, while on the other hand it is a straightforward and often enjoyable job to train brilliant men handpicked for promotion; but the middle group falls between stools. Above all, the traditional training for executives was worked out when middle management hardly existed—when most firms were family firms and management was control.

This method was to bring a man up the hard way. Either he was spotted as a "likely lad" on the workshop floor or in the counting-house, or he was a member of the family—son, nephew, perhaps son of a business acquaintance—in which case he started on the shop floor or high stool. Either type of neophyte was then given instruction by what is now called "job rotation" until he became personal assistant to one of the directors. A scion of the family rose faster, perhaps, than a "likely lad"; but for both teaching was by word and precept from an experienced man.

There are two points to be made about this simple system. The first is that, whatever its failures, it produced a phenomenal number of first-rate executives. Most of the chairmen and directors who are today considering what system of "executive development" to instal, if any, are the products of it. A research into management promotion methods in large firms, shortly to be published by the Acton Society Trust shows that of the 3,300 managers studied, 55 per cent started from the bottom and a fifth of them had only a primary education; seventy per cent of top executives had no professional qualifications. A third had been to a university—about the same proportion as in Germany. Top management's ideas on training are inevitably influenced by the fact that it went through the mill in the industrial conditions of the twenties and thirties, or even before 1914.

The second point is that going through the mill remains the main way in which managers are trained. Yet many firms cannot claim even to train on this simple model. An investigation of a sample of 112 firms in the north-western industrial area undertaken by the Department of Industrial Administration, Manchester College of Technology, showed that only 36 per cent of them had a training scheme which gave "systematic and conscious thought" to the assessment of its managerial needs, to the recruiting and training of future executives, and to "the creation of an individual programme with periodic progress review and the use of outside educational courses." The most that the remainder could say was that "they knew exactly who would be the replacements for every managerial casualty"—a bold claim.

The Acton Society research into fifty of the biggest firms revealed that a third of them took no interest in managerial development, and that the interest of the rest, such as it was, often dated only from the end of the war, when inexperienced, untrained men had often to be put into responsible positions. Formal schemes, whether they make use of technical college courses or not, are confined to a tiny minority of British firms.

But, of course, firms can thrive, and can find managers, without training them. Many take the view that "you

can't keep a good man down"—that a good man shows himself by finding out how the firm works, and that being self-assertive is the proof that he has "got it in him." Old-fashioned pushfulness is certainly a vital quality in many businesses, especially on the sales side; though good men may stay down also—push is not the sum of management. It is also always open to firms to buy the managers trained by somebody else; and this is a two-way traffic between large firms and small. Large firms may buy men self-trained in the process of making a success of a small unit; but small firms often buy specialised experience and wider know-how from big firms by offering perquisites, powers and prospects which the big firm, run nearly on public service conditions, cannot.

★

Whether this inherited patchwork of methods to produce a supply of, and a market in, managers is adequate is another matter. There is a danger that as the "family tradition" in business declines, the personal interest in training, which is all-important, will decline with it; for the responsibility for looking after selection, recruitment and training on the board of a public company, or of a big private company where the "& Son" is an anachronism, is rarely coveted. It confers little power.

What drives firms to instal training schemes is, in fact, largely the need to promote, or recruit, men for positions of responsibility, especially when the firm is expanding. Sometimes the problem of succession is prominent; it is not uncommon today to hear an ageing managing director complain (but perhaps with a touch of pride) that he cannot find anyone to take over his task; that the older men offer no solution to the problem of continuity, and there are no good young ones (i.e., none have been trained).

The need to make better use of promotable material off the floor, and from the ranks of junior and middle management is brought home by the fact that to get young men from outside, firms must increasingly buy graduates. Any idea that industry likes this situation would be starry-eyed. A great many business men bitterly regret the passing of the old system of getting a boy straight from school, letting him take his national certificate in some technology if he could, and otherwise keeping his nose to the lathe until the time came to promote him. Graduates cost much more, and have to be told to forget a lot of what they learned, which means setting up a system of teaching them something different. But in any case, with graduates costing and expecting so much, and outside experience so expensive to pirate, there is sense in making sure that if you have got men of promise in the firm, you spot and promote them.

Departmental talent-spotting, the time-honoured selection procedure in medium and large firms, can be haphazard, and indeed downright unfair. Regular assessments of individual performance over a convenient period, usually a year, are becoming more frequent; firms with management structures numbering thousands can now hardly do without them. To find men on the floor or in junior management some firms advertise vacant jobs internally (besides it looks democratic). Recruiting from outside is changing also. Firms which do not advertise find that the flow of good applicants

tends to decline. Big firms increasingly think in terms of booking the best university talent before graduation; some offer paid part-time vacation work to undergraduates doing science or technology. One of the most important duties of personnel officers (or of directors charged with recruitment) is to maintain close relation with appointment boards, with principals of technical colleges and headmasters.

Job rotation and "learning by doing" is still the guiding principle of most existing training schemes, aimed mainly, as has been said, at developing men for senior posts. Investigation has shown that by far the greatest factor in a trainee's performance is the quality of the men under whom he works. This is, more than anything else, what determines the success of training; clearly it is this also which transmits a tradition of efficiency and humanity or the reverse. But industrial training schemes do increasingly include lectures on the firm's organisation, operations and policy; most emphasis is placed on tool subjects like works study, costing, and production control. "Crown princes" are often given a period in the works study or central planning department.

The major problem is how to give men a series of "little ship" responsibilities. A chemical firm may start a man in the laboratories, and let him work on a project which he will carry through to the pilot plant stage, learning as he goes something about costing as well as labour relations; he may then go on to small manufacturing plants. A trading firm, or an oil company, will have a series of branches of varying size in which men can develop as leaders. In engineering and motors, inter-department rotation is the rule; enlightened firms now send men temporarily to allied firms—suppliers or customers—to gain experience. The steel report recommends this. One advantage of collecting a variety of subsidiaries is that they provide training grounds for budding executives. Where men must be trained under one roof, the American system of making them act as assistant foremen, or in other such positions, is sometimes practised. Some firms encourage men to join small firms

where they will have top responsibility, with the intention of re-employing them later on. Finally, large firms now sometimes have their own "staff colleges" for advanced training; others hire colleges like Ashridge for a week at a time to get senior executives together.

But not all firms can pass managers through grades of responsibility, or give them any wider background, or successfully impart managerial training to specialists and technicians, or arrange staff courses. Their teaching also suffers because the subject matter is confined to one firm, and the spirit of criticism is lacking. But as a rule it is not until the firm's resources are proved inadequate that "academic" courses for supplementary training—except for foremen—are considered. The common attitude is summed up in the remark "When a man is in a rut, and there's a bigger job for him, we send him on a staff course somewhere for a fortnight or so. The lectures may be punk, but he meets new people, and the fact that he's been chosen and the firm is paying, boosts his morale." Most firms insist that they cannot spare men for long, and the use of a staff course is simply to "broaden" men trained in the firm. However, there can be no question that the short residential course to "broaden" managers has got a real grip on British industry. The salient example is, of course, the Henley Staff College course. This takes three months—a long period by most firms' standards—but is accepted by so many firms as the proper "postgraduate" course for a man being groomed for senior management that there is a long waiting list. Other colleges provide shorter courses.

On the other hand the proportion of firms who dovetail an internal training programme with a part-time technical college course, or run a sandwich course with an internal scheme and a technical college residential course is still small. But it is growing, as is shown by the rising numbers of part-time students. The idea that universities and technical colleges have something to give is at last taking root. But it is still a precarious growth.

The Academic Contribution

THERE is a story of a white-faced professor of economics who, asked by a colleague what had upset him, replied that he had lost his faith. His colleague, not knowing him to be particularly religious, looked surprised. The professor sighed, "I've been teaching economics for thirty years and only just realised that I've no idea how business men make a profit at all." "But surely," his colleague said, "they only have to compete with other business men."

This should perhaps be taken to illustrate the diffidence with which British universities approach the question of teaching business men their jobs. They offer no first degrees in management, and even the Bachelor of Commerce degree is being abandoned. This is not just because they regard management as vocational, but because they regard it as vocational without any core of basic intellectual discipline. Five universities offer postgraduate courses in business administration; but Birmingham and Glasgow lay the emphasis on production engineering, and only the London School of Economics, the Manchester College of Technology and the Dundee School of Economics offer anything comparable to the postgraduate courses given at Harvard. The teaching is at university standard; besides lectures

in subjects that require lecturing about, they use the case-study method in discussion seminars, link study-visits to factories with problems under discussion in the classroom, bring in business men to have their brains picked on their own specialties. They conduct research into business problems, and the small cadre of British "business professors" find themselves as welcome in industry, and their advice as sought, as their American opposite numbers.

Yet they are disappointed about the progress achieved. After 25 years the response from industry remains negligible. They desire to mix graduates (usually with degrees in economics or sociology) with men of 30 to 35 marked down for middle or senior management in firms and sent to the university for a thorough grooming and intellectual broadening. But it is painfully clear that industry is (1) completely unsold on the idea of losing promising men to the university for a whole year on such a course, and (2) while it will certainly take on graduates who have "done" business administration after their first degree, it is even keener to get the bright young men immediately after they have graduated. English students are unwilling to spend an unpaid year "doing" business administration

AT SHELL-MEX AND B.P. LTD. training for management goes hand in hand with the efficient development and distribution of its products. This is an investment which ensures the future of the Company, its staff and its customers.

Enquiries welcomed by Staff Manager,

SHELL-MEX AND B.P. LTD., SHELL-MEX HOUSE, STRAND, W.C.2.

HOUSE OF LEARNING

Staff education and training have always been regarded by I.C.I. as valuable means of advancing efficiency in the conduct of the Company's business. Many educational activities are carried out locally in I.C.I.'s manufacturing Divisions and Sales Regions. These include training courses which draw their members from all parts of I.C.I., both at home and overseas, and are designed primarily to improve knowledge and skill in the various branches of the business. In the Spring of 1955, I.C.I. established a new Staff Training Centre at Warren House, Kingston-on-Thames, with the object of

organizing, on a fully residential basis, regular courses in management. Warren House is fostering an intelligent appreciation of the Company's aims and affairs, and providing a further opportunity for the exchange of information and opinion between members of the world-wide I.C.I. organization. In this way, I.C.I. is equipping the men who will take on the responsibilities of tomorrow with that progressive attitude towards management which has come to be a Company tradition.

The Aristocracy of the 20th Century

IN THIS COUNTRY we live by our brains, and it is by our skill, experience and integrity as manufacturers that we make our living. We must therefore foster in every way the contrivance, inventiveness and enterprise of our young people, especially those with the capacity to become professional engineers, the aristocracy of the 20th Century. Within Associated Electrical Industries, high responsibility and pay are there for men with that capacity.

In the electrical industry, where opportunities can be grasped only by those with training, engineering apprenticeship forms an essential part of training for management. University graduates and those who have passed the General Certificate

of Education at advanced level, who believe they possess ability, should write to the Education Manager of one of the following companies of A.E.I., for details of training schemes.

rather than "getting into the works." The courses are an export business, patronised mostly by foreign students.

This is the more disheartening inasmuch as business men often praise American business education, and declare that they would send men to British universities if they were "as good as Harvard." But they are thinking of the Harvard advanced and middle management three-months' residential courses corresponding to Henley. They forget that American firms rely on postgraduate courses taken immediately after the first degree to train their middle managers.

Nevertheless, the leaders of the management movement are bitterly critical of the "failure" of the universities to provide business education; they blame the snobbery of the past and the vested interests of other faculties. They continue to think of first degree courses, of the type provided in ordinary American business schools—although Harvard rarely accepts such "graduates" for postgraduate study. According to *Fortune*, while the "business majors" outnumber the graduates of all other faculties except teachers, their average intelligence is the lowest of any.

However that may be, it was to fill this gap in British education that the scheme for management education at technical colleges to be jointly operated by the Ministry of Education, and the British Institute of Management was set up on the recommendation of the Urwick Committee. It was an ambitious scheme. The "professional" institutes such as the sales managers and office managers accepted a common intermediate examination with a syllabus framed by the Urwick Committee; students could then branch into more advanced specialised studies and take the appropriate professional examination or take a diploma in general management. Some 80 technical colleges undertook the teaching, and a vast expansion of staff and facilities took place—not only to meet this commitment but also to cope with the expansion in other technical and managerial courses of which the British Institute of Management has listed some 300.

The course for management studies is based on five years' part-time study—three years to intermediate level and two years to the diploma. It is now almost ignored by the professional bodies, and is taken for its own sake as a course in management by hopeful students. Since it was instituted so recently, it may seem unfair to judge the results; but, in fact, it is now widely regarded as an almost complete failure. The scheme is now under investigation by a "working party" set up by the British Institute of Management and the Ministry of Education. The fate of those who have gone through the course is to be the subject of a special research. It is probable that the diploma for general management will be abandoned; but the reshaping of the syllabus is giving difficulty.

The course can be judged by the quality of its students. Men with university degrees cannot stomach such elementary and theoretical stuff, so that its contribution to middle management must be negligible. It has, in fact, mainly attracted earnest self-improvers of the supervisory grades—indeed, the steel industry report recommends it for them.

Part of the reason for its ill-success lay in the impossibility of equipping the technical colleges to carry it out in so short a time. The full-time teachers often work far too long hours and try to cover far too many subjects; to range from management accounting to economics, development and design and "human relations" (psychology, of a sort) can amount to little more than reading what was in a text book to students who then write it all down again in notebooks.

The Ministry of Education makes sure that outside lecturers have good qualifications on paper; but the fees are low, and if the lecturers need them, they can hardly be very high-grade managerial timber. Such teaching, with little or no organised discussion, a dearth of good case studies, no visits to factories or any background of research may correspond to the performance of the poorer American business schools, and the Ministry may be satisfied that it is the best that resources permit: but it is not what the Urwick committee set out to achieve. Some university teachers think that the working of the BIM/MOE scheme has turned business men even more against an academic contribution to training for management than they were. If this is so, it is a bitter blow for the British Institute of Management.

★

In the light of experience, it would obviously have been far better to have concentrated upon a few technical colleges and given them adequate resources to try out the scheme and—what is no less important—to experiment with it. The assumption that the part-time five-year BIM/MOE syllabus necessarily met practical requirements was unwarranted. Technical colleges which have felt their way with local industry in finding out what was wanted (rightly or wrongly) and supplying it, have done better. Their justification is their students; both Birmingham and Manchester Colleges of Technology, for example, see that they are getting promising young men from middle management to train, as well as supervisors and technicians. But they are careful how they describe their executive development courses for young men on the way up. "We don't claim to train managers," one principal said. "We sell a course at a fair price which fits local firms' arrangements, which we have studied. All we claim is that we can help them with their training." He added thoughtfully, "In theory, of course, we give a diploma. But nobody has ever seen it."

What, then, does industry want, to judge by the response? It would be impossible to assess the 300 or so courses given in the British Institute of Management's survey. Broadly, what industry will buy (in management not, of course, technology) seems to fall in these categories:

1. Part-time, residential, and weekend courses on general foremanship and on specialised supervision.
2. Part-time courses (covering 12 to 30 weeks) on practical subjects like work study or personnel management.
3. Part-time courses in executive development dovetailed into firms' own schemes, covering a year or less.
4. Short staff courses (say 4-6 weeks) of evening lectures on practical subjects.
5. General "broadening" courses for shop stewards and trade unionists.
6. Short "broadening" residential courses: at Henley for higher executives, and at the BIM or the University Summer schools, or other colleges, two weeks to three months.
7. Weekend conferences at Ashridge, Chesters, etc., arranged usually by such organisations as the British Institute of Management, professional bodies or firms.

This may seem a poor showing by American standards, even when the third rate business school training and the sillier conference activity is trimmed off; but it compares well with Germany, where the universities and *technische hochschulen* offer no more and are as short of teachers. Nevertheless, out of the money and effort expended on management education, disappointingly little has emerged so far. What can be done to find a better answer?

A Time for Experiment

IT is obvious that it will take a further period of experiment to work out processes of management training to suit British conditions. Neither the universities nor the business men show any inclination to develop anything like the American network of business schools. The most fruitful possibility seems to lie in the collaboration of the Colleges of Technology with local industries (the Colleges of Technology are freer to experiment than the technical colleges under the thumb of the Ministry). This in time should establish the relative roles of internal and "academic" training in the making of a manager of any particular grade. It will not come about by central planning, or by the sort of indiscriminate "do gooding" which backs any and every scheme or course on the grounds that even the worst is better than nothing. It will come about as the two parties most concerned—the industrialist and the teacher of management subjects—get to know each other's minds better.

The immediate task therefore is to improve the contact between classroom and boardroom. The great need is to improve the quality, standing and educational grasp of the teacher himself. Only when he can talk to top management as one who knows exactly what he is talking about can he make an impression. The ill-paid, overworked, ill-qualified teacher of the past was too obviously near the level of the students he instructed—supervisors and minor technicians.

The primary needs are:

- (i) Colleges should have a staff adequate to allow teachers to specialise in two or three management subjects.
- (ii) The staff should, further, be large enough to give teachers time to spend in industry, or to alternate between industrial and educational employment; and, in particular, to take consultancy work at appropriate fees.
- (iii) It should also be large enough and of sufficient calibre for the college to be able to undertake serious research.

Under such conditions, with the improved Burnham scale, it should be possible to attract a larger number of men to teaching who have had worthwhile business training, and thus to produce a counterpart to the American "business professor." Alternation between teaching and managing is vital, though not all educationalists will approve teachers making outside money; but unless they can (and business men will respect them more if they can) it will be hard to attract teachers who know their subject well enough to be paid by industry to practise it. Consultancy is to management instruction what pure research is to university teaching. Out of research and consultancy work will come both living and written "case studies" which are the anatomical specimens of management seminars.

On the industrial side it is clear (i) that top management will get more out of the good colleges of technology if they meet their teachers half way with facilities and (ii) that industrialists must help with the teaching. There are signs that industrialists are prepared to discuss their management problems more with the colleges, notably those from industries (like locomotive building) which have received hard jolts in recent years. Not all university teachers consider that business men can do worthwhile part-time teaching, and deny the analogy with teaching hospitals; their view is that teaching administration is a specialised, and essentially a university job. The colleges think differently, and

many believe that they are successfully training business men to teach both by courses of lectures and in seminars. In any case, managers at every level must continue to teach in their own firm's training courses. The growing number of graduates in industry should produce a more co-operative and understanding attitude from the industrial side.

The improvement of technical college teachers of management subjects, and a growing cadre of "teaching industrialists," should also raise the standards of staff college courses. It is in large part for lack of teachers that they—and especially Henley—adopt the "syndicate" method of instruction, which basically means that the students teach each other under a leader experienced in getting everyone to make a full contribution out of his specialised knowledge. Because most staff courses are so short their subject matter should be specialised and taught with professional skill.

Finally, there is the future of the graduate in industry to consider. Some can take improved management courses at colleges of technology. But, however described, this is postgraduate training and the question is whether the universities ought not to provide it. They can, however, expect to play only a small part until firms are prepared to face the cost of releasing a man for a year to take a full year's postgraduate work. There is this difficulty: a senior man is unwilling to take a year off unless he is sure he is going to be promoted thereafter, which in turn means financing a fairly well-paid man, destined for higher rather than middle management. On the other hand it is less expensive to put a young trainee through such a course, but harder to assess if it is going to be any use to him. The answer may lie in a sandwich course, under which a graduate does a first year with his employers, then an academic postgraduate year, and then further training in the firm. Some plans along these lines are being made. The universities are convinced that a year's course is the minimum in which a worthwhile training can be imparted; and they certainly have the example of Harvard to support them. But they have an academic setting, and the British industrialist (so far) feels that Harvard has a more practical atmosphere and a more realistic technique in teaching men to deal with business situations. The universities intend to discuss the problem next February.

There is certainly no future for diplomas and degrees in management, though their abandonment will mean the loss of a nice export line in parchment and engraving. Examinations, on the other hand, are perhaps necessary if work and syllabuses are to be assessed.

The business man who feels that the great bulk of formal training must still be done inside factory or office walls is no doubt right. It will also mainly be done by the big firms. But this is as true of the United States where learning by doing is a respected maxim. Good American management—especially middle management—is not the result of a record number of business degrees. It is the product of a national climate of industrial attitudes of which the schools are only one expression. Better British management can only emerge from a conviction of its "professional" dignity and importance which finds British modes of expression.
