United Nations: Tenth Anniversary

AT Opera House, San Francisco, the fifty founding members of the United Nations, together with the ten who acceded later, have met once again this week in an atmosphere of hope to commemorate the signing of the United Nations Charter ten years ago. In 1945, the men who assembled at San Francisco amidst the gloom of war-time devastation were eager for the dawn of a new era. In the ten years since, their wishes have not been adequately fulfilled. The Cold War among the Big Powers commenced shortly after and then, on the fifth anniversary of the United Nations, war broke out in Korea. Until a year ago, the prospects for peace in the world have never seemed bright. The turn for better in international relations is very recent and dates back only to the Geneva Conference of last year; optimism has so far been felt only for a fraction of this decade since the United Nations came into existence.

But hope springs eternal from the human breast and it has been possible for the sixty nations now assembled to feel once again that they are at the dawn of a new era of peaceful international relations. The world's statesmen who gathered at San Francisco, have now reaffirmed their faith in the principles of the Charter. But they now know from their own experience that the Charter by itself cannot go to work to ensure peace. Without an honest desire on the part of the members to observe the spirit of the Charter, the United Nations cannot be a success; for proof of the existence of that spirit we have to look elsewhere, not within the Articles of the Charter. At the moment men everywhere are anxiously pinning their hopes on the "Summit" talks at

Geneva to be held later this month; but so long as shooting war is kept away, there will always be something else to provide that source of hope.

That ten troubled years after their proclamation, the principles of the United Nations Charter should still be found to be not only acceptable but also unexceptionable is a glorious tribute to the lofty vision of its founders. In the difficult times which have followed, there have been frequent suggestions for revision which are still being put forward. Some amendments are indeed necessary and may have to come in due time but that is not the crux of the problem of the United Nations. Mr. V. K. Krishna Menon expressed a profound truth when he said that without Big Power agreement, no amendment would be possible and that when such agreement can be secured, amendments become superfluous. This is rather over-simplified but it emphasises the need for the right approach. The leaders of member Governments have shown, on the whole, that they are not the workmen who quarrel with their tools.

The outstanding contribution of the United Nations during these years of tension was that it provided a world forum—Mr Dulles has quoted Vandenburg's famous phrase "town meeting of the world"—which gradually acquired a strong moral influence. That is why the General Assembly has risen in stature while the Security Council, originally designed as a more powerful body, has taken a back place. A serious obstacle to the expansion of the General Assembly's role now arises from the difficulties about extending its membership. So long as the fourteen nations, who have waited long for admission, and the others who have yet to qualify for it are kept out, there will be a major flaw in the principle of universality of membership which will be a constant reproach on those who are responsible for the situation.

The conditions of membership of the Security Council are not less objectionable. The Council is based on interests rather than on the principles of equality; and even so, the virtual exclusion of China and the ineffectiveness of France has further imparted unreality to its proceedings and impaired the executive functions of the Council. It is, therefore, not merely abuse of the veto which has been responsible for its decline. If there had been no veto but only a rule of majority, the other inherent drawbacks due to faulty representation would have risen to the surface to make the United Nations a controversial institution. The existence of the veto was an essential condition for the coming together of major Powers in the United Nations and it is naive now to wish it had been away.

The imperfections of the United Nations are best seen in the ad hoc agencies and procedures which have been established to fulfil those needs of member nations which could have been better met within the Organisation itself. New groupings of nations have come into existence; some are merely found in the lobbies at Lake Success, but others are based on regional or historical links. The Commonwealth is an important force in world politics today, because of the opportunities available to it to supplement with the methods of quiet diplomacy, the [illegible] activities of the U.N. The meeting of [illegible] only an extension of [illegible] private diplomacy. [illegible] charged an additional role; it brought together many nations hitherto kept out of the world body for one reason or another. Similarly, the weakness of the Security Council in the discharge of its police functions has compelled the creation of regional defence systems which have greatly stretched the meaning of the appropriate provisions of the Charter. All these circumstances go to show that in an imperfect world, the United Nations could not become an all-embracing world organisation to regulate international relations. It had to be buttressed on all sides by other institutions.

In sum, the political achievement is not inconsiderable. The small nations have acquired confidence in the Assembly. In Iran, Greece, Indonesia and Korea dangers to peace have been tackled by reasonably prompt measures, in other areas, efforts at mediation have brought a halt to hostilities even if they have not provided permanent solutions. To this must be added the quiet achievements of the Economic and Social Council in its varied activities to promote material welfares and relieve distress. This experience has strengthened the capacity of the United Nations to undertake new responsibilities, whether in the field of disarmament or the peaceful uses of atomic energy or the improvement of living standards. The last ten years have proved that when men are brought constantly together, to discuss their differences as much as their problems, they tend to agree eventually in some form.

Here in India, public opinion has not uniformly approved the actual working of the Charter of the United Nations. There has been a legitimate grievance over the poor representation for Asia in the Security Council and the anomaly of the Formosan Government continuing to function as a permanent member. India has unsuccessfully canvassed the case for the admission of the Peking Government to the United Nations. On Kashmir, the Security Council, it is felt, hesitated to take a strong view of aggression, which it felt expedient and necessary in Korea. And on questions of racialism and colonial rule of backward areas the Indian standpoint has been on the whole ineffective against the Powers concerned. There was distrust of the Security Council's procedure on Kashmir. There has been dislike of the intense lobbying and Big-Power influence in voting in the General Assembly.

Against these shortcomings, however, there have been important gains. The United Nations has offered scope for distinguished Indians to play leading parts in international gatherings. The late Sir B. N. Rau earned a high reputation for himself and his country; Mrs Vijayalakshmi Pandit as President of the General Assembly and Mr Krishna Menon as India's delegate have played equally notable roles in the United Nations. By thus enlarging the scope for useful activity in spite of her being treated on a par with the smallest nation, India has been able to demonstrate that permanent membership does not mean much in practice, except for its usefulness in safeguarding special extra-national interests of certain Big Powers. With time, however, India has acquired the type of diplomacy suited to make the best of the United Nations while accepting its limitations. It is due partly to the realisation that in paying homage to immutable principles while making many necessary compromises in practice, the United Nations is not functioning very differently from India herself.

The Deadline in the Viet Nam

AS July 20, the deadline for initiating talks on elections in Viet-Nam, approaches, a deepening shadow is falling across the existing prospects for eventual peace in Asia. Many anxious statements have already been made—the most anxious and urgent of all being Mr. Nehru's, at a press conference in Vienna on Monday. Mr. Nehru paid a tribute to the spirit of co-operation in the International Supervisory Commission in Indo-China, indicating that the source of the present trouble lies not in the composition of that body but in developments in Viet-Nam which have wildly confused the picture. Besides the question of elections, Mr. Nehru mentioned that the adherence of the three Indo-China States to major military alliances had further complicated the position. Here then is a problem which has defied the influence of the changing climate of international relations at high levels. The only outcome of the Geneva agreement has been the stoppage of the senseless slaughter of French troops. But in all other respects the situation seems much worse than before. It is certainly so in South Viet-Nam which the democratic world hoped to save from the worst consequences of the civil war.

It seems unlikely that the Geneva Summit talks, which will synchronise with the deadline for election talks would find a way out of this problem. But there is no need to assume that the Big Powers do not have the means to bring the parties round if they so desire. The Viet-Minh leader, Ho Chi-Minh, is now on a mission to Moscow via Peking. There is certainly significance in its timing, though larger issues of economic and other collaboration with the Communist Powers is said to be the objective of his mission. Haiphong has now been occupied and a majority of Viet-Nam's population numbering about 12 millions have now come under the rule of the Communists in the North as a result of the Geneva settlement. Will the possibility of these people being tutored and coerced to vote for the Viet-Minh—together with such votes as can be secured through propaganda from sympathizers in the southern areas—encourage the Communist leaders to agree to free elections under international supervision, under conditions which will also be acceptable to the South?

Considering the confused conditions in the South, it may pay the Communists to appear reasonable about the conditions for fair and free elections. The Government of India's influence has, in this case, been exerted strongly on the Communist Powers. The Nehru-Bulganin declaration has given a lead, so to say, to the Communists. It was indeed a round-about way in which the subject has come up in the Moscow talks between the two Prime Ministers; the declaration invokes the Soviet Union's joint Chairmanship at Geneva last year and India's Chairmanship of the International Commission as providing the close common interest of the two countries in the subject .The exhortation to the Governments concerned is unlikely to meet with resistance on the Communist side except that in practice many difficult situations can be created. This declaration at Moscow has been further reinforced by the Warsaw joint statement to the same effect, deploring the new difficulties that have arisen. Will obstacles then arise from the other side?

At the moment, there are some very uncomfortable features about the Government of South Viet-Nam. Premier Ngo Dinh Diem has been harassed by the insurrection of crazy political groups which enjoy no reputation either for integrity or patriotism. Their actions are believed to be inspired by French interests still operating in the country. This discreditable internecine struggle seems to be nearing its end but clearly it has not helped the Premier to extend his political influence or administrative control over a major portion of South Viet-Nam which is not under Communist influence. Dinh Diem has been carrying on at the same time a controversy with Paris demanding control over the army and de facto independent authority for his Government, revealing himself thereby as a fanatical nationalist. There is a probability that he would show similar fanaticism in his attitude to the elections. Though he enjoys the active encouragement and assistance of the United States authorities, it can very well be urged that the Premier is at the same time not amenable to Western influence, in the sense the Communist leaders are reputed to be subservient to Moscow.

Herein lies a serious danger. There is the risk that in obstinately sticking to the technical plea that neither the Government of Viet-Nam nor the U.S.A. was a party to the Geneva Agreement, its implementation would be resisted. The time lost thereby could be utilised for preparing for elections, so that when they are finally held, they do not enable an easy Communist walk-over. The alternative to an immediate agreement on elections would be the continuance permanently of two spheres, as in Korea, in which sources of future discord will be inherent. In other words, conditions might arise in which the operative portions of the Manila Treaty could be invoked on the grounds of subversion or threat of invasion, even if the internal unpopularity of Diem regime should be responsible.

Under the Geneva Agreement, France alone has the obligation to carry out the Geneva settlement, but French policies in Viet-Nam, especially in encouraging or in not controlling the dissident sects, has been shortsighted and has hardened Diem's opposition. Bao Dai has now been more fully revealed as impotent and it is perhaps a matter of time when he will be repudiated more completely than he has been. American influence on Diem has, therefore, become the vital element in the situation. Mr. Dulles has now expressed his faith that if there are conditions of really free elections there is no serious risk that Communists would win. "The Communists" he said, "have never yet won any free election. I don't think they ever will." The conditions of such freedom matter very much but the people of Viet-Nam must also find they have a stake in defending the southern regime.

The political foundations of the democratic half of Viet-Nam are yet feeble and it is clear they cannot be improved by military fortifications alone. That makes it odd that there should be a premium on defensive alliances even to the extent of endangering a settlement reached on the basis of the Geneva negotiations. It is possible to hold that conditions will not be ripe for free elections in view of the developments subsequent to the Geneva Conference. But the proper course then would be to negotiate afresh for postponement and not to avoid elections for reasons which will not appeal very much to Asian or world opinion.

THE WEEK'S NOTES

TITO'S VISIT TO MOSCOW

THE ANNOUNCEMENT that Marshal Tito, has accepted an invitation to visit the Soviet Union, should be read in conjunction with a passage in the joint communique issued this week on the conclusion of talks between Yugoslavia and the United Kingdom, French, and United States Governments. This states: "The four Governments expressed their firm conviction that the existence of a strong and independent Yugoslavia, and continued co-operation between them under conditions of full equality, are a contribution to peace and stability." The fact that President Tito's acceptance of the invitation was made public after the issue of the four-Power communique sufficiently indicates that the visit is in conformity with the terms of the latter. That Marshal Tito should go to Moscow would be a logical sequel to the agreement reached between the Yugoslav and Soviet Governments in Belgrade "to take further steps towards normalization of their relations." That he will go as head of State of a "strong and independent Yugoslavia" will be in consonance with the attitude which the Marshal has consistently maintained.

It may further be recalled that the Yugoslav-Soviet communique of June 2 expressed agreement regarding "compliance with the principle of mutual respect for, and non-interference in, internal affairs for whatever reason, whether of an economic, political, or ideological nature, because the questions of internal organization, of different social systems, and of different forms of socialist development are solely the concern of the individual countries." This Soviet vindication of Titoism was an outstanding product of the Soviet-Yugoslav talks. On the four-Power exchanges of views in Belgrade, the communique states that the talks have taken place "in an atmosphere of cordiality and mutual confidence." The Soviet-Yugoslav communique said the talks "were conducted in a spirit of friendship and mutual understanding." It is noteworthy that whereas the Yugoslav-Soviet communique contained no reference to the Balkan pact, the four-Power communique states that the four Governments "consider that the fruitful co-operation being developed in all fields in the Balkan alliance is also an important contribution to peace and stability in this part of the world."

MALAYAN PEACE FEELER

POSTED IN a town in Siam by a representative of the "Malayan Racial Liberation Army Supreme Command H.Q." and addressed to the United Planters Association, a letter from the Malayan Communists demands the end of the eight-year war in the Federation, and a round-table conference of all political parties to discuss means of ending the emergency. "The emergency regulations must be abolished" says the letter, "and democratic freedom and the rights of the people must be safeguarded to enable a general election to be carried out in a peaceful and democratic atmosphere". The anthenticity of the letter has not been doubted by the Administration. It bears the date June 7, and the timing is certainly significant. Lieut-General Sir Geoffrey Bourne, the Malayan Director of Operations claims that the Communists have in fact been defeated while the party claims that they have not been vanquished.

The question is whether the Communists should be left to avail themselves of the terms of surrender offered to them—which some individual Communists have accepted already—or whether their demand for special conditions should be considered. There will be no disposition to offer special terms for those who have practised terrorism and are surrendering either from weakness or because the aims of international communism have for the present been modified. It is estimated that there are today only 3,500 terrorists compared with 8,000 in 1951 and desertions are reported to be increasing. It might be convenient now for the Communists to transfer their activities to the political front and spread confusion among the political parties but there is no obligation to accept their offer to participate in constitutional processes at times of their own choosing.

RISK GUARANTEE TO PRIVATE CAPITAL

THE PROPOSED scheme for a system of incentives for the outflow of American private capital into India is not quite new. The Randall Commission had considered it among other things and it has been reported that a number of countries have agreed to accept it. There is no particular defect in the proposal which should make it unacceptable to India and on the face of it the considerations which applied to the treaty of commerce navigation and friendship, do not enter here. The venture capital will flow only in those industries which the Government of India is ready to permit. The insurance will become effective only in case of loss of investment arising through the action of the Government concerned and in such cases the investor will be reimbursed by the U.S. Government, which the latter will recover them from the country of investment. The definition of the circumstances in which claims will become effective by the investor and the U.S. Government respectively may prove somewhat difficult.

The real question is whether the existing guarantees to foreign private investors are so inadequate as to need fresh measures. The Prime Minister was quite emphatic in his speeches on the Constitutional Amendment about compensation to foreign investment in the event of acquisition. The question may arise whether other regulatory legislation would attract the system of guarantee and full details would be needed to arrive at any definite conclusion on the subject. How much will such special guarantees enlarge the scope for foreign private capital into this country? The answer would vary. It is not possible to say that the dangers of expropriation or exchange inconvertibility are real in India so far as foreign capital is concerned, whatever be the position for local investors. It is also useful to quote an American view on this matter. Mr Clarence Randall, former Chairman of the President's Commission on Foreign Economic Policy had this to say "...it adds heavily to cost, since it is paid for like insurance. In practice the programme has not greatly stimulated private investment abroad. Most American companies seem to prefer to go it alone, taking their own risks in the traditional American way, and not looking to their Government for support."

ORDINANCE AND TRIBUNALS

THE PRINCIPLE of issuing Ordinances during a parliamentary recess, which was hotly agitated some time ago, is again involved in the two Ordinances issued this week. While the State Bank of India (Amendment) Ordinance meets a special situation arising out of the nationalisation of the Imperial Bank from July 1, the Industrial Disputes Appellate Tribunals (Amendment) Ordinance involves no such emergency. A press note claims that the step was necessitated by the large accumulation of certain applications with the Appellate Tribunal which has seriously interfered with the more important part of its work of hearing appeals. The accumulation could not have occurred sudden[illegible]

and the amendment of the procedure established by a law enacted by Parliament could well have been left to Parliament, if timely action had been taken.

Section 22 of the Appellate Tribunal Act 1950, provides that an employer should take the Tribunal's sanction for alteration in the conditions of service or discharge of an employer while a dispute is pending before the Tribunal or while there is time for filing appeal. Section 23 provides for a complaint to the Tribunal by an employee where an employer takes action without such sanction. In both cases, Parliament had specially provided that even these applications should be heard by the whole Tribunal, as if they were appeals. That was perhaps uncessary, because they could have been treated like interlocutory applications in civil appeals. The Ordinance now provides that the Chairman or any other authorised member may dispose of such applications sitting singly. It is also provided that such applications may be transferred to any of the industrial tribunals specified for the purpose by the Government; such industrial tribunals can dispose of them finally and there will be no right of appeal to the Appellate Tribunals from these decisions. To this extent, there has been a limitation of the appellate jurisdiction; but in practice, this would depend on the Chairman of the Appellate Tribunal who may or may not exercise the right of transfer of applications.

STRAIN OF THE STRIKE

WHEN SOME months ago, there was a prolonged newspaper strike in Britain and there was a blackout on important developments it was considered a very serious affair. Actually, however, it turned out that it was not felt as keenly as newspapermen in their vanity thought it would be. Similarly the U.K. railway strike which has now ended created a state of national emergency and its economic consequences have been greatly feared. There is less anxiety now on this matter. The cost is expected to be much less than expected. The coal industry did not it appears, suffer any interruption or dislocation in spite of its close dependence on rail transport. Some rail workers had also remained in their posts but there was a speedy shift to road transport and it is claimed that deliveries of coal were about four-fifths of normal and that the steel industry had worked at about 90 per cent of its capacity. Workers resorted to several kinds of make-shift arrangements for reaching their places of work.

A curious consequence of the strike is also the discovery of some traders of alternative and cheaper means of transport. In carrying fish from port towns to the centres of population, road transport has been found to be economical. It is true that export orders could not be fully honoured though in important cases air transport also was utilised. Manufacturing establishments could carry over some of their demand for transport by running down their stocks of raw materials. When they replenish their stocks, some additional demand would result. But there has been shown a great capacity for adaptation, for out of evil there comes some good.

The bad consequences of strikes cannot be minimised on that score. The final agreement in this case does not show that the strikers had gained their points while the strain of the strike has been severe on the entire nation.

TRIBALISM—BLACK AND WHITE

THE DOW COMMISSION on East Africa has presented its report after two years of investigation of the problems of land and living. The Commission has arrived at some bold conclusions, though this does not mean that they will be accepted and implemented. There is little new in the finding that the African peoples resist change; the Mau Mau represents a relapse into primitive ways. It is not Africans alone who regard "land-holding as the sole form of economic security." The preservation of the White Highlands represents an equally narrow outlook, the less excusable because it is held by more advanced people. "Tribal and...racial rigidities affecting land have...brought about a situation of increasing tension, the basis of which is fear. Those who occupy land fear that they may lose it or be deprived of it without proper compensation and with no opportunity to purchase other land in its place. Those who have no land fear that they may never be able to acquire it. Thus those who occupy land cling to it, irrespective of their ability to use it properly."

While there is no excuse for holding the two races at different levels of civilisation equally culpable in this manner, the Commission has done well to refuse to be rigidly bound by its terms of reference which precluded its taking into account existing obligations in relation to land at present reserved for the white races and other groups. Land policy should aim at the ownership of land by individuals and sufficient mobility in the transfer and disposition of land to promote its economic use. This seems obvious but the prospects for its implementation are dim; the Government would hardly be in a position to take the lead in such a revolutionary proposal which affects settlers' interests.

RECORDS & STATISTICS

(QUARTERLY BULLETIN)

Editor: R. V. MURTHY, M.A.

"The Eastern Economist" Bulletin of Records and Statistics surveys economic trends in each quarter in India and abroad with the aid of graphs and all available statistics. One of its special features is the Investment Supplement.

A Window on the World

HOW HISTORY IS WRITTEN

BY

ODYSSEUS

THE GREAT CHANGES of history—the Mutiny of 1857 or the French Revolution of 1789—are brought about by the ideas that inspire men to action, and these changes then become watersheds of new ideas that influence the minds and actions of men for decades or centuries after they took place—as have the events of 1857 and 1789. Since ideas are so powerful, I suggested last week that it is of the first importance to ensure that they are based on facts, conscientiously ascertained and honestly interpreted. Today, I cite four versions of an episode of history and I hope to show how uncertain was the evidence on which these historians had to base their confident accounts and interpretations. That the episode may be examined more objectively and that whatever lessons it offers may be more readily accepted, I have chosen it from French rather than from Indian history.

An introductory observation: Consider the problem of historians such as W. H. Moreland and A. C. Chatterjee, who undertake to tell the whole story of India, beginning with Mohenjodaro, in one volume of 538 pages of approximately 400 words each, which works out to 43 words in which to narrate the events of each year! Yet to report the events of one single day, a newspaper like the "Hindustan Times" publishes 14 pages of which about 8, each with 8 columns of 800 words each, are devoted to reporting the news, i.e. a total of 51,200 words, the equivalent of 128 pages of Moreland and Chatterjee's book which covers 5,000 years! The historian's task cannot be that of a photographer. He must be a painter. It is clear that a painter cannot get the whole landscape on to his canvas; it is impossible to reproduce every rock and tree, still less the shadows and mosses on each rock or the tens of thousands of leaves on each tree. As L. B. Nemier says in his delightful "Avenues of History", to distinguish a tree you look at its general shape, bark, and leaf, but to count its leaves and measure its branches would get you nowhere. Similarly what matters in history is the great outline and the significant detail. What must be avoided is the deadly morass of irrelevant narrative.

Obviously then, before he begins to write, the historian must study what can be a virtually limitless amount of source material in order to decide what his outline will be and what significant details he will choose, and it follows that since he will not have use for more than perhaps the thousandth part of the sources that he studies, he is subject to the temptation of delving superficially, here and there, and has little inducement to penetrate below the surface, to widen and deepen his studies; it will save him time and trouble if, instead of checking the archives afresh, he accepts the versions of their contents that previous historians of the same subject have given.

All this suggests once more the extraordinary degree to which we are dependent on the historian's industry and integrity. Be it said to the credit of the profession that honest scholars abound in it. Even so, their number is greatly exceeded by the potboilers who put history together from "secondary sources", i.e., the published work of original researchers. The law of libel prevents me from naming names.

A FORGOTTEN REVOLUTION

The historical episode that I have chosen for analysis is the French Revolution of 1848. In that year, King Louis Philippe lost his throne following a rising in Paris between February 21 and 24th. This week we will see what the historians say happened and why they think it important, if they do. Next week we will compare this with the evidence of some contemporary witnesses.

I hasten to add that I am not suggesting that these particular historians are necessarily wrong in their assessments. Their accounts are in broad agreement and complement each other. What is, however, interesting, is the different amounts of space that each can, within the framework of the outline upon which he has decided, afford to devote to the episode and the different aspects on which each lays emphasis. You will perhaps grasp better one of the points that I am making if you try to imagine what impression of the events of February 21-24, 1848, you would have if you were to read only one book about them and that therefore each of my extracts is the sole and entire knowledge that you have of an event which "echoed round Europe". To play fair, I must disclose that in order to keep within my own allotted space, I have had to cut down some of the accounts cited; this, however, merely modifies the scale, but not the point, of my argument.

Let me sketch the background of 1848. My own assessment of such secondary sources as I have read suggests that this revolution decided the course of European history for the next thirty years and had even further repercussions. The abdication of the king, Louis Philippe, set off risings in Prussia, Italy, and the Austro-Hungarian empire. If the Liberals had achieved the unity of Germany in 1848, Bismark could not have laid the foundations of German imperialism, and there might have been no World War I and no Hitler. If Louis Philippe had not abdicated, Louis Napoleon Bonaparte could not have got himself elected president of the Second French Republic and thereafter have become that emperor of the French who lost the Franco-German war of 1870, thereby starting a chain of Franco-German enmity that has not yet been broken.

Professors A. J. Grant and H. Temperley in "Europe in the 19th and 20th Centuries", a book of 701 pages, sum up the momentous events of February 21-24 in 22 words: "The French Revolution of 1848 was the work of Paris alone, and of only a small part of the population of Paris". Bus hogia!

Chambers' Encyclopaedia says: "Throughout Guizot's Ministry the Opposition demanded electoral and parliamentary reforms... In 1847, the 'banquets' campaign was organised throughout France. The first was to take place in Paris on February 22, 1848. It was banned by Guizot. Barricades were set up in the centre of Paris and the National Guard shouted 'Vive la reforme!' A clash between soldiers and demonstrators led to a general rising. Louis Philippe taken completely by surprise...abdicated..." and then skips to the story of the Second French Republic.

EMERGENCE OF A LEGEND

H. A. L. Fisher in the 2,455 pages of his monumental three volumed "History of Europe" has space for no fewer than six pages on 1848, and he lists among its several causes one of direct interest to our discussion on the power of ideas: the emergence of the Napoleonic legend. "As the years proceeded, what was painful and ruinous in the policy of the great emperor (Napoleon) was forgotten. The grinding tyranny of the conscription, the destruction of the flower of French manhood, the foreign invasions, and the loss of territory, while poets, pamphleteers, and historians combined to decorate the wonderful epic of French victory which was recalled by the very sound of his name... While Beranger sang of his wars, and Victor Hugo celebrated his victories in the 'Ode a la Colonne', the memoirs and conversations of the exile at St Helena, being arranged with a view to the future of his dynasty, presented the Empire as a transitional fabric, designed to promote Liberalism and nationality, but ruined through the malice of the dynasts before it had been able to display the full measure of its beneficent quality. This view of the Empire, not as a despotic, but as a Liberal and democratic thing, steadily gained ground. The legend of the little Corporal, who, carving his own way to fortune, toppled over throne after throne, and then died a martyr to British tyranny in a wind-swept island in the Atlantic, built itself up with many affecting and pathetic circumstances in the heart of the people. When in 1840, the ashes of Napoleon were brought back to be buried in Paris the Second Empire was as good as made." Napoleon's nephew Louis, took advantage of this historical myth to stage a bonapartist come back and to create a second empire that collapsed in 1870.

In the course of the three pages that he can spare out of the 241 of his "Re-making of Modern Europe 1789-1878", J. A. R. Marriot says: "Louis Blanc preached Socialism to the masses, and from him the French artisan learnt of his 'right to work' at the hands of the state. It was this doctrine which supplied the driving power of the Revolution of 1848, and which was thus responsible for the overthrow of the Orleans monarchy...The immediate cause of the outbreak in Paris was the obstinate bungling of the Guizot Ministry in regard to a banquet which the Reformers had organised for February 22 to advertise and promote their objects. Interdicted by the government, it was abandoned by the Reformers, but the same day Barrot rose in the Chamber to propose the impeachment of the Ministry. In Paris, the temper of the mob was rising rapidly. Crowds were beginning to parade the streets; the familiar barricades were erected, only to be demolished by the troops. On the 23rd, Guizot's resignation was announced... But it was too late. Not even Barrot could control the mob. Several collisions had already taken place between the troops and the people; the corpses of fifty victims had been paraded through the streets; the National Guard had mutinied ..."

We noted earlier that these accounts complement rather than contradict each other. This could arise from four possible causes: all the writers (1) were of the same political outlook; (2) shared the same contemporary attitude towards the events in question; (3) had exhaustively investigated the original sources and reached the same conclusions, or (4) were all drawing on a common "secondary source", i.e. a predecessor who had claimed to have gone thoroughly over the originals and to have written the definitive work in 1848! Those familiar with these historians will know that (1) they have different political outlooks, and (2) all wrote in this century, long after 1848. There remain possibilities (3) and (4) which we will examine, together with some contemporary 1848 witnesses, next week.

Please be good enough to keep this issue of "the Eastern Economist" in some safe place so that you may compare what was said today with next week's evidence.

THE BIRLA JUTE MANUFACTURING CO., LIMITED.

NOTICE is hereby given that the Annual Ordinary General Meeting of the Shareholders of the Company will be held at the Principal Office of the Company, No. 8, Royal Exchange Place, Calcutta, on Wednesday, the 27th July, 1955, at 3-30 P.M. for the following purposes:

(1) To receive and consider the Report of the Directors and to pass the audited accounts of the Company for the year ended 31st March, 1955.

(2) To declare dividends on Preference and Ordinary Shares.

(3) To elect Directors in place of those retiring by rotation.

(4) To appoint Auditors and fix their remuneration.

(5) To transact any other business which may be brought before the Meeting with the permission of the Chairman.

The Share Transfer Books of the Company will remain closed from 18th July to 27th July, 1955 both days inclusive.

By Order of the Board,
CALCUTTA, BIRLA BROTHERS LTD.
Dated, 22nd June, 1955. Managing Agents.

In particular to: Smt. Grihya Kumari, Smt. Sarojini Devya, Mrs. Rubie Nanda, Messrs. Ambika Charan Neogy, Gopal Chandra Das, Burjoriji D. Mama, Andrew Gibb, Gayanath Saha and C. K. Mistri & Ors., Kedarmani A. Dikshit and E. E. F. Moseis.

NOTE: If Dividends on shares as recommended by the Directors are passed at the meeting, THE DIVIDENDS WILL BE PAYABLE ONLY TO THE REGISTERED SHAREHOLDERS, whose names are on the Company's Register on the 27th July 1955. No application need be sent for dividend as relative Transfer Deeds for Ordinary Shares of Soorah Jute Mills Co., Ltd., or fractional coupons will be posted to such shareholders by the 27th of August, 1955. On receipt of the Transfer Deeds duly signed by the shareholders and on completion of the transfer, the respective share certificates will be sent to them.

The shareholders are requested at once to notify any change of address.

BOOK REVIEWS

ECONOMIC DEVELOPMENT

Approaches to Economic Development: Authors: Norman S. Buchanan and Howard S. Ellis: The Twentieth Century Fund, New York: $5.00.

The literature on economic development, particularly of underdeveloped countries, has now become so voluminous and in parts so controversial, that the time is ripe for a substantial work of consolidation which brings the subject up-to-date. The Twentieth Century Fund in the United States is to be congratulated in having performed this task in a work which can justly claim to be the standard reference work in the growing and conflicting field. This book forms part of necessary reading for all those engaged in economic development in South-East Asia. Although written primarily from the American point of view with a frank admission that America's stake in the underdeveloped countries is political as well as economic and humanitarian, it is capable of direct application without any corrective for American bias. It is anti-Communist in purpose, but objective throughout, remarkably so in Chapter 10, which deals with Economic Development of the U.S.S.R.

Part I and II which deal respectively with "An Analytical view of the Problem" and "Economic Development as Recorded History" are essential preliminaries to the major argument of Part III, where the kernel of the book is to be found. Even more precisely, the kernel is to be found in Chapter 19 which treats of "A General View of Economic Development". This article deals with three propositions of major Indian interest contained in this exposition.

On page 407 is to be found a philosophy, of which adequate notice has not hitherto been taken. The authors state: "Merely providing more capital equipment from abroad or demonstrating superior techniques of production will not create an environment from which innovations are bound to appear, or in which the entrepreneureal spirit and point of view are certain to flourish. If these could be assured, internal productive capital formation would almost certainly follow. Only in a very limited and comparatively trifling sense can economic development be "imported". In nearly all its important essentials it must be generated from within. A people whose standard of living is not above its level of living is not likely to achieve much material progress. There must be a desire for economic progress coupled with a determination to achieve it."

This pregnant paragraph has certainly an application to recent Indian experience. No purely economic explanation is sufficient in respect of India's spectacular economic progress since 1952. There is no doubt that a great psychological change has accompanied Indian economic development since 1952. It may well be that in agriculture at least, it is this change rather than the economic co-ordinates, which have been causative.

If the psychological factor has been causative, it may well be that the continuance of economic progress at this rate will depend not so much on capital formation as on what the authors call "entrepreneurship, innovation and technical progresss". The authors tend to underrate capital accumulation as a dynamic factor and advance a powerful argument to support their view. They say: "Specialists believe that a rate of increase in total output in the developed countries over long periods has probably averaged about two to three per cent. Let a calculation based on plausible (even generous) assumptions, first concerning the probable yield on increments of the capital stock, say, 5 to 10 per cent per year, and second, concerning the proportion of total income that goes to capital formation say, 10 to 15 per cent, yields a rate of increase in total output well below the 2 to 3 per cent increase that in fact seems to have occurred. For example, if total income were 100, and if 10 per cent of this were capital goods output on which the average yield was 10 per cent, then the increase per period in total output would be 1 per cent. With a yield rate on 15 per cent, the figure would be 1.5 per cent. With capital formation 15 per cent of output and an average yield rate of 15 per cent, a figure which is almost certainly too high, the resulting increase in total output would be only 2.25 per cent.

It is the entrepreneur allied to the forces which "make it possible to produce the same product with fewer productive resources" that accounts for the difference. The figures quoted are certainly very suggestive. It is likely that mere capital volume used does not explain more than half of established rates of economic growth. The entrepreneur with all that inspired management, allied to new technical processes has contributed the other half.

There is a consistent underestimation in India of the character of entrepreneurship and the agency which brings technical progress into economic play. Much of physical planning on the Mahalanobian model sets out the generation of income as if the agency of management is either neutral or equally effective in the private and public sectors. This is almost certainly a major error.

The third important point in the discussion relates to an error which dominates the report of the Indian Taxation Enquiry Commission. The authors state: "Productive capital formation in these (underdeveloped) areas need not necessarily be at the expense of consumption, in the sense that consumption must decline if capital formation occurs. If idle resources can be utilized or if resources can be diverted from non-productive uses—from ceremonial activities, from non-productive capital formation or from the maintenance of non-productive capital goods—then productive capital formation can go forward without appreciably affecting consumption." No comment on this judgment is here necessary.

U.S. FOREIGN ECONOMIC POLICY

A Foreign Economic Policy for the United States: Clarence B. Randall. The University of Chica go Press. $1.95. Pages 93.

To those who have watched with dismay the manner in which powerful congressional lobbies have thwarted successive attempts to make U.S. foreign economic policy progressive, the recent change in climate would come as a great relief. Even when the Randall Commission reported, there were, inevitably, concessions to business interests mainly arising out of the composition of the Commission. Mr Randall has since then seized an opportunity to make his own personal views clear. In three lectures presented under the auspices of the Walgreen Foundation of the University of Chicago, he lays down in unequivocal language what American economic policy should be in respect of trade and tariffs. Condemning strongly the inability of the American business community "to place national welfare above self-interest" Mr Randall outlines a set of unexceptionable rules of

policy which would enhance America's security and the strength of the rest of the world. They may not be politically feasible all at once and Mr Randall is not unaware of the need for gradualness but his impassioned plea for realism seems to stem from the conviction that outspoken criticism would do nothing but good to the U.S.A. at this stage. Himself a businessman until he became chairman, his criticism cannot be misunderstood and his continuance as Special Consultant to the President on foreign economic policy augurs well for the implementation of a new policy.

Mr Randall is mercilessly logical in exposing the contradictions of protectionist arguments. His lectures were addressed to American audiences and there is little, if any, criticism of other countries. He stresses the importance of making countries like Japan economically viable, of promoting East-West trade for that purpose and of helping convertibility of currencies. The necessity for outlow of private capital from the U.S.A. and steps for the expansion of tourism are also emphasised. And on the touchiest of all subjects, namely farm price supports and American sale of surplus agricultural products, Mr. Randall has no hesitation in declaring that the system is full of contradictions and that there should eventually be a movement away from fixed prices. He minces no words; his great strength of conviction and mastery of the subject are clearly revealed in the decisive tone of his argument.

ECONOMIC SURVEY

1. **Economic Survey** 1919-1939 by Professor Lewis, Stanley Jevons, Professor of Political Economy, University of Manchester. Third Impreession 1953. Price 15s. Pages 221.

THE GREAT INFLATION

2. **The Great Inflation** 1939-51 by A. J. Brown M.A., D.Phil., Oxford Professor of Economics, University of Lleeds.

The first world war marked a decisive change in the temper and tone of world economy. The half century prior to 1914 was one of the expansion and confidence in continued, progress. In spite of increased production and higher standards of living (on the whole) in leading countries in the post-war era, the climate of hope could not be recovered but gave place to one of insecurity. Professor Lewis finds the explanation to this phenomenon in the collapse of international trade that followed the war and peace of 1914-1919. He traces waves or cycles in the period from 1919 to 1925, 1925 to 1929 and 1929 to 1939 and reviews the efforts made in The United Kingdom, U.S.A., Germany, Japan, France and the U.S.S.R. to recover normalcy by their governments. The second half of the period was marked by a complete recognition of the necessity of State action to restore the national economy to its moorings. It was the period or era of Planning. Professor Lewis shows how this Governmental action was not always wise and far-seeing. The remedy however, was not going back to laissez faire but forward to discover more effective methods of government action in economic matters.

Professor Lewis does not consider the validity of the claims of socialism by contents himself with the suggestion that it is possible within the four corners of the capitalist system to regulate or control economic forces in such a way as to remove the deadlocks at present clogging economic advance. Economists need to find an economic expression for class or social unity which would be inclusive of the interests of labour and capital, and justify a certain amount of economic inequality in the interests of all. Also, it is necessary to define further the particular ways in which government could intervene without supplanting private enterprise altogether. Can the world regain a stable and expanding economy? Professor Lewis indicates two lines of hope. One is increased production of primary commodities through application of technology, especially in South East Asia. The second is the industrialisation of new countries like India and China.

Professor Brown carries on the story of the post-war era in terms of the new worldwide inflation that lasted from the last war (1939) to the Korean crisis. The two books together offer us a complete picture of the new era after 1914 up to the present day with its phases of collapse of international trade, inflation, unemployment, price control, devaluation, rationing and so on. Professor Brown also stresses the need to stabilise the prices of primary commodities to counteract inflation. He agrees with Professor Lewis in thinking that the best way of doing this is by holding buffer stocks in accordance with international agreements.

3. **Essays on Liberty Volume II** by several writers. Published by The Foundation for Economic Education, Irvington-on-Hudson, New York. 1954. Pages 442.

These essays on liberty make a fresh analysis of human rights in the light of the American Declaration of Independence. They defend property rights as part of human rights. They seek to limit the functions of government to the primary duties of defence, law and order and justice. They take up an extreme anti-Statist view which is entirely out of tune with current feelings. Nor do they offer a constructive alternative to the Government-sponsored activities of social and economic guidance extending everywhere today. They are negative and critical and so fail to convince the reader.

NEW NATIONS OF SOUTH EAST ASIA

4. **New Nations of Southeast Asia** by William Henderson. Headline Series: Foreign Policy Association, U.S.A. Pages 57. Price 35 cents. 1955.

This is a short pamphlet giving a succinct account of the present position, economic and political, of four important countries of Southeast Asia—Malaya, Thailand, Indonesia and Indo-China. Nature is abundant here but owing to foreign subjection for a long time (except Thailand) the people are ill-prepared to take up their responsibilities as free nations and build up a modern, democratic society and state. The author is aware of the necessity for a "cultural synthesis" to enable the peoples of these lands to transform their traditional culture and to assimilate modernism with self-respect and confidence. He is aware of the danger of Communist subversion in these societies and approves of the America-sponsored SEADO. He recommends that free economic aid should also be given to sustain the new economies and help them to resist communist blandishments.

WORLDGRAM

AGRICULTURE

Lower World Food Output: For the first time since the war total world agricultural production in the year 1954-55 failed to rise above the level of the previous year. Small gains in production in Western Europe, Latin America, and the Far East were offset by falls in North America and the Near East. Apart from sharp fluctuations in cocoa, coffee and tea prices which fell to below late 1953 levels, there were no pronounced disturbances.

*

U.S. Farm Exports: United States Sales of farm products abroad increased from July 1954 to January 1955, to be 10 per cent higher than they were in the corresponding period in 1953-54. Total for the 6 months is estimated at $1.8 billion. United States farm exports totalled $329 million in November 1954, greatest monthly total since March 1952 and 17 per cent higher than in November 1953. Largest increases were in cotton, cotton seed oil, soyabeans, organes, barley, potatoes, and dry edible peas and beans. Declines took place in milk, beef, corn and rice.

*

Legislation for Land Reforms: Two land reform Bills, namely, the Punjab Occupancy Tenants (Vesting of Proprietary Rights) Amendment Bill, 1955, and the PEPSU holdings (Consolidation and Prevention of Fragmentation) Amendment Bill, 1955, have received the President's assent. The object of the first Bill is to clarify certain provisions of the Punjab Occupancy Tenants (Vesting of Proprietary Rights) Act, 1952, which vested proprietary rights in occupancy tenants and provided for payment of compensation to the landlords whose rights are extinguished for certain consequential and incidental matters. The Second Bill seeks to remove certain lacunae and ambiguities in the existing law. Under this legislation, non-evacuee lands allotted in lieu of evacuee lands would assume the attributes of evacuee property, while the evacuee lands included in non-evacuee holding would cease to be evacuee property in PEPSU.

INDUSTRY

European Steel Production Rises to New Heights: Figures given in the United Nations Economic Commission for Europe's latest 'Quarterly Bulletin' of Steel Statistics indicate that European crude-steel production in the first months of 1955 has broken new records. Expressed as an annual rate, exceeded the record or near-record 1954. Production in the first quarter 1955, outputs by the following percentages: Italy 20, Western Germany 18, France 18, Belgium 15, Luxembourg 11, United Kingdom 10, Saar 4 and Netherlands 1.

*

West German Industrial Expansion: Industrial activity in Western Germany continues as strong as ever. Imports of raw materials are still at a record level. The German motor-car industry has made an excellent start to 1955, producing at an annual rate of over 800,000 units of cars and vehicles. Compared with the January-February period of 1954, output this year is 37 per cent higher—133,254, units, against 97,811 last year. Steel output is running at an annual rate of 19.5 million tons. January-February output in 1955 totalled 3,256,738 tons, against 2,508,584 tons in the corresponding period last year. Export orders from countries outside the coal and steel pool area increased from 122,500 tons in January to 168,300 tons in February.

*

Record Industrial Output: Australia's industrial production reached an all-time high record in 1954. Business conditions were buoyant during the year, and Christmas retail sales were at record level. In Queensland meat production improved, sugar production was a record, and wheat production increased to 15 million bushels compared with 9,000,000 in 1953. Dairy production was static. The real level of output of the nation's economy in 1953-54 increased by 5.98 per cent above that of 1952-53, and 4.77 per cent over the previous peak of 1950-51. Last year's expansion of production was attained by a work force which by the end of the year numbered 3,520,000. Real output for each worker last year was 3.72 per cent higher than in the previous year, and 3.47 per cent above the 1950-51 peak. The Bureau suggested there were indications that pressure points were appearing at which both demand and cost inflation could present actual problems. The economy was virtually at the "full" employment stage. On the other hand, there had been powerful deflationary forces evident which were responsible for holding in check widespread inflation.

*

Vegetable and Chrome Tanned Leathers: The Indian Standards Institution has recently published an Indian standard on methods of sampling and test for vegetable and chrome tanned leathers. This standard gives detailed procedure for sampling of leathers and prescribes methods of test for chrome and vegetable tanned leathers, which include medium and light substance shoe upper leathers, like box sides, box kips, box calf, glazed kid, chrome gloving leather and other chrome tanned industrial leathers. This standard is to assist the leather industry in the country to adopt uniform methods of sampling and tests.

TRADE

Yugoslav-Burmese Economic Co-operation: In the first quarter of 1955, the Yugoslav firms concluded contracts for considerable trade with Burma. The total value of exports amounted to 232,000 dollars. The contract included among other things, such as cement, lead pipes, salonite-sheets, nails and small metal goods, delivery of 100 goods wagons costing 212,00 dollars. Apart from the supply of military equipment exports to Burma so far were not great. The value of exports in the first four months this year amounted to only 5,760 dollars, whereas imports from Burma during the same period amounted to 290,650 dollars. The chief items of imports from Burma were rice and teakwood. It is, however, stressed that economic co-operation between both countries has already surpassed the frames of the exchange of goods. A team of Yugoslav geologists is taking part in the geological survey in Burma. In addition to these, Yugoslav firms have submitted to the Burmese authorities a large number of plans for various projects. The results achieved so far in the field of economic co-operation are quite encouraging.

*

India's Trade with Pakistan, Afghanistan, Iran and Burma: The total value of foreign trade of India by land with Pakistan, Afghanistan, Iran and Burma during April 1955 are as follows:

Merchandise exports :	Rs. 50 lakhs
„	To Eastern Pakistan Rs. 26 lakhs
„	To Western Pakistan Rs. 19 lakhs
„	To other countries Rs. 5 lakhs
Merchandise imports :	Rs. 153 lakhs
„	from Eastern Pakistan Rs. 136 lakhs
„	from Western Pakistan Rs. 1 lakh
„	from other countries Rs. 16 lakhs
Total Trade	Rs. 203 lakhs
Re-exports	Nil
Trade in treasure	Negligible
Balance of Trade	The total value of exports fell short of imports by Rs. 103 lakhs.

Danish-Polish Trade and Payments Agreement: A trade and payments agreement between Denmark and Poland for 1955, provides for an exchange of goods to the value of DKr 55-65 million. Denmark has hitherto paid for Polish coal to the extent of 7 per cent in dollars and 20 per cent in sterling. Under the new agreement, all payments will be made in sterling and the earlier swing credit will be discontinued.

*

Indonesia's Exports of Raw Materials in 1954: Exports of raw materials produced by foreign estates in East Sumatra in 1954 increased compared with figures in 1953, with the exception of rubber whose exports declined by 15 million tons. Rubber exports in 1954 were 161,136,367 tons whereas in 1953 they amounted to 177,783,366 tons. Increases were exports of tea, hemp, palon-kernal and palm-oil. Hemp exports in 1954, amounted to 20,283 tons, in 1953 they were 17,781 tons. Tea exports in 1954 amounted to 14,790,894 tons in 1953 to 13,557,691 tons. Exports of palmkernal in 1954 were 12,118,382 tons, in 1953 it was 41,329,418 tons. Exports of palm oil increased from 154,579,221 tons in 1953 to 162,921,115 tons in 1954.

FINANCE

World Bank Loan for Karachi Power Project: The International Bank for Reconstruction and Development has announced a loan in various currencies equivalent to $15,800,000 for the development of electric power in Pakistan. The borrower is the Karachi Electric Supply Corporation (KESC), which supplies power to the metropolitan area of the Pakistani capital. The project, being financed with the help of the Bank, will double the present output of power generated by KESC and will help to relieve the acute power shortage in Karachi. The Bank expects that all of the loan will be in European currencies, chiefly pounds sterling and German marks. Six of the Eastern exchange banks—a group with offices in Pakistan—are participating in the loan, without the World Bank's guarantee, to the extent of £735,000 ($2,058,000).

*

Customs and Excise Revenue in April 1955: The total gross sea and land customs revenue collected in the Indian Union during April 1955 amounted to Rs. 12.22 crores as compared to Rs. 11.68 crores collected in the corresponding month of the previous year. Of the total customs revenue collections, import duties accounted for Rs. 9.7 crores, export duties for Rs. 2.28 crores and land customs and miscellaneous for Rs. 24 lakhs. Figures for the corresponding period for last year were: import duties Rs. 9.6 crores, export duties Rs. 1.86 crores and land customs and miscellaneous Rs. 22 lakhs. The total gross collection of Union Excise duties amounted to Rs. 10.51 crores as compared to Rs. 9.35 crores for the corresponding period last year. The grant total of gross customs and Union excise revenue realised was Rs. 22.73 crores as compared to Rs. 21.03 crores during the corresponding months of the preceding year.

*

Reduction of Licence Fees: Following the withdrawal of the exemption granted to powerloom factories producing cotton fabrics, numerous representations have been received by the Government pointing out that the annual licence fee of Rs. 100 weighs heavily on the smaller units. Government have given careful consideration to these representations and have decided that as a measure of immediate relief the licence fees payable by powerloom factories should be reduced to a nominal sum of Re. 1 in the case of units with less than 10 looms, to Rs. 5 in the case of units with less than 25 looms and to Rs. 10 in the case of units with less than 100 looms. Instructions have been issued to all—Collectors of Central Excise to give effect to these orders immediately and to grant appropriate refunds in all cases where the full rate of Rs. 100 has been already realised.

*

Capital Issues Control: During the quarter ended December 1954, Government of India granted consent to 42 applications from Joint Select Companies in the country for issue of capital of a little over Rs. 21.49 crores. Thirty of the applications were from Industrial Joint Stock Companies, while the remaining 12 were from non-industrial Joint Stock Companies. Of the 42 applications, 20 were from new companies for a total issue of capital amounting to Rs. 10.07 crores. The Industrial Credit and Investment Corporation India Ltd., with a total issue of Rs. 5 crores capital, figures prominently among the 20 new companies, which include tea estates, two sugar factories, two mining enterprises, one company for the manufacture of Ferro Manganese, two cotton textile companies, a concern manufacturing automobile and stationery engine parts; sugar refinery and a rubber estate.

MISCELLANEOUS

Electric Traction Equipment for India: Electric traction equipment worth about £900,000 has been ordered from Associated Electric Industries (India) by Jessop & Company, which is supplying 104 coaches for broad-gauge multiple unit trains for the Calcutta suburban railway electrification scheme. The new rolling stock will comprise 34 three-coach units, each consisting of two driving trailers with a motor coach in between. Two spare motor coaches have also been ordered. The bulk of the electrical equipment will be made by Metropolitan-Vickers Electrical Company at its works at Sheffield and Trafford Park, Manchester. Approximately 10 per cent will be manufactured in India. The South African Railways and Harbours Administration has placed an order for 349 electrical railway coaches with Metropolitan-Camel Carriage & Wagon Company to the value of £7,200,000.

*

Indo-U.S. Agreements: Three supplementary agreements amounting to $522,700 U.S. assistance for joint projects have been signed between the United States Government and the Government of India. India's contribution to these joint projects amounts to Rs. 11 lakhs. By another supplementary agreement India's contribution has been raised by Rs. 71.25 lakhs for a joint project for "River Valley Development." According to an agreement, the United States Government will place a sum of $279,000 at the disposal of the Government of India for a joint project for Social Welfare Education. By another U.S. will contribute $235,000 for a joint project for expansion and modernisation of marine and inland fisheries. But for the study of thermal environmental conditions, U.S. will contribute $8,300. And for expansion of Aviation, U.S. contribution will amount to $2,340,500 in which India's contribution amounts to Rs. 603,000. U.S. will raise its contribution by $90,000 for another project for Training, Construction Equipment Operators and Mechanics.

*

FOA Loan to Iran: An agreement for a loan of $32 million to Iran was announced on April 4 by the Foreign Operations Administration. The loan, which is repayable in U.S. dollars over a 25-year period at an average rate of interest of 2.41 per cent, is part of FOA's $74.3 million allotment to Iran for technical cooperation and development assistance during the current fiscal year. The loan funds will help Iran carry out its extensive plan for economic development. FOA loans, made under provisions of Sec. 505 of the Mutual Security Act, are negotiated by the U.S. Department of State and FOA. The FOA is responsible for disbursement of the loans and other administration is handled by the Export-Import Bank.

NEWS IN BRIEF

INDIAN

The number of foreign tourists in India last year touched the record figure of about 40,000, while the country's earnings of foreign exchange from the tourist industry amounted to nearly Rs. 5 crores.

*

The Rehabilitation Finance Administration disbursed Rs. 950.94 lakhs as loans to displaced persons till the end of April, 1955.

*

The estimated expenditure on a basic type of community project (which does not include urban units) is Rs. 65 lakhs spread over a period of three years, of which Rs. 6.35 lakhs is dollar expenditure.

*

In the case of an urban unit of the ommunity project, the estimated cost is about Rs. 11 lakhs, of which Rs. 4.5 lakhs is in dollars.

*

A five-man delegation is being sent by the Government of India to Australia and Indonesia for about five weeks to study the various steps taken in those countries for the proper development of the sugar industry to see how far these measures could be applied in tackling the problem of the Indian sugar industry.

*

A £1,000,000 order for a dredger for Calcutta has been placed with a British firm by the Calcutta Port Commissioners intended for service on the River Hooghly.

*

Nearly 1,000 delegates, including 500 from India, are expected to attend the ninth Congress of the International Society of Sugarcane Technologists to be held in New Delhi from January 27 to February 4, 1956. An exhibition of sugar machinery of the latest design is proposed to be organised during the session.

*

The Punjab Government proposes to spend Rs. 28 crores on education schemes under the second Five-Year Plan.

*

Overall overseas trade figures for 1954-55 reveal that U.K. continued to be both India's best customer and supplier of goods, with exports to Britain increasing faster than imports.

*

Jute production in India in 1955-56 is expected to reach 4 million bales as a result of the implementation of the main recommendations of the Export Committee on jute set up by the Government in 1952.

*

The Government of India have reviewed the policy with regard to export of Kyanite ore and have decided to continue free licensing on presentation of shipping bills till the end of December, 1955.

*

The Institute of Indian Foundrymen was founded in 1950. The Institute's scope and activities are limited to the technical field, including foundry training, improving foundry practice and technique in the country to bring it at par with the best practices elsewhere in the world.

Economic Report from the U. S.

AMERICA'S FARM PRICE SUPPORT PROGRAMME

WASHINGTON, June 28.—America's wheat farmers just a few days ago casted their most important ballot of the year. When they voted on the agriculture Department's proposed marketing quotas for their 1956 crop, they were in effect deciding the fate of the Government's farm price support programme. The result was a surprise, not so much over the outcome itself, as over the decisive margin by which growers voted for continuation of the price support programme. More than 254,000 or 77.5 per cent of those casting ballots, voted in favour of quotas. This means that wheat plantings for the 1956 U.S. crop will be held down to 55 million acres, although the same as the 1955 acreage allotment, yet well below the 1954 and 1953 allotments. Each farmer will have his own allotment within this total, based on the number of acres he had planted in other years. His marketing quota is the amount of wheat he raises on his allotted acres.

With wheat surpluses continuing to mount, however, the Government's support price on the 1956 crop will be lowered to $1.81 a bushel, representing 76 per cent of "parity"—the theoretical figure deemed fair to farmers in relations to the prices they pay for the things they buy. Supports on the 1955 crop were figured at $2.06 a bushel, or 82.5 per cent of parity.

In view of the proposed lower support prices, observers were predicting a much closer vote, with the possibility that farmers might even reject the quota programme, as last year, quotas were approved by 73 per cent of the farmers voting. If marketing quotas had been rejected, the 1956 suppport price would have dropped by law to 50 per cent of parity, i.e., about $1.19 a bushel. In actual practice, this could have meant no controls at all, since most farmers probably would have preferred to take their chances on getting a better price in the open market. But the wheat growers apparently favoured the present system, because they were undoubtedly aware of the chain reaction that rejection of marketing quotas could have set off. A substantially lower price for wheat, for instance, could have put it into competition with corn (as livestock feed), affecting livestock marketing and supplies and endangering historic relationship among farm products.

The Government's price-support programme provides floors under basic farm products, which includes corn, tobacco, rice and wheat. If the market price falls below the support level, the Government puts the farmer's product in storage and pays him the support price. The Government, however, cannot sell a stored crop until the market price reaches 105 per cent of the current support price. For several years, the market price has been below the support level, and the stored crops have continued to accumulate. Despite the acreage and price cuts of recent years, the stored surplus of wheat has grown to about 1,000 million bushels. The Government's investment in these supplies now total some $2,700 million, estimated at 37 per cent of the total funds the Government has put into farm price support programmes.

With this year's crop estimated at 845 million bushels, there is little chance of any surplus reduction before the 1956 harvest. Domestic consumption and exports this year are expected to total about 842 million bushels. Exports have increased some 30 per cent this year. But at an estimated 240 million bushels, they are still less than half the total in the 1952 season. This may reflect efforts of importing countries to attain greater self-sufficiency, as well as attempts of other exporting countries to expedite sale of their wheat abroad.

In this connection, the agriculture department has pointed out that more than 96 per cent of the world's wheat crop is produced and marketed under various forms of Government incentive and planning. In addition to the United States, such exporting countries as Argentina, Australia, Canada and Sweden have domestic price support programmes. In many other lands, Governments fix wheat prices or purchase wheat supplies outright. Wheat problems, therefore, are by no means peculiar to the United States. In time, as population continues to grow and living standards improve, the problem will be subject to gradual solution. For the present, the prospect is that U.S. farmers will be producing less wheat at lower prices next year, and perhaps in years to come.

GOVERNMENT OF INDIA

NATIONAL PLAN BONDS - SECOND SERIES (3½% 1965)

Limited to Rs. 100 crores (Approximately)

Rate of Interest 3½ per cent per annum payable half-yearly on 1st January and 1st July,

Repayable on 1st July, 1965.

Opening on 1st July, 1955 and closing on 5th July, 1955 or earliar without notice.

Issue Price Rs. 98-8-0 per Rs. 100 (Nominal)

Subscriptions will be received in the form of (i) Cash or (ii) 2½ % Loan 1955, or (iii) 4½ per cent. Loan 1955-60 which will be accepted at Rs. 100 for every Rs. 100 (Nominal) tendered for conversion.

Interest will be paid on the 2½ per cent. Loan 1955 and 4½ per cent Loan 1955-60 tendered for conversion up to and including 30th June, 1955.

Applications will be received at the offices of the Reserve Bank of India at Bombay, Calcutta, Delhi, Madras and Bangalore, at the branches of the State Bank of India at other places in India except in the States of Hyderabad and Mysore, at the branches of the Hyderabad State Bank in Hyderabad State and at the branches of the Bank of Mysore Ltd., in Mysore State.

For full particulars apply to any of these offices, branches or treasuries.

WEST BENGAL AND SECOND FIVE-YEAR PLAN

Observations by Dr. B. C. Roy, Chief Minister, West Bengal, regarding the proposed Plan Frame for the Second Five-Year Plan.

Three papers have been circulated for consideration by the Planning Commission regarding the framework of the Second Five-Year Plan, viz.,

one, by the Statistical Institute,

the second, by the Economic Divisions of the Finance Ministry and the Planning Commission, and

the third, by a Panel of Economists.

These papers differ somewhat in the number and content of the objectives of the Second Five-Year Plan. It seems there is a confusion between objectives and targets. The objective is the long-term goal. Targets are subsidiary positions to be covered in successive stages in order to reach this goal. The distinction is not merely pedantic; it has a practical importance. Targets follow from the objective. Targets should be concrete and specific; the objective can be only indicated in a general way. The objective is single, unipurpose; targets can and should be multiple, converging to this one final aim.

The objective of social planning can be only one. It is the conscious promotion of human growth. Such an organic growth postulates a balanced development of all aspects of human life, not only of the material base through steel plants, hydro-electric power, locomotives and machineries, but also of better nutrition, medical care and living comfort as well as mental stimulation and well-being through educational expansion.

We can only fix upon the targets of the Second Five-Year Plan if we are clear about our ultimate goal. One of the profoundest consequences of the definition of planning as the conscious promotion of human growth is to make us realise that social planning is an essentially biological problem. A mere statistical-mechanical approach is basically unwise and unsuitable, perhaps dangerous.

In order to reach our objective we should asses

(a) our currently available surplus resources, both material and human, which can be straightaway utilised for further growth;

(b) our current capacity for the organisational effort required for promoting such growth.

In assessing these, it is not enough that we recognize the potentialities of our resources or of our long-term capacity for effort. We should find out the current resources and current capacity. The potential may be larger, but to transform it into kinetic energy will require the utilisation of some portion of the available kinetic energy itself. Hence, what matters is not what are our potential reserves, but what is the extent of the existing resources and our ability to utilize them within the period of the Second Five Years. It is clear, therefore, that in this assessment we should recognise the qualitative as much as the quantitative approach through statistics and mechanical formulae.

All the three papers agree at achieving rapid development. They recommend a bold plan. They have tried to estimate the increase in national income, investment and employment to be achieved in the next five years.

ANNUAL NATIONAL INCOME

It is stated that the annual income in 1950-51 was Rs. 9,190 crores; it became in 1955-56 Rs. 10,800 crores, the rate of increase being 2.5 to 3 per cent. per year or 12.5 to 15 per cent. in five years.

It is proposed to increase the national income to Rs. 13,700 crores in 1960-61, i.e., the rate of increase should be 5 per cent. per year, or 25 per cent. in five years, that is to say, the present rate is to be doubled.

The per capita income is proposed to be increased from Rs. 282 in 1955-56 to Rs. 334 in 1960-61 after taking into account the increase in population in five years.

A. In order to achieve the above, it is suggested that the rate of investment in the next five years is to be raised from 7 per cent. of the national income to 11 per cent. of the national income. The total fresh investment required for new development works in the second five-year period will be Rs. 5,600 crores, of which Rs. 4,950 crores will come from domestic savings and Rs. 650 crores from foreign sources. Of the Rs. 5,600 crores, Rs. 3,400 crores will be in the public sector and Rs. 2,200 crores in the private sector. Rupees 3,000 crores more will be necessary for carrying on the present items of development and development outside the plan.

B. It is proposed that taxes should be increased even on essential supplies, if necessary, by amending Article 286(2) of the Constitution.

TOTAL EMPLOYMENT

It is proposed to increase the figure from 9 to 12 million over the five-year period. It is suggested that the major increase will be in mining and factory establishments, which will absorb 42 per cent. of the total increase in employment.

Let us test these two propositions.

(a) Is there any room for increased taxation? So far as State subjects are concerned, it is almost impossible to increase the sources of taxation, much less to attempt taxing essential supplies like food products.

(b) The level of our standard of living is very low. The margin of saving left after meeting the essential requirements is very narrow. If we take away a part of it for investment in schemes which will only bear fruit for direct consumption after some interval, the present standard of living will be further depressed. Therefore, there cannot be a curtailment of present consumption, which is already very low. It may be possible to get increased receipts of taxation if we can tap the higher income groups. But our present structure of taxation of these groups leaves little scope for them to bear any further burden.

To meet this criticism, it has been suggested that unemployed manpower and unexploited resources can be brought together to increase both consumption and investment simultaneously. It is also suggested that in an under-developed economy, where there are idle resources, increased investment need not necessarily imply reduction of consumption. We may agree that in the large-scale organised sector of the economy, unemployed resources of skilled labour can be put to work the present installed capacity of plant and equipment without any fresh investment . This can be done by working double shifts or more. We may consider the position of six of our large industries in India today, viz., textiles, sugar, steel, tea, cement and paper. It is reported that all these concerns are working at

more or less full pressure. But perhaps we may increase the production 5 to 10 per cent. by utilising the excess capacity of their present equipment.

In the vast sector of small-scale and petty production, semi-skilled or even unskilled labour, now unemployed or under-employed can put to work available land and existing hand-tools and craft-implements more intensively.

Both the above measures may increase employment to a certain extent. Additional wealth may be so acquired without any encroachment on current consumption. This additional wealth can be invested in improving our capital equipment. Of these two sources of increased wealth, the first one is mainly urban, well-knit, and perhaps easily controlled. The second one can only succeed if the people are motivated and the effort is spontaneous. These two processes are inter-dependent; expansion in the productivity of the urban sector can only be possible if increased raw materials are available and there is an improved market for urban products.

It has been suggested above that there has been increase in national income from Rs. 9,190 crores in 1950-51 to Rs. 10,800 crores in 1955-56. But it cannot be overlooked that the increase of wealth is not all in the form of directly consumable products. A considerable portion has been in the shape of dams, factories and other capital investments, which will take time to express themselves in a rise in the standard of living. A part has to be set aside for maintenance of capital previously installed, another part for the consumption requirements of the increased population. Only the remainder represents the net addition to wealth available for direct consumption.

We cannot calculate the amount that would represent such addition to wealth available for direct consumption. But it must be small. So far as the rural sector is concerned, increased production of food, for instance, will naturally lead to increased consumption by them. This demand for increased intake of food will be irresistible.

PATTERN OF TARGETS

Of the total proposed investment of Rs. 5,600 crores it is proposed to allot—

(A) Rs. 1,400 crores to industry, of which

(a) Rs. 100 crores will go to factories making consumer goods;

(b) Rs. 200 crores to household and hand-industries;

(c) Rs. 1,100 crores to manufacture of producer goods like heavy machinery, iron and steel, cement, chemicals, fertilizers and expansion of existing State enterprises;

(B) Rs. 1,350 crores for construction;

(C) Rs. 500 crores for electricity;

(D) Rs. 900 crores for transport and communications;

(E) Rs. 950 crores for agriculture and irrigation; and

(F) Rs. 500 crores for buffer stocks.

Perhaps barring part of Rs. 950 crores allotted to (E) and Rs. 300 crores to consumer goods, no consumable results are likely to be expected within the five years from the investment of the rest of the Rs. 5,600 crores.

The workers who are employed in concerns manufacturing non-consumer goods will receive wages which they would like to spend on consumer goods. According to the allocation of funds for different purposes, such demands for consumers goods cannot be met, with the result that there will be steep rises in the prices of consumer goods and a vicious spiral of inflation may result.

It is suggested that the surplus production from agriculture and small-scale consumer goods mentioned above will be controlled and rationed to meet the increased demand of consumer goods by wage earners. This is called a common production programme. This is hardly feasible in this country. The reasons are

(a) the excess from small-scale and hand-industries will be poor in quality and small in quantity,

(b) they won't satisfy the demands of the wage earners,

(c) the surplus will have to meet the increased demand of the villagers and they will not offer them for sale unless they get something in return which they value. Heavy capital or producer goods will not satisfy them. We should, therefore, plan for the needs of the villagers for their village enterprises—the need for raw-materials, improved tools, equipment and cheap power. We can then estimate the surplus which will be needed of coal, iron, steel and yarn, machineries for making tools, irrigation facilities and so on.

Such supplies will have an assured market. We can then calculate our targets for heavy industries also. Therefore, we should plan for

(a) increased production in agriculture and small-scale enterprise;

(b) increased consumer goods for the use of the increased number of workers engaged in making capital goods, construction works, transport, electricity, etc.; and

(c) begin with a fuller use of present installed capacity for consumer goods.

The Plan may be expanded to put in new installations in due course.

Letters to the Editor

PLANNING IN WEST BENGAL: THE FIRST ROUND

[We publish below without comment a reply from an official source to our article on this subject published in our issue of June 3, 1955:—Ed.]

The critical references to the West Bengal position contained in the article appearing in the issue of the Eastern Economist of June 3 last is welcome but it is to be feared that the Eastern Economist's contribution has been faulty both in regard to the logic of the argument which is under scrutiny, as well as the factual assumptions on which it proceeds. West Bengal's approach to the Second Plan has been made on the following assumptions (1) No sector of the economy, as also, no section of society, can be left out of account in a plan of comprehensive development. (2) Targets of efforts in each of these sectors and sections must bear a determinate relation to one another. (3) The starting point for tracing this pattern of relationships is at the base, which is in the rural sector (4) The sum total of efforts in all directions, taken together, cannot exceed the sum total of our current resources.

Once this reasoning is grasped, it should not be difficult to see that development must of necessity be multi-frontal. To launch a programme of simultaneous improvement in a number of directions is not only not inconsistent, but is imperative for promoting harmonious growth. Speaking concretely, it must be evident that even a simple measure of increasing agricultural efficiency in the village, such as, through provision of a slightly improved implement of tillage, demands a whole series of supporting measures through extension, experiment, research, training, and supply of ingredients. Consequently, a plan must make provisions in all these spheres; and not all of them are confined to work in the village. In other words, a properly conceived village-based plan involves action in the fields of medium, large-scale, heavy and basic enterprises also, and must draw into its orbit the middle classes and moneyed sections, no less than the people in the villages. To pillory West Bengal because it wants the Ganga Barrage Project and the Durgapur industries at the same time that it wants to construct a plan on the basis of rural development is to have missed this logic.

The Eastern Economist has urged that dams, factories and other capital installations represent the essential wealth of the nation. The West Bengal argument points out that minimum consumption for healthy growth is no less essential; and to ensure this is even more fundamental, because if that be denied, then there will be no development of the capacity to make use of and enjoy the wealth which may be ultimately produced by our capital projects. The truth is that efforts in all these directions are essential in different ways and that wise planning is a challenge to advance in a balanced manner without undue sacrifice of any of the vital requirements of social growth.

It is difficult to follow another charge which has been levelled against the West Bengal stand. It has been started that "to plead for further utilisation of pre-existing capacity of land and craft-equipment in preference to land reclamation and large-scale production is to put a permanent premium on inefficient methods of production." Let it be stressed again that, as indicated already, large-scale enterprise has not been left out of account. The point made by West Bengal is that large enterprise means large investment of capital; and in a poor country there must be the closest attention paid to augmenting our scarce supply of capital by stretching to the full all existing resources in the vast field of petty, rural enterprise. Would such a course of action mean stabilizing inefficiency, or would it mean, on the contrary, setting inefficient, petty industry on its feet towards sustained growth by tapping a hitherto neglected source of progressive capital formation?

Figures have been cited to show that while the Chief Minister of West Bengal pleads for moderating the targets in the all-India plan, the schemes in his own State are being drawn up on a grossly over-ambitious scale, bearing no relation to capacity or the overall requirements of balanced development which he enunciates as his objective. This criticism is based on incorrect information about certain facts. It is not true that a plan of 550 crores was cut down to 450 crores in Darjeeling. The object of the Darjeeling discussions was for Government as a whole to acquaint itself with the nature of the various proposals which had been drawn up by the different Departments. The first stage in planning is to prepare an inventory of needs. The needs arising in each of the different problem areas in charge of the different administrative Departments have first to be listed. The Darjeeling meetings considered the separate inventories drawn up for the separate problem areas. Thereafter certain directives were laid down. These directives referred to the steps which were to be taken to relate the needs of different categories with one another in order to make an organic whole, according to the basic objectives to be pursued.

In view of the paucity of resources, it was felt that priorities must be indicated in the ultimate choice of schemes. In determining such priorities, certain factors were asked to be taken into account. It was laid down that three main factors were to be borne in mind: the capacity of particular schemes to directly contribute to the production of new wealth. Secondly, the extent to which the increased production would lead to increased consumption and well-being; thirdly, the extent of diffusion of the increased production by employing the maximum number of people, so that their purchasing power and consumption standards should be raised. It was laid down for this reason that an important criterion for judging the various schemes would be their potential for productive employment, by which means alone we could ensure increased consumption of the wealth which was produced.

The Darjeeling directives also emphasised the importance of matching the effort which might be finally envisaged in this manner to the capacity which might be estimated to be available. But in considering this matter, West Bengal could not be obviously regarded as a self-sufficient and insulated area of planning. Certain advantages which West Bengal was specially suited to develop would accrue to the benefit of people beyond the borders of this State. Certain problems here would similarly demand the attention and support of the rest of India. There would be need to exploit these advantages to the maximum extent possible within all-India capacity. There would be equal need to mobilize a part of the resources beyond West Bengal to relieve particular tensions here which have country-wide repercussions. The Eastern Economist itself has shown a vivid awareness of these facts in the past.

West Bengal's plan is being hammered into shape with all possible regard to these considerations. It is hoped that this account will give a correct picture of the process which is involved.

INDIA'S MARGINAL RATE OF SAVING AND THE MAHALANOBIS PLAN

Sir,

In "The Eastern Economist" of May 6, 1955, you have observed that the marginal saving ratio implicit in the Draft Recommendations on the second Five-Year Plan by Prof. Mahalanobis is unduly high and as such the investment targets given are unrealistic.

Your arguments are based on the following two proportions: (a) the observed ratio for India is much lower and (b) the ratio observed in the past is likely to hold in future. For establishing the first proposition you have used a method of estimation which cannot be accepted as valid. Any estimate based on just two years may give a trivial result even when applied to similar data for so-called advanced countries. Also in using the investment data, you must have used some deflator the choice of which (being arbitrary) might lead to a ratio fitting in with preconceived ideas.

You do not seem to have correctly interpreted the position of Professor Mahalanobis in your attempt to

infer from the past the likely magnitude of the ratio on the future. Professor Mahalanobis would possibly agree that the ratio is likely to be relatively stable if no deliberate action is taken to change it. He has been, however, talking in terms of planning; and hence your arguments appear to be irrelevant. In planning, the instruments of economic policy are so chosen as to achieve the desirable objectives set out in the shape of the production targets. The targets are chosen in such a way that they are mutually consistent, indicating that it is physically possible to achieve the targets. The financial and monetary policies are then chosen so as to bring about the allocation of resources necessary for the realisation of the targets. Thus, any argument based on a study of conditions of an economy left on its own cannot apply to the conditions envisaged by Professor Mahalanobis. Both the aggregate and marginal rate of investment may be stable or even falling in a purely laissez-faire economy, but these ratios do rise in Planned economies and there is every reason to expect that they would also rise in India under conditions of economic Planning.

To sum up, in your exposition the logical structure underlying the draft Plan-frame of Professor Mahalanobis has been ignored. Also, you have tried to disprove a proposition by assuming laissez-faire conditions while the proposition was stated to be valid under conditions of economic planning. The inconsistencies in your exposition will be apparent to those who are familiar with the theory and methodology of economic planning. But it is necessary to bring to the notice of the uninitiated readers the fallacy and inadequacy of your exposition.

Yours faithfully,
Sd/- B. L. RAWAT.

New Delhi.
4th June, 1955.

["The Eastern Economist" is glad to publish Mr. Rawat's letter. It exhibits very markedly the danger of "logical consistency" in human affairs.

In regard to questions of fact on the Ratio and the Marginal Rate of Saving, on which Mr. Rawat calls "The Eastern Economist" estimates in question, will he kindly give his own or Prof. Mahalanobis estimates for purposes of comparison? It will then be possible to see how "preconceived ideas" have vitiated "the Eastern Economist's" argument.

On the major issue, surely to argue that because a Plan is "logically consistent", it is practicable, is absurd. One can logically assume any figure for the rate of saving. Why not fifty per cent of increments of output? Does this imply the Indian people will perform, or can be made to perform according to the Plan? There were limits, even in the U.S.S.R. to the capacity of the Government to extract savings from its people. In democratic planning, any great duration from the existing rate will be impossible.

In any case, a Plan which assumes superhuman efforts from the people and determines to enforce them is not a democratic Plan. What Mr. Rawat must mean when he talks about "the conditions of economic planning" must be totalitarian planning with the aid of a prisonhouse—Ed.].

ECONOMIES OF EASTERN EUROPE

The post-Stalin period has been witnessing certain changes in Soviet economic policy, with its inevitable reaction on the countries which lie within the Soviet orbit. The emphasis during the Stalin era on heavy industry (which was considered to constitute the firm base for the national economy and the defence and security of the Union, and which, accordingly, was raised to a privileged position in the allocation of resources), suffered a slight and temporary eclipse during the Malenkov regime (which laid stress on the importance of achieving a sharp increase in the production of consumer goods). The period from August 1953 to the end of 1954 saw a series of measures designed to increase inputs into agriculture and light industry, and to expand consumer purchasing power. There has since been a shift in the emphasis of economic policy.

These changes in economic policies have found their echo in Eastern European countries, even though their immediate implications have varied with the extent of the changes introduced in 1953 in the relative scale of priorities previously prevailing. During the period which started about the middle of 1953, the planning authorities in Eastern Europe seem to have had three main aims:— To make a new start towards the solution of agricultural problems, to remove the lack of balance between the basic industries, and to bring about an immediate and substantial improvement in living standards.

A vital problem common to the Eastern European countries arises from the fact that the number of non-agricultural people is in excess of the farm population. This has compelled the Governments concerned to resort to what are called "economic incentives." Their plans have envisaged sharp increases in agricultural production with promises of sharp increases in agricultural investments for mechanization, construction, irrigation and drainage of land, and increased production of farm tools and fertilizers. The incentives, it was hoped, would induce peasants to develop wastelands. Except for an increase in the area of maize cultivation and in fodder supplies in Rumania and Hungary, the incentive policy has not met with the expected success. Large tracts of derelict land remained in Czechoslovakia and Poland. The manpower position remained acute in Czechoslovakia. It had been hoped to recruit 105,000 additional workers to agriculture in 1954, but only 17,000 were forthcoming. Little progress was made in manning State farms in those parts of Poland where the labour-land ratio is anomalously low. The terms of trade had been turning against farmers and not adequate efforts were put forth by peasants and co-operative farm managers. In spite of outward appearances to the contrary, there have been indications that the peasants had been showing resistance to socialised agriculture. Until the Communist leaders come to grips with this central problem, it is hard to see how patchwork remedies can substantially improve the agricultural situation.

The only redeeming features in the agricultural sector have been the general increase in the volume of investment in agriculture (shown in the table at the end of this article) and the increasing output of large-scale machines for agriculture during the last two years.

In the field of industry the position is hardly better in the People's Democracies. Eastern Europe's bottleneck industries are mining, steel, electric power and building materials. The pace of development of electric power was held back by the world shortage of machinery for the manufacture of generating equipment. More generally, the planning authorities have wanted to avoid increasing capacity, which by its nature must be in large units, each very costly, faster than the demand for its products expanded, with the result that demand has regularly tended to press against capacity in basic industries. In each of the countries concerned, the strain on capacity had reached an acute phase in 1953. The solution attempted in these countries all had one common feature—a decision to reduce the rate of increase in the demand of the fabricating and building industries for the products of the bottleneck industries. In practical terms this meant a slackening of the rate of expansion of industrial investment. Every effort was, however, made to expand output of electric power, steel and cement and, in the event, the shortages became less and less acute in 1954. The situation in coal mining industries has, however, remained unsatisfactory, and in most countries there has been a fall in output per man. Old coal fields have been running short of better seams and production costs have been increasing, particularly in Poland and Czechoslovakia.

Information published by Eastern European Governments showed a steady rise in personal incomes since 1953, and consequent rise in consumption which was reflected in a sharp rise in retail sales. In Eastern Germany, Hungary and Rumania the actual increases in the total volume of goods sold at retail were very close to the targets called for in the operational plans. Nevertheless, there remained a persistent shortage of certain kinds of food, mainly animal products, which had to be imported from abroad. The planning authorities found it necessary to recognise the tightness of the food position by cheapening manufactured goods relatively to food stuffs.

It has been the custom in the Soviet Union from time to time to reduce some retail prices by more than was justified by a nice comparison of the extra supplies in sight and the extra demand thus created. The reasoning behind this is presumably that a single big reduction in the prices of durable goods is likely to have a greater incentive effect on workers than a gradual downward slide of prices. It is possible that some of the excess demand in Eastern European countries was deliberately created for the same reason. In Poland since the end of 1953, two price cuts have been announced on several articles and the wages of certain categories of workers have been adjusted. On the basis of this move, the regime is attempting to convince the working class that real wages will increase by 15 to 20 per cent by the end of 1955. There is nothing more uncertain than this promise and the Polish people know it. Many industrial managements have been indulging in violations of the social provisions of the labour code. Finding that managers, sometimes in agreement with the competent ministry, have not been respecting bilateral agreements with workers, the

latter have assumed an attitude of indifference to the regime's invitations to enter into production agreements. In turn, the regime, not infrequently, finds it necessary to resort to terror methods.

Efforts to restore financial discipline in industry have begun in all countries of Eastern Europe, particularly in Eastern Germany and Hungary. Managers of enterprises have been informed that from now on they will not to able to recoup themselves for exceeding the cost limits laid down in their plans. Workers have been warned that their wages are to be tied closely to their performance.

The 1955 plans of the People's Democracies, published in December 1954 or early in 1955, do not indicate any significant changes from those for 1954 in the pattern of output or in the rates of growth laid down for the year. The targets set for agriculture are of the same order of magnitude as in 1954. The increases in total indulstrial output called for are not greatly different from those achieved in 1954. From the following table it will be seen that investment is to be stabilised or only slightly increased, and that the share of agriculture and the basic industries—coal, power and steel—in investment is to be increased. Almost the only sign of changes in allocations is the increased provision for national defence made in the State Budgets. It is difficult to reconcile this stability with the renewed emphasis laid on the importance of speedy industrialisation and, in particular, of the further expansion of heavy industry. It will not be surprising if overfulfilments of the targets eventuate in at least some branches of industry.

POLICY FOR LOCAL FINANCE

LAST week the Central Council of Local Self-Government met for its first session, but it could not give the lead which was expected of it on the shape of the development of local self-Government in the next Plan. It merely urged that the scant treatment which was meted out to local self-Government in the first Plan must in no event be allowed to be repeated. The report of the Taxation Enquiry Commission, in so far as it relates to local finance, figured prominently on the agenda before Council's session. But the outcome on this important issue was the appointment of a special committee for investigation and report. This was perhaps inevitable because of the composition of the Council. To the Ministers of Local Self-Government in the States, who form the bulk of the Council, it was embarrassing to forestall their respective governments by definite commitments. If the special committee, which consists exclusively of State Ministers holding this portfolio and the Union Minister of Health, succeeds in persuading the State Governments to announce their decisions on the TEC's recommendations within the prescribed deadline of two months, much of the uncertainty that hangs round the future of local finance would be ended.

The Finance Minister said in the course of his speech in Bombay two days ago that State schemes for development of local self-government remain to be incorporated in the plan-frame. He has, given the assurance that liberal financial provision would be made for local bodies for giving priority to schemes of water supply, drainage and slum clearance.

In the rural sector, in the case of local boards generally, but more specifically in the sphere of village panchayats, enthusiasm to expand the range of general activities must be curbed. The activities of the rural bodies ought to be concentrated primarily on sanitation, water supply, health, and secondarily on education, communications and works of minor irrigation. Himachal Pradesh typifies the maximum preponderance of tax revenue to the extent of 100 per cent, while Saurashtra shows great reliance on Government grants to the extent of 87.7 per cent. In both the cases, the small size of the total revenue places restrictions on the range of their activities and services. Between these two extremes other States enjoy varying proportions of tax and non-tax revenue. The composition of the revenues of district local boards is brought out in Table A.

TABLE A

PERCENTAGE RATIOS OF SOURCES OF REVENUE OF DISTRICT LOCAL BOARDS TO TOTAL REVENUE*

State	Taxation	Fees & Fines	Grants	Miscellaneous
Bihar	33.5	..	54.8	..
Bombay	55.2	..	44.6	..
Madras (Pre-partition)	43.8	14.2	31.5	10.5
Orissa	25.6	4.9	65.3	4.2
Punjab	30.2	18.0	42.1	9.9
Uttar Pradesh	24.8	21.82	53.6	..
West Bengal	45.1	0.3	43.8	10.8
Hyderabad	90.2	1.1	..	8.7
Mysore	35.6	19.11	17.5	27.4

*Note: Figures for latest available year from 1950-51 to 1952-53.

The high percentage of tax revenue (90.2) in Hyderabad must be read in conjunction with the total revenue at the low level of Rs. 34 lakhs. It establishes

restriction on capacity for expenditure. Excepting for Bombay, Madras and West Bengal, all the States specified above disclose a disturbing position as regards income from taxation and consequent dependence on Government grants.

Because of their better sources of revenue municipalities are relatively well placed. Table B in this article highlights the large ratio of tax-revenue to total revenue. In absolute terms, Himachal Pradesh, Hyderabad and Madhya Bharat show the impressive role of tax-revenue, which loses much of its meaning when related to total amounts of income. In U.P., Bombay and Madras where aggregate revenue ranges between Rs. 665 lakhs and Rs. 715 lakhs, we find a higher level of income from taxation. Grants-in-aid assigned to municipalities are either matched or excelled by other non-tax sources like operation of public utilities. An important feature of expenditure is the inadequate provision for water supply and sanitation services which ought to claim a larger proportion of total expenditure.

A sound system of local taxation alone can provide a solid basis for sound local finance. State Governments ought to be prepared to accept an increasing measure of decentralisation and to transfer suitable financial powers and responsibilities to local bodies where they must lie. The modifications of the present policy suggested by the Taxation Enquiry Commission are calculated to increase self-dependence of local bodies. Taxes on property, octori duties, taxes on vehicles and on animals and boats, professional taxes and taxes on advertisements cover a major part of sources of rural local taxation and over half of the sources of municipal taxation. In respect of these taxes, reservation of their proceeds solely for the requirements of local bodies has now become urgent for stepping up their revenues. A higher share on motor vehicle taxes for municipalities and district local boards is called for; in the case of the share in land revenue for local bodies in rural areas a higher limit of 15 per cent has been proposed by the TEC. Bombay State, for instance, has announced its decision to allocate 30 per cent of land revenue to village panchayats in place of the existing 15 per cent and another 5 per cent to local boards for the next five years. In most other cases the proposed limit will prove high in relative terms. New sources of tax revenue that have been urged include duty on transfer of property at the rate of 2 per cent of capital value. For professional taxes in municipal areas minimum rates are strongly advocated and the present maximum is sought to be doubled to Rs. 500 per head per year. The growing scale of local expenditure makes this liberalisation essential.

The higher scales of expenditure on obligatory functions have increased the need for grants-in-aid and the TEC urges a bold policy subject to recognized principles. A general purpose grant is suggested for all local bodies, except bigger municipalities, to discharge minimum functions after insisting on a definite level of tax-income. A minimum period of three to five years is suggested for these basic grants to ensure availability of funds on a continuous basis. Specific conditional grants, however, stand on a different footing in view of their restricted purpose. Where loans prove inadequate, the case for subsidies would be justified on the test of urgency. The governing principle for the share of State Governments in local finance in a phase of expanding liabilities should be sufficiency of funds, provided the preliminary condition of utilising the funds effectively is assured.

TABLE B

REVENUE AND EXPENDITURE OF MUNICIPALITIES**

	Percentage Ratios of Revenue from Various Sources			Percentage Ratios of Expenditure under Various Items				
State	Taxation	Grants-in-aid	Non-Tax Sources other than Grants-in-aid	Administration	Service, Water, Drainage, conservancy etc.	Medical & Public Health	Roads & Bldgs.	Miscell. including Education

The Business World

IMPROVEMENTS IN IMPORT POLICY

Considering the continuation of the liberal, though cautious trend introduced in the previous two half years, the attempt to maintain stability and continuity in the basic structure, the positive steps for promotion of industry and the absence of the apprehended restrictions in imports, the import policy of the Government of India for the second half of 1955, has been naturally welcomed by both trade and industry. In fact, with minor adjustments justified by the balance of trade position, the latest policy announcement represents practically an extension of the import policy for the period January-June 1955. It will be noted here that both imports and exports have been running at higher levels during the past half-year. While during the period January-June 1954, the value of imports aggregated Rs. 279 crores, during the past five months—January to May—the total value of imports amounted to Rs. 267.61 crores. Likewise, as against the total exports of Rs. 245.49 crores in the first-half of 1954, the aggregate value of exports during the first five months of 1955, has been Rs. 235.78 crores. There has been no significant change in the position of our sterling balances which, on May 31, 1955, stood at Rs. 712 crores, as against Rs. 733 crores on January 1. The decline of Rs. 21 crores, which has resulted from larger imports, is only a seasonal feature, common during this period of the year. However, in view of the increased foreign exchange commitments of the country, it has been necessary to be cautious and selective, and the area of liberalisation has been extended not so much by increasing quotas as by raising the minimum values of licences, the extension of the basic period over a wide range of items and further provision for imports from the dollar area.

Quotas have been increased for 41 items that are mainly needed for industry or for meeting increases in demand which have not been matched by corresponding increases in domestic production. These include antimony ingot, drills, house service meters, textile preservatives, writing and printing paper, shock absorbers, bleaching powder and cellulose transparent paper. The case of certain domestic articles, whose quality does not compare well with the imported ones, has been taken note of. The quota for zip fasteners, for instance, has been increased from 50 per cent to 100 per cent.

Quotas have been cut down for items, numbering 36, where rising production in industry has been able to take care of a larger portion of domestic demand. These include hacksaw blades, certain varieties of iron and steel chains, shuttles, polishes, sparking plugs, torch bulgs and certain chemicals. But the most notable items are coconuts, copra (or coconut kernel) and coconut oil, the quota for each of which has been uniformly curtailed from 100 per cent to 75 per cent. This uniform reduction of 25 per cent is, however, not maintained in the face value restrictions which have been imposed for these three items. For the January-June period, quota licences were granted subject to the provision that not more than two-thirds of the face value of licences could be utilised for the import of coconut oil and the balance one-third would be used for the import of copra (and kernel). On the other hand, according to the latest policy announcement, quota licences will be granted subject to the provision that not more than 50 per cent of the face value of licences can be used for both coconut oil and copra (and kernel). The object of Government's restrictions on these imports is to aid the producer and stabilise domestic prices. But does this move really provide the intended safeguard to the producer? Rather, does it not really benefit the trader and the middlemen in the calling?

It is gratifying to see that the slight dollar surplus has been taken advantage of for increasing the import quotas on six items and that, in respect of 49 items, a portion of the soft currency licences will be allowed to be utilised on dollar area. This will enable importers to extend the field of their choice and go in for the best qualities available.

The needs of industry have been prominently kept in view: 18 new items have been thrown open to actual users; these include white metal, fabricated iron and steel, aluminium collapsible tubes, road rollers, ball bearings of unrestricted category, jute bobbins, high tension insulators and trailers. The small importer and the new comer have also been taken care of. The scope of the newcomer scheme has been enlarged, and an important concession has been made to the small importer by fixing the minimum value of the licences at Rs. 500, irrespective of the licensee's entitlement on the quota basis. It has been recognised that the rigid application of the system of quota licences has, by circumscribing the opportunities for the exercise of commercial skill and enterprise, operated as a stumbling block for attempts on the part of small importers to improve their business. The Government has now sought to provide an opportunity to small licence holders to expand their business in certain specified items. But, will this concession really benefit small traders, seeing that imports of small quantities for such small amounts may prove uneconomic? For the benefit of the established importer, the basic period has been extended to 1953-54 in as many as 92 items.

The policy of controlling prices of refrigerators and air-conditioners, introduced during the last half-year, has it is claimed, met with success, with the result that the arrangement has now been extended to electric shavers, the Government also seems to be convinced that the policy of canalisation of imports through official or officially-sponsored agencies, which was adopted for the previous period and applied to the imports of raw silk, caustic soda, soda ash and sodium carbonate, has been successful in practice. Accordingly, the Central Rubber Board, is hereafter to be in sole charge of import of raw rubber. The aim of the Government is to ensure equitable distribution at steady prices. Monopoly trading, however, beneficial in this particular case, is objectionable to the extent it involves elimination of the normal channels of trading and distribution.

There is another aspect concerning the policy to which business men have drawn attention. The system of "ad hoc" licences is being extended and, it has been pointed out, unless the criteria governing the issue of such licences are formulated and publicly notified, there is room for grievances that in the grant of "ad hoc" licences the administration is acting in an arbitrary manner. Another pertinent criticism advanced is against the imposition of multi-restrictions on the quality and quantity of imports which, it is contended, will complicate the trade and create unforeseen difficulties.

BUSINESS NOTES

ORDINANCE ON STATE BANK ACT

THE STATE Bank of India (Amendment) Ordinance, 1955, promulgated by the President on June 23 last, is not a substantive but only an enabling measure, which is intended to facilitate the transfer of the assets and liabilities of the Imperial Bank of India to the State Bank of India in respect of the former's branches situated in foreign countries by a procedure whose legality will be beyond question. There are also other ancillary objects in issuing the Amendment Ordinance. The Imperial Bank of India has eleven branches in foreign countries, three of which are situated in London, Rangoon and Colombo and eight are situated in Pakistan. Expert legal opinion particularly in these countries has revealed that transfer of the assets and liabilities of Imperial's branches in these countries to the State Bank in pursuance of an Act of the Indian Parliament will be doubtful validity. The straight course, therefore, is to allow the transfer in question to take place by Imperial's branches making the transfer in conformity with the provisions of the laws of the respective foreign countries, where the branches are located. There is also the minor, but no less important, legal question of obtaining a variety of licences and authorisations for the State Bank of India from the concerned authorities in certain foreign countries before it can commence business within their territories.

The effect of the Ordinance will be that until the requisite legal documents are executed for the aforementioned transfers and until authorisation is procured for the State Bank of India to transact business in the specific foreign countries the Imperial Bank will be kept alive. Its life will not become extinct on July 1, 1955, as contemplated by the State Bank of India Act. All transfers and other schemes within India will remain unaffected by the ordinance and will proceed according to the original schedule. The vesting of Imperial's shares in the Reserve Bank and payment by the Reserve Bank to the shareholders of the Imperial Bank will be effected as provided by the Act prior to the amending Ordinance.

THE NEW LOAN:

The Central Government's announcement of June 24 last about the floatation of the new loan has come according to market expectations. This loan described as the national Plan Bonds (Second series 3½ per cent 1965) is different in many vital respects from last year's National Plan Loan 3½ per cent 1964. Last week's loan will be open for subscription for a definite period July 1 to July 5, 1955, while the National Plan Loan was kept on tap for a period of three months and succeeded in garnering Rs. 158 crores. It was a combined cash issue for the loan programmes of the Central and State Governments and of the total subscriptions Rs. 25.5 crores were allocated to the State Governments.

The National Plan Bonds, Second Series 3½ 1965, which mature and become redeemable on July 1, 1965, will carry interest, subject to income tax. The redemption yield works at 3.68 per cent—the same as on last year's National Plan Loan, but lower than the yield of 3.80 per cent on the National Plan Bonds, First Series. The present loan which is purely a Central Government floatation has an issue price of Rs. 98-8 per cent as against the issue price of Rs. 98-4 for the National Plan Bonds, First Series. This Second Series is a cash-cum-conversion issue and there is the offer to accept conversion of the Government of India 2½ per cent 1955 loan or the 4½ per cent 1955-60 loan whose combined outstandings are of the order of Rs. 69 crores. This year's loan programme of the Government envisages a target of Rs. 125 crores and considering the timing of the present loan in the slack season it is expected to net in a good part of the total. It is reasonable to presume that the Government will come out with the next loan in the later part of the current year.

REPORT ON CUSTOMS ADMINISTRATION:

The combined review of the customs administration in India during the financial years 1952-53 and 1953-54, issued by the Central Board of Revenue, revives this annual series of departmental publication after its suspension in 1,941.42. This is an appropriate point of time to decide whether mere revival of the prewar practice of publication is of much practical value. The inordinate delay in this publication, after the customs duties if not the bulk of the customs procedure and law have undergone great changes, makes it of little more than academic interest. When the country has already passed from the period of high export duties and tight control of imports as well as exports to a new and more normal phase of trade liberalisation, this first review after the war amouts to little more than a post mortem examination.

From the peak collection figure of aggregate customs revenue collection of Rs. 232.03 crores in 1951-52, there was a steep decline in 1952-53 to Rs. 175.61 crores which was carried still downwards to Rs. 159.37 crores in 1953-54. Customs revenue represented 45 per cent of the total Central Government revenue from taxation in 1952-53 and 44 per cent in 1953-54. The new taxation policy already recognizes that the role of customs in tax revenue is dwindling and in future greater reliance is to be placed on excise duties. The values declared by importers in Bills of Entry disclose that relatively to 1951-52 the average value of imported merchandise declined by only 1.1 per cent in 1952-53, whereas in 1953-54 there was a steeper decline of 11.2 per cent. In the case of exports, the values declared by exporters in Shipping Bills show a great fall of 30 per cent in 1952-53 as compared to the previous year, while in 1953-54 the decline amounted to 6 per cent. These trends reflect the price changes after the Korean boom receded.

On the administration of the law and procedure governing customs, the comparative figures, in terms of numbers of cases detected, adjudicated or carried to the stage of punishment, hardly give the correct idea of the quality and efficiency of administration. But it would appear that the test task of detecting the smuggling of gold establishes the fact that the administration leaves much to be desired. This report throws no light on the actual results of the employment of the the new electronic device to detect smuggled gold and makes a bare statement that the device was experimented upon. The volume of gold smuggling corresponds with the disparity in the Persian Gulf prices and Indian prices. This is illustrated by the higher seizure of gold in 1953-54 than in the previous year, the total quantity seized in that year being 55,500 tolas value at Rs 44 lakhs. The new amendment to the Sea Customs Act, which seeks to throw the entire burden of proof of bona fide possession of goods on the person from whom they are seized by the customs authorities on suspicion, in flagrant disregard of the basic principle of criminal jurisprudence, is in one sense a commentary on the efficiency of the customs administration.

INTERNATIONAL COMMERCIAL ARBITRATION

THE BRIEF report of the special committee of the International Chamber of Commerce, set up at the recent Tokyo session, to investigate the problem of

providing a machinery for the countries of the ECAFE region for international commercial arbitration, has reiterated the basic principle that the very idea of arbitration should create greater allegiance to the decisions of the arbitration authority and that the legal aspects of the question need not be raised, as far as possible, in considering the potentialities of the machinery. These latter should have only a secondary place because the very approach to arbitration implies a keen desire to eschew the protracted, expensive and very often technical forum of law courts. Parties to commercial disputes are interested in amicable and equitable settlements and the idea of a legal victory is far from their minds.

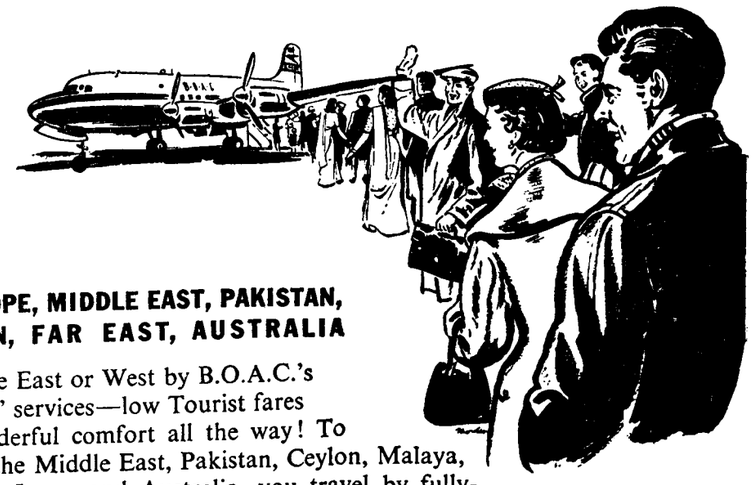
The Committee's report, it must be stressed, hardly suggests any vital departure from the pattern of arbitration organizations which have been functioning in Western countries. Freedom of choice for the parties in evolving the rules governing arbitration and trust in the capacity of the arbitration authority to grant impartial awards are the very corner-stones of the arbitration organisation. For this purpose national centres should be established in the ECAFE countries, but the idea of the International Chamber of Commerce coming into the picture in exceptional cases as a forum of the last resort should not be ruled out. The trend of thought which discloses disapproval of this role of the ICC is deprecated by the committee, and as a via media and a measure of reassurance the creation of an Asian Section of the Arbitration Court of the ICC has been urged by it. Much of the discussion of the committee has centred round the legal aspect of arbitration awards. In particular, an insurmountable obstacle is presented to the final settlement when the decision of the arbitration agency is rejected by a party and its execution becomes impossible by reason of technical issues relating to jurisdiction. For over a quarter of a century enthusiasts of international commercial arbitration have tried to see if co-ordination of law and procedure could be secured in some broad measure. Their efforts have proved fruitless.

A fool-proof system cannot be devised. The legalistic aspect may arise in exceptional cases, but advocates of arbitration ought not to allow themselves to be obsessed with it. The agreement which the Arbitration Tribunal of the Indian Chambers of Commerce and Industry reached recently with American Arbitration Association rests on the sound principle that a normal machinery for smooth and expeditious settlement of commercial disputes by arbitration is the best means to cultivate mutual trust and to promote trade.

INVESTMENT AND TAXATION

MR. K. R. P. SHROFF'S analytical survey of the state of the stock market in 1954, in the course of his presidential speech at the last week's annual session of the Bombay Stock Exchange, could not leave out a critical examination of the impact of taxation on investment. The stability, which the stock market regained last year after a long spell of declining share prices, was the direct outcome of the sound health of the economy, acquired on the return to normalcy, and there was every indication that this stability could be maintained and the stock market geared to the requirements of developmental investment, provided, of course, sound and realistic economic policies were pursued.

A correct policy on taxation of personal incomes was an integral part of these sound policies, but there were portends in the situation that this very precautionary policy would be overlooked. The danger of a misdirected tax policy with regard to income taxation now really looms large because of the lead given by the Taxation Enquiry Commission to the school of thought which believes in restraint on consumption to stimulate savings and investment. Mr. Shroff recalled the conclusion of a study made by the Reserve Bank to the effect that 59.5 per cent of the investors in stocks and shares are earners of income below Rs. 8,000 per year and it is erroneous to believe that restraints on the consumption of these middle class investors would necessarily result in saving and larger investment. On the contrary, there was a positive danger that depressed standards of consumption which would follow higher taxation would depress production by reducing effective demand and bring about an overall reduction in real national income. Rising production is fostered in a climate where it is absorbed by higher consumption. Mr. Shroff was highly critical of the taxation policy on the corporate sector and he made a pointed reference to the retrograde measure aimed at taxing retained earnings. An exhaustive study of joint stock company finance by the Reserve Bank brought out the extent of retained earnings. Out of the gross profits of companies about 30 per cent were eaten up by taxation and only 24 per cent were available for dividend distribution after setting apart as high a proportion as 46 per cent as savings for re-investment. Taxation of these savings in the hands of shareholders, in case of the liquidation of the concern, was nothing short of taxation of capital.



GROWTH OF TOBACCO TRADE

It can hardly be claimed that the official report on the marketing of tobacco in India is free from the common drawback of reliance on old and somewhat out-dated statistics which detract from the real utility of these reports. Last year's plight of the tobacco trade and the emergency measures which were adopted to bring partial relief specially in Andhra State would make a cold analysis of the figures for an earlier period of little practical interest. A full appreciation of the growth of marketing techniques for tobacco in this country during the post-war decade must await the publication of the report. In the mean time, such information as is available from the scanty Press summary gives a rough idea of the main trends.

Total production of tobacco of all grades and varieties in this country was of the order of 675 million lbs. in 1949-50. Of this, 25 per cent constituted the cigarette types, another 25 per cent hookah types, a little less than 20 per cent bidi types and the rest was intended for requirements of cigars, cheroots and snuff. Bulk of this output is consumed locally and by normal international criteria this bulk does not qualify for commercial manufacture of standardized tobacco products. The regional distribution of tobacco cultivation discloses a share of 42 per cent for pre-partitioned Madras State, 29 per cent for Bombay and 12 per cent for U.P., the remaining 17 per cent being scattered over the rest of the country. From the present position of the export of virginia tobacco to the U.K. and on a lesser scale to certain countries of Europe as also its consolidation, Andhra assumes great importance because it is in this State that the production of cigarette types is concentrated. Compulsory grading of Andhra Virginia tobacco under the auspices of the special inspectorate at Guntur and the confidence generated by the Agmark for graded tobaccos has no doubt helped the export trade to hold the markets. From last year's experience it would appear that storage facilities are too inadequate to prevent deterioration. The Central Tobacco Committee's work needs to be judged also from the angle of improvements offered to varieties other than cigarette types.

COMPANY AFFAIRS

MAHINDRA & MAHINDRA'S BOLD EXPANSION

Messrs. Mahindra and Mahindra, Limited, who have been converted into a public company from June 15, 1955, are launching an ambitious programme of expansion of their automobile project. The requisite licence from the Central Government has been duly obtained. The Company has earned reputation during the last 10 years in the automobile industry of this country in particular by its programme of assembly of jeep cars. The new project of the Company envisages entry into the second stage of manufacture of jeeps. For this purpose it has retained the technical and financial collaboration of Willys Overland Motors Inc. of Toledo (Ohio), U.S.A. Besides jeep cars, the Company has a programme of the manufacture of tractors, trailers, textile machinery, diesel engines and so on. This enterprise has good potentialities of development.

Under the expanded scheme the Company's authorised capital will be of the order of Rs. 1.50 lakhs divided into 12,50,000 ordinary shares of Rs. 10 each of a total value of Rs. 125 lakhs and 25,000 Redeemable Cumulative Preference Shares of Rs. 100 each of the total value of Rs. 25 lakhs. The Issued Capital will consist of 3,33,618 ordinary shares of an aggregate value of Rs. 33,36,180, of which the present issue will be in respect of 2,16,382 ordinary shares of the total value of Rs. 21,63,820. Besides these the present issue includes all the redeemable cumulative preferecne shares. After deducting the shares which the directors and their friends have agreed to take up, the following shares in the present issue will be offered for subscription to the public: 1,56,382 ordinary shares of Rs. 10 each of the total value of Rs. 15,63,820 and 13,000 redeemable cumulative preference shares of Rs. 100 each of the total value of Rs. 13 lakhs. Full particulars of the capital structure and all other relevant matters will be found elsewhere in this issue.

The subscription list will open from July 11, 1955, till July 13, 1955, both days inclusive.

THE METAL BOX

The Metal Box Company of India Ltd. was able to achieve an expansion of about 10 per cent on the previous year's sales volume of Rs. 321.05 lakhs. The profit at Rs. 22.02 lakhs, after providing for depreciation and taxation has gone up by about 33 per cent over the previous year's Rs. 16.55 lakhs. The company is hopeful of bright prospects as small branded consumer packages for foodstuffs etc. are increasingly becoming popular. There was, however, felt a shortage of indigenous tinplate, consequently it was imported from America.

A sum of Rs. 9.75 lakhs has been provided for depreciation against last year's 8.86 lakhs and Rs. 13.25 lakhs have been provided for Taxation against Rs. 9.41 lakhs during the previous year.

The dividend on the Ordinary Shares has been maintained at 10% since 1951, but during the year under report the directors have recommended the payment of 12½ per cent. A sum of Rs. 5.00 lakhs has been separated out to be transfered to General Reserve against Rs. 3.50 lakhs during the previous year.

BALMER LAWRIE

Trading generally improved for M|s Balmer Lawrie and Co., Ltd., a Managing Agency, and the income from sales and service increased by 13 per cent from Rs. 993.54 lakhs in the previous year to Rs. 1,122.75 lakhs during the year ended December 31, 1954. The income from commissions too has gone up from Rs. 17.81 lakhs to Rs. 22.98 lakhs. In line with sales the profits at Rs. 14.47 lakhs have improved by 17 per cent as compared to last year's 12.79 lakhs.

Fairly good results were shown by the Bengal Paper Mills, the Bengal Flour Mills and the Bridge and Roof Company while disappointment had to be faced from the Indian Galvanizing Company and the British India Electric Construction Company. A provision for Bad and Doubtful Debts has been increased by Rs. 2 lakhs to cover the doubtful portion of the loan made to B. I. Electric Construction Company.

The provision for depreciation has been increased to Rs. 3.30 lakhs against Rs. 2.70 lakhs during the previous year. The provision for taxation remains almost unchanged at Rs. 6.27 lakhs.

A Reserve Fund of Rs. 5.01 lakhs, almost equal to the last year's Rs. 5.00 lakhs, has been separated out and an Ordinary Dividend of 8 per cent has been proposed to be given against 15 per cent including 7½ per cent Bonus last year.

	(Rupees in lakhs)		
Year ended December 31,	**1954**	**1953**	**1952**
Sales and Service	1,122.75	993.54	971.04

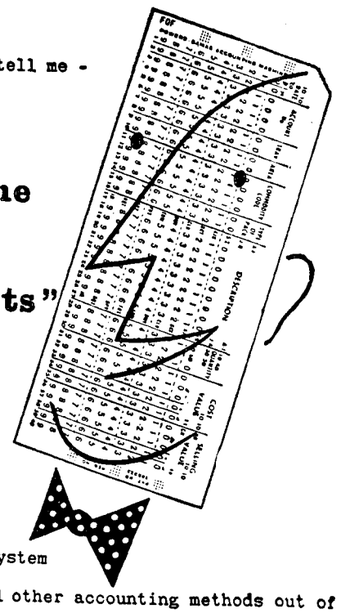
Balance carried forward	5.50	5.44	5.15

* After providing for depreciation and taxation.
† Includes a bonus of 7½ per cent.

THE SIMPLEX

Increased sales of cloth and yarn at Rs. 245.22 lakhs by the Simplex Mills Company Ltd., for the year ended March 31, 1955, against Rs. 232.19 lakhs for the previous year have resulted, instead of increased profits, in an actual decline in profits. The decline is fairly steep. One major factor for this result is an exceptionally higher bill for salaries and wages. A sum of Rs. 6.23 lakhs has been debited to salaries and wages in the year under review for an adjustment in the Dear Food Allowance with retrospective effect from May 1, 1953, and for additional bonus for the year 1952, as a result of an Award of the Labour Appellate Tribunal. Amount spent on repairs and renewals is also much higher at Rs. 5.37 lakhs against Rs. 3.58 lakhs last year, as it was necessary to carry out substantial repairs to the Mills buildings.

A comparatively smaller amount—Rs. 2.85 lakhs—has been provided for Depreciation against Rs. 5 lakhs last year. The provision for taxation too is lower at Rs. 2.00 lakhs against Rs. 5.00 lakhs during the previous year.



A dividend of 20 per cent has been proposed to be given against a dividend of 22 per cent last year and 30 per cent a year before.

	(Rupees in lakhs)		
Year ended March	**1955**	**1954**	**1953**

Accountants tell me -

"You're welcome on all accounts"

Here is the Powers-Samas punched-card, part of the system that makes all other accounting methods out of date, keeps figures really up to date. Powers-Samas speed and efficiency keeps pace with figures and events as they occur; indicates trends as they start to develop. For large combines and small concerns Powers-Samas methods handle invoicing, statements, stock-records, payroll, costing and statistics of all kinds with unequalled speed, neatness, accuracy and economy.

There is a range of Powers-Samas punched-card equipment for every type of application.

SITUATION VACANT

Required by a leading and old-established group of industrial and commercial organisations in North-East India, a man of first-class ability and personality to fill the post of Labour Adviser. Candidates should have a good University degree, preferably in economics or in law and a diploma in either social science or industrial administration or other equivalent qualification. They should also have a thorough knowledge of labour legislation and its practical application and at least 10 years' practical experience of personnel management and industrial relations under Indian conditions. A sound command of English is essential and a good working knowledge of both Bengali and Hindi is desirable. Age group 35-45 preferred. Salary will be commensurate with age, qualifications and experience, and the post carries Provident Fund benefits. Candidates should submit full details of educational qualifications and practical experience to Box No. 101: c/o 'The Eastern Economist' 52, Queensway, New Delhi-1. Only the applications of those candidates possessing the requirements enumerated above will be entertained.

India's Tea- India's Wealth

EXPORT:

During 1954 India exported 450 million pounds of tea. This is more than 2/3 of her total production. Exports were directed to Great Britain, United States, Eire, Canada, Egypt, Continental ports, Turkey, Sudan, Australia, New Zealand, Iran and other countries.

TEA BOARD INDIA

No other drink refreshes you so much, yet costs so little as TEA

PST 136

This is an advertisement and not a Prospectus. A formal Prospectus dated 28th June 1955 has been prepared and filed with the Registrar of Companies, Bombay.

Consent of the Central Government has been obtained to this issue by an order of which a complete copy is open to public inspection at the Head Office of the Company. It must be distinctly understood that in giving this consent, the Government of India do not take any responsibility for the financial soundness of any schemes or for the correctness of any of the statements made or opinions expressed with regard to them.

A Licence (No. L|11|6|54) has been obtained from the Central Government for effecting a substantial expansion to this industrial undertaking of which a copy is open to public inspection at the Head Office of the Company. It must be distinctly understood that in granting this Licence, the Government of India do not take any responsibility for the financial soundness of this undertaking or for the correctness of any of the statements made or opinions expressed in regard to it.

APPLICATION WILL BE MADE TO THE STOCK EXCHANGES FOR PERMISSION TO DEAL IN THE SHARES.

THE SUBSCRIPTION LIST WILL OPEN ON THE 11TH JULY, 1955, AND, IN ACCORDANCE WITH THE REQUIREMENTS OF THE BOMBAY STOCK EXCHANGE, WILL REMAIN OPEN TILL 13TH JULY, 1955 (INCLUSIVE).

MAHINDRA & MAHINDRA LIMITED

(Incorporated under the Indian companies Act VII of 1913).

Mr Cecil Johnson, Johnson Associates, Taledo, Ohio, (USA).

MANUFACTURE OF JEEPS IN INDIA.

The Company has acted as the sole representative of the Willys Overland Motors Inc. of Toledo (Ohio), U.S.A. since 1945. Steps were taken early in 1948 to organize an assembly Plant in Bombay thereby introducing knowledge of assembly operations as well as affording opportunity for studying progressive manufacturing possibilities. The Assembly Plant located in the Mazagon Dock area is today one of the most efficient and economic Assembly units in the worldwide Willys organisation. After exhaustive investigations ranging over three years by several teams, comprised of engineers from Willys and the Company a detailed plan was developed for the manufacture of Jeeps in India.

The Company's proposals do not envisage the establishment of a single, self-contained and integrated factory on a large scale. Our technical experts came to the conclusion that by drawing up on spared resources in the engineering industries, a co-ordinated manufacturing organisation can be set up and the Jeep progressively built in India without large capital investment initially.

Willys-Overland Export Corporation have entered into a 10 year licence arrangement providing for the grant of exclusive right to the Company to manufacture and sell in India the 4-wheel drive Jeep and other vehicles, furnishing the requisite technical assistance and also giving the Company full benefit of their research and development.

Willys have further agreed to extend a long term loan to the Company to the extent of $230,000,00 or 10% of the total subscribed capital of the Company. It is contemplated that in course of time the Company will be able to negotiate the export of Indian-built Jeeps to countries adjoining India.

HISTORY AND BUSINESS

The Company was incorporated at Bombay on the 2nd of October, 1945, as a private company for the purposes set forth in its Memorandum of Association. The main objective before the Company was to participate in the building of a sound industrial and agricultural economy in the country. What has been concretely achieved in these fields is briefly summarised below.

1. **JEEPS:**—As sole representatives of the manufacturers, the Company has established a sound reputation for service and sales in respect of this famous vehicle and its allied range of utility models, namely, the Utility Wagon, the 4-wheel drive truck, Cargo Personnel Carrier Jeep Fire Engine, Jeep Aircrash Tender and ambulance unit.

Hitherto the import quotas have been restricted to about 900|1000 Jeeps a year and it was only in the year 1954, after Government approved the Company's manufacturing plans, that the import quota was liberalised. During the manufacturing period of three years, 1955-58, Government has agreed to permit imports up to 2500 units a year and sanctions for even larger numbers, it is hoped, will be forthcoming on request. In 1953-54 the Company successfully built about 1650 units. During the six months of the current year (1st November 1954—30th April 1955) the Company has sold over 1100 Jeeps and it is expected that this rate of turnover will be sustained during the following period. The Assembly Plant today has facilities, not only for meeting the requirements of the initial outturn of 2000|2500 units, but it can handle almost double

As part of the programme of progressive manufacture of Jeeps in India and in the ordinary course of business the Company has recently purchased a factory at Bhandup in Greater Bombay, consisting of Plant, machinery and equipment suitable for manufacture of automobile parts. The owner of the premises has granted a lease of the premises and an option to the Company for an extension of the lease for a further period. The Company has already commenced operations in this factory.

2. **TRACTORS** :—The Company has linked up with the famous firm of **David Brown** of United Kingdom. Experience in the short period of two years has proved both the reliability and suitability of the David Brown range of tractors for most of the soils in India and the Company has arranged with David Brown the question of progressive manufacture of their tractors and implements in India.

3. **TEXTILE MACHINERY:**—The Company sponsored the floatation in November, 1946 of MACHINERY MANUFACTURERS CORPORATION LIMITED for the specific purpose of manufacturing medium light industrial equipment, in particular textile machinery. Arrangements were successfully concluded with two American firms of repute for technical collaboration. The Company is the Managing Agent of this Corporation.

The M.M.C. Carding Engine has been very exhaustively tested at a number of critical installations throughout the country and it is a source of gratification that it has proved not only equal in performance and efficiency to any imported product, but that it is being retailed in the market at prices lower than the cost of a British Carding engine of equivalent specifications.

4. **DIESEL ENGINES:**—The Company has in collaboration with National Oil and Gas Co., Ltd., of Ashton (U.K.) and Turner, Hoare and Co., Ltd., (a subsidiary of the Company) floated the INDIAN NATIONAL DIESEL ENGINE COMPANY LIMITED (INDEC) with a substantial financial participation of the British Group. INDEC has undertaken to manufacture diesel engines to "National" design and it is hoped that the first Indian made horizontal diesel engine will be on the market by end of July 1955.

5. **TRAILERS:**—The Company possesses a separate well-equipped trailer manufacturing shop at Worli (Bombay) where trailers ranging from 10 cwt. to 1½ tons are manufactured, including the well-known Jeep trailer. A close technical collaboration has been agreed upon with the British Trailer Company, one of the leading trailer manufacturers in Europe.

6. **STEEL:**—The Company, by virtue of special arrangements with manufacturers, has established a premier position in the import of Steel. The Company represents the renowned British firm of Richard Thomas and Baldwin on an exclusive basis and also holds exclusive representation from VALOR, one of the three French Steel Groups, for Plates, Bars, Sheets and Structurals, as well as from SIDELOR for Rails and Sleeper Bars. From Japan the Company has received exclusive offers of Plates and has succeeded in securing large tonnages for the Iron and Steel Controller. The Company has also interested itself in quoting for the steel coming to India under the T.C.A. from America and in such dealings arrangements have been concluded with Tata Incorporated in New York to handle our quotations as well as secure, where possible, offers from U.S. Steel Companies.

7. **GENERAL SALES AND SERVICE:**—The increasing volume of sales in the many branches of the Company's activity—Jeeps, Tractors, Trailers, Steel—has been achieved by a consistent endeavour to improve the marketing channels and by strengthening the after sales service facilities. In addition to having branch offices in Calcutta, Delhi and Madras the Company has a very efficient chain of distributors, dealers and sub-dealers throughout the country. Regional field officers and inspectors are constantly on tour providing sales and technical guidance as well as check on the distribution efficiency of the area. A mobile tractor school is in operation throughout the year at various centres; Jeeps service is extensively provided through distributors as well as by direct field inspectors. Stockist arrangements for steel supplies have been completed for Bombay and Calcutta.

FINANCIAL INFORMATION

AUDITORS' REPORT:—

The following are extracts from the report of the Company's Auditors, A. F. Ferguson & Co.:

"The profits of the Company for the three years were as set out hereunder and have been arrived at after charging all expenses of working and management and after making such adjustments as are, in our opinion, necessary:—

	Year ended 31st October: 1952	1953	1954
Income			
Sales	1,51,50,411	2,66,99,841	8,61,95,802
Commissions	1,48,276	1,10,044	1,22,583
Managing Agency Commission and Allowances	39,406	37,304	36,000
Income from Investments	2,52,011	1,17,282	58,594
Interest	9,584	1,912	534
Miscellaneous	36,102	29,489	67,193
	Rs. 1,56,35,790	2,69,95,872	3,64,80,706
Expenditure:			
Cost of Sales	1,32,55,635	2,37,40,866	3,13,37,359
Salaries and Wages	9,92,423	13,47,347	18,15,422
Expenses	10,03,746	14,56,008	20,07,494
Depn. as charged by the Company	92,520	1,04,733	1,03,959
	Rs. 1,53,44,324	2,66,48,954	3,52,64,234
Profit before Taxation	Rs. 2,91,466	3,46,918	12,16,472
Appropriation:			
Provision for taxes	1,00,000	1,30,000	5,30,000
Investment Reserve	2,650	..	..
Special Reserve	23,355	45,281	75,000
General Reserve	..	83,900	1,50,000

"We further report that the dividends paid by Mahindra and Mahindra Limited in respect of the three years ended 31st October, 1954, on its issued share capital were as follows:—

Year ended	Share Capital	Dividends Rate	Amount
31-10-1952	2,400 Ordinary Shares of Rs. 500 each	13%	1,56,000
31-10-1953	2,400 Ordinary Shares of Rs. 500|- each	14%	1,68,000
31-10-1954	3,000 Ordinary Shares of Rs. 500|- each	28.6%	4,29,000

"The above dividends were paid free of tax and were paid out of current profits."

PROSPECTS

The trading results of Mahindra and Mahindra Ltd., for the last three years ended 31st October, 1954, reflect the increase in the volume of sales, particularly of Jeeps, Steel and Trailers:—

TURNOVER:—

1951-1952	1952-1953	1953-1954	Six months 1-11-1954—30-4-1955	
Jeeps and Spares				
Rs. 99,58,759	1,02,46,712	1,54,63,023	1,43,42,620	appr.
Tractors and Spares				
,, ..	1,37,759	14,98,110	7,71,714	,,
Trailers				
,, 2,27,094	6,23,676	11,09,833	7,54,662	,,
Steel				
,, 29,43,087	1,22,55,852	1,20,87,232	84,47,991	,,

On the basis of the Auditors' report the earnings also show a steady increase over the last three years. It should be added that dividend policy in the past has been confined strictly to the declaration of the minimum distribution permissible under Section 23A of the Income Tax Act. Projects for development and expansion now in hand should on completion, prove of benefit to the Company hereafter. While the progressive manufacture of Jeeps to be completed by 1958 is geared to the initial production output of 2,500 units annually, it is probable that the market in India will expand to a level demanding more than 2,500 units a year. As Government has agreed to issue import licences to the Company up to 2,500 units a year during the three-year manufacturing period, it is hoped that the offtake of Jeeps will, from 1955, show an increase every year. Proforma Profit and Loss account for the six months ended 30th April, 1955, has been prepared and is summarised as follows:—

"Statement of Profits for 6 months to 30th April, 1955."

INCOME		
Sales	Rs.	2,45,67,317
Commissions	,,	150,550
Managing Agency Allowances	,,	18,000
From Investment	,,	12,458
Interest	,,	278
Miscellaneous	,,	70,813
TOTAL	Rs.	2,48,19,416
EXPENDITURE		
Cost of Sales	Rs.	2,16,51,524
Salaries and Wages	,,	9,47,263
Expenses	,,	10,48,417
Depreciation	,,	51,980
TOTAL	Rs.	2,36,99,184
Profit before Taxation		11,20,232

During the six months of the current year (November 1954—April 1955) about 1,100 Jeeps have been sold as against 1,600 units in the whole year (Nov. 1953—31st Oct. 1954). For the year ended 31st October,

1954, the net profit amounted to Rs. 6,73,346|- after providing for depreciation and taxation. Allowing for a dividend of Rs. 1,50,000|- on cumulative preference shares of the value of Rs. 25 lakhs, the balance net of Rs. 5,23,346|- from 1953-54 profits without taking into account the results of earnings from sales of larger number of Jeeps and increase in turnover of Trailers, Steel, Tractors, etc., would be sufficient to pay a dividend of over 9 per cent free of tax on the proposed ordinary share capital of Rs. 55 lakhs. The proforma accounts for the six months ended 30th April, 1955, reveal even a better position and if the rest of the Company's current year yields similar results there would be sufficient to pay a dividend of more than 10 per cent free of tax on the ordinary share capital for the current year. It is accordingly anticipated that the Company will be able to distribute a dividend of 10 per cent free of tax on the ordinary share capital of the Company. This rate of return is specifically referred to herein for ready reference and should not be construed as a definite indication that such a dividend will in fact be declared as it is obvious that the Company's dividend paying capacity hereafter must be contingent on the profits actually made which, in their turn, are naturally liable to be affected by conditions ruling at the time.

GENERAL INFORMATION

The minimum amount upon which the Directors will proceed to allotment is Rs. 40 lakhs.

Until the 15th day of June, 1955, the Company was a private Company with its issued capital consisting of Ordinary Shares of Rs. 500|- each and employee Ordinary Shares (Series "B") of Rs 10|- each. The Company had by that date an issued capital of the face value of Rs. 16,68,090|- all of which had been paid for in cash. On that date the Ordinary Shares of Rs. 500|- each were sub-divided into shares of Rs. 10 - and the entire issued capital was thus made up of shares of Rs. 10|- each. The Company also by then had reserves which were on that date capitalised and 1,66,809 fully paid up Ordinary Shares of Rs. 10|- each of the total value of Rs. 16,68,090 were issued to the then existing shareholders pursuant to the agreement dated 25th April, 1955. The said fully paid up Ordinary Shares were issued as capital distribution and in consideration **inter alia** of the shareholders agreeing to the conversion into a public company. It is intended to replace a minimum of Rs. 3,50,000|- of the reserves so capitalised out of the profits of the current year. The physical assets and stocks of the Company have been conservatively valued.

COMMISSION AND DISCOUNT:—

Apart from brokerage hereinafter mentioned, no amount has been paid by the Company at any time or is payable as commission for subscribing or agreeing to subscribe or procuring or agreeing to procure subscription for any shares in or debentures of the Company or as discount in respect of the Share issued. No amount has at any time been paid by the Company or is intended to be paid by the Company to any promoter.

DIRECTORS AND MANAGEMENT:—

There are to be no Managing Agents. There is also no contract as to the appointment of Managing Agents. The Company has not issued any founders or management or deferred shares with any special interest in the property or profits of the Company. No restrictions are imposed by the Articles of Association on the Directors' powers of management and the control of the Company's affairs is vested in the Directors.

Hitherto approximately 90 per cent of the issued share capital of the Company has been held by the Directors.

The Chairman of the Company, Mr. K. C. Mahindra, is under an agreement dated 11th day of August, 1954, to serve the Company in the honoarary capacity for five years during which he is to receive no salary and the Company has only to meet his travelling and other expenses while on business as therein provided. Messrs. Keshub Mahindra, Harish Mahindra and Aloka Mitra act as executive Directors, under five years service agreements entered into by them with the Company.

The Company has no Manager as defined in the Indian Companies Act.

VOTING RIGHTS:—

The Redeemable Cumulative Preference Shares confer the right to attend and speak at General Meetings of the Company but not any right to vote except when—

(i) the Preference Dividend is passed over in any year or has remained in arrears for more than six months from the date it is declared; or

(ii) any Resolution affecting the rights, privileges or interests of the Preference Shareholders is proposed; or

(iii) any resolution for the winding-up of the Company is proposed.

No member entitled to be present or vote either personally or by proxy or as proxy for another member at any general meeting or upon a poll or to the reckoned in a quorum whilst any call or other sum is due and payable to the Company in respect of any of the shares of such member.

Upon a show of hands, every member entitled to vote and present in person, or being a Company present by a representative duly authorised as provided in Article 90, has one vote. Upon a poll, every member entitled to vote and present in person (including a Company present by a duly authorised representative) or by proxy has—

(a) One vote in respect of every Ordinary Share.
(b) Ten votes in respect of every Redeemable Cumulative Preference Share.

RESTRICTIONS ON RIGHT TO TRANSFER:—

The Directors, without assigning any reason for such refusal, may decline to register any transfer of shares.

UNDERWRITING:—

The issue is not being underwritten.

BROKERAGE:—

A brokerage of 1 per cent on Preference Shares and four annas per share on Ordinary Shares will be paid on receipt of allotment money in respect of application from the public bearing the stamp of a recognised Stock Broker.

APPLICATION FOR SHARES:—

Application for shares from the public will only be received on the footing of the formal Prospectus and on forms issued therewith by the Company and these may be obtained from the Registered Office of the Company at Gateway Building. Apollo Bunder, Bombay, or from its branch offices at Calcutta, New Delhi and Madras; or from Batlivala & Karani, New Union Bank Building, Dalal Street, Bombay; Lewis & Jones, Bank of Baroda Building, Apollo Street, Bombay; Place Siddons & Gough, 6, Lyons Range, Calcutta; Dalal & Co., National Insurance Building, P.B. 149, Madras."

Application forms can also be obtained from branches of Llyods Bank Ltd., at Bombay, Calcutta, Delhi and Madras.

Peace Amidst Plaudits?

THE triumphal receptions accorded to India's Prime Minister in most East European capitals in the last three weeks should fill every patriotic Indian with pride. There is a strong personal equation in these receptions; almost certainly any other Indian Prime Minister than Jawaharlal Nehru would have fared less well. The halo of romance which surrounds Jawaharlal at home has travelled with him abroad. Millions of people who know nothing of India's foreign policy or the romantic career of the darling of the Indian people have turned out to do Jawaharlal Nehru honour. It cannot be that all this has been organized; it has a ring of spontaneity which stands above the almost military precision with which each visit has been conducted. The truth is that Jawaharlal Nehru today is the most popular man in the world. This is a fact of supreme political importance.

It is a fact—however unpalatable it may be to some—that Indian foreign policy has now become invested with the personal equation which belongs to Jawaharlal Nehru. Indian foreign policy, today, is in fact an extension of his personality in the foreign field, just as trite commentators have often described foreign policy of

a country as an extension of policy at home into a foreign climate. This is not an unmixed blessing. The Prime Minister is deeply human, and his impulses are warm and generous. As a result of his identification with India's foreign policy, his personal sentiments have often been confused with his policy. Thus when he said that he had left a portion of his heart behind in the U.S.S.R., the conclusion was hastily reached that India did not dislike totalitarianism. The truth is that Jawaharlal Nehru dislikes totalitarianism though it may be that his dislike is less than that of the Indian people as a whole. Why was this left so much in doubt? The tour in Eastern Europe has certainly given the world the erroneous impression that India likes the totalitarian countries better than she likes the Free World.

It is necessary to correct this impression. It is necessary, because it is so little advertised, to point to the impersonal side of India's democratic life. In literally hundreds of thousands of villages men and women are being encouraged to help themselves; they are not being driven by law or by any official lash. In literally thousands of Indian papers there is free criticism of Governments. The legal framework of the Indian Constitution is based on the concept of the Rule of Law and, notwithstanding executive encroachments here and there, practice is based on the grand spirit of that great concept. To say that India stands neutral between totalitarianism and democracy because of an unhappy choice of words on the Prime Minister's part is to travesty not only the Prime Minister's outlook; it is to cast a libel on the great spirit of democracy enshrined in the working of Indian institutions since Independence.

It surely is not necessary to assure the Free World that the thought of an alliance in ideology with the Curtain countries is totally absurd. But it surely is not unnecessary that we should ask ourselves why if we dislike totalitarianism, we are so prone to give the impression that we are not so particular? Again, so far as foreign policy is concerned, can we as Indians lay the flattering unction to our souls that we enjoy in equal terms as three years ago the reputation for independent neutrality as between the two great Power blocs? Is there not more than superficial justification for the view that the leaning on countries behind the Curtains has grown while that on others has tended to remain stationary? In so far as Panch-Shila—or the five principles—go, it may be that the Curtain countries have come our way, and not we theirs. But the line of division between policy in so far as it expresses itself in statements of Prime Ministers has tended to grow continuously more tenuous. India is certainly working for peace; but peace, like truth, has many colours. Is there not a suggestion at least that the existing preference is for the red variety?

India's capacity for exerting her influence in the cause of peace depends in no small measure on her regaining that position of independence in which the direction of her leaning was not apparent to either side in the Cold War. This is the more necessary because the Cold War is thawing. The Peace Offensive, now being played brilliantly by Marshal Bulganin, may well make him the hero of 1955. As with Chou En-lai at Bandung, Nicolas Bulganin may capture the spotlight at Geneva this month. The Communist countries are now showing that they need no good offices. They are capable of reaching agreement with countries of the Free World without an honest broker going between.

India, that has played honest broker for the last three years at least, will then find herself out of a job in international politics. There is no harm in this result if it leaves us friends with all the world. But what would we gain, if in the process of settlement, we were left without the advantages of being wooed by either side? It is conceivable that the U.S.S.R. might choose to transfer its attentions to Europe and that, without any comparable advantages in political or economic terms, we would have earned the suspicion of leading countries of the Free World.

It is vital that we should not allow the impression to be created that we have in the pursuit of peace at any price found our way by mistake into the wrong Peace camp. We had no camp in the Cold War. We should have no camp in the Cold Peace. There is still time in the Prime Minister's present tour for this to be made clear.

B.C. Roy versus P.C. Mahalanobis

THE controversy now raging in West Bengal between Dr. B. C. Roy, Chief Minister of West Bengal, and Prof. P. C. Mahalanobis, author of the draft second Five-Year Plan, deserves a wider audience than is at present listening in. The fact that Dr. B. C. Roy has a reputation of leaning somewhat to the Right, whilst Prof. Mahalanobis has a reputation for leaning heavily to the Left, might lead one to suppose that this is the traditional Right-Left controversy being waged with its acknowledged leaders in the forefront of the fray. This is not, however, the case. The battle at present being fought is largely free from ideological considerations. It is in the main a straight administrative issue as to whether the Plan frame possesses the necessary requisites of a detailed picture, and whether the approach towards implementation suggested by Prof. Mahalanobis is administratively feasible in India.

The first issue is whether for the purpose of planning in India at the present time one can impose targets from above, with no direct relations to existing conditions, or whether one needs to examine the gaps on the field and build, so to speak, from below. Dr. B. C. Roy is an exponent of building from below. More precisely, this means that no arbitrary imaginary financial figures should be set into the targets on this stage. Each State will need to make a list of projects before it makes a list of totals. Totals arrived at without any content in terms of precise projects might be misleading in one or other of two ways, either because the resources presupposed are too high or too low. It would be the strangest of accidents if the figure arrived at in a statistical laboratory by a wholly academic process were exactly the appropriate figure to be reached by adding project to project up to a limit when administrative organisation

was fully strained. In Prof. Mahalanobis' strange outlook, the administrative capacity of the country at a particular time provides no bottlenecks; everything it seems can be done by finance. In Dr. B. C. Roy's approach, administrative capacity is a dominant element deciding what can be achieved in a definite time.

It is not necessary to accept Dr. B. C. Roy's evaluation of what exactly India's administrative capacity is at the present time in order to admit that his approach is obviously to be commended. Finance whether obtained by existing resources or by deficit finance must in the last analysis be subordinate to administrative factors. Mere provision of finance cannot build projects. If there is a bottleneck in physical resources or administrative ability, additional finance is of no avail. It is this simple proposition which stands behind Dr. Roy's insistence that a practical plan for India must be built up in the field.

When a plan is so built up, the chances are that there will be also a far more precise description of the elements which can go to its fulfilment than at present obtained. It is one of the greatest weaknesses of the plan frame that its figures convey no picture of the volume of the raw materials or, indeed, of the manpower required for its execution. The truth is that there is no relation whatsoever between the financial figures in the draft plan and the employment figures. These latter are pure poltical interpolations, being nothing more or less than directives from the Central Government on the volume of employment it would be desirable to provide.

While this approach to the Plan—whether it should be built from above or below—is the main issue, a subsidiary issue arises from the manner in which Prof. Mahalanobis has set out to provide the additional employment which he considers that it is his duty, irrespective of all practical considerations, to provide. The Mahalanobian concept of India's new economy is that of a head in heavy industry, limbs in cottage or household industries, and no body at all. Dr. B. C. Roy points out that a structure of this kind is a physical impossibility, and therefore, it will not come about. But even if it should come about it provides no solution to the particular demands which are likely to arise in the next few years. Consider, for example, the needs of industrial workers engaged on heavy industry. Their incomes will need to be spent on consumer goods. They have already formed habits in regard to the kinds of goods on which they wish money to be expended. For the most part, outside food, these are goods manufactured in medium-scale industries such as textile mills, shoe factories and so on, that is, industries which, in Prof. Mahalanobis' structure, are to be restricted fiercely in favour of the cottage variety. It is true that the cottage industries may produce more and more of this extra production may even be sold largely in villages where production takes place. But it is unthinkable that the Indian working classes will be satisfied with the quality or the prices of cottage industries products, which Prof. Mahalanobis intends to impose upon the country to the exclusion of factory products. Dr. B. C. Roy points out that just as there is a limit on the rate of advance set by administrative difficulties, so there is a limit on the capacity to change the structure of the Indian industrial system because of the degree of rigidity which exists in consumer behaviour. It is India's working classes who in the last analysis are to determine the rate and quality of industrial output. They will certainly not acquiesce in a return to lower standards of production at steadily rising prices. Prof. Mahalanobis' proposals are not merely reactionary; they are unworkable.

In the end, the controversy between Dr. B. C. Roy and Prof. Mahalanobis rests on the issue whether the economy designed for India in the second Five-Year Plan is to reflect free choice or to be imposed by methods, more or less totalitarian, upon the Indian people. Here at least there can be no doubt that Dr. Roy's approach is wholly sound, and Prof. Mahalanobis' wholly dangerous. In the last analysis, the choice in favour of democratic methods has already been made. This choice is enshrined in our democratic Constitution, but it is far older than January 26, 1950. It is part of the Indian way of life down the ages. Our people refuse to be dragooned; they will resent deeply any suggestion such as that implied in the doctrine of forced saving, which will be necessary if the Mahalanobian target of a saving of thirty per cent of an increment of output is to be enforced. Dr. Roy points out that the Indian people will never agree to have this pattern of consumption or saving decreed and regulated in the manner that Prof. Mahalanobis proposes. In private Dr. B. C. Roy, who is an astute politician, argues that the Mahalanobian view imposed upon the country at this time will involve the loss of a large block of Congress votes at the next general election.

The Mahalanobian Plan is in error in demanding an excessive rate of saving to finance income generated at a level which recent experience has shown can be obtained with much smaller resources. In rejecting the Mahalanobis estimate on the rate of voluntary saving, Dr. B. C. Roy is certainly right in his calculations as recent articles in "The Eastern Economist" have shown. But since the ratio of capital to income generated can be considerably lower than that provided in the Mahalanobis Plan, Dr. Roy is not equally correct in rejecting the income targets. With this qualification it might be said that that in the controversy now raging in Calcutta, Dr. Roy is fundamentally right and Prof. Mahalanobis is fundamentally wrong. To accept Dr. Roy's thesis on three points, namely, building from below, developing the existing structure of industrial organisation, and maintaining a democratic society in spirit as well as in form does not imply the acceptance of every figure which he indicates. It is likely that he has been misled by the Central Statistical Organisation's figures in regard to the rate of possible economic progress.

Only a brief comment on the political climate which enters into the controversy may be added. On all the three issues described above on which Dr. Roy differs from Prof. Mahalanobis one would have expected him to have the overwhelming support of practical men, particularly the members of the Central Cabinet and the leading Chief Ministers of States. Curiously, this is not the case. An explanation for this strange phenomenon, by which an argument so obviously sound is not entertained by the majority of India's political leaders, needs to be given. There is no doubt that the encouragement given to Prof. Mahalanobis by the Prime Minister and the Finance Minister has been responsible for giving to many mistaken notions in the draft Plan an

economic respectability and a political authority which is wholly undeserved. The Chief Minister of West Bengal is to be congratulated on having stood firm against the political tide. India at this critical time needs more men in authority with courage such as this. Dr. B. C. Roy this week has entered into his seventy-fifth year. Age, it seems, cannot dim nor custom stale his infinite variety. There will be many in India today who will wish that he may long be spared to wrestle with the false prophets that confused counsels in high places always bring forth.

The Nationatisation of Insurance

FOR too long have people, especially of a particular political persuasion, been talking of nationalising insurance in this country without caring to convince themselves or the public of the definite advantages of such a course. Whenever reference has been made to this subject, these protagonists have said no more than that it would place ample additional resources at the disposal of the State and that, in any case, it would not make matters worse than they have been—a very poor argument. Presumably because of this there was no disposition on the part of insurers to take the suggestion seriously, despite assertions even by official spokesmen that the question was receiving consideration. But, after the Prime Minister himself declared recently that personally he was in favour of nationalising insurance and banking at the right time, insurers must have begun to feel that the threat of nationalisation is both real and imminent. This doubtless explains the prominent attention that the subject received at the hands of Mr. A. D. Shroff, Chairman of the New India Assurance Company, Limited, last week, in Bombay. After thoroughly examining all aspects of the problem, Mr. Shroff has established that, while the so-called gains from nationalisation of insurance are extremely dubious, the move is not without serious risks, risks that the country can ill afford at the present time, more especially in the context of its five-year development plans.

There are five heads under which the subject has been appropriately examined, namely, the purpose of the proposal to nationalise, the character of the industry and its adaptability to nationalisation, the record of the industry, the ability of the industry as it is constituted at present to continue to contribute to the economic development of the country, and the experience of other countries which have sought to nationalise insurance.

The underlying object of nationalisation of insurance, in so far as those who advocate it have averred, is that it is basic to the national economy and that the resources of the industry would be available for development purposes, particularly in the public sector. But it has been proved ere now that this assumption is quite unfounded. In the first place, the resources are not as abundant as they are made out to be, what with a per capita life insurance of Rs. 25 and a per capita premium of Rs. 1-5 (in 1952) as compared to Rs. 8,365 and Rs. 327 in the United States and Rs. 1,840 and Rs. 106 in the United Kingdom, respectively. The population covered by life insurance in India is still below 5 per cent of the families as against nearly 80 per cent in the United States. Moreover, under the Indian Insurance Act, very little discretion is allowed to the insurer in the matter of investment of funds. It is noteworthy that, in practice, insurers in India actually invest a larger percentage of their funds in Government securities than in other forms of investment such as equities and immovable property. Thus, the consideration that more resources would be available to the government if insurance were nationalised is not borne out by facts.

Those who talk of nationalising insurance are not themselves very clear as to whether they would want nationalisation of all branches of insurance, that is, both life and general. Even countries economically more advanced than India where enthusiasts of nationalisation have not been found wanting have stopped at nationalising life insurance and, subsequently, have had to go slow on nationalisation of life insurance as well. The experience of several countries with State-owned and State managed insurance, such as Poland, France, Russia, Sweden and New Zealand, among others, to which Mr. Shroff has drawn attention, makes an illuminating commentary and is not without its moral to countries like India which are thinking of action along similar lines. The record of performance of these countries convincingly proves that general insurance does not only not readily lend itself to nationalisation but will greatly undermine the sound position of insurers, especially in the foreign field. It would therefore be unfortunate if Indian insurance, which has only lately begun to make notable progress in this field in neighbouring countries, were to be nationalised and thereby made to suffer a setback.

Before an existing scheme of things is replaced by another, it is necessary not only to prove the merits of the new one that is sought to replace it but also to establish that the existing scheme has failed to come up to expectations. It cannot be seriously contended by any one that the performance of the Indian insurance industry, whether on the life side or on the general side, has not been satisfactory, although it may not be spectacular.

Then, again, it is pertinent to examine whether, with all the development programmes that India has before it, it should not explore every avenue to harness the savings of the community effectively before tampering with the existing agencies and thereby causing avoidable dislocation. Before embarking upon nationalisation of insurance, the authorities will also do well to ask themselves the question whether they have the requisite trained field organisation to tap the immense potential resources yet awaiting to be tapped in this sphere. It should not be forgotten, incidentally, that this would entail the diversion of both men and money from their present assignment with all its consequences. In fine, while it is doubtful whether nationalisation of insurance will at all benefit the Government, it is sure to retard the progress of our development plans, besides depriving the private sector of a potentially effective source of capital formation.

THE WEEK'S NOTES

MR. KRUSHCHEV EXPLAINS

MR. KRUSHCHEV'S important speech at the U.S. Embassy Independence Day Reception in Moscow is in keeping with his reputation as an unconventional Communist. He gave the warning that the Soviet Union will not be negotiating at Geneva because of weakness. There is one school of opinion in the West which has always assumed that any compromise is a sign of weakness; so it has never favoured concessions to others while concessions from others are expected to increase by being rejected. There is no need to regret the decline of influence of this school. The more valid criticism of Russian gestures has been based on distrust and, what Mr. Krishna Menon described as mistaking perpetual suspicion for caution. Russia has no one to blame but herself for creating such suspicion.

There are many ways of interpreting Russian weakness. The cruder interpretation seeks support in a decline in agricultural or industrial production or temporary difficulties. There is also the general weakness common to all Powers arising out of the danger of a nuclear war; humanity everywhere is afraid of such catastrophe. In any case, the argument that Russian inferiority in tactical or nuclear weapons is responsible for concessions is not held by many responsible persons and it may be that the Russians themselves have been too conscious of this interpretation being put on their gestures. That explains also the magnificent air display in Moscow this week which has produced a great impression on Western observers present on the occasion.

"We made these decisions because they were the only right decisions and that is what motivated us." If that frame of mind persists and if the Soviet leaders could alter their perspectives each time they are convinced of their mistakes, discussions can be fruitful. But most often, Soviet policy changes have come about with changes in the situation, not only with reference to the Western countries but even in regard to the Communist world and the neutral powers.

A COMMUNIST ESSAY IN COMPROMISE?

IN ITS long 8000-word Resolution which embodied the fruits of its recent heart-searching, the Communist Party of India has only acted in the manner generally expected of it. The resolution is riddled with contradictions which the Party has to accept because they flow from the fountainhead at Moscow. Marshal Bulganin's compliment to India's foreign policy and her economic advance—which was paid without the slightest heed for the Indian Communist Party's loss of face—has landed the C.P.I. in the same dilemma which faced it during the Andhra elections. The Resolution is a confusing string of Communist claptrap about imperialists, war-mongers and peace-camps from which there emerges the thesis that though India's foreign policy is not wholly independent of Western influence, it has had a commendable 'reorientation' because 'in the main' it opposes the war-drive of imperialism, and "generally"—not forcefully or wholeheartedly—opposes colonialism.

All these follow from the initial thesis that only 900 million people (in the Communist World) have broken away from the orbit of imperialism and that Commonwealth membership subjects India's foreign policy to British imperialist influence, which is one of the chief enemies of world peace. There is then the surprising conclusion that the Government of India has been able "to assert increasingly India's sovereignty and independence." "The policies that the Government of India pursues today in its relation with other countries," the Resolution adds, "are essentially independent and are not under the decisive influence of any foreign power".

Similarly, while it blows hot and cold even about domestic developments the C.P.I. Resolution has to concede that India's Plan "did achieve certain results". (Otherwise Bulganin could look completely foolish when he commended India's progress). But the Communist Party feels bolder in condemning feudal landlordism and capitalism; the Soviet steel plant alone seems to stand out in happy and bold relief in a Plan which is "linked with the world capitalist market which is crisis-ridden." The policies of the Nehru Government have forced the Communists to proceed to the remorseless conclusion that they "taken as a whole, continue to be reactionary and undemocratic in practice despite talks about a socialistic pattern of society." The Communist remedy, therefore is the organisation of "mass resistance" and "struggles"—whatever these words may mean. If the Communists abjure such language they will cease to have their raison d'etre. By emphasising the personal role of the Prime Minister—which is what Moscow or Peking is immediately concerned about—the Communists seem to have found a formula by which they can vary the content of these slogans and reconcile the irreconcilable for the present, while reserving their views on fluture conduct.

SUEZ TO SIMONSTOWN

THE SIMONSTOWN agreement which provides for co-operation between the U.K. and the Union of South Africa in matters of defence is of some importance in view of the possibility of South Africa becoming a Republic and deciding to leave the Commonwealth. The agreement is similar to the Suez Canal settlement with Egypt. It has taken as many years to negotiate, though the talks did not create a sensation. Britain will now transfer control of the naval dockyard to South Africa and in return the British Navy will be allowed the right to use the dockyard in peace and war. Sir Anthony Eden has told Mr. Attlee, who sought clarification on this point, that the base was guaranteed for the use of the U.K. in war even if South Africa were to be neutral and that Britain's allies also could make use of it. South Africa has not only undertaken to maintain the base at full efficiency but also to refrain from imposing restrictions on the recruitment of workers on the basis of colour. A maritime strategic zone round the Cape sea routes will comprise an area under a South African flag officer, but in a war in which both countries are involved, the whole zone will be under a British naval Commander-in-Chief.

As in Suez, Britain has attempted to secure in substance the right to the base, while conceding the principle of South African control. South African fears about her own military weakness are undoubtedly responsible for this helpful attitude. The Union Government has decided to expand its naval forces and to place orders for ships to the value of £18 million in Britain.

There is, however, a general statement in an exchange of letters, that the defence of South Africa against external aggression lies not only in Africa, but also in the gateways to Africa—namely in the Middle East. What will be the regional arrangements contemplated to secure the sea-routes and lines of communication around South Africa? Will the Middle East countries and the U.K. fall in line with arrangements of the kind that will fully satisfy South Africa's fears of aggression? A conference to be sponsored by the two Powers is expected to go into this question more fully.

U.N. TECHNICAL AID IN 1954

NEARLY ONE hundred countries and territories in all parts of the world received technical assistance during 1954, according to a report published this week by the Technical Assistance Board of the United Nations. The Board's report to the Economic and Social Council shows that more contributions were made for technical assistance during 1954 than ever before. Between 1950 and 1954 the number of contributing governments increased from 54 to 74. Nevertheless, the report regards 1954 as "another year of paradox". For financial reasons the tempo of operations had to be slowed down. The basic needs have exceeded financial resources. The report shows that expenditures on the three main forms of assistance—experts, fellowships and equipment —amounted to $15,111,000 in 1954. The entire assistance programme for 1954 amounted to $19.5 million; it supplied 1,584 experts and 1,524 fellowships to the participating countries and satisfactory progress was made in regard to new methods of programme planning on a country basis. Experts were provided in 1954 to 71 countries and territories; and fellowships were awarded in 86.

The two-way nature of participation by countries in the expanded programme is cited by the report. Europe pledged a total of $7,120,000 and received assistance amounting to $1,500,000. Asia and the Far East pledged $1,288,000, were given assistance amounting to $4,650,000. Latin America pledged $1,286,000 and received assistance totalling $3,921,000. The Middle East pledged $248,000 and received a total aid of $3,252,000. The African continent, not in a position to offer any extensive assistance, received aid totalling $1,279,000.

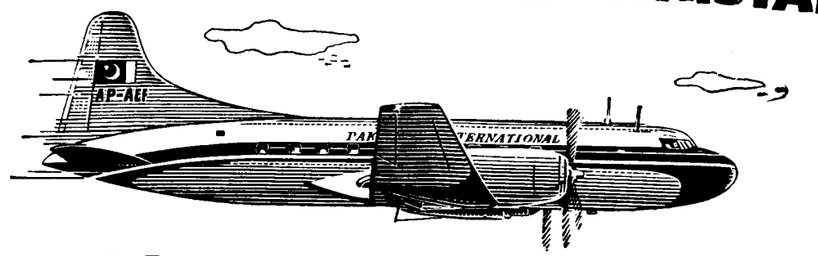
Events in the past year, says the Report, have clearly illustrated the difficulty of carrying out what should be essentially a long-term programme on the basis of year-to year financing. The amount pledged for 1954 totalled $25.3 million and the cash actually collected including arrears amounted to $28.6 million. But obligations actually recorded by the end of the year amounted only to $19.5 million though the minimum programme for 1954 approved by the T.A.B. on priority requests amounted to $27.1 million. So, the T.A.B. seems to need some more technical help in organising its own affairs to make the best use of the money available.

The increase in the funds placed at the disposal of the T.A.B. is not unsatisfactory, considering that three years ago there was a drastic 'axe-ing' which affected the expansion of assistance schemes. It is reported that the Soviet Union is dissatisfied with the poor use made of the funds she placed at the disposal of the U.N.; if there is any truth in this, it should be fully investigated. Whatever the motives of the Soviet Government in agreeing to participate in the scheme, the virtue of aid through the U.N. is that it can be administered without "strings" of which most receiving countries are afraid.

PAPERWORK MANAGEMENT

THERE IS a streak of economy-mindedness among most human beings, which can show itself in many odd personal habits, often amounting to eccentricities. Millionaires have saved pieces of string or lace and economised on footwear leather even when they wore out their motor-tyres mercilessly. Some such impulse forces the Federal Government in the United States to set up inquiry committees for probing into possible economies in administration; and the outcome invariably is a vivid picture of extravagance and waste. The Americans seem to have it both ways. They get a kick out of the large figures of production and of the enormously expanding consumption; and then, they can always have the pleasure of calculating the waste and of being penitent for it.

The Hoover Commission in the U.S.A. has now produced four reports which show how federal spending can be cut by $4 billion a year. One of the Reports has the picturesque title "Paperwork Management". The Commission is convinced that by adopting its 18 specific suggestions with regard to "paperwork areas where savings are possible", at least $250 million a year could be saved. This is only a mild estimate by the side of the calculation that the federal government uses 25 billion pieces of paper every year and has accumulated 24 million cubic feet of paper in 2 million file cabinets requiring 16 million sq. feet of office space. This excludes the tons of paper used for technical manuals, pamphlets and periodicals; the total is indeed stupendous.



The remedy? The word "standardize" comes easily to the rescue. Standardize letters, forms, reports and procedures; write more routine letters, using standard texts. But why this austerity line for Government alone in a milieu in which ever-increasing consumption is the test of sustained economic progress? Have the millions of tons of newsprint—which inflates the U.S. per capita rate of consumption and makes it a constant source of pride—passed the test of essentiality in the interests of the intellectual and moral progress of the nation? The point is that the Government cannot be separated from the prevailing social and economic attitudes and the person who is not conscious of the extra pounds of newsprint he takes without needing all of it may not suddenly develop a new attitude in his place of work, to do with less paper.

PROGRESS IN PAKISTAN

ANNOUNCING THE decision of the Government of Pakistan to float two new loans to finance development projects (3 per cent 1960 and 1963 respectively), a press note from Karachi gives details of the progress made in development so far, which certainly sounds impressive. It is claimed that industrial production was, in 1954, 185 per cent of the 1950 level. The jute industry's target of 6,000 looms by 1957 will be attained in the course of this year and 11,000 tons of jute goods were exported in 1954. The Karnafulli Paper Mill with a capacity of 30,000 tons is now in full production. There has been a remarkable increase in cotton textile installed capacity. There are now 1,316,312 spindles and 18,427 looms—which is about a tenth of the size of the Indian industry. As in India, cement production has doubled in six years, though the total was only 674,000 tons in 1954. Besides the hydel power of over 60 megawatts which existed at the time of partition, 197 megawatts of thermal power has been added—which involves a further demand for coal. Coal output has increased from 241,000 tons in 1948 to 541,000 tons in 1954, and oil from 500,000 to 1,700,000 barrels. Though, in absolute quantities production in 1954 is still modest, output has doubled in a number of lines, supporting the claim that the industrial production index on a 1950 base was 185 in 1954.

There is a large number of schemes on hand. The major drawback has been the inability to make rapid arrangements for the construction of link canals to use the waters of the western Indus system. The Sind Barrage costing Rs. 24 crores is expected to be finished in 1960 and the Gudu Barrage Project (Rs. 18.30 crores) will be completed in 1958-59. The Thal, Taunsa and Mangla Dam are all among the bigger projects but they are not presumably making much progress yet. In the earlier years when political difficulties were much less than now, the administrative structure was inadequate; but now, the political uncertainties may hamper the bigger projects.

LINKING INDIA AND PAKISTAN

PIA for new standards in air travel

PIA

Member, International Air Transport Association. Serving INDIA, PAKISTAN, BURMA, EGYPT and GREAT BRITAIN.

Fly to KARACHI, from BOMBAY and DELHI in modern Convair Skyliners, impeccably equipped, fully pressurised and air-conditioned. Courteous cabin attendants to look after your every comfort, serve you delicious meals. *Excellent bar service.* Five *fast* non-stop services each week from Bombay and four from Delhi.

From Delhi

On Monday, Tuesday, Thursday and Saturday. Departs 7-15 p.m. One-way Rs. 166. Round trip Rs. 316.

From Bombay

On Monday, Tuesday, Thursday, Saturday and Sunday. Departs 12 noon. One-way Rs. 170. Round trip Rs. 323.

LINOLEUM

is NOW manufactured in India

Another important stride towards India's industrial self-sufficiency has been taken with the establishment of India's first Linoleum factory. LINOLEUM—the smart, hygienic, and durable floor-covering—is now made in India by India Linoleums Ltd.

Modern machinery and expert craftsmen in our factory produce Linoleum that is comparable in quality to the finest foreign makes. Apart from meeting India's entire demands, this pioneer factory is manufacturing enough to export its products to foreign markets.

LINOLEUM floors give :

MODERN LOOK—Linoleum floors help shops and stores to look more efficient, more attractive.

MORE COMFORT—For the ultimate in underfoot comfort, remodel your homes, offices and factories with resilient Linoleum floors.

LONGER LIFE—The strong burlap base lasts longer. Ideal for use in railways, steamships, automobiles, public institutions etc.

To cover your new floors and to protect the old ones lay Linoleum from wall-to-wall because it makes the floor itself as well as a carpeting.

Show Rooms :
7, Chowringhee, Calcutta.
1/155, Mount Road, Madras

Available in colourful designs, Plain Pastel Shades and in other pleasing effects Linoleum is most suitable floor-covering for

A Window on the World

WHAT STARTED THE REVOLUTION?

By

ODYSSEUS

MAULANA AZAD has commissioned Dr. S. N. Sen to prepare a definitive history of the 1857 Mutiny, and in order to (1) form an idea of the magnitude of his task, and of the kinds of problems involved, (2) illustrate how dependent on the industry and integrity of historians must be the ordinary man who, unable to delve into the archives himself, can only acquire his knowledge of history at second hand, and (3) show how important historical accuracy is in view of the influence of ideas on the minds and activities of men. I quoted last week four versions of the events leading to the French Revolution of 1848 and promised to set forth some of the contemporary evidence on which their confident narratives and interpretations were based.

In a nutshell, the historians tell us that throughout the ministry of Guizot under King Louis Philippe, the Opposition had demanded parliamentary reforms, that they had organised banquets in 1847 to publicise their demands, and that one which was to take place in Paris on February 22, 1848, was banned by the Government, whereupon demonstrations led to clashes between troops and people (in which 50 were killed), ending in a popular rising that swept Louis Philippe off the throne, and that was the signal for risings in Germany, Italy, and Austria-Hungary. The broader repercussions were that the failure of the German Liberals to secure the unity of Germany enabled Bismark to build up the continental European imperialism that led to World Wars I and II. Louis Philippe's abdication enabled Louis Napoleon Bonaparte to create the Second Empire which collided with nascent German imperialism in the Franco-Prussian war of 1870, and this led to the enmity between the two countries which still bedevils international relations in Europe and indirectly throughout this One World.

All this flowed from the bloodshed in the streets of Paris between February 21-24, 1848. The foregoing is both a statement of facts and an evaluation of them. Professor E. L. Woodward points out in his classic "War and Peace in Europe, 1815-70" (Constable, London, 1931) that in order to make such statements and evaluations, the historian must answer four questions: (1) What happened? (2) Why did it happen? (3) Why did it happen that way and not otherwise? (4) What is the meaning of the happening?

THE VALUE OF AN OFFICIAL ENQUIRY

The French historian, A. Cremieux, who published a critical study of the events of February 21-24, 1848, began by classifying the sources available as: (1) Official documents; (2) Unofficial contemporary documents; (3) memoirs, i.e., records of eyewitnesses, although the date of writing may have been much later than 1848; (4) histories of the Revolution. Cremieux noted that the closer to 1848 was the publication of any history of February 21-24, the less reliable it was, being written under immediate reactions for or against the Revolution; early historians are, therefore, to be regarded as themselves primary authorities on the divisions of French opinion rather than on the facts of the Revolution.

Chief among the official documents was the Magistrates' Enquiry that followed the shooting. What could be better? Trained legal minds sifting out the evidence. But consideration of the documents suggests that the Enquiry was a concession to the popular outcry for vengeance on the defeated "traitors". The Enquiry was purposely dragged out long enough to allow passions to cool and therefore to protect the fallen ministers from popular vengeance. Bearing the Magistrates' apparent motives in mind, we can nevertheless agree that use can be made of much of the evidence collected.

Government offices were ransacked for any documents that might prove that the "wicked government" had resisted demands for reform. Evidence was secured from eyewitnesses of the revolt. Few documents were found. People don't have time to write reports in the heat of action. Many decisions were taken at anxious and excited meetings and orders given, and messages taken, verbally—in tense circumstances which made for contradictory recollections afterwards. The evidence itself varied in quality with the intelligence and sympathies of the witnesses and the skill or sympathies of their examiners.

Unofficial contemporary documents included newspapers and pamphlets. Cremieux tells us that as reporters of facts the newspapers were of little value—the collection of news was not so elaborately organised as today. The value of the newspapers is in drawing attention to contemporary motives and attitudes. Cremieux first tried to ascertain the viewpoints of each newspaper and its financial resources (to ascertain whether it was dependent on any party for support). The time and meticulousness demanded of the conscientious historian is shown by Cremieux's division of 28 newspapers into 10 classes, ranging from the Official Gazette, Extreme Right, Right, Centre, Left Centre, Left, Socialist, to Communist. Pamphlets are of little use to the historian of a revolution that lasted four days. If the Revolution had lasted several months, polemical pamphlets, for or against, could have thrown light on personalities and motives. As it was, pamphleteers found it wise to accept the accomplished fact and side with the victors.

When we come to memoirs, we find that some writers make only fleeting references to February 21-24; others are anxious to justify themselves or damn their enemies; most, naturally but tantalisingly, assume that all the events are common knowledge.

Examining the histories of the revolution, Cremieux found that the nearer to them the events that the historians described, the more involved were their own feelings, so Cremieux classified their histories in chronological order to correspond with the successive changes of public opinion towards the revolution and towards the regimes of the Second Republic, and then of the Second Empire, which followed it. In the first months after February 21-24, histories were written by the enthusiastic supporters of the new regime; no one was rash enough to criticise the "heroic victors of the barricades". But the new Republic (like all governments) failed to realise public hopes, and as time passed, critics emerged. The events then began to be narrated from the viewpoint of the fallen ministers, or of the Centre, or the Royalists, who now ceasing to be the enemies of the people become the "friends of the people deluded by the demagogues!" Opposite criticism from the Extreme Left was just as strident.

"HISTORY" CHANGES EVERY YEAR

Roughly speaking, it was not until 1912—sixtyfour years later—that there emerged in Cremieux an historian who had no personal interest in 1848 save to piece together the truth. Cremieux's classification of the historians of 1848 suggests that history is not a final judgment on a given set of facts, but a series of changing interpretations of those facts dictated by recourse to "history" for precedents to promote, justify, or condemn, present policies, parties, movements, and aims. We need to remind ourselves that this is not true History but historical mythology dressed up in History's trappings, and to be on the watch for it in the course of our reading, continually asking ourselves: "Is this man using a myth to propagate a view, or is he honestly trying to answer professor Woodward's four deceptively simple looking questions?"

But what about the famous banquet that started the revolt? Who organised it and why? Among the documents seized after the revolution were some concerning the "Reform banquets". These papers showed that the parliamentary Opposition felt that these banquets, started in 1847, were losing their popularity; they were being ridiculed by the cartoonists. The Opposition did not, therefore, want the Paris banquet, the initiative for which came from a few obscure party zealots led by one, Roinville, anxious to make themselves as conspicuous as others in "the cause". When he got 900 acceptances, Roinville became alarmed at the unexpected size of his banquet. He had not bothered to obtain the permission necessary in accordance with a law passed to ensure civil peace. Now he did. The police, fearing disorder, refused. Roinville felt that he must enlist the support of more important people than himself and appealed to the Opposition leaders without whose aid he could not defy the police and without whose presence the banquet would be a flop. The M.P.s had never wanted a banquet; they had not Roinville's motive for defying the police; their izzat was not involved in a surrender. The Opposition press now heard of the banquet and used it a stick to beat the government, accusing it of denying the right of public meeting.

Roinville afterwards published his memoirs in which he reproduced the text of his letter to the police, containing no request to authorise the banquet. Unfortunately for him and fortunately for the conscientious historian, his original letter survives in the police archieves and shows that he did ask for permission. Why suppress this? Because Roinville's request proved that he knew that authorisation was the law of the land; if so, refusal was equally lawful; if so, the government could not be attacked for "illegality".

Professor Woodward cites Roinville as an example of the value of checking memoirs with documents. Roinville's letter in the archives alone would not reveal his anxiety to hide from his friends the important fact that he shrank from telling them that he had asked for authorisation: his memoirs alone would not reveal that he did.

A compromise for the izzat of the police and of the Opposition leaders was found. It was agreed that they would march to the meeting hall (in a remote quarter), would there be told that it was illegal, would propose one toast to "Reform", and then go home. The Opposition press, however, played up this procession into a great popular demonstration. Once more the M.P.s were alarmed at the possibility of disorder. Whatever they were, they were not revolutionaries; they cancelled the procession!

What? No banquet? No procession? How then did the clash between troops and people arise on February 21, day of the banquet? The provocation of the banquet (abandoned by its reluctant and law-abiding sponsors) to the Revolution of 1848—with all its repercussions, national and international—seems to have diminished to vanishing point. How did fifty people get killed in a procession that never started? See Next Week's Thrilling Final Instalment.

THE BIRLA JUTE MANUFACTURING CO., LIMITED.

NOTICE is hereby given that the Annual Ordinary General Meeting of the Shareholders of the Company will be held at the Principal Office of the Company, No. 8, Royal Exchange Place, Calcutta, on Wednesday, the 27th July, 1955, at 3-30 P.M. for the following purposes:

(1) To receive and consider the Report of the Directors and to pass the audited accounts of the Company for the year ended 31st March, 1955.

(2) To declare dividends on Preference and Ordinary Shares.

(3) To elect Directors in place of those retiring by rotation.

(4) To appoint Auditors and fix their remuneration.

(5) To transact any other business which may be brought before the Meeting with the permission of the Chairman.

The Share Transfer Books of the Company will remain closed from 18th July to 27th July, 1955 both days inclusive.

By Order of the Board,
CALCUTTA, BIRLA BROTHERS LTD.
Dated, 22nd June, 1955. Managing Agents.

In particular to: Smt. Grihya Kumari, Smt. Sarojini Devya, Mrs. Rubie Nanda, Messrs. Ambika Charan Neogy, Gopal Chandra Das, Burjoriji D. Mama, Andrew Gibb, Gayanath Saha and C. K. Mistri & Ors., Kedarmani A. Dikshit and E. E. F. Moses.

NOTE: If Dividends on shares as recommended by the Directors are passed at the meeting, THE DIVIDENDS WILL BE PAYABLE ONLY TO THE REGISTERED SHAREHOLDERS, whose names are on the Company's Register on the 27th July 1955. No application need be sent for dividend as relative Transfer Deeds for Ordinary Shares of Soorah Jute Mills Co., Ltd., or fractional coupons will be posted to such shareholders by the 27th of August, 1955. On receipt of the Transfer Deeds duly signed by the shareholders and on completion of the transfer, the respective share certificates will be sent to them.

The shareholders are requested at once to notify any change of address.

A DELHI DIARY

THE POSTAL SECTOR

INTELLIGENT readers of this Delhi Diary (and which of my readers is not intelligent?) will have sensed that some thing went wrong last week. There was no Delhi Diary and no explanation for its absence. The truth is that a Delhi Diary was composed from a distant place and was dutifully put in a post box on Wednesday in the belief (particularly as it had been marked 'Express Delivery) that it would be delivered in Delhi on Thursday morning. As things turned out, it was delivered in "The Eastern Economist" on Saturday evening. Various researches conducted into the reason why an express letter should take three days to reach Delhi from a city connected with the Capital by a night air service have not yielded any result. "Argus" refuses absolutely to take blame on this occasion, and passes on the facts to the Director-General of Posts and Telegraphs for enquiry. Frequent absences from Delhi, it seems, carry their own risks. With the postal system not growing greatly in efficiency, perhaps, it would be safer for "Argus" to stay at home. This, he has (for two months) resolved to do.

There is an added attraction in home-coming. The monsoon has broken early and Delhi has made itself a much more agreeable place than it usually is at this time. Not, indeed, that it is overflowing with excitement. The Prime Minister is away and his tri-weekly speeches on the home front do not now illuminate front pages of newspapers although his movements abroad are still front-page news. There are no interesting Government decisions to attract notice and controversy. I can think of only one thing this week which gives me good cheer. This is the proposal of the Ministry of Health to make provision in the second Five-Year Plan for Central Government servants to proceed to hill stations. Having just arrived from a hill station (and having recommended the extension of the Welfare State in that direction) I am naturally pleased to find an echo in the hard interior of a Government Department. One must, however, restrain one's optimism. The cost to the Exchequer which is estimated at between Rs. 20 and Rs. 30 lakhs has not yet got past the Finance Minister!

NATIONAL DAYS

The week has been full of National Days. There were three national days between July 1 and July 4. Canada came first on July 1, the Philippines second on July 3, and the United States celebrated its Independence Day on July 4. They were all interesting occasions with hospitality generous in the numbers invited, which seem to grow from year to year. The Canadian reception was aided by an auspicious shower of rain. The other receptions were not so fortunate; the American reception was quite literally dry. It seems a pity that a decision was made on this occasion to honour a directive principle of the Constitution. I fear I was one of those who were disappointed that on this occasion we were not shown one lively aspect of the American way of life!

THE MOSCOW LINE?

In the absence of the Prime Minister, politics, as I have said, has tended to be subdued. There has, however, been one trumpet call in the form of a declaration of economic policy by the Communist Party of India, which was released to the Press on Thursday. It does not look as if the walls of Delhi (or even Jericho) will fall at the sound of these trumpets. Some of the sounds are so out of tune with the prevailing temper of Congress party that one wonders why they were included at a time when the Communist Party is anxious to show that it can wear a mild and gentle look, at least in front of the Prime Minister. The proposals include confiscation of British capital, immediate nationalisation of manganese mines, gold mines, copper mines, coal mines, British controlled jute mills and plantations and foreign-owned banks and insurance companies. They "demand" that the lot of all workers should be improved, and agricultural workers be granted minimum wages. On the other hand, rationalisation is to be stopped and at the same time the prices of manufactured goods are to be brought down.

This last proposal that workers' wages should be raised, that peasants should be guaranteed secure prices for their produce and raw materials but that the price of manufactured goods must be brought down in value is based upon the performance of an economic miracle, the means to which are not explained. Apparently all things are possible. There is emphasis on the rapid industrialisation of the country, which it is assumed will come about in the Mahalanobian way without, however, additional taxes on the "poverty-stricken and tax-burdened people". Prof. Mahalanobis thus obtains a pat upon the back, which, considering its source, will bring him cold comfort.

The theory behind this remarkable document, remarkable for its splendid ideological impossibilities, is apparently that India's problems are all connected with distribution and ownership. Nationalisation, it seems, can do every trick. Strangely, the public mind is all too credulous on this point. It seems that one has only got, as Goebbels said, to repeat a dishonest slogan often enough for a large number of people really to believe it.

One wonders whether men like Ajoy Ghosh, whom no one can accuse of being devoid of intelligence, really believe what they say when they proclaim that the mere grasping of foreign controlled concerns will increase the national wealth of the Indian nation significantly enough to dispense with taxation of the relatively poor. It was noticed on Thursday that Mr. Ghosh was not ready to be involved in too long an argument. He himself was taking an early plane to Moscow. While forwarding a copy of the economic proposals to the Planning Commission he indicated, however, that representatives of the Party if invited would be glad to meet the Commission "to discuss the matter". What matter? An economic revolution a la Lenin? That does not seem to be within the terms of reference of the Planning Commission, or (with the new plan-frame), is it?

Thus ends, for all practical purposes, the talk of sweet reasonableness in the Communist Party of India. It is clear that just as the leopard is unable to change its spots the Indian Communist Party is quite unable to lie down calmly with a meek democratic regime. Can it be that economic policy has had to be more drastic, the more readily to conceal agreement with the Prime Minister on foreign policy? Or does the great dilemma continue; must the Prime Minister really be accepted? Can he be separated into two (unequal) halves; a foreign self and a home self? Ajoy Ghosh is, it seems, not likely to find enlightenment in Moscow; but at any rate it is the duty of the prophet to approach the mountain.

ARGUS.

Economic Report from the U. S.

TRADE BETWEEN EASTERN AND WESTERN EUROPE

(BY GUY SIMS FITCH)

WASHINGTON, July 5.—A study just completed by the United Nations bureau of economic affairs contains a most revealing statement that strategic trade control by the free nations does not appear to have been the principal factor limiting the volume of trade between Eastern and Western Europe. The question arises as to what, then, are the principal reasons? The United Nations study, titled "the quest for free trade," assigns it to the deficiencies of the Soviet Communist system. The chief difficulty seems that the countries of Eastern Europe have not been able to deliver the goods required to finance imports from the West. But there are other factors, too. In the Soviet Union, and its Communist satellites of Eastern Europe, trade is a state monopoly, subordinated to central economic planning. Communist trade practices have followed political objectives restricting trade with the West, while building up in the East an isolated trading system dominated by the Soviet Union.

These political and economic policies, have made it impossible for the Soviet bloc to co-operate with other nations in multilateral efforts to free international commerce from trade and exchange restrictions. When the General Agreement on Tariffs and Trade (G.A.T.T.) was concluded in 1947, no country with a state trading monopoly participated in it. Today, even without effective Communist co-operation, G.A.T.T.'s 34 partners have negotiated multilateral agreements covering some 60,000 items involved in 80 per cent of world trade. East-West trade has been adversely affected by lack of business contacts resulting from the Soviet bloc's self-imposed isolation.

These views are shared by a report released by the United States Government. The report, a review of U.S. trade controls in the second half of 1954, notes that there has been little increase in East-West trade despite the substantial relaxation in the free nation's strategic trade controls last August. Relaxation in U.S. controls, for instance, has freed some 600 additional items for export to Eastern Europe. Yet during the last quarter of 1954 only eight shipments, valued at $3,472, were approved for export to the European-Soviet bloc that would not have been approved prior to the August relaxation.

Similar patterns are evident in the case of other free nations. Free-world trade as a whole with the Soviet bloc, including Communist China, rose moderately during 1954. Exports went up to $1,720 million from 1953's $1,389 million, while imports rose to $1,738 million from 1953's $1,620 million. Even with this increase, however, the $3,458 million in Communist trade made up only 2.2 per cent of the $152,542 milllion of free-world trade. And to achieve this increase, the Soviet Union had to sell gold to pay for much of its imports which implies that it cannot or will not deliver enough exportable goods to finance its imports from the free nations. There are signs, moreover, that the rise in East-West commerce may be levelling off, despite growing Soviet promises of trade expansion. Goods moving to the Soviet bloc from the free nations actually were less in the second half of 1954 than in the first half, despite the greater trade opportunities presented by free-world action in opening up hundreds of formerly prescribed products to peacetime commerce.

Experts, however, are convinced that the Soviet Union will have to make adjustments in its industrial and agricultural policies, if there is to be a substantial rise in trade with the free nations. Most of its efforts in the industrial field are directed to the building up of heavy industry—much of it being non-exportable armaments. Its agricultural difficulties, despite its rich land resources, have left it without any real exportable supplies of farm products. In fact, it has had to import wheat and other commodities. President Eisenhower, for his part, has stated publicly that the American people have an open mind on the subject of East-West trade. So long as it does not directly help the war-making powers of the Communist bloc, its expansion is welcome.

WORLDGRAM

AGRICULTURE

Price Variation in Agricultural Commodities: The Agricultural Prices Variations Inquiry Committee decided to convene a conference of representatives of States in New Delhi, in July. The Committee also agreed to study the problem of variations in prices in respect of food grains as well as commercial crops. The types of variations that the committee will inquire into would include (a) variations over-time, (b) variations in the space, and (c) variations in the movement of wholesale and retail prices. Inter-commodity and seasonal variations will also be within the purview of these investigations. The committee decided to examine similar variations in the movement of prices of agricultural commodities which the cultivator sells and the prices of manufactured articles which he buys. Reactions of prices to announcements of export and import quotas and the effect of foreign prices on the internal market will also be subjects of study by this committee.

*

World Wool Output: It is forecasted that the world would produce more wool this year than compared with the last year. World wool production is estimated at 4,475 million lbs, greasy basis, compared with its revised estimate of 4,390 million lbs produced in 1954. The preliminary 1955, estimates "indicate increases for Australia, New Zealand, Union of South Africa, Soviet Union and some of the Middle East Countries." There would be no significant change in output from Argentina and Uruguay. During the first quater of 1955, consumption in the principal wool consuming countries increased by an estimated two per cent above the comparable period of 1954. The most marked declines in output in 1954 had occurred in Argentina and the Soviet Union.

*

Bombay State Amends Forest Act: The Indian Forest (Bombay Amendment) Bill, 1955, have received President's assent. The Bill amends the Indian Forest Act, 1927, as applied to Bombay State. Under this Bill, Apta and Temburni leaves, an important minor forest produce yielding an annual revenue of Rs. 3 lakhs will be treated as forest produce, and their collection and transport will be strictly supervised. The State Government has also been empowered to assign its rights in or over any land, which is a reserved or protected forest, to village panchayats and co-operative societies.

INDUSTRY

The Second Charleroi International Technical and Industrial Exhibition: The second International Technical and Industrial Exhibition will take place from the 17th September to the 2nd October, 1955, at Charleroi (Belgium) in the heart of the industrial basin of Hainaut. This Exhibition has the double aim of presenting the foreign buyer with a panaroma of Belgian-produced capital goods and, on the other hand, to enable subsidiary and allied foreign industries to display their products in ideal surroundings for such a purpose.

*

Industrial Programme Under Second Five-Year Plan: Outlines of the industrial programme under the second Five-Year Plan will be considered by the Central Advisory Council of Industries at its sixth meeting to be held here on July 22, 1955. The Council will also consider the annual reports of the Development Councils for different industries set up under the Industries (Development and Regulation) Act. The report of the Engineering Capacity Survey Committee will also come up for consideration at the Council Meeting. Notes regarding the development of a number of important industries prepared by the Ministry of Commerce and Industry will also be considered.

Continuation of Protection to Titanium Dioxide Industry: Government have accepted the Tariff Commission's recommendation that the protection granted to the industry should be continued for a further period of two years, i.e., up to December 31, 1957. Revised rates of protective duty on titanium dioxide decided upon with the concurrence of the Commission, namely, 44 per cent **ad valorem** (standard) and 34 per cent **ad valorem** (preferential) have been brought into force.

*

Electricity Output in March, 1955: During March, 1955, 686 public utility power stations in India generated 696.1 million kWh (kilowatt hours) of electricity of which 568.3 million kWh were sold to ultimate consumers. The new addition during the month was one undertaking at Khargaon in Madhya Bharat. As compared to February, the electricity output increased by 69.9 million kWh.

*

Tamarind Kernel Powder for Sizing: A draft Indian standard specification for tamarind kernel powder for use in the cotton textile industry has been prepared by I.S.I.'s Textile Sizing and Finishing Materials Sectional Committee. In this draft standard, methods of preparation of 'pure' and 'heavy' size mixing are given. Also three methods of manufacture of the tamarind kernel powder have been prescribed. The present draft standard is a revised version of the standard which was first issued in 1951 as **tentative** for a period of one year, and which was later extended up to October, 1954. In this draft revision, additional requirements of odour, moisture content and freedom from adulterants have been included.

TRADE

Export of Chrome Ore: The Government of India have reviewed the policy with regard to export of chrome ore and have decided to continue free licensing, till the end of December, 1955. Exporters are, however, warned that they should not enter into commitments with foreign buyers for shipments beyond December 31, 1955.

*

Export Duty on Tea: The Government of India have issued a notification fixing the price of tea, for the purpose of determining the export duty, at Rs. 2-6-5 per lb, as against Rs. 2-7-3 per lb in force form June 1, 1955. The export duty at this price will be annas four per lb. which means there will be no change in the exisitng duty.

*

Export Duty on Cotton Reduced: The Government of India have decided to reduce the export duty on all varieties of cotton from Rs. 150 per bale to Rs. 125 per bale. It has also been decided to allow an additional export quota of 150,000 bales of cotton. The Government have examined the question of floor and ceiling prices to be fixed for the 1955-56 season and have decided to maintain the present level of the floor and ceiling.

*

Export of Cotton Yarn to Tibet: In super-session of all the previous notices issued regarding export of cotton piecegoods and cotton yarn in Tibet, the Government of India has decided to allow fully with immediate effect cotton piecegoods for export to Tibet and also to the states of Sikkim and Bhutan in the same manner as they are licensed for exports to other permissible destinations. So far as cotton yarn is concerned the applicants who are recommended by the Political Officer in Sikkim will be allowed to export cotton yarn to Tibet anly as nominees of mills holding quota for export of yarn.

Fresh Trade Arrangement Between India and Norway: A fresh trade arrangement has been concluded between Government of India and the Government of Norway. The arrangement will remain in force up to December 31, 1955. Under the arrangement, the trade between the two countries will be governed by their respective import, export and foreign exchange regulations. India will accord soft currency treatment to Norway in the matter of import and export licensing and Norway will extend to India the import liberalisation measures she applies to the countries in the Organisation for European Economic Co-operation. There is a provision in the arrangement for consultations between the two governments in case either of them enters into agreements with other countries affecting commodities in the export of which they are vitally interested.

*

Export of Agricultural Commodities. The Government of India have reviewed the export policy for certain agricultural commodities and have decided to license export of cane jaggery and cane jaggery powder, gram and gram flour, kardi seed cakes and nigerseed cakes freely without any quantitative restrictions up to the end of December, 1955. The export of pulses other than gram will also be licensed freely with certain quantitative restrictions till the end of December, 1955. The export of maize grit and maize gluten will also be licensed freely until further orders. The export of wheat bran, rice bran will be licensed freely till the end of September, 1955 and December, 1955. The export of Kardi seed, nigar seed and groundnut oil cakes will too in discussed freely.

*

India's Trade with Pakistan, Afghanistan, Iran and Burma: According to the land-borne trade returns received in the Department of Commercial Intelligence and Statistics, the provisional figures of total value of foreign trade of India by land with Pakistan, Afghanistan, Iran and Burma during May, 1955, are as follows: Merchandise Exports: Rs. 45 lakhs; Exports to Eastern Pakistan Rs. 23 lakhs; Exports to Western Pakistan Rs. 19 lakhs; Exports to other countries: Rs. 3 lakhs. Merchandise imports: Rs. 2,02 lakhs; Imports from Eastern Pakistan Rs. 1,84 lakhs; Imports from Western Pakistan Rs. 1 lakh; Imports from other countries: Rs 17 lakhs; Total trade Rs. 2,47 lakhs; Re-exports Nil, Trade in treasure: Negligible; Balance of trade: The total value of exports fell short of imports by Rs. 1,57 lakhs.

FINANCE

National Wealth Survey: The Government of Japan will make a survey of nation's wealth. For this purpose a special Committee of 30 members, including university professors and men of wide experience, will be formed in the Economic Counsel Board. The planned survey will be the first in 20 years. The previous one in 1935 recorded the national wealth of Y170,000 million. The Board plans to survey during the current fiscal year (1) State-owned property (2) property of Government-agencies, such as public business and financial corporations and (3) property of private corporations. The project will be completed by the first-half of 1957.

*

New Facility for Stock-Holders: To enable bondholders to get interest on their bonds at the residences, the Government of India, in consultation with the Reserve Bank, have approved of a procedure whereby such interest could be remitted to the holders by money order. The present practice is to pay such interests only through the treasuries. The remittance faciilties by money order can, however, be provided only in the case of those who have taken their securities in the form of stock certificates and not promissory notes. For the promissory notes interest will continue to be paid from the treasuries as at present.

Subsidised Industrial Housing Grants: A sum of Rs. 2,71,75,645 was sanctioned by the Government of India to various State Governments and private concerns during May this year for the construction of 9,877 tenements-under the Subsidised Industrial Housing Scheme. Out of this amount, the Government of Uttar Pradesh will get Rs. 1,04,54,520 as subsidy and an equal amount as loan for the construction of 6,224 single-room and 1,176 double room tenements at Kanpur, Lucknow, Bareilly, Rampur, Ghaziabad, Gorakhpur and Naini. A sum of Rs. 55,23,700 divided equally as loan and subsidy, will be given to the Government of Rajasthan to build 1,760 single room and 440 double-room tenements at Jaipur, Pali, Bhilwara and Kishangarh. The Government of Mysore has been sanctioned Rs. 2,90,040 as loan and an equivalent amount as subsidy for putting up 200 single-room and 12 double-room tenements at Bytarayanapura. A loan of Rs. 1,08,550 and a subsidy of Rs. 54,275 will be given to Shri Kurla Kamgar Co-operative Housing Society Ltd., Kurla, Bombay, for constructing 65 double-room tenements at Kurla.

MISCELLANEOUS

Indigenous Photographic Enlarger Manufactured in India: An improved type of photographic enlarger with a $2\frac{1}{2} \times 2\frac{1}{4}$ to 35mm negative carrier has been designed and manufactured in an Ordnance Factory in India. It is reported that all the components of the enlarger had been manufactured in the factory itself. It was fitted with all the modern features which were at present available only in the more expensive imported varieties. Experts are now busy designing a 35mm. sound cinema projector. Besides this, binoculars, miscroscopes, self-illuminated blocks, pocket-holding magnifiers, drawing instruments, splinter group goggles, range finders and component parts of teleprinters and typewriters are also being manufactured in this factory. The factory has also undertaken to execute Government orders for about 2,000 items of extra-part manufacture. The factory has a repair shop attached to it, where binoculars, microscopoes and cameras from various military formations are received for repair and renovation.

*

Development Work in Tribal Areas: The Community Projects Administration have made special arrangements for giving specialised training to social Education Organisers who will be posted to work in the community projects extension Blocks in Tribal areas. Already, in a large number of tribal areas, e.g. in Madhya Pradesh, Orissa, Assam, West Bengal, Bihar and other parts of the country, the Community Development Programme is functioning. The special training now contemplated will enable the Social Education Organisers working in these areas to have the proper scientific approach to a problem which is admittedly a specialised one in its historical and cultural context.

*

New Soil Insecticide: Aldrin, the new soil insecticide which controls a wide range of soilpests such as the termites, cutworms, white grubs and weevils, attacking the roots of all crops, is now being incorporated in fertilizers, for the first time in India, by Dharamsi Morarji Chemical Co., Ltd., Parry & Co., Ltd., and Shaw Wallace & Co., Ltd. The use of such an aldrinissed fertilizer means that the crop recives the maximum benefit from the application of fertilizer by preventing any soil insect attack from sowing time to harvesting. Aldrin while giving protection to all crops for up to a year with one application does not harm the crop in any way and causes no taint in edible crops grown in treated soil. Extensive trials in India and elsewhere have demonstrated the outstanding value of aldrinised fertilizers. On potatoes in Poona and in the Nilgiris and on Chillies in Belgaum, the aldrinised fertilizer treatments gave considerable yield increases over the fertilizer treatment without aldrin.

ECONOMIC PROGRESS IN THE MIDDLE EAST

THE report on "Economic Development in the Middle East, 1945 to 1954" issued as a supplement to the United Nations World Economic Report for 1953-54 discloses, what has already been known for some time now, that the rate of economic progress in the Middle East countries is among the higher ones in the world. In the region as a whole, says the Report, the rise in national income was distinctly greater than the population growth, though great differences exist between individual countries. There is good reason to believe that in future also the progress will be rapid, with an increasing proportion of the national income being absorbed by investment. It is, however, felt that consumption has not matched the increase in per capita incomes, possibly due to an unequal distribution of the increments of output, which in particular countries has been partly offset by increased State provision for social services. Such stagnation in consumption is not regarded as a virtue; considering the type of economic development and the stimulating forces, the slower rise in consumption seems to be an inhibiting factor.

This progress cannot be precisely measured for all countries for lack of statistics of national income. Even total income statistics may be misleading; we must try to separate the prosperity arising out of oil wealth from the rate of increase over the rest of the economy of the countries concerned, to see if the people as a whole are making progress. Exports of crude petroleum and refined products have increased from 28 million tons in 1946 to 81 million tons in 1950 and to 125 million tons in 1954. The direct oil revenues increased from the annual rate of $55 million in 1946 to $700 million in 1954, the total for the nine years amounting in all to $2,500 million; this is in addition to the income arising out of wages paid out and local purchases made. Investments in the oil industry have more than doubled since 1945 and some new refineries have been set up. Of a total of about $3.8 billions of foreign investments which has flown to Middle Eastern countries, a third was in petroleum companies. Thus output of crude oil has multiplied by over four times and refinery capacity increased by 50 per cent. This has been a great source of dynamism in the economies of the region, because of the incomes generated.

But this is not the whole story and though oil revenue has provided the stimulus by adding to incomes and enabling Government expenditure, production both in agriculture and industry has increased. In the post-war period (1945-57) agriculture in the Middle East had declined below the 1934-38 average, but this was made up by 1950 and in 1953, a 50 per cent increase was recorded over 1945-47. Turkey achieved the largest increase in foodgrains and Syria, Iraq and Egypt have also expanded grain production. Egypt and Sudan have benefited by cotton prices. Over the whole region there has been an extension of the cultivated area by 40 per cent above the pre-war average, while the total population in the region is only about 25 per cent greater than before the war. Per capita food consumpion had regained pre-war levels in 1950 and is now slightly higher.

PRODUCTION IN THE MIDDLE EAST

(1) Egypt, Turkey, Iran, Syria and Lebanon

(2) Egypt, Turkey and Israel

(3) Egypt and Turkey.

Industrial production in the region (excluding all stages of oil production), has also increased by 50 per cent during the war and by a greater proportion since then. New industries have been established mainly in Israel, Egypt and Turkey. Of the 2 million persons employed in manufacturing in the area, three-fourths are in Turkey and Egypt. In Iran, Syria and Iraq consumer goods industries have sprung up. While the industrial growth is still due to private enterprise,

NATIONAL INCOME, INVESTMENT AND PRICES IN SOME MIDDLE EAST COUNTRIES

Country	Currency		Pre-war	1945	1950	1953
Egypt (N.I.)	E£ Million	National Income	168	502	860	856
		Capital Formation	8	122	113	..

		Investment	..	..	..	2,060
		Price Level	21	95	97	107

Government assistance has played a notable part. Manufacturing industries have mainly proceeded on import substitution, which is the normal feature of expansion of an underdeveloped economy; that means that the market is ready and is moderately well developed by cheap foreign goods.

Whereas in agriculture good seasons have, as in India, helped greatly, various measures have been put into operation to improve methods of cultivation and increase yields per acre which are now above pre-war. But in industry, the major dynamic factors has been the widening of the internal markets owing to increased oil revenues and to better agricultural production. It supports the thesis that development does not necessarily involve a restriction of consumption but its diversification.

It is difficult to measure the rate of advance, for a whole region with many disparities in natural resources and abilities. But it is easy to demonstrate that where productivity is very low, the initial stages of development through a reorganisation of resources can yield high returns. A good beginning has been made and better techniques will be put into operation to use idle resources. Oil income may often prove a source of inflation which will steadily expand the market for consumption goods and so long as opportunities are open to profit by this expansion, progress seems to be possible at a satisfactory rate.

INDIA'S TRADE IN WORLD PERSPECTIVE

THE major developments in the external trade of India in the recent past can now be assessed in the light of the changes in the pattern of world trade The United Nations World Economic Report, 1953-54, emphasizes the basic change in global trade which bears a distinct impress of relief from the strain of balance of payments difficulties for a majority of the countries. It is significant that the current easy position in respect of balance of payments has been achieved without reliance on the abnormal size of demand from the United States. This shift towards regional diversification is important for progress towards the goal of multilateral trade. It must be interpreted in a restricted sense since several countries have managed to balance their payments account with the U.S. by retention of import controls. The liberalisation of trade with the U.S., wherever it is introduced, as in Western Europe and India, ought to be regarded as tentative.

In fact, the scale of the American demand in the last two calendar years has gone down. One vital factor which imparted a tone of buoyancy to world trade is the rising and sustained level of demand emanating from Western Europe. The support which the revival of economic activity in Western Europe lent to primary products is certainly one of its outstanding features. Variations in India's foreign trade during these two years conform to this global trend. Between 1953 and 1954, India's imports from the OEEC countries, as the Table on the next page discloses, rose from Rs. 97.2 crores to Rs. 126.1 crores, accompanied by an increase in the value of exports from Rs. 44.7 crores to Rs. 54 crores. The limited size of India's trade with this area, however, is explained by the conventional pattern of her trade.

Total world trade achieved a new peak in 1954 and while the larger share of this increase has been claimed by the group of industrial countries, primary producing countries have also secured a fair share. In the UN classification of trade regions, India is included in the primary producing countries as a part of the overseas sterling area. This classification which is made on a broad basis does not properly define the character of India as a partner in the world trade. India's position is somewhat anomalous as she stands mid-way between the two groups. Accepting the UN classification, it would appear that the increase in India's trade in 1954 has been higher than the increase in the combined trade of the primary producing group. The Reserve Bank of India's estimate puts the increase for the last year at 5.6 per cent.

Over the primary producing countries as a whole, there was a distinct upturn in their staple products. This increase was largely accounted for by Latin America and the overseas sterling area. Argentina was the main contributor from among the Latin American countries and a reassuring price level for petroleum coupled with the high tempo of demand for coffee and cocoa as well as a sharp rise in their prices strengthened the export position of that continent. In the sterling area, Australia's earnings from wool could not, however, be sustained in the second half of 1954. India's share in the export of the overseas sterling area, however, relates primarily to her exports of tea (Rs. 130.7 crores in 1954)—an increase of 30 per cent and jute manufactures which rose by 10 per cent to Rs. 121.4 crores. The higher levels in the export trade of the primary producing countries could not be expected to be shared by all the countries and among those which had lower exports were Australia, Brazil, Canada, Pakistan, Taiwan and Thailand. The decline in their exports is attributable to the fall in the external demand for their staple products—cereals, coffee, cotton, jute, sugar and wool.

Any attempt to find a common trend in the movements of the prices and volume of primary commodities as they enter into the world trade is bound to prove fruitless, as the impact of demand from importing countries must vary widely from region to region. Again from the view-point of the exporting countries the supply position is influenced by a variety of factors, as illustrated by the crop conditions in plantations and agriculture affected by weather. Recovery in the export prices of rubber, wool, jute and cotton in the last year demonstrates the net effect on the expansion of their trade at a modest pace. The unit value index of agricultural raw materials (1953 = 100) stood in 1953 at 99, while in the case of minerals it rose to 117. India's exports of minerals establish the wide discrepancies in export earnings as between different countries in the primary producing group. As compared to 1953, her exports of manganese ore fell steeply by 45 per cent to Rs. 14 crores in 1954, while mica had a fall of 25 per cent to Rs. 6.5 crores.

Developments in the direction as well as composition of individual countries cannot adequately be traced on the basis of their two-fold classification as adopted in the UN report and it must be stated in fairness to it that it does not make any such attempt. On an individual basis, the changes in the direction of India's foreign trade are apparent from the Table set out in this article. Her trade with the sterling area is again on the increase, the expansion being quite marked in imports which rose by Rs. 33 crores. The lower trade and expanding trade surplus with the dollar area of the order of Rs. 11 crores in 1954 as against 1.5 crores in 1953 is in keeping with the overall world trend. The higher volume of trade with OEEC area marks a reversion to the pre-war pattern and among India's suppliers of capital goods, Western European countries are now reclaiming a larger share. The expansion in India's imports from the rest of the non-sterling area to Rs. 68.8 crores is in a large measure the result of bilateral trade agreements.

On the basis of the first three quarters, the overall trade deficit of the industrial countries of the world was reduced from $4.30 billion (U.S.) in 1953 to $3.25 billion in 1954. For the primary producing countries combined, the deficit was enlarged from $0.58 billion in 1953 to $1.0 billion in 1954. The trend in India's trade balance, although it runs counter to the overall surplus of the overseas sterling area, is in keeping with the primary producing group. India's trade deficit has increased from Rs. 39.1 crores in 1953 to Rs. 75.7 crores in 1954—a rise of 87.5 per cent. No signs of alarm need be read in this trend and it is characteristic of the prevailing mood of confidence in the health of the economy of the country that, while exports are being promoted by removal of duties and active stimulation, the liberalisation of import trade was deliberately continued in 1954. Reduction of food imports released in 1954 foreign exchange of the order of Rs. 31 crores. India's expanding import surplus is explained by the requirements of planned development and the increase of Rs. 18 crores to Rs. 83 crores in the imports of machinery and vehicles in the first three quarters of the last year is an indication of this trend.

REGION-WISE ANALYSIS OF INDIA'S BALANCE OF TRADE

(In crores of Rs.)

Area	1954 Imports	1954 Exports	1954 Trade Balance	1953 Imports	1953 Exports	1953 Trade Balance

OEEC Countries	126.1	54.0	—72.1	97.2	44.7	—52.5
Rest of Non-Sterling Area ..	68.7	80.2	+11.5	58.7	90.2	+31.5
TOTAL	624.5	548.8	—75.7	575.1	536.0	—39.1

IN BIHAR

It's THE SEARCHLIGHT & PRADEEP

For years advertisers have consistently used the columns of THE SEARCHLIGHT (English Daily) and PRADEEP (Hindi Daily) to sell their products in Bihar. The reason is simple : no other paper can give such satisfactory coverage of the territory as THE SEARCHLIGHT and PRADEEP.

And Remember:

Bihar is becoming an increasingly prosperous market. The Five-Year Plan has allotted a sum of Rs. 57.79 crores for the development and improvement of the State's agriculture and irrigation, transport and social services. The efforts to raise the standard of living of the people are already bearing fruit. In Bihar, more and more goods and services are in demand now—a demand that will continue to increase every day. That's why *more* advertisers are today using *more* space in THE SEARCHLIGHT and PRADEEP than any time in the past.

THE LOAN AND THE LENDER

THE success of the Government of India's loan (3½ per cent 1965 National Plan Bonds—Second Series), although not altogether unexpected, has taken some seasoned money market men at least by surprise. It is not that they disapproved of the terms or the ability of the authorities to evoke sufficient response. But these circles felt that there was not enough money with the public to subscribe freely to the loan. Does the response to the loan belie this?

Let us examine the total subscription figures as released by the Reserve Bank. The communique issued by the Bank says that, as against the Rs. 100 crores offered, the total amount of subscriptions aggregated approximately Rs. 103.65 crores, of which conversions amounted to Rs. 57.87 crores. This means that cash subscriptions alone amounted to nearly Rs. 46 crores—Rs. 45.78 crores to be precise. Now, out of the two outstanding loans that could be offered for conversion (4½ per cent 1955-60=Rs. 9.05 crores+2½ per cent 1955 =Rs. 60.45 crores) it was expected that most of those who held the 2½ per cent 1955 loan would opt for the new loan by reason of the relatively better terms of the new loan. To the extent that these holders have not done so, therefore, it is permissible to assume that they preferred repayment, which is more probable, or to switch over to some other form of investment. If the holders of the 4½ per cent 1955-60 loan preferred repayment in cash to exchange for the new loan, they cannot be blamed for the obvious reason that the terms offered were not favourable to them. On this basis, it may be argued that the cash subscriptions actually exceeded expectations alike of a section of the money market and of the authorities themselves.

But it would be rather facile to hasten to this conclusion before one has an idea of the amount of the existing Government securities disposed of by the holders, mainly institutional, with a view to going in for the new loan. If this has been resorted to on a large scale, it only means that money already invested in an old loan has been turned over to the new loan. In other words, there would be no large-scale net absorption of fresh money, not even to the extent ostensibly represented by cash subscriptions. It would be interesting to know these details from the authorities, but as they are not likely to make this information public—they have never been in a hurry to do this—both the schools in the money market, one asserting that there is plenty of money about and the other arguing that there is not much idle money awaiting investment, can continue to stick to their view, although the latter can score a point by pointing to the fact that its view is confirmed by the very fact that the authorities have come out with a loan for only Rs. 100 crores, as against a total borrowing target for the Centre of Rs. 125 crores budgeted for by the Union Finance Minister. This argument may, however, be met by the other school by saying that the Government of India's decision to borrow only Rs. 100 crores has stemmed out of its concern for the State Governments which are expected to enter the market shortly, unlike last year when the Centre itself borrowed on its own and also on behalf of the States. All the same, it is permissible to infer that, to some extent at least, the authorities were influenced by a spirit of caution, presumably because they must have felt that the tempo of deficit financing has not been as much as was thought out it would be at one time.

It would, however, not be correct to arrive at a categorical conclusion on this point from the response to the new loan only. If there has not been more subscription from the public to the loan, it may be because there are relatively more attractive alternate investments. Latterly, for instance, there have been issues of debentures and redeemable preference shares on very attractive terms. The fact that many of these issues have been classified as Trustee Securities has doubtless been an additional inducement to institutional investors. This apart, one cannot ignore the fact that there has been a marked expansion in credit. The deposits with the scheduled banks are a clear proof, if proof were needed, of the relatively larger supplies of money with the public.

A POLICY FOR COTTON

By

CROESUS

WHEN, as Union Minister for Food and Agriculture, Mr. K. M. Munshi inaugurated his triple self-sufficiency (food, cotton, and jute) programme, there were sceptics who questioned the desirability, as also the feasibility, of such a programme. Those sceptics must now be feeling that there was indeed much insight and farsightedness behind the move of Mr. Munshi. But who would then have dreamt that India would have had a cotton crop of as much as 49.50 lakh bales in 1954-55? Yet, such is the estimated (commercial) crop of Indian cotton for that season. With this crop and a carry-over from the previous season of 20.22 lakh bales (which itself was nearly 2½ lakh bales more than the previous season's carry-over of 17.96 lakh bales), together with imports of about 5 lakh bales, the cotton supply position in the season 1954-55 has been very comfortable. As Mr. Jehangir P. Patel, Vice-President of the Cotton Buyers' Association, Bombay, observed at the last Annual General Meeting of that body; "this is an achievement which the country can well be proud of, since it proves the fact that India has now attained a very large degree of self-sufficiency in her cotton supplies". It is noteworthy that cotton has achieved this gain not at the cost of the country's food crops, but through other means such as better cultivation methods, increased use of fertilisers, extended irrigational facilities and cultivation of higher yield varieties, not to speak, of course, of the favourable weather. There is now no need to fear—as some are disposed to do—even if one may not expect a continuance of favourable monsoons year after year—that cotton cultivation will receive a setback, thanks to the completion of the several multi-purpose projects and the resultant better irrigational facilities. Nevertheless, the authorities must not feel unduly complacent over what has been achieved.

Now that it has been the good fortune of India to have had a good cotton crop with prospects of its con-

tinuance in the years to come as well, it is very necessary that adequate steps should be taken to absorb the increased production. Accordingly, to quote Mr. Patel again, "Care should be taken to see that the surplus which this increased production will create does not prove burdensome and does not tend to act adversely on the cotton economy of the country." How can this be done? The Cotton Buyers' Association Chief has himeslf offered a perfectly feasible fourfold export policy programme as a solution. The need to have a stable export policy is obvious not only because there are keen competitors in the field with better resources but also because, in the absence of an internal market for all the cotton that is being produced, other outlets such as exports must perforce be found. In this context, the following statistical position as outlined by Mr. Patel is of interest:

1954-55 SEASON

(In lakh bales)

Supply:

Carry-over from the previous season	20.32
Current Season's crop	49.50
Imports	5.00
Total Supplies	74.82
Distribution:	
Mill Consumption:	
Indian Cotton	41
Foreign Cotton	6.5
Exports	2.75
TOTAL	50.25

Balance, being the carry-over for the next season = 24.57 lakh bales.

The next season's crop is also expected to be in the region of 50 lakh bales, and it is anticipated that total imports would amount to about 6 lakh bales. There will thus be, in the aggregate, a comfortable supply of 80.57 lakh bales for disposal in the next season (1955-56).

In view of this extremely comfortable supply position, the suggestions made by Mr. Patel are not only timely but worthy of careful consideration. His first suggestion was that the Government must release for export, before the commencement of the new season, 2 lakh bales of cotton (both old and new) of staple lengths up to and including 13/15". Secondly, he wanted export releases to follow the emergence of demand in the foreign markets and not after the demand has ceased to exist. His third point was that the Government should follow a steady policy as regards export duty. Here, again, he urged that any announcement bearing on export duty be made only at the beginning of the season and not at random in the middle of a season. Finally, Mr. Patel desired that top priority should be given to the movement of cotton destined for export.

It is gratifying to note that the Government of India has promptly acted on at least one of the suggestions of the Cotton Buyers' Association spokesman. On the first of this month, the Union Government notified a reduction in the export duty on all varieties of cotton from Rs. 150 per bale to Rs. 125 per bale. It also decided to allow an additional export quota (for the 1954-55 season) of 150,000 bales. This is good in so far as it goes, inasmuch as it has come well before the commencement of the new cotton season. The Government's decision further to do away with the allocation of cotton to mills and also to maintain the floor and the ceiling prices at the present level for the next season removes considerable uncertainty in the minds of the cotton trade. For some time past, it may be remembered, there was an agitation in certain quarters that the floor level should be reduced. This was, of course, out of the question. Inasmuch as the Government is intent on stabilising agricultural prices, it would have laid itself upon to blame if it had done so, besides inviting vigorous criticism from champions of the agriculturist classes. However, the Government might have considered Mr. Patel's suggestion in the light of the availability of ample supplies of cotton during both the present and the next season to do away with the only remaining vestige of control on cotton, viz., that on cotton prices. In not having done so and in not having even indicated (in the press note issued by the authorities) that the Government would undertake an immediate review of this aspect of the question as Mr. Patel has urged, the Government was probably influenced by the consideration, as alleged by some, that, if control on cotton prices were lifted, the mills might benefit unduly, first, by way of lower prices for the raw material and, secondly, in the form of higher prices for its finished products. This, in our opinion, is not only not warranted but a little far-fetched. For, in the buyers' market of today and with so much of keen competition from both Lancashire and Japan it is unfair to the Indian mill industry to regard it as being so short-sighted as to increase the prices of its goods and thereby risk a loss of an otherwise assured market.

Mr. Patel's plea for top priority for movement of cotton destined for export only serves to remind one of the inability of our railways still to meet the growing transport requirements of this country's steadily expanding trade and industry. It goes without saying that the responsibilty of the Government does not cease with releasing quotas for export. Simultaneously, it must also notify to the Railways to accord the highest priority to the transport of cotton intended for export. One of the several charges levelled against Indian exporters by our foreign customers and also by our Trade Commissioners abroad is that they (Indian exporters) do not keep to a time schedule. Does it not behove the Government, before allowing its spokesmen also to join in accusing the shippers of delayed shipments, to remove all causes of delay for which it is itself responsible?

HASTINGS MILL LIMITED

NOTICE

The Annual Ordinary General Meeting of the Shareholders will be held at the Registered Office of the Company, 14-Netaji Subhas Road, Calcutta, on Monday the 25th July, 1955, at 3-30 P.M. for the purpose of receiving the Directors' and Auditors' Report, passing the Accounts for the year ended 31st March, 1955, declaring Dividends, electing Directors, appointing Auditors and transacting such other business as may be brought forward.

The Share Transfer Registers of the Company will be closed from 11th July to 25th July, 1955, both days inclusive.

The Dividends will be paid to Registered Shareholders.

By Order of the Board,
Per Pro. BANGUR BROTHERS, Ltd.,
Sd/- N. D. Bangur,
Managing Agents.

CALCUTTA, 27th June, 1955.

BUSINESS NOTES

INSURANCE AT THE CROSS-ROADS

AT A time such as the present, when the question of nationalisation of insurance is being given active consideration in official circles, it is but right and proper that top-ranking executives in the line, such as Mr. A. D. Shroff, Mr. N. Rama Rao and Mr. M. G. Mody, should come out with forthright statements drawing public attention to the dangers inherent in the Government's contemplated move. These thoughtful men wonder what the Government, which already controls and directs the insurers and the investment of their funds, hopes to gain by the nationalisation of an industry which, as a private enterprise, has a good record of service to its credit and which owes its success essentially to personal service. Presiding over the 27th annual meeting of the Indian Insurance Companies Association, Mr. Mody reiterated these views and said that once the Government assumed management and ownership of insurance, the bright prospects of expanding insurance business in the rural areas in the years to come would fade out. Indian insurance business abroad would also receive a crippling blow, resulting in loss to the country of a valuable source of foreign income.

Touching next on the developments in various fields of insurance during the past year, Mr. Mody felt that the reduction of premium rates in the fire section had been forced by the authorities on the assumption based on the results of only the last three or four years that the rates of fire insurers were very high. It would be only fair on the part of the authorities to respond to his plea for keeping a watch on the effects of the reduction and, should any adverse results eventuate, promptly enforce an upward revision of the tariffs. It is equally advisable to check the unhealthy rivalry of non-tariff insurers in the automobile section. Marine insurance business is also being written at a very uneconomic level. As regards the statutory limitation on overall costs, which is not conducive to the development of companies having no tied business in big block, Mr. Mody maintained that "the stage has come when we have got to make up our mind whether we want only a few big companies to operate in the country or we want business to be handled also by medium-sized and smaller units".

SALE PRICES OF STEEL RAISED

THE RISING trend in world prices of steel during the last twelve months, after a brief spell of stabilisation at moderate levels, had created apprehensions for some time past that pressure would be exerted on the sale prices of steel in this country in the upward direction. Those apprehensions have now come true. Sale prices have been increased with effect from July 1. The increase is not applied at a uniform rate for different varieties of steel, the determining factor in the quantum of increase being the amount of subsidy to be paid for different grades of imported steel. This policy flows logically from the scheme of control of steel prices. A few varieties used for agricultural and domestic requirements like galvanised sheets have had to bear a light burden of increase, but it cannot be argued by any stretch of reasoning that the increase has been nominal or negligible. By and large, the increase has been as high as Rs. 20 per ton. The price of a wide range of imported varieties has been raised now to Rs. 420 per ton. This is the crux of the latest price revision. During the last three years, the sale price of steel has been raised thrice, the combined increase amounting to Rs. 67 per ton.

This increase in the pool price of steel has been found inescapable in view of the heavy rate at which the Steel Equalisation Fund was being depleted. The margin between the landed cost of steel and the sale price fixed under the control mechanism represents the amount of subsidy paid out of the Steel Equalisation Fund and this margin kept on increasing in recent months. Since world prices of steel showed no signs of coming down, suitable action had to be taken to safeguard the position of the Equalisation Fund by relieving the strain of the subsidy on it. It should now be possible to maintain a relatively high rate of imports which is necessitated by the expanding requirements of steel under the development projects. This year's import programme of 350,000 tons will be completed according to schedule, as hardly 60,000 tons are left uncovered by actual orders at the present time.

It will be recalled in this context that the retention price of steel from Indian Iron and Tata Steel has been increased, as an interim measure until the Tariff Commission completes its pending price enquiry, to Rs. 385 per ton on a uniform basis with retrospective effect from April 1. This amounts to an increase of Rs. 7 per ton in the case of Indian Iron and Rs. 54 in the case of Tata Iron, on the basis of their works costs. It is beside the point here that this increase has been granted on the explicit condition that its proceeds will be earmarked for re-investment in the plans of expansion and modernisation. But it is important to note that the direct consequence of this increase in the retention price will be to reduce accretions to the Steel Equalisation Fund. This consideration too must have weighed as one factor in raising the sale prices.

"VIRGINIA" AND "BIDI" TOBACCO

INDIAN TOBACCO exports have, of late, been following a favourable trend. In 1954-55 our exports rose to 76.4 million lbs from 72.2 million lbs in 1953-54. If, however, India's competitive position in London and the continental markets is to improve and our growers are to be ensured at least the prices in parity with those prevailing in foreign markets, it is necessary to effect certain improvements in respect of production and marketing of this commodity. At the recent annual meeting of the Indian Central Tobacco Committee, held in Madras under the chairmanship of Mr. K. R. Damle, some of the factors involved were dealt with. Considering the preference shown by the British markets for fine-textured and flue-cured Virginia type, the need for concentrating on the production of leaf of this character has become imperative, and the Central Government has done well in sanctioning a scheme for tobacco extension service for the Guntur district in Andhra which is an important centre for the cultivation of Virginia tobacco. If this scheme is immediately implemented, the problem of eliminating low grade tobacco may also solve itself.

The Government of India's efforts for promotion of tobacco export—including stationing of officers charged with export promotion work in the U.K., in Antwerp and in Hong Kong—have resulted in the clearance of large stocks of Virginia leaves which had accumulated in the country. But the position in regard to bidi tobacco is not so favourable. Large stocks continue to be with growers and traders. The market for this tobacco outside the country is inconsiderable and remedies other than those which have helped India in the disposal of Virginia stocks will have to be found. The matter should receive the urgent attention of the Government of India, whose announcement, some time back, of a reduction in the excise duty on the accumulated stocks of 1953, does not appear to have produced tangible relief to the producer or trader concerned. A former Vice-President of the Central Tobacco Committee, Mr. M. A. Parikh, apprised the meeting of the dif-

ficulties caused to the bidi tobacco trade by the assessment of excise duty on bidi tobacco at different rates in different localities on the basis of the extent of its actual use in bidi making. The Government has not yet set up the inquiry committee in pursuance of the Taxation Enquiry Committee's suggestion on this issue. There is also the need for a searching enquiry into the tobacco marketing conditions in the country. It is high time that the State Governments concerned provided regulated markets where they do not exist. As in the case of other commercial crops, regulated markets are necessary for tobacco to ensure the producer a fair price for his produce and to protect him from unauthorised deductions and other grievances.

PROGRESS OF CIVIL AVIATION

THE HALF-YEARLY progress report on civil aviation in India for July-December, 1954, discloses continuance of the improvement which, since the reorganisation of the Indian air services in August 1953, both Air India International and Indian Airlines have been making in respect of carriage of passengers and flying mileage. Indian aircraft, both scheduled and non-scheduled, flew nearly 13.2 million miles, during the second half of 1954, as against 12 million miles flown in the previous half year. The number of passengers carried increased from 281,611 to 282,405, freight from 82 million lb. to 99.7 million lb, and mails from 4.6 million lb. to 6.1 million lb. in the corresponding period.

Giving breakdown figures, the report also shows that Air India International flew 1,783,599 miles, carrying 20,796 passengers, 905,991 lb. of freight, 35,749 lb. of newspapers and 345,609 lb. of mails, as against 1,578,882 miles flown and 15,705 passengers, 912,929 lb. of freight, 54,347 lb. of newspapers and 258,554 lb. of mails carried in the previous half-year. The Indian Airlines Corporation flew 8,321,998 miles on scheduled services, compared with 8,113,217 miles during January-June, and carried 195,655 passengers, 41,431,431 lb. of freight, 3,175,589 lb. of newspapers and 5,756,539 lb. of mails, as against 199,439 passengers, 36,921,701 lb. of freight, 2,977,169 lb. of newspapers and 4,312,023 lb. of mails in the preceding half-years. This diminution in the number of passengers and mails is also repeated in the number of passengers and freight carried by the night airmail services, which decreased from 14,626 to 11,767 and from 673,782 lb. to 610,863 lb., respectively.

Not much progress has been achieved in one important aspect of the Plan for the development of civil aviation, namely, the provision of increased aerodromes and auxiliary facilities, work on which has proceeded slowly owing to delays in the acquisition of land and the purchase of technical equipment. As against the Plan provision of Rs. 10.07 crores, the expenditure on the construction of new aerodromes and improvement of the existing ones in the first three years of the Plan period was only Rs. 3.84 crores, of which Rs. 1.39 crores was spent in the year 1953-54. Similarly, the expenditure on equipment for air routes and aerodromes in the first three years was only Rs. 16.24 lakhs as against the Plan provision of Rs. 67.80 lakhs. Progress on the programme relating to aeronautical communication services has also been slow. One cannot be too sanguine about the progress that has since been made.

POPULARISING PLASTICS

ALTHOUGH THE Indians plastics industry is of recent growth, it is gratifying to know that, instead of confining itself to purely utility goods, the industry is now extending its activities to the manufacture of a wide range of industrial items consumed by building, engineering, chemical and electrical industries, and for telephones, automobiles, radios, textiles, camera and surface coating. Plastics are rapidly replacing traditional raw materials like wood, leather, porcelain, rubber and glass. In other words, the development of plastics has brought about a small but significant revolution in the field of consumer goods and industrial raw materials, as Mr. Tulsidas Kilachand observed in his presidential address to the eighth annual conference of the All-India Plastic Manufacturers' Association, held in Bombay a few days ago.

The total investment in plastics industry in India amounts to about Rs. 7½ crores and the 100 manufacturing units provide employment to around 15,000. But the annual domestic consumption of plastic goods (estimated at 4,000 tons) is obviously so small that the manufacturers often complain of unutilised capacity which, of course, largely arises from the low purchasing power of the people. Apart from this fact, however, if the industry has to make notable strides both in the domestic and foreign markets, continuous research must be made to improve quality and standardise the products. The temptation to sell cheap, scrappy material in the market by resorting to unfair rivalry must be resisted. A major responsibility devolves on the manufacturers to remove the existing consumers' prejudice against such plastics goods.

The Government of India has, no doubt, recognised the importance of the plastics industry by setting up a separate development wing to assist the industry and proposing the establishment of an Export Promotion Council for plastics. In this context, as Mr. Kilachand has suggested, the Government could go a step further by including Indian plastics goods in the list of articles when bilateral agreements are concluded with other countries.

DEVELOPMENT OF FISHERIES

MEASURES TAKEN so far to exploit the country's sea food resources have not been as satisfactory as they were expected when the first Plan was ushered into existence. The Plan provided for a total expenditure of Rs. 5.14 crores by the States and the Centre. Out of this only a sum of about Rs. 1.30 crores (or 25 per cent) had been spent in the first three years. Figures are not yet available to show whether the expected increase in production at the end of the Plan (from 1 million tons to 1.5 million tons) has materialised. Only a very small portion of India's fishable area of 110,000 square miles is at present worked, because the methods used by Indian fishermen are not modern. Mechanisation of country craft and chartering of deep sea fishing have made some headway thanks mainly to the equipment received through the Indo-U.S. technical co-operation scheme. Under the second Plan, the mechanical vessels that will be used for stepping up fishing operations are expected to be bigger and better equipped than the ones now used.

Training in power fishing to some extent has been imparted by six Japanese and ten Norwegians experts under the U.S. Technical Aid Programme and the Norwegian Aid Programme. But the existing fisheries staff in most States requires intensive training for which adequate provision has not been made in the Plan. This gap must be adequately met during the second Plan period. The commendable work done by a Japanese trawler on the West Coast should encourage Indian private firms to take active interest in coastal fishing. It is also necessary to provide adequate harbour and landing facilities. It is gratifying to note that in three or more places on the coastline "fishing harbours" would be constructed, but the success of commercial fishing is also dependent upon the provision of more refrigeration plants, quicker transport and efficient marketing facilities. While the 11 insulated rail transport van, as provided for in the first Plan, have been obtained under the Indo-U.S. Technical co-operation programme, only two cold storage plants, out of 9 recommended, have been installed so far.

COMPANY AFFAIRS

BRITISH INDIA GENERAL INSURANCE

The Company maintained its all-round progress in spite of a difficult year for general insurance due to acute competition resulting in a rate war especially in the non-tariff section. During the year ended December 31, 1954, net premium in general department increased to Rs. 61.32 lakhs against Rs. 57.87 lakhs during the year before. The Fire claims ratio shows an improvement and stands at 31.59 per cent against 33.70 per cent, but there is an increase in claims in the Marine and Accident Departments. The total claims paid and outstanding in all the three departments (Marine, General and Accident) gives a ratio of 37.63 per cent as against 37.57 per cent in the previous year.

The Reserve for Unexpired Risks, together with the additional Reserves created amounts to Rs. 36.11 lakhs, against Rs. 34.08 lakhs last year. The Investments show an increase by Rs. 5.27 lakhs and stands at Rs. 21.14 lakhs during the year under report.

After crediting Rs. 1.76 lakhs as interest, and transferring the profit from the Fire and Accident Revenue Accounts, the total account amounted to Rs. 6.58 lakhs. Transferring Rs. 9 thousand to the Life (closed) Account, and debiting Rs. 43 thousand as expenses not charged to Other Accounts, Rs. 6.06 lakhs were transferred to the Profit and Loss Account. Rs. 2.15 lakhs were provided for taxation against Rs. 2.30 lakhs last year.

The directors have recommended a dividend of 11¼ per cent against 10 per cent last year.

Year ended December	1952	1953	1954
Paid-up Capital	20.00	20.00	20.00
Profit*	5.86	3.80	3.91
Taxation	2.10	2.30	2.15
Dividend (rate per cent)	10	10	11¼
Carried forward	0.99	1.24	0.83

* After providing for Taxation.

THE NEW INDIA ASSURANCE

The total premium earned by the Company in the general and life departments reached a peak at about Rs. 10 crores during the year ended December, 1954. The general department contributed Rs. 4.37 crores, an increase of Rs. 47 lakhs over 1953. There was a phenomenal progress in the life department. Net sum assured during the year amounted to Rs. 43.42 crores, showing an increase of Rs. 23.51 crores over the last year. As a result of lowered life premium rates, demand for life assurance was stimulated and the premium income amounted to Rs. 5.62 crores.

An amount of Rs. 13.00 lakhs was transferred to Reserve for taxation as against Rs. 19.36 lakhs during the previous year. Transfers to General Reserve were Rs. 10.00 lakhs against Rs. 9.00 lakhs and Transfers to Dividend Equalisation Reserve was Rs. 3.00 lakhs against Rs. 1.00 lakhs during the year ended December, 1953.

The directors have recommended a dividend of Rs. 2-8 per share. The total funds of the Company now stands at Rs. 30.58 crores. The conservative policy has been approved as it provides increasing security to the widening clientele. A sum of Rs. 71,250 has been carried forward.

The profits of a subsidiary Company—the South Indian Insurance Company Ltd.—to the extent of the Dividends for the year ended December 31, 1953, have been credited in these accounts.

SRI KRISHNARAJENDRA MILLS

Encouraging results have been shown by the working results of the Company for the year ended March, 1955, in spite of an acute competition in the buyer's market. The sales of yarn, cloth and hosiery etc. have increased by about 10 per cent from Rs. 88.95 lakhs to Rs. 97.52 lakhs during the year under report. Sales have reflected themselves in profits which have gone up by about 90 per cent, at Rs. 17.78 crores, (before providing for Taxation and Depreciation) against Rs. 9.20 lakhs during the previous year. Provision for taxation this year has been raised to Rs. 2.12 lakhs against Rs. 1.12 lakhs last year and an additional sum of Rs. 3.32 lakhs has been provided for previous years' taxation. Depreciation on Building, Plant and Machinery, etc. have also been raised to Rs. 6.00 lakhs against last years' Rs. 4.32 lakhs.

A sum of Rs. 2.35 lakhs has been provided for cotton price fluctuation reserve. A dividend at the rate of 10 per cent per annum has been decided to be paid against 9 per cent during the previous year and 8 per cent during the year before. Rs. 28 thousands have been carried forward.

(In lakhs rupees)

Year ended March	1955	1954	1953
Sales	97.52	88.95	85.39
Stocks	34.71	23.11	22.65
Net Profit*	17.78	9.20	6.75
Taxation	5.44	1.12	1.00
Depreciation	6.00	4.32	2.11
Reserve Fund	..	0.22	0.24
Other Funds	2.65	0.20	0.50
Ordinary Dividend (rate per cent)	10	9	8
Carry Forward	0.28	0.26	0.23

* Before providing for taxation and depreciation.

INDUSTRIAL INVESTMENT TRUST

The company's investments have brought 4 per cent more income as dividends at Rs. 6.15 lakhs during the year ended December 31, 1954, against Rs. 5.90 lakhs last year. After providing for salaries and wages to the extent of Rs. 23,792 and othe rexpenses the net Revenue for the year is 5.5 per cent higher at Rs. 5.45 lakhs against Rs. 5.18 lakhs last year.

A sum of Rs. 25,000 has been set aside towards Investment Reserve and the Directors have recommended the payment of a dividend, equal to the previous year, at the rate of 4½ per cent per annum.

The company has invested 15.97 per cent in Cotton, 11.24 per cent in Banks, 8.93 per cent in Jutes, 8.63 per cent in Public Utilities, 7.95 per cent in Sugar and 19.69 per cent in 'Miscellaneous.' Investments in Shipping, Tea, Paper, Iron and Steel and Cement is 3 to 4 per cent and still lower in others. The approximate valuation of Company's Investment at market quotations as on December 31, 1954 was higher than the Book Value by 2 per cent.

COMMODITY NEWS AND NOTES

GINGER AND SESAMUM ACREAGE

The area sown with gingelly (sesamum) in Madras State in 1954-55 is estimated at 458,500 acres, states the fourth and final forecast report issued officially. Compared with the final area of 452,700 acres for 1953-54, the present estimate shows an increase of 1.3 per cent. The crop has been or is being harvested in most of the districts of the State. The yield per acre is expected to be normal in the districts of Tanjore and Tirunelveli, and slightly below normal in the remaining districts.

The area under ginger in 1954-55 in the Districts of Madurai, Malabar, South Kanara and the Nilgiris is estimated at 14,880 acres. Compared with the area of 15,250 acres estimated for the corresponding period of last year, it shows a decrease of 2.4 per cent.

The total yield is estimated at 5,090 tons of dry ginger. Compared with the estimated yield of 5,440 tons of dry ginger for the corresponding period of last year it shows a decrease of 6.4 per cent.

MANGANESE ORE EXPORT

The Government of India has reviewed the export policy for manganese ore and iron ore from the ports of Madras, Visakhapatnam, Masulipatam, Kakinada and Bombay in the light of available rail transport capacity and the conditions obtaining in the international market. Movement of ore from Bellary-Hospet (metre gauge section) for export through the ports of Visakhapatnam, Masulipatam and Kakinada and from Bangalore area (metre gauge section) through the port of Madras will continue to be regulated by the issue of registration slips. Such of the registration slip holders as have made no shipments at all since July 1, 1954, will not be issued registration slips but may apply as fresh newcomers.

IMPORT LICENCE FEES

By a notification published in a Gazette of India Extraordinary dated June 30, the fees to be paid by applicants for the grant of import licences have been scaled down. Under the revised schedule, a fee of Rs. 10 will be levied for applications for the grant of import licence where the value of the goods specified in the application does not exceed Rs. 10,000. No fee will be levied if the value of the goods specified in the application does not exceed Rs. 250 provided the goods are required for the personal consumption of the applicant. If the value of goods specified in the application, does not exceed Rs. 25,000, a fee of Rs. 25 will be leviable; Rs. 35 will be charged for goods valued up to Rs. 50,000; Rs. 50 for goods up to Rs. 75,000; Rs. 70 for goods up to Rs. 1,00,000; and Rs. 100 for goods not exceeding Rs. 2,00,000. For goods exceeding Rs. 2 lakhs in value, an additional fee of Rs. 15 will be levied for every Rs. 50,000 or part thereof subject to a maximum of Rs. 250.

WORLD COTTON OUTLOOK

The problem of surplus production of cotton in non-Communist areas of the world is highlighted in a report on the world cotton situation in the 1954-55 season by the International Cotton Advisory Committee. The season has again confirmed the "persistent tendency towards chronic over-production of cotton", the report says. Production again exceeded consumption by a substantial margin despite the rigorous application of acreage control in the United States and the maintenance of record consumption.

Stocks at the beginning of the 1955-56 season will be the highest since the end of the war, mainly due to an expected rise of about one million bales in the United States are likely to show little aggregate chance. Extra long and long staples, however, may be in better supply and demand relationship than medium staples in which most of the increase in production outside the United States has occurred. Although the limited States will again control for the next crop, indications are that many other countries plan to expand their 1955-56 acreage. A key factor, the ICAC says, appears to be India where acreage is expected to remain high.

Consumption will depend mainly on politico-economic factors in the short term. Favourable conditions are likely in the United States and consumption is expected to remain near present levels in Western Europe. The outlet for textiles in Japan is considered problematic. But long-term plans in India are for an increase in consumption. The paramount question for trade is what policy decisions will be taken in the United States. One thing that is certain, the report concludes, is the support of agricultural prices, including cotton, will remain a cardinal principle of United States Administration.

ESTIMATE OF COTTON

According to the Directorate of Economics and Statistics, Union Ministry of Food and Agriculture, the all-India final estimate of cotton for 1954-55 puts the current year's area and production at 18.35 lakh acres and 4.30 lakh 4.30 lakh bales (of 392 lbs. each) of cotton lint, as against the partially revised estimate of 17.18 lakh acres and 3.97 lakh bales respectively for 1953-54. The current year's estimates thus show an increase of 1.16 lakh acres or 6.8 per cent in area and 0.33 lakh bales or 8.4 per cent in production over last year. The production of cottonseed is estimated at 1.5 lakh tons during 1954-55, as against the partially revised estimate of 1.3 lakh tons for 1953-54, thereby showing an increase of 0.12 lakh tons. The significant feature of current year's estimate is that it exceeds the Five-Year Plan targets of 18.00 million acres of area and 41.7 lakh bales of production for 1955-56 by 0.35 million acres and 1.3 lakh bales respectively, with still a year left in the Plan period.

EXPORT OF ALLOYS

The export of lead-tin-antimony alloys, such as white metals, anti-friction bearing metals, type metals, printing metals and solders will be permitted for export, provided they conform to the recognised standard specifications, says a notification released recently at Bombay by the Joint Chief Controller of Exports. Shippers who wish to export these alloys should, in the first instance forward to the export trade control authorities at ports analysis reports from recognised analytical laboratories on the physical condition and chemical analysis of the materials along with the sealed samples before filling shipping documents, the notification adds.

SURVEY FOR MINERAL DEPOSITS

The Central Government has decided to intensify the survey work of the field parties of the Raw Materials Division of Atomic Energy Department for the location of new deposits of these minerals and to extend it to areas which have hitherto not been worked as uranium and other atomic minerals have assumed urgent importance for Government atomic energy programme. With the small geological staff of this department, it is necessary to enlist popular co-operation so as to widen and intensify search for uranium and other atomic minerals.

With this object in view the Government is proposing to send round one field party, consisting of eight to ten geologists for tour in certain areas in Punjab during the current recess season some time from June to end of September to educate and create interest among common villagers of the localities in the search for atomic minerals for the discovery of new deposits of which the Government has announced a number of small and big rewards.

Company Meeting

NEW INDIA ASSURANCE CO., LTD.,

Mr. Shroff on Nationalisation of Indian Insurance

Speech delivered by Mr. A. D. Shroff at the 36th Annual General Meeting of the New India Assurance Co., Ltd., on 29th June, 1955.

"Insurance business is essentially international in character, and its free development depends on the promotion and maintenance of international peace", observed Mr. A. D. Shroff, addressing the 36th Annual General Meeting of the New India Assurance Co., Ltd. In this context, he referred to the easing of the international tensions, towards which India's Prime Minister had made a significant contribution.

Apprehensions of a major world recession have been fortunately set at rest, by a distinct upturn in the United States business activity. During 1954, the Governments of the U.K., the U.S., West Germany and number of other countries continued the use of the flexible monetary weapon with a view to stabilising or stimulating activity. In the U.K. the policy of Incentive and Discipline followed by Mr. Butler has struck a responsive chord and the economy has gained a momentum, which, though occasionally hampered by labour troubles like rail and dock strikes, is unprecedented in recent British history.

The picture of the national economy, in the 4th year of the first Five-Year Plan, was generally one of sustained progress and overall stability. Mr. Shroff, however, referred to the shift in Government's economic policy towards a socialistic pattern of society, and deplored a possible further encroachment on the Private Sector, more so, when the Private Sector had fully vindicated itself as evidenced, among others, by a record rise in industrial and agricultural production, respectively, of the order of 40 and 20 per cent, during the first four years of the Plan. He wished that the Industrial Policy Resolution of 1948 had been allowed to run its allotted span of 10 years.

The pattern of the price picture, as it had developed between pre-Korea and now, was disturbing. Mr. Shroff also referred to the rigidity of Government's monetary and industrial policies. For example, the money supply with the public had risen by only 6 per cent, during the last 5 years, as against the tremendous increase in industrial and trade activity. The unbalancing of price levels appeared to indicate a fundamental imbalance in the economy, particularly as the price parity between manufactured goods and primary products had been upset. Productivity, in manufactured goods, was the essence of the Problem. In this connection, Mr. Shroff drew Government's attention to the able plea made by Mr. J. R. D. Tata, while addressing the Annual General Meeting of the Tata Iron and Steel Co,. in favour of rationalization.

Describing the Report of the Taxation Enquiry Commission as a "patchwork", in parts, which may do more harm than good", Mr. Shroff criticised those recommendations of the report, which suggested a steep progressive increase in direct taxation and a ceiling on net personal incomes. Referring to a recent study of tax structures in various countries, Mr. Shroff pointed out the undue heavy load of tax on the upper middle income groups in India—the group on whom rests the sole responsibility of motivating the Private Sector. In view of Governmental policies, towards a reduction of taxes in the U.S., the U.K., Germany etc., the need for a more liberal taxation policy in this country stood out in marked relief.

NATIONALIZATION

The recent references to nationalization of Insurance Industry in India, in Government quarters and elsewhere, Mr. Shroff observed, cannot but harm the cause of Indian Insurance. An objective appraisal of the issues and stakes involved in the proposal to nationalize Insurance would require a consideration of the basic facts of the Industry. These are:

(i) the social and economic purposes, underlining the proposal to nationalize;

(ii) the adaptability of the industry to nationalize;

(iii) the performance of the Indian Insurance Industry;

(iv) the ability of the industry relatively to a state-owned one to fulfil the national objective of optimum production, and

(v) experiences of other countries, in regard to nationalization.

Underlining these vital questions, were the two requisites of successful conduct of insurance business, namely,

(i) the creation and stimulation of the insurance habit, and

(ii) the building of a vast field force.

Discussing the two main classes of Insurance, namely, general insurance and life assurance, Mr. Shroff said that general insurance business is highly complex, technical and essentially international in character, and, as such, was the least amenable to nationalization. It was a necessary adjunct of free and active foreign

trading. Servicing and prompt settlement of claims were the hall-marks of success of private general insurance. Indian general insurers have succeeded in planting their flag in as many as 50 countries, earning a net premia of about Rs. 7½ crores in respect of foreign risks, as against Rs. 7 crores in respect of risks situated in India. Nationalization of General Insurance will greatly prejudice the position of Indian Insurers abroad. In this context, Mr. Shroff also referred to the British Labour Party's proposal, in 1949, to nationalize Industrial Assurance, which the party was obliged to revise, possibly because of complexities involved in general insurance.

Life Assurance, although mainly domestic, bristled with problems equally complex and basic. The Life Assurance coverage sold to the public was essentially a personal one; and tailor-made, to fit individual requirements. The product Life Assurance sold was an intangible one—future security. Further, in India, Insurers have to combat against negative factors like, ignorance, lack of thrift and lack of insurance habit.

Governmental essays in nationalization, such as the Postal Life Assurance, had a comparatively poor record. For example, in the case of the U.K., the Postal Life Assurance had to be closed down in 1928 because of poor volume of business. Governmental efforts in numerous other countries, where State Insurance has been tried, have not succeeded, because State enterprises sell only security, and not both security and service.

A further argument against nationalization of insurance is that it was essentially a co-operative institution, where 92½ per cent of profits were passed on to policyholders. Thus, private insurance came very much close to a nationalized one.

The case against nationalization is strengthened by achievements of Indian Insurers, which were most encouraging. Their business turnover, since the war, compared favourably with that in the U.K., the U.S.A., Canada and other highly developed countries. On the other hand, the Indian Postal Life Assurance had increased its business only by 16 per cent during the decade ended 1952, as against an increase of 214 per cent in the Life Insurance business of Indian Insurers.

Most important of all is the fact that Indian Life Assurance Companies were rapidly expanding their business in foreign countries, their premium income from outside India having increased 3 times during the period 1946-53. No other Industry, in the country, possessed as effective technical know-how as the Indian Insurance. The foreign associate of Indian Companies have freely drawn on the technical know-how acquired by Indian Insurers, with the result that a tremendous amount of goodwill exists for Indian Companies abroad.

In view of such remarkable achievements, the Indian Insurance Companies are well poised for fulfilling bigger objectives, which await them. Our calculations show that a huge life business potential of the order of Rs. 8,000 crores exist in the country. Substantial as our progress is, it is nothing compared to that in more advanced countries. Our Life Assurance Premium is a meagre Rs. 1/5 as against Rs. 106 in the United Kingdom, and Rs. 327 in the United States. The Per Capita Life Assurance in India is Rs. 25 against Rs. 8,365 in the United States; Rs. 6,647 in Canada; Rs. 1,840 in the United Kingdom; and Rs. 2,544 in Australia. The total Life Assurance business in force in India is less than 10 per cent of the national income, as against 95 per cent in the United States; 108 per cent in Canada; 51 per cent in the United Kingdom; and 47 per cent in Australia. The target of Rs. 8,000 crores to be achieved in 10 years' time, would mean only a policy of Rs. 1,000 per family, or a premium of about Rs. 50 per year, per family.

In the light of these facts, Mr. Shroff requested Government to consider, whether they would be in a position to measure up to such potentialities, particularly in view of their commitments under the Five-Year Plan.

In spite of the above arguments, Mr. Shroff added, if Government are still of the opinion that State-owned enterprises are necessary for the fulfilment of the national objectives, than a better course for them would be to start new State-owned units. This suggestion was in no way a challenge to the State, but fitted in well with Government's declared policy of not disrupting the existing successful units through nationalization as in the case of the Steel Industry.

Reviewing the results of New India's operation during 1953, Mr. Shroff observed that the total premiums earned by the Company in the General and Life Departments reached a new high level which is a little short of Rs. 10 crores. Out of this, the premium in the General Department amounted to Rs. 4.37 crores—an increase of Rs. 47 lakhs over 1953, and the profit inclusive of interest earnings at Rs. 34.1 lakhs were 7.8 per cent of the premium income.

Progress in the Life Department has been phenomenal. Net sums assured during the year amounted to Rs. 43.42 crores showing an increase of Rs. 23.51 crores over the business for 1953. From 1st March, 1954, Life Premium rates were reduced by New India which stimulated a large demand for life assurance. The total premium income during the year amounted to Rs. 5.62 crores and the interest income net of tax Rs. 78.5 lakhs.

The Triennial Valuation Report ending 31st December, 1953, shows a handsome surplus of Rs. 1.57 crores from which Rs. 11.6 lakhs has been credited to Shareholders' Account. A bonus of Rs. 14 per thousand on Endowment Assurance and Rs. 16 on Whole Life Assurance was declared during the year. Policyholders can look forward to still higher bonuses if the present rate of progress continues.

The Life Department celebrated its Silver Jubilee during the year. Sir Benegal Ram Rau presided at the celebration which coincided with the opening of the new Administrative Office Building at Vile Parle.

The Board recommended a dividend of Rs. 2-8 per share after making adequate provision for taxation and other reserves. The total funds of the Company now stand at Rs. 30.58 crores. Mr. Shroff expressed the hope that the shoreholders will approve the conservative policy of the Directors in order to provide increasing security to the widening clientele.

Since the publication of the Report, he added, the Company has acquired a controlling interest in Bombay Fire and General Insurance Co., Ltd., which is expected to widen our activities and connections.

Company Meeting

THE NEW GREAT INSURANCE COMPANY OF INDIA LTD.

STEADY PROGRESS MAINTAINED

Baneful Effects Of Nationalisation:

Lucid Exposition By Mr. Tulsidas Kilachand

The Twelfth Ordinary General Meeting of the Shareholders of the New Great Insurance Co., of India Ltd., was held at the Registered Office at Baroda on Saturday the 2nd July, 1955, under the Chairmanship of Mr. Tulsidas Kilachand.

At the outset, Mr. Tulsidas referred to the retirement of Mr. Dharamsey Mulraj Khatau, one of the Founder-Directors and paid glowing tributes to his invaluable services to the Company from inception.

FIRST AND SECOND FIVE-YEAR PLANS

He then proceeded to make a brief survey of the country's remarkable progress under the first Five-Year Plan and referred to the various gigantic projects launched by the Government. He added that the projects started during the pre-Planning period substantially contributed to the success of the first Plan, and appealed to the community not to be complacent, as it was the results achieved under the second Plan which would give us a clearer picture of the country's progress. He, therefore, urged upon all concerned to put in much more strenuous and sustained efforts, so that the second Five-Year Plan could turn out to be even a better success. In this task of accelerating the pace of development during the second Plan period, he directed his appeal particularly to the business community who had a very important role to play in the sphere of industrialisation and expressed the hope that in spite of the very difficult conditions under which they would have to work, they would persevere in their efforts to fulfil their social responsibility.

Turning to the Taxation Enquiry Commission Report, Mr. Tulsidas welcomed the Commission's recommendations on the question of reserves, although they fell short of the Trade's expectations, and requested the Government to accept the same.

PLEA AGAINST NATIONALISATION

Turning to insurance problems, Mr. Tulsidas dwelt at considerable length on, perhaps, the most burning topic of the day in insurance circles, viz. Government's proposal to nationalise insurance. He made out a very able, strong and clear case against any such move which, if implemented, would cause incalculable harm to Indian insurance. If by nationalising the industry, the Government expected to get more funds, he explained that even as it was, very little surplus was left in General Insurance, after providing for claims expenses, reserves etc. Further General Insurance was essentially of an international character and, in view of the trade's dependence on foreign companies for reinsurance, he warned that the facility at present enjoyed might not be available to the same extent to a Government-sponsored industry, as there was a general tendency to be cautious in the exchange of business where one of the parties concerned was a Government which was subject to changing political influences. Speaking of Life Business, he mentioned that India's per capita income was still very low, and it required all the persusive powers and influence of an agent to prevail upon a prospect before he agreed to take out a policy. If this was the position in spite of the very severe competition among companies for writing bigger and bigger volume of business, he wondered how Government hoped to improve the situation any the better, particularly in the absence of the element of competition. It was admitted on all hands that service could be rendered more efficiently and satisfactorily by private agencies, since experience had shown that in the case of nationalised enterprises, the incentive and competition usually associated with private enterprise were always lacking. If the Government's object was to canalise into their Loans, the funds built up by Life Insurers, through nationalising the business, Mr. Tulsidas hastened to point out that even under the provisions of the existing Act, a substantial portion of the Life funds was being compulsorily invested in Government securities. Citing the case of the United Kingdom which can boast of some of the strongest insurance companies, built up by private enterprise over the years. Mr. Tulsidas drew pointed attention to the fact that even the Labour Party, when in power, wisely refrained from including insurance in their programme of nationlising key industries. Whilst, therefore, appealing to the Government to abandon all thoughts of nationalisation, he took the opportunity to request them to examine other possibilities as to how best to help the Indian insurance industry, so that what Government wished to achieve could be achieved in a simpler and sounder way. At the same time, he urged upon the insurers to extend their activities to the rural areas and spare no efforts to make the agriculturists and artisans insurance minded. Whilst on the subject of expansion, he also gave a timely and much-needed advice to the industry. It was not sufficient for them to render efficient service. What was more important was they should let the public know the nature and

quality of the service they rendered to the community at large.

Dealing with the revision in Fire premium rates, Mr. Tulsidas mentioned that if Government expected to eradicate the evil of rebating by such revision, he was afraid this was a wrong remedy. He was firmly of the opinion that trading conditions had, if anything, deteriorated since the introduction of the Code of Conduct Rules, and therefore, suggested a move on the part of Companies to represent to the Government to do away with the existing machinery relating to the Code, and to enact certain amendments to the Act similar to those obtaining in U.K. The industry also should do well to formulate its own voluntary code of conduct and thus avoid giving opportunity to Government to interfere in their day-to-day activities.

Dealing with the Departmental accounts, Mr. Tulsidas stated that the gross income for the year 1954 was Rs. 49,55,178 in Fire, Rs. 17,54,401 in Miscellaneous Insurance and Rs. 41,11,323 in Marine, whilst the net premiums were Rs. 21,17,689, Rs. 14,42,440 and Rs. 18,78,120 respectively. After providing for losses and expenses, and reserves at 50 per cent in respect of Fire and Miscellaneous Insurance Departments, a sum of Rs. 2,76,098 from Fire and a sum of Rs. 1,05,077 from Miscellaneous Insurance were transferred to the Profit and Loss Account. In the Marine Department, in view of the increase in the premium, the reserve was increased from Rs. 15,10,957 to Rs. 18,78,120, and this necessitated a transfer of Rs. 2,88,900 from the Profit and Loss Account.

The Company received 3,185 proposals for assurance amounting to Rs. 1,35,02,900 out of which 2,582 proposals resulted into policies amounting to Rs. 1,15,21,650. The net premium received from the new business amounted to Rs. 5,36,930 and the renewal premium Rs. 15,41,859. Total claims amounted to Rs. 1,41,201. The Life Fund at the end of the year was Rs. 73,20,694 against Rs. 58,91,777 in 1953.

The Chairman also mentioned that the Valuation Report as at 31st December, 1954, was almost complete, and was confident that there would be a substantial increase in the Bonus available for distribution to "with profit" Policyholders over those of the previous valuation.

In the Profit and Loss Account, after providing for the necessary outgo, the balance left over amounted to Rs. 2,32,483. The Directors have proposed to transfer to Taxation Reserve Rs. 1,00,000 and to pay the Sixth Dividend on Ordinary Shares at Rs. 1-4 per share, free of income tax.

The Chairman also took the opportunity of thanking the Company's Agents, Field-workers, and the Officers and Staff for the splendid work that they have done last year.

Breach in the Plan-Frame

THE Mahalanobian plan-frame has been well and truly breached this week. Now that it is coming under non-emotional examination in the various Ministries of the Government of India, almost all the initial approval to its particular targets has been withdrawn. It is now recognised by many that this strange document which arrived at totals without ever adding up projects would never stand the strain of detailed inspection. But even its worst critics did not believe that differences of the order of 60 to 70 per cent might reveal themselves. This week that has proved to be the case in respect of a central target of the Plan, which is the target for transport development. Calmly and unobtrusively, as is his manner, the Railway Minister, Mr. Lal Bahadur Shastri, proclaimed this week that a reasonable target for transport development would need to be in the region of Rs. 1,500 crores against about Rs. 900 crores in the draft Plan. This is only the leading challenge that the Plan-frame has had to meet; it is significant that it comes from the most accommodating of all Ministries; there is worse to come.

It would be unfair to place the blame for the mistaken targets of the Mahalanobian Plan in

railway transport entirely on the shoulders of the statistical professor. The Railway Board must itself accept some part of the responsibility for the error. As late as February 1955, the Railway Board seemed to be satisfied with a Plan of only Rs. 800 crores, and the Indian Statistical Institute might claim it was justified in assuming that, in making full provision for this demand, it was displaying due reverence for the technical excellence of the Railway Board. It was clear, however, that when the Railway Board was submitting its estimates in February 1955 it was not thinking in terms of the total dimensions of the new Plan-frame. If Prof. Mahalanobis had enquired of the Railway Board if its Rs. 800 crore target was consistent with his other ingredients of investment, he would certainly have received a very different reply. It would have been to the effect that investment on railway development would need to be increased by fifty per cent. Again Prof. Mahalanobis made a provision of only Rs. 100 crores for roads, shipping and other communications. For this fantastic allocation surely no blame attaches to the Transport Ministry.

An addition of Rs. 600 crores to the Transport Plan will mean an enhancement of the Plan by at least this quantity, as no Ministry is willing to surrender even imaginary resources, unless it be the Ministry of Commerce and Industry which realistically considers more factories of no avail without the necessary transport for raw materials and finished goods. How a provision of Rs. 1,500 crores is to be made for railway transport within the general Plan-frame is a question for Prof. Mahalanobis to answer from afar. No doubt a convenient (theoretical) answer can be found by stepping up the assumed rate of saving which can be imposed upon the Indian people. After all, statistical planning is made of just this kind of assumption. For less sophisticated persons, however, there will be seen in the new railway demands a mortal blow to the present Plan-frame.

The weakness of the frame is being demonstrated much sooner than expected. It is not, however, only the frame which is at fault. It is obvious, that if every Ministry proceeds to inflate its targets in this manner there will have to be instituted a drastic cut of all Plans in order to accommodate them to the resources available. Is a Procrustean bed now to be invented to force departmental Plans into the Mahalanobian framework, or is the framework to be inflated on the best principles of theoretical consistency?

An illustration of the extent to which thinking in the Government of India is fluid, and even fickle, is to be found in some comparable figures on ingredients of the railway development Plan in February this year and at the present time. It is reported unofficially that rolling stock and machinery which called in February 1955 for an expenditure of Rs. 320 crores now runs up to Rs. 470 crores. Allocation for electrification projects for which a meagre provision of Rs. 10 crores was made in February appears to run up to Rs. 130 crores in the July estimates, that is, thirteen times as much as before. Improvement of track moves from Rs. 80 crores to Rs. 125 crores; a single provision for the Ganga Bridge from Rs. 10 crores now moves up to Rs. 45 crores for various bridges. More extraordinary than all, it is rumoured that an entirely new item of Rs. 165 crores suddenly makes its appearance for workshop improvement and expansion.

To point out that some of these estimates must be unduly inflated does not argue the case against a large additional provision for transport. For example, there is no doubt whatever that the provision of Rs. 195 crores for improvement of line capacity is moderate and certainly a far more suitable figure than Rs. 77 crores included in the previous draft. It is to be remembered that the improvement of line capacity includes the doubling of track over 2,500 miles and a great improvement in marshalling yards at transhipment points. There is every reason why the allocation for this item should be as large as the allocation for entirely new lines and the restoration of old ones, for which fortunately a stable figure of about Rs. 200 crores seems to have been included in both drafts.

It is clear that in the political pressure battles which will now have to be fought between the Ministries for a share in the planning cake, economic considerations are not likely to receive the attention that they deserve. The issue is not one of pressures alone; it is greatly to be feared that the principles of wise economic balance have not yet been framed. It is easy enough for the Railway Ministry, for example, to lay down the order of priorities between the various items under its control. But who will determine the order of priorities between transport and education, or between education and health, and between agriculture and industry or more, generally, between transport and the whole Plan? No one today seems to know the size of the coming cake or of its ingredients: only the Finance Minister, with a loyalty to the Plan-frame which is remarkable in its steadfastness, quotes Prof. Mahalanobis' figures on total investment.

The Finance Minister's devotion to the Plan-frame (or is it to the person of Prof. Mahalanobis?) is a cruel handicap for the country at this time. For it is the Finance Minister who is primarily responsible for adjusting priorities in different sections of the Plan to keep them in appropriate financial balance. If the Finance Minister surrenders his judgment entirely to the Professor, much as a disciple to a guru—as is reported from every source—how can the rectification of these serious errors in the Plan be effected? Unofficial reports have been current this week that the Finance Minister has been taken aback rudely by the inadequacy of the transport provision in the Plan. That surprise should overtake the Finance Minister on so fundamental a point so late in the day indicates the extent to which Sir Chintaman Deshmukh has been taken out of touch with realities by his wholesale commitments to the Indian Statistical Institute. If the blind should lead the blind, will they not both fall into the ditch?

India and Kashmir

PANDIT GOVIND VALLABH PANT'S statement at Srinagar on July 5 has not unnaturally hit the headlines. Addressing the National Conference Workers at the Kashmir capital, India's Home Minister, who is also Minister for States, declared firmly that "India could neither allow prolonged uncertainty about the future of Kashmir nor could she stand in the way of Kashmir's trying to rid herself of this uncertainty". Elections for the Constituent Assembly had been conceived towards that end and "India could not fail indefinitely to respect the verdict of the Kashmir people already expressed through the National Conference". In effect the verdict of the people of Kashmir "which cannot be disregarded had already settled finally the question of accession to India". "It is only people living in the Pakistan-occupied area of Kashmir who have to decide their future".

This blunt statement that there is now no necessity for a plebiscite in that portion of Kashmir which has acceded to India has naturally aroused widespread comment both here and abroad. It is unthinkable that the Minister of States would have made a statement of this kind without a full sense of responsibility. This implies under present political conditions in India that the statement must have the support of the Prime Minister; indeed, it could not have been framed in so final a manner unless it had the overwhelming support of the whole Indian Cabinet.

It is vital, largely because this statement appears to resile from an international obligation, to understand and appreciate the circumstances under which it was made. It is difficult for any person who has not recently visited the Valley of Kashmir to understand how deeply needed, at least in one large section, such a statement is deemed to be. It is theoretically true that such a statement does no justice to India's international commitments. It is equally true that it is nontheless urgent from the point of view of the people of Kashmir. There is in the Valley at the present time tiredness of insecurity and an anxiety to dispel it which presents a new psychological factor in the Kashmir scene. It is the pressure of this factor which has been responsible for Pandit Pant's statement. It is a recognition of the force of that pressure which alone can provide an understanding of its significance.

The simple truth of the matter is that the Government of Jammu and Kashmir is faced with that relentless demand for economic progress which has been the dominant note in the life of the Indian people since Independence. Now that more settled conditions have been established in the State and the traffic of ideas has grown with the volume of Indo-Kashmir trade, particularly in tourism, it is natural that the people of Kashmir should be seeking equal progress with India. The Government of Kashmir has up to a point achieved something in the direction of economic stabilisation. But economic stabilisation is clearly not enough at a time when Indian economic progress is substantial and becoming every day more widely known. Public pressure in Kashmir has grown, producing an intangible, but nonetheless real, demand that Kashmir's progress should move on lines parallel to those of the Indian Union.

This demand for economic progress, which can be sensed deeply by recent visitors to the Valley, must have been described; however inadequately, to the Minister of States during his eight-day visit to Kashmir. Pandit Pant is also too sensitive an observer to have missed this fundamental point which those who run can read. Again, the first condition of this progress is that political stability should be assured, that is, that Kashmir should be an inseparable unit of the Indian Union. Pandit Pant's statement has been deliberately designed to convey this assurance to Kashmir from the Indian side. Bakshi Ghulam Mohammed has often enough pledged Kashmir's word to India.

It is this attempt, notwithstanding the international commitments that surround Kashmir, to face up to an immediate and inescapable problem which must explain and excuse what might look like an act of political bad faith. This declaration made before the Prime Minister's visit to Karachi represents no more than the fact that further uncertainty in Kashmir is incompatible with economic progress and India has made her choice.

Only one further comment on the statement is necessary. If the purpose behind the Minister of States' declaration was to secure full economic co-operation with India, it cannot be completely successfull unless further action is taken by the Government of Jammu and Kashmir to convey an assurance to Indian business men and those visiting Kashmir that they will enjoy a status similar to that which they enjoy in India. If it is logical and expedient for Kashmir to abolish political insecurity by a declaration in which her liberty is supposed to be restrained, it is logical and even more expedient for her Government to frame a declaration of economic policy in an area where theoretically it is completely free. In other words, the justification for a bold political statement will not be seen unless the Government of Jammu and Kashmir follows it immediately with a declaration formulating an ecnomic policy in which Indian investment and initiative will be as welcome in Kashmir as it is in India at the present time.

At present Indian citizens are not full citizens of Kashmir. Indeed even the writ of the Indian Government does not now run in Kashmir as it does in other States of the Indian Union. One glaring instance of limitation of the powers of the Central Government is to be found in the sphere of audit. At the present time, even Indian Central Government expenditure in Jammu and Kashmir is not under the control of the Auditor-General of India. This is a wholly anomalous situation which should be remedied without delay. Even if Kashmir declines to have her State expenditure placed under the Auditor-General's control she cannot under any circumstances object to the control of Central Government expenditure for which, in the last analysis the Indian Parliament is responsible. It is essential that the claim which has from time to time been made by India's Audit authorities that they should receive accounts of Central Government expenditure in Kashmir should be accepted in full.

It is no secret now that an industrial policy statement is shortly to emerge, but it is not known if it will make citizens of India equal to Kashmiris in the holding of property and all that is allied thereto. What would it profit either India or Kashmir to lose face with the world if they did not satisfy the demand for economic progress which is the cause and the sole justification for the States Minister's declaration?

Survey at the Summit

"WE are going there honestly to present our case in a conciliatory, in a friendly attitude and we don't intend to reject anything from mere prejudice or truculence or any lesser motive of that kind." This is how President Eisenhower has summed up the position of the United States at the summit talks that will open at Geneva on Monday. This attitude implies a substantial change of mood in the United States. Until about six months ago, American official opinion was very sceptical of the value of informal talks among Big Four leaders. There is now a feeling of subdued optimism in the West about the Geneva meeting, even though it is perfectly understood that the Conference will not reach any decisions on the outstanding issues but agree only on the right approach to them in working out solutions at lower levels. The major developments which have caused this change are not far to seek. The West had, rightly or wrongly, assumed that it would not be negotiating with strength so long as the ratification of the Paris agreements and the linking of Western Germany with NATO was not completed. The ending of the Indo-China war was another distinct gain which had preceded the ratification; and the Austrian Treaty which followed, created a climate of hope which has made the Geneva meeting possible.

That is not the same as saying that all the conditions for a successful conclusion now exist. This is an impression which is likely to spread on the basis of the widespread belief that the Russian leaders are today more anxious than ever for peace. For example, Mr. Jawaharlal Nehru's statement that he found Marshal Bulganin anxious for peace is apt to give an altogether distorted picture of the situation. It can lead to the inference that if there is a failure to agree at Geneva, the Soviet Union cannot be solely or mainly responsible—which would be far from true. Merely because the Soviet Union is now ready for a settlement, the record of the recent past and the consequences of that record to Western policies cannot be wiped out. It is clear that the Soviet Union is only seeking to negotiate for an agreement on the conditions of co-existence without war and Mr. Krushchev has made it abundantly clear that it does so from a position of strength. The assertion of this point about Soviet strength is significant for more than one reason. For one thing, it may or may not really indicate intrinsic strength in economic or logistic terms; but even if it does, it would only mean that the Soviet Union is now finding it expedient to attain by the methods of diplomacy what it has all along sought to achieve by war or covert threats of minor wars. It means, that Marshal Bulganin will drive a hard bargain at Geneva to preserve the existing stable of the world's power balance while seeking to avoid the possibilities of global war. This dislike of war is indeed only a negative aspect of the aspiration for peace; it may be an essential prelude to the establishment of peace but not indeed conclusive proof in itself of the ability to maintain all the conditions of peaceful co-existence.

The value of the Geneva talks cannot be assessed until the subsequent phase of detailed investigation of specific differences is well under way. There can be quite a great gap between the conviction that nuclear war is disastrous to both sides and should be avoided and the creation of the conditions under which genuine peace has a chance of becoming permanent in the world. Some of the immediate sources of conflict may be successfully resolved but there are still imperfect answers to the large question-marks hanging across the major issues like Korea, Indo-China, Formosa and Eastern Europe. The Soviet Union may, perhaps, consider the sacrifice of East Germany a good price to pay for the retention of her hold over the rest of Eastern Europe along with the neutralisation of Central Europe. But similar steps are at the moment improbable in Korea or Indo-China and China's attitude on these questions—which is a vital consideration and not necessarily dependent on Russia's—will not be known at Geneva.

To state that the Soviet leaders are anxious for peace is not the same as saying that their pursuits have been and still are peaceful. They have all along been in the forefront in building up military strength, though Russia's actual achievements might have been limited by the state of nuclear research and the economic strain of translating its gains into production of tactical weapons. The Soviet Budget shows an increased outlay—from 100 billion roubles in 1954 to 112 billions in 1955—on defence, which is one-fifth of the total expenditure. The leaders of the Soviet Union like all shrewd men everywhere dread an atomic war and would go a long way to avoid it. Some of the conditions for a moderate degree of disarmament are even possible in the present circumstances. It is possible to allay fears of small-scale aggression at strategic points by the establishment of international inspection teams. The size of military budgets may be cut down in that process to enable the strained, but not necessarily weak, economies of the Communist Powers to devote more towards providing welfare. These are laudable measures, if they could be carried out in practice. And if they are accompanied by steps for freer trade, some of the pressing problems of both the Communist and the non-Communist world could be solved. It is yet too much to hope that barriers to free movements and exchanges of men and ideas—which alone can in the final analysis dispel deepseated distrust—would also follow these measures.

An understanding or agreement to reduce some of these immediate dangers will not in itself be acts of dedication to peace. That depends largely on the attitude to the techniques of securing and exercising political power prevailing in any society; these can make an essential difference in the attitudes to war and peace. It may be true that as an individual Marshal Bulganin is devoted to peace, especially with his background of military experience which knows the horrors of war. But he is still the product—and possibly an unstable product-of a system which is still in the grip of violent and frequent changes. This is not a factor to be overlooked. The impressive Moscow air-display held a fortnight ago was not the achievement of a peaceful but a highly militarised authority. While conceding the genuineness of Moscow's desire for a settlement at this stage it is possible to hold that the conditions for co-existence will not be easily forthcoming. A settlement would be welcome respite after the long cold war and any respite can help to work out the conditions for the eventual establishment of peace by reducing the scope for suspicion.

THE WEEK'S NOTES

TROUBLE-MAKERS IN VIET-NAM

FROM SAIGON comes the news that two members of the National Revolutionary Council have accused most of the members of Premier Dinh Diem's Government as traitors and enemies. The timing of this move, on the eve of the deadline set for the talks on elections with North Viet-Nam, is significant. The denouncers have not attacked Premier Diem or others who support him. It is unlikely that it would be seriously heeded by the Premier but the purpose of the move is transparent. The members have opposed Bao Dai and they are clear that at the present time Russo-Chinese Communism is perfect colonialism. They are opposed to any negotiations now with the Viet-Nam Communists on elections and have stated that only an elected National Assembly can decide the question of Viet-Nam's unification. Their statement also mentions that Viet-Namese have ignored the Geneva Agreements and regard the international Supervisory Commission as "collaborators of the French expeditionary corps and the Communist Government and more or less foreign tourists".

The inspiration for this line is not far to seek but it reveals that at least a part of Diem's Government is for negotiations on elections in spite of the Premier's reluctance. His Foreign Minister has stated that the Government agrees to elections in principle. Even the Premier has expressed disbelief only in the possibility of getting the right conditions for free elections in negotiations with the Communists. But this can only be tested out in the course of discussions and cannot be assumed in advance. There is the possibility that even if the Southern leaders are given freedom to work in the north, they may not be able to make much headway, while in the troubled conditions of the south, the Communists may hope to win some support There is also the possibility of the Communists not respecting the final verdict if it goes against them, though they may now consider such a possibility as unlikely. In South Viet-Nam serious efforts are being made to secure the condition that the supervision of the elections should be by the United Nations or by a different international commission—which will necessarily constitute a reflection on the Indian role. If talks are broken off on this ground, it would still violate the Geneva settlement, which is just what its opponents would want. There should be a way by which such a move can be thwarted.

GOAN DEVELOPMENTS

MR. NEHRU'S visit to the Vatican has helped to clarify the misunderstanding spread by propaganda to the effect that the religious susceptibilities of Goans were involved in Portuguese refusal to consider Goan independence. The Portuguese Legation in Rome has denied Mr. Nehru's assertion that the Lisbon Government had tried to make the problem of Goa a religious matter. This denial is also a helpful confirmation of the same point, and should strengthen such of the Catholic groups that had felt that in sympathising with the independence movement they would be hurting their own religious interests. The Portuguese Government would have alienated the non-Christian majority if it had acquiesced in the interpretation that it was safeguarding the Catholic religion. At the same time, no one interested in the welfare of Catholics whether in the Vatican or outside could have urged that under Indian rule, this religion would not have all the privileges now available. The position of Indian Catholics would then become untenable. All this was known even before Mr. Nehru's visit to the Vatican. They do not alter the magnitude of the problem of Goa. Except for Mr. Nehru's firm optimism that the area would become Indian territory, there is nothing to indicate that we are nearer to a solution.

There have been more incidents and with each major incident the sense of frustration is bound to increase. All the opposition political parties have sought to blame the Government for the delay and lack of firmness and the Communist cry for "police action", only seeks to make capital out of the Government's apparent lack of a strong policy. The Congress President Mr. Dhebar has been active in advising impatient Congressmen to be restrained. The Congress Working Committee is expected to discuss this question at its meeting on July 23. It has no easy task in trying to reconcile the preference for the pursuit of peaceful methods with the obstinacy of the Portuguese Government in refusing to consider India's demand in a constructive way. The new reforms proposed by Portugal will hardly satisfy the needs of the present situation.

THE AKALI MORCHA

THE AKALI morcha in Amritsar has at last ended though it had not weakened even after two months. The Akali Dal insists that the agitation was against the ban on the utterance of Punjabi Suba slogans but in effect it was testing its own strength on the issue of a Punjabi State with a predominant Sikh influence. An agitation on the latter issue alone might not have built the following for the Akali Dal in the manner in which it has now done. The Punjab Government by banning even the utterance of slogans had made the Akali Dal's demand for civil liberties a reasonable one. Thus it has gained more support than it has been able to all these years and after 7000 arrests, more recruits appeared to be flowing in from adjoining PEPSU. Though the moderate Sikh leaders have been ready to condemn the agitation, which was a camouflage for a communal political demand, they appeared to be losing ground. The Akalis have been using the gurudwaras for fomenting the agitation but police firing was hardly tactful. The worst of all dangers lay in some of the counter movements which might have been let lose to make the issues on openly communal quarrel.

The Punjab Government cannot be credited with tact in handling the affair. It is no use saying that law and order has to be maintained. The law had to be manifestly reasonable when motives were bound to be suspected and if more Sikhs get the impression that even Constitutional measures to get their rights (as they conceive them) are impossible, the defeat for the Government would be great. It is now clear that the ban did not by itself eliminate incidents while it gave a righteous cause for the morcha. There is enough in Punjab politics to create discord and in PEPSU, Congress policy has created enemies in the past some of whom are now actively helping the movement with men and money. The existence of a States Reorganisation Commission cannot justify repression against linguistic demands even though they only cover up communal claims. There has been too much of a tendency in high places to deprecate regional claims as anti-national but they may not always be brushed aside by armchair verdicts or casuistry. They can, however, he subordinated by sensible political arrangements which do not ignore any group of men on the basis that they are unfit to be dealt with.

REFORM OF ELECTION PROCEDURE

THE PROPOSALS, reported in the press, for the simplification of election procedure at the next general elections are on the whole well-conceived. By effecting too many changes at one stroke, they may cause some lack of understanding but they are generally in the right direction of liberalisation of the severe rules prescribed in 1951. It is, however, doubtful whether the writs for the general election could, as now proposed, be issued by the Election Commission. This seems to be clearly outside the constitutional responsibility of the Commission. Whereas bye-elections form part of the "conduct" of the general elections, the Commission's power of "superintendence, direction and control" under Article 324 would not include authority to call for general elections; the elections must be ordered by an independent agency before the Commission can derive its powers of superintendence and direction.

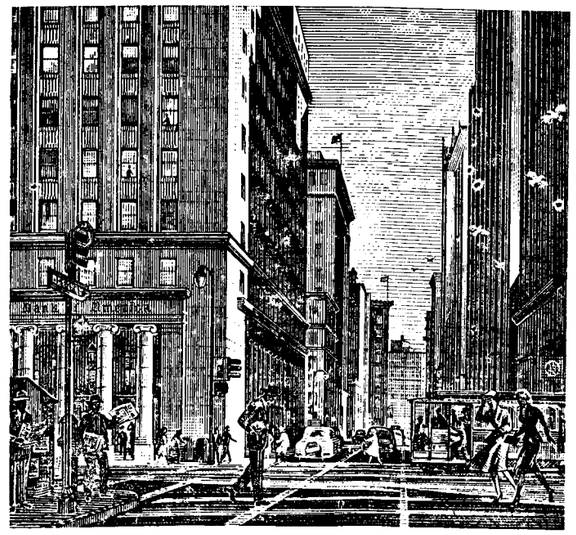
It is necessary that general elections should be held simultaneously all over the country, irrespective of the varying tenures of the State Assemblies. The reduction in the duration of the election programme between the issue of the writs and the polling is also a desirable step. It is also desirable that the duration between the polling and the counting should be reduced because there will be less room for suspicions about tampering which arise when counting commences more than three or four weeks after the polling. The proposal to reject ballot papers involving double voting for the same candidate in a plural constituency is somewhat drastic.

The most important of all the measures needed is the reduction of the very heavy responsibility now placed on the returning officer because of the power of rejecting nominations. By defining the qualifications too rigorously the rejections become too many and since no other legal remedy is open to the aggrieved party except to seek to set aside the election, the procedure has been dilatory and wasteful. A reliable set of definitions of disqualifications with illustrations should be made available to candidates filing nominations; if a summary appellate reference can also be added it would be better still but the reduction of the duration of the election programme may not allow this. The next best is to expedite the disposal of election petitions and this is sought to be done by the provision that tribunals may consist of one member, though an appeal to the High Court may offset the advantage derived by this simplification.

MILLERS AND POUNDERS

CRAZY AS it may seem, the recommendation of the Rice Milling Committee for the replacement of rice mills in India by the hand pounding "industry" is, perhaps, consistent with the prevailing sentiments which seem to govern our economy today. It is doubtful whether the rural population everywhere would agree that it is a profitable occupation and, in any case, it involves the performance of heavy routine operations which sets limits to the duration of such work and to the mobility of such labour. In the areas in which rice yields and total turnover are high, there may not be enough workers who would be available to fulfil the additional demands for milling. Invariably, the surplus landless labour which suffers from seasonal unemployment would be found in the less fertile areas where rice is not the main crop. As a nostrum for rural unemployment, the case for hand-pounding is untenable; but its high cost must have ruled out the course if there had been any serious investigation.

The pounding cost per unit of rice must be at least five times as much as the milling charges. Such considerations of cost might not have weighed very strongly in a rural economy based on barter and on rights to performance of specific customary functions at customary charges; but when these are breaking fast, the substitution of hand pounding on a commercial basis would greatly add to the price paid by the consumer, even if labour is available in the right volume and in the right places. There will also be fluctuations in rice prices in the market according to the availability of seasonal labour, which alone will be attracted to this work, if at all. And, however, irrational the consumer may be in choosing polished rice with less of the vitamin in it, his palate and preferences are not so unimportant as to be dismissed with a supercilious sneer.



There is perhaps no reason to take the Committee so seriously as all that. Where rice is the major crop and the staple foodgrain, the consumer can assert himself against the politician's carrying any fad to extreme lengths. But it is sometimes surprising that such suggestions should be seriously made. The Committee's strong deprecation of small-scale hullers can logically apply even to sewing machines and the question that such committees often fail to ask themselves is 'What are we industrialising for?'

CHINA'S PLAN: PROMISE AND FULFILMENT

CHINA IS reported to have revised her Five-Year Plan in terms of a lower agricultural production, and emphasis on heavy industry. It appears that the original target for grain production in 1957 at the end of the Five-Year Plan involved a 30 per cent increase but this has been reduced to 17.6 per cent, involving an output 192,800,000 tons in 1957. The increase in industrial production is expected to be 98.3 per cent and Vice Premier Li Fu-Chun, who is head of the State Planning Commission, is reported to have estimated the total outlay in the Plan period in terms of gold as 700 million ounces ($24.5 billion or Rs. 12,250 crores) which seems prima facie a highly exaggerated figure. The actual target figures that have been set are reported to be as follows:

	1952 (Output)	1954 (Estimate)	1957 (Target)
Steel (Million tons)	1.35	2.17	4.12
Electricity (Million KWH)	7,260	10,800	15,920
Coal (Million tons)	63.5	81.99	113
Generators ('000 KW)	30	..	227
Electric Motors ('000 KW)	640	..	1050
Cement (Million tons)	2.86	4.73	3
Paper (1000 tons)	370	480	650
Sugar (1000 tons)	249	..	686
Cotton Yarn ('000 bales)	N.A.	4.600	N.A.

Whatever be the accuracy of these statistics, they are significant because they give absolute figures of the targets for the first time. The length of railways have increased from 21,700 Kilometres in 1949 to 25,500 Kilometres in 1954 while the volume of freight is reported to have increased by 60 per cent. The rate of advance visualised is ambitious though in per capita terms, China is still very much behind India in most respects.

PROSPERITY THROUGH THE COTTON MILL INDUSTRY

FACT 2

The mill industry is the mainstay of millions of cotton growers in the country. It buys the bulk of the cotton produced by them. On an average, it consumes annually about 38 lakh bales of Indian cotton besides some 7½ lakh bales of imported cotton. The value of all cottons, Indian and foreign, consumed by the industry in one year is estimated at Rs. 200 crores. It is also a large consumer of fuel, electricity and lubricants, valued at Rs. 11 crores.

A number of ancillary industries, producing dyes and chemicals, mill stores, sizing and packing materials, are also supported by it. The value of such goods consumed by the industry is estimated at Rs. 26 crores. The industry also gives employment to a vast army of men engaged in cotton, yarn and cloth trades and in the transport services. It supplies all the yarn required by the handlooms which produce annually 1,200 to 1,500 million yards of cloth.

In short, the number of the industry's beneficiaries is so large and its influence on the Indian economy is so all-pervasive that any precise assessment of its importance to the country is almost impossible.

A Window on the World

THE HISTORIANS AND US

BY

ODYSSEUS

IN AN ATTEMPT to form a concrete picture of the problems that Maulana Azad has set Dr. Sen by charging him to prepare a definitive account of the 1857 Mutiny, we have been engaged in looking up what the historians have said about an event which occurred nine years earlier—the French Revolution of 1848—and comparing their accounts with the evidence of contemporary witnesses.

The Revolution of 1848 was, we are told, sparked when the police banned a banquet sponsored by Opposition leaders that was to have taken place in Paris on February 21 to promote the cause of parliamentary reform. We established last week that similar publicity banquets had been staged throughout France during the previous twelve months, had lost their first appeal, and were the object of the ridicule of cartoonists. The Opposition leaders did not sponsor the Paris banquet; it was initiated by an obscure group of party workers who wanted to demonstrate their zeal. Fearful that disorders would follow the banquet, reluctant to disavow their party workers, the Opposition leaders reached a compromise with the police whereby the banqueteers would march to the hall, be told that the banquet was illegal, drink one toast to "Reform" and, izzat satisfied, disperse. Meanwhile, however, the Leftist press publicised the procession as a Grand Demonstration of the Popular Demand for Reform. Alarmed once more, the Opposition leaders, who had no wish to scare property owners or to give the Paris mob any excuse for another of those sanguinary exploits for which they were notorious, cancelled the procession. Yet, in the event, blood was shed and the revolution broke out. How?

Before calling further witnesses, we can attempt an evaluation of the facts so far disclosed. It seems clear that this was a revolution that nobody wanted. There were no demonstrations or disorders in any part of France outside Paris. (On the contrary, the first job of the revolutionary government's friends was to write pamphlets for circulation in the provinces explaining why this revolution was a good thing). The Opposition in parliament wanted an enlargement of the electorate; the Ministry refused this, but it is clear that the Opposition did not think reform worth a revolution. We can understand, too, the weakness of the government set up after the revolution. M.P.'s who were timid before the peace had been broken and who strove to avoid the occasion for it were not likely to be heroic upholders of a revolutionary government. Politicians anxious not to offend property owners were not likely to build a new revolutionary world. This situation gave Louis Napoleon Bonaparte (nephew of the great emperor) his chance for a Bonapartist come-back. The revolutionary regime was timid, without popular support, and distrusted the mob.

Now, back to the streets. The decision to cancel the procession failed to quieten the effervescence of the Paris mob who to this day enjoy any opportunity for clashing with constituted authority—which does not, however, mean that they necessarily speak for France, any more than a bazaar mob necessarily speaks for India. There were various processions shouting slogans on February 22. Rumours were rife. The attitude of the National Guard (Auxiliary police troops) was uncertain. They were ready to uphold the dismissal of the premier, Guizot, and a change of policy, but they had no wish for a revival of the bloodshed of 1789, 1793, and 1830, which were living memories. The Ministry shilly-shallied. Guizot resigned on February 23. The middle classes were pleased; holiday crowds thronged the streets—and it is in this paradoxical atmosphere that we now reach the fusillade and the revolution.

THE PROCESSION SETS OUT

As a precaution troops had been posted around the Foreign Affairs Ministry (of which Guizot had been Minister) where they were disposed across the street. Towards these troops between 9 and 10 p.m. there marched an excited mob in procession from the working class quarter of the Faubourg St. Antoine. Why? A number of witnesses testified later that the march had been suggested by a National Guard officer on duty in the Faubourg where a crowd had assembled. It does not seem to have had leaders with a premeditated plan but to have consisted largely of goondas ready to take advantage of the unrest of the times. Diverse voices called for the disarming of the National Guard and an attack with the weapons taken from them on the Town Hall, the traditional objective of Paris revolutionaries. The Guard officers were patient. They sought to avoid a clash and one of them, Lieutenant Schumacher, suggested that if the crowd were marched round the boulevards this would work off their excitement harmlessly. The crowd marched to various centres, gathering numbers. They went to the offices of the Leftist newspaper, "Le National". Witnesses say that the staff harangued the mob, urging them to keep their arms lest they be duped by the government. Thus we learn that some in the crowd were armed; they were excited by speeches, and warned of unknown dangers.

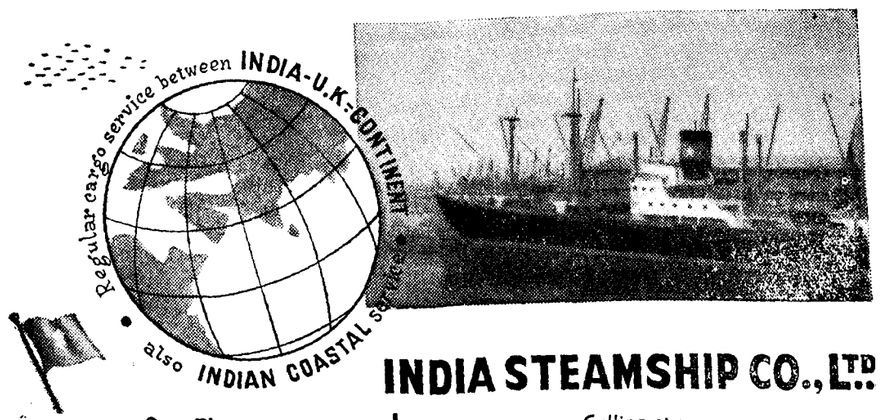
The procession now turned to go home. There was a choice of routes back. The evidence as to why the route past the Foreign Affairs Ministry was chosen is contradictory. Bystanders who were eyewitnesses testified that only a few in the mob were armed and these few were mostly in the front ranks, i.e., in the ranks visible to the troops. The front halted; the rear could not see what was happening and pushed on. The colonel in command would not allow the procession to pass. Lieutenant Schumacher told him that the crowd was peacefully minded. The colonel said he had his orders. The mob brandished the torches that they were carrying in the faces of the troops. A man seized the bridle of the colonel's horse. Under pressure of the crowd and the restiveness of his horse, the colonel retired behind his troops and then gave the protective order "Cross bayonets!" Pressed by the mob, the troops retired a few paces in order to obey. Their rifles were loaded. Suddenly a shot rang out. A fusillade followed that lasted two minutes.

"The first shot echoed throughout Europe; but we cannot tell who fired it," says Professor Woodward. The soldiers unanimously testified that the shot came from the mob. A pamphlet published soon after the

revolution alleged that this shot was deliberately fired by a member of a revolutionary secret society, named Lagrange, who wanted to make trouble for the sake of "the cause", as Communists take advantage of similar opportunities today. Lagrange scraped through on an alibi of sorts: another admitted revolutionary swore that Lagrange was with him miles away at the time of the firing. On the other hand, Maxime Du Camp, the well-known author, "revealed" twenty-seven years afterwards, in 1875, that the shot was fired by a sergeant to protect the colonel. This is possible. The sergeant never uttered a word of it to the Enquiry but, if the shot was his, he would not have dared to admit it at the time.

THE LIMITS OF HISTORICAL CERTAINTY

Professor Woodward sums up: "If we do not know who fired the first shot, can we be sure whether there was or was not an order for the fusillade? One of the men nearest the colonel heard nothing. Others maintained that an order was given. Schumacher and another of the leaders of the procession deposed to the same effect. Can we trust the accounts of soldiers affected by the terrible and momentous effects of their act? Can we trust Schumacher and his friends whose good intentions had led to such calamity? We have passed out of the limits of historical certainty."



Such are the practical difficulties that Dr. S. N. Sen cannot fail to encounter in his work on the records of 1857. Wealth of material does not of itself guarantee a higher measure of 'certainty'. There are indeed degrees of historical certainty; but certainty of any kind depends as much upon the subject matters as on the lapse of time or the mass of material. It is possible, for example, to fix the date and hour of a battle which took place 5,000 years ago during a total eclipse of the sun. The character of our knowledge of topography differs from the character of our knowledge of human motives. The campaign of Austerlitz, for example, throws light upon Napoleon as a military genius. But it does not 'explain' his motives.

The nearer we come to the ultimate questions—to the evaluation, say, of the personalities, motives, responsibilities, and influences on the events of 1857 of Dalhousie, "Clemency" Canning, Hodson, Bahadur Shah, Metcalfe, the Lawrences, Nana Rao, Ali Naqi Khan of Oudh, Azimullah Khan, Rangu Bapu, and all the other figures, great, terrible, or tragic, that stride across the mighty panorama—the less can the historian depend on technique or bulk of information, the more is he dependent on his own experience of life to appraise personalities, divine motives, disentangle responsibilities, and trace out influences. No little man with a narrow experience of affairs, unfamiliar with the dilemmas that confront those called upon to quell a riot, govern a province, or frame a foreign policy, who has never moved among those with grievous responsibilities and great powers for good or ill, is likely to penetrate the mists of myth that must for every envelope the more important actors of history. Why? Because when it comes to interpretation, the historian, like the artist or the novelist, is putting himself, his own experience of a lifetime of research, reflection, and imagination, on to paper, and a little man can have but little to put.

The more we ,who are politicians, diplomats, civil servants, businessmen, or economists, realise how constantly we appeal to history in the formulation of our policies, whether as foreign ministers searching the past in the national interest, or as exporters, importers, or manufacturers in the interests of ourselves our firms, or our industries the movement we realise how utterly we are at the mercy of the industry and integrity, and above all, the intuition, of the professional historians, for they investigate these matters of which we can have only second hand knowledge. The more therefore must we salute the occasional genius, the Thucydides, the Acton, or the Churchill, who by illuminating the past on which we are building our present, enables us in some degree to control the future.

Is there a moral? asks someone, bringing me back to earth. Why, yes. Never think you know any history until you've read at least six different historians on the same subject.

A DELHI DIARY

A GREAT HOME-COMING

NEVER in the history of human adulation have so many worshipped at the shrine of so few. This ponderous thought, in imitation of Winston Churchill's classic description of the RAF defence of Britain in 1940, came into my mind as I was watching the tremendous concourse of people to receive the Prime Minister at Palam on Wednesday. Never in the experience of anyone in Delhi has there been a reception such as this. The crowds that collected at least an hour before the plane arrived were obviously paying a great spontaneous tribute to the place the Prime Minister occupies in the hearts of the Indian people. It is true that many Congress leaders used their influence to obtain a good attendance. It is true also that special bus fares made that attendance easy. But any one who considers that either of these "facilities" was responsible for the amazing enthusiasm at Palam on Wednesday will miss the central point of the popular mood. It was a great display of spontaneous gladness of a kind which needed no prompting; happiness was deeply infectious and grew with each wave of popular emotion which, every now and then, burst official bounds. Members of the diplomatic corps and senior officials who are accustomed to privilege on these occasions were lightly brushed aside. That, if ever, was the hour of the common man. The Prime Minister who was obviously deeply touched felt he could not refrain from giving his ruder friends in this great assembly a mild rebuke. He said: "I am glad to be back in Delhi and thank you for this great reception. But you have spoilt a part of my happiness by this uproar and confusion. I have a lot to say to you. I shall do so at the appropriate moment. Now, I thank you for your love and affection".

And thus there ended the most memorable homecoming that all of us have seen or, it seems, shall ever see!

Reporting of the Prime Minister's tour has (I dare to say) been very uneven. When one happens to read three or four morning papers—as, for my sins, I have to do—one gets the impression that the special representatives of these papers saw this tour through unchanging eyes. I expect when one is a member of a party dashing about a country with a great deal of hospitality overflowing, one tends to become a part of the surrounding atmosphere. There was almost no criticism or even moderate notes of caution in assessing the USSR's political and economic achievements. It may be these articles are still to come. But one wonders whether a few analytic pieces could not have been made an excellent background for a report of the Prime Minister's tour. A mere record of receptions and visits tends to be monotonous in itself, and to convey a feeling of sameness from one country to another. Receptions (alas!) are the same in almost every country. The core of the differecence between country and country has thus nowhere been brought out. One hopes that the thirteen good men and true who accompanied the Prime Minister as part of his press retinue will use their present opportunities now to provide that historical assessment without which these events can have no larger interpretation.

LAST BUT NOT LEAST!

In a tour of this kind the significance of particular contacts may be totally masked by the rush and volume of social occasions. For example, it has been noted by two or three shrewd observers in Delhi that the Prime Minister's visit to the United Kingdom was the most unobtrusive of all. He was rushed away by Sir Anthony Eden to Chequers; there were no milling crowds as there were in the USSR or in the East European Capitals. But who will say that the conversations between our Prime Minister and Sir Anthony Eden were the least important of all the important conversations that have taken place on this tour? The fact that so little time was lost in the trappings of friendship seems to me to indicate that there was much more solid work done.

ERRORS OF OMISSION

Just as it seems to me the emphasis on the diplomatic value of visits to particular countries has tended to be thrown out of proportion by description of popular enthusiasm, so the reporting of speeches (on the numerous occasions when words needed to be exchanged) leaves me not a little unsatisfied. Hardly a single speech has been reported in full and the total impression one gets from reading all at one sitting is to get the impression that the record has been distorted by a personal equation. Take the speech of the Prime Minister before the Yugoslav Parliament. I have not been able, in spite of much unusually hard journalistic work, to obtain the full text of the Prime Minister's address to the Yugoslav Parliament. But one paper (of the four which I read) carries on Sunday, July the 3rd the important observation: "Mr. Nehru spoke sarcastically of Communist-sponsored world peace movements and that was extraordinary that world peace should become a political slogan".

I should have thought an observation of this kind was of tremendous political significance as it was made shortly after the Prime Minister's departure from the USSR; it should have received wide publicity in the Free World. How, I ask myself, does it come about that in three out of the four papers I receive this emphasis was totally ommitted? How comes it that this speech has been censored in so many of India's leading newspapers?

Similarly, another paper on the same day, July the 3rd, carries the observation "Great significance also attaches to Mr. Nehru's re-affirmation in emphatic terms of his faith in democratic methods. Declaring that India was building up a socialistic pattern of society by doing away with vested interests, privilege and inequality and bring freedom, access to knowledge and opportunity to all he reiterated: "I believe in freedom of the individual and the democratic system of working". This, like the previous observation, was obviously one which should have found a place in every report intended for the Free World. How comes it again that three out of my four papers had a quite different emphasis?

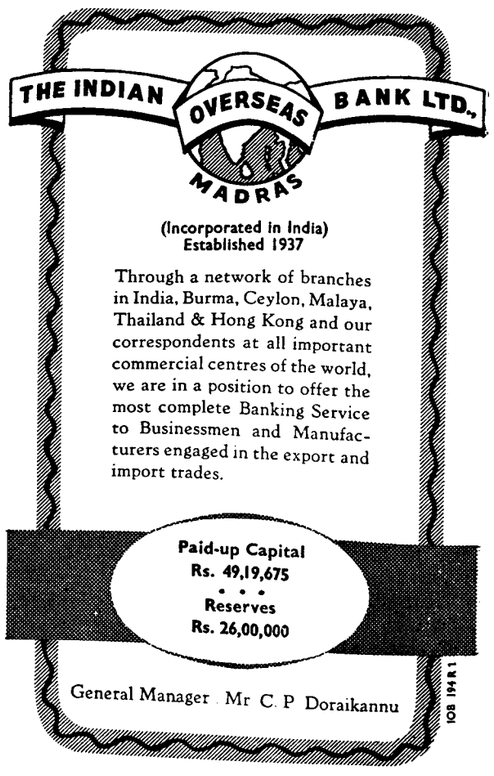
It has been sometimes said of the Indian Press that its reporting was splendid, but that its editorial pages were not always of equal standard. Can it be that our Editors are coming up whilst our Reporters are going down? Perhaps, this is the appropriate response in a socialistic pattern of society!

ARGUS.

Economic Report from the U. S.

U.S. ASSISTANCE FOR ECONOMIC PROGRESS

(By Guy Sims Fitch)



WASHINGTON, July 12.—The foreign aid programme of the U.S. is now under new management. On July 1, it was taken over by the new International Co-operation Administration (ICA). Since ICA functions as part of the department of State, this reorganisation not only assures continuation of the aid programme; but it also indicates that the programme has become an integral part of U.S. foreign economic policy. The programme ICA inherits has made available more than $50,000 million in grants and loans to other countries since world war two—grants and loans that have helped foster economic reconstruction and development in all parts of the world. Congress has just authorised another $3,300 million for the year ahead.

But too often overlooked alongside this large-scale Governmental programme have been the very real contributions American private business had made to world economic progress. A recent survey by the "New York Times" reveals that U.S. private investors, including more than 2,000 business firms, have put nearly $24,000 million into the industrial and agricultural development of other lands. Whether it is an oil refinery in Indonesia, a pharmaceutical plant in India, a shoe factory in Israel, a hotel in Egypt, a food-processing plant in South Africa, an electric power plant in Brazil, an automobile factory in England or a tractor plant in Turkey, these private U.S. enterprises have one thing in common. They have brought with them not only capital but ideas and skills that have benefitted the economies and the peoples of those lands in which have found a productive place. The Government of Burma, which recently launched a new programme to encourage the inflow of private foreign investment, has pointed out that this type of enterprise can contribute to a country's economic and social progress by increasing productivity and living standards and introducing needed managerial and technical skills. In the long run, this can mean more and better products at less cost for more people.

Not all this private technical co-operation requires large capital investments. In many cases, the chief stimulus to progress has come from licensing arrangements between U.S. and foreign firms. More than 300 such arrangements, for instance, have been concluded between U.S. and Japanese businesses since 1945. These technical tie-ins have brought such wonder drugs to Japan as aureomycin, streptomycin, terramycin and cortisone, all locally produced, to combat such scourges as trachoma, dysentery and typhus. Production of U.S., developed pesticides has made possible a significant increase in the average Japanese rice crop, one-fifth of which used to be lost to the rice-stem borer. Other technical agreements have helped to improve Japanese steel-making methods and have helped Japan make better plastics. One new Japanese company, operating under an American license, is expected to begin production shortly of materials for low-cost concrete buildings which may supply the answer to housing needs not only in Japan but in other parts of the Far East as well.

Nor does all this know-how flow in one direction. The U.S. has benefitted from investments and techniques from other countries. Just as, for instance, new American steel and gasoline making processes have been introduced into Germany and other European countries, American firms are using locomotive designs from Germany and aluminum-processing methods from France. One thing that private international ventures require, of course, is a favourable climate in which to operate. Economic development is relative; American business men find their own country a most fruitful investment outlet, as witness the more than $28,000 million they are pouring into new domestic plants and equipment this year. Other nations desiring American capital and know-how must compete with development opportunities in the United States itself.

A recent report by the United Nations is highly encouraging in this respect. It notes that nations seeking to accelerate their economic development have been easing their regulations on the entry of foreign capital and the operation of foreign enterprises. And recognising that a reasonable opportunity for profit must accompany worthwhile private ventures, many also have been reducing their restrictions on the transfer of income and the repatriation of foreign investment capital.

WORLDGRAM

AGRICULTURE

U.S. Agricultural Plan for India: A team of six or more experts in Agriculture from Ohio State University and the Agricultural Experiment Station at Wooster will visit India next autumn to direct a two-year agricultural education and research programme aimed at helping the people. A preliminary survey has been conducted of the four states in North-Western India to be served by the project. Objectives of this Plan will be to enable the agricultural leaders of India to pattern newly established agricultural colleges and experiment stations after the land grant colleges of America. The Ohio State team will operate in Punjab. Also, there will be several trainees from India coming to Ohio State for special training.

*

Crop Production and Development: U.S. Government will contribute $10,000 for a joint project for crop production and development under a Supplementary Agreement signed recently. The purpose of this project is to assist farmers in India to substantially increase the production of maize, through introduction and production of maize hybrids for seeds, and through improved agricultural methods. The total acreage under maize cultivation in India is about 88 lakhs, while the total production of maize in India is 28 lakh tons. Extensive experiments in other countries like United States, Mexico and Italy have shown that the use of hybrids seeds, combined with increased fertilization, maize yield has increased by 25 to 100 per cent. India will contribute Rs. 40,000 towards this joint project.

*

Grow More Cotton Campaign in Pakistan: The Grow More Cotton campaign, started in Sind recently has gathered momentum. Efforts are being made, to increase production during the current year, at least by 25 per cent of the total cotton crop viz. approximately 1,20,000 bales of 392 lbs. each in the four cotton growing districts of the province. A target has been fixed to consume about 25,000 tons of ammonium sulphate for manuring the cotton crop in the current year. Out of the total of 25,000 tons of ammonium sulphate, about 5,000 tons have already been made available and stocked in various depots.

TRADE

*

Japanese Plant Export in 1955: An ambitious plan to boost the nation's plant export has been drafted by the Japan's Ministry of International Trade and Industry, according to which its annual total amount is to be raised up to $229 million in the current fiscal year, the highest figure after the end of the War. According to the ministerial plan, plant export to the dollar area during the 1955 fiscal year will be halved, whereas that to the sterling area will be doubled, both in comparison with the previous fiscal year. Plant export to the open-account area, the Soviet Union and Communist China is also expected to increase.

*

World Trade Expands $2,000 Million in Two Years: World exports of manufactures in 1954, were 8 per cent more than in 1953. But if Western Germany and Japan are excluded the increase was only 5 per cent. German exports of manufactures were about one-fifth more than in 1953, while those of Japan, during the second-half of the year, rose by over one-third. The increase over the same period in the U.K. was only 3 per cent. U.S. exports expanded steadily during the year as did those of most west European countries, although later in the year Italy and Holland lost some of the impetus of the early months. Total world exports of manufacturers have risen from $13,200 million in the second half of 1952 to $15,200 million in the second-half of 1954. Nearly one third of this increase is attributed to Western Germany alone.

*

New Czechoslovak Trade Pact With Belgium: Trade and political negotiations were recently held in Prague which were concluded by the initiating of a new trade and payments agreement. The new agreement which includes trade with the Belgian Congo, represents an increase in mutual exchanges of commodities of more than 15 per cent. Under the agreement Belgium will deliver to Czechoslovakia textile raw materials, meat, fodder, raw rubber, non-ferrous metals, and other industrial and consumer goods. Czechoslovakia will supply Belgium with motor cars hops, malt and brewer barley, sawn timber, cellulose, machinery and equipment, footwear, textiles, glass and imitation jewellery, China and other consumer goods.

*

Big Rise in U.K. Cine Equipment Exports: In the first quarter of this year, exports of cinematograph equipment from the United Kingdom totalled £551,000—£89,000 more than in the corresponding period of 1954. Sales showed marked increases in no fewer than 25 markets, including, India, Australia, New Zealand, Pakistan, Spain, Portugal, Ecuador, and Chile. Purchases by the last two countries were particularly high—much higher, in fact, than for the whole of 1954.

INDUSTRY

German Steel Output: German steel output in June was the second highest on record, amounting to 1,793,000 tons, against 1,696,000 tons in May. Daily output averaged 66,400 tons. March output was the highest so far, with 1,875,000 tons. Output during the first-half of 1955 totalled 10,273,000 tons, compared with 7,870,000 tons in the first half of last year. Steel output in Western Germany is now running at a higher rate than in the whole of Germany in 1938.

*

Draft Standard for Pure Caustic Soda: The Indian Standards Institution has issued, a tentative draft Indian standard specification for pure caustic soda. The draft standard covers requirements and methods of test for caustic soda, pure, both in the solid and solution form, suitable for the rayon industry. The requirements prescribed are in respect of sodium hydroxide content, carbonates, sulphates, chlorides, silicates, iron, copper and manganese. Instructions for packing and sampling of the material have also been included. The draft standard has been prepared by the Heavy Chemicals (Inorganic) Sectional Committee of the Indian Standards Institution.

*

*

Rise in Industrial Production in U.K.: Industrial production in May maintained the general level of 5 to 6 per cent advance this year over 1954 evident in earlier months. In May, electricity generation was up 11 per cent. Passenger cars up 16 per cent, and commercial vehicles were also about this amount higher. Steel output was at record levels and 7 per cent above 1954. Coal and textiles output was, however, down.

*

Industrial Fair in Pakistan: The Pakistan Industrial Fair will start its second session in September next. The exhibition will last for about six weeks. The fair will display Pakistani products to popularise the country's manufacturing industries. Agriculture will have a separate section, which will be mainly instructional. For the convenience of agriculturists, foreign machinery used in agriculture and in pro-

cessing of agricultural products, will also find a place in the exhibition.

*

Capacity of Hindustan Cables Factory to be Doubled: The capacity of the State-owned Hindustan Cables Factory at Rupnarainpur in West Bengal is to be doubled to enable the Factory to meet all the requirements of the Posts and Telegraphs Department in respect of armoured cables. The Cables Factory which went into production in September last year is the only factory producing telephone cables in India. It is designed to produce on a single shift basis 470 miles of subscriber telephone cables, made up of 90 miles of unarmoured and 380 miles of armoured cables. As the capacity of the armouring shop of the factory is limited, it has now been decided to double the armouring capacity by installing additional equipment. The expansion scheme is estimated to cost about Rs. 7.5 lakhs. The work is expected to be completed by the end of September, 1956.

*

Protection to Soda Ash Industry: The Government of India have accepted the Tariff Commission's recommendation that the protection granted to the industry should be continued for a further period of three years, i.e, up to December 31, 1958. Government have also accepted the Commission's view that the quantum of tariff protection to the industry should remain stable and have in this connection brought into force with immediate effect, protective duties at the specific rates of Rs. 5-10-0 per cwt. (standard) and Rs. 4-3 per cwt. (preferential) on soda ash.

*

Coal Development under Second Plan: A three-day conference was held recently with representatives of associations of producers and consumers of coal to discuss questions relating to the formulation of a development programme for the coal industry during the second Five-Year Plan. After a general discussion, a committee consisting of representatives of Government and the industry was set up to examine and report on various questions relating to increase in production of coal. The industrial and railway expansion envisaged during the second Five-Year Plan will greatly increase the demand for coal and it was agreed that a target of 60 million tons by 1960-61 should be aimed at.

FINANCE

Pakistan's Balance of Payments: Figures relating to the Pakistan balance of payments show a surplus of Rs. 2.7 crores for the quarter ending December 1954, against a deficit of Rs. 10.8 crores in the previous quarter. The improvement is mainly due to the marked increase in the export earnings from jute. Total receipts for the quarter amounted to Rs. 35 crores over the July-September quarter. The total payments amounte to Rs. 32.3 crores showing a decline of Rs. 1.22 crores over the previous quarter. Of the increase of Rs. 12.28 crores in the total earnings, jute alone contributed Rs. 9.84 crores. Of the total receipts of Rs. 35 crores, jute accounted for Rs. 18.33 crores or more than 50 per cent. The receipts on account of cotton fell from Rs. 6.81 crores in July-September quarter to Rs. 5.11 crores in the quarter under review. A notable feature in the exchange earnings is the growing volume of receipts on account of miscellaneous exports (exports other than cotton, jute, jute manufactures, wool, hides and skins and tea) which now occupies a position next to jute and cotton. The receipts under this head were Rs. 4.25 crores against Rs. 1.9 crores in the preceding quarter.

*

Aid for Grow-More-Food Programme: A sum of Rs. 35 lakhs is being made available to Rajasthan by the Government of India for construction of wells. This amount, forming a part of the financial aid from the Central Government for the Grow-More-Food schemes during the year 1955-56 comprises a loan of Rs. 33 lakhs and a grant of Rs. 2 lakhs. The total amount of loans granted to the State under the Grow-More-Food scheme for this period is over Rs. 87 lakhs including provisions of more than Rs. 27 lakhs for distribution of seeds, Rs. 5 lakhs for mechanised cultivation and over one lakh rupees for manures and fertilizers.

*

Italy's National Income: The gross national income, based on the ordinary market prices, rose in 1954, to 11,797,000 million lire—a net increment over the 1953 figure equal to 704,000 million lire or 63 per cent. The considerable increase in income continued an upward trend dating back to 1950-51, when the national income rose by 6 per cent. The same trend persisted though on a lower level, in 1952 (when a 3 per cent rise was recorded over the 1951 figure), and again, and at a higher rate, in 1953, when the national income rose by 7 per cent as compared to 1952.

World Bank Loans: The World Bank set a new year's high for lending by making loans totalling $409.6 million in the fiscal year ended June 30, 1955. This compares with the previous high of $324 million lent in the 1954 fiscal year. Altogether the Bank has now made 124 loans totalling some $2,235 million in 37 countries. The increased rate of Bank lending was particularly marked in the last three months, when 7 loans amounting to $155.2 million were concluded for a variety of development programmes and projects in Europe, Asia and Latin America. Largest single loan was a loan of $70 million to the Cassa per ic Mezzogivrno, the Italian Government agency. In Northern Europe, the Bank lent $25 million to Norway. The Bank lent an equivalent of $10 million to help finance the Luners hydro-electric project in Western Austria. The other main loans were $13.8 million to the Karachi Electric Supply Corporation Ltd., in Pakistan and $15.9 million loan to the Colombian National Railroads. Peru got $18 million for an irrigation project and $2.5 million for building a portland cement plant in northern Peru).

MISCELLANEOUS

Fumigation and Quarantine Station at Cochin: Government of India have decided to establish shortly a Plant Quarantine and Fumigation station at Cochin to enable American cotton to be imported through that port. To begin with, fumigation arrangements for about 4,500 bales of American cotton per month will be introduced there. At present, as a measure of safeguard against entry of dangerous cotton pests, imports of American and West Indies cotton are allowed only through the ports of Bombay and Madras where fumigation facilities exist. Imports of cotton from other countries are also subject to similar landing restrictions if it is stored in one and the same hold of the ship with American cotton while in transit.

*

Community Development Programme: By an Agreement signed between the U.S. Government and the Government of India, the U.S. Government will contribute an additional amount of $680,000 towards assistance in connection with the additional 250 Community Development Blocks, which will be initiated by the end of the first Five-Year Plan. U.S. will provide equipments, supplies and assistance to all Community Development Blocks undertaken during the period of the first Five-Year Plan ending March 31, 1956. This is in addition to the assistance already provided by the U.S. Government for the projects started earlier. The total U.S. contribution towards India's Community Development Programme, including the amount now agreed to, amounts to $14.25 millions or Rs. 6.65 crores, as against the Government of India's total expenditure for these projects amounting to Rs. 90 crores.

NEWS IN BRIEF

INDIAN

The additional food production due to irrigation from the Hirakund Dam Project is estimated to be 45 lakh maunds of foodgrains.

*

Government expenditure on the Community Development programme during the first three months of 1955 was Rs. 6.67 crores, while the figure for the period October, 1952 to September, 1954 was only Rs. 13.83 crores.

*

It is reported that India's exports of tea during 1954-55 were valued at Rs. 146.53 crores. During the same period she exported tobacco valued at Rs. 11 crores.

*

Till the end of March 1955, the total value of people's contribution towards the Community Development Programme in terms of labour, land and cash amounted to Rs. 10.21 crores, as against a total Government expenditure of Rs. 20.50 crores.

*

During the first three and half years of the Five-Year Plan, 330 miles of new roads were constructed, 2,434 miles of existing roads improved and 25 major bridges completed.

*

During April-September 1954, the Indian Telephone Industries factory produced 26,040 telephones and 14,000 exchange lines.

*

Indian fishermen will be for the first time landing netfuls of tuna, the succulent fish prized in the U.S., Europe and Japan for canning, when measures to exploit the country's sea food resources get under way during the second Five-Year Plan.

*

The Bombay Electric Supply and Transport Undertaking has just placed a £200,000 order for 75 Titan double-deck bus chassis with Leyland Motors Limited. All these vehicles will be equipped with the "No Clutch" pneumo-cyclic gearbox.

*

A direct radio-telegraph service has been opened between India and Yugoslavia bringing the total number of countries with which the overseas communications service operates direct radio-telegraph service to twelve. India has already direct radio-telegraph link with the United Kingdom, Australia, China, the U.S.A., Afghanistan, Japan, Indonesia, the U.S.S.R., Thailand, Indo-China and Poland.

*

The Uttar Pradesh Government has evolved a scheme to rehabilitate thousands of Bhotias living on the strategic Indo-Tibetan border. Under the scheme seven training-cum-production wool centres and 28 spinning centres are being established in the border areas in the districts of Almora, Pauri Garhwal and Tehri Garhwal.

*

In response to the Union Government's invitation, the Food and Agriculture Organisation of the United Nations has decided to hold the technical meeting of poultry production in Asia and Far East probably in October this year in India.

*

It is reported, a proposal to erect a synthetic oil plant near Korba in Bilaspur district of Madhya Pradesh is under the active consideration of the Government of India.

FOREIGN

It is reported, the chemical industry of the U.S. will carry out an aggregate plant expansion programme of about $1,000 million in 1955. The planned investment this year falls slightly below the 1954 figure of about $1,130 million.

*

Italy has abolished the 3 per cent salex-tax on sales of gold and on gold and silver coins. Imports of gold and silver coins and their sale in Italy have also been exempted from the tax. Import of gold remains in the hands of the Italian Exchange Control.

*

The State Housing Bank of Norway has financed the building of altogether 123,000 homes in Norway since the war, and has made loans and grants totalling £162.6 million.

*

It is reported, the Committee for Industrial Power and Production of the French National Assembly has recommended to the Assembly the ratification by France of the International Tin Agreement.

*

The General Motors Corporation of America has announced a new expansion programme calling for capital expenditure aggregating $500 million. The programme which will enable the company "to make its full contribution to a strong and expanding national economy", will be substantially completed by the end of next year.

*

Pakistan will shortly negotiate with the World Bank for a loan of Rs. 3.6 crores (£3.9 million) for reconstruction of the east wharf of the Karachi port. Reconstruction of the Wharf is estimated to cost Rs. 7.8 crores. Preliminary work has already commenced by foreign firms on contract.

*

A group of veterinary and medical administrators met in Geneva last month to consider the relationship between health in animals and health in human beings. Among other things, the group concentrated on a list of 80 diseases transmitted from animals to man and drawn up in 1951 by a joint expert committee of the two U.N. specialized agencies.

*

A pennicilin factory is proposed to be established in Pakistan shortly with the financial assistance from certain International organisations of the U.N.O.

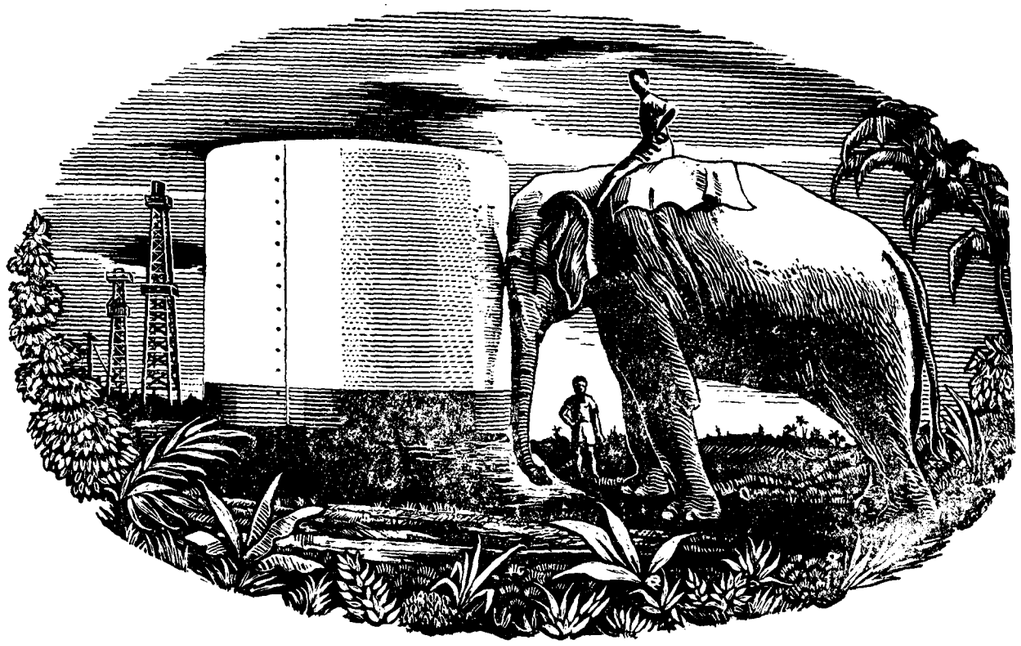
*

The U.N.'s Educational, Scientific and Cultur Organisation (UNESCO) reports there are three time as many television stations in the world as there wer two years ago. Plans are underway to introduce tel vision in 20 additional countries.

*

A census Bureau estimate places the population c America now at approximately 165,250,000. Ther were about three million persons in America when th Declaration of Independence was signed on July

*



In the Raciborz Metal Products Factory, in Opol Voivodship, work has now been completed on assem bling a 35 ton lathe ordered by the Indian Board o Railways for wheel work on waggons and trams.

*

The British Transport Commission had a net defici of £11.9 million during the year 1954, as against a ne surplus of £42 million in 1953.

*

The total exports of raw jute from Pakistan during the year ended, June, 1955, are estimated at 5 million bales—100,000 bales less than in the previous year—worth about Rs. 55 crores.

It's a BIG job....

running an oilfield

Many special kinds of skill are required to keep India supplied with oil, from the study of fossils to the operation of complicated plant in refineries—and not excluding the care of elephants.

Consider the complexity of the Assam Oil Company's operations at Digboi, in north-east India. Here, at India's first and hitherto only oilfield, nearly a thousand wells have been drilled into the earth's rocks—a total of over 300 miles of hole. More than 600 of these wells still yield oil regularly, modern production techniques ensuring that the maximum amount of crude is recovered from the field. Science and engineering skills guide every phase of the company's work, nowhere less than in Digboi refinery which in a single day supplies the Indian market with over 250,000 gallons of high-quality petroleum products. In all branches of this full-scale industry the Assam Oil Company employs nearly 9,000 persons, while many hundreds more are engaged in serving the consumer.

Yes, the day-to-day running of the oil industry is a big job. To keep it running the Assam Oil Company has to spend crores of rupees just in "looking ahead." For no oilfield lasts for ever, and in order that India's vital flow of oil may be supplied to an increasing extent from India's own resources, the company is constantly exploring for new sources of petroleum.

BRIDGING THE GAP IN THE AIR

THE finances of the Indian Airlines Corporation continue to be a source of increasing concern. About two years ago, when the domestic airlines were nationalised and integrated into one consolidated organization, hopes were entertained quite reasonably that the deterioration in the financial structure of the country's internal airlines would not only be arrested, but some tangible improvement would be shown and the size of the net deficit would be reduced. Results of periodical financial operations, on the other hand, disclose that the disequilibrium has proved virtually intractable. The Corporation's working in the first full financial year, April 1954 to March 1955 reveals an aggregate loss of Rs. 115 lakhs. For the preceding eight-month period, since the airlines were nationalised in August, 1953, the loss was of the order of Rs. 80 lakhs which works at an annual rate of Rs. 120 lakhs. This apparent fractional improvement was really no improvement at all, if the unplanned and disorganised pattern of management immediately after nationalisation is given due weight.

Last week the Corporation announced an increase in rates and fares for the carriage of traffic. The revised tariffs have been adopted pursuant to the recommendations of a special committee of enquiry. No apology, however, was needed to justify what is called the rationalisation of rates and fares. The rate structure of the domestic airlines was distorted by the high-handed manner in which the night air-mail service was introduced in October, 1949, and pressure was exerted on the day-time services, under the strain of competition, to reduce their rates and fares. The new scheme raises the charges for passenger as well as freight traffic on the night services to the level of day-time services, abolishes the concessional fares for the evening Delhi-Bombay service and puts up the charges on a few day-time services. This change introduces the principle of uniform charges for all types of services. The attraction for the night air mail service will not be so appealing as before and part of its traffic will be diverted to the day-time services. But since a nationalised monopoly undertaking owns the industry, the effect of the changes in fares and rates is not likely to be regressive. The estimated increase in the annual traffic receipts is put at a modest figure of Rs. 18 lakhs. It does not alter the fact that fares for the domestic airlines in India are uneconomical and among the low in the world. The significant fact about the effect of this increase on the finances of the Corporation, however, is that it will prove no more than a palliative. The causes of the disorder in the financial structure of the Corporation go deeper and they need imaginative remedies for long-term cure.

The Deputy Communications Minister tended before the Lok Sabha in November last, a written statement of the financial operations of the Corporation for the first twelve months after nationalisation—August 1953 to July 1954—which revealed aggregate loss of Rs. 127.46 lakhs. In explanation of this staggering figure in relation to the combined estimated loss of Rs. 12.07 lakhs of the private airlines in 1952 (subsequently calculated at Rs. 40 lakhs), he emphasized the following important factors of differential costs which add up to Rs. 100 lakhs:

Loss of petrol rebate	Rs.	35.00 lakhs
Interest on bonds or borrowings ..	„	14.40 „
Loss of Revenue earned by Air India Ltd. as Managing Agents of Air India International	„	10.50 „
Additional provision for insurance and depreciation due to total lack or inadequate provision	„	13.00 „
Normal annual investment due to revised salary time scales ..	„	8.00 „
Increased facilities for pilot and technical training	„	10.00 „
Overdue renovation or overhaul of aircrafts or engines	„	6.00 „
Arrears of increment to staff of Air India	„	3.04 „
TOTAL	Rs.	99.94 lakhs

The last two factors are non-recurring in respect of which the Corporation may expect set-off against the amount of compensation it will pay to the nationalised companies. The figure of loss of managing agency commission makes no allowance for saving of expenditure on administrative, managerial and technical services no longer required to be performed. If the non-recurring factors and the economy in costs of services rendered to Air India International are excluded, the burden of extra recurring costs is of the order of approximately Rs. 85 lakhs. This is not a fixed but variable quantum.

The crux of the Corporation's financial problem is: How is this yawning gap of Rs. 85 lakhs to be covered? The solution is partly within the control of the Corporation and partly assistance must be provided to it by means of financial relief.

In one respect, however, an avoidable heavy burden has been foisted on the Corporation by the Government under pressure of political expediency. It is the firm commitment against retrenchment of staff after nationalisation. It is a patent fact that the Corporation is constrained to retain inflated staff. There can be no sense in integration if the single integrated Corporation is to be operated by the same strength of staff as was required under separate managements of nine air transport companies. The rationalised pay-scales have imposed on the Corporation a normal annual increment of Rs. 10 lakhs after compromise with the staff on the effect to be given to the Puranik Committee's report. This single item alone is enough to absorb in a couple of years the entire increased revenue of Rs. 18 lakhs which is anticipated from the enhancement of rates and fares. There can be no escape from this liability until productive employment is found for the surplus staff in increased traffic. Even so, full elimination of surplus labour force is difficult to achieve. It is a bane of nationalised industries in all democratic countries which have risked this experiment.

The Corporation has inherited from its predecessors a dynamic asset. All doubts about the ability of airlines traffic to survive the post-war boom have been completely set at rest and the expanding vitality of civil aviation has established its integral place in the future scheme of overall transport. Both by virtue of the expeditious and emergency character of its service as well as the growth of new standards of life, air transport has carved a secure place for itself. The following table, showing the expansion of civil aviation

operations between 1951, the year of peak performance before nationalisation, and 1954, the first complete year after nationalisation, is instructive.

Monthly Averages of Airlines Operations in India

(Figures in Thousands)

	1951	1954
Passenger Miles	22,055	23,907
Freights Ton-Miles	1,061	1,049
Mails: Ton Miles	231	325
Newspapers: Ton Miles ..	79	112
Total Load in Ton Miles ..	3,330	3,574

Excepting for a marginal decline in freight ton-miles operated, there is a definite increase in every activity and a substantial expansion of the total load. It should be the Corporation's special task to nurse the expansionist trend in the behaviour of air traffic by suitable incentives as also by tapping new routes. The proposed experiment with feeder lines run by 14-seater economical Herons is an illustration of the search for developing activity for larger revenue. Economies in fleet utilisation, saving of costs in maintenance, repair or overhaul, rationalisation of workshop facilities, imaginative publicity to stimulate traffic and similar improvements offer ample scope for reforming the financial structure of the Corporation. The fundamental charge against the Corporation's management is that it has failed to give assurance that it is in earnest about capturing these avowed benefits of integrated operations. The Dakota which predominates, and the Viking which takes the next place in, the Corporation's fleet are uneconomic and need to be replaced over a phased programme. A small beginning is scheduled to be made with modernisation by discarding Dakotas on the night airmail services. Their obsolescence, and not the safety factor, is the justifying cause for replacement.

One hard reality must be faced squarely. The extent to which the aviation spirit bill, and in particular the tax element, operates as a drag on the finances of internal airlines is not properly appreciated. External airlines enjoy immunity from the petrol tax in the territories of foreign governments which is a great contribution to their financial health. The Indian Airlines Corporation's bill for the petrol tax is reckoned as approaching one crore of rupees per annum. Precisely here the relief by way of rebate has been withdrawn. It deserves to be restored on an enlarged scale to about Rs. 50 lakhs. Until this relief comes forth, the deadweight of financial disequilibrium will threaten to persist.

PROGRESS OF COMPANY FLOATATIONS

AT a time such as the present when there is so much controversy about the new Companies Bill and the official control of capital issues is being continued it is heartening to know that there has, in fact, been no setback to the growth of Indian Joint Stock Companies. Latest available figures, as revealed in the monthly publication (for March 1955) of the Company Law and Investment Administration of the Central Ministry of Finance, show that during 1954-55 there was nearly a four-fold increase in the authorised capital of joint stock companies—to be more specific, from Rs. 56.4 crores in 1953-54 to Rs. 226 crores in 1954-55—and that not less than 42 companies had an authorised capital of Rs. one crore and above. Of the 1,203 companies floated during 1954-55 (as against 1,193 during the previous year) 219 were public companies, the remaining 984 being private. The total authorised capitals were Rs. 174.9 crores and Rs. 51.1 crores, respectively.

The breakdown of new company registrations into public and private reveals that, while the total number of private floatations during the two years has been nearly equal, the authorised capital of these companies in 1954-55 has been nearly 50 per cent more than in the preceding year. The average authorised capital of the new private and public companies in 1954-55 works out at Rs. 519,000 and Rs. 7,951,000, respectively, as against Rs. 331,000 and Rs. 1,125,000 in 1953-54—a significant rise in respect of public floatations.

It is of additional interest to see that the list of 42 giant floatations is topped by a first class private enterprise having an authorised capital of Rs. 50 crores, namely, the Durgapur Iron and Steel Works. Next in size comes the Rs. 25-crore Industrial Credit and Investment Corporation of India which is backed by the Central Government. The other important companies include two State enterprises, Bharat Electronics and National Industrial Development Corporation of India. The total authorised capital of the 42 big floatations was about Rs. 178 crores, representing nearly 80 per cent of the total authorised capital of all the 1,203 new companies floated.

An obviously disquieting feature of joint stock concerns pertains to continued liquidations of private companies in which there was a considerable increase during 1954-55. A total of 522 private companies was liquidated during this period, as against 428 during the corresponding period last year. As many as 924 joint stock companies, limited by shares, with a total paid-up capital of Rs. 7.8 crores, were either liquidated or finally dissolved, as against 910 companies with a total paid-up capital of Rs. 7.4 crores during 1953-54.

An industry-wise study of the companies reveals that practically the same types of industries figure both in respect of new registrations as well as liquidations. Thus, during 1954-55, by far the largest number of companies (774) were registered under "Trading and Manufacturing" group, followed by "Hotels, theatres and Entertainments" (76), "Banking, Loan and Insurance" (67), "Transit and Transport" (67), and "Mills and Presses" (65). Likewise, of the 924 companies liquidated during 1954-55, 558 related to "Trading and Manufacturing" group; followed by "Transit and Transport" (94), "Hotels, Theatres and Entertainments" (76) "Banking, Loan and Insurance" (70), and "Mills and Presses" (68).

Table I gives details of the main industrial groups which figured in liquidations during the last fiscal year.

TABLE I

Industrial Groups	Capital in lakhs of rupees	
	No.	Paid-up Capital
Banking, Loan and Insurance	70	65
Transit and Transport	94	213
Trading and Manufacturing	558	277
Mills and Presses	68	137
Tea and other Plantations	12	18
Mining and Quarrying	17	23
Estate, Land and Building	16	19
Breweries and Distilleries	4	2
Sugar Manufacture	1	1
Hotels, Theatres, and Entertainments	76	26
Companies other than those specified above	8	1
TOTAL	924	782

From the following Table II, containing the dates of registration of companies liquidated during the last two fiscal years, it will be noticed that during 1954-55

of the total liquidations, as many as 122 companies had been floated before 31st March, 1940, that is, mostly during the period of the general economic "depression". But what is even more significant is the number of casualties of the war-time "mushroom" growths. In other words, 207 companies, which were floated during the war period (1940-45), were liquidated during 1954-55, as against 123 of the same types in 1953-54.

A study of the net position of the paid-up capital under various industrial groups in the first eleven months of 1954-55, discloses that, with the exception of banks and life insurance companies, all other industrial groups have, during the period under review, improved their position in respect of paid-up capital, either by fresh issues of further calls on the partly paid-up shares or by issue of bonus shares. Among the industrial groups registering increase in paid-up capital, the important ones are iron ore, public services, cotton mills, navigation, agencies (including managing agents), iron and steel, jute and engineering groups. During the period, an increase of Rs. 37.16 lakhs has taken place in the paid-up capital of all companies, of which Rs. 20.93 lakhs, that is, 56 per cent has been raised in the State of Bombay alone. Other significant additions to the net increases in the total paid-up capital are noticed in the States of West Bengal, Madras, Mysore and Delhi with Rs. 9,75 lakhs; Rs. 1,71 lakhs, Rs. 1,61 lakhs and Rs. 1,22 lakhs, respectively.

It is estimated that there are 29,827 companies at work with a total paid-up capital of Rs. 9,79 crores as on March 31, 1955.

REPORT ON CURRENCY AND FINANCE FOR 1954-55

THE Reserve Bank's Report on Currency and Finance for 1954-55, which consists of a brief survey of International economic developments and a detailed review of the Indian Economy states that world economy in 1954 continued to be relatively stable. Production was well maintained, prices were generally stable and the International payments position recorded a further improvement. "Monetary and credit policies" continued to be flexible in several countries during 1954 as in the past few years and tended to be liberal for the greater part of the year. Towards the end, however, and particularly in the first quarter of 1955, they were tightened in some countries with the emergence of inflationary symptoms. Trends in the "capital markets" in the leading countries generally reflected the internal economic stability and the prospect of continuing economic growth in those countries, rather than international developments and speculative activities. Gilt-edged ruled, on the whole, firm; equities were buoyant and the new issue market was more active than in 1953. "Budgetary policies" in the advanced countries were generally directed towards increasing the tempo of economic activity, while, in the underdeveloped countries, they continued to reflect the need to raise larger revenues to finance development programmes in the public sector and at the same time to stimulate savings and investment. In the sphere of "trade and balance of payments", economic developments in the U.S.A., along with the continuation of its defence and economic aid, led to an increase in the reserves, of other countries, particularly of Western Europe and the sterling area. This strengthening of the foreign exchange position together with an improvement in the volume and balance of world trade enabled a number of countries, especially in Western Europe, to relax generally their restrictions on trade and payments, including some against dollar imports, and made the climate more favourable for further efforts in the direction of currency convertibility.

INDIAN ECONOMY IN 1954-55

Against the background of these international developments, the Report proceeds to review the major economic and financial developments in India during the year ended March 1955. Economic developments, the Report observes, were marked by a considerable expansion in industrial output, a substantial increase in money supply and a decline in prices along with enlarged budgetary deficits, a small surplus on the external account and a better flow of savings. The growth in the budgetary deficits of the Central Government and the States indicated the quickened pace of developmental expenditure, which partly made up for the relatively slow progress in the preceding three years. Nevertheless there was no evidence of an emergence of inflationary pressures and the economy made considerable progress during the year with a measure of overall stability. But the disquieting features were the sharp fall in agricultural prices and the continued seriousness of unemployment. To meet the problem of unemployment, labour intensive schemes were added in 1953-54 to the original Five-Year Plan and during the year under review special steps were taken to stimulate the expansion of small scale and cottage industries. The emphasis in the second Five-Year Plan now in the process of formulation is on the creation of as many extra jobs as possible to relieve both unemployment and underemployment.

"Industrial Production" in 1954, the Report states, was 8 per cent higher than in 1953, which was itself 5 per cent higher than in 1952. Since the inauguration of the Plan, industrial output has increased by about 40 per cent. Agricultural output also showed a record increase in 1953-54. For 1954-55, total agricultural output according to the report is expected to be around the peak level reached in 1953-54.

In line with higher output, the need for larger private finance on the relaxation of controls and the increasing tempo of economic development, "money supply", figures for which have been revised to take into account the circulation of "Hali Sicca currency", showed a substantial rise of Rs. 124 crores or 7 per cent during 1954-55; in the previous year, it had risen by Rs. 72 crores. The increase stemmed mainly from two factors, namely, the Union Government's budgetary deficit and the growth in bank credit. Net borrowings by the Government from the Reserve Bank amounted to Rs. 104 crores; this along with the net decline in cash balances makes a total of Rs. 110 crores reflecting the impact of the budget deficit on money supply. Open market operations of the Reserve Bank, however, tended to curtail money supply to some extent. During the greater part of the year, there was a general broadening of the demand for funds, which was met by banks without any undue strain on their resources on account of the appreciable growth in bank deposits as well as the larger volume of seasonal finance made available by the Reserve Bank.

In the field of rural finance, a significant event during the year was the publication of the "General Report of the Committee of Direction of the All-India Rural Credit Survey". As part of their integrated scheme of rural credit, the Committee recommended the establishment of a State Bank of India, which would take over the Imperial Bank of India and certain State-associated banks. Government accepted this recommendation and have since enacted the necessary legislation and set up a State Bank. The "capital market" in India, the Report observes, reacted well to the general improvement in the country's economy. The gilt-edged ruled firm in spite of considerable borrowing by the Central Government while the industrial share market was also buoyant.

Reviewing "Government finances", The Report states that during 1954-55, the budgetary position of the Central and State Governments showed a perceptible change from the previous year towards larger overall deficits, stemming from the rising momentum of expenditure in the public sector. In the revenue account of the Central Government, a deficit of Rs. 5 crores replaced a surplus of Rs. 8.5 crores in 1953-54, while in the combined revenue account of Part A and part B States, the swing was wider still with a deficit of Rs. 33 crores instead of a surplus of Rs. 5 crores in the previous year. Excluding the net increase in receipts estimated under floating debt and adjusting for the net changes in investment reserves, the overall deficit of the Central Government in 1954-55 (Rs. 200 crores) was more than twice that in 1953-54 (Rs. 87 crores). In the case of part A and part B States, there was an adjusted overall deficit of Rs. 36 crores as against a surplus of Rs. 19 crores in 1953-54—a swing of Rs. 55 crores. For 1955-56, revenue deficits of the Centre and the States (after tax changes) are placed at Rs. 17 crores and Rs. 66 crores, and the adjusted overall deficits at Rs. 327 crores and Rs. 65 crores, respectively.

An event of special significance during the year was the submission to Government of the "Report of the Taxation Enquiry Commission", which contains far-reaching recommendations for widening and deepening the tax structure. The "balance of payments position" showed a smaller surplus on current account of nearly Rs. 4 crores during the calendar year 1954 in comparison with Rs. 59 crores in 1953, but at a much higher level of trade.

FRAMEWORK UNDER FIRE

BY

CROESUS

THERE are three aspects of Prof. Mahalanobis's draft of the draft plan frame which are being hotly debated in Bombay. These are (i) whether the total investment outlay, excluding the non-monetised sector, proposed in the second Five-Year Plan period is feasible; (ii) assuming that the total investment outlay is feasible, whether the country can garner the required resources and, if not, whether and to what extent the gap could be covered by deficit financing, and (iii) whether we have the requisite administrative machinery to handle the huge investment outlay proposed.

The draft plan frame envisages a total investment outlay of Rs. 5600 crores, of which Rs. 3400 crores is to be spent in the public sector and the remaining Rs. 2200 crores in the private sector. Actually the total outlay in the public sector would not be just Rs. 3400 crores if we should add certain recurring development expenditure included in the Plan. It would then amount to as much as Rs. 4300 crores which compares with an estimated outlay of Rs. 2244 crores and probably an actual outlay of no more than Rs. 2200 crores, in the first Plan. Whether this is feasible or not will entirely depend on the assumptions of the Plan frame about the rate of increase in the national income and savings proving correct. In the Plan frame is prescribed a target of 25 to 27 per cent increase in national income during the second Plan period. This is on the basis of an annual rise of 5 per cent, which seems—however desirable it may be—unduly ambitious, compared to the experience in other countries as well as in our own during the first Five-Year Plan. In the first of a series of lectures on the second Five-Year Plan, arranged by the Press Guild of India, which was inaugurated, the other day, by Mr. V. L. Mehta, a member of the Taxation Enquiry Commission, Prof. Shenoy, who, it may be remembered, has appended a note of dissent on the Memorandum of the Economists' Panel, maintained that even in vastly more favourable circumstances, none of the Western democracies was able to attain an annual rate of increase of 5 per cent in national income.

In Germany, for instance, he said, the rate of increase was only 2.8 per cent during the heyday of that country's industrial expansion; in Canada 2.6 per cent; in Australia 2.3 per cent and in the U.S.A. 3 per cent (during the last quarter of a century). The experience of our own country is that the total increase in the net national output during the five years ended 1953-54 has been under 8 per cent. Again, in order that an investment of the magnitude proposed by the Plan frame might become possible, domestic savings must increase from the present level of 6 per cent to 10 per cent during the period of the second Plan. Neither of these seems practicable, considering that the most liberal estimate of real increase in national income during the first Plan period—which, however, is disputed—has been no more than 12 to 13 per cent. To assume, therefore, a rise of double this, and that in the face of an annual increase in population of 1.25 per cent is, to say the least, Utopian.

PRUNING THE PLAN

If the size of the Plan has thus been "unduly inflated by unrealistic assumptions" as pointed out above, it might be argued that the size of the Plan could conveniently be cut down to meet the objections of even such conservative economists as Mr. Shenoy who strongly hold that "no plan can be bigger or bolder than the available resources". Unless one has all the relevant data, it is not possible to prescribe any size. But on the basis of our achievements in respect of the first Five-Year Plan and in the light of the experience of other democratic countries, Prof. Shenoy thinks that the safe order of magnitude of investment on the second Five-Year Plan would be about Rs. 3500 to Rs. 4000 crores. According to another estimate, if it is decided not to have a net deficit financing of more than Rs. 1000 crores over the second Five-Year Plan period, the plan outlay on the public sector should be in the region of Rs. 3600 to Rs. 3700 crores. (The corresponding figure—of the Plan outlay in the public sector indicated by Prof. Shenoy is between only Rs. 2500 and Rs. 2800 crores).

Granting, for arguments' sake, that we could have a Plan of this reduced dimension, 'prima facie', one would conclude, from the estimates of resources in the Plan frame work, that there should be no difficulty to finance the Plan, of course, with a provision for deficit financing of not more than Rs. 1000 crores. But a detailed examination would show that the resources indicated also have been considerably overestimated. Thus, to take only the total investment outlay of the Government on the second Five-Year Plan of Rs. 4300 crores, the Plan frame expects, by way of revenue surplus (on the assumption that the present rate of 3.5 per cent of national income will continue) Rs. 700 crores; railway surplus Rs. 200 crores; loans, small savings, etc. Rs. 1000 crores; foreign assistance Rs. 400 crores; additional taxation, compulsory savings and higher profits from Government enterprises (other than railways) Rs. 800 to Rs. 1000 crores, and deficit financing Rs. 1000 to Rs. 1200 crores. Let me examine the estimated receipts under each one of these heads.

FINDING THE RESOURCES

It is not clear how the framers of the draft Plan have taken it for granted that the increase in tax revenue will be proportionate to the rise in national income. It has been observed by a competent student of public finance that the maximum tax yield from additional tax measures, provided every recommendation of the Taxation Enquiry Commission is fully implemented, will be about Rs. 100 to Rs. 120 crores per annum. But the draft Plan has budgeted the revenue surplus for the five years under the second Plan at about Rs. 100 to Rs. 200 crores higher than even this figure. Apparently the planners are not aware that, inasmuch as a large portion of the new income to be generated as a result of the Plan outlay would be in the non-monetised sector or in sectors not reached by the tax net, the materialisation of the estimate would require not merely additional tax efforts but measures which are more extreme than even those recommended by the Taxation Enquiry Commission. Apart from whether the present proportion of tax revenue to national income is going to be maintained or not, the tax revenue would also suffer a setback if the increase in national income, which is dependent on the total investment outlay, were to be lower than the assumed level.

As regards the railway surplus, again, one is unable to see how the Plan frame could assume an annual contribution of Rs. 40 crores during the second Five-Year Plan period. For, in 1953-54, this was no better than Rs. 14 crores, while the highest figure for

any year during the first Five-Year Plan period was only Rs. 38 crores, that is, in 1951-52. Even the Railway Budget for 1954-55 provided for a contribution of just Rs. 17 crores. Making allowances for all the increase in traffic—subject to the railways being able to handle it all a fair estimate of the contribution from railways for the second Five-Year Plan would be an average of the lowest and the highest figures for the first four years in the first Five-Year Plan period, which works out to about Rs. 26 crores. In this case, again, the Plan frame's estimate markedly overshoots the reasonable mark. As for loans and small savings, informed opinion is that, here too, the figure assumed is an overestimate.

The taxation measures and the efforts to equalise income are certainly not expected to to create a conducive climate that would tend to increase the present level of receipts from these sources; on the contrary, they might well show a decline. In the first three years of the first Five-Year Plan, the Government could get only Rs. 35 crores by means of new loans and Rs. 151 crores by way of small savings. In 1954-55, these figures rose to Rs. 112 crores and Rs. 50 crores, respectively. The success of the latest Government loan probably suggests that the same figure may be taken, but certainly nothing higher. Computed on this basis, the total would still fall short of the Rs. 1000 crores estimated by the Plan frame. The estimated receipt of about Rs. 800 to Rs. 1000 crores from additional taxation, compulsory savings, profits of public enterprises, etc. would also appear to be an inflated figure. When the actual receipts under these heads become available they should make a revealing eye-opener to the authors of the Plan frame. One does not hear much criticism of the amount estimated under only one head, namely 'foreign aid'. There is, therefore, no great harm in assuming that it will go up to Rs. 400 crores, considering the favourable turn in the climate of opinion on this subject, particularly in America. To sum up, therefore, the total resources, on which one could safely proceed to base the second Five-Year Plan, would be not Rs. 4300 crores as the frame work indicates, but about Rs. 2000 crores less than that. If the whole of this shortfall is to be met from deficit financing, the disastrous consequences that would accrue can well be imagined.

DEFICIT FINANCING

On the precise extent of net deficit financing, opinions are bound to differ not only because the estimates might differ but also because there is wide difference of opinion as to the exact dose of deficit financing that the economy can bear. Even the Panel of Economists, who fixed the ceiling at Rs. 1000 crores for five years have urged the need for keeping the situation continually under watch, besides pointing out the danger of continued deficit financing at the rate of more than Rs. 200 crores a year. At the time of expressing this view, it could not have escaped the attention of the Panel that the estimated net deficit for 1955-56 itself has been put at over Rs. 250 crores. Prof. Shenoy believes that the maximum deficit financing that one can think of under the existing Indian conditions is about Rs. 50 crores per year or Rs. 250 crores for the whole of the second Plan period. Even the most simple forms of investment require some little capital and this, he says, can be created only by savings or by the inflow of foreign capital, which reminds one that economic development of poor countries is necessarily a painful process.

The problem before the country today is to provide large-scale employment—of the order of 10 to 12 million—with its limited available resources and, in view of this, it is argued by some, a bolder plan in content as well as structure is called for even if it means deficit financing.

Now, since there seems to be general agreement that, even if it means some deficit financing, the economic development of the country must go apace, it is very necessary to make sure of two things: (i) that the magnitude of deficit financing is severely determined by the total monetary outlay estimated on the basis of the available physical resources and employment programme and the capacity for taxation and borrowing, internal as well as external, and (ii) that the extent of deficit financing does not pass beyond the stage when it may entail the application of totalitarian measures to counter the harmful effects of runaway inflation. Any attempt at investment in excess of the available real resources, according to Prof. Shenoy, will lead to one of three consequences, namely, uncontrolled inflation, gradual or rapid writing-off of individual freedom and democratic institutions by administrative or legislative action, or a wide gap between targets and achievements as has happened in the case of our first Five-Year Plan. In a democratic country, where masses of the people live close to the margin of subsistence, everyone must agree with Prof. Shenoy that uncontrolled inflation might undermine the existing order of society. In any case, as he says, it will impede the overall economic development by diverting economic savings into gold hoards or socially less useful investment. It is, therefore, of the utmost importance to ensure that the greatest care is taken so that the extent of deficit financing that the country can permit itself is not such as to produce serious inflationary consequences and entail measures of control, which must necessarily be of a totalitarian character.

REGIMENTATION?

While there is divergence of views about the precise extent of deficit financing that the country can safely indulge in, it is interesting to note that, even otherwise, there is entirely outside the programme of deficit financing, the plan framework contains features wherein lurk dangers of totalitarianism. There is, for instance, the calculated attempt to relegate the organised private sector into an insignificant position and a correspondingly insidious attempt to enlarge the scope of the public sector beyond a reasonably realistic and desirable limits. Again, the disproportionate emphasis on heavy industries in imitation of the communistic model is likely to compel the country to resort to totalitarian methods. One also apprehends the possibility of the totalitarian danger in the Government's expressed willingness to take over banking, insurance and some aspects of trade, if need be, to facilitate the implementation of the Plan. Finally, the plan framework does not sem to have given adequate attention, even while contemplating an unwarranted expansion of the public sector, to the availability of the necessary administrative machinery.

In the light of what has been discussed so far, it is pertinent to ask whether we might not be content with a plan less ambitious in scope and more in keeping with our resources. Even the very conservative size of the plan indicated by Prof. Shenoy postulates an investment in the public sector which roughly corresponds to the targets under the first Five-Year Plan and an achievement which is about 40 per cent higher than that under the first Plan. Even this should be regarded as remarkable, considering that it does not even remotely savour of totalitarian strategy. The democratic approach towards economic development ensures as spectacular results as, if not more spectacular ones than, the totalitarian approach.

BUSINESS NOTES

SYNTHETIC RUBBER PLANT FOR BOMBAY

BOMBAY BIDS fair to have a 15,000-ton synthetic rubber plant, if the Government of India approves of the plans of the Oil Refinery Companies in the State to set up a Rs. 30-lakh plant for this purpose, making use of their waste products. It is estimated that more than 16 per cent of the crude oil that enters the refineries annually, or some 3,75,000 tons, comes out as gas, for all of which, however, economic disposal has yet to be found. In the refineries themselves, thanks to the latest design incorporated in these furnaces, a fraction of these just about 2 per cent, is employed for heating the cracking furnaces. The waste gas is known to be rich in methane, ethane, butane, etc, which are the starting materials for the synthetic rubber and the plastic industries. The Dow-Kilachand plant for producing polysterene would probably absorb some of these products. Even then there would be left a considerable quantity of waste products and the proposal to turn them into synthetic rubber is really commendable.

However, one has to reckon with the reactions of natural rubber producers in this country to the proposal, in that, when the proposal materialises, it is they who would be vitally affected. It should be remembered that 15,000 tons of synthetic rubber represent more than 50 per cent of the total consumption and about 75 per cent of the total production of natural rubber in this country. When Indian synthetic rubber, which will undoubtedly be cheaper than any imported synthetic rubber, is on the market, it is sure to bring down natural rubber prices from their present levels (Rs. 138 for 100 lbs.), even which are not considered sufficiently remunerative. As against this disadvantage, there is one advantage. It will eliminate dependence on our imports which, in recent years, have been steadily rising. Also, if, as a result of the profits from their synthetic rubber sales, the refinery companies should reduce their oil prices, the country too would stand to gain to some extent. All these aspects of the question would no doubt be borne in mind by the Union Government in arriving at a decision about licensing the proposed synthetic rubber plant in Bombay.

NEW HEDGE CONTRACT: PROPOSED CHANGES

NOW THAT the sub-committee appointed by the East Indian Cotton Association (Bombay) has completed its labours on the revision of the hedge contract for the coming season, and it is reported that the Forward Markets Commission, which was kept fully informed of the discussions of the sub-committee throughout, also has accepted the amendments suggested, it is only a matter of days before trading in the new cotton contract will commence. For the most part, the E.I.C.A. sub-committee's discussions were highly technical which many may not have cared to follow or to bother themselves about, but the main changes agreed to be affected, which will interest all, are as follows:

(i) There is to be only one hedge contract and not two contracts as some had been urging.

(ii) The revised basis of the contract provides, inter alia, for:

(a) all tenderable varieties under the Hedge Contract being tenderable only up to 2/32" 'ON' 1/32" 'OFF' for staple;

(b) The basic cotton Jarilla, fine staple, being raised from 25/32" to 13/16" and made tenderable up to 14/16" with a tolerance of 1/32" 'OFF' for staple (¾" Jarilla also is to continue to be tenderable but it will be grouped as B (the others being A) without any 'ON' allowance for staple);

(c) a separate standard being created for Rajpipla and Jhogadia cotton, the basic staple for this standard being 27/32";

(d) dividing Jayadhar and Laxmi cotton into two different groups A and B; and

(e) deletion of Punjab-American 4F, as no such commercial crop is grown in India now.

(iii) There is to be no change either in delivery months, or in weightage, these continuing to be February, May, and August and 6¼ per cent, respectively, as at present.

(iv) The commission under by-law 54B (9) for upcountry delivery, is to be raised from ¼ per cent to 1 per cent.

(v) No change is to be made in the prevailing number of tender days, but, in order to meet the demand of those who want to restrict upcountry tenders up to 15th, it seems to have been agreed that, by suitably amending the bye-laws, the spot rate fixed by the Board on due date for basic cotton might be made applicable for invoicing back under the Hedge Contract until the surveys and appeals are finally disposed of, leaving it to the Daily Rates Committee to fix spot rates applicable to Delivery Contracts only.

(vi) No change is to be made either in respect of tendering differences (by-law 55) or fixation of spot rates for basic cotton during the delivery period and on the due dates (by-laws 31 and 32).

(vii) The prohibition on fresh business on and after the first day of the delivery period for trading in such conract except for liquidation purposes is to go, and there is to be no restriction on fresh trading during the delivery period.

(viii) The buyer is no longer to have the right of buying on account under the hedge contract.

(ix) A new bye-law is to be enacted requiring debtor as well as creditor member of the defaulting member to put in statements of their dues and claims as a result of the closing out of contracts of the member declared defaulter in the previous clearing, so that all claims and liabilities of a defaulter-member would be covered completely within the authority of the E.I.C.A. and not left to the whims of the parties concerned.

(x) A standing bye-law committee is to be appointed to go into the suggestions for revisions in the bye-laws, received from time to time, and to report thereon to the E.I.C.A. Board.

FIVE MONTHS OF INDO-U.K. TRADE

THE INCREASE in the overall trade between India and the U.K. noticed in the first quarter of 1955 has been well maintained up to the end of May. For the first five months of this year, India has sent Britain goods valued at £75,835,000, as against only £57,799,000 the figure for the corresponding period in 1954. With the value of total imports from the U.K. into India for the period remaining at only £55,615,000, India has been enabled to strike a favourable balance of trade, for the fifth month in succession, to the tune of £20,220,000.

Tea, which accounted for almost 60 per cent of India's export trade with the U.K. during the first four months, continues to be the major item. At £42,073,000, the value of exports of Indian tea during January-May, 1955 represents an increase of £15,775,000

over the corresponding figure for 1954. If the present high rate of tea exports to Britain is maintained for the rest of the year, the total value of tea exports to the U.K. for the whole year may well exceed that for the previous year of only £76,963,000.

The next largest group of Indian exports to the U.K., namely, miscellaneous textile manufactures, however, shows a slight fall as between the first five months of 1955 and 1954, presumably due to the conciliatory attitude of Indian textile interests. Thus, the value of goods exported under this head at £7,546,000 for the five months ended May, 1955 compares with £8,147,000 recorded in 1953.

Machinery other than electric headed the products of British heavy engineering industry that made up the bulk of India's imports from the U.K. up to the end of May. During the five months under review, the value of these imports was placed at £13,150,000 as against £12,469,000 for the corresponding period during the previous year. The trend of imports of electric machinery, apparatus and appliances, as well as chemicals, also remained favourable to the U.K.

SWITCH-OVER TO MAN-MADE FIBRES

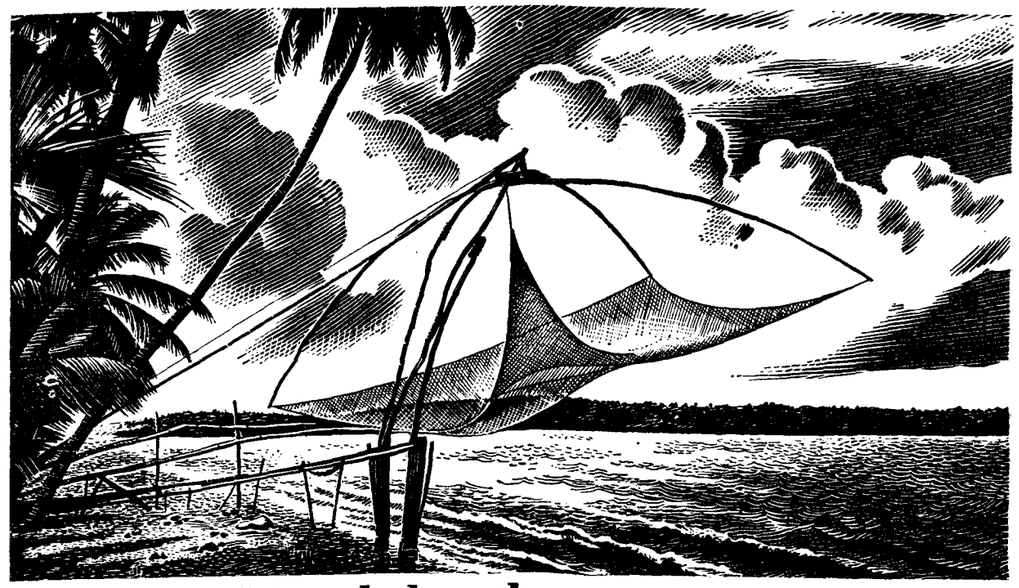
THE WORLD has lately been witnessing a shift in emphasis towards man-made fibres as contrasted to natural fibres. Besides the use for garments, there is rapidly being found increasing uses for man-made fibres in the industrial sphere as well. Evidently the idea has caught on, as is seen from the fact that much machinery originally installed for spinning, weaving, and processing natural fibres is now reported to be in operation only because it has been switched over to the production of man-made fibres. This perhaps explains the cryptic forecast made by the Chairman of Balstone, Cooke and Raonese Ltd. when he recently referred to the increasing use, in the textile industry, of man-made fibres, that "Lancashire is all right for the next 100 years." With the experience of over fifty years in the textile trade, his remark that there is more scope for progress in the textile trade than ever before, what with a dozen or so new types of fibres being developed, and his advice to the industry to acquire flexibility and switch over to the production of fabrics in which foreign competition would be less intense are significant. And this should be of some concern not only to cotton goods manufacturers but to cotton producers as well.

The switch-over of a large number of Lancashire spindles and looms to new raw materials received great impetus even as early as in 1937, when big strides were made in producing yarns and cloths from rayon staple, rayon filament and other man-made fibres following the withdrawal of rigid utility specifications and the high prices of raw cotton subsequent to the outbreak of the Korean war. In 1954, the annual capacity for the truly synthetic fibres rose to more than 100,000 bales in the U.K. and is expected to reach 170,000 bales by 1956. In America also, the votaries of man-made fibres have been on the increase. Thus, between 1937 and 1953, the consumption of man-made fibres increased by 353 per cent, whereas cotton, wool, silk, and linen combined rose by only 14 per cent! Among other countries in the free world, Japan led the rest with its rayon production in 1954 which was five times larger than in 1949.

It is difficult to gauge the actual repercussions on the cotton market as a result of the popularity that is steadily being gained by rayon and other synthetic fibres, but this much can be said, namely that it has provided greater opportunities for mixing these fibres with pure cotton, particularly in countries like Japan, where man-made fibre is relatively cheaper than cotton.

REPORT ON RAILWAY CORRUPTION

THE PRECIOUS little that has trickled through in the Press about the findings of the Railway Corruption Enquiry Committee cannot fail to produce the impression that the situation is graver than generally assumed. Acute corruption is the legacy of war-time shortages. If it is rampant on a relatively much more extensive scale than in several government departments, it is because of the persistence of shortages of railway transport capacity. The Committee puts its finger on the long-term remedy when it says that marshalling yard, transhipment and loading or unloading facilities should be expanded. This expansion is, of course, an integral part of the railway development plan. But the suggestion probably does not take account of the fact that traffic also will keep on expanding.



Suppression of corruption, however, cannot wait on the gradual elimination of shortages of capacity on the railways. The Committee has minced no words and it has stressed in a tone of gravity that this evil has demoralised even the higher ranks in railway services. It has cited several sources which open up lucrative outlets for corrupt officials at all levels to extract illicit rewards. But it would appear that engineering contracts and settlement of compensation claims are the most fruitful among them. It is astonishing that disparities between original and revised cost estimates in contracts should run amuck to the extent of 60 per cent. Why this is tolerated year after year is a serious question which must be tackled by the Railway Ministry ruthlessly. The user of freight transport is the worst victim of corrupt practices, but the passenger too is subjected to various sorts of petty harrassments. The Committee has recommended the establishment of a separate machinery for investigation into offences arising from corruption. It would be pointless to duplicate the machinery, but the independent cadres of anti-corruption police need to be strengthened and extended.

Probably a revealing verdict recorded by the Committee is the one that relates to the constant interference by legislators with the normal administration of railways for wrongful purposes. This verdict, coming as it does from a committee composed of Members of Parliament, constitutes a serious condemnation and calls for effective measures to put a stop to intermeddling with administration by politicians armed with potential authority. It is difficult to see how otherwise the morale of the railway staff can be maintained.

METAL BOX—ANOTHER STEP FORWARD

THE METAL Box Company of India Limited took another step forward in its expansion activities last year ended on March 31, 1955. The tight situation in raw materials which threatened to develop into a crisis due to shortage of tin-plates was energetically handled by timely action to import supplies from America. In spite of this temporary difficulty and the set-back which production suffered at Calcutta owing to labour trouble inspired by irresponsible trade union leadership, the company was able to score a substantial measure of progress. Sales were pushed 10 per cent above the previous year and in this successful promotion activity the growing popularity of the company's consumer package products and intensive efforts of the sales staff had a real share. The dividend was maintained at 10 per cent at which it is stabilised since 1951—a year which constitutes a landmark in the company's history when Indian investors could begin to acquire interest in its share capital.

Mr. H. Chiswell Jones, the Chairman of the Company, has explained in his speech, which appears elsewhere in this issue, not only the progress on the financial and operational fronts but also on the technical front. The broad details of the agreement with the company's technical consultants in London, which are set out in the speech, indicate that all benefits of research and technical advances in flexible packaging will be ensured for the company.

How banking helps the FISHING INDUSTRY

THE seas around India's 2,900 miles of coastline are rich in fish. In the South of India, particularly, fishing is an important industry. It supplies food and many valuable by-products, some of which are exported.

In South India alone, the fishing industry employs over 1½ lakhs of people, and its catches are worth about Rs. 3½ crores every year.

Banking has greatly helped the growth of the fishing industry. The facilities and guidance of a good bank, such as the availability of ready funds when needed, and the collection of dues in any part of the country, are an essential part of good organisation in the fishing industry.

We at Palai are proud that so many leading fishing firms, and indeed important firms in every field of business and industry in South India, employ the *complete* banking service we offer:

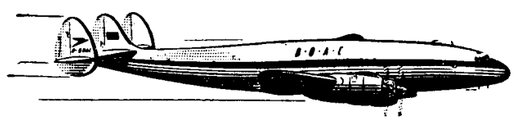
Current Accounts — Demand Drafts — Telegraphic Transfers — Investments — Letters of Credit — Bill Collection — Deposits — Loans and Overdrafts — Confidential Credit Reports, etc.

If you have business interests in the South, it will pay you to open an account with us. Our 25 branches are strategically located, 23 in important South Indian business centres and two in Delhi and New Delhi; and we have correspondents in all important Indian cities. We offer a fully comprehensive banking service at each office.

Our clients can make deposits at any of our correspondent banks, situated in all important Indian towns, and have the amounts credited to their accounts at any of our branches.

ESTD. 1927

PALAI CENTRAL BANK LTD.



Head Office : Palai, Travancore-Cochin
Branches at : Madras, Madurai, Cochin, Quilon, Trivandrum, Mangalore, Bangalore etc. Also at : Delhi and New Delhi.

A LEADING BANK IN SOUTH INDIA

B·O·A·C offers frequent services to

HONGKONG & TOKYO

Via RANGOON or BANGKOK

Four services to Hong Kong and three to Tokyo, weekly. Enjoy speed, luxury, dependability when you fly by B.O.A.C. First Class 'Majestic' services. These four-engined, world-proved *Constellations* are fully-pressurized to fly high above the weather where the air is clear and calm. Relax in the deep comfort of fully reclining chairs, enjoy delicious free meals, drinks and attentive service day and night.

Also "low fare" Tourist Services by B.O.A.C. Argonaut airliners. Four-engined and fully-pressurized. Same high standard of B.O.A.C. service and experience.

Drinks on Tourist Services at duty free price.

From DELHI To	FIRST CLASS Single	FIRST CLASS Return	TOURIST CLASS Single	TOURIST CLASS Return
HONGKONG	Rs. 1,174	Rs. 2,114	Rs. 934	Rs. 1,682
TOKYO	Rs. 2,014	Rs. 3,626	Rs. 1,614	Rs. 2,906

Consult your local Travel Agent or B.O.A.C., Speedbird House, Service Road, Connaught Place, New Delhi 1. Phone: 43978, 44234, 45085 and 47356.

FLY B·O·A·C

BRITISH OVERSEAS AIRWAYS CORPORATION

Listen to the B.O.A.C. programme "Enchantment in the air" on Thursdays at 8.0 p.m. on Radio Ceylon, 31 and 49 metre bands.

COMPANY AFFAIRS

THE AGARPARA CO., LTD.

The audited accounts of the Company for the half-year ended 30th September, 1954, show that with the sum of Rs. 54,435 brought forward from the previous half-year and after providing for depreciation and all other charges, there remains a balance of Rs. 6,43,972 from which has been set aside Rs. 1,80,000 for taxation and Rs. 50,000 for Reserve for Doubtful Debts leaving a balance of Rs. 4,13,972 which it is proposed to be dealt with as follows:

Payment of Dividend on 10,000 Preference Shares at 7 per cent per annum free of Income-Tax	Rs.	35.000
Payment of Dividend on 60,000 Ordinary Shares at 7½ per cent per annum free of Income-Tax	„	2,25,000
Transfer to General Reserve	„	50,000
Carry forward to net period	„	1,03,972
TOTAL	Rs.	4,13,972

In accordance with the provisions of the Indian Jute Mills' Association Working Time Agreement 12½ per cent of the total looms remained sealed. The working hours were 42½ hours per week from the commencement of the period till 12th July when working of 45 hours per week was commenced. These hours were further increased to 48 hours per week from the 18th October, 1954, to meet the growing demand for goods. Trading conditions continued to be difficult. Raw jute prices which fell earlier on the reports of a large crop rose steadily later on as a result of the heavy floods which affected most of the jute growing districts of India and Pakistan. Since the close of the period under review some modern machinery for the hessian section has arrived and has been installed.

THE INDIAN GALVANIZING CO. (1926) LTD.

The audited accounts of the above mentioned Company (Managing Agents: Balmer Lawrie and Co., Ltd.) for the year ended 31st December, 1954 are as follows:

The profit for the year, after deducting items relating to previous years and providing for depreciation, was	Rs.	1,69,361
To which is added the balance brought forward from 1953	„	18,139
TOTAL	Rs.	1,87,500

The Directors recommend that the total of Rs. 1,87,500 which is available for distribution be dealt with as follows:

Dividend on Preference Shares at the rate of 6 per cent (subject to deduction of Indian Income-Tax)	Rs.	16,947
Dividend on Ordinary Shares at 4 per cent free of Income-Tax	„	1,47,783
Balance carried forward	„	22,769
TOTAL	Rs.	1,87,500

The output of the Bombay Drum Plant valued at Rs. 37 lakhs conceals the continued low production of the Calcutta Works and the reduced sales of Henry Hopes products which have combined to give a disappointing return on an improved turnover of Rs. 93 lakhs.

The Managing Agents have decided to waive a proportion of the commission due to them as they consider that the calculation on which it is based does not conform to modern practice.

CLIVE ROW INVESTMENT HOLDING CO., LTD.

The Directors of the above Company present the audited accounts for the half-year ended 31st March, 1955.

After providing Rs. 1,90,000 for Taxation, the Profit for the half-year under report amounted to			Rs.	2,14,010
The Balance brought forward from the Previous half-year ended 30th September, 1954, was			„	23,68,981
TOTAL			Rs.	25,82,991
The Directors have transferred to General Reserve	Rs.	10,00,000		
The Proposed dividend for the half-year ended 31st March, 1955, at As. 6 per share will absorb	„	5,20,500	„	15,20,500
Leaving a balance of			Rs.	10,62,491

The Company's investment portfolio was reorganised during the half-year by selling certain non-dividend-paying investments and purchasing further investments mainly in Ordinary Shares of Public Companies. At 31st March, 1955, the Company's investments were spread over industries of the country in the following proportions:

Tea	24 per cent	Paper	6 per cent
Jute	23 per cent	Shipping	6 per cent
Coal	18 per cent	Miscellaneous	23 per cent

The results for the year ended 31st March, 1955 are as follows:

Dividends and net interest received			Rs.	12,32,956
Scrip and transfer fees			„	346
TOTAL			Rs.	12,33,302
Deduct expenditure:				
Salaries and Wages	Rs.	12,478		
Charges General	„	19,390		
Secretaries' Remuneration	„	62,500		
Directors' Fees	„	96	„	94,464
Deduct:				
Provision for Taxation			Rs.	4,11,000
Net Profit for the year ended 31st March, 1955			Rs.	7,27,838

Note: In future years the Company's accounts will be closed annually on the 31st March instead of half yearly as hitherto.

COMMODITY NEWS AND NOTES

FINAL SUGARCANE ESTIMATE, 1954-55

According to the Directorate of Economics and Statistics, Ministry of Food and Agriculture, Government of India, the All-India final estimate of sugarcane, 1954-55, puts the current year's acreage and production at 3,932,000 acres and 54,648,000 tons of cane, as against the partially revised estimate of 3,498,000 acres and 43,873,000 tons of cane respectively, for 1953-54. This shows an increase of 434,000 acres or 12.4 per cent in area and 10,775,000 tons of cane or 24.6 per cent in production over last year. Expressed in terms of gur, the production is placed at 5,546,000 tons during 1954-55 and 4,464,000 tons during 1953-54.

The increase in acreage and production of sugarcane has been reported by almost all the major sugarcane growing States; it is, however, more marked in U.P. and is due mainly to high prices of gur, better seasonal conditions and better irrigation facilities during the current year as compared to last year. Slight decreases have, however, been recorded by Andhra, Madhya Bharat and Mysore.

U.P. SUGAR INDUSTRY

Questions relating to the reorganisation of the State's sugar industry and the extension of the crushing season were discussed at a meeting of U.P. Sugarcane growers, millowners and Government, held in Lucknow on July 11. Mr. A. P. Jain, Union Agriculture Minister, who participated in the talks, said that while the Government of India did not consider displacement of U.P.'s sugar industry feasible, it could not encourage its continued subsistence at the cost of consumers in other States. The cost of production in South India was lower by Rs. 5 a maund. It was, therefore, necessary, Mr. Jain said, to reorganise and strengthen the industry so as to make it competitive.

With a view to meeting the problem created by an anticipated "over-production" of cane this year, it was suggested that the mills should begin crushing on October 15. While it was agreed that the extension of the normal crushing season by about two months would help to utilise the entire crop, millowners demanded relief by way of reduction in the price of cane or abolition of excise duty or cane cess to offset the effect of poor sugar content of earlier cane. Growers rejected this demand on the ground that the price of cane is already lower than what it should be.

COCONUT OIL FUTURES

Forward trading in coconut oil will be transacted under the auspices of the Alleppey Oil Millers' and Merchants' Association from August 1955, instead of under the joint control of the Association and the Alleppey Chamber of Commerce as at present.

Mr. G. Chidambara Aiyar, Vice-President of the Association, who disclosed this at the third annual general body meeting of the Association, said the "fusion" of the forward sections of the two organisations was because they were not likely to get separate licences for forward trading in future under the present policy of the Government of India. For all other purposes, the Association and the Chamber would function as two separate bodies.

OUTLOOK FOR COCOA

World production and consumption of cocoa beans increased by 600 per cent in less than 40 years—from about 100,000 tons in 1900 to 730,000 tons in 1934-38, according to the Food and Agriculture Organisation of the United Nations. Because of the enormous rise in the prices of beans, quality of cocoa is not what it used to be. With the exception of rubber, no other agricultural crop has experienced such a rapid growth and today the economic outlook for cocoa is probably more favourable than for any other agricultural commodity, the F.A.O. states.

POPULARISING LEATHER GOODS

Attainment of self-sufficiency and greater use of indigenous materials were the two most important objectives envisaged in the nearly 100 papers read at the three-day symposium on the Tanning Industry which concluded at the Central Leather Research Institute at Madras recently.

Substitution of the imported Wattle Bark by indigenous tanning materials, increased production of suitable types of leather goods to capture foreign markets and improved techniques for the manufacture of synthetic tanning materials in India, were the main recommendations.

HAND-POUNDED RICE

The replacement of rice mills in India by the hand-pounding industry, organised and developed on co-operative lines, within a period of about five years, is the main recommendation of the Rice Milling Committee. This, according to the Committee, will serve to open an additional avenue for employment to rural population, relieve seasonal unemployment amongst agricultural labour and also ensure better nutritional value for the rice-eating population of the country.

The Rice Milling Committee was set up by the Government of India in October, 1954, with Mr. C. P. Karunakara Menon as its chairman, to examine the working of different types of rice milling now in vogue in the country in all its aspects, such as technical, nutritional, economic, consumer preference and employment.

MARKETING OF ORANGES

The Nagpur District Orange Growers' Association will shortly introduce a scheme for crop financing and marketing of oranges to expand and develop this premier fruit industry of the State with an annual outturn of nearly Rs. 3 crores. The scheme is intended to integrate cultivation with industry.

Company Meeting

THE METAL BOX COMPANY OF INDIA LIMITED

Review by the Chairman—H. Chiswell Jones

SALES

The general improvement I anticipated over the unsettled conditions in 1953-54 materialised. Notwithstanding the time lag between the country's increased economic activity and its translation into demand for our products, we were able to achieve an expansion of 10 per cent on the previous year's sales volume. This increase was in no small part due to a vigorous effort to expand our sales and we took full advantage of the opportunities offered by the improved demand for packaged consumer goods.

Our fortunes are intimately linked with those of the middle classes and measures which by design or effect reduce their purchasing power will adversely affect all the consumer goods industries we serve. As you know, we have been the pioneers of the small branded consumer package for foodstuffs, the increasing use of which is highly important if India is to make the most efficient use of her food resources. Of the total fruit and vegetable crop, amounting to several million tons, a considerable portion goes to waste. If a substantial fraction of this was canned, India's requirements of processed food containers could be raised from 6 million (compared with Japan's figure of 700 million) to as much as 1,000 million cans per annum; a fact that emphasises what tremendous savings could be achieved by a well-organised canning industry. It is gratifying to know that the development of this important industry is being considered for the Second Five-Year Plan. But, even a small reduction of consumer purchasing power would block progress and mean continued wastage of food. More generally, since the small pilferproof consumer-package must of necessity be slightly more expensive, it could lead to a return to the old insanitary bulk pack, undermining those efforts which must relentlessly be applied if the quality of consumer goods and their hygienic presentation is to be improved.

The purchasing power of the public shows signs of remaining steady and, provided no serious economic crisis arises, I consider the prospect for the year is a continued expansion of sales.

PROFIT

The increase in sales, forecast at the time of my last Review, together with the strict maintenance throughout the year of the operational economies introduced earlier, resulted, as expected, in a better trading profit.

Although competition is keen, I have confidence that the upward trend of sales can be maintained and a reasonable profit level sustained.

FINANCE

The dividend on the Ordinary Shares has been maintained at 10 per cent since 1951; the year in which the Indian public acquired an interest in the equity capital.

Fixed Assets during the four periods ended 31st March, 1955, have increased by approximately Rs. 70 lakhs, i.e. nearly 70 per cent, and this substantial increase has been largely financed from profits retained in the business.

The Directors feel that it is reasonable for shareholders to expect some return on the additional finance they have thus provided for the Company's modernisation and expansion programme. With this in mind the Directors are recommending a final dividend of 7½ per cent on the Ordinary Shares, making a total of 12½ per cent for the year.

RAW MATERIALS

In June last year we were informed that crisis in tinplate supplies was likely to develop later in the year following a temporary shortage of steel bars and a considerable overbooking of orders by many consumers in anticipation of a scarcity. In consultation with the authorities, it was deemed necessary to import tinplate from America in order to safeguard our customers' supplies. With the help of our Associates abroad early delivery was obtained and the crisis averted.

Indigenous tinplate production is presently running below demand, but expansion plans are well advanced and, early next year, a substantial additional tonnage should be available. The present shortfall is being met by importation.

There has been no change in the price of Indian tinplate during the year.

As a result of continued expansion of local manufacture and packing of previously imported goods, our consumption of aluminium is increasing. For collapsible tubes we obtain satisfactory indigenous material and, though at one time last year there was a temporary shortage of supply, this has since been remedied.

However, the special aluminium sheet required for the production of pilferproof seals, screw caps, penicillin phials and general containers is not at present produced in the country to the required standard and finish and, from time to time, delay in obtaining import

licences, coupled with a steadily increasing demand, has kept us on a hand-to-mouth basis. There appears to be a good case for either an increase in the quotas granted to established importers or placing the material on Open General Licence; representations have been made to Government.

Generally, costs of other raw materials remain steady but the new Excise duty will increase the cost of coatings, lacquers and varnishes, paper for packing purposes and board for the manufacture of composite containers.

INDUSTRIAL RELATIONS

In Bombay and Madras relationships with our workers have been excellent throughout the year. In Bombay our Works' Committee has rendered most valuable service acting as the vital link between Management and the main body of the workers on day-to-day matters, whilst in Madras the position exemplifies the fact that excellent labour relations can be maintained given sound Union leadership and a responsible Works' Committee.

In Calcutta, I am distressed to report a deterioration which, shortly after the end of the financial year, resulted in the temporary closure of the factory.

Towards the end of 1954 the Union leadership passed into the hands of extremists—a dismissed employee was elected as Secretary of the Union and, through his instigation, a series of acts of indiscipline were staged including assaults on supervisory personnel for which the assailants were dismissed. A stay-in strike took place on March 30th and, notwithstanding that Conciliation proceedings were in progress, a further strike was called and took place on April 20th. It being clear that normal work could not proceed without an assurance that these acts of indiscipline would cease, the Company decided, for security reasons, not to resume work until a satisfactory undertaking of good behaviour was obtained.

The closure lasted for 18 days with consequent loss to the Company, its workers and its many important customers in the Calcutta area, whose patience and understanding is gratefully acknowledged.

We have always been willing to sit down with our employees and discuss their reasonable aspirations and representations, but, when attempts are made to coerce Management by threats, by restraint and by attacks on the staff, we have no alternative than to take such action as will ensure the safety of our employees and the protection of our property.

It is impossible for a large industrial undertaking to function in an atmosphere of worker indiscipline; yet, in the majority of cases those responsible are a mere handful of the total labour force. These irresponsible elements—themselves with little to lose for they are often paid by outside sources—lead the main body on with extravagant promises. Such situations rarely, if ever, lead to any lasting benefits for the workers, and more often than not, to suffering and hardship.

The situation in the Calcutta factory is now much happier and I hope will remain so for a long time to come.

DEVELOPMENTS AND NEW PROJECTS

Having successfully overcome the inevitable teething troubles inseparable from a new undertaking, full scale production of aluminium pilferproof seals for glass bottles commenced in Bombay in the latter half of 1954. This new development has been well received by bottlers throughout the country; a substantial demand is forecast and we now plan to manufacture in Calcutta as well.

The Technical Development Section are manufacturing the special machines required to apply these caps.

Owing to unforseen difficulties over the lease, now settled, the opening of the small scale factory at Delhi was delayed; production has since commenced.

The Technical Research Laboratory at Calcutta has been completed and is expected to make a valuable contribution to the development of improved surface finishing materials. The Laboratory will work in close co-operation with indigenous manufacturers of printing inks, coatings, varnishes and lacquers, to attain agreed standards on an all-India basis, which should ultimately result in operational economies.

We have recently extended the agreement with our Technical Consultants, The Metal Box Company Limited, London, to cover all aspects of Flexible Packaging—a generic term covering bags, pouches, pockets, satchels or wrappers made from viscose or thermoplastic films such as polyethylene, or laminated combinations of these with paper or cardboard. Through our Consultants we will receive the benefit of technical knowledge and research in this promising new field, but so many varied developments are currently taking place in Europe and America that we are proceeding cautiously in order that we may obtain the benefits of the latest techniques and equipment.

The Mangalore factory has completed its first full year of operation and is working smoothly and successfully.

I referred in my last Review to the start we had made on the production of Industrial components. From the trade response it is clear that we are providing a valuable service, making it unnecessary for manufacturers to set-up specialised equipment for limited production of component parts which, in themselves, are merely ancillary to their main production. We expect a steady expansion of demand in this promising new field.

Until recently collapsible tubes greater than one inch diameter had to be imported, but further extrusion and printing equipment covering a larger size range has been installed and we are now making all sizes of tubes presently required. The same equipment enables us to make larger sizes of rigid aluminium tubes. Machinery has also been installed to provide internal lacquering for products which react with aluminium and need this additional protection.

The new printing factory at Calcutta has been completed and is in operation.

STAFF

Once again it is my pleasure to thank all the staff for their fine effort throughout the year. Their keenness, enthusiasm and loyalty to the Company has contributed in no small measure to the satisfactory results attained.

Red Herrings : Out of Season?

ONE of the consequences of the confused counsels on economic affairs prevailing in New Delhi is the ease with which red herrings can be drawn across the path of planning. There are numerous issues on which those who are either confused themselves or wish to add to the confusion can operate. It is doubtful, however, if there is any issue which is so capable of raising more confusion or emotion of the wrong kind than the place of cottage and household industries in the second Five-Year Plan. At his Press Conference last Tuesday, the Prime Minister not merely raised this red herring on his own account, but also reflected not a little of the current confusion. Strangely, the Prime Minister thought the villains were some economists who were happily left undescribed; he seems to have understood that during his absence certain economists had been presenting the case against the cottage industries. He did not indicate who the economists were, and almost no identification is possible because, as a matter of fact, no economists—good or bad—have attacked the general principle of the development of cottage industries in order to increase employment. What is under question is not this general principle which is universally acceptable, but the specific means suggested for this objective in the Plan-frame.

The problem of cottage and household industries in India would have been charged with emotion even if it had not been tied up with the Gandhian legend which, rightly or wrongly, has held the minds of many persons concerned with India's economic affairs. But much of this emotion is misplaced. There is no doubt that organised industries in India have significantly failed to contribute to employment, although in the last five years they have materially contributed to the rise in real wages in India's organised working population. More specifically, it might be said that while Indian industrial production has risen by something in the region of 50 per cent in the last three years, there is no significant evidence that employment today is greater than it was in 1946 or in 1952. In other words, it is almost certain that Indian organised industries cannot provide any solution to India's present unemployment problem. Since agriculture is admittedly working under excessive population pressure, there is really only one major field in which a solution to the unemployment

problem can be sought. This is in the range of small-scale industries, and, therefore, there cannot be any reasonable doubt that anything which can successfully establish these industries is worthy of support.

What then is wrong with the Mahalanobian teaching on this point? It is a counsel of despair, which argues that our cottage industries can only survive if organised industries are severely restricted. It is on this, and on no other point, that the debate has arisen. Again, it is, by and large, not a debate in which the economists are involved since the issue is largely administrative. The debate proceeds not in the Press, but inside the administration, here in Delhi and in the Cabinets of State Governments. Dr. B. C. Roy's views, and not those of any economists, are now recognised as presenting the antithesis of the Mahalanobian view. As has been pointed out in an article "B. C. Roy versus P. C. Mahalanobis" in *The Eastern Economist* of July 8, the issue is not whether cottage industries ought to be developed but whether they can be made a complete substitute for organised production in larger industries.

There are two broad aspects of this argument which need constantly to be stressed. The first of these is that cottage industries will need to be provided with the productive tools for their tasks. At the present time, largely because inadequate tools are in use, the quality of many cottage industry products is such that they are quite unacceptable to our new mass market. It is not essential that cottage industries should suffer from this disqualification. The Ford Foundation Team on small-scale industries showed the way out of this dilemma and, indeed, in Germany, the United States and Japan these recommendations can be seen in operation on a tremendously successful scale. But whereas in other countries small-scale industries do not demand that large-scale industries should be restricted, in this country, instead of seeking co-operation, there is a persistent fear that large-scale industries will not help, but will, somehow or another, destroy small-scale industries. Even when it is pointed out that as a maker of tools such for example, as lathes, fretwork machines, powerlooms and so on, large-scale industries have a vital interest in developing small-scale industries, the view is constantly held that there is a violent conflict which implies that the survival of one involves necessarily a restriction of the other.

It is this basic falsehood in the Mahalanobian philosophy that summarises the differences existing on this issue. It is not only a production problem. It is also a vital marketing one. Who is to buy the ouput of our cottage and household industries? Prof. Mahalanobis seems to assume that there will be no marketing problems and all that is produced—however inferior in quality—will always be sold. Dr. B. C. Roy has pointed out that to argue that the Indian factory worker who has already acquired a standard of consumption, both in quality and price, which he is not prepared to depress, will fall in with Prof. Mahalanobis' simple assumption is to argue flatly in the face of facts. Again, it is in every country in the world that the large and medium-sized industries provide the main market for small-scale products. This is either directly in the form of products processed for the large-scale industries, or, indirectly, as a result of the derived demand for small-scale products which the incomes distributed by larger industries generate. If, for any reason, the power of medium-scale industries either to make supplies of tools or to provide the income for purchasing the products of cottage industries is injured, cottage and household industries will be seriously hurt.

It is when things are seen in this perspective that the real issue in debate can be resolved. It is fortunate that not all Ministries of the Government of India share the confusion on the Cottage Industries problem which belongs to the Mahalanobis' Plan. Thus it is reported that in the meeting today of the Central Advisory Council of Industries an investment target for the cotton textile industries has been set out which takes full cognizance of assistance which large-scale industries must give to cottage and household industries. The larger part of investment of about Rs. 100 crores in cotton textiles is directed to develop the spinning section, holding cloth production only slightly above the present figure. It is thus proposed to raise the output of cloth from what is called the decentralised textile sector from 1,600 million yards as at present to 2,880 million yards over the next five-year period. This is a splendid illustration of the kind of co-operation between large-scale and small-scale industries which is needed. If the mill industry does not provide the handloom and household powerloom sections with yarn, there will be no means of developing these industries. Prof. Mahalanobis would decentralise both spinning and weaving. The net effect of this would be to raise the cost of yarn, and the price of cloth would become prohibitive. Then the whole scheme for developing textile small industry weaving units would be defeated by limitation of the market. And, illustration such as this multiplied many times will show the weakness of the Mahalanobian thesis at the present time.

There is thus really no reason for controversy or emotion in this matter at the present time. The country has resolved on the expansion of cottage and household industries and this resolution is already being worked in the constructive and practical manner in which it has taken shape in the Ministry of Commerce and Industry. So long as the objective is attained, why are these red herrings being drawn across the path? They are out of season.

Liberty and/or Democracy?

MR. WALTER LIPPMANN'S recent book "The Public Philosophy" which has just made its appearance in India has awakened considerable interest in the Western hemisphere, finding friends and foes in a very short time. This is largely because of the fierce challenge that it presents to the democratic philosophy. It has hitherto been an axiom of that philosophy that democracy, whose method is the expansion of the area of consent freely expressed, must necessarily contribute to individual liberty in the process. The possibility that individual liberty could decline while democracy is extended has never been given the consideration that it obtains in this book. The antithesis between liberty and democracy thus bluntly presented might have been calculated to make every democratic country acutely uncomfortable. If that was Mr. Lippmann's purpose, he has succeeded all too well.

Mr. Lippmann is not a defeatist, although he is by no means an optimist. His conclusion on the conflict between liberty and democracy is best expressed in his own words: "My hope is that both liberty and democracy can be preserved before the one destroys the other. Whether this can be done is the question of our time, what with more than half the world denying and despairing of it. Of one thing we may be sure. If it is to be done at all, we must be uninhibited in our examination of our condition. And since our condition is manifestly connected with grave errors in war and peace that have been committed by democratic governments, we must adopt the habit of thinking as plainly about the sovereign people as we do about the politicians they elect. It will not do to think poorly of the politicians and to talk with bated breath about the voters. No more than the kings before them should the people be hedged with divinity."

What, so far as we in India are concerned, is the lesson to be derived from this provocative book. The source of the trouble in India as everywhere else lies in the fact, that "mass public opinion and legislation subject to popular pressures have come to exercise a dominant and dangerous influence over the executive functions of Government." It cannot be claimed that democratic Governments are the only Governments to be blinded by passion or by extraneous pressure; all Governments, to a greater or less extent, are under pressure. And it has been pointed out more than once in recent discussions of Mr. Lippmann's book that this problem of safeguarding liberty against democracy is as old as Plato, on whom incidentally Mr. Lippmann excessively leans. But whether tainted by excessive Platonic pessimism or by undue optimism in assessing the virtues of other systems, Mr. Lippmann has certainly a point in arguing that democracy has in our time failed conspicuously to extend the area of liberty in most countries of the world. More particularly as Mr. Lippmann says: "The powers which were ceded by the Executive passed through the assemblies which would not exercise them to the mass of the voters who, though unable also to exercise them, passed them on to the party bosses, the agents of pressure groups, and the magnates of the new media of mass communication."

In India at the present time no one need deny that in the name of the people many areas of individual liberty are being blotted out and that the concentration of power is with one party, even if it is not entirely in the hands of party bosses. Here the instrument of concentration is as much in the philosophy of the governing party as in its agents. The suggestion, for example, that because Prohibition is the will of the large majority it should be imposed over the whole country without exception is an example of the democratic ideal being used for the extinction of some individual liberty. Similarly, it may well be that in the process of working a socialistic pattern of society a la Mahalanobis party Government policy will be unduly harsh on individual values. Here the danger is not a shortage of what Mr. Lippmann calls the "public philosophy". This might err in excess as well as in shortage.

And thus Mr. Lippmann's answer is both incomplete in itself and inappropriate in its application to India, at any rate for the present. The "public philosophy", which formed the basis of the convictions of the Founding Fathers, is a solution based upon the particular American historical tradition. That "public philosophy" was conceived as a balance to the doctrine of individual liberty on which the Founding Fathers were reared. But in Eastern countries, which have had no widely accepted individual pholosophy as part of their democratic tradition, undue emphasis on a "public philosophy" may be a remedy worse than the disease. India, like other countries in South-East Asia, needs to face the challenge of the conflict of democracy with liberty in an abruptly different way.

The conflict between democracy and liberty is, nevertheless, real in the Eastern, as well as in the Western, hemisphere. The disease is the same, a lack of balance between individual liberty and the "public philosophy". But the remedies are different. If there is too little interference by public authorities in the West, there may be too much in the East. Who is to apply the remedies in each case?

Gold : A Bad Precedent

IS the Mysore Government's policy of nationalisation of the Kolar Gold Mines the result of a well-thought-out economic plan, or of political expediency, or of the frustration born of the State's failure to enrich its coffers from the 1949 agreement between the lessees and the Government? The State's Minister for Industries, Mr. H. Siddaveerappa, has been frank enough to admit that, while the State Government expected to receive an annual royalty of some Rs. 30 lakhs, it had not got "even 30 coppers so far". This seems to be the key to the whole controversy, but who is really at fault for this adverse turn in the deal? In terms of the agreement, the companies were to pay the Government a "contribution", in lieu of the then existing gold duty, of 70 to 75 per cent of the "net surplus", in addition to royalty. Since the agreement was signed six years ago, there has been a steady fall in the value of gold—a decline of as much as 18 per cent. Further, there has been a continuous rise in production costs.

These two factors have inevitably hit not only the contributions due to the Government but also the dividends to shareholders. For this untoward development, no hue and cry has been raised by the shareholders but the State Government has unfortunately chosen to do so. Having thrown the blame on the companies, the findings of the subsequent inquiry committee—the representative character of which was questioned by the industry—were a foregone conclusion. Accordingly, it is not surprising that the Committee has tried to play down the real factors which have reduced the contributions from the companies, and has harped on the thesis that the shareholders have received in return many times the amounts of the investment.

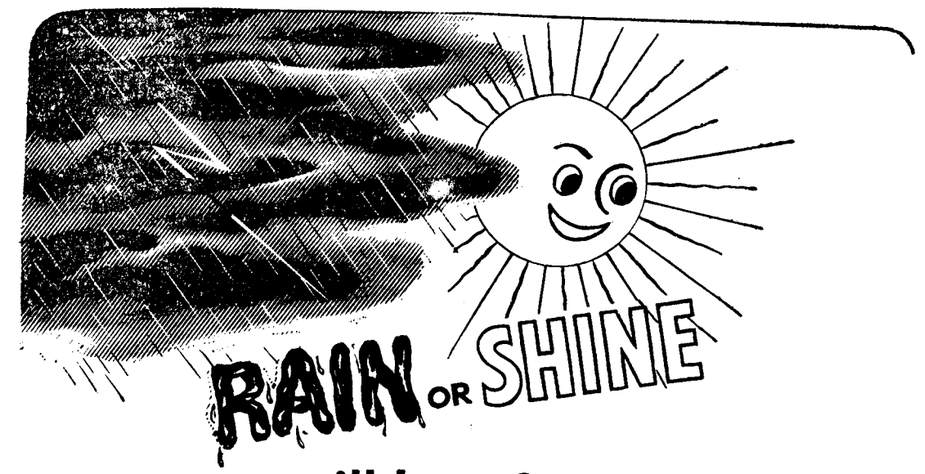
Instead of facing squarely the realities of the situation, the State Government has been exhibiting a strange sense of frustration. Stating that the Government wants the companies, in the first place, to agree to the payment of an enhanced 10 per cent royalty to secure a "reasonable return" to the State from the industry, Mr. Siddaveerappa has threatened that "if the mining companies do not see their way, there is no alternative but to nationalise....We do not want to take any hasty step but we are certain that the present agreement must be scrapped as early as

possible." Does this mean that the Government has not yet finally decided on nationalisation? The Minister is peeved at the absence of response so far from the companies to his new demands.

If the Government is determined to nationalise the concerns nothing can prevent it from doing so, after paying adequate compensation. But then it would have hardly convinced the interests concerned of the equity of its action. The management of the mining companies, on its part, has made it perfectly clear that the nationalisation of the mines is not a matter for the assent of the management and that this assent has not been given. It has only agreed to continue the development and expansion activities of the mines in the normal way and to co-operate with the Government in dealing with problems that may arise.

The present trouble might not have arisen but for the wayward course in the price of gold since 1949 which has deprived the State of a reasonable revenue from the working of the agreement. The average price of gold, which was as much as Rs. 114-15 per tola in 1949, slumped to Rs. 86-2 in 1953 and fell further to Rs. 83-7 in January 1954. Although output had been increased to the utmost capacity of the mines, the precipitous fall in the price—with no compensating fall in working costs—reduced the profits so much that the permitted amount of 15 per cent of costs became available only in small part for setting aside towards depreciation and development expenditure, while there was no surplus on which to pay contribution to the State Government, and only meagre dividends were paid to shareholders. Since then, however, the market rate has been fluctuating with an upward tendency. By the end of 1954, the price had gone up to Rs. 87-9 and, since then, the upward trend has been maintained almost throughout with the result that in June this year the level was as much as Rs. 94-1. There is nothing to indicate a possible reversal of this trend.

A compromise formula may be possible which will satisfy the contending parties. If the royalty can be linked to the price of gold, the Government will continue to receive a reasonable share of the surplus profit even when the price of gold follows a downtrend. A workable arrangement of this kind may, thus, be tried which will avoid the need for nationalisation until the expiry of the present agreement in 1970. Such avoidance is desirable at least to assure business interests in India and abroad that the Government of India really means what it says that it is primarily interested in expanding the public sector and not in substituting its own ownership in place of the existing private owners. In an industry which suffers from increasing costs in entering deeper layers, there is no assurance that the public sector can operate to greater advantage and get by direct operation what it now demands from the Company.



Oil: A Good Precedent

JUST as gold furnishes a bad precedent for the relation between the public and the private sectors in India, oil, it seems, will furnish a good and happy one. On Wednesday, July 20, it was announced by the Chief Minister of Assam, Mr. Bishnuram Mehdi, and the Union Minister for Natural Resources, Mr. K. D. Malaviya, that a new agreement had been reached with the Assam Oil Company providing for a new pattern of co-operation in the oil exploration industry. For the present it is unnecessary to look with undue curiosity at the terms of this agreement by which the co-operation of the private sector has been secured in a great enterprise. It is important to note the spirit in which this agreement has been concluded which is resoundingly different from the manner in which the Kolar Gold Mines Companies have been forced into submission. Nobody should object to voluntary agreements of this kind which extend the sphere of the public sector with the full consent and active co-operation of private elements in the industry.

Not, indeed, that the private sector has in the oil negotiations had, by any means, its own way. Under the new pattern illustrated in the present agreement the original period of the mining lease has been reduced from thirty to twenty years with an option only to the Government to extend the period by another twenty years. This has taken the place of the old petroleum concession which was for thirty years and gave the lessee an opportunity to extend the period by another thirty years making virtually sixty years in all. Again, the share of the Central or State Government is now to be a third of the capital of a new rupee company which is floated so that the Government has also advanced its holding compared with its 25 per cent share in the operations of the Indo-Stanvac Company in West Bengal. Again, a clause in the agreement ensures what is described as "the maximum employment of Indian personnel at all stages of the organisation" with an undertaking not to recruit any foreigner for a task for which a suitable Indian is available.

Not only has the spirit behind the negotiations been accommodating on both sides. It clearly has a forward-looking purpose. Mr. Malaviya made it clear that there was no desire on the part of the Government of India to discourage foreign interests in the tasks of mineral production. The Central Government, he said, was quite prepared to examine any proposals of foreign companies for prospecting in other areas, and, indeed, a dozen applications are already before the Government.

The idea that there was some unbridgeable gap between the "capitalistic" view and the new "socialistic" pattern of society has been thus falsified. It is seen by chapter and verse in this case that a large oil company is quite willing to assist the public sector under conditions which will provide in time for its progressive elimination. This is not a unique instance. Students of the economic history of the U.S.S.R. know that private interests have been quite willing to work even with Communist Governments. It is good that one should remember that this co-operation has been made available on terms which Capitalist-hating countries have not deemed unfair. It is interesting to see if the current prejudice against foreign collaboration will be subdued by these new illustrations of the capacity of believers in a private enterprise system to accept and co-operate in the working of an unpalatable system, if moderately reasonable conditions of return were provided. The belief is all too common in India that the terms of co-operation with Communist countries are necessarily more favourable than those with Capitalist countries. This is by no means the case; it is doubtful if the U.S.S.R. would accept the terms which the Assam Oil Company has gladly accepted.

THE WEEK'S NOTES

AT GENEVA

ON THE hallowed principle that well begun is half done, the Geneva Four-Power meeting may be said to have fulfilled already half the hopes of the world. The cordiality among the leaders has exceeded all expectations and the agreement on the agenda has been quick. All these hopeful features vindicate the faith of those who have all along urged such high-level talks but it has to be remembered that it is not the mere fact of the meeting that has promoted this degree of cordiality. The particular point in the time-sequence of the cold war at which the meeting is being held has been responsible for the leaders approaching their problems with a new determination, avoiding all the acrimony of the earlier phase of their relations. The agenda—German unification, European security, disarmament and East-West relations—does not include Asian maladies, for which, as Mr. Nehru has pointed, another conference, with China included, would be necessary. Geneva must first succeed in infusing new hopes before these further plans can be made and it is heartening to hear that the Conference is now well-set for such hopes to materialise. If an atmosphere of mutual trust is created among the leaders, all other obstacles—political, military, legal and economic—can be removed in a short time.

Sir Anthony Eden has proposed a series of possible guarantees to ensure that the unification of Germany in freedom, and the freedom of a United Germany to associate if she so chooses with the West, should not involve a threat to the Soviet Union. These proposals include a demilitarised zone, limitation on forces and supervision of armaments and a security pact in which the victim of aggression would be assisted by the others. These are not hard and fast proposals and their merit to the Russians must lie in the recognition accorded to Russian fears about her security if Germany grows stronger. President Eisenhower has reiterated this desire to take account of the legitimate security interests of the Soviet Union but at the same time he has been candid about the fears generated elsewhere in the world by the conditions in Eastern Europe and by the activities of international Communism. There is enough in the opening declarations at Geneva that a new spirit has been injected into international diplomacy. There is frankness without bitterness and this should help break the vicious spiral of suspicion of bona fides which has obstructed all progress till now.

POLITICAL MOVES IN PAKISTAN

THE DISMISSAL of the North-West Frontier Province Ministry as a result of the Chief Minister, Sardar Rashid's attitude to the one-unit scheme for West Pakistan, once again illustrates not so much the determination of the leaders of Pakistan to push the scheme through at all costs as the growing opposition to it outside West Punjab. Khan Abdul Ghaffar Khan's entry into his home province has been marked by considerable popular enthusiasm and he has not been slow to declare that the Pakhtoons should be governed by the Pakhtoons themselves. His influence will in all likelihood increase. Sardar Rashid having committed the inexcusable offence of refusing to take responsibility for keeping Khan Abdul Ghaffar Khan out of the Province and of making a public declaration to that effect in the Constituent Assembly at Murree, will have to go into the opposition. It is not known to what extent his successor or Dr. Khan Sahib will succeed in counteracting these influences in order to sell the one-unit scheme to the Pathans. Even the Muslim League Council of the Province has demanded full autonomy under the one-unit scheme, which is a contradiction in terms. The truth is that there is distrust everywhere of Punjabi influence in the one-unit Government and it is a moot point whether unity can result from such distrust.

These developments must open the eyes of the Pakistani leaders to the difficulties of imposing unity from above. Every step taken in that direction has involved repudiation of faith in the democratic principle because of summary dismissals of Ministers. It gravely impairs Pakistan's case when it demands self-determination for the people of Kashmir. In Sind, the N.-W. F. Province and in East Pakistan,there have been summary rejections of public opinion whenever it was critical of the Central Government. The democratic process has not been smoothsailing in Pakistan and its leaders have in the last few years had to resort to many questionable constitutional practices to maintain a semblance of political stability. It ill becomes the leaders of Pakistan, therefore, to criticise India for not playing the game on Kashmir since they will not be able to give the people there what they have not been able to give to their own citizens, namely local governments of their own choice.

The Pakistan Constituent Assembly has now adjourned to meet at Karachi next month and the interval may prove to be a period of intense political manoeuvre. It is now openly known that Mr. H. S. Suhrawardy wishes to displace the Prime Minister because he cannot forgive him for his sudden and unexpected alliance with Mr. Fazlul Huq. But if the latter is antagonised in the process the stability of the newly-installed Ministry in East Pakistan may be in jeopardy. Altogether, politics in Pakistan is now in a confusing state, and has left the Government less and less competent to deal with the many problems that arise.

ECONOMICS OF GERMAN REARMAMENT

WESTERN GERMANY'S prosperity boom in the first half of this year points to some of the problems which will have to be faced in future, if she decides to rearm. German labour reserve has been nearly exhausted even now as a result of the expansion of the economy and the unemployment figure is only about 450,000, mostly women. So there are proposals to attract more women into industry. The position is similar to that of Britain in the approach to full employment and it is reported that there are no signs at the present time of this expansion losing momentum, because order books are full and delivery dates are still long. Orders received by German industry are still in excess of the orders executed; Siemens engineering industry has a backlog of over a year. Steel production is now running at an annual rate of 20 million tons; output of cars and vehicles has increased by about one-third over the first half of last year. Exports have increased and German gold and dollar reserves have risen by about 1,600 million marks in the last twelve months.

The strains of full employment are becoming felt in the migration of labour to better-paid jobs and in new wage demands. The wages of nearly three million workers have already been increased in the first half of the year and further demands from the rest are expected. If the burden of rearmament should be imposed on this situation, it is bound to have reactions over the whole of the economy which is now geared to an expanding export market. Whereas rearmament under Hitler was possible in the context of six million unemployed and much unused capacity in industry, it

cannot now be an easy process. With further expansion of East-West trade in the changed political climate of Europe, Germany may well lack the zest to embark on arms while peace continues to be paying well enough.

THE LIBRARY AND THE LAW

IT IS very unfortunate that a controversy should at all arise over the disposition of the India Office Library and still worse that it should defy the efforts made by the Education Minister towards an amicable settlement. It has been reported that the legal position stood in the way of a solution, but so far as one can see, the only legal maxim that can support the British stand is that possession is nine points of the law. What the British Government came to have, it feels it should own; otherwise it is hardly conceivable that the records, manuscripts and books which were maintained at India's expense all along until recently could have become inalienable acquisitions of the British Government. The raison d'etre of the Library was British rule over India and any successor Government should similarly have a right of use of those facilities, unless it could be proved that any part of these are strictly not necessary for the successors. If they are of exclusive or predominant interest for the British historian, suitable arrangements cannot be beyond the ingenuity of the two Governments.

But this is a matter to be settled only by detailed negotiations, not one on which there can be an assertion of a prescriptive right. It is possible that the Government of India would find it advisable to keep a part of these records in the India Office under its own control for the benefit of research workers. But there can be no moral or legal justification for acting as though Indian historians and the Indian Government should not have the control and free use of documents which pertain to this country's past for the purpose of reconstructing that past in her own way.

Lord Home has now displayed an acquisitive outlook, on an issue in which it was hardly appropriate, and at a time when mere title to property without justifiable public function attached, no longer confers privilege. It may be that even such trivial matters will gradually become issues to be discussed at the "summit", in view of the current popularity of this ordinary word.

AFTERMATH OF THE AKALI MORCHA

THE AFTERMATH of the withdrawal of the ban on slogans by the Punjab Government has been entirely satisfactory. The Akali Dal has not committed the mistake of persisting in an agitation which has pointed out to them the dangers of opposition as much as the strength it can muster when it works on a plausibly good cause. The Maha Punjab counter-agitation has also gained strength, which, perhaps, did not enter fully into the Akali Dal's original calculations. If the Punjab Government had merely allowed the banning order to lapse in the ordinary course, the Akalis would have had less reason for satisfaction. As it is, the Punjab Chief Minister has taken responsibility for a good gesture of compromise and the Dal can rest on its laurels because it has now achieved greater importance than it had expected. It is unlikely that the pro-Akali Sikhs were ever hopeful of securing a Punjabi Suba on the lines they had demanded and the Maha Punjab agitation must serve to warn them that one type of communalism will breed its opposite to the detriment of all the communities concerned. They may, however, hope that at local levels, there will be greater accommodation among the various groups.

The statement of the acting President of the Shromani Akali Dal, Sardar Bahadur Singh, that the Akalis would accept Mr. Nehru's decision "regarding Sikh grievances and the creation of the Punjabi-speaking State" comes as an anti-climax. Its importance lies in the craving for the recognition of the Dal at higher levels as a political force to be reconciled, if not to contend with. Obviously its leaders feel they have now earned the right to such recognition. But their methods were hardly such as to induce Mr. Nehru to accept them. It may be expedient, however, not to create further room for the feeling that Sikh demands will not get proper consideration; for it can be cleverly manipulated by irresponsible leaders. Meanwhile, all other agitations which were the by-products of the Akali Morcha must cease and the Akalis must give assurances that they will not abuse the sanctity accorded to religious places by carrying on their political agitation within their precincts.

A Window on the World

THE DETERMINIST GOSPEL

By

ODYSSEUS

SOME OF YOU may (or may not) remember that in March, 1954, I published a series of articles here entitled "Freud's Challenge to Philosophy", in the course of which I said that Freud's theories on psychology launched simultaneously one of the biggest scientific advances and one of the worst philosophic setbacks that the world has experienced since Darwin caught the philosophers of the nineteenth century out of step with his theory of evolution. My theme was that the Freudians had applied theories which satisfactorily explained abnormal psychological symptoms to explain away ethics, with such apparent success that the average educated man today thinks that nobody can be held morally responsible for actions that used to be praised as "good" or blamed as "bad" because he believes that all the conscious faculties of men are beyond their control, deep in the unconscious. Courage, for example, is merely sublimated masochism; conscience but a sublimated feeling of guilt derived from memories of parental scoldings.

It is always pleasant for a minor scribe to find his views upheld by a major prophet. I refer to a challenging little book of 78 pages, entitled, somewhat forbiddingly, "Historical Inevitability", published at 6/- by the Oxford University Press, written by Isaiah Berlin, who is one of the most distinguished of the younger contemporary British philosophers.

I used to see something of Isaiah Berlin in Washington D.C. during the war, when he used to prepare for the Commonwealth authorities a weekly survey of that baffling phenomenon: American public opinion. This survey was an astonishing piece of observation and analysis, expressed with the wit expected, and a charity less usual, in a Fellow of All Souls, Oxford. All those who received Mr. Berlin's survey read it with relish, and returned to their tasks feeling that at last they understood the incomprehensible. Isaiah Berlin's readers included Winston Churchill and myself. I enjoyed one advantage over Churchill in that I had only to pick up my telephone to get a scintillating elaboration of any point that interested me. Churchill, as impressed with Mr. Berlin as I was, was anxious to meet him, so that when, one day, he heard that Mr. I. Berlin was in London, he told his secretary to invite him to 10, Downing Street at once. The ensuing effort of the two men to understand what was going on in each other's formidable minds is said to have led each to doubt the sanity of the other, for whereas Winston was Churchill all right, the Mr. Berlin who had been brought before him was not Isaiah, philosopher, but Irving, the popular song writer, composer of such memorable ditties as "When I Lost you," and "You Forgot to Remember". I would like to have been present at that remarkable interview.

However, what I set out to say was that Mr. (Isaiah) Berlin's new book is a successful effort to rebut two powerful doctrines, Relativism and Determinism, which have for too long been at large spreading fallacies in contemporary thought, and doing great damage to the minds of ordinary citizens like you and me, who are too busy earning our livings to have leisure to check up on ideas which seem plausible and are taken for granted by every third person one meets.

Last March, I submitted arguments upholding the freedom of the individual to choose between good and evil. What makes it more important than ever to establish the truth of this proposition is the wide prevalence of the Marxist Determinist view, which lays down that men are not each unique, entitled to the freedom and respect due to individuals, but, like the animals, vegetables, and minerals, belong to classes which obey general laws, and that once these laws have been applied (as in the U.S.S.R.) this produces universal felicity (as in the U.S.S.R.?). This conviction is not peculiar to Marxists but is echoed by many planners, technocrats, bureaucrats, and believers in a scientifically planned and controlled society.

THE RED DAWN

Hegel, and after him Marx, were among the pessimistic Determinists. They assumed that men are part of a wider nature which Hegel regarded as spiritual and Marx as materialist. Both thought that social forces are at work of which only a handful of exceptional individuals ever become aware. Ordinary men, they asserted, do not know what shapes their lives, but invent childish theologies and mythologies to explain the world to themselves. From time to time the real forces, impersonal and irresistible, which govern the world, develop to a point at which a new historical "advance" is "due". These advances occur in violent cataclysmic leaps, destructive revolutions that establish a new order on the ruins of the old. Hegel saw History as a perpetual struggle of vast spiritual forces embodied now in institutions—churches, civilisations, empires, states—now in individuals of heroic stature, towering over and contemptuous of their puny fellowmen. Marx saw the struggle as between socially conditioned classes—capitalists and reactionaries, and the proletariat shaped by the fight for subsistence and consequently for the control of power.

"There is," remarks Mr. Berlin, "a note....of sardonic gloating in the words of both these thinkers as they contemplate the discomfiture and destruction of the philistines, the ordinary men and women caught in one of these decisive moments of history." Both conjure up an image of peaceful and foolish human beings, largely unaware of their part in history, building their homes, with touching hope and simplicity, upon the green slopes of what seems a peaceful mountain side, trusting in the permanence of their own economic, social, and political order, unaware of the cosmic processes of which their lives are but a passing stage. But the mountain is a volcano and when (as, of course, the philosopher always knew it would) the inevitable eruption comes, they and their homes and their elaborately tended institutions, their ideals and values, will be blown out of existence in the cataclysm which marks the leap from a "lower" to a "higher" stage. To be wise, in the Marxist view, is to understand the direction in which the world is "inexorably" moving and to jump on the band waggon—to resist, to think one knows better, is useless, infantile, fatal. Salvation lies in identifying oneself with the rising power that is ushering in the new world.

WHEN HISTORY "DOES HER STUFF"

When History takes her revenge (and Marx looked to History to avenge him against those he hated) the

"mean, pathetic, ludicrous, stiffling ant hill will be justly pulverised"—justly (and this is the point towards which we have been working) because what is just and unjust is determined not by the moral choices of the individual but by the impersonal goal towards which all creation is moving. Woe to the conquered! whoever is on the side of the victors is by that very fact just, wise, and rational, and whoever is on the side of a society that is foreordained to destruction is, for that very reason, foolish, ignorant, subjective, reactionary, blind; and if the fools try to resist their doom, they are rightly anathematised as wickedly hostile to the welfare of mankind.

To the diligent frequenter of this column who has seen these fallacies refuted on many a hard fought weekend, a dozen objections to Marx's picture will occur. Nevertheless, we must concede that to millions, the Marxist gospel seems inspiring, heartening, consoling. It is easy to see why. It relieves its adherents of the burden of personal responsibility. When Mussolini learnt that the British and Americans had landed at Anzio, he might have been overtaken by remorse for the series of disasters that his childish imperialist ambitions had inflicted on millions of his innocent fellow countrymen. But the Determinist philosophy that is at the back of all totalitarian systems of the Right as of the Left enabled him to hide from his own soul behind a grandiose dusk-of-the-gods smoke screen. "History," he cried "has seized us by the throat!" It was jolly decent of History thus to step down from Olympus at the right moment to pronounce her Awful Decree because she thereby allowed Mussolini to camouflage his errors and failures in the black and purple hues of high tragedy, and relieve himself of any personal responsibility for his doom. "History is wiser than we, and its purposes are unfathomable to us", says Mr. Berlin ironically. How inspiring it is to feel that we are but the instruments of some vast all-embracing scheme of eternal human progress, of Manifest Destiny or the Dictatorship of the Proletariat. Any moral censure, the accusing finger of historians, or the agonies of the individual conscience, are explained away as sophisticated versions of primitive taboos, now manifesting themselves as moral consciousness, growing out of that ignorance which alone generates those "fallacious beliefs" in Free Will that will be eclipsed by the growing Revelation of Scientific Truth.

No sooner do we acquire the Determinist's insight into the "inevitable" workings of fate than our sense of guilt is automatically dissolved; the fear of failure vanishes as we see ourselves as members of a "larger whole". We are soldiers in an army; our goals are set for us. We do not have to think or fend for ourselves. All doubts are stilled by Authority.

This is a formidable religion, a faith of a kind for which many will be ready to die with a cheer in their throats. It can nevertheless be shown to be the false religion of a false god. The logical objections to it have often been set forth in this column. Next week, however, I will outline one or two of Mr. Isaiah Berlin's new and most original refutations, the like of which, in fairly widespread reading on the subject, I have not come across elsewhere, and which, as far as I know, have not even been touched upon by that prolific writer, Mr. Irving Berlin.

A DELHI DIARY

HIS FINEST HOUR

I LIKE to think of this last week as containing the Prime Minister's finest hour. There is no doubt that all over India all this week the spotlight has been on the Prime Minister. It has been full of affection, abundant and overflowing. Those who saw the film describing his experiences in the U.S.S.R. might even make a comparison in their own minds of the extent to which Indian enthusiasm has surpassed that in the U.S.S.R. It has been wonderful to behold what happened in the U.S.S.R. There has been in all Delhi cinemas, where it has been shown, great enthusiasm although there were many technical aspects of the picture which might have been considerably improved. I pay the Films Division tribute, however, for the manner in which the spontaneous character of the tour has been faithfully recorded. It has also been good to find that it has been so effectively exhibited all over India this week bringing the Prime Minister close to the people whose popular hero he, now more than ever, is.

It was appropriate that the Head of the State should draw special attention to the services which the Prime Minister has rendered to India. There never has been a time in all India's history where a single individual has been able to add by his personal acts so much to the prestige of the country in so large an area of the world. There was a note of pride in the President's Speech on the occasion. He spoke of "the avidity and eagerness with which we have looked forward to the news of the splendid welcome which has been extended to Jawaharlal Nehru by the Governments and peoples of the various countries which he visited." He went on to say: "We are an ancient country but a very young Republic, and it is a matter of gratification to know how its activities and policy for the establishment and maintenance of peace are being appreciated and how they have raised our honour and prestige." It was a happy speech to which the Prime Minister happily responded, though moved all the time with deep emotion.

While I think the conferring of a decoration was appropriate on this occasion (although I still maintain that all decorations are still contrary to the spirit of the Indian Constitution!), I cannot say that I am happy about the particular decoration given in this case. I mean no disrespect to those eminent persons to whom the Bharat Ratna has already been given. But I think they will be the first to admit that the Prime Minister's contribution to the prestige and honour of India belongs to a different class. Even if it were necessary to maintain the existing class it might have been possible to give the decoration a new name so that everyone would know the quite unique appreciation which was accorded to Jawaharlal Nehru.

The physical strain of the elaborate programme arranged in many countries (made no easier by the vast number of new faces and minds to be remembered) has certainly worn the Prime Minister down. At his Press Conference last Tuesday he had two additional handicaps with which to wrestle. The first was a comparatively sleepless night as he was at the airport till 4 p.m. conversing with President Soekarno who was on his way to Mecca. He also contracted a cold which obviously had a depressing effect on the Press Conference. The Prime Minister chose his words carefully and there was information enough to be found but I did have the feeling that Room No. 63 was duller on this occasion than it had ever been at a previous Press Conference.

ROOM NO. 63!

It may be that part of the fault is with Room No. 63. I cannot for the life of me understand why vast sums are being spent elsewhere while this central room in Parliament House should continue to be so neglected. There are indeed marks of air-conditioning. But, at any rate last Tuesday, air-conditioning was conspicuous by its absence. Again, I cannot understand who chose the heavy velvet curtains designed to make this room the gloomiest of all rooms in this imposing building. The dark wooden panelling combined with heavy curtains produces an atmosphere of gloom which it must be difficult to surpass. The pictures chosen to adorn this room have good subjects, namely, some of India's great architectural monuments. But why are they of the wrong size and why do they hang at different levels? I do hope sincerely that someone responsible for this unhappy room will go speedily to its rescue.

I blame the Prime Minister's Press Conference, which was not very exciting so far as I was concerned, on a late night, a bad cold and Room No. 63. I had a feeling shared by many journalists that questions were slow in coming forth and that when they came forth they did not show India's accredited Press representatives in their happiest form. Again, I had a feeling that the Prime Minister was somewhat easily displeased by the questions asked. One particular question in regard to the Anglo-Portuguese Treaty was, I know, provocative. A Press Conference is after all meant to be the freest of all assemblies. Can one have a free assembly of this kind without some possible provocation?

I make a complaint against my kind not so much in terms of factual omissions in reporting (as in the European tour) but in terms of perspective. The whole daily press seemed to have found in the Prime Minister's outburst on Goa almost the sole point of interest in the Conference which touched on at least twenty other important points. And while the Prime Minister's statement was directed against some British papers, I doubt if his resentment carried over to any particular Government, except that of Portugal. At least I did not think so. Was it not bad perspective therefore to pillory the "Atlantic" Powers—undefined—in banner headlines? Again, on this particular issue, although there was firm language there was no new policy declaration. And, if there is no policy declaration, was the mere fact that the Prime Minister was particularly upset at the behaviour of the Press abroad, a matter to receive the overwrought attention which was given in the newspapers on the following day?

THE RETREAT!

I know I am rushing in where angels fear to tread. I shall be told that it is an ill bird that fowls its own nest. In any case, trade unionism is now popular and I must behave as a good member of the Federation of Working Journalists. I, therefore, now very humbly withdraw!

ARGUS.

The Birla Jute Manufacturing Co. Ltd.

NOTICE is hereby given that an Extraordinary General Meeting of the members of the above-named Company will be held at the Principal Office of the Company, 8, Royal Exchange Place, Calcutta, on Thursday, the 11th August, 1955, at 3-30 P.M. in the afternoon to consider and if thought fit to pass with or without modification the following resolutions, viz:

Ordinary Resolution:

(1) That the Authorised Capital of the Company be increased to Rs. 4,00,00,000 by the creation of 8,00,000 new Ordinary shares of Rs 10 each and 1,75,000 new second Preference shares of Rs. 100 each with powers to Directors to issue such 1,75,000 new second Preference shares with such preferential or special rights, privileges or conditions attached thereto as they may decide.

Special Resolution:

(2) That clause 3 of the Memorandum of Association of the Company be amended so as to include two new sub-clauses 2A and 2B as detailed below:

"2A. To carry on, in all its branches, the business of producers, manufacturers, purchasers, refiners, importers, exporters, sellers of and dealers in cement, alumine cement, portland cement, lime and limestone, kanker, plasters, artificial stone and materials of every kind used in the manufacture thereof, whiting, clay, gravel, sand, sacks, bricks, tiles, building materials of all kinds, and all materials analogous to or connected therewith and the business of miners, metallurgists, builders, contractors and to purchase and vend all materials raw, processed or otherwise and all articles in any way connected with the aforesaid business."

"2B. To carry on, in all its branches, the business of producers, manufacturers, purchasers, importers, exporters, sellers and dealers in all kinds of synthetic fibre including all types of fibrous material and all materials analogous thereto or connected therewith and to purchase and vend all materials raw, processed or otherwise and all articles in any way connected with the aforesaid business."

The Share Transfer Books of the Company will remain closed from 1st August to 11th August, 1955, both days inclusive.

By Order of the Board,
BIRLA BROTHERS, LTD.,
Managing Agents.

CALCUTTA,
Dated 13th July, 1955.

In Particular to: Sm. Grihya Kumari, Smt. Sarojini Devya, Mrs. Rubie Nanda, Messrs. Ambika Charan Neogy, Gopal Chandra Das, Burjorji D. Mama, Andrew Gibb, Gayanath Saha and C. K. Mistri and Ors., Kedarmani A. Dikshit and E. F. E. Moses.

"The Eastern Economist"

BLUE SUPPLEMENTS

A NEW FEATURE

With effect from this month 'The Eastern Economist' will publish in the last issue of each month a *Special Supplement* dealing comprehensively with a large topical economic issue.

The first such *Supplement* will be published on July the 29th and will contain a discussion of *Company Law* with special reference to the proposed *Companies Bill.*

Subscribers to 'The Eastern Economist' *will receive these Supplements free of charge.*

Single copies of the *Supplements* will be available at annas eight each. The subscription for twelve copies will be Rupees Five, inclusive of postage.

For further information, write to:

The Manager,
The Eastern Economist Ltd.,
52, Queensway,
New Delhi.

WORLDGRAM

ICULTURE

'akistan's Wheat Policy: The objectives of the tan Government's wheat policy are to have at mes a reserve of 500,000 tons of wheat and to e further the price of wheat, which now is 8-12 per maund (1maund = 82 pounds). The new t year would begin with a reserve of 225,000 tons, ı is 50 per cent less than in the previous year ; to an insufficient crop last season. The Gov- ent, Plans to step up its wheat procurement in iew season to satisfy domestic demand and to e the reserve to the minimum required.

*

aly's Agricultural Production in 1954: Agricul- yields, in 1954, were only 6.3 per cent below the igure. Owing to rising prices, in 1954, the sale of the year's crops totalled 2,912,000 million lire t 2,954,000 million in 1953 (—1.4 per cent). In 4, the consumption of fertilizers rose by 14.6 ent over the 1952 total, the respective figures ed being 3,246,000 metric tons used in the latter , as gainst 2,831,700 tons in 1952-53.

*

anese Paddy Method in Nasik District: One thou- additional acres of land would be brought under by adopting the Japanese method of cultivation esult of the intensive propaganada made by the District Development Board in the rice growing f Igatpuri, Peint, Nasik, Dindori, Kalwan, Chandor iphad talukas and Surgana Mahal. Meetings rganised in June, in centrally situated 15 villages verywhere cultivators showed keen interest in panese method.

TRY

rtilizer Factory in Pakistan: A fertilizer factory Rs. 6.35 crores for the production of 50,000 ammonium sulphate per annum is being set up OC at Dandhel. Railway siding facilities have been provided for the transport of heavy ient to the factory site. The equipment and ery for the factory is arriving according to the nme. The factory is expected to be in opera- the middle of 1956. FAO has agreed to contri- 0.5 million towards the cost of the plant, while investment is estimated at Rs. 2.35 crores.

*

w Jute Works for Pakistan: The Dundee and engineering firms in U.K. have obtained a tial share of machinery orders for new jute hments in Pakistan and Turkey. The Dundee ill supply the looms and ancillary machinery, he preparing and spinning machinery will be l by James Malkie and Sons, Belfast. The f the contract is not yet known. The Pakistan will be called the Platinum Jubilee Jute Mills. ill be at Khulna and will have 750 looms. The Works, Government sponsored, will have 500

*

put of Coal During May, 1955: The output of collieries in India decreased to 3,175,335 tons 1955 from 3,230,006 tons in the previous month, g to official statistics released by the Chief r of Mines. Despatches of coal, however, d to 2,743,546 tons in May as against 2,692,508 April. Coal stocks at pitheads increased from tons at the beginning of the month to tons at the close of the month.

Electrical Wiring Accessories: Two draft standards have been issued by ISI for electrical wiring accessories. The drafts now issued prescribe standard dimensions of the respective accessories, minimum insulation resistance which will ensure safety from electrical hazards, and a number of tests to determine electrical and mechanical performances including expectations of life and ability to withstand a higher voltage than the supply voltage. The drafts also describe a number of gauges which can check the interchangeability of these accessories.

*

Production of Ammonium Sulphate in Japan: Japan will produce an estimated 2,711,000 tons of ammonium sulphate fertilizer during the 1955 fertilizer year (August to July, 1956), according to the Government's latest production Plan. Of the total estimate 611,000 tons will be set aside for export and the remaining for home consumption, including 160,000 tons to be specially reserved for adjustment of demand and supply during the period. The total output estimated for the 1955 year will be 201,000 tons more than the revised production figure for the 1954 period.

*

Continuance of Protection to Industries: The Tariff Commission has taken up for summary investigation the question of continuance of protection to the following four industries beyond December 31, 1955. Coated abrasives, Motor vehicle batteries, Automobile sparking plugs and power and distribution transformers. In this connection, the Commission has prepared special questionnaires for producers, importers and consumers in the case of each of these industries and they are ready for issue.

*

Steel Factory in Thailand: Government surveyors in Thailand have found extensive iron deposits of high quality in Umkrum mountain, 50 miles north of Kanchanaburi, and a Plan to open a smeltry has been outlined. Foreign firms are invited to exploit the deposits either alone or in the co-operation with the Government. The smeltry would produce not less than 100 tons of steel a day. Preliminary work will be undertaken by the Government to provide details on converting the ore into finished products and to provide information regarding a site for the factory, the rate of delivery, and the amount of capital needed in Thai and foreign currencies.

FINANCE

Belgium's National Income: Estimates of Professor Baudhuin put the national income of Belgium in 1954 at BF 330.3 billion (US $6.6 billion), compared with BF 310.7 billion (US $6.2 billion) in 1953. Retail prices rose by 2 per cent during 1954, and the increase in real national income is estimated at 3 per cent. The distribution of income in 1954 changed only a little. Wages and salaries accounted for a slightly higher proportion than in 1953, whereas the share of profits in trade and industry was somewhat smaller. Savings amounted to 9 per cent of the national income in 1954, the same as in 1953.

*

Centre's Loan to States: The Government of India have sanctioned a loan of Rs. 2 crores to the local bodies or other road authorities in various States to meet the share of the cost of construction of over or under bridges proposed to be built in place of existing road-rail level crossings. The grant has been made from the provision in the Five-Year Plan for loans to Corporations. The level crossings proposed

to be replaced under the scheme are situated in the States of Andhra, Bombay, Madras, Punjab, West Bengal, Mysore, Rajasthan and Travancore-Cochin.

*

Aid for Village Industries and Handicrafts: The Government of India have sanctioned further grants and loans for the development of village industries and handicrafts. The All-India Khadi and Village Industries Board has been given a grant of Rs. one lakh which will be disbursed as subsidy to centres engaged in the production of hand-made paper. The Board gets another grant of Rs. 10,000 for conducting experiments to improve implements used in village industries. For the development of the village oil industry, Ajmer has been given a grant of Rs. 25,750. Out of this, a sum of Rs. 15,000 is for providing rebate on sales of ghani oil and the balance is for equipment subsidy and establishment charges. West Bengal gets a loan of Rs. 19,800 for the development of the palm gur industry. The amount is to be utilised for the marketing of palm gur through the State Sales Emporium.

TRADE

New Trade Agreement between Sweden and Yugoslavia: A new trade agreement between Yugoslavia and Sweden with a term of validity from July 1, 1955 to June 30, 1956, and providing for 30 to 40 million Swedish crone worth commodity exchange was signed in Belgrade recently. Yugoslavia will mainly export farm products, ores, metals semi-finished non-ferrous metal products, hardwoods, etc. to Sweden, while importing high grade steels, machinery, ball bearings, electric and telephone equipment, cellulose, newsprint and kraft paper, etc.

*

Pakistan's Exports Exceed Imports: Pakistan's exports exceeded imports on private account by Rs. 54.91 millions in April 1955. The exports on private account amounted to Rs. 111.4 millions while imports to Rs. 56.5 millions. Private account imports in April were the lowest since the beginning of the current trade year. The exports during the month under review, however, were in fact, about one-fifth more than in the previous month. Principal exports on private account during April, 1955, were jute, cotton, wool, hides and skins, and fish, whereas principal private import accounts during the month were, machinery, metals and ores, mineral oil, vehicles and instruments.

*

Anglo-Japanese Trade: Japan and the United Kingdom are negotiating for a new Anglo-Japanese trade and payments agreement. The object is to establish trade volume and payment method for one year period beginning this September 1. The original trade arrangement expired at the end of last year. It was later extended for three months until March-end and then re-extended in revised form for another three months. Japan proposes setting each way trade between Japan and the sterling area at a volume of £220 million, an increase of £10,500,000 over the present level.

*

Dutch-Israeli Trade Pact: A new commercial agreement between Israel and Holland—the sixth since the foundation of Israel in mid-1948—was signed recently. The new agreement provides for a further increase in trade between the two countries. The new agreement is again for one year with the possibility of automatic extension. Israel's purchases will consist of agricultural products and food,—edible oils and fats, chemicals and other new materials, as well as manufactures, including machinery. In exchange Israel will export citrus, other agricultural products and an increased quantity of manufactures, including tyres and glass.

*

Canada's Rise in Exports: Major increases in the exports of planks and boards, newsprint, paper, aluminium, copper, nickel, asbestos and petroleum and lesser gains in wood pulp, zinc and fertilizers contributed in pushing the value of Canada's domestic exports up 15 per cent in April to $336,100,000 from $292,400,000 in the corresponding month last year. Cumulative exports for the January-April period rose 13 per cent to $1,287,200,000 from $1,143,400,000. There was a particularly sharp rise in the exports to the United Kingdom, and substantial increases to the United States, Europe and the rest of the Commonwealth.

MISCELLANEOUS

Sui Gas Pipeline to be Extended to Multan and Lahore: A new contract has been awarded to Pakistan Constructors for the building of a 16-inch pipeline from the Sui gasfields to Multan—a length of 188 miles. The firm has just completed the gas pipeline over the 348 miles from Sui to Karachi. Work on the new line will begin in the middle of 1956, and will take about seven months to complete, though the country which the line will traverse is considered particularly difficult for pipe-laying. The line will later be extended to Lahore, and will have branch lines to Kot Adu, Montgomery, and Jhang Maghiana. The new contract is reported to be worth about £5,000,000. Pakistan Constructors, the successful tenderer, is a joint venture by a British organization and the Pakistani subsidiary of a U.S. Company.

*

Technical Aid by Britain: Britain has so far this year contributed £800,000 out of a world total of $19,430,028 to the U.N. Technical Assistance Board. This organisation sends experts to underdeveloped countries to advise about local production and other problems and arranges for trainees from these countries to pursue advanced studies abroad. Since the present assistance programme started in 1950, Britain's total contribution has been £3,160,000.

*

Rural Electrification Plans: While about 6,500 villages will be electrified at the end of the first Five-Year Plan, it is expected that during the second Plan, about 10 to 12 thousand more villages will receive power. The Planning Commission is, for this purpose, considering that in the second Five-Year Plan a sum of Rs. 10 crores should be allotted every year during the Plan period. The Planning Commission accepted the recommendations of the Roorkee Seminar and agreed to sanction Rs. 20 crores as loans to various States for electrification of villages and small towns in the last two years of the first Five-Year Plan. This was to be a part of the scheme for increasing employment opportunities. Of this sum, about Rs. 12 crores are to be spent on schemes intended for rural areas only.

*

Labour in Sugar Industry: There were 170 sugar factories employing 92,000 workers in India during 1953, according to the Labour Bureau, Government of India. The minimum basic wage of the worker varied from Rs. 15 to Rs. 30 per month in Bombay, to Rs. 8 to Rs. 24-6 inAndhra. The minimum wage inclusive of dearness allowance in U.P. and Bihar was fixed at Rs. 55 per month. The dearness allowance paid to the workers varied from place to place. It was linked with the cost of living index in Andhra, Madras and Travancore-Cochin. The rate was 2 annas per point of rise. The dearness allowance paid to the workers in Orissa, Modhya Bharat, Madhya Pradesh, West Bengal, Bhopal and Bombay was according to income groups and ranged from Rs. 21 to Rs. 51-12 per month.

NEWS IN BRIEF

INDIAN

The area under cotton in 1954-55 was 18,346,000 acres which is an improvement upon the area (17,182,000 acres) in 1953-54 and also exceeds the Plan target (1955-56) of 18 million acres.

*

It is reported that the Union Government would give necessary aid to start seven sugar factories on co-operative lines during the second Five-Year Plan in Andhra State.

*

The intake of nutritional foods in India is below the minimum requirement, according to the second "World Food Survey" and the "Year Book" of the Food and Agriculture Organisation.

*

It is reported the Government of India have referred to the Tariff Commission for investigation and report the claim of thin ball bearings industry to protection and assistance.

*

It is reported the Education Ministry hopes to provide every secondary school in non-Hindi speaking States in the country with at least one Hindi teacher under its programme for the second Five-Year Plan.

*

Rajasthan's second Five-Year Plan, as finally approved by the State Government is estimated to cost Rs. 132.5 crores.

*

The Delhi State Government's Rs. 8 crore milk supply scheme, envisages distribution of 7,000 maunds of milk per day.

*

The total subscriptions to the National Plan Bonds —second series 3½ per cent 1965—amounted to Rs. 103.65 lakhs, of which conversions accounted for Rs. 57.87 lakhs. Cash subscriptions will receive full allotment.

*

Export of tinplate containers will continue to be licensed freely to all permissible destinations other than the Portuguese possessions in India up to the end of 1955.

*

The Government of India has decided to release for export a further quantity of 1,50,000 bales of Indian raw cotton of current years (1954-55) crop or from crops of earlier years.

*

A programme for the manufacture of typewriters in India has been approved by the Government of India. Under this, three firms—Godrej Boyce of Bombay, the Remington Rand of India, Calcutta and the Rayala Corporation of Madras will in all be manufacturing 33,000 typewriters per year.

*

The Planning Commission has allotted Rs. 32.4 lakhs to the Ministry of Natural Resources and Scientific Research for equipment for the national laboratories under the Technical Co-operation Mission programme.

*

The Government of Bhopal has decided to start an agricultural research institute-cum-college shortly.

*

Orissa has planned to increase its raw jute output from 190,000 bales to 300,000 bales by 1960-61 under the Five-Year Plan. A Jute Research Station will shortly be setup in Kendrapara with the assistance of the Central Government for carrying research to inform the yield as well as the quality of jute in Orissa.

FOREIGN

The West Germany Radio industry expects to produce about 400,000 television sets during 1955, most of them being for the home market. At present only 150,000 persons hold television licenses. By 1958, production of television sets is expected to be at the rate of 1 million per annum.

*

Additional inducement to foreign investors in Israel's industry and agriculture are provided in an amendment to the law for the encouragement of capital investment which Parliament has just passed.

*

President Eisenhower has signed into law the Trade Agreements Extension Act of 1955. The new Act gives the president the right to trim U.S. tariffs by five per cent a year for the next three years and to roll back to 50 per cent of an import's value any duties above that rate.

*

It is reported an agreement providing for immediate wage increases averaging more than 15 cents per hour has been reached between the C.I.V. United Steel Workers Union and the U.S. Steel Corporation, the country's largest steel company.

*

The export duty on tea shipped from Indonesia during the third quarter of 1955 has been fixed at 4 per cent on the fixed value of 17 rupiahs for leaf and brokens and 13 rupiahs per kilo for small farmings and dust. These rates will be equivalent to 34 cents and 26 cents per half kilo, respectively.

*

The price of tea in New Zealand has been cut by 8d. to 7s. 4d. per lb. The revised price is well below the Government fixed maximum price of 9s. per lb.

*

A group of American banks has granted a loan of $30 million to Sapin for exchange stabilization purpose.

*

The world population at mid-1954 was estimated at 2,523,300,000 according to report of the United Nations 35,000,000 more than a year ago.

*

The Scottish firm of rolling stock and wagon builders, has received a £7,50,000 order from the Pakistan Government for carriages underframes and bogies. Delivery is to be made by end of next year.

*

With an average of 953,000 barrels a day, the Arabian American Oil Company produced a record amount of iron and oil in Saudi Arabia last year. The acreage for 1953 was 844,642 barrels daily.

*

Commercial airlines have decided to cancel flights to Chile due to tense situation in that country over the protest strike by 1,200,000 Chilean workers against the Governments inflative policy.

*

The Indonesian Batik Manufacturers Association (PPBI) in Jogja and the batik enterprises union (PPBI) in Jogja and the batik enterprisers union 2 Cambrics factories in Jogja at an expenditure of about Rp. 40 million each.

Special Article

DOLLAR BALANCES FOR INDIA

NOW that the problem of financing the Five-Year Plan is beginning to appear in more practical detail, some original optimism regarding India's likely balance of payments over the whole planning period is tending to be lost. This is not so much because the balance on current account is adverse in dollars at the present time. Indeed, it has been favourable in each of the last two years. It is largely because a virtual decision has been taken to expand imports in order to accommodate the tempo of industry to the likely demand for engineering products when the new steel plants commence to deliver. This may mean that from 1957 onwards India may be importing between one million and 1.5 million tons of steel, part of which will certainly need to come from the dollar area. Apart from this consideration there is the real possibility that there may be a lag in the production of capital goods, necessitating rather heavier imports than at present contemplated. If at the same time there should be a fall in dollar aid or private investment, it is conceivable that a dollar shortage might be a serious impediment in the fulfilment of the Plan.

Farsighted observers in Delhi have long appreciated the handicap that India suffers by reason of the fact that at the present time her sterling balances are inconvertible except in respect of current transactions covered by the No. 1 account. At a time when the gold and dollar reserves were low, it was not reasonable to expect from the British Treasury Authorities that an allocation of something between three hundred to five hundred million dollars would be allowed to be held in balances on India's account in the United States; that would have produced a critical situation for the gold and dollar reserves of the whole sterling area. The position since 1952, when the last critical payments problem arose for the sterling area, warrants however, a new approach to this problem. The table alongside shows the movement in the sterling balances for every month since January 1953. It is not only that the balances have moved up from 1.978 billion dollars to 2,680 billion dollars, that is to say, a rise of well over 25 per cent. The figures for increases and decreases show in recent months a narrowing which indicates a position of comparative stability and the level of United States defence aid has also now reached amoderately stable figure so that although sterling may be weak at the present, the total outlook for the sterling area can never be as bleak as during the sterling area crises of 1949 and 1952.

From this proposition that the gold and dollar reserves of the sterling area have now entered a range of comparative safety, one might perhaps argue that the plea that the gold and dollar reserves do not admit of convertibility has ceased to be relevant, and there is now another powerful consideration. India's need for financial accommodation in the Western Hemisphere has grown steeply with the size of the second Five-Year Plan.

Financial authorities in the United States as well as in India are now agreed that if India does not have significant balances in the United States she will not enjoy, for purposes of raising loans in the United States, one large condition often sought by American investors. It is also true that so far as the major American banks are concerned, interest in Indian loans for development will not be aroused until substantial dollar balances are indicated from which repayments, even if deferred, can always take place. The possibility of a dollar loan of significant dimensions can not now be ignored. As a first step towards the raising of such a loan it would be a great help if India's sterling in her No. I Account were transferred to Washington and held as a dollar balance. It is also quite possible for India's releases from the sterling balances to be payable in dollars. This is no more than saying that India will consume her sterling releases on current account. Existing arrangements with the sterling area already provide for transfer in dollars on items of actual payments for trade or services. What will be new will be only the holding of these balances in the United States when not utilised.

More specifically, this proposal is for the transfer at once of something of a 100 million dollars to an account in the United States and an addition thereto of a 100 million dollars every year for the next five years making available a sum of six hundred million dollars in all. This is no large request to make of the sterling area at this time of India's need.

The Business World

TRANSPORT AND TAXATION

THE deterrent effect of the heavy incidence of motor vehicles taxation on the growth of road transport in this country has now been universally acknowledged and there is unanimity on the urgency of the need to give immediate relief in taxation to remove one serious handicap to motor transport development. It is also acknowledged on all hands that the anticipated extreme pressure of traffic on the demand for transport must be met in full, if a slowing down of the rate of agricultural and industrial production is to be averted. Road transport is bound to come in for an increasing share, on a much more spectacular scale than ever before since planned development of the country's economy was undertaken, in providing capacity for the higher demand.

The Indian Road Transport Development Association has tendered its memorandum to the Central Government on its views on the recommendations of the Taxation Enquiry Commission in so far as they deal with taxation of road transport. A scrutiny of other vital aspects of motor transport, chiefly an examination of the policy of motor vehicles licensing and regulation of road services, was outside the scope of the memorandum. The emphasis on relief in taxation as a direct and powerful incentive to the expansion of motor transport should not be misconstrued as dispensing with the need to relax the severe restrictions on licensing and liberalisation of the policy for motor traffic operations.

The memorandum of the IRTDA goes directly to the root of the problem of retardation of motor transport development. The real beginning of intensive growth of motor transport is to be traced to the period immediately following the termination of World War I. The tempo of growth went on increasing at a rapid pace and during the three decades from 1920-21 to 1950-51, the increase in the registration of motor vehicles, on the average, has been of the order of 12 per cent. In telling contrast with this encouraging rate of progress, the increase in vehicle registration for 1950-51 to 1952-53, coinciding with the earlier part of the first Five-Year Plan, took a precipitate fall to 3.7 per cent. It would, of course, be preposterous to attribute this sharp fall to the impact of taxation. There is certainly no evidence that the incidence of taxation shot up so suddenly during this period. The memorandum of the IRTDA does not make out any such case. There were other factors which were responsible for this decline, but the fact remains that taxation was a potent factor which operated to discourage the growth of motor transport. If the criterion of consumption of motor spirit is applied to assess the rate of growth, the downtrend in the utilisation of the existing motor vehicle fleets would be quite obvious. The downtrend is apparent from the following figures of civilian consumption of motor spirit:

Year	Consumption Million Gallons	Civilian Vehicles Excluding Motor-Cycles	Average Consumption per Vehicle
1950-51	204	2,77,990	734
1951-52	257	2,78,963	957
1952-53	258	3,00,076	859
1953-54	254	2,96,000	858

After the spurt in consumption of motor spirit, following the policy of derationing, in 1951-52, total consumption declined progressively in spite of an increase in the number of vehicles. The net result is seen in the sharp fall after 1951-52 in the average consumption per vehicle. It reflects less intensive utilisation of the registered stock of vehicles.

The question of taxation has been discussed at great length in the last five years since the Motor Vehicle Taxation Enquiry Committee tendered its report and more recently after the publication of the report of the Taxation Enquiry Commission. The case for tax relief need not be argued since it has now been conceded. An outstanding and distinguishing fact about the recommendations of the TEC is that the principle of earmarking of part of revenue from road transport taxation for outlay on road development has been unequivocally accepted, although the share of tax proceeds to be earmarked has been fixed at a little more than 44 per cent of the taxation of motor spirit. This principle offers a solution for compromise on a co-ordinated policy of taxation as between the State Governments and the Central Government. Hitherto, the State Governments adopted an unbending attitude of opposition to a ceiling on motor vehicle taxes at the rate prevailing in Madras, which in 1950 was, on the basis of average tax per vehicle, 3.7 times as high as the average tax for the rest of India. The justification offered by the Madras Government for the high rate of taxation, namely, that the proceeds were necessary to finance road development expenditure is not fully borne out by facts. The estimate made by the IRTDA discloses that only about half of the tax-revenue is used for this type of expenditure in Madras. The vital issue of fixing an actual ceiling on motor vehicle taxation apart, the State Governments can now agree to appreciable tax relief once they are assured that separate funds on a non-lapsable basis can be set apart for road maintenance, repairs and development. It has become practicable for them at long last to cross this major hurdle to tax relief.

The reliefs urged in the memorandum of the IRTDA would have the effect of reducing the aggregate tax-receipts, on the basis of 1953-54 figures, from Rs. 63 crores to Rs. 53 crores—a loss of Rs. 10 crores. The stimulus which motor transport will receive will more than compensate for this loss and it is anticipated that the number of vehicles as well as the tax proceeds will increase by not less than 100 per cent in a period of 10 years.

The recommendations made by the IRTDA may be recapitulated in brief: (1) Passenger buses, goods trucks and cars manufactured in India should be exempted from the special sales tax of State Governments. (2) The Central duty on petrol should be reduced to 12 annas per gallon and the States tax on it fixed at 4 annas. (3) Three-fourths of the total tax on motor spirit and the entire proceeds of the tax on motor vehicles should be credited to the States' Road Funds which should be non-lapsable. The balance required for road expenditure should come from the general revenues. (4) The motor vehicle tax should be based on all-India receipts of this tax for 1953-54 which are about twice those in 1949-50 at the time of the report of the Motor Vehicle Taxation Enquiry Committee. The tax should be the same in all States like other taxes, e.g., sales tax on motor spirit, and should be brought to a uniform level throughout India

in a period of three to five years. (5) Tyres supplied to motor vehicle manufacturers as original equipment on new vehicles should be exempted from excise duty and in all other cases the existing tyre duties should be reduced by 10 per cent ad valorem. (6) Wheel tax on motor vehicles in all municipalities including corporations should be abolished and adequate compensation paid to municipalities now levying it. (7) With the abolition of octroi and transit duty on goods passing through a local area, the octroi on goods for local consumption should be collected, with the freight by road operators, according to a schedule. (8) To ensure adequate development of rural roads, a Statutory Road Board, with control over the entire road system, should be created in each State and given specific grants from specific sources. The Boards should work to a common policy of road development in consultation with the Centre. A portion of local revenues should be handed over to these Boards, as local board contribution for rural roads.

DEATH THROUGH EXHAUSTION?

AFTER well-nigh 80 days' trial of strength between the employers and workers, the textile labour strike in Kanpur died practically of exhaustion. While the belated decision of the Suti Mill Mazdur Sabha to end the unjustified stoppage has naturally caused great relief to all concerned, one really wonders whether, considering the huge loss of cloth production, estimated at one million yards per day, and the estimated losses to industry of Rs. 150 lakhs, and to workers of Rs. 50 lakhs (with the consequent distress caused to their families), the strike could not have been averted at all. The issues involved were not complicated; they might have been solved by direct negotiations; and yet the deadlock was foisted on the workers by the tussle for power and recognition between the I.N.T.U.C. and the Suti Mazdur Sabha comprising the pro-Communist and other Leftist groups. That, since the strike started, several workers, braving threats and intimidations from recalcitrant elements, were going to their mills for work in increasing numbers, was proof positive that the Sabha did not have the support of the entire labour force numbering nearly 50,000.

Apart from the demand for redressal of certain minor grievances, the major point at dispute was the introduction of rationalisation schemes in certain textile mills, to which, be it noted, the labour leaders themselves had, at least in principle, lent their support in the past more than once—when they signed the Nimbkar Committee Report which upheld the principle of rationalisation and when they participated in the Naini Tal tripartite conference in June 1954, which had been called with the declared purpose of settling a programme for, and deciding the principles of, rationalising textile labour. A seven-man Committee was to have been appointed to supervise the rationalisation schemes in six different mills in Kanpur. Unfortunately, however, the leader of the Sabha soon came out with a statement repudiating the understandings reached at the Naini conclave, and asserting that only "examination" of the tentative schemes of rationalisation was all that had been agreed to. It was this difference in interpretation that turned out crucial and, when the Government of U.P. was left with no alternative but to disband the Committee and leave the employers free to introduce rationalisation collectively or otherwise, the Suti Sabha seized the opportunity to foment labour unrest. When, with the approval of the State Labour Commissioner, some mill managements introduced changes in workload, the Sabha declared a general strike, involving workers in woollen mills as well.

Credit goes to the Kanpur City Congress Committee, which, sensing the anxiety of labour leaders to effect a rapprochement without loss of face, initiated mediation moves which led to the clarification of the official viewpoint that the rationalisation proposals did in no way constitute a final scheme and that the gaps left by the Naini Tal formula could be filled in by mutual discussion. This view found favour with the workers' leaders and they saw the Chief Minister of U.P. last week, armed with "14 points". Although there is no confirmation of Mr. Sampurnanad having accepted the 14 points, the General Council of the Suti Mazdur Sabha, as is evident from its resolution withdrawing the strike, seems to have been satisfied with the clarification given by the Labour Commissioner. The State Government, although not a direct party to the strike, has swiftly acted by deciding to set up a Committee under Justice Bindbasini Prasad to go into the dispute. The Chief Minister has made it clear that rationalisation of the Naini Tal pattern has quite properly been accepted by all parties. The Committee will have on it representatives of industry and labour in equal number.

The vital question that the strike raises is: What has labour gained by this uncalled-for strike? Nothing— apart from securing postponement of the "odious" rationalisation schemes. And what have the employers gained?—the extent of rationalisation introduced during the strike period. But no further steps will be taken until the new Committee's findings are available. On the side of the Government, there is a distinct gain to the extent that it has succeeded in getting back the Suti Mazdur Sabha to the position agreed to at Naini Tal. What is now needed is the maintenance of the atmosphere essential for the proper functioning of the new Committee. The futility of this deplorable strike in Kanpur should serve as a neye-opener to workers elsewhere who allow themselves to be misguided by interested labour leaders. By taking law into its own hands, labour not only harms its own interests but alienates the sympathy of the Government which, in the normal course, is sympathetically disposed towards its legitimate demands for amelioration of working conditions.

Economic Report from the U. S.

AMERICAN ECONOMY

(By Guy Sims Fitch)

WASHINGTON, July 19.—Historians will record that in the first half of 1955 the economy of the United States advanced to a peak it had never known before. Among the most obvious aspects of the current rise are its size and speed. In less than a year, the American economy has moved from recession to recovery and on to the highest prosperity it has known. Total output of goods and services, industrial production, personal income, and new employment, have reached record levels. And unlike the previous high mark achieved in the first half of 1953, this upward movement gives every sign of continuing.

But there is another and even more striking aspect to the current economic advance: the drive behind it is coming from the American consumer. In early 1953, Government outlays—particularly for defence—were rising, the current period is marked by a waning in Government expenditures. Outlays for munitions are running 35 per cent behind the levels of the second quarter of 1953. Then they were hitting an annual rate of $23,200 million; now they are down to $15,000 million. Consumer spending, on the other hand, is up about $12,000 million to a total exceeding $242,000 million a year. This is reflected in the demand for things that are eaten, worn, driven or otherwise used in civilian life—demand that is reflected, in turn, in the use of basic materials that go into consumer goods. Output and use of such materials as aluminium, steel, copper and rubber are soaring.

The electrical appliances industry is enjoying a healthy increase in business, with many appliances being made and sold in record numbers. Passenger car output is 15 per cent ahead of 1953 peaks. Building materials—glass, lumber, brick, cement—are 6 per cent ahead. Textile and apparel industries are making a strong recovery, only a point or so below their old peaks. But this consumer activity is founded on more than record employment and income levels. The fact is there has been a significant change in the pattern of family income. Government reports show that in the eight years since 1947, the number of families with incomes over $4,000 a year, in current dollars, has increased by 70 per cent. This gain has not been eaten up by inflation; purchasing power of the average family is 12 per cent greater than in 1947.

The typical family, in spite of its heavy spending since World War II, also has money laid aside for emergencies. Personal savings in liquid form total more than $209,000 million. More than two-thirds of American families have sizable savings accounts; and most of the few that do not still have other forms of security in the shape of cash, insurance and pension reserves. Investigation also shows that most families are putting their money into assets more tangible than the stock market. Only 8 per cent own stocks—about the same ratio as in 1953. But more than half now own their own homes, and nearly 70 per cent own one or more automobiles. Household purchases—such as appliances and furniture—are at record or near-record levels. Expenditures of this type often are made on the instalment plan. The total now owed by consumers is estimated at more than $115,000 million. But nearly three-fourths of this is in home mortgages. repayable over many years—usually from 15 to 30—and in amounts generally comparable to rental payments.

Most families, in fact, do not owe for goods bought on a pay-as-you-go basis. The vast majority of those who do can clear themselves of debt within a year, if necessary. Only three per cent have instalment debts stretching more than two years. The general conclusion, therefore, is that the American is not overloaded with debt that will keep him from doing more buying at a time when his income is high and rising.

The consumer market today is as broad as the American population itself.

THE RAMAYANA
OF
TULSIDAS
IN ENGLISH VERSE

LATEST "HINDUSTAN TIMES" PUBLICATION

The famous Hindi epic regarded by many as "the greatest book in all devotional literature" is for the first time now available in English verse.

The translator, the Rev. A. G. Atkins, completed the book after ten years of devoted work. He has tried "to keep and express in English in the fine rhythm and music of the original in simple lucid language, and with as much of the vivacity, wittiness and picturesqueness that Tulsidas has put into his work." He has also followed in some measure Tulsidas's metrical variations such as **chhand, chaupai, doha** and **soratha.**

In a foreword Mr C. Rajagopalachari says: "Mr Atkins' monumental work and his Introduction are a revelation of hope for those who desire to see all the great religions of mankind come together. - - - - His service is not only to English-speaking people but also to that very large number of Hindus in India who do not speak the Hindi language and to whom English has become a very familiar medium."

The book is of special value to libraries, scholars and devotees of Tulsidas.

It has been issued in the following four editions:

I. Original text of Tulsidas with translation in English verse; three volumes; price Rs. 50 net.
II. Translation in English verse, without Hindi text, two volumes; price Rs. 40 net.
III. Special tissue paper edition of I, one volume, price Rs. 100 net.
IV. Special tissue paper edition of II, one volume, price Rs. 100 net.

PROHIBITION AND ITS PRIORITY

Sir,

The second Five-Year Plan has an ambitious programme of many social welfare and other measures embodied in the directive principles of the State, besides that of prohibition, but the success of the Plan depends on adequate finance. The loss of revenue from nationwide prohibition plus the cost of effective enforcement may never be made up from other sources. The Government will then be faced with a problem in priority in implementing the directive principles. If it gives priority to prohibition, other social welfare measures such as more hospitalization facilities, slum clearance, low cost housing, adequate nutrition for the children, etc., may suffer for lack of enough funds. Surely prohibition does not deserve priority over other more urgently needed amenities for the people, particularly if we interpret a little less rigidly Article 47 of the Constitution which directs that the State shall endeavour to bring about prohibition of the consumption of intoxicating drinks and of drugs which are injurious to health.

It cannot be said that drinking in strict moderation is injurious to health or causes intoxication. (Churchill's fitness has never been questioned. According to a British heart specialist, drinking beer may be good for heart ailments. On the other hand recent medical research seems to indicate that too much smoking leads to cancer of the lungs. That calls for prohibition of smoking too!)

The habitual anti-social behaviour of an individual who resorts to excessive drinking is inherent in the mental make-up of the individual concerned, rather than in the alcohol. A drink addict is an emotionally maladjusted individual, who is high in "inhibition" and low in "self-sufficiency", according to Dr. Salter, an authority on Conditioned Reflex Therapy. This applies just as much to the irresponsible workman who squanders his weekly wages on drinks as to the sophisticated socialite who disbehaves at a hotel bar or a club. The cure of such a person includes total abstinence from alcohol but if he is forcibly deprived of alcohol without any attempt to reconstruct his personality, he is sure to develop other symptoms or habits which are just as serious as addiction to alcohol, as far as he is concerned. For instance, he may become addicted to narcotics; he may develop hypochondria, insomnia, stomach uclers, high blood pressure, obesity, spastic colitis, claustrophobia, agarophobia and neurasthanea, to name a few; he may become moody, shy and sensitive, lose weight through a perpetual state of anxiety and even commit suicide. (The same things may happen even if he were a teetotaller to begin with.) Thus total prohibition in itself is no solution for him as he just substitutes one evil for the other.

On the other hand, the majority of those who drink, are more or less normal and emotionally balanced. They are not compulsive drinkers and drinking for them is no evil as long as they do not deliberately drink to the point of intoxication, or injure their health by excessive drinking.

It appears, therefore, that the objectives of the directive principle of prohibition can be realized in spirit by adopting the following measures, which will ve sacrifice of revenue and additional tax-

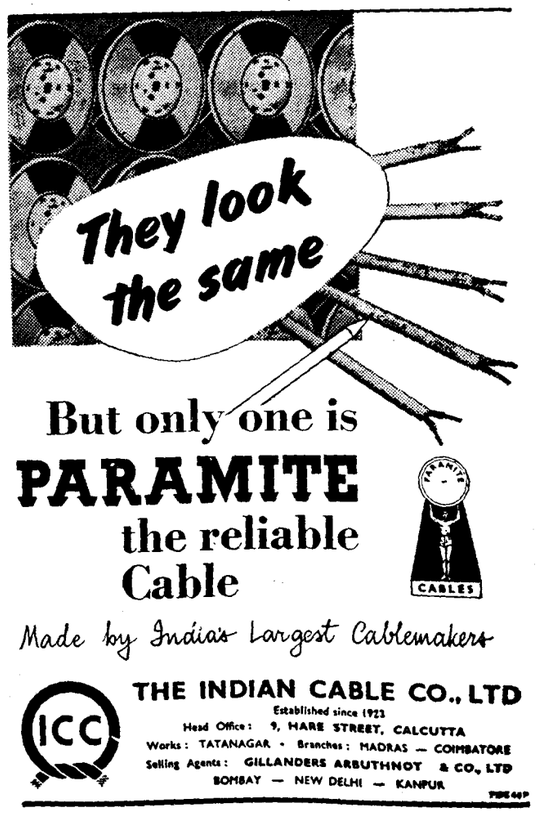
1. Formation of officially sponsored citizens' committees throughout India for ensuring restraint and reduction in drinking.

2. Substitution of all official, diplomatic and business cocktail parties by "Tea Parties". Drinking orgies such as those in Delhi commented upon by the Prime Minister must be stopped.

3. Restriction to two drinks per person at all hotel bars, restaurants, clubs and public places.

4. Voluntary restraint by all drinkers in the consumption of alcohol at home; voluntary restraint in the serving of drinks at strictly private parties.

5. Rehabilitation of alcoholics through proper medical and psychiatric treatment and total abstinence from alcohol.



6. A programme of social education and personal counselling for the industrial workers.

These measures and any others that may be considered appropriate, should be given a reasonable trial before introducing total prohibition throughout India.

Yours faithfully,

A. R. PALIT.

BUSINESS NOTES

SALES OF COTTON TEXTILES

THE SATISFACTORY performance of the piecegoods market for the first fortnight of July comes as a refreshing contrast to the real state of affairs on the export front of the textile market which had been characterised by a steadily declining trend. According to the latest figures available, Bombay Port alone would appear to have suffered a sharp decline in the quantum of exports of mill-made cotton textiles for the month of May, when only 62.1 million yards of cotton piecegoods were exported showing a net decline of 10 million yards over the previous month's offtake. While part of this decline could be attributable to the seasonal slackness in demand, it was also partly due to the labour strike in Bombay docks during that period. However, it is significant that the May figure was in itself a record, in that it has not been surpassed for the corresponding month in any year since 1951. But, the fact remains that there has been a fall of 37 million yards in the export of cotton piecegoods for the first five months of this year which, at 327.6 million yards, compares unfavourably with 364.6 million yards registered for the corresponding period of 1954.

The reason for this decline in the export of mill-made cotton textiles is not far to seek. Of late, there has been a steadily declining trend in the offtake of Asian markets. Despite the valiant efforts of the Textile Export Promotion Council in laying bare the shortcomings that the Indian textile exporter has become heir to, losing in the process one attractive market after another, and that too invariably making a present of these markets to Japan whose high pressure sales technique has always yielded good dividends no steps would appear to have been taken by either mills or exporters to set matters right. In fact, discussing the loss of the Iranian markets, the Textile Export Promotion Council has pulled up the Indian mills and exporters and observes: "To revive the dwindling interest in this market, the first and foremost pre-requisite is the offer of quality textiles in secure and attractive packing. The little extra money that may have to be spent will be more than compensated by the business turnover and good will. Secondly, complaints of whatever nature must be promptly settled. Thirdly, there is an urgent need for effective and sustained publicity campaign and personal contact on a regular basis with importers". The indifference of the textile-exporting interests to details that would pay could not be more eloquently expressed. For the advice given by the Council is but the rudimentary principles of sales promotion.

In the circumstances, it is no wonder that the decline of 6 million yards in May as compared with the month of April in the offtake of Asian markets has been mainly responsible for the steep fall in India's exports of cotton piecegoods. These markets include those of Afghanistan, Pakistan, Iran, Iraq and Indonesia. The recent Pak-Afghan deadlock proved a damper to the transhipment of Indian textiles to Afghanistan, as most of the Indian exports to this destination have to pass through Pakistan. In the case of Indonesia, lack of issuance of fresh licences would appear to have been the immediate cause of slackening in offtake by that country. Apart from Japanese competition, the fall in India's exports to Iran is also attributable to the exorbitant import duty imposed on coarse and medium varieties, which accounted for the bulk of India's exports.

As against the offtake of 11.98 million yards of Indian cotton piecegoods recorded in the month of April, the European markets accounted for only 8.94 million yards while continued dock strike eroded into the usual quota of U.K.'s offtake.

Even in respect of the African markets, which provided the only silver lining to an otherwise gloomy picture of exports, shortage of shipping space, particularly to East African ports, cut into the quantum of exports from this country. India's best market in Africa, namely Sudan, has taken one million yards of cotton textiles less than that in the month of April, the reason for this decline being Sudan's resumption of textile imports from Japan under the new Cotton Link System.

Among the ten main markets, for which figures are available, U.K. and Sudan have maintained their traditional first and second places, respectively, in the quantum of offtake of Indian cotton textiles, with British East and West Africa showing a perceptible improvement. From a variety-wise analysis of the exports for the month under review it is clear that sheeting has constituted the main item of export, comprising roughly about 48 per cent, more than 15 per cent higher than in the previous month.

'ORPHAN' COTTON

NO OTHER single factor has given rise to repeated worries to the cottonmen in this country as the chameleon-like policy pursued by the Government in respect of Saurashtra cotton. Saurashtra cotton, which includes Dholleras, Mathias, (Wagad, Kalagins and Kalyan) is mainly grown in Saurashtra and Kutch States, the cultivated acreage being 10,91,000 acres. Considerable weakness was noticed in this cotton during the past few months following a sharp increase in the size of the crop. This year the crop is estimated at about 3,25,000 bales, as compared to about 2,38,000 bales in 1953-54 and only 1,57,000 bales in 1952-53. This apart, when there was excess supply in 12"s to 16"s group, instead of the usual short supply, following larger yields of Khandesh crop, as well as thinner styles cotton of lower spinning value, the weakness in the Saurashtra cotton was doubly emphasised. This cotton, therefore, became a deadweight on the market and threatened to remain so unless some export outlet was found. But, the Government's earlier stipulation, (announced towards the middle of April) stating that exports of cotton of ¾" staple and below, amounting to 35,000 bales of Saurashtra cotton, could be made only from Saurashtra ports acted as a drag on the market. For, shippers pointed out that these ports were generally not seaworthy during the monsoon and representations were made to the Government urging this stipulation to be removed and allowing exports of Saurashtra cotton from any port. Representations were also made pleading for the abolition of the export duty on this cotton. It was in answer to these protests from the trade that the authorities announced, on the last day of June, that the stipulation that 35,000 bales out of the 1,00,000 bales of cotton allowed for export on April 12th, should be shipped from Saurashtra ports alone, has been dispensed with. Simultaneously, export duty "on all varieties" of cotton was also reduced by Rs. 50 per candy. This latter decision, although welcomed by the trade in general, placed Saurashtra cotton once again back to its original 'orphan' status. In fact, the reduction in duty benefit-

ed the foreign buyers at the expense of the Indian Exchequer.

The last straw on the camel's back has now been placed, as it were, by the Government removing the stipulation about 35,000 bales of Saurashtra cotton entirely. Thus, by a notification, dated 15th July, issued by the Joint Chief Controller of Exports, Bombay, the clause relating to the stipulation that 37 per cent of the quantity licensed (to individual shippers) should be of Saurashtra origin has been removed. In the event, Saurashtra cotton bids fair to remain an 'orphan' cotton until the Government thinks it fit to stop playing fast and loose with the trade.

TEA PRICE TRENDS

THE CONTINUED demand for tea and the progressive improvement in prices at London auctions, coupled with the relaxation in retailers' resistance, indicate the advent of a period of comparative stability for tea during the months ahead. A significant factor is the increasing activity of the grocers in the U.K. who were the backbone of the consumer resistance which broke the spiral of rising prices earlier this year. That export sale prices in Calcutta have been showing an upward trend will be evident from the latest results. Clean Black Pekoe has risen from Rs. 2-12 per lb. on June 14 to Rs. 3-2 per lb. on July 12, while Plain Broken Pekoe, which was ruling at Rs. 1-14-6 a month ago, was quoted at Rs. 2-7-6 on July 12. Similar gains have been recorded by Medium Dooars Dust which fetched Rs. 2-2 on July 12, against Rs. 1-11-6 on June 21.

In the recent London sales, offerings, however heavy, have been fully absorbed at steady prices. At the auctions held in the second week of July in London, the average price realised was 3s. 8.3d. against 3s. 7.59d. in the previous week, and 4s. 7.55d. a year ago. Retail prices, it would appear, have been seeking a more stable, though lower, level throughout the U.K. All this indicates that, while the runaway prices of tea witnessed last year—which can only bring a reaction inimical to the interests of the trade—have been halted, prices have, in general, been finding a lower, but certainly a more stable, level. The prospect of stability is aided by the growing realisation on the part of producers that in a falling market, poor quality teas have become less and less saleable. Consequently, attention is concentrated more on quality than on quantity.

RISE IN INDUSTRIAL OUTPUT

THE GENERAL index of industrial production for the first quarter of 1955 stood at 157.2 as compared with 155.8 for the last quarter of 1954. The average for the corresponding quarter of 1954 was 137.6. The general index of industrial production reached in separate months of the quarter was 150.9 for January 1955, 157.8 for February and 162.9 for March 1955.

Of the major industries, engineering, textiles, chemical and sugar showed increased production. Iron and steel, coal and cement recorded a slight decline as compared with the production in the previous quarter but the production of coal and cement was higher as compared with the first quarter of 1954. The total production of cloth by the mill industry during the quarter increased by 11 million yards to 1,262 million yards, as compared with the previous quarter. The increase was due to satisfactory offtake of cloth and the availability of large supplies of cotton. Some of the important chemical industries which showed higher output during the quarter were soda ash and dyestuffs. The production of sugar during the quarter amounted to 9,58,300 tons as compared with 7,10,100 tons for t corresponding quarter of 1954. The output of ir and steel showed a slight decline as compared with t last quarter of 1954. The production of finished st totalled 3,15,900 tons, which was lower by about 10,(tons, as against the previous quarter. The output pig iron which stood at 5,02,600 tons in the precedi quarter declined to 4,70,100 tons. The production cement also declined by about 17,000 tons to 1,121,1 tons, and of coal from 9,747,000 tons to 9.706,000 to Jute goods output totalled at 254,600 tons, showing slight fall of about 3,000 tons as compared with t previous quarter.

GLASS INDUSTRY'S PLIGHT

BARRING INDIVIDUAL units which, in particul years, might be experiencing hopeful results, t situation in the Indian glass industry on the whc presents the same unhappy problems arising from t rise in production costs, competition from import products and deterioration in productive efficienc While the 1955-56 production target for sheet glass 26,000 tons, only 11,250 tons were actually produced i 1954. At this rate, it is hardly likely that the targ would be reached, especially if reports of the closu of several factories in recent months are true. Tl fact that the future of the glass industry depenc upon continuous improvement in productive efficien was brought home by Mr. S. Chattanatha Karayal in his address to the 12th annual meeting of the Trava core Ogale Glass Manufacturing Company, Ltd., who working has resulted, for the third successive year, a loss.

While the price level of goods in the market dictated by several economic factors—some of whi are unpredictable—the cost of production is a fact over which some control is possible—to the exte efficiency could be improved by the co-operation labour and adjustment of the latter's demand to t industry's capacity to pay. Mr. Karayalar devoted major portion of his speech to this vital aspect of pr ductivity, emphasising that the deterioration in ef ciency of production was not due to intrinsic ineff ciency on the part of labour but on account of extraneo influences exerted by wrong leadership. He pointed o how labour leaders are obsessed with the notion that mo and more may be extracted with less and less wor This obsession has become the bane of trade unionis in this country and the sooner the workers concerne realise the detrimental effects of this notion the bett will it be for the future of industry and for their ow welfare.

COMPANY AFFAIRS

THE PARASEA COLLIERIES LTD.

The Report of the working of the Parasea Collieries Ltd., for the half-year ended 31st December, 1953, together with the Balance Sheet, etc., shows the following results:

Company's profit for the half-year ending 31st December, 1953, after providing Rs. 46,154 for depreciation and Rs. 33,800 for Income-tax	Rs.	26,899
Add: Balance brought forward from last Account	„	6,618
Transferred from General Reserve Fund	„	1,20,000
Less: Provided for old depreciation and taxation as per Income-tax assessment	Rs.	1,06,623
Balance available for disposal	Rs.	45,895

The Directors propose payment of Dividend to the holders of 8,000 Preference Shares at the rate of 5½ per cent per annum taxable for the year ending 31st December, 1953. This would absorb a sum of Rs. 32,450. They also propose payment of Dividend to the holders of 83,400 Ordinary Shares at the rate of Annas Two per share free of Income-tax for the half-year ending 31st December, 1953, which will amount to Rs. 10,425 leaving a balance of Rs. 3,020 to be carried forward to the next half-year.

During the half-year under review, the Output decreased as compared with the previous half-year. Moreover, raisings had to be restricted due to heavy accumulation of stocks. However, the despatches have been improved to a great extent and the stock position became normal at the end of the year. The results for the next half-year are more satisfactory.

	For the half-year ending Dec. 1953	For the half-year ending June 1953	For the half-year ending Dec. 1952
			(In tons)
Raisings	35,987	38,495	31,687
Despatches	37,139	34,107	33,937
Stock after Boiler Consumption	1,676	6,173	6,126

South Parasea Collieries Ltd., in which the company holds shares is progressing satisfactorily and the Company has commenced payment of dividends on the Ordinary Shares.

THE SONE VALLEY PORTLAND CEMENT LTD.

The Report and the Audited Accounts of the Company have been submitted for the year ended 31st December, 1954. The rulings were arrived at, in respect to the new selling prices for cement by the Central Government as a result of the findings of the Tariff Commission's enquiry. The new price fixed by Government for the sale of Rohtas Cement, which came into force as from the 8th February, 1954, resulted in a reduction in revenue of some Rs. 4 lakhs. The net surplus available for distribution after provision for all changes and Taxation, is thus adversely affected by approximately Rs. 2¼ lakhs and stands at Rs. 4,57,006 which together with Rs. 6,448 brought forward from the previous year amounts to Rs. 4,63,454-5-4 which is available for distribution. T Directors have recommended a dividend at the r of 5 per cent for the year, free of tax, absorbi Rs. 3,75,000 and the balance of Rs. 88,454 to be carri forward.

Cement produced and deliveries made during t year as compared with the previous year are follows:

	1954	1953
Production	1,96,910 Tons	2,13,900 To
Despatch	2,00,277 „	2,10,878 „

Heavy repairs and renewals to the Wet and D Mills were carried out during the year and this reflected in the lower tonnage produced. Developme operations of the Company's Hutar Colliery proceede satisfactorily and raisings amounted to 54,000 to with despatches at 49,000 tons.

THE UNITED PROVINCES SUGAR CO., LTD.

The audited accounts of the above mentione Company for the year ended 30th September, 19 show:

Profit on Sugar Account	Rs.	4,22,42
Sale Proceeds of Motor Car and Scrap	„	6,82
TOTAL	Rs.	4,29,24
Less—Loss on Estates Account	„	5,36
Profit for the year	„	4,23,88
From which has been deducted: Provision for Central and State Taxation	„	1,90,00
Leaving a balance of	„	2,33,88
To which falls to be added the credit balance brought forward from last year	„	5,18
Leaving a balance available for distribution of	„	2,39,06

Which is recommended to be dealt with as follows:

Payment of a dividend of 12½ per cent for the year to 30th September, 1954 (5 per cent for 1953)	„	2,00,000
Leaving a balance to be carried forward to credit of Profit and Loss Account	„	39,061

Provision for Depreciation absorbed Rs. 71,194 while expenditure during the year on new batteries and wiring amounted to Rs. 9,958.

The results for the year are considered as quite satisfactory when compared with those of the previous season and this in spite of the difficulties encountered in regard to flooding and price agitation by cane growers. Government control over the sale of sugar continued throughout the year, but satisfactory prices were obtained for the stocks released for free sale. A bonus at the rate of 2½ annas per maund of sugar produced and amounting to Rs. 29,777 was paid to workers under the terms of the Government of Uttar Pradesh.

Season's crush at 24,83,996 maunds against 18,96,330 maunds in 1953-54 has been satisfactory and the recovery at 10.16 per cent is slightly better than that of 10.05 in season 1953-54. The results should, therefore, be satisfactory unless the position is materially affected by the recent 50 per cent increase in the excise duty, the surplus sugar stock in the country and the fall in sugar consumption.

COMMODITY NEWS AND NOTES

FINAL ESTIMATE OF LINSEED

According to the Directorate of Economics and Statistics, Union Ministry of Food and Agriculture, the all-India final estimate of linseed, 1954-55, puts the current year's area and production at 3,290,000 acres and 388,000 tons, as against the partially revised estimate of 3,360,000 acres and 374,000 tons, respectively, for 1953-54. The current year's estimate, thus, shows an increase of 14,000 tons or 3.7 per cent in production over last year in spite of a decrease of 70,000 acres or 2.1 per cent in area.

The decrease in acreage under linseed during the current year has been reported mainly by Bihar, Madhya Pradesh and Uttar Pradesh due to unfavourable weather conditions at the sowing time. The decrease in acreage has, however, been offset to a certain extent by the increases registered by Vindhya Pradesh and Hyderabad due mostly to favourable seasonal conditions. In spite of an over-all decrease in acreage there has been an increase in production of linseed shared by almost all linseed growing States.

SINGAPORE RUBBER REACTS

Rubber prices in Singapore slumped last week following a suggestion made by Mr. J. Collyer, Chairman of the B. F. Goodrich Company, that the U.S. Government intended to reduce its crude rubber stockpile by selling 200,000 tons to the trade. This suggestion was, however, denied by the U.S. General Services Administration in Washington which pointed out that it could not sell such a large amount from the stockpile without the approval of Congress—which has to be given six months' notice of intention to sell.

Mr. Collyer's suggestion had depressed the Singapore market because of fears that such a move would seriously affect private traders in Asia. July first grade fell from 130 Straits cents per lb. to 125, and August from 122½ cents to 118. The wave of selling was, however, well absorbed at the lower levels and there was a big turnover. July first grade closed at 125½ cents.

ENDING SUGAR CONTROL IN U.K.

The British Government has introduced in Parliament a Sugar Bill which provides for the end of State trading in sugar and the setting up of a new Sugar Board. The object of the measure is to facilitate the reopening of the London Terminal Sugar Market. The new Sugar Board will be entrusted with certain statutory duties designed to ensure that the Government's obligations to Commonwealth producers under the Commonwealth Sugar Agreement are discharged under free trading. Its main function will be to buy, at the negotiated price, the sugar which the Government has contracted to purchase under the Commonwealth Agreement and to resell it in the country of origin at the current commercial price to refiners and other traders.

State control over sugar in the U.K. has been maintained not because of any shortages, which no longer exist, or of the need for a cushion against derationing,—since the heavy stocks of dollar imports have already been dispersed—but because it has afforded a method of giving the guaranteed price to the Commonwealth producers who, under the Commonwealth Sugar Agreement, provide the U.K., at a fixed price, with some 1.6 million tons of sugar out of the total annual domestic needs of about 2½ million tons. Further, the guaranteed price that is paid for this sugar and also the guaranteed price paid by the British Sugar Corporation to home growers of beet sugar, have been above the world price, and hence the retention of State trading has, as the London "Financial Times" points out, "meant simply that the Government could pay these prices and then, averaging out with the balance of sugar bought at the world price, resell to the trade at common price to cover its average costs."' Apart from removing the artificial home price (which has been unrelated to world price movements), the decontrol decision reconciles freedom with the guarantees to Commonwealth and U.K. producers.

THE JIYAJEERAO COTTON MILLS LTD.

(Incorporated under the Gwalior Companies Act 1 of Samvat 1963)

SHARE CAPITAL:

Authorised:		Issued & Paid-up	
5,25,00,000/-	divided into 3,50,000 Ordinary shares of Rs. 150/- each.	4,63,65,300/-	divided into 3,09,102 Ordinary shares of Rs. 150/- each.
2,00,00,000/-	divided into 2,00,000 Cumulative Redeemable Preference shares of Rs. 100/- each.		
7,25,00,000/-		4,63,65,300/-	

There are no Founders' Management or Deferred shares.

LOAN CAPITAL:

The Company has no Debentures, Mortgages or loan capital outstanding.

ISSUE OF 1,00,000 5½% CUMULATIVE REDEEMABLE PREFERENCE SHARES OF Rs. 100/- EACH.

The whole Issue has been underwritten and of which 60,000 Preference Shares have already been agreed to be subscribed, which will be allotted in full.

40,000 Preference Shares of Rs. 100 each, payable Rs. 25 per share on application and Rs. 75 per share on allotment, are now being offered for public subscription.

TERMS AND CONDITIONS OF ISSUE

The Preference shares confer the right to a fixed Cumulative Preferential dividend @ 5½ per cent per annum (tax free) on the capital for the time being paid up thereon and in any year in which for any reason, whatsoever, there is no taxable profit of the Company and the dividend is distributed on the preference shares, in such year the company will pay the tax on such dividend. The preference shares will be redeemed at par on the 31st December, 1965. The Company will give 12 months' notice before the aforesaid date of redemption and interest will cease to accrue on the said shares with effect from the date of redemption, so notified.

The preference shares carry the right in winding up to repayment of the capital paid up thereon together with the payment of arrears of the said preferential dividend before any return of capital is made on the Ordinary Shares, but do not confer any further rights of participation in the profits or assets of the Company. The preference shares do not confer on the holders thereof the right to attend or vote either in person or by proxy or by attorney at any General Meeting or to any notice of meeting. The Company is at liberty upon any further increase of capital to issue new shares with any preferential, deferred, qualified or special rights, privileges or conditions attached thereto. But it is not proposed to issue any debentures until the present issue has been redeemed. The said preference shares shall be redeemable in accordance with the provisions of Section 105B of the Indian Companies Act, 1913.

REGISTERED OFFICE

P.O. Birlanagar, Gwalior.

HISTORY AND BUSINESS

The Company was registered in Gwalior as a public Company on the 9th August, 1921, and started the manufacture of cloth in the year 1923. It made steady progress and declared its first dividend in the year 1929. The dividend was steadily increased until 1948 when the Company was able to issue bonus shares in the proportion of 14 new Ordinary shares of Rs. 10/- each to the holders of one Ordinary share of Rs. 10/- each. The whole issue was then consolidated to make the face value of Rs. 150/- for each Ordinary share. Starting on a modest scale the Company has built up for itself an important place in the textile industry of the country. While the main manufacturing activities of the company are spinning of cotton yarn and manufacture of cloth and hosiery, the Directors of the Company are of the opinion that the time has now arrived to extend the Company's activities and they have accordingly decided after a careful survey to undertake the manufacture of Soda Ash and Caustic Soda at Porbunder in Saurashtra. The Company's Plant will be installed at Porbunder and will have a capacity of 100 tons of Soda Ash and 75 tons of Caustic Soda per day. The total consumption of Soda Ash in the year 1954-55 was approximately 1,42,000 tons of which 94,000 tons were imported. The consumption of Caustic Soda during the same period was 77,000 tons of which 49,000 tons were imported. The consumption is expected to further increase substantially by the end of the second Five-Year Plan. Porbunder offers a good site for a Soda Ash Plant as it has the twin advantage of having both salt and limestone, the principal ingredients, in abundant quantities and easy transport to the consuming centres. Part of the production of Soda Ash will be used for the manufacture of Caustic Soda in which field also at present the imports predominate.

URPOSE OF ISSUE

The proceeds of this issue will be utilised towards tting up of the Soda Ash Plant of the Company at orbunder. The necessary licence has been obtained om the Government of India and negotiations are in ogress with the Saurashtra Government for the quisition of suitable land and with foreign manufacrers for the purchase of plant and machinery. The aurashtra Government have promised all possible help id are expected to supply power at a very reasonable ite.

PPROVED INVESTMENT

The Preference Shares are an approved investment r Insurance Companies under Section 27A of the surance Act.

NDERWRITING AND BROKERAGE

The whole issue has been underwritten and the irectors are satisfied that the resources of the underriters are sufficient to discharge underwriting obliations.

The Company will pay brokerage at the rate of ne per cent to the recognized brokers or bankers on llotments made in respect of the application for Preerence Shares bearing stamp of such brokers or ankers.

The underwriting Commission payable by the ompany to the said underwriters is 1 per cent on the ominal value of the Preference Shares.

INSPECTION

The copy of the Prospectus, Memorandum and Articles of Association, the Consent Order of the Controller of Capital Issues, Licence from the Central Government, to set up a Soda Ash Plant, the Original Report and Certificate of Company's Auditors as set out in the Prospectus and also the Contracts referred to therein may be inspected at the Registered Office of the Company at Birlanagar, Gwalior, during office hours until the subscription has been closed.

GENERAL

The subscription list will open on the 18th July, 1955, and will be closed on 25th July, 1955, or earlier as the Directors may decide.

The application forms for Preference shares may be obtained from and should be sent duly filled in and completed either to the Registered Office of the Company at Gwalior or any branch of the United Commercial Bank Ltd., or the Bank of Baroda Ltd., accompanied by payment in accordance with the instructions given thereon. The amount may be paid either in cash or by cheque or draft.

In case no shares are allotted, the amount received on application will be refunded and where the number of shares allotted is less than the number applied for, the balance of the application money will be refunded to the applicant.

Company Meeting

THE TRAVANCORE OGALE GLASS MFG. COMPANY LIMITED

UDYOGAMANDAL P. O.

Speech delivered by Sri S. Chattanatha Karayalar, M.P., Chairman, at the Twelfth Annual General Meeting of the Travancore Ogale Glass Manufacturing Company Limited, Manjummel, Alwaye, held on Saturday the 25th June, 1955.

Gentlemen,

I welcome you to the Twelfth Annual General Meeting of the company. The Directors' Report and the Audited Accounts of the company for the year have been in your hands for the requisite period and with your leave I shall take them as read.

From the audited statements of accounts, it will be seen that the company's working has resulted in a loss of Rs. 99,505 and it is the third successive year in which loss has been incurred. This is certainly disappointing to you as it is to us. Although part of the result is due to general market conditions, the major contributory factor with which I shall deal a little later is one which is controllable. As losses have become a recurring feature, it will be legitimate to enquire into the contributory causes and to find ways and means to overcome them.

In my speech last year I said that there was very considerable scope for improvement of production and production efficiency which could be achieved by a greater sense of co-operation on the part of workers with the management. I also said that in the then state of affairs, the future of the concern could not be regarded as very bright and that if labour did not wake up to its responsibilities and play its part in improving efficiency, their interests as well as the interests of the company would be in jeopardy. This I said on June 26, 1954; within 6 weeks, there was a strike on August 10, 1954, which continued for one month. Under the new agreement with labour, the production bonus scheme has been liberalised and incentive has been provided for better and efficient production. From the results obtained so far, I am constrained to say that the workers have not made efforts to take advantage of the additional benefits offerred under the scheme. Production efficiency has suffered a decline in spite of the efforts made and the incentives offered by the management.

The broad facts which stare us in the face are: recurring losses, deterioration in production efficiency and rise in the cost price of saleable product and fall in the sale price thereof. The losses incurred by the company during 1952, 1953 and 1954 are Rs. 61,644, Rs. 46,756 and Rs. 99,505 respectively. The production efficiency determined in terms of recovery has deteriorated gradually from 47 per cent in 1950 to 44 per cent in 1954. The cost price of saleable product has risen gradually from Rs. 1,235 per ton in 1950 to Rs. 1,424 in 1954 while the sale price has fallen from Rs. 1,315 in 1950 to Rs. 1,221 in 1954. These facts have a significant tale to tell regarding the future of this company and of the employees including workers. The situation in the Glass Industry as a whole presents the same broad features. Out of 119 Glass Factories in India, 44 have closed down in recent years, owing primarily to recurring losses brought about by rising cost of production and falling prices of manufactured goods. While the price level of goods in the market is dictated by general economic factors, the cost of production is a factor over which some control is possible. This can be effected by improvement of production efficiency and by adjustment of demand of workers to the capacity of the industry to pay. It is exactly in these respects the Trade Union leaders have to exercise their wholesome influence. As I said last year, the deterioration in efficiency of production is not due to intrinsic inefficiency on the part of labour, but due to extraneous influences. To my mind it occurs that wrong leadership is responsible for these influences. There is a growing disposition on the part of leaders to regard trade union rights as giving them so many chances to start agitations instead of looking upon them as remedies for real grievances. In other words, these rights are the starting points for the agitation and the process of exercising the rights in the event of grievances arising is reversed. This is an entirely erroneous attitude to take and is responsible for the ugly scenes being enacted in almost all concerns. This creates a vicious circle which must be ended in the interest of the economy of the country. Leadership is unmindful of the interests of the industry or of the community or of the country's economy. The leaders are either obsessed with the notion that more and more may be extracted with less and less work or are totally ignorant of the implications of their programme and policy. In either case, the interests of the industry are in jeopardy and workers will have to pay dearly for their attitude. The root cause of the trouble seems to lie in the introduction of the outside element in trade unionism which desires only to entrench itself in political and economic power. The outside elements cannot justify their existence, if their services are not requisitioned at all times. This mental attitude of the leaders complicates the situation and is responsible for the industrial unrest which is witnessed today. The economy of the country is being disrupted by the subtle influence exercised by wrong leadership. It is high time that the democratic idea underlying trade unionism were exalted and the totalitarian ideal enshrined in outside leadership were thrown overboard by legislation. I would make an appeal to the worker members of unions to assert their inherent rights and free themselves from the overpowering influence of the so-called leaders. Such a move will be to their own benefit and secure the stability of the economy of the country.

If labour does not tighten its belts and awake to their obligations and responsibilities and help to set this company on a stable foundation, I fear that this company cannot continue to function long and if such a contingency should overtake this concern, the workers will be the worst sufferers and they will have only to thank themselves for it.

The industrial development of the country has to be viewed primarily from three angles, viz: the eco-

nomy of the country, the interests of the investing public and the interests of labour. All these interests must be harmonised and co-ordinated by the parties concerned. But there has been an unfortunate tendency among Trade Unions to look at the problem from one angle only in absolute disregard of the other points of view. This insular view sponsored by leadership is leading to catastrophic results damaging the economy of the country. The overall aim of the industrial policy is to secure maximum production with a view to raising the standard of living of the people. This is the direction in which the energies of all parties should be concentrated. But it is being constantly instilled into the minds of labour by their leaders that more and more may be demanded for less and less work. This kind of unhealthy propaganda is creating a situation in which the industrial development of the country is being seriously hindered and retarded. The notion that the money income of labour can be raised indefinitely without a corresponding increase in output is not only intrinsically wrong but also constitutes an outrageous attack on the fundamental objective of national economic policy. It has therefore to be condemned as an offence against the State. The attempt to raise the standard of living will be frustrated at every turn if the general attitude of Union leaders continues to be what it is today.

The duty of labour is clear. They must think in terms of the interests of the industry, their interests and the interests of the country. They must put their heart and soul into their work and improve the production efficiency and consider that their prosperity is linked up with that of the industry. These are things which are within their control and if they do not exercise their will in these directions they will rue it before long. This is an appeal and a warning. I hope my appeal will not fall on deaf ears.

In the course of my speech to you last year, I pointed out that our product has to compete not only with products of Indian manufacture but also with articles imported from other countries which have attained a high degree of efficiency. I also emphasised that if this company were to survive as a productive unit, we have to build up our competitive strength by making our factory highly efficient, i.e., by greatly improving our productivity and if this could not be achieved the consequences would be disastrous to the company and to the workers. I would very strongly repeat the same observations and would conclude with the words of our Chief Minister, Sri Panampilly Govinda Menon at the opening of the Ammonium Chloride Plant at F.A.C.T. the other day: "It is my hope and wish that the management and labour will be fully alive to their responsibilities and continue to work in a spirit of understanding and good will and would spare no efforts to vouchsafe to the third partner in the industry—the shareholder—a fair return on his capital".

The Private Sector and the Plan

XPECT nothing and you shall be gloriously surprised. Something like this proverbial rprise was achieved at the meeting of the ntral Advisory Council of Industries held in w Delhi last Friday. It might be safely stated at there has been no meeting in recent years New Delhi which has been characterised by much good sense, moderation in statement and many sound practical decisions as were con- ned in the proceedings of this Council. On Government side, Mr. T. T. Krishnamachari, ister of Commerce and Industry, made a ch-needed statement on industrial policy ich might be assumed to be final so far as the rency of the second Five-Year Plan is con- ned. It is known that this declaration of policy with its emphasis on non-nationalisation had the prior approval of the Prime Minister and is not an individual statement. The Finance Minister who was present throughout the session showed himself deeply interested in the difficulties of industrialists and conveyed the impression, which had been absent for some time, that he was as interested in providing finance for the private sector as he was in providing "resources" for the public sector. General approval was communicated to a document which sets out in some considerable detail the place to be assigned to organised private industries in the second Five-Year Plan.

This was a heartening document, not least because it was prepared with that attention to

detail in each industry which is so conspicuously absent in the plan-frame. Largely because of a sound secretariat blueprint, there was reached almost without controversy a unanimous decision on a course of action, thus in one great sweep bridging the gulf between the private and public sectors which has grown ever since the plan-frame made its appearance some months ago. There are good reasons why the private sector should be gratified at the new place that has been assigned to it in the organised industrial sector. While the plan-frame seemed to envisage an investment of only about Rs. 200 crores in this sector, the figure now mentioned "for the private corporate sector other than coal, sugar, and small-scale industries" is to be of the order of Rs. 750 crores. Details have been given in supporting papers for a figure of about Rs. 650 crores and it is stated that "plans for heavy machinery and machine-tools which are not yet complete are to cover a provision of Rs. 60 crores while a provision of Rs. 40 crores is to be made for nylon and similar products".

The fact that the private sector has been assigned a considerably larger place than seemed possible after the plan-frame implies no more than that the original plan-frame targets were hopelessly biassed. Just as the transport targets of the plan-frame when they came under scrutiny in the Ministry of Transport were proved to be out to the extent of 60 to 70 per cent, so it has come about that the targets of the plan-frame when examined in terms of private industrial projects have proved to be out by something like 300 per cent. In other words, the Ministry of Commerce and Industry, following hard on the heels of the Ministry of Transport, has found it necessary to arrive at a totally new figure for the areas of development for which it considers itself responsible. This is the second large breach in the plan-frame; all the initial indications are that it will widen as time proceeds. This time the private sector wins but that is, so to speak, an accident. It will be remembered that on the last occasion the beneficiary was a public authority; this is not a battle between the sectors.

However, there is good ground for the private sector to strengthen its position. This arises from the fact that the public sector, which, as was decided last Sunday by the National Development Council, is not to reduce its expenditure below Rs. 4,300 crores, has not the apparatus at the present time to spend this figure or anything near it in wholly public operations. While, therefore, a financial provision of Rs. 4,300 crores will need to be made in the public sector, not less than 50 per cent of this expenditure will involve orders placed upon the private sector, in much the same way as orders for railway wagons are placed on fabricating units and engineering construction companies in Calcutta. Thus it would appear that the figure for investment suggested by the Central Advisory Council of Industries last Friday is an adequate measure of the volume of business which the private organised sector will need to handle. Taking both the strictly private sector and the orders which the public sector will need to place on the private sector into account, it is doubtful if additional output in the organised private sector arising from the second Five-Year Plan will be less than Rs. 3,000 crores over the whole planning period. In other words, it is likely that the organised private sector may be handling work of an additional order of something like Rs. 600 crores a year. It will be thus working at pressure considerably in excess of the pressure at which it worked during World War II.

This figure is a cause for satisfaction but not for jubilation, and certainly not for any complacency. While the private sector is better equipped than the public sector for making prompt decisions and for implementing them when it has the resources, there is considerable doubt as to whether those resources can be readily applied at the present time on the scale that is required. This is largely because of the very large bottleneck which railway transport entails. The virtual doubling of industrial production in a matter of five years cannot be achieved unless the outlook on transport is radically different from what it is at the present time. To make a financial provision for the expansion of transport within five years is by no means to imply that adequate transport will be available in any of the next five years. If transport is not available, production which is dependent on such transport will not be available. While, therefore, there are many people who are quite convinced this week that the organised private sector can fulfil all its obligations under the heads assigned, there are factors outside the competence of the private sector which may justify the judgment that under present circumstances it may be biting off more than it can chew. This is no argument for the public sector in place of the private sector. It is an argument for realistic understanding of the limitation transport places on both sectors. It is vital that the private sector should not be led into the false belief that it can have all the public transport that is necessary for the job. That will never be the case; private transport will have to become a major industry in the Plan. If this can be arranged, things may be better than they look.

The private sector has now both an opportunity and a challenge. The opportunity to the private sector to develop at a rate considerably greater than in the first Five-Year Plan has been given. The Government of India has thus kept faith. But giving an honoured place to the private sector will not alone do the job. Again, finance alone is not enough. An assurance has been given by the Ministry of Commerce and Industry that resources up to about Rs. 100 crores might be made available through the National Development Corporation and other loan agencies so that the Plan for the organised private sector will not fall down because of finance. So long as transport is covered by doubt, the whole Plan is affected. The result is that, while a spacious opportunity has been held out before the private sector and neither politics nor finance will stand in its way, one essential public requisite has still not been underwritten.

To point out that, in some respects, uncertainty will continue to prevail does not imply that in the last week there has not been a tremendous advance in the practical determination with which the Government of India is proceeding. Business men all over the country have taken fresh heart. There is good cause for optimism even while disquiet on the Companies Bill is extending. The Government of India is acquiring in this phase of planning a sound practical and pragmatic approach which was missing at the stage of theoretical formulation. Shrewd observers have noticed that the Government of India's second thoughts are always immeasurably superior to its first; here at least it is running true to form.

Final Court of Appeal

THE major item before the current session of Parliament relates to the Indian Companies Bill. It is a matter for some considerable misfortune that the place of the joint stock idea in economic development in other countries is very inadequately appreciated in India. It is still more unhappily true that Members of the Indian Parliament have been drawn so little from business circles that both Houses reflect very inadequately the limited commercial experience that the country has on the eve of its great development plans. The Indian Companies Bill thus meets with a double handicap. It has been framed in a manner which shows extensive application of good intentions misapplied, largely because of inadequate appreciation of the practical details which are so necessary to sound and appropriate implementation. Secondly, the Bill itself has not been adequately revised at the Select Committee stage and is now being placed before a House which can only see the Bill's provisions in vague general terms. It is widely believed, as a publication of the Congress Parliamentary Party makes clear, that the issue is one primarily concerned with the distribution of economic power and wealth. The Indian Companies Bill has unfortunately been made to look as though it is part of the battle for a "socialistic pattern of society".

Because this is an entirely mistaken view of the purpose of Company legislation, 'The Eastern Economist' has judged that this an appropriate opportunity for launching on a Special Supplement dealing exclusively with one subject. This issue of 'The Eastern Economist' contains the first blue supplement, a feature which it is proposed now to continue in the last issue of each month. It is hoped that readers of 'The Eastern Economist' will find here in a central place a fair and just statement of problems of policy on the issue discussed. But the present Supplement is addressed not only to readers of 'The Eastern Economist'. It is addressed more particularly to Members of the Indian Parliament. They constitute at the present time the final Court of Appeal.

'The Eastern Economist' is full of optimism on the working of democracy in this country. It is, indeed, full of optimism on the working of the Indian economic system which has given us in the last three years a rate of economic progress, particularly in the field of organised private industry, which is one of the highest in the world. The disqualification that so few people in Parliament understand, or are interested in, commercial intricacies has hitherto not been a major disadvantage weighing down the dynamic factors in Indian economic progress. There is no need to be pessimistic. The Indian Parliament has conducted itself with dignity and honour and has won for itself an assured place for moderation and good sense throughout its current existence. There is no reason to believe that if the issues are fairly put to it today, it will fail to recognise that the interest of a nation always stands above the interests of a party or the loves or hates of any group.

The vital issue is not whether power is now concentrated in the Managing Agency system which is, in any case, doomed to die. That decision has already been made and must be loyally accepted. The question is not whether there are abuses in the existing administration of Company Law; there most certainly are, and these abuses need to be corrected. The question is whether the need for adjusting the Managing Agency system and correcting the abuses of Company Law should be made an occasion for a wholesale attack on the active elements of India's economic system. The danger is not that we will be slow to correct bad. The danger is that we may strike at the good much more than at the bad and might in fact empty the baby with the bath.

In commending, therefore, the studies which have been made in this first "blue" supplement of 'The Eastern Economist' to Members of the Indian Parliament, 'The Eastern Economist' makes only one request and that is, that the views presented should be read and read with care. It is impossible to get any understanding of a piece of complicated legislation of this kind without going through it section by section. But it is not every section that is important; an attempt has been made to direct attention only to major mistakes made in a piece of voluminous drafting which has greatly exceeded the capacity of the men who have been assigned this task.

The danger is that a very heavy price will be paid for these mistakes if they are not now corrected. For the rest the Representatives of the People must be trusted to rid themselves of all bitterness and political rivalries at this time of national development. Anger and hate and jealousy are all bad counsellors, however justified they may seem to be in individual terms. There is privilege certainly conferred by wealth and economic power; that should be abated, where possible, consistently with the national interest. But privilege is sometimes related to effort and national service. One must separate the chaff from the grain. Let the chaff burn, but let the riches of the nation be conserved for all.

A Truce to the Cold War

LAST week's Big Four conclave at Geneva should rank high as a landmark in international relations, if not for anything else, at least for bringing face to face the summit figures of the two opposing blocs, for "unloosening" the rigidity characterising post-war diplomatic relations, and for transforming, in a matter of six days, the air of bitterness and suspicion of the past eight years to one of peaceful and friendly negotiation. For once both the free press of the U.S. and the fettered press of the U.S.S.R. are harping on the same tune; both acclaim the agreement and express

faith in negotiated peace. All this is no mean achievement. The final agreement arrived at serves to end the cold war between the East and the West and to rebuild the war-time alliance of the Great Powers on a peace-time basis. It provides a telling commentary on the futility of long-distance recriminations and the utility of personal contacts.

From the very start, a return to stark reality was visible at the conference—a situation impelled by the realisation, on both sides, of the horrors of a nuclear war, although, strangely enough, this was not openly mentioned during the meetings. The hydrogen bomb, Mr. Eisenhower has truly said, has made war impossible; and the U.S. and the U.S.S.R. know only too well that it is they who possess these terrible weapons which give rise to the fear of a surprise attack and the overwhelming tragedy that is bound to follow. No wonder, then, the Geneva scene was dominated by America and Russia, the U.K. and France playing a relatively secondary role.

The conference prudently limited the goal of the work that the Big Four had to tackle, omitting, for instance, Formosa and China. The problems at stake were three, namely, German reunification and European security, disarmament, and East-West contacts. In getting into grips with these questions, President Eisenhower came out with an auspicious assurance that the U.S. would never wage an aggressive war against anyone, not excluding Russia, and this was immediately reciprocated by Marshal Bulganin who remarked significantly: "I believe you." However, the nature of the issues permitted no easy solution. The Soviet proposal envisaged the conclusion of a general European treaty on collective security in Europe instead of the formation of grouping of some European States bisected against other European States which, in his view, gives rise to friction among nations. He held that the establishment of collective security would facilitate the early settlement of the German problem through the unification of that country. In other words, Russia wanted European security to get priority over German reunification. It is this issue which proved to be the bone of contention and actually threatened to break up the conference. The Russians plainly fear that the emergence of a united non-Communist Germany would prove a dangerous counterweight to Soviet influence in the heart of the European continent and, having suffered the brunt of the Nazi war of attrition, they cannot contemplate with equanimity the effect of the fall of East German Communist regime on other satellites. But America insists on priority being given to German reunification on the ground that no security in Europe is possible until the German problem is solved first, and that any security plan without a German settlement is a "trap." On the other hand, a rearmed Germany, it is felt, will prove a bulwark against Russian aggression.

On the issue of disarmament too the divergence of opinion was sharp. Here again, the Russians were the first to put forward certain proposals. Marshal Bulganin proposed a two-point plan, banning all atomic and nuclear weapons, and withdrawing all foreign forces from European countries. The plan, he said, should begin with the "freezing" of NATO and its Eastern counterpart (the eight-nation grouping at Warsaw) and their eventual liquidation. The Western Powers knew how the plan, if implemented, would expose the European countries to the mercy of Communism, like the present "Peoples' Democracies". The plan was obviously unacceptable to the Big Three and a deadlock seemed inevitable when President Eisenhower, as if by way of a counterblast, threw a challenge to Russians to prove their sincerity by a bombshell proposal for exchange of military blueprints and aerial reconnaissance of the United States and the Soviet Union. There is little doubt that the Russians were taken aback at the bold and sweeping nature of the American proposal. However, they dismissed it as fantastic and impracticable, but their real dissatisfaction arose from their feeling that President Eisenhower was bypassing the basic issue of prohibition of nuclear weapons and the plan for disarmament which they had advocated earlier.

The directives issued to Foreign Ministers, who are to meet in October next, show that a compromise has been effected all along the disputed lines—a tactical move rendered inevitable to avoid a break-up. German reunification is basic to political stability in Europe, and it speaks much of the statesmanship of the men at the summit that a compromise was worked out which, while effecting a compromise on the goals vouchsafed, left the details to be threshed out at a later conference, and thereby were made acceptable to both sides. The Heads of Governments have rightly agreed that the settlement of the German question by means of free elections shall be carried out in conformity with the national interests of the German people and the interests of European security. The Heads of Governments have also agreed that the various proposals on disarmament, including President Eisenhower's offer to exchange military blueprints with Russia, should be discussed at a meeting of the U.N. Disarmament Sub-Committee in New York in August. The Foreign Ministers are also to study measures to bring about progressive elimination of barriers interfering with free communications and peaceful trade. The importance of bringing about a freer flow of ideas, information and population between the East and the West cannot be exaggerated.

Although an understanding on the means for further negotiation has been reached, there is no certainty yet of a final elimination of tension, for which the October meeting of the Foreign Ministers will have to work with tact and patience. Again, it will be idle to pretend that present-day world tensions will end even if the October conference resolves the European tangle. There are equally burning issues in Asia, the solution of which is so vital to world peace, such as recognition by the U.N. of the People's Republic of China and the question of Formosa. And yet the problems of East Asia, in which India has naturally a greater interest, were not discussed at Geneva. This is not said in criticism of the conference, for, had it tried to cover the Asian questions too, it would have simply courted failure. But it is a timely reminder that Herculean efforts will have to be made on foundations laid by the Big-Four heads if the world is to secure, within measurable time, a peaceful settlement of the outstanding difficulties both in Asia and Europe.

The Pioneers of Progress!

From the time of Edison's invention of the first incandescent lamp, the G. E. Scientists have continued to contribute to the world of science, new facts, new discoveries and new theories. The list of their many and diverse contributions is long—hundreds of scientific and technical papers include the works of Charles P. Steinmetz, William D. Coolidge, C. G. Suits, Willis R. Whitney, and Irving Langmuir, regarded the world over as being among the greatest authorities in their respective fields.

Under the leadership of these great scientists, the products of General Electric have grown in quality and their wide diversification.

The work of G. E. Scientists never ends. From their future work will come new discoveries... new developments to benefit the expanding electrical age and the infant atomic age... to enrich the modern civilization with new and better products.

THE WEEK'S NOTES

DEMARCHE ON GOA

THIS HAS been a week full of exciting developments over Goa. The meeting of the Congress Working Committee last Saturday provided the occasion for an important revision of Congress policy. While the Committee reiterated that there should be no mass entry of Indians into Goa and that the freedom struggle should be predominantly one for the Goans themselves, it has now accepted the thesis that the people of the rest of India as well as the Government of India should strive for the liberation of Goa. The implication is that the entry of individual satyagrahis will no longer be frowned upon. The Working Committee, however, has strongly insisted on the pursuit of peaceful methods by the Government and the people. This was the prelude to Mr. Nehru's statement in Parliament on Goa on Monday in which he traced the whole history of the Goa problem ending with the 'demarche' about the withdrawal of the Protuguese Legation in New Delhi. All these steps were warranted not only by the stupid obstinacy of the Portuguese Government but also by the increasing clamour in the country for stronger action, which the opposition political parties were quick to utilise against the Government. Simultaneously with this, train services to Goa have been stopped because it is suspected that the track has been mined and no assurances to the contrary have been forthcoming from the authorities in Goa.

These actions have helped the Government to reject the demands for stronger action made during the course of the short-notice debate in the Lok Sabha on Monday. But if Portugal persists in saying that there can be no peaceful transfer of sovereignty to India, the patience of the Indian people will be greatly strained though the Government is determined that India should not resort to force except for self-defence. The French parallel is generally overdrawn. France was, in spite of her political feebleness, a working democracy which could at least occasionally throw up a far-sighted leader with courage to do the right. Portugal is different and may persist in the folly of repression even when the bulk of the Goan population are demonstrably opposed to colonial rule.

MR. BUTLER'S NEW MIXTURE

THE VARIOUS restrictive measures which Mr. Butler announced this week to strengthen the British economy will not come as a surprise. Some indication of the deepening crisis of British prosperity was given even last February when the Chancellor of the Exchequer put up the Bank rate in order to curb spending and check the depletion of sterling area's gold and dollar reserves. Whether more severe measures were postponed due to the general election is a political issue which the Opposition will undoubtedly take up as Mr. Gaitskell has already done. But to the dislocations caused by overspending was added another—namely the disturbance caused by rumours about sterling which resulted in its weakening in the free markets. The purport of these rumours was that since Britain was committed to convertibility at an early date, it would help her to pay out less dollars for each pound—a queer argument which none the less did not die out as soon as it should have.

Mr. Butler's three-fold prescription on the present occasion attempts a more drastic remedy. There is firstly a restriction on hire-purchase credit for domestic goods like television sets, motor cars and washing machines—designed to check consumer spending and promote saving. Secondly, there is an attempt to restrict credit available for investment. Till now, only the high interest rate was a deterrent; hereafter banks will be asked to recall some of their loans, making business spending more difficult. As a token of the seriousness of the situation, it has been proposed to cut the outlay even in some of the nationalised enterprises like coal. Thirdly, Mr. Butler has scotched the rumours about convertibility by declaring that sterling convertibility is not contemplated now. If the dock strike had not made the position much weaker, British exports would have paid for imports. In the next few months, the replenishment of stocks run down during the strike would keep imports at a high level. Stringent as some of these measures seem, no responsible person has criticised them for going too far; on the other hand, it has been said that they do not go far enough. Interested opinion in India will mainly stress the fact that any step which strengthens the solvency of the sterling area is desirable. The days are gone when a common policy to stem inflationary pressures was deemed necessary for the whole sterling area.

A DISCREDIT TO DINH DIEM

REPORTS COMING in from Saigon seem to corroborate the allegation of Mr. M. J. Desai, Chairman of the International Supervisory Commission in Viet-Nam, that the attack on the headquarters of the Commission was deliberately organised. This deplorable move against the Commission seems to have had the sympathy of the South Viet-Nam Government which has now put forward lame excuses, when it is supposed to co-operate with and provide protection to the Commission. The attempt to arouse anti-Communist feelings might have been laudable in itself, and if such feelings had been aroused towards the closing phases of the Civil War, when the North was advancing forward and the South lay completely demoralised, it would have greatly enhanced Mr. Diem's credit. At present, however, it is being directed against a neutral Commission and amounts to nothing more than an attempt to sabotage the Geneva Pact, which saved the South from the complete chaos for which it seemed destined after Dien Bien Phu.

The three Western Powers have appealed to Mr. Ngo Dinh Diem not to stall the forthcoming general elections in Viet-Nam for unification of the North and the South. The contention of South Viet-Nam Government that it was not a signatory to the Geneva Pact has been shown to be without substance, because as a successor Government, it has an obligation to honour the commitments of the French. It is arguable whether the time is now ripe for free elections. If the Diem Government, which has accepted elections in principle, has genuine reasons to put forth for their postponement or for their being held under U.N. or other international supervision, it should have presented its case in a proper manner for consideration during the discussions. But, as in Korea, anti-Communist fury has been spent on peaceful neutrals rather than on the Communists, revealing a pattern of behaviour which tends to be uniform in such matters.

It may be difficult for the Supervisory Commission to function in an atmosphere of hostility, but such occasions were always on the cards. If the Viet-Nam Government shows further intransigence during the discussions with the north on the question of elections, the outcome cannot be entirely a happy one for those who wish to stem the Communist tide. It can reflect no credit on the Premier if he had been in sympathy with this mischief; if he had not been, the incidents show what little hold he has over his own followers.

INDORE INQUIRY

PRODDED BY public pressure, a brief and, what is termed as "arbitrarily made" summary is all that the Madhya Bharat Government has thought expedient to publish of the report of Mr. Justice Wanchoo on the Indore firings in July last year when about ten people were killed and nearly 200 injured. This may suggest that it is an attempt at hiding some undesirable facts about guilty officers in order to shield them. The contention of the Government that the report ought not to be published, because certain cases were pending in a court of law, may or may not carry weight. What is important, however, is that the very purpose of setting up impartial commissions of inquiry is defeated when their findings are not published in full for the general public to know and judge the facts of the case.

Whatever little the summary of the Wanchoo Report contains, indicates that there was considerable confusion and miscalculation on the part of the authorities during the troubles. The firing around the High Court, which was set on fire, is described as 'erratic and ill-directed' and at some other places as unnecessary and unauthorised. The view that any of the political parties had directed the disturbances is also discounted and the Government's plea that Sec. 144 was not promulgated immediately because of the procession consisting of students is not accepted as plausible. There was no justification for the students to strike or demonstrate on purely administrative matters; nor was their exhibition of hooliganism in destroying and damaging public property, excusable. The authorities have, however, a responsibility to act with patience and tact in all situations and their approach to the students should not have been based on rule-of-thumb.

MAYORS IN CONCLAVE

IN THEIR conference held recently, the Mayors of six major cities of Bombay, Madras, Bangalore, Ahmedabad, Poona and Calcutta, have drawn the attention of the Planning Commission to their common problems of slums, housing shortage and overcrowding and have sought financial assistance to implement development schemes of the cities included in the second Five-Year Plan. It has been argued that the revenue resources of the six city corporations, with a total population of 9 millions, aggregate to Rs. 20 crores, which cannot be increased further. In order to give practical shape to their development schemes which are beyond their resources, the corporations will need loans and other financial aid.

With the emphasis on industrialisation in the second Five-Year Plan, the urban population is bound to increase. It is, therefore, essential that some thought and action is devoted to the problems of these expanding cities, which are in a sad state so far as even basic civic amenities are concerned. The Prime Minister, during one of his visits to Bombay some time back, had also pointed to this urgent need. The public, on their part, have also to be enterprising and more cooperative. For instance, 'Chawls', the main dwellings of industrial workers, comprising some of the worst slums, have to be demolished. The obligation of providing the worker with better accommodation devolves not only on the employer, though it is refreshing to find that some of the mills have already taken the lead in this direction. In the first Five-Year Plan, local authorities have been slow to take advantage of the housing schemes in collaboration with industrial employers to improve the housing situation in cities. It is wrong to believe that they would have solved their problems once they get consent for an impressive figure of outlay. They have much to improve in their capacity to execute schemes which would make urban life more tolerable than it is today in some of the major cities.

THE PRACTICAL APPROACH TO PLANNING

DR. B. C. ROY'S approach to the problem of planning is that of the man on the spot on whom must necessarily devolve the responsibility of implementing specific schemes and projects comprising the plan. His exposition of the rationale of the practical approach, in the course of a public address which he delivered here last Tuesday, was in no sense dogmatic and, in fact, he stressed and conceded that broad principles and objectives must govern all planning, if implementation was to be effective and to proceed in the right direction. Planning had to take care of all the interests and sections of the population and there could be no successful achievement of the goals and targets fixed in the plan, unless a realisation was brought home to the people that the plan meant something positive affecting their living standards in concrete terms. That was the real way to carry conviction that it was a democratic plan and that was the effective way to enlist active co-operation of the people.

This basic approach made it imperative that there should be full consultation with the people at all levels before the targets are drawn up and this was the technique adopted in preparing the second Five-Year Plan for West Bengal. In this process of building from below, a large amount of pruning of local demands was inevitable, if total needs were to be matched to the available resources. But any practical plan had to maintain a reasonable balance between diverse demands. Dr. Roy fully recognized the claim of capital goods industries in the plan, but he stressed that a reasonable share had also to be accorded to consumer goods industries. An arbitrary statistical technique which sought to impose allocation of resources from above inevitably carried grave risk of imbalance in the plan which could not fail to impair its feasibility.

PLAN FOR PRIVATE INDUSTRY

AT THE meeting of the Central Advisory Council of Industries in New Delhi last week, members had expressed confidence that the private sector would be able to raise all the resources necessary for achieving the investment and production targets under the industrial programme for the private sector in the second Five-Year Plan. The draft outline of the Plan prepared by the Ministry of Commerce and Industry envisages a total outlay of Rs. 750 crores. It is considered possible that out of this total outlay Government may be able to provide Rs. 100 crores. The investment estimates relate to investment expenditure exclusive of expenditure on maintenance and normal replacement, but in the case of cotton textile industry, the total provision of Rs. 100 crores includes Rs. 38 crores expected to be spent on modernisation. It is expected that foreign exchange may constitute about 40 per cent of the total outlay.

An investment-output ratio of approximately 100:120 is said to have been obtained from industries other than iron and steel, for which plans have been prepared. If cotton textiles are excluded, the ratio is 100:110, the ratio for cotton textiles being 100:160. The investment-output ratios have been calculated as the relation between the investment in fixed capital and gross output. The ratios relate to new units established on an economic basis and working on the number of shifts usual in the industry concerned. They will be useful in indicating the turn-over that can be expected from a certain volume of investment, a measure taken into account by business men. The level of gross output that can be expected from planned investment is also significant in relation to the study of problems of money supply and prices. The employment estimates take into account only the direct permanent employment in the units concerned after the period of construction is over. Employment during the construction period and induced employment in ancillary activities are left out of account.

A Window on the World

THE DETERMINIST'S MOTHER'S CAT

By

ODYSSEUS

GLENDOWER:

At my nativity

The front of heaven was full of fiery shapes,

Of burning cressets; and at my birth

The frame and huge foundation of the earth

Shak'd like a coward.

HOTSPUR:

Why, so it would have done at the same season, if your mother's cat had but kittened.

William Shakespear.

Determinist philosophers see the world in the grip of vast, "inexorable, inevitable" forces, that sweep empires, nations, social orders or classes, on to their appointed destinies regardless of individual men and women, who are but specks, tossed hither and thither on the surface of the seething and unfathomable waters.

"Quite," says our professional objector drily from his safe position at the back of the class, "but what I want to know is what this high falutin' discussion is doing in the columns of a periodical that professes to serve the interests of practical business men whose primary pre-occupation is not the state of their souls but of their balance sheets?" The short answer is that if business men are as disturbed, as most of them profess to be, by the threat of Communism that looms over Asia, it is as well that they should understand the basis on which the creed which they reject is built up, and know something of the strong and weak points in the enemies' case.

Now there are many refutations of the Determinist creed, some of which have been outlined here before (a) on the philosophic plane in the series "Freud's Challenge to Philosophy" in March, 1954, and (b) on the economic plane in "Free Enterprise and Socialism" which occupied us between April 23, and July 9, 1954. This week I propose to borrow some points scored against the Determinist view of life from Mr. Isaiah Berlin's "Historical Inevitability" just published at 6/- by the Oxford University Press. It is, however, only fair to Mr. Berlin to say that he deals with the Determinist view as applied to the writing of history, and that I have chosen to quote him on what is for him but an incidental aspect of his broad theme.

Mr. Berlin recalls that Determinists are always urging historians in the name of science to avoid bias. What meaning have these exhortations, he asks, save on the assumption that to praise or blame, to seek to be just, is not irrational, that human beings deserve justice as stones do not? Yet once we transfer responsibility for what happens from the backs of individuals to the broad back of History (remember last week we cited Mussolini as exclaiming when he learnt the dire news of the landing of Allied troops at Anzio: "History has seized us by the throat!"), to institutions, civilisations, or concepts, such as the Dictatorship of the Proletariat, working out their destinies in foreordained revolutionary patterns, what can be meant by imploring us to avoid bias and to take care not to be unjust in the award of praise or blame?

RAIN SHOWS BAD JUDGMENT

Nobody accuses us of biassed accounts of geologic changes or of misplaced blame in describing the effect of the Italian climate on the agriculture of ancier Rome, because these are inanimate objects, like Vesuvius which cannot choose whether to blot out Pompe by an eruption, or are natural phenomena, like rai which notoriously is incapable of soaking only the un just. Can you be biassed against a volcano? It i true that people are often "angry" with the monsoor for failing, but the monsoon is an insensitive type anc shows no visible emotion in response. In spite of this it is among the inanimate or natural phenomena that the Determinist philosophers have classified men, by insisting that they are as helpless as volcanoes or monsoons in the face of natural laws or Impersonal Universal Forces, or of cataclysmic leaps from a lower to a higher stage when some great revolutionary "advance" is "due".

Many critics have said that Gibbon and Macaulay showed prejudice in their presentation of history: that they were unjust; that because they wished to secure our approval for one side, they therefore denigrated the other; they suppressed evidence inconvenient to their thesis in their anxiety to show that certain people whom they liked (such as Whigs) always acted better than others whom they did not like (such as Tories). We complain not merely of distortion but of the propagandist aims out of which these distortions arise.

But to speak of propaganda at all, let alone to assume that it can be dangerously effective, is to imply that man is not a predestinate object, designed to move in a groove, like a tram, but a human being capable of choice between right and wrong, and therefore open to praise or blame. You can broadcast misleading propaganda about the motives of a man but not about a tram. To insist, for example, that a just, and not a propagandist, account should be given of the events of 1857 is to imply a belief in individual responsibility, both in the free choice of the historical British or Indian characters described, and in the character of the historian who decides to emphasise this trait, because he thinks it particularly illuminating, or to ignore that fact, either as unimportant in itself or as unimportant to his purposes, just as, for example, in borrowing ideas from Mr. Berlin, I have decided that, for the purposes of this column, I need deal with only one or two of the innumerable treasures of thought that his booklet contains.

How great a degree of freedom one considers that the individual enjoys depends on one's reading of nature and of history, but it must be some degree—it cannot be nothing at all. And it is just this that is virtually denied by these historians and sociologists, steeped in metaphysical or scientific Determinism, who say that, in the last analysis, everything—or so much of it as makes no difference—boils down to the effects of race, or civilisation, or social structure, or class.

One of the deepest of human desires seems to be to find an explanation by which the whole of experience, past, present, future, can be made more readily understandable to the ordinary man by being seen to fit into a symmetrical pattern. But the moment that you assume the existence of a pattern, you get yourself into the whole series of illogicalities arising from the denial of individual personal choice. And it is pre-

cisely this that the Determinist philosophers, historians, and sociologists (like Marx) fail to realise.

ISAIAH BERLIN'S ENCHANTING VIEW

One of the results of this failure is the growth of an alleged "sociology of knowledge" which suggests that our methods, conclusions, and reasons for believing them, can be shown to be largely or wholly determined by the stage reached in the development of our class, group, nation, or culture, and this is followed by the fusion of these usually unconvincing but at least quasi-scientific doctrines with what Mr. Berlin pleasingly calls "such non-empirical figments" as the "Collectivist Spirit", or "The Contemporary Collapse of Values", or "Modern Man", or "The Last Stage of Capitalism".

These modes of speech, Mr. Berlin delightfully argues, have peopled the air with supernatural entities of great power, angels and demons who play with us as they will, and make demands on us which, we are told, we ignore at our peril. I am enchanted by Mr. Berlin's view that there has grown up in This Unsuccessful Age (as the late Walter Eucken called it) a quasi-sociological mythology which, in the guise of scientific concepts, has developed into a new Animism—more primitive and naive than the traditional faiths that it scorns and seeks to replace!

This new cult leads troubled persons to ask such questions as "Is War Inevitable?" or "Is Civilisation Doomed?" The way in which these questions are posed implies a belief in the occult presence of vast impersonal entities—wars, collectivism, doom—forces at large in the world, which we have but little power to deflect, except perhaps by propitiatory rites such as "joining the party", or jumping on the revolutionary bandwaggon, to ensure that we are on the right side when the inevitable catastrophe comes.

Sometimes these unseen powers are said to embody themselves in some titanic figure—Napoleon, Lenin, Stalin—who because they are "at one with their age", achieve superhuman results; sometimes they embody themselves in classes—the great capitalist combines which are said to work for ends that their members hardly understand themselves, ends towards which their economic or social positions "inevitably" drive them. Sometimes these unseen angels or demons embody themselves in huge inchoate entities called "The Masses", which do the work of History. Wars, revolutions, dictatorships, military and economic transformations, are thus conceived like the genii of the demonology of the Arabian Nights, which, once set free from the jars in which they have been confined for centuries, become uncontrollable, and capriciously play with the lives of men and nations.

Cowed and humbled by the panoply of the new divinities, men are eager for the comfort of the new sacred books (e.g. of Marx or Hitler) and of the new orders of priesthood (e.g. the Communist Party of India) which affect to tell them how to propitiate the spirits of the air. And the books and the priests do speak words of comfort: demand creates supply. Their message is as simple and as ancient as that of the Odyssey (I do not here refer to this column but to the writing of my well-known predecessor, Mr. Homer). In a world where such monsters clash, the discovery of new and terrifying impersonal forces may render life more dangerous but they do at any rate divest their victims of all responsibility—from all those moral burdens which men in less enlightened days used to carry with such labour and anguish.

Yet this is all very odd, for what are these spirits in the air? They arise from the application to the alleged science of sociology of empirical generalisations that constitute the laws of the natural sciences. But as we have seen, laws that apply to inanimate rocks and volcanoes do not apply to animate man.

Alas, I have no further space to borrow more ideas from Mr. Isaiah Berlin and can only urge you to read his rollicking and witty pages for yourselves. To be fair to you, I should utter the warning that his arguments are hardly bedside reading; on the contrary, they demand wide awake concentration. Nevertheless, they are ("in the last analysis" as the Determinists are so fond of saying) comprehensible even to the layman, like me. But don't get him mixed up and ask your bookseller for "Historical Inevitability" by Mr. Irving Berlin. He, as Sir Winston Churchill once discovered, is quite a different kettle of philosophy.

BHARAT NIDHI LIMITED

NOTICE is hereby given that the Annual General Meeting of the Company will be held at the Constitution Club, New Delhi on Wednesday the 31st August, 1955 at 3-30 P.M. to receive and adopt the Directors' Report and Audited Accounts for the year 1954, to declare dividend, at 6 per cent (less income tax) on Preference Shares and at 5 per cent (without deduction of Income tax) on Ordinary Shares, to elect a director and to appoint Auditors and fix their remunerations.

Share transfer books of the Company shall be closed from the 16th August, 1955, to 31st August, 1955—both days inclusive.

Dividend would be paid to the registered shareholders as on 31-8-55 or their mandataries. Holders of scrip under blank transfer are requested to send in their shares for registration in the books of the Company as early as possible.

By Order of the Board,

J. B. JAINI,

Manager.

A DELHI DIARY

GENTLEMEN OF THE PRESS

A BOMBAY reader has encouraged me to be (foolishly?) persistent in my comments such as those in the last two Delhi Diaries on the Gentlemen of the Press. I have been pressed to "continue to analyse the serious disease growing in the Fourth Estate." My correspondent tells me that a very large number of people in India are as dissatisfied as I am with the reporting of the Prime Minister's tour. One or two of his informants, he tells me, have suggested that the choice of Press representatives was not as wide as it might have been, because of a double check at External Affairs and the U.S.S.R. embassy. I do not accept the view that those who went were not adequately qualified or that there was a heavily biassed initial selection. The results, however, were certainly not happy. It is no good blaming the Russians or External Affairs for this. This sin is our own.

In addition to the examples which I have previously quoted to show that either there was wilful suppression of facts or there was carelessness enough to permit of wholesale omissions in reporting, I now submit an instance which relates to the reporting of events in Geneva last week, which in my opinion, is inexcusable.

MISCHIEF IN GENEVA?

A leading Special Representative of a leading Indian daily paper reporting on the reception to President Eisenhower's proposals for the exchange of blueprints of military bases wrote as follows on the "satisfaction the West had in recovering the initiative on peace".

"This expression of triumph was implicit in the briefing given last night by the official American spokesman, Mr. James Haggerty who, after announcing the President's proposal with less than his usual objectiveness, paused slightly and said at slow dictation speed 'There is no comment yet from the Russians'.

"To another section of opinion in Geneva—and this was far from confined to Communists—the American offer was unfortunate because it was unrealistic and impracticable. It belonged to the realm of fantasy. Inasmuch as the Eisenhower plan was regarded as incapable of implementation it did no service to the cause for which the Big Four Conference assembled and they, on the contrary, had encouraged an amusing game of competitive argument. To say that the Russians have made equally fantastic proposals in the past does not alter the situation. This conference at any rate was being conducted with a large measure of earnestness until the Americans' peace explosion."

Mark the inimical slant in describing Mr. James Haggerty's announcement and the words 'unfortunate', 'unrealistic', 'fantasy' and mark the sentence, "Inasmuch as the Eisenhower plan was regarded as incapable of implementation it did no service to the cause for which the Big Four Conference assembled and they on the contrary had encouraged an amusing game of competitive argument", and "To say that the Russians have made equally fantastic proposals in the past does not alter the situation," and the words "peace explosion". Can there ever have been in the reporting of any great practical gesture for peace (since even the Russians have now accepted the American proposal as a basis for discussion) such supercilious contempt? If all the Big Powers consider a proposal worth considering why should an Indian Pressman describe it as 'fantasy' without a single reason for the word? Curiously the same Special Representative on the very next day altered his tone completely and said:

"Mr. Haggerty, President Eisenhower's Press Secretary, was the first to give the success news to the waiting world" and again,

"Earlier today Marshal Bulganin also agreed that the U.N. Disarmament Sub-Committee—the Big Four and Canada—be charged with the tasks of discussing proposals advanced here including President Eisenhower's dramatic offer to exchange military blueprints with the Soviet Union." I can only explain the action of this Special Representative in terms of good Marxian dialectics. He has become too attached a part of his own intimate circle.

It seems to me obvious that the Indian Press wherever it goes has now acquired a slant on the presentation of "peace" moves which accords not a little with the outlook of several officers of the Ministry of External Affairs. I go further and say that there is some correlation between the slant and the extent of contact which Gentlemen of the Press are afforded in the corridors of the South Block.

Most biases in human animals rise unconsciously. I am Marxian enough to recognise that economic bias is the largest of those which prevail in most occupations of the world; the bias of journalists is no exception. In India there have been particular factors which have tended to make the bias what it now is. In the first place, there are many senior Indian journalists who feel that they do not command in a Press, which is steadily losing prestige, the position they think their talents can command elsewhere. It is no secret that more than one senior member of the Press would like to change his job for a diplomatic assignment. Following from this desire it is but natural that the Ministry of External Affairs (which is, after all, the architect of diplomatic assignments) should acquire an influence over the seekers of office which is quite incompatible with the just and honest performance of interpretation of controversial international events. Added to the bias which comes from the desire for prestige and power there is quite frankly the pursuit of opportunities to go abroad. The choice of Press representatives to accompany the Prime Minister has been made in a manner which indicates that those unfavourable or those less favourable to the Prime Minister's interpretation of events in the Cold War or otherwise do not receive the same encouragement as those of whom the Ministry of External Affairs approves.

Gentlemen of the Press who owe a duty to the country which is greater than the duty to the Ministry of External Affairs or even to the Prime Minister will have to guard jealously their reputations which are likely to be jeopardised because of the temptations which the present situation places in their path.

I have implied in the last (three!) Delhi Diaries that there is an urgent need for an examination of conscience. I do not think the situation is one which is desperate in that the Indian Press has lost its capacity for independent judgment already. But I have heard in the last week so many criticisms of the Indian Press as being "servile" and "slavish" in its attitude towards authority that I would be failing in my duty if I did not say that there is enough of a suggestion of truth in the accusation for us of the journalistic profession to pull up ourselves sharp. It is our job to be taking the blinkers off others; are we not wearing some ourselves? In any case, there is no point in being complacent. Denmark is not the only country of which it has been said that there was something rotten there!

ARGUS.

Economic Report from the U. S.

COAL: A POWER SOURCE

(By Guy Sims Fitch)

CHARLESTON, WEST VIRGINIA, July 26.—Two ompeting American industries—one new and one old—re looking forward eargerly to the future. Up in lew York State last week, the nation's first atomically enerated electricity for commercial use coursed rough transmission lines, bringing the atomic age a ep closer. Down here in the coal regions of West irgina, the news was received with remarkable equnimity. For coal is making a comeback; no longer oes the spectre of the peacetime atom fill the hearts of iners with foreboding. So far this year, with the merican economy operating in high gear, coal output running 20 per cent ahead of last year. Industry fficials speak of turning out 440 million short tons this ear, compared with last year's 392 million. Immediately oticeable is the happier look of mining communities west Virginia and neighbouring Pennsylvania. In e past few years, as coal output skidded, more than 0,000 miners lost their jobs; others saw their work eek trimmed to two or three days. But now there e more jobs for miners, and the work week generally back to five and even six days. This means more oney in the bank for mining families and more to end in their communities. The average union miner rns a basic daily wage of $18.35. With overtime ork, which is becoming more frequent, average earnngs are close to $20 a day. Employers, moreover, ntribute 40 cents per ton of coal produced to the zable welfare fund of the United Mine Workers nion.

An annual output of 440 million tons is still a far y from the record 688 million mined in 1947. But ine operators are confident that within a few years al will be starting a long upward swing that can rry it to an annual output of 1,000 million tons by 75. They point out that recoverable coal reserves the United States, estimated at nearly 800,000 million ns, far surpass the nation's known reserves of oil gas. As time goes, industrial plants and electric ilities may have to rely increasingly on coal as a wer source. Coal already produces half of all U.S. lectric power, and in the past year has been outgaing its competitors as a fuel for generating electricity. oreover, the nation is growing economically at a henomenal rate. The electric utility industry expects double its present output by 1965, and to triple it y 1975. Increasing activity in such other industries steel, aluminium, cement and chemicals also will oost demand for coal, in both power and non-power pplications.

On top of domestic consumption will come rising emand from abroad. Coal already is feeling the imact of expanding economies throughout the world. he industry expects to export nearly 30 million tons his year, compared with less than 16 million last year. ut the coal industry is not just waiting for its golden ge to arrive; it is working to bring it about. Investnents in new machinery are running some 40 per cent head of last year. Productivity in the nation's coal ines already has gone up from a 1946 average of 6.3 ons mined per man-day to 9.5 tons, with some highly echanized mines getting as much as 28 tons. Equipnent makers, who have developed mechanical miners apable of working seams as narrow as 38 inches, see 00 tons per man-day as a distinct possibility.

The transportation problem, still a bottleneck in any mines, is being solved through the growing use of conveyor belts to move more coal out of mines more rapidly and to carry it longer distances from producing to consuming centres. Pipelines also are being planned as coal carriers. One such line soon may be transporting a mixture of coal and water 100 miles from mining properties in the State of Ohio to the city of Cleveland. As these improvements continue to bring costs down, coal will become more competitive for a wider range of uses. Among the reasons for the growing use of coal this year have been the price concessions producers have been able to make in the eastern and north-eastern parts of the country, where electric generating costs are relatively high.

Coal men concede that the peacetime atom will be a competitive power source in the years ahead. But they see large-scale generation of economic nuclear power slow in coming. Meanwhile, more coal-burning plants will be going up. By 1975, when economic nuclear power will be established on the American industrial scene, the economy will have grown so large, they say, that electric utilities alone will require 500 million tons of coal. If to this is added the potential demand from other expanding industries, it is easy to understand the rejuvenated optimism in the coalfields.

WORLDGRAM

AGRICULTURE

Afforestation in Second Five-Year Plan: Afforestation of the great Indian desert, which extends from the Gulf of Kutch to the Rajasthan desert tracts, and rehabilitation of the ruined hills in the foothills of the Himalayas are among the soil conservation schemes during the second Five-Year Plan. The schemes will in all cost Rs. 30 crores. It is proposed to deal with tracts seriously affected by soil erosion and areas which are liable to both water and wind erosion. Several research stations have already been opened in different soil climatic regions of the Union to tackle the problems of deserts, ravines, black soils, hills and river-valley projects, and some more are likely to be started soon to cater for other soil regions.

*

Use of Agricultural Surpluses: The question of utilizing agricultural surpluses in countries like America, Australia and Canada for financing development programmes in underdeveloped countries was discussed at the recent F.A.O. meeting in Rome. There was general agreement at the meeting that the studies already made on the subject deserved to be pursued and that every attempt should be made to arrest unnecessary lowering of the price level in the producing countries and utilize the agricultural surplus of the World for financing development programmes in underdeveloped countries. This matter would be further discussed at the next Conference of the F.A.O. in October or November in Rome.

*

New Co-Operative Farms in Poland: New co-operative farms are being set up all over Poland. Small and middle holders are joining the existing co-operative farms. In May this year, eleven new co-operative farms comprising some 250 farmsteads, were organized in Cracow Voivodship. In addition, the existing co-operative farms were joined by some 100 new members. This year the co-operative farms in Szezecin Voivadship have admitted 760 new members. Peasants in Olszlyn Voivodship have organized thirty new co-operative farms. New co-operative farms are constantly being set up in Bydgrszez Voivodship, their number amounting at present to 1,070.

INDUSTRY

Seven-Fold Rise in India's Bicycle Production: An installed capacity for the production of 757,500 bicycles is likely to be established in India, when the schemes already licensed for additional manufacturing units and for the expansion of one of the existing units are completed. The total installed capacity at present is 437,500 bicycles per year. India's bicycle production has gone up by seven times since independence. As against a production of 48,827 bicycles in 1947 the production in 1954 is estimated at 350,000. At the same time there has been a steady decline in the import of bicycles. The number of bicycles imported in 1953-54 was 90,362 as against 264,392 in 1948-49. It is reported that the indigenous industry will be able to meet the increasing demand for cycles during the second Five-Year Plan.

*

Robot Driver for Tractor: An ingenous device has been invented in Britain which works diesel tractor without driver or supervision. Briefly, it consists of an arm fitted to the tractor's steering-gear, with a thin cord connected to a square reel mounted horizontally upon a vertical pole based on a skid. The pole is set up in the centre of the field to be worked. The tractor, is started from the centre and the pull on the cord causes the tractor to steer in a circle which increases in diameter as the cord unreels. On reaching the limit the cord begins to re-wind and the operation is repeated in reverse until the tractor reaches the centre again, when it automatically stops. A spring, hooked between the tractor steering rod and a point over the tractor axle, prevents the machine following an irregular course. Possible mishaps are prevented by control bumpers fitted to the front of the machine. A spring on a yoke, connected to the fuel control knob and hooked on to the tractor seat, immediately cuts fuel off from the engine if the bumpers come in contact with wall, hedge, or other obstacle.

*

Japan's Shipbuilding Programme: The Ministry of Transportation of the Japanese Government announced recently that its shipbuilding programme for the fiscal year 1955 (April 1955-March 1956) provides for the construction of between 185,000 and 189,000 gross tons of vessels: 68,000 gross tons of regular service freighters, 67,000 gross tons of tramp freighters, and 50,000—54,000 gross tons of oil tankers. For this programme, about Y11.4 billion, or some 80 per cent of the total required, will be loaned to the ship-building firms by the Government through the Development Bank of Japan; the remaining 20 per cent will be financed by the city banks. The Government will also extend loans of about Y4.8 billion through the Development Bank to shipbuilders to complete the shipbuilding programme of the last fiscal year.

*

New Iron and Steel Plant Project for Pakistan: The Pakistan Industrial Development Corporation and Germany's Iron and Steel producers Krupps are reported to have reached complete agreement over the question of jointly setting up an iron and steel plant in Multan district of Punjab (P). The PIDC are stated to have moved the Pakistan Government for approval of Rs. 60 crore schemes for the 250,000 plant.

*

Installation and Maintenance of Induction Motors: A draft Indian standard code of practice for installation and maintenance of induction motors for industrial use has been prepared by the Indian Standards Institution. It covers starting and control appliances associated with motors, is intended to assist the average user of industrial motors to ensure that the machines installed and maintained give the best possible service under conditions generally obtained in this country. Among the more important aspects dealt with in the code are general requirements, including conformity to Indian Electricity Rules, types of drives, inspection and testing, maintenance prcatices and design considerations. Five appendices to the code cover respectively rating of motor cables, recommendations for selection of drives, motor check chart as a ready guide for routine fault location, periodic maintenance schedule and recommended methods of wiring.

TRADE

Indo-Austrian Trade Agreement Extended: Letters were exchanged between the representatives of India and the Austrian Federal Republic at Vienna extending the validity of the Indo-Austrian Trade Agreement up to December 31, 1955. The existing Trade Agreement signed on December 9, 1952, as modified by an exchange of letters dated March 8, 1955, and now extended provides among other things, for the free importation into Austria from India of castor oil, coir, coir yarn, fibres for brushes and brooms, handicraft manufactures of ivory, brass, horn and brocade, iron ore, linseed oil, manganese ore, mica, myrobolams, shellac, spices, cashewnuts and tanned leather (cow, buffalo, kid and goat). The Austrian Federal Government will also consider favourably applications for import from India of cotton piecegoods, carpets (hand-manufactured) and coir manufactures other than coir yarn.

Taiwan's Foreign Trade: According to the Bank of Taiwan's exchange settlements data, Taiwan's foreign trade in the first quarter of 1955 showed a surplus of U.S.$12 million, compared with a surplus of $0.5 million in the corresponding period of 1953 and a deficit of about $8 million in the corresponding period of 1954. In the three months' period this year, total exports were $31 million, and imports about $19 million, excluding U.S. aid.

*

Brazillian-German Payments Pact: It is reported trade between West Germany and Brazil will in future be settled in limited convertible marks. The offset accounting system has been abolished in the Trade and Payments Agreement concluded in Rio recently. German officials see the pact as a first step in the setting up of a new multilateral payments system outside the European Payments Union. The system would comprise, Britain, Germany, Brazil and the Netherlands. Under the new system, according to German officials, Brazil will be free to use all of her marks earned for purchases in any of the other member countries and vice-versa. But there will be limitations in the use of these currencies elsewhere, and in particular, the use of them in the dollar area will be discouraged.

*

Swedish-French Trade Agreement: A Swedish-French trade agreement covering the period April 1, 1955—March 31, 1956, was provisionally signed in Stockholm recently. Certain increases, amounting to about Kr. 30,000,000 (£2,070,000; $6,000,000) concerning commodities which are still subject to French quota restrictions, have been attained for such Swedish export articles as wallboard, tractors, machine tools and office machines. New on the French list of quota allocations are road machinery, certain chemicals, etc. However, the French quotas for Swedish iron and steel have not proved acceptable to Sweden, and a clause providing for continued talks on this matter has been included in the agreement, this country claiming a right to the return of her traditional position as an important supplier to France of such goods. Sweden has also protested against the so-called temporary import duties imposed by France on paper, pulp, paints and laquers, etc. French imports are liberalized at 75 per cent, whereas Swedish imports are 90 per cent free. Mainly automobiles and certain agricultural products still remain among the French commodities now subject to quota restrictions in Sweden.

FINANCE

Rehabilitation Finance Administration: The Rehabilitation Finance Administration has sanctioned at its last meeting about 132 loan applications for a total amount of about Rs. 8.73 lakhs. Of these 90 applications were from Calcutta, 27 from Gauhati, 3 from Delhi and one each from Bombay, Lucknow, and Jaipur. Since its inception, the administration had till May 31, 1955, disbursed Rs. 956.59 lakhs as loans to displaced persons.

*

Customs and Excise Revenue: According to the returns received in the Department of Commercial Intelligence and statistics, the total gross sea and land customs revenue collected in the Indian Union during May 1955, amounted to Rs. 12.15 crores as compared to Rs. 12.17 crores collected in the corresponding month of the previous year. Of the total customs revenue collections, import duties accounted for Rs 10.16 crores as against Rs. 9.93 crores, export duties for Rs. 2.45 crores as against Rs. 1.98 crores and land customs and miscellaneous for Rs. 14 lakhs as against Rs. 26 lakhs. The total gross collection of Union excise duties amounted to Rs. 11.30 crores as compared to Rs. 8.49 crores. During the two months, April and May 1955, the grand total of gross customs and Union excise revenue realised was Rs. 47.16 crores as compared to Rs. 41.69 crores during the corresponding period of the preceding year.

*

World Bank Loan to Nicaragua: The World Bank made two loans totalling $7.5 million for the development of electric power in Nicaragua. The loans will help to finance the constructions of a 300,000-kilowatt thermal power plant in Managua, transmission lines to 15 outlying towns, and expansion of the distribution systems in Managua and the towns. The project will double electric generating capacity in Nicaragua and help to meet the demands for power in the Managua and Pacific coastal plain areas, the most populous and productive in the country.

*

International Finance Corporation: It is reported that the Union Government is studying the charter of the proposed International Finance Corporation transmitted to it by the World Bank. The Corporation when established will operate as an affiliate of the World Bank, and is designed to supplement the activities in association with private investors, to productive private enterprises in particularly less developed areas, without requiring a Government guarantee, in cases, where the necessary capital is not available from other sources on reasonable terms. The authorised capital of the Corporation will be 100 million dollars (Rs. 47.5 crores) divided into one lakh shares of 1,000 dollars (Rs. 4,750) each.

MISCELLANEOUS

Wind Power for Lift Irrigation: A Rs. 7-crore project for the installation of between 20,000 and 30,000 windmills in the windswept areas of the country is getting ready under the second Five-Year Plan. The windmills will be used for lift irrigation in small farms and gardens and also for providing cheap electric power in rural areas for the villagers' homes and for small-scale industries. A low-cost windmill using indigenous materials and adapted to the conditions of the country is being evolved by the Wind Power Sub-Committee of the Council of Scientific and Industrial Research. This windmill, in the construction of which bamboo and wood will be used to a large extent, will cost between Rs. 800 and Rs. 1,000. Imported windmills at present cost between Rs. 3,000 and Rs. 4,000.

*

Foreign Trade Institute in Israel: Plans for the establishment of a Foreign Trade Institute in Israel have been concluded. American technical experts working with the U.S. Operations Mission (USOM) participated in the discussions and gave valuable assistance in promoting the project and finalising the technical details of its future operations. The Foreign Trade Institute will be concerned with the developing of foreign markets for Israel's expanding industry and agriculture, especially in Asia and Africa. Simultaneously with the expansion of new industries and expansion of existing plants, it will undertake research into marketing possibilities. It will send agents abroad for the purpose of developing such markets and will deal with all matters which can contribute to increasing exports of Israel's industrial production.

*

Coal Mines Provident Fund Scheme Amended: The Coal Mines Provident Fund Scheme, as enacted in 1948, provides for the recovery of contributions only on basic wages of the employees. The working of the scheme has shown that contributions based on basic wages alone will be insufficient. The Government of India, on the recommendation of the Board of Trustees of the Fund, have now amended the scheme to provide that dearness allowance (including the value of food concessions in cash and in kind) should be reckoned as part of wages for purposes of contributions to the Fund.

NEWS IN BRIEF

INDIAN

It is reported about five lakhs of additional houses will be required for industrial workers in the private sector during the second Five-Year Plan period.

*

The Indian National Scientific Documentation Centre received 4,800 orders from, and supplied 3,021 documents to scientific institutions, universities, industrial concerns and individual scientists during 1954-55.

*

The Hindi Section of the Ministry of Education has so far prepared 30,526 scientific and technical terms in Hindi. Twenty-five Hindi books in children's literature are being prepared for children's libraries throughout India.

*

Though wheat in North Indian markets is bought at reasonable prices, it has not yet become adequately available in markets in the South. To meet this situation, Government of India have decided to release and sell wheat in the Southern Region from their stocks.

*

The Government of India is contemplating the manufacture of printing machinery in India. It is expected to ask some foreign experts to prepare a project report to start plans in the country in co-operation with Indian industrialists.

*

The National Research Development Corporation is considering a pilot scheme, estimated to cost Rs. 20 lakhs, to produce photographic films and papers in India.

*

A loan of Rs. 10 lakhs was sanctioned by the Centre to Delhi State during 1954-55 for the development of small-scale industries. The amount was to be disbursed as loans to cottage and small-scale industries.

*

The Government of India has allotted Rs. 1 lakh as loan and Rs. 15,000 as grant to the Family Welfare Co-operative Industrial Society, Ltd., New Delhi, for the establishment of a match factory at Delhi.

*

Schemes for production of long staple cotton in India are being considered by the Indian Central Cotton Committee, meeting at Bombay for a five-day session beginning July 25.

*

A five-man Indian textile team, led by Mr. C. C. Jhaveri, toured Colombo to make an on-the-spot study of markets, and to assess the extent of Ceylon's cotton textile requirements. Besides, the team was to study consumer preferences in the wake of changing dress habits and investigating other incidental problems, vital to the promotion of export of Indian textiles.

*

An official Indian delegation is scheduled to leave New Delhi for Moscow to study representative steel works in the Soviet Union and works producing metallurgical equipment, in terms of the agreement between the Government of India and the U.S.S.R. for the establishment of an iron and steel plant in India.

FOREIGN

It is reported increasing use is being made of natural rubber in road building in many countries and the attitude of road engineers to rubber roads has changed remarkably in the last two years.

*

Burma is likely to have a direct public radio telephone service to London and radio-telephone and radio-telegraph circuits linking Rangoon and Madras.

*

It is reported Venezuela has asked the United Nations Technical Assistance Administration for experts to help with huge public works projects there. A chief engineer from the hydro-electric services of Electricite de France has been designated to aid the Venezuelans construct a large dam on the Garoni river.

*

The General Electric Company of England is setting up a multi-million dollar industry in Canada which should enable Britain to earn dollars and thus be able to buy more from Canada.

*

The output of the Belgian spinning mills in 1954 showed an increase of 44 per cent over that in 1953, but fabrics production last year was 14.8 per cent lower.

*

The Thai Defence and Agriculture Ministries have announced plans for the establishment of a modern 15,000,000-dollar oil refinery in Southern Thailand near the Burmese border.

*

A modern flat-glass plant, capable of producing 6,000 tons (12,000,000 square feet) of window glass is being built at Inchon, Korea, by the United Nations Korean Reconstruction Agency, in co-operation with the Government of the Republic of Korea.

*

Already the largest exporters in the world of heavy commercial vehicles, Leyland Motors have formed a new company for the progressive manufacture in India of Leyland vehicles and diesel engines.

*

A Five-Year Plan for meeting housing shortage in Spain has been announced. The Plan envisages construction of 550,000 cheap dwellings at a total expenditure of £27 million.

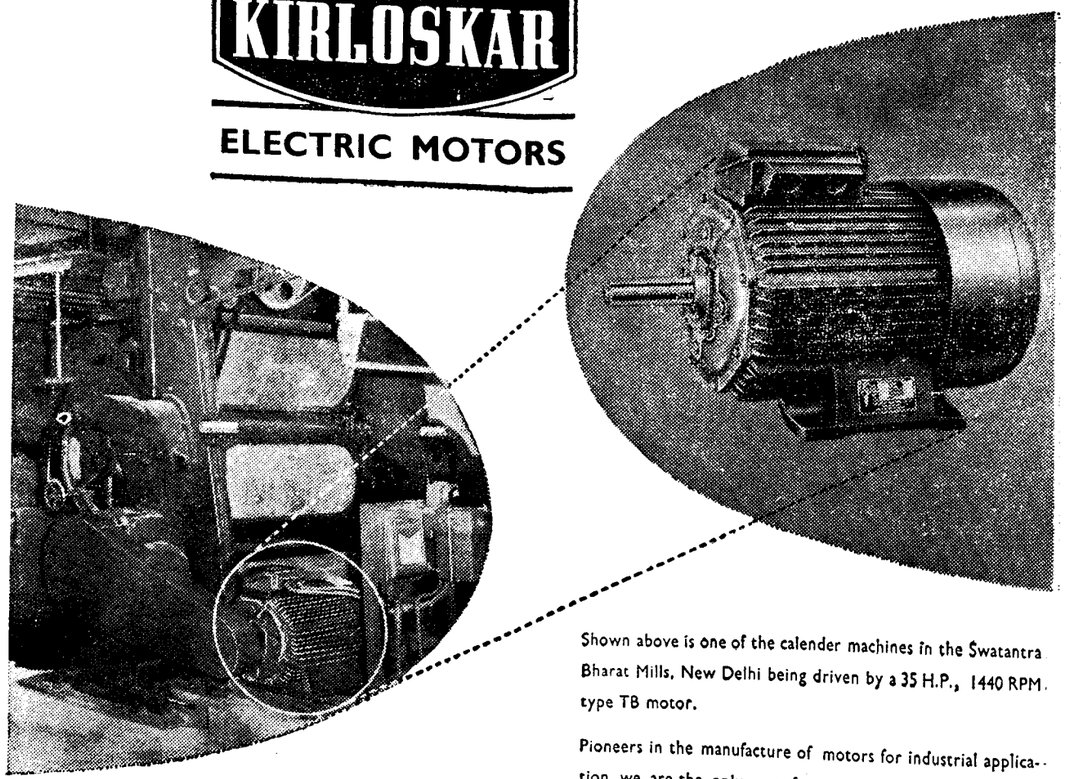
*

The world mine production of tin during the first four months of 1955, was at an annual rate of 155,000 tons, the quantity actually produced in that period being 51,700 tons. The output during 1954 aggregated 169,000 tons.

*

With a view to curbing expansion of hire-purchase business in Australia, the Commonwealth Bank has asked all the trading banks not to grant any new or additional advances for hire-purchase or instalment selling purposes.

*



Nepal has been invited to send a representative on Ministerial level to attend the forthcoming plenary session of the Colombo Plan Consultative Committee to be held in Malaya.

*

Total credit in national and private savings institutions as on December 31, 1954, in France amounted to about 1,200 billion francs, or approximately 200 billion francs more than as on the same date in 1953.

GRANT

it's a BIG job...

prospecting for oil

Crude oil is not found everywhere in the world. Here and there it may occur in rocks that were once at the bottom of ancient seas and lagoons. But finding an old sea-bed is no guarantee that oil will be discovered there; *that* can be decided only by drilling a test well.

In some areas, likely clues to buried rock conditions may be found on the surface of the earth, but where surface features are absent, as in the Assam Valley, the search for oil possibilities is aided by geophysical surveys.

Three different methods of geophysical surveying for oil are being employed by the Assam Oil Company to "feel" for suitable rock conditions under the Brahmaputra's thick blanket of Alluvium.

By aeromagnetic, gravity and seismic surveys, scientists can form a picture of the type, depth and attitude of buried rock layers.

But none of these can point to oil —even if it is there. The scientists, after studying the results, can only say—there *may* be oil there. The only absolute way of finding out is to drill a test well. Frequently the answer then is—no oil. The prospector must try again elsewhere . . . and so the search goes on, in the hope that India's petroleum requirements may be supplied to an ever increasing extent from her own resources.

RATIONALISATION—WHY AND HOW?

BY

CROESUS

THERE are few trade union leaders in our country who are as well-informed and as well-intentioned as Mr. V. V. Giri, our former Union Labour Minister. In the ranks of our labour leaders, he is rather among the exceptions who have the courage to tell employers and employees alike, and also the State, that the well-being of industry is not the concern of merely the workers and the employers but of the nation at large as well. All the same, it was unusually refreshing to hear the view expressed by a labour leader—although it should cause no surprise, coming as it did from Mr. Giri—that true rationalisation does not mean only higher production and profits to the employer and more work-load and higher wages to the worker but also a fair deal to the consumer, in the form, I suppose, of better quality goods at lower prices. In the context of the second Five-Year Plan, with its known emphasis on industrialisation, it is such an attitude towards rationalisation that one would like all sections of the public to develop. And, in having given the right lead thus to what has proved to be the most controversial topic in the field of labour-management relations in India presently, in the course of one of his three illuminating lectures under the "Scindia Lecture Series" which he inaugurated the other day in Bombay, Mr. Giri has undoubtedly rendered a distinct service. The Scindia management and the Union staff of the Scindia and Associated Companies who sponsored the series have begun very well indeed and deserve to be congratulated on their choice of both the lecturer and the subjects for his lectures.

We often hear that agreement has been reached on the question of rationalisation here or there, in Ahmedabad today and in Kanpur tomorrow, but when actually some mill or factory in these places launches on any rationalisation move, even with the blessings, at times, of the concerned State Government and the co-operation of a section of labour—the recognised union, to boot—there is still trouble and strikes and agitations follow. The nearly three-month textile strike in Kanpur is only one ugly manifestation of this. What many who are devoutly working for industrial peace—and, on the eve of the launching of the second Five-Year Plan with its stress on industrialisation, there is greater need for industrial peace than ever before—would want to know is whether it is at all possible to have rationalisation in this country and, if so, how best to create the climate congenial for introducing rationalisation, especially where it is found to be absolutely necessary. In his lecture, Mr. Giri tried to answer these questions and I feel his views need to be more widely disseminated, if only to stimulate discussion on an admittedly vital issue facing the country today.

I am really happy to find that Mr. Giri thinks that rationalisation is not only necessary but is possible. Now, mark these words: "We cannot afford to allow our workers to carry an insufficient workload, especially at a stage when we are rapidly developing the country. Laziness would be a crime against society as a whole. Everyone of us, whatever his chosen field of activity, must give a full day's work and should be encouraged to surpass average standards by comfortable margins. That is the only way to build up a State and build up ourselves too."

This means, beyond a shadow of doubt, that our workers today do not carry a sufficient work-load. But a mere statement like that even from Mr. Giri will not convince the workers and, releasing this, no doubt, Mr. Giri has suggested a machinery first to determine standards of 'normal' performance after an objective and real study of the conditions prevailing in each industry. The next problem is to make the workers and employers accept these standards and then to proceed to lay down work-loads. That is not an easy problem as everyone knows, considering that there are such wide variations in performance in the same industry even as between two comparable units. Hence Mr. Giri's second suggestion that, "when disputes arise between employers and workers over work-loads, a proper enquiry should be made by a competent and impartial personnel and the results of their study should be accepted and enforced without any further objections from either side". Very good. Anticipating trouble with the Industrial Relations Act, the former Labour Minister has even provided for suitable amendments to the Act. But the snag comes when either of the party—more often than not labour—starts questioning terms like "proper enquiry", "competent and impartial personnel" etc., and, even after all these are settled, refuses to accept the verdict. Experience has proved that it is always easier to enforce any verdict on the defaulter employer than on the offending employee and the latter is clever enough to know it. Not until employees, why, for that matter, both the parties to a dispute, learn to submit to any impartial tribunal's verdict without demur even when the decision goes against them, will any scheme, however ideal and well-intentioned, succeed. If past experience is any guide, labour will accept the findings of these bodies only so long as they are favourable to them and no sooner than one or more of these findings turn against labour or even if labour feels that way without any justification, than they would perhaps face the same fate as the Labour Appellate Tribunal has been doing now.

What is the object of rationalisation or an adequate work-load? It is not just to make the labourer put in more work than he is doing now; nor is it to enable the employer to reduce costs and raise his profits. But it is, to quote Mr. Giri, "to benefit all the three parties, namely employer, workers and consumers".

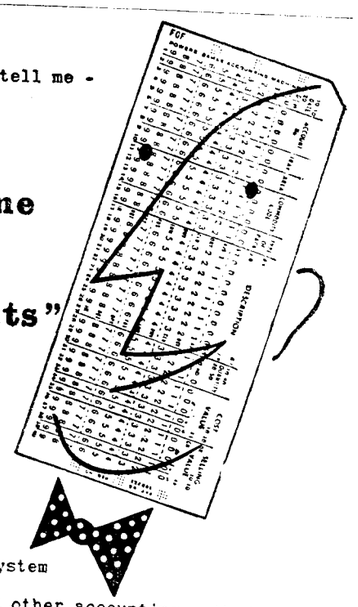
Mr. Giri also refers to deficiencies in managerial responsibilities and quotes the observations of the I.L.O. Productivity Team. Referring to the view of the Working Party for the Textile Industry that there are 150 uneconomic units out of 457 units in the country, he says: "If so large a proportion of mills is uneconomic, it is a serious matter calling for investigation", and asks: "how many of these have been reduced to their present plight through managerial neglect and inefficiency?" All this may be accepted, but what purpose will it serve now to dig up the past? As Mr. Giri has himself noted, the blame for this state of affairs must also lie squarely on the shoulders of the administration under the Factories Act. In order to avoid a repetition, he wants the Central Control Board, a new body he has proposed, to undertake periodic inspections and hopes that the Industries (Regulation and Control) Act will be suitably amended for this purpose.

Rationalisation implies replacement of worn out or inefficient machines by new ones. But who is to determine whether and when a machine has become worn out or inefficient? Here, again, there might be differences of view as between employers and workers and

Mr. Giri expects his Control Board again to decide the issue. Even otherwise, according to him, replacement of any machinery above a certain value must be approved by the Control Board.

Although not opposed to rationalisation, it is noteworthy that Mr. Giri is opposed to mechanisation of processes hitherto done manually, for, he says, this will reduce the volume of employment. But he seems to be prepared to relax this in cases where production is going to be adversely affected by not going in for immediate mechanisation.

To Mr. Giri some retrenchment is inevitable in all schemes of rationalisation involving either an increase in the work-load or the installation of modern machinery. "There is no use shutting our eyes to this central fact", he says, but, "if we are going to have large-scale industrialisation in the second Five-Year Plan", he feels, "the problem of the surplus labour thrown out of existing industries as a result of rationalisation can be faced". Expansion of spindleage in the cotton textile industry and the setting up of three more steel plants, according to Mr. Giri, should provide a large volume of additional employment. Before starting these new industries, he wants a survey of surplus workers in the existing units with a view to their absorption in the new units. This is, in effect, redeployment of labour and involves a number of problems, the chief of which is that of immobility of our labour. It is going to be a serious problem to make a worker in Bombay or Jamshedpur to go to the South or Bhilai, and there is also the question of the State or States where the new units would be located being prepared to accept outside labour. Mr. Giri is no doubt aware of these difficulties, but feels that "these objections will have to be firmly discouraged, if we believe in National Planning". Excellent no doubt though the suggestion is, one wonders whether it is practicable. Similarly, it may sound all right, if State Governments prove recalcitrant, to threaten them by saying that we shall locate all new industries in cities like Bombay, Ahmedabad, Kanpur, or Coimbatore where the unemployment is particularly acute, but after the recent wrangles about the location of the steel plant, he would be a bold man indeed who could wield these threats effectively enough.



What should be the agency to decide on rationalisation? Mr. Giri thinks that neither the Rationalisation Committee suggested by the Bombay Textile Labour Enquiry Committee nor the panel of experts recommended by the Working Party for the Textile Industry (approved, in either case, by both workers and employees) will be able to stand the strain of large-scale action. It is certainly large-scale action that the veteran labour leader has in mind, for he says: "In the matter of implementation of just and proper rationalisation, it is highly necessary to devise correct work-loads, having regard to conditions existing in our industry and the stamina of our comparatively under-nourished workers, to ensure that those bearing a higher work-load are adequately compensated, to supervise and ensure that only the requisite amount of machinery is brought in to provide for the alternative employment of retrenched workers either in new units or in future vacancies in the existing units, to carry out periodical inspections of units with a view to watching the extent of care or neglect of machinery, to apply corrective measures before it is too late, eventually to take over the management of mismanaged units and, these are large responsibilities which can be adequately discharged only by a high-powered, independent and authoritative agency working in conditions reasonably free from political pressure and undue influence from vested interests".

Mr. Giri does not think the Central Government, through its Central Advisory Councils and Development Councils, could do much to implement the day-to-day implementation of the rationalisation policies and wants a separate compact body, to be called the Central Board of Control, for implemening rationalisation in all the industries where it is called for. This Board will, in its turn, set up expert bodies to investigate and report on all technical problems. The true labour leader that he is, Mr. Giri has reiterated his call to trade unions to have technical experts on their staff, which, he believes, will be possible only if there is one trade union for one industry and all the workers are members of that union. This, again, is very desirable, but so long as political parties vie with each other to dominate the trade union movement, there can never be only one union for one industry not even one union for one unit in the industry.

After having fully discussed the subject, Mr. Giri has concluded by saying that "nobody can at present give a verdict as to what definite course should be adopted in the matter of rationalisation specially in countries like ours which are overpopulated and underdeveloped". Here is the true humility of the student who still seeks the answer, not the arrogance of one who is out to say: "this is the only solution and you must accept it". Thank God, we have still such staunch belivers in democracy like Mr. Giri.

Accountants tell me -

"You're welcome on all accounts"

Here is the Powers-Samas punched-card, part of the system that makes all other accounting methods out of date, keeps figures really up to date. Powers-Samas speed and efficiency keeps pace with figures and events as they occur; indicates trends as they start to develop. For large combines and small concerns Powers-Samas methods handle invoicing, statements, stock-records, payroll, costing and statistics of all kinds with unequalled speed, neatness, accuracy and economy.

There is a range of Powers-Samas punched-card equipment for every type of application.

BUSINESS NOTES

COTTON EXPORTS—EXTENSION OF TIME

WITH THE approach of the end of the 1954-55 cotton season, both shippers and exporters have been sorely exercised over the wide disparity between the total quota released during the season and the quantum of actual shipment which represents the large amount of unutilised quotas. Thus, of the total quota of 4,80,000 bales released for the 1954-55 season, the quantity so far licensed amounts to just 3,78,854 bales, while the quantity passed for shipment up to July 15, aggregates only 1,66,609 bales, leaving a balance of 2,12,245 bales (licensed). As between the total quota released for the entire season and that for which export licences have been issued, there is a shortfall of 1,01,146 bales. In other words, cotton actually shipped up to the middle of this month was only a little over a third of the total quota released. It is, therefore, imperative, it seems, that the validity of the licensing period must be extended: otherwise the Government's liberalised export policy will not have any meaning.

It might seem odd that shippers should always seem to be wanting an extension of the validity of the licensing period thus. But they have their problems. Now, licences for the entire season are not valid beyond August 31, 1955. It is known that export sales in cotton usually take the form of forward shipments, which means that the export of cotton licensed so far before August 31, 1955 is an impossible task. Another hurdle in the way of quick disposal of cotton is the preference shown by some of the cotton-consuming countries for staggering their imports over an extended period. This arises partly from the fact that foreign exchange allocations in these countries are made in fits and starts, as it were. Japan, which tops the list of buyers of Indian short-staple cotton, for instance, always suffers from exchange allocation difficulties, making it incumbent on her importers to stagger their imports.

Even otherwise, the plight of shippers in this country is quite unenviable. For, over and above these difficulties, they have to face shortage of shipping space. Paucity of freight space has, of late, become very accentuated due to increasing shipments of piece-goods, oilseeds, oilcakes, etc. To this must also be added the invariable congestion at various ports of call which upsets the normal shipping schedule, a factor over which the exporting interests have no control. Even during normal times, when shipping conditions are favourable, bulk cotton shipments, especially to countries which have entered into contracts with the U.S. for American aid cotton, are an exception rather than the rule, for these countries fight shy of entering into bulk commitments with India for understandable reasons though.

THREAT TO INDIGENOUS LINOLEUM

ALTHOUGH THE latest half-yearly import policy claims to have officially established, for the first time, the principle of protecting Indian industries by restricting imports, in individual cases, it is seen that the new policy has actually hit some new Indian industries. A case in point is the Linoleum industry. At no time since its inception—the first and only factory in India producing linoleum went into operation in 1951—has this industry been in such a prosperous condition as to merit the luxury of free competition with imported linoleum. It is too much to expect a highly specialised industry like this, for which there is only a limited home market, to make such great strides of progress as to do without protection in only a few years' time. And yet, by permitting the import of floor cloth during the July-December, 1955 licensing period, the authorities have unnecessarily damped the enthusiasm of this pioneering industry. The case for allowing imports arises only when the imports are of an essential nature and cannot be met by the indigenous industry or when the indigenous industry is proved to be profiteering by taking advantage of the shelter afforded by protection. The Indian linoleum industry has proved that it can meet the entire requirements of the country and could even export a quantity and earn foreign exchange for the country. The fact that Indian linoleums are now sold in a number of countries in the face of keen foreign competition is a clear proof of the high quality and competitive ability of the Indian product.

It must be noted that, for a new Indian industry to be able successfully to compete in the foreign market, the prices quoted by it cannot be very high. Indeed, according to the spokesmen of the industry, prices of Indian linoleum have had to be fixed at very low rates so as to meet the fierce competition from well established foreign producers in export markets. The prices charged to the Indian consumer also had to be kept low. For as it, there is only a very restricted home market, and in order to popularise the new product, it must be marketed at a cheap price. This explains the loss incurred by the only unit of the industry in India over the last four years, in spite of the fact that, in the last year of report, namely, 1953-54, the Company made a modest gain of Rs. 53,177 and that too before providing for depreciation. At the end of March 1954, the Company had to carry forward a net debit balance of Rs. 9,10,758. The effect of the liberalisation of imports will only be to cause a serious setback to the industry with all its attendant risks, such as throwing out of employment all those presently engaged in the industry. According to our information, about 500 persons are employed in this industry. Besides, nearly Rs. 50 lakhs have been invested in the enterprise and the finished product uses only indigenous material. Because of the restricted demand and the need to educate the public in the uses of linoleum and create a market, even the capacity of the existing industry is not being fully utilised. Above all, there is the fact of consumers' prejudice towards the indigenous product and, if imports are allowed, it is not unlikely that even the little demand that exists for the indigenous product will disappear. Hence the need to maintain the total ban on imports, as the Government of India had been doing for the last three years. Moreover, imports of foreign floor cloth will result in a still larger percentage of the capacity remaining idle and thereby adding to further unemployment. In these circumstances, it is to be hoped that the authorities will review the position and reconsider decision.

HIGHER EXPORT OF WOOL TOPS

THERE HAS been a continuously rising trend in world trade in wool tops. Available figures of export of wool tops from the nine leading exporting countries indicate an annual rate of as much as 172 million lbs. for the current season, as against an average of only 158 million lbs. recorded in the year 1952-54. In the first quarter of 1955, the exports of wool tops at 43 million lbs. show an increase of one million lbs. over the corresponding period in the previous year.

In line with the steady upward trend in world exports of wool tops, history has been made in three

leading wool-producing countries in the Commonwealth. Leading the rest, Australia, the world's largest wool-producing country, it is reported, has achieved a 4,000,000-bale clip in the 1954-55 season just concluded. Announcements made in that country reveal that the quantity of wool sold in Australia during the 1954-55 season was 3,955,476 bales, which compares with 3,647,000 bales in the previous season. The full quantity of wool received into store last season was 4,034,076 bales. It is also gathered that New Zealand has sold, for the first time in history, more than 1,000,000 bales in a single season, the actual figure being 1,002,863 bales (for the season 1954-55) which is to be compared with only 941,320 bales in the previous season (1953-54). Although exact figures are still not available, it is estimated that South Africa too would cross the one-million mark for the first time in the matter of sales of wool.

In the light of the above, the reported scheme drawn up by the Union Food and Agriculture Ministry, with a view to achieving better and larger production of wool in the next five years seems to be in keeping with the pace of world wool development. The scheme envisages an increase of 24 million lbs. in the yield of wool by 1960-61. Provision has also been made under the scheme for the establishment of 460 sheep and wool extension centres in different regions. The move is bound to receive wide acclaim, when it is known that the average annual value of raw wool exported from India, even as things are, amounts to about Rs. 9 crores.

BRIGHT OUTLOOK FOR BICYCLE INDUSTRY

MR. R. D. BIRLA'S presidential speech at the last annual general meeting of the Hind Cycles Ltd. makes an objective assessment of the rapid progress which the bicycle industry made in this country in recent years. It gives a firm assurance that the rate of progress can undoubtedly be accelerated in the period of the next Plan by 150 per cent. Production which stood low at 1 lakh bicycles in 1949-50 shot up to 3.7 lakhs in 1954 and in the current year it can easily reach the of 5 lakhs. Hind Cycles as the premier unit had the largest individual contribution to make to this increase, but the entry in the sphere of new units functioning in collaboration with British producers is also an important factor in this rapid development. The second Five-Year Plan contemplates, according to present estimate, a target of 12.5 lakh bicycles in 1961 which is quite moderate in the light of the increase in installed capacity and the ambitious programme of road development.

Hind Cycles has launched a bold plan of expansion which will be ready for active implementation by the beginning of 1956. Additional plant and machinery which has been ordered is expected to be delivered in good time to be installed and put under production early next year. The factory is now self-sufficient in respect of all components and materials except for certain special raw materials. The latest achievement is the manufacture of chains which have been put in the market. Future plans for expansion of this important line of production are well in hand. Hind Cycle's output increased to 1.3 lakhs in 1954 and in view of the expansion of plant it can easily be stepped up to 2 lakhs by the end of 1956. If the factory is self-sufficient in the production of all parts and components, this is a factor as much of some weakness as of strength—of weakness because its competitive strength is impaired vis-a-vis most other factories which rely for part of their requirements on specialised cheap producers. This is a vital fact which labour employed in Hind Cycles need to reckon. It is certainly up to labour now to render its contribution to reducing the production costs by higher productivity as a fitting return for the high scale of wages which it enjoys.

SYNTHETIC RUBBER PLANT FOR BOMBAY

WE ARE reliably informed by sources close to the oil companies that the report flashed by a news agency which formed the basis of a note under the above caption in a recent issue is without foundation. A spokesman of one of the Refinery Companies, whose attention was casually drawn to this story, stated that the smallest economic unit of a synthetic rubber plant would have to be at least of 100,000 tons capacity. But, as against this, the news agency message gave out the capacity of the proposed unit as only 15,000 tons. Furthermore, the oil companies are too well aware that, given the necessary facilities the natural rubber interests themselves can more than bridge the present gap between the country's total production and consumption of natural rubber of just around 5,000 tons.

TEXTILE RESEARCH BODY

CONSIDERING THE important position occupied by the cotton textile industry in India's economy, the amount that is being spent on research is negligible. The value of harnessing science to industrial purposes has long been recognized in advanced countries, and even in our country certain tentative steps were taken a decade ago when the Government of India constituted a Cotton Textiles Fund Committee which was to start a research institute for the textile industry. Unfortunately the scheme did not materialise, and the lacuna was filled, to some extent, by the research institutes organized by millowners in Ahmedabad and in the South.

The Bombay Textile Research Association, which recently held its first annual meeting, represents, however, an ambitious enterprise and may be expected to satisfy the needs of textile research to a more satisfactory extent. The steps being taken by the Mill-owners' Association, Bombay, for the establishment of the institute on sound and modern lines, were explained by Mr. V. N. Chandavarkar, its Chairman. Estimated to entail a capital outlay of Rs. 1 crore and a maximum recurring expenditure of Rs. 11½ lakhs, the Institute will be equipped and staffed to cover the entire field of textile research. Twentyeight mill companies have already become members of the Association, contributing Rs. 28½ lakhs. The contributions have to be raised to Rs. 50 lakhs by enlisting more mills, so that the Association may claim an equal amount from the Cotton Textiles Fund. It should be possible for the organisation to give a really good start to the Institute with Rs. 1 crore at its disposal.

METAL BOX COMPANY'S DIVIDEND—A CORRECTION

A MISSTATEMENT about the dividend to the shareholders of the Metal Box Company Limited for the year ended March 31, 1955, crept in these columns through oversight in the issue dated July 15 last. The correct position is that the Directors of the Company have recommended further dividend of 7½ per cent which brings the total dividend to the ordinary shareholders to 12½ per cent for the year ended March 31, 1955. This marks an increase of 2½ per cent above the dividend which was maintained at the rate of 10 per cent before.

4%

Bombay State Development Loan, 1967

ISSUE PRICE Rs. 100 PER CENT

Open at 10 a.m. on the 16th August, 1955.

The loan will be closed as soon as a total of approximately Rs. 600 lakhs has been subscribed, and in any case not later than the close of business on the 31st August, 1955.

The applications will be received at the offices of the Reserve Bank of India, Bombay, Caclutta, Delhi and Bangalore; at Branches and Treasury Pay Offices of the State Bank of India within the State of Bombay and at the Government Treasuries and Sub-Treasuries in the State of Bombay at places where there is no branch or pay office of the State Bank of India.

Full particulars can be obtained at any of the offices of the Reserve Bank or Branches and Pay Offices of the State Bank of India or at any Government Treasury or Sub-Treasury in the State of Bombay.

How banking serves the RUBBER INDUSTRY

RUBBER was first planted commercially in India in 1902. Today Indian rubber plantations, concentrated in Travancore-Cochin and Malabar, produce 20,000 tons of rubber every year, valued at four and a half crores of rupees. More than 250 Indian factories depend on this output for their production of finished goods.

Without banking, this growth could never have taken place. The facilities and guidance offered by a good bank, such as the availability of ready funds when needed and the collection of dues in any part of the country, have become part of the structure of the rubber industry.

We at Palai are proud that so many important rubber producers, and indeed leading firms in every field of business and industry in South India, employ the *complete* banking service we offer.

Current Accounts—Demand Drafts—Telegraphic Transfers—Bill Collection—Letters of Credit—Deposits—Investments—Loans & Overdrafts—Confidential Credit Reports, etc.

* * * *

If you have business interests in the South, it will pay you to open an account with us. Our 25 branches are strategically located, 23 in important South Indian business centres and two in Delhi and New Delhi ; and we have correspondents in all important Indian cities. We offer a fully comprehensive banking service at each office.

Our clients can make deposits at any of our correspondent banks, situated in all important Indian towns, and have the amounts credited to their accounts at any of our branches.

COMPANY AFFAIRS

THE UNITED INDIA LIFE ASSURANCE CO., LTD.

The Audited Balance Sheets and the Revenue Account for the year ending 31st December, 1954, show that during the year 21,249 proposals were received for Assurance amounting to Rs. 6,33,37,869. Out of these and also the proposals pending at the beginning of the year, 17,233 new policies amounting to Rs. 5,30,06,733 were issued during the year. Out of the above, 499 policies assuring a sum of Rs. 37,13,771 have been re-assured. The total assurances in force in the books of the Company as on 31st December, 1954, including bonus additions, amounted to Rs. 30,56,25,736, of which Rs. 2,06,91,929 is re-assured. The total anmities in force amount to Rs. 1,49,245 per annum. The Policyholdes Trust Fund at the end of the year stood at Rs. 9,32,48,118 as against Rs. 8,03,78,135 at the beginning of the year. The total Revenue from Premiums, Interest and other fees for the year 1954 amounted to Rs. 1,68,17,358.

During the year under review, there were 2,622 claims for Rs. 52,85,057 (less re-assurance claims) out of which 528 claims by death amounted to Rs. 15,54,019 and 2,094 claims by maturity amounted to Rs. 37,31,038. Out of the total claims which arose during the year, claims paid during the year itself amounted to Rs. 41,19,531. Claims for Rs. 8,80,274 relating to previous years were also paid during the year. Thus, the total amount of claims paid during the year amounted to Rs. 49,99,805. Since the Company was established, a sum of Rs. 3,93,07,220 has been paid by way of claims.

The Directors recommended a dividend to the Shareholders at the rate of Rs. 50 per share, free of income-tax, for the year under report. This dividend is at the same rate as in the year previous. The Directors recommend payment of a Bonus equal to a month's salary (as drawn for the month of December, 1954) to all such permanent employees of the Company as were in the service of the Company during the entire year (namely, 1st January to 31st December) and continuing in the Company's service on the date of the Annual General Meeting.

In accordance with the Order of the High Court of Madras the assets and liabilities of the Indian Business of the Winterthur Swiss Life Assurance Company, Ltd., have been transferred to the Company.

HASTINGS MILL LIMITED

The Audited Accounts of the Company for the year ended 31st March, 1955, show the following results. After providing for Depreciation and making necessary allowance for taxation there is a balance of Rs. 8,62,745-3-8 at the credit of the Profit and Loss Account including the balance brought forward from the previous account. This credit balance is recommended to be dealt with as follows:

Final dividend on Preference Shares @ Rs. 3 per share	Rs.	75,000
Dividend on Ordinary Shares @ Rs. 11-8 per share	Rs.	4,60,000
Carry forward	Rs.	3,27,745
TOTAL	Rs.	8,62,745

In accordance with the main and supplementary working time Agreements of the Indian Jute Mills' Association 12½ per cent of the total looms continue to remain sealed and the mill worked 45 hours per week from 12th July, 1954 and raised to 48 hours per week as from 18th October, 1954. The Company's Silk Department, Shree Ram Silk Manufacturing Co., resumed working from 24th October, 1954 after a long gap of closure.

DEVKARAN NANJEE INSURANCE CO., LTD.

The Report of the Devkaran Nanjee insurance Co., Ltd., for the year ended 31st December, 1954, reveals good results. Last year the dividend was Rs. 2 per share. The Directors have recommended an enhanced of Rs. 3 per share, free of income Tax. This is largely due to the conservative policy pursued by the Board of Directors.

In Life Business 1143 Proposals resulted into policies amounting to Rs. 34,07,250. The net premium income in respect of the Company came to Rs. 10,40,481. The Life Fund at the end of the year stands at Rs. 63,64,251 as against Rs. 56,09,150 at the end of the previous year.

The Company wrote a net Fire Premium of Rs. 5,09,468. The net claims amounted to Rs. 1,51,387 i.e. 30 per cent of the net premium. The Reserves have been further strengthened by the creation of a Special Reserve over and above the Additional Reserve bringing up the Fire Fund to Rs. 2,64,767. The account shows a Profit of Rs. 42,033 which is transferred to the Profit and Loss Account.

The Company wrote a net Miscellaneous Premium of Rs. 2,15,707. The Reserves have been further strengthened by creation of a Special Reserve over and above Additional reserve bringing up the Miscellaneous Fund to Rs. 1,12,168. The Account shows a Profit of Rs. 28,756 which is transferred to the Profit and Loss Account.

The interest less Income-tax amounting to Rs. 45,707 and the Transfer from Fire and Miscellaneous Departments amounting in aggregate to Rs. 70,789 have been credited to this Account. After charging expenses not applicable to other department, the balance of Rs. 1,09,478 is carried to the Profit and Loss Appropriation Account. The total balance in Profit and Loss Appropriation Account at the end of the year is Rs. 2,31,848.

THE BANK OF BARODA, LTD.

The Profit of the Bank of Baroda Limited for the half-year ended 30th June 1955, subject to audit, including Rs. 2,70,301-15-5 brought forward, amounts to Rs. 15,85,999-11.

The Directors have resolved to declare an Ad-Interim dividend at the rate of 10 per cent annum free of income-tax which will absorb Rs. 5,00,000 and to carry forward the balance of Rs. 10,85,999-11 to the next account.

COMMODITY NEWS AND NOTES

CENTRAL COTTON COMMITTEE

The Indian Central Cotton Committee which met in Bombay from July 25 to July 29, 1955 under the chairmanship of Mr. K. R. Damle, Vice-President, Indian Council of Agricultural Research, considered questions connected with targets for the production of cotton under the second Five-Year Plan, the establishment of cotton ginning and pressing factories on a co-operative basis and the development of co-operative marketing.

Several proposals for the extension of schemes already in operation and for sanction of new schemes received attention. Another important subject that was considered in great detail was the report submitted by Dr. S. C. Harland, Professor of Botany, Manchester University, who was invited by the Government of India to review the research work done by the Institute of Plant Industry, Indore, and other cotton research schemes. The suggestions made by him on the problem of producing long-staple cottons in India to replace the cottons at present being imported was carefully examined first by a special sub-committee of the agricultural research sub-committee.

FINAL ESTIMATE OF SMALL-MILLETS

The All-India final estimate of small-millets for 1954-55, puts the current year's area and production at 13,680,000 acres and 2,424,000 tons, as against 13,979,000 acres and 2,427,000 tons in the partially revised estimate for 1953-54, according to the Directorate of Economics and Statistics, Ministry of Food and Agriculture. This shows a decrease of 292,000 acres or 2.1 per cent in area, and 3,000 tons or 0.1 per cent in production over 1953-54.

The decrease in acreage has been shared mainly by Andhra and Madras and to a lesser extent by Rajasthan, Mysore and Madhya Pradesh due to unfavourable weather conditions at the time of sowing. This decrease in acreage has, however, been offset considerably by the increases reported mainly by Uttar Pradesh and Vindhya Pradesh and to a lesser extent by Hyderabad and Himachal Pradesh.

The decrease in production has been shared mainly by Andhra, Madras and Madhya Pradesh due partly to the decrease in acreage. The decrease in production has been almost offset by the increases reported mainly by Uttar Pradesh and to a lesser extent by Vindhya Pradesh, Mysore, Bihar and Himachal Pradesh due partly to the increase in acreage and partly to favourable climatic conditions during the growing period.

THIRD TOBACCO ESTIMATE

The All-India third estimate of tobacco, 1954-55 puts the area and production figures at 837,000 acres and 238,000 tons, as against 871,000 acres and 243,000 tons for 1953-54, according to the Directorate of Economics and Statistics, Ministry of Food and Agriculture, Government of India. Thus the estimate for 1954-55 shows a decrease of 34,000 tons, or 2.1 per cent in production over 1953-54.

The decrease in area during 1954-55 has occurred mainly in Andhra, Bombay and Hyderabad and has been attributed to unfavourable climatic conditions at the time of sowing. The decline in production has occurred mainly in Bombay. This Estimate does not contain information in respect of the late variety of the crop grown in U.P. It also does not give information about the final position of the crop in the case of Punjab, Mysore, Pepsu, Rajasthan, Coorg, Delhi Himachal Pradesh, Tripura and Vindhya Pradesh which will be reported at the time of the Final Estimate.

CASHEWNUT SHELL LIQUID

The Indian Standards Institution has circulated for comments a draft Indian standard specification for cashewnut shell liquid. The draft standard prescribes requirements and methods of test for this material which is used as a natural phenolic ingredient in the manufacture of moulded plastics, lacquers, enamels and insulating varnishes.

India produces some 5,500 tons of cashewnut shell liquid out of an estimated world production of about 8,000 tons. The material is obtained as a bye-product in the roasting of cashewnut for obtaining the kernel which contains a fixed oil but is generally eafen as a nut. Most of the Indian product is at present exported, but consumption of cashewnut shell liquid is also slowly developing in the country.

STATE BANK OF INDIA

Successors to the Imperial Bank

Security for generations to come

On July 1, 1955, the State Bank of India came into existence, taking over the business of the Imperial Bank. It offers you all the services you require and expect.

You will continue to benefit from the guidance of experienced officers, and your business will receive the same personal, completely confidential attention that has been given in the past.

Not only have we inherited the sound banking traditions of a century and a half, but we have also inherited the public goodwill that has been so marked since 1806, when our first constituent bank was founded. And our policy, as always, will be guided by this ideal —to further your interests and those of the entire nation, now and in the years to come.

The State Bank's branch at Delhi, one of more than four hundred offices waiting to serve you throughout India

STATE BANK OF INDIA

Company Meeting

HIND CYCLES LIMITED

SATISFACTORY WORKING RESULTS

Increasing Production, Bright Future Outlook

Speech delivered by Shri R.D. Birla, Chairman, at the Fifteenth Annual General Meeting of Hind Cycles Limited, held on 25th July, 1955.

Gentlemen,

The Directors' Report and the Statement of Accounts for the year ended December, 1954, has been with you.

EXPANSION OF PRODUCTION

The results of the last year's working are satisfactory. Production increased to 1,30,000 bicycles. As mentioned in the report, your Directors have decided to increase the production capacity of the Factory. Machinery has been ordered and is in the course of shipment. Extension of the building necessary for increased production is nearly completed. The additional plant includes a Semi-Automatic Conveyor Plating Equipment and a very modern Polishing Plant. Both these plants are due to arrive here by October, 1955, and your Directors hope to complete the erection of all the new machinery and start production on increased basis early next year. When the new plants thus come into operation, the production capacity of the Factory will be raised to a little more than two lakh bicycles per year. Looking to the shipment position of various plants and machinery ordered, your Directors feel confident of achieving production of two lakh bicycles by the end of the year 1956.

Production of chains is well in hand, and we are now operating the plant fully. Our chains have been marketed. Your Directors will consider the question of expanding production of chains in future in light of the circumstances, such as, expansion of the consuming market, its reaction and the shape of the Government policy with regard to important questions, like imports, etc.

MANUFACTURE OF BICYCLE PARTS

Our country is on the eve of entering the second Five-Year Plan. Progress in the Cycle Industry during the first Five-Year Plan is striking. As against the production of a little more than a lakh of bicycles in 1949-50, production in 1954 was 3,72,000 bicycles and is expected to be around five lakhs in 1955. This increase in production was mainly due to increased production by your Factory by about 40 per cent and establishment of factories in India by well-known British firms, like Hercules and Raleigh in our country. The other notable feature of the progress in the Bicycle Industry is that India now manufactures all the parts and components in the country, including chains, freewheels, rims, hubs, etc., and even steel tubes to a certain extent. Thus, except for some special raw material, India is self-sufficient so far as the type and number of components are concerned.

In the second Five-Year Plan, the target of production in 1961 for bicycles is understood to be in the neighbourhood of twelve lakh bicycles. The consumption of bicycles till 1955 has been estimated by the Tariff Commission as five lakhs, and compared to this figure, the target for the next five-year period is increased by 2½ times. I feel that if the road construction programme of the Government of India is implemented, the programme for bicycle production and consumption may be fulfilled.

HIGH WAGE LEVEL

Your Directors are glad to report that so far the relations of labour and management are happy. System of Works Committee composed of representatives of workers freely elected has worked successfully and most of the questions are settled amicably. Average earning of daily paid labour in your Factory is one of the highest in the country, and the Management is proud of it; but this high wage level combined with the fact that we have to manufacture almost all the parts under one roof, unlike any other factory either in the West or in India, results in a comparatively high cost of production, and I hope that the labour would realise that this state of affairs can only continue till the time we can stand in competition with other manufacturers, and that labour will also appreciate that our method of production on self-sufficiency puts us to a disadvantage compared to other units who have varying quantity of imported parts in their bicycle.

4 PER CENT
STATE GOVERNMENTS LOANS 1967

(1) Government of Andhra	..	Rs. 250 lakhs	Issue price	Rs.	99	8	0 per cent.
(2) Government of Bihar	..	Rs. 150 lakhs	Issue price	Rs.	99	0	0 per cent.
(3) Government of Bombay	..	Rs. 600 lakhs	Issue price	Rs.	100	0	0 per cent.
(4) Government of Hyderabad	..	Rs. 200 lakhs	Issue price	Rs.	99	0	0 per cent.
(5) Government of Madhya Pradesh	..	Rs. 100 lakhs	Issue price	Rs.	99	8	0 per cent.
(6) Government of Madras	..	Rs. 700 lakhs	Issue price	Rs.	99	12	0 per cent.
(7) Government of Mysore	..	Rs. 275 lakhs	Issue price	Rs.	99	0	0 per cent.
(8) Government of Saurashtra	..	Rs. 200 lakhs	Issue price	Rs.	99	0	0 per cent.
(9) Government of Uttar Pradesh	..	Rs. 600 lakhs	Issue price	Rs.	99	8	0 per cent.
(10) Government of West Bengal	..	Rs. 500 lakhs	Issue price	Rs.	100	0	0 per cent.

The loans will open for subscription on 16th August, 1955 and close on 31st August, 1955 or earlier without notice as soon as subscriptions approximate to the amount of each issue.

Each loan will bear interest from 1st September, 1955. Interest from the date of application to the 31st August, 1955 inclusive, will be paid to the applicants at the time of issue of new securities at the rate of 4 per cent. per annum on the nominal value of the loan applied for and accepted.

Subscriptions will be in the form of cash/cheque in respect of all the loans.

3% Bombay Government Loan, 1955, 3% Madras Government Loan 1955 and 3% Madhya Pradesh Loan, 1955 will be accepted at par and 5% Mysore Government Loan, 1955 at Rs. 100-8-0% for conversion into the new loan of the Government concerned; interest on the securities of the respective loan tendered for conversion will be paid upto and including the 15th August, 1955.

Applications for all the loans will be received at the offices of the Reserve Bank of India, Bombay, Calcutta, Delhi, Madras and Bangalore.

Applications for any particular loan other than Hyderabad and Mysore Government loans will also be received at branches of the State Bank of India and at Government Treasuries and Sub-Treasuries within the State issuing the loan as indicated in the relevant loan notifications. Applications to Government of West Bengal Loan will not be accepted at Treasuries and Sub-Treasuries.

In the case of Hyderabad Government Loan applications will be received at branches of the Hyderabad State Bank and at Government Treasuries and Sub-Treasuries in the Hyderabad State. For Mysore Government loan applications will be received at branches of the Bank of Mysore Ltd. and at Government Treasuries and Sub-Treasuries in the Mysore State.

N.B.—Copies of Notifications and Application Forms may be obtained at any Receiving Office.

Challenge with Confidence

THE Indian business community continues to spring surprises upon an expectant world. Barely six months ago it seemed so deeply taken aback by the advance of a "socialistic pattern of society"—with and without Constitutional amendments—that there were many members of the community who were asking anxiously if there was any justification for optimism on the future of the private sector. At the present time optimism is unrestrained and this is by no means a matter of speech only. The Stock Exchanges in the last few weeks have shown that this optimism is fully reflected in bull operations. Something needs to be said, therefore, about the change of philosophy of the business community which has recently taken place. Mr. G. D. Birla's address to the Democratic Group and the Commerce Graduates' Association in Bombay on July 29 indicates, perhaps more clearly than anywhere else, the change of outlook in a leader of the progressive wing of the Indian business community.

Briefly, Mr. Birla considers the second Five-Year Plan a great challenge to the Indian business community; he is full of confidence that the challenge will be taken successfully. He considers that there is no battle between the sectors; indeed he considers that even the provision of new employment is primarily the responsibility of business men. "If", he says "the Congress Government cannot solve the problem, it will have to disappear. Only those who can solve the problem will be able to survive. We have accordingly to put our heads together and try to solve the problem in a more realistic manner." In other words, the business community is no longer to work within the ambit of its own economic field for profits only; it has now to take account of social purposes and the political ends which are necessary for the maintenance of stability and ordered government. In other words, business has now to be flexible with eyes constantly on the political scene. This is a new dimension in Indian business acumen. In Mr. Birla's words: "We have to work in certain types of atmosphere. When we find the atmosphere has changed, we do not change accordingly. That is where we make a mistake." Thus, it is the business community,

not the public sector, that takes the blame, or is the implication that there must be a meeting ground half-way?

Following on this point that the private sector and the public sector must accept the same responsibilities for the amelioration of the people, Mr. Birla went on to argue that business men should not seek guarantees against nationalisation. "Let me say something about the amendment to the Constitution. I do not like it. Many men do not like it. Nor do they like the threat of nationalisation. I am told that when the colliery owners were asked to expand their production, they put this question to the Government: 'Is there any guarantee that our collieries are not going to be nationalised?' Now I ask you. What is the value of a guarantee? Today it is the Congress Government, tomorrow it may be some other Government. Moreover, business men in the past were not against nationalisation. It was with every business man's consent that the railways were nationalised as far back as 1920. Now we are against nationalisation. There is no guarantee against nationalisation. However, it has been said by so many and on several occasions that Government are not going to fritter away money on nationalisation by acquiring existing industries. I therefore do not ask for guarantees against nationalisation."

Apparently, Mr. Birla is not alone in accepting with grace the socialistic pattern of society in which the privilege of the few is to be a constant target for attack. The proviso he makes is that the proposed changes serve an accepted social purpose. He would raise the lower brackets rather than lower those at the top, but levelling is an acceptable creed. He said: "People are no longer interested in seeing big men enjoying life. They want to enjoy prosperity themselves. I therefore feel that the best way to preserve capitalism in this country is to make everyone, small or big, a capitalist. Unless wealth and prosperity are spread widely, we are going to disappear. In any case with high taxation it seems impossible to maintain or do anything big after some twenty years." The Finance Minister himself could not have spoken in more ominous terms.

Mr. Birla goes further and not only accepts the prevailing political philosophy but identifies himself with two vital economic ends of the Plan, namely, a rise of 25 per cent in the national income by 1961 and the creation of 10 million jobs by 1961. The major difference between his view and that presented in the draft second Five-Year Plan is one of detail—he thinks it unnecessary that the objectives of the Plan will require an investment of Rs. 5,600 crores. His personal view is that we can manage with considerably less, and he specifically mentioned a figure of Rs. 3,000 crores, which is certainly too optimistic, if transport is to take Rs. 1,400 crores. While Mr. Birla has figures for recent years on his side, one wonders whether a reduction of investment of this order in the Plan will not now raise insuperable political obstacles. It will be difficult enough for the Finance Minister to scale insatiable States' demands down from about Rs. 12,000 crores to Rs. 2,000 crores. If Mr. Birla's investment figure is accepted, it may be necessary to halve the States' allocation. Who will face the wrath which is to come? There is no doubt that, having raised an appetite for high and broad finance, the Government of India will find it impossible to withdraw.

For the present, however, the issue is not that of the increasing embarrassment which the Government will face if it reduces the investment in the Plan. It is the capacity of the business community to undertake the obligations which Mr. Birla has conferred upon it. That capacity is high and is rising and on two particular points confidence is well justified. In the first quarter of 1955 industrial production in the private sector of Indian industry reached the highest figure for any quarter. At the same time the figure for April 1955 touched 166.5 in the interim index, which is the highest figure ever recorded, exceeding by about one point the previous peak in December 1954. It is true that a curious rise in sugar production is responsible for the whole of this success, which is in part statistical, because of the weighting of sugar in the interim index. Nevertheless, the broad pattern of industrial production shows that the private sector in Indian industry is not merely justifying its optimism on the basis of future promises. Its performance here and now is one of which it is justly proud.

Secondly the balance sheets which are appearing for 1954 indicate that average profits in that year have been higher than ever before. This is traditionally a measure of incentive in the private sector, and it may be assumed that, notwithstanding the fears entertained on the Companies Bill, the special climate for industry is created by high profits more than anything else. One wonders if Mr. Birla's optimism would have been as great had it not corresponded very accurately with the economic picture in the organised private sector both in a production and a profits sense. It may be largely because leading business men in India have the evidence of the rise in production and profits before them that the political setbacks of the last six months have tended to be rapidly discounted.

It may be right that these setbacks should be discounted as much as Mr. Birla would suggest. But here at least there are uncertainties which might warrant a more cautious, and even cagey, outlook. There is danger in the business community or indeed in any section of the public in a democracy committing itself in advance to all the politicians' assessment of the people's voice. The present unrest is good; it is by no means perfect and it could have been better if political haste had not been imposed upon a Ship of State that was riding well. While therefore the business community should accept the full challenge which has been so eloquently described by Mr. Birla, it should not create the impression which is untrue that it has accepted the Government's economic philosophy. Again, it is essential that the Government of India should not be allowed to escape any share of its own obligations, while the private sector recognises that it has more searching tasks to perform. Much the larger portion of the Plan has been contained, quite deliberately, in the public sector, and it is impossible therefore for the private sector to provide all the spacious solutions which Mr. Birla commends. He is right in making a point that the business community must think in more spacious terms. He is wrong if he believes that the opportunity will be given to the business community to undertake a major fraction of the appointed task. Let the private sector broaden its shoulders and sharpen its wits. But who will give [illegible] tools to finish the job?

The Pakistan Rupee

DEVALUATION always comes like a thief in the night. In a sense it is a thief because it robs a national currency of some of its value. The belief that this loss is compensated automatically by an improvement in the devaluing country's balance of payments belongs to orthodox economics and dies hard. It may be untrue. It may be that in the case of countries developing as Pakistan is doing, with a relatively inelastic demand for imports, particularly of capital goods, the advantages on the side of exports are more than offset by a higher cost of imports. It is by no means clear that the operation which has been now completed will strengthen Pakistan's balance of payments or make it easier for her to control an inflationary situation. The chances at best are that the operation will be comparatively neutral on the balance of payments whilst being slightly inflationary on internal costs.

The news on Wednesday and Thursday is not reassuring. The prices of practically all imported articles and not a few indigenous commodities showed a pronounced upward trend on August 2 and 3. It would appear that the inflationary factor has been underestimated by the Pakistan Government; it may be that some considerable administrative controls will need to be imposed if prices which have sharply risen are to be pushed back. It was noticed, for example, on August 2 that the prices of drugs and medicines registered a rise of 40 per cent and a drop of 10 per cent on August 3 would not have taken place but for warnings on the possibility of the reimposition of price controls. There is no doubt that this is a situation in which price controls on important products are abundantly justified. On new imports prices will naturally have to be higher, but there is no reason why this rise should be immediately granted on old stocks. It is clear that a severe administrative problem in price control has now been set to the financial authorities in Pakistan. There would also appear to be political restiveness in East Bengal which is reported to be due to the fact that there was no consultation with the East Pakistan Government on the likely effects of devaluation in East Bengal before it was undertaken. There is likely to be some difficulty in a quick return to equilibrium in view of the political pressures to which the Government of Pakistan is now exposed. The slump in the black market rate in the Pakistan rupee of 100 Pakistan to 65 Indian rupees in free markets in Calcutta is some measure of existing uncertainty.

To assess Pakistan's devaluation in these terms is to fail to do justice to what in the long term must be a wise decision from the point of view of the Indian sub-continent. There is no doubt that over the last five years, when the Indian and Pakistan rupees have had different par values, the difference in exchange rates has been a fruitful source of limitation of trade and, by consequence, an irritating stimulant to black markets. Whether the natural rate between the two rupees is parity or not, there has been enough evidence, taking the five years as a whole, to indicate that something like parity was a convenient, if not an absolutely exact, measure of the comparative intrinsic strength of the two currencies. When a flow of capital was also accompanying current trade transactions, as it obviously was with refugees from East Pakistan, there really was no practical advantage to be obtained from maintaining an uneconomic rate which it was impossible to enforce. For some months, the black market rate has been between Rs. 85 and Rs. 90 Indian for Rs. 100 Pakistan. This has meant that some of those least able to afford it—refugees from East Pakistan—were compelled to sell at a severe loss. If for no other reason than that it makes life considerably easier for holders of Pakistan currency in East Bengal who wish to return to India, Sunday's decision will be welcome. Behind these cold and calculating figures of exchange rates there stands a story of human privation which now at least will in some measure obtain relief and much overdue consideration.

There is no doubt that, viewed largely in terms of this unhappy human traffic that exists between the two Bengals, the devaluation of the Pakistan rupee is warmly to be welcomed. In less human terms, there is a gain of another kind. The risks of entering into black market transactions are always great and, apart from the fact that they are often clandestine and secretive, they do tend in any case to destroy morale. It is good that exchange between the two rupees can now take place openly; it is hoped that exchange control on both sides will permit transactions without restraint. Both India and Pakistan can well afford free interchange without injuring significantly their balance of payments.

While the Pakistan Government is, therefore, to be given credit for having initiated a move which will help to restore balance between two sectors in the sub-continent, credit must be given to the Government of India for its quick appreciation of the significance of this move in terms of India's international trade. The removal of the jute export duty with immediate effect on Monday—said to have been taken with unprecedented swiftness—shows the degree of efficiency which is now being acquired in the handling of economic issues of this kind. Those who remember the painful discussions which took place in September 1949, when Pakistan declined to devalue, will recognise how agreeably different the situation is today.

The Government of India has followed up the abolition of jute goods levies with a cut in the export duty on certain varieties of raw cotton from Rs. 125 to Rs. 50 per bale. There is good cause for this reduction—as also for cotton textiles and steel reportedly under close review—since the devaluation of the Pakistan rupee will operate as a subsidy of about 30 per cent on Pakistan's trade in these items. It is essential that India should not allow her trade in these terms to be lost through the unilateral action of any country. The abolition of export duties is a defensive operation which cannot be avoided even though it is likely to lose significant revenue, which we can ill afford to lose at this time.

Tea Auctions

THE decision of the Government of India announced last week on the limitation of the North Indian tea crop for direct shipment to London ends, for the time being, a matter which has been under discussion for some years. The present decision is the result of a detailed enquiry which should give satisfaction to all sides involved in this decision. The Committee on Tea Auctions had three Englishmen amongst its members; these included Sir Percival Griffiths, Representative of the Indian Tea Association in London, and Mr. R. E. Culverhouse, a representative of Buyers, who in turn reflect the views of consumers. There has been no time at any stage in the enquiry when the rights of consumers in the United Kingdom, which still represents much the largest market for Indian tea, have been neglected. The Committee's report was unanimous and seems to have been drafted with a full recognition of the practical difficulties of a quick change-over in Calcutta no less than the desirability of maintaining every legitimate British interest on the consuming side. The Chairman of the Tea Board, Mr. U. K. Ghoshal, was Chairman of the Committee of Enquiry; since the Tea Board has the responsibility for implementation, one might assume that the practical responsibilities of the Chairman have been borne in mind throughout these deliberations.

For a variety of reasons, the Committee unanimously reached the opinion that the enlargement of auctions in India should not be postponed any further. The principles governing the process of enlargement had already been laid down by the "Ad Hoc" Committee on Tea in 1950, to the effect that the development should be related to actual conditions, that is, each successive phase of enlargement should be reviewed and implemented in the light of trade and economic conditions, prevailing from time to time. The Tea Auctions Committee's report was prepared in a very much more favourable climate for tea marketing than had existed in 1950 and the prospects for world tea continue to remain bright. That helps to minimise some of the risks involved in a change-over, which might otherwise have prompted too great caution. Auctions in India have been increasing in size during the past few years and the trend would continue; the issue before the Committee was only how best the tempo could be accelerated.

The immediate course recommended was the imposition of a ceiling of 30 per cent of the total Indian crop as the quantity that can be exported for purposes of auctions. It was suggested that this should be reduced to 25 per cent in 1956-57, but only after precaution was taken to investigate whether new factors have intervened to make it inexpedient. But in view of the traditional links between Mincing Lane and the Indian tea producer and the importance of utilising the knowledge of the tea requirement of the largest market for Indian tea, the Committee was convinced that London auctions should continue to exist as a supplementary outlet for Indian tea. Subject to these broad considerations, the actual quantities to be reduced became a matter of detail but on a reduction of 25 per cent or 50 million lbs phased over two years, there has been no serious disagreement.

Briefly, the major decision the Government of India has reached is that while there is to be no ceiling fixed each year in terms of the percentage of the total crop, there will be an overall limitation of 140 million lbs for direct shipment of North Indian tea against actual consignments of 209 million lbs in 1953 and 167 million lbs in 1954. In the case of South India the Government of India do not consider it necessary to fix a specific ceiling during the current year because they are satisfied that their actual consignments are unlikely to exceed the previous level of 23 million lbs, a quantity well below 25 per cent of the South Indian crop. It is stated, however, that the situation will be watched and, should different trends appear, steps will be taken to prescribe a ceiling. These decisions seem to have the merit of being somewhat simpler in operation than a flexible ceiling to be fixed each year in relation to the size of the crop, which may not always be possible to determine accurately in time for administrative orders to issue early in the season.

Not only has the Government of India's decision in this matter the merit of simplicity; it has been obviously designed to be implemented with as little dislocation as possible. For this purpose a scheme of voluntary enforcement in accordance with the recommendations of the Committee has been adopted. The main Producers' Associations of North India have expressed their willingness to set up a joint committee to ensure that the prescribed ceiling is not exceeded. The Government of India have accepted this offer; there is no reason to believe that on either side this attitude of trust between the public and private sectors will be regretted.

One of the vital recommendations of the Committee was concerned with warehousing facilities in Calcutta, which it would appear are not wholly adequate even without any enlargement of auctions. While no very great difficulty has been experienced in accommodating chests even when auctions went up to 62 per cent of the total crop, the recent deterioration in the labour position in the port of Calcutta makes new warehousing an urgent necessity. It would appear from an appendix in the report that there is more than one method of calculating the required warehousing accommodation. It would seem that existing accommodation is sufficient for about 700,000 chests, while something between 250,000 to 500,000 additional chests may be in residence at the peak if the crop rises significantly and additional auctions are currently taking place. The Tea Board which has now been assigned the task of expanding warehousing facilities in Calcutta will need to arrange accommodation for something like 250,000 chests while long-term measures are set in operation for about double that number. This is so central and practical a condition of larger auctions that it is hoped that no time will be lost in the implementation of this proposal.

For the rest it is only necessary to draw attention to the statesmanlike manner in which the interests of the predominant producing and consuming countries have been brought into line in this case. A spirit of broad tolerance and understanding has been shown by all the interests and by both governments. Tribute is due particularly to the trade, both in India and abroad, for placing at the disposal of the Committee all necessary information, and for accepting a direction which in some quarters was unpalatable. This is a fine example of the strength of the democratic method in economic affairs.

THE WEEK'S NOTES

RETURN OF THE DECIMAL

THAT THE decimal system, which was born in India, could not find a place for itself in the country of its origin, while it travelled far and wide to find ready acceptance in foreign lands, has been a powerful argument to compel acceptance of a decimal coinage for this country. Arguments about the practical uses of the decimal coinage perhaps played a less prominent part during the passage in the Lok Sabha last week of the Indian Coinage (Amendment) Bill. The desirability or otherwise of the changeover to the decimal coinage and the inconveniences it may involve was subordinated to the wish of a section of the House, for the retention of the current name of 'paisa' for the new unit, and even the Prime Minister seemed ready to concede the desirability of retaining that name. The word has, indeed, become a synonym for 'money', not only for a coin, but it seems wrong to confuse it with a cent which has a specific meaning in the decimal system and possesses the virtue of being self-explanatory. This is one more example of straining at a gnat after swallowing a whole camel of revolutionary change.

There is substance in the fear that during the period of transition from the old system to the new, important sections of the community in the countryside will find it difficult to work out the right exchange rate between the old coins and the new. Even the more wary urban housewife may find it very trying to settle the daily bargain with the tradesmen. Measures will have to be taken against sharp practices. One should not, however, exaggerate these difficulties. Smooth transitions have taken place, for instance, when the pie disappeared completely from circulation, and, again, when the Osmania currency was recently superseded.

It is wrong to underestimate the prestige of the 'paisa' by assuming that its currency in our language would be affected when the smaller denominations bearing this name are withdrawn eventually. The word would still mean 'money' and in common parlance, it has often been stretched to denote prices, remuneration and states of affluence or bankruptcy among individuals. The 'paisa' seems destined to live long after it dies out as mere small coin; a mere 'cent' cannot acquire its very rich connotations. It can be tolerated as one of those strictly utilitarian tools, devoid of the romance which has been built up around the 'paisa' in Parliament.

THE MALAYAN POLITICAL FRONT

WITH ITS unprecedented success in elections anywhere, the Malaya Alliance Party has created a new record by capturing 51 of the 52 elected seats in the 98-member Legislative Council of the Federation. The twin goals of striving to attain full independence in four years and providing for a fully elected Legislative Council seem to be mainly responsible for this triumphant victory. As an immediate step towards these ends, the Alliance has demanded self-government within two years. The Party wants the power of veto, now vested in the High Commissioner, to be abolished, and seeks full self-government including control over defence. This would exclude foreign affairs, which will be sought only when independence (within the Commonwealth) is achieved.

That the Malayan people have an overwhelming aspiration to assume charge of their affairs, though in gradual stages, has been made clear beyond any doubt. The British Government are also showing intelligent awareness of the necessity of reform, but it seems likely that there may arise differences over the question of time. Yet another controversial factor is the view held by the Alliance Party that, in order to help restore stability in the Federation, a general amnesty be granted to the insurrectionists, which, according to the present indications, may not be acceptable to the British who have always demanded their complete and unconditional surrender. There is, however, much that can be said on the differing viewpoints. But it may not be in the best interests of either party to delay for long the much needed reforms.

If experience in other territories is any guide, a free nationalist Malaya, understanding its rights and responsibilities, may ultimately prove to be far more effective than the British to withstand any possible Communist pressure. There is, however, one somewhat disquieting feature about the Alliance; with gradual assumption of responsibility and power, the heterogeneous groups of the Malayan Chinese, the Malayan Indians and the Malay Nationals, comparising the Alliance, may find it difficult to maintain the same coherence with which they came through the elections. Much depends on what they do about the citizenship law, on which they have yet to define their intentions.

In Singapore, now constitutionally separate from Malaya, the elections held recently, which put the Labour Front in power, resulted in political troubles and strikes. At one time it seemed the crisis would deepen when Mr. David Marshall, Chief Minister in the first elected government of the island, threatened to resign. However, with the visit to Singapore of Mr. Lennox-Boyd, British Secretary of State for Colonies, and his discussions there, the crisis may be averted.

ATOMS FOR PEACE

ON MONDAY, August 8, the world's leading scientists, including those from the U.S.S.R., will gather for a 12-day conference at Geneva for concentrated international effort to make the atom work for peace. The scientists will tackle the problems, among others, of production of power through nuclear reactors and the use of radioactive isotopes in medicine, biology, agriculture and industry, in public discussions and individual technical papers, of which over 1,000 have been compiled and approximately 450 will be read in the conference. At the final plenary session on August 20, Dr. H. J. Bhaba, President of the Conference, will summarize the highlights of the proceedings. The peaceful use of atomic energy has thus made great progress since President Eisenhower's historic December, 1953, proposal before the U.N. General Assembly for cooperation among the nations of the world in developing nuclear energy to serve mankind. The General Assembly's unanimous call last year for the international technical conference to explore the possibility of developing the peaceful uses of atomic energy and methods for its practical use has thus been answered.

One of the interesting features of the conference will be that many of the participating nations will exhibit their achievements so far in the field of harnessing nuclear energy for peaceful needs. Already, some of the nations have made considerable progress and have advanced plans for such schemes as atom-powered locomotives, peace ships, electricity, industrial furnaces, power reactors, accounting machines, etc. The portable power plants are being so designed in the U.S. that they can be transported by plane to provide power, light and heat for a community of 2,000 persons. They can also be used to provide power for drawing water for irrigation from underground streams in desert areas. Atomic electrical power, from a land-based prototype of submarine intermediate reactor, is already being distributed on commercial scale. All this is, indeed, a moving demonstration of the fact that the atom can

be stripped of its military casing and adapted to the arts of peace. The fervent hopes of mankind are contained in the words of President Eisenhower: "To find a way by which the inventiveness of man shall be consecrated to his life."

UNIVERSITY EDUCATION

ONE VITAL suggestion in the report on the University Grants Commission Bill, submitted by the Joint Select Committee of Parliament, is that no institution other than a university should be permitted to grant any recognised diplomas or degrees. The other recommendations mainly concern the composition of the Commission, its functions and the measure of control the Government should exercise over it. Whereas the recommendations reveal very little of anything new in such reports, the main weaknesses are not far to seek. In so far as the personnel is concerned, it has been recommended that the entire Commission be nominated by the Central Government. It is quite possible that the composition of the Commission in this manner, without adequate non-official element in it, may take away much of the initiative and confidence necessary for the execution of its functions with drive. The report suggests that the Commission will assume unbridled powers in the matter of sanctioning grants to institutions, which may leave enough scope for a tendency of favouritism to develop. To ensure fair play to every educational institution, it is essential that certain standards should be formulated, and an institution should acquire title to the grant only when the Commission is satisfied that the concerned institution answers such conditions.

The minutes of dissent by six members, appended to the report, contain some useful suggestions which deserve careful consideration. In order that the country may keep pace with the rapid developments in the scientific field, the universities should be able to provide the necessary facilities for study and research in technological, aerial and atomic developments. Higher education in soil improvement engineering, water control, etc., for rural development should figure prominently in the universities, and the Commission should address itself vigorously to such important tasks.

HANDING OUT TO HANDLOOMS?

THE TARGET of 3000 million yards for handloom cloth at the end of the second Five-Year Plan, prescribed by the All-India Handloom Board, has the virtue of consistency with the present Government's policy and the aspirations of the political party in power, but it may have nothing more to commend it for acceptance. To say this does not involve condemning the men behind the looms to the human scrapheap, as indignant apologists of the handloom industry would say. An expenditure of Rs. 100 crores has been envisaged, Rs. 60 crores in grants and Rs. 40 crores in loans—of which the major items are Rs. 21.78 crores for working capital to weavers' co-operatives societies, Rs. 15 crores for rebate, Rs. 11 crores for starting a thrift fund and Rs. 19 crores for building weavers' colonies. This is a substantial dose of welfare in addition to legitimate assistance to a particular group of the community, which—though under severe hardship due to its low productivity and consequently low competitive strength in relation to modern industry—is not alone in its disabilities because of larger groups living under comparable conditions in the self-employed category of artisans and workers.

The handloom worker needs credit and he has to be organised to be freed from the exploitation of the yarn merchant on the one hand and the cloth middleman on the other. An extension service which will tell him of the types of demand that exist and the adaptations in size, design, texture and quality he can make would certainly strengthen his position. Credit for ordinary operations and for improvements should be freely provided. It is difficult to accept that the impressive totals of outlay proposed would achieve all this effectively. In any case, there should be no serious discrimination between other artisans who, though in smaller numbers in each special group, together face a not dissimilar problem, in matters like housing or other welfare measures.

The increased target for handlooms can be achieved only with a progressive increase in powerlooms as suggested by the Kanungo Committee, the economics of which is not free from complexities when it is extended on a large scale. The handloom industry seems at the moment unable to profit fully by the expansion of the cloth market: while mill cloth stocks are declining, stocks of free yarn have increased by over 25 per cent since last year—not because of very large yarn production. If future demand arises in lines in which the mills now specialise, the outlook for the handloom may not be quite bright, especially if powerlooms also take some share of the existing market. The problem is not indeed easy, but there seems to a tendency to work out solutions on facile assumptions.

INDUSTRIAL FINANCE CORPORATION OF INDIA

KEELING ROAD, NEW DELHI.

NOTICE

NOTICE is hereby given that the SEVENTH ANNUAL GENERAL MEETING of the Shareholders of the INDUSTRIAL FINANCE CORPORATION OF INDIA will be held on Saturday, the 17th September, 1955, at 4-00 P.M. (Standard Time) in the hall of the Constitution Club, Curzon Road, New Delhi, to transact the following business:

(1) The Balance Sheet of the Corporation and the Profit and Loss Account for the year ending 30th June, 1955, together with a report by the Board on the working of the Corporation throughout the year and the Auditors' report on the said Balance Sheet and accounts shall be read and considered.

(2) To elect one Director each in place of (1) Mr. H. C. Captain, (2) Mr. L. S. Vaidyanathan, and (3) Mr. V. P. Varde, being Directors elected to represent shareholders referred to in clauses (c), (d) and (e) of Section 10 of of the Industrial Finance Corporation Act, 1948, respectively, who retire by rotation and are eligible for re-election as provided by Section 11 of the Act.

(3) To elect under Section 34 of the Industrial Finance Corporation Act, 1948, one Auditor duly qualified to act as Auditor of Companies under sub-section (1) of Section 144 of the Indian Companies Act, 1913 (VII of 1913) by the parties mentioned in sub-section (3) of Section 4 of the Industrial Finance Corporation Act, namely Scheduled Banks, Insurance Companies, Investment Trusts and other like financial institutions and Co-operative Banks, in place of Messrs. S. B. Billimoria and Co., Bombay, who retire at the end of the year but are eligible for re-election.

H. V. Venkatasubbiah,
MANAGING DIRECTOR.

NEW DELHI,
23rd July, 1955.

LINOLEUM

is NOW manufactured in India

Another important stride towards India's industrial self-sufficiency has been taken with the establishment of India's first Linoleum factory. LINOLEUM—the smart, hygienic, and durable floor-covering—is now made in India by India Linoleums Ltd.

Modern machinery and expert craftsmen in our factory produce Linoleum that is comparable in quality to the finest foreign makes. Apart from meeting India's entire demands, this pioneer factory is manufacturing enough to export its products to foreign markets.

LINOLEUM floors give :

MODERN LOOK—Linoleum floors help shops and stores to look more efficient, more attractive.

MORE COMFORT—For the ultimate in underfoot comfort, remodel your homes, offices and factories with resilient Linoleum floors.

LONGER LIFE—The strong burlap base lasts longer. Ideal for use in railways, steamships, automobiles, public institutions etc.

To cover your new floors and to protect the old ones lay Linoleum from wall-to-wall because it makes the floor itself as well as a carpeting.

Show Rooms :
7, Chowringhee, Calcutta.
1/155, Mount Road, Madras

Available in colourful designs, Plain Pastel Shades and in other pleasing effects Linoleum is most suitable floor-covering for

INDIA: STATE OR NATION?

BY

ODYSSEUS

I HAVE been reading "Welsh and Scottish Nationalism" (Collins, London, 1954), Sir Reginald Coupland's last book, published after his death, and this has made clearer in my mind a proposition that I have often submitted in this column: the survival of the Indian nation is bound up with the success of democracy.

Now, the "Shorter Oxford English Dictionary" defines a "nation" as "A distinct race or people, characterised by common descent, language, or history, usually organised as a separate political state, and occupying a definite territory". By this definition India can only with difficulty be admitted to be a nation, because it is hard to argue that this sub-continent is inhabited by one race or that it is characterised by common descent (Cf. Pathans, Goanese, Maratthas, Bengalis, Tamils, Nepalis and Kashmiris), still less by a common language or history (at any rate until the nineteenth century). Can it then be that all those who assert that there is an Indian nation, to which they are proud to belong, are suffering from an illusion?

On the contrary, those who feel like that actually constitute the Indian nation. The Indian, Jewish, Welsh, Scottish, Polish, English (or other) nations are made up of all those who are conscious of being Indian, Jewish, Welsh, Polish etc., and who take pride in their own culture. In other words, I submit that in the definition of nationality the emphasis should be on spiritual and cultural values. Ernest Renan (1823-1892), the French historian, said that nationality is a spiritual principle sustained by the continuing force of a tradition from one generation to another, and inspired by the memory of "great things done together" and the "desire to do more of them". This spiritual character differentiates a nation from a state. Renan also asserted that the nation is incorporated in the state as the soul in the body, but I suggest that while this is sometimes, it is not always, true. Throughout most of the nineteenth century, for example, the Polish nation (which spiritually was very much alive and self-assertive) was politically divided between the states of Austria, Prussia, and Russia; the Welsh and Scottish nations flourish today within the state of Great Britain; and in my reading I frequently come across references to the Sikh and Maratttha "nations", which form part of the state of India.

THE DEFINITION OF A "NATION"

In short, a nation exists where enough people (of whatever race, descent, language, or history) passionately desire it to exist.

Mazzini (1805-1872), one of the fathers of the Italian nation, said that a nation justifies this claim to life and freedom by the contribution that it makes to the welfare of the international community. He preached that selfishness in a nation was as wicked as in an individual. I would not dispute the truth of this, but as I look round the international scene, I cannot help wondering how many contemporary nations are justifying their existence and how many more are behaving in such a way as to justify their liquidation from history.

The final question, which, says Coupland, must be, but has not yet been, answered is: What kind of political instrument is needed to enable a nation to fulfil its function? Two contradictory answers have been given.

John Stuart Mill (1806-1873), the "Aristotle of nineteenth century Liberalism", anxious though he was to protect the rights of minorities, went so far as to assert, in his classic "Representative Government" (1861), that free institutions are next to impossible in a state made up of different nationalities and that the boundaries of governments should therefore coincide with those of nationalities. For Mill, "democracy" meant that the nation controlled the state and this inevitably implies a one-nation state. Democracy means majority rule, which Mill argued, can only work in a society which shares the same traditions, standards, and purposes, to such an extent that any minority within it can acquiesce in the decisions of the majority. It is true that in a state which embodies more than one nation (e.g. New Zealand with its Maories), national differences may not be strong enough to obstruct the rule of the majority, but if the differences go deep enough (e.g. as in the old Austro-Hungarian empire with its Czechs, Poles, Slovenes, Croatians, Rumanians, Ruthenians etc.) then an intractable problem arises because a nation is not like a party: it cannot increase its votes by winning people over; if it is weaker than the other nation or nations which make up the multi-national state, it is a permanent dissatisfied minority subject to a permanent majority.

THE NATIONS WITHIN THE STATE

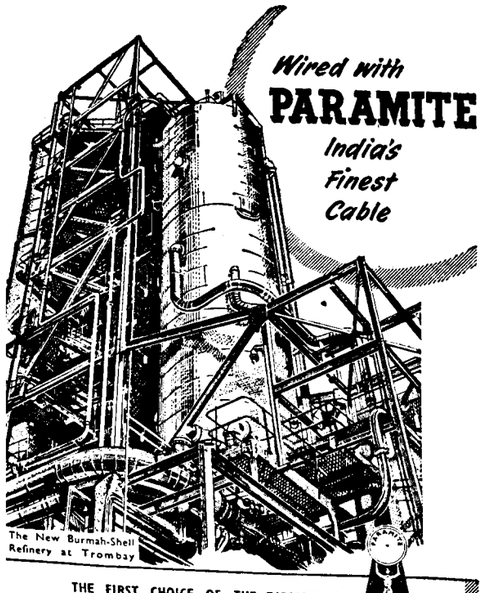
Lord Acton (1834-1902) lost no time in challenging Mill's view in his essay on Nationality (1862). Alarmed at the disruptive effects on the composite Austro-Hungarian state that Mill's doctrine might have, he urged that the combination of different nations in one state is as necessary to civilised life as the combination of men in society, and those who have followed Acton's lead insist that in a democracy it is the duty of a nation to "preserve and augment its cultural traditions as its distinctive contribution to the common treasury of civilisation" (Cf. the French in Canada). For that, no political instrument is necessary. The members of all nations are also members of states; but, provided that it is democratic, the state's frontiers need not correspond with those of the nation.

Contemporary Europe pullulates with nations divided between different states, e.g. the Basques divided between (democratic) France and (totalitarian) Spain, the Germans divided between (democratic) Western and (totalitarian) Eastern Germany, but, of course, those who follow Acton would deplore these examples as not fulfilling the principle that division is not important providing that a democratic state allows the divided nation self-expression.

In this sub-continent, we have an interesting Actonian situation, for if the pre-1947 doctrine of the Congress party be accepted, the Indian nation has been divided between the states of India and Pakistan, and, as long as both states remain democracies, the pure Actonian would not object on the score of alleged injury to the nation (whether or not he would object to the weakening of the international political influence of the sub-continent by its division into two states, which is a different argument). And the pure Actonian would not object to those who regard themselves as belonging to the Sikh or Maratttha "nations" within the Indian state, for he argues that a multi-national

state is a more advanced, more civilised polity, than a one-nation state; and he concludes that in a democratic state a man's nationality is no more the state's business than his religion, that to make nationality the basis of the state is out of tune with progressive thought and is a reversion to the pre-national European conception that one religion should be supreme in any one region (cujus regio, ejus religio).

Coupland points out that the French Revolution, by changing the character of nationalism where it existed and stirring it to life where it did not, brought the relationship between nations and states to the front of European politics. Rousseau's conception of the sovereignty of the people extended the range of consciousness of nationality from the circle of the king and the ruling aristocracy, first to the middle classes and eventually to the people.



This idea is the nub of our discussion, for it was the conception of the sovereignty of the people that brought the French nation into existence as it had never existed before, embodying them in a truly national state and inspiring them with a sense of national mission. Next, the reaction to the mission, when Napoleon had converted it into an attempt to make France mistress of a multi-national empire, started the birth pangs of nationalism in the subjected countries. Likewise the spread of democratic doctrine after 1815 sparked dormant nationalisms within the Austrian, Russian, and Turkish empires, which were (a) absolutist and (b) multi-national states, in which weaker nations were dominated by an imperial nation. Thus it was that the struggle for democratic freedom has, ever since, been identified with the struggle for national freedom. The British brought these ideas to India.

History does not support the assertions made (for understandable reasons) by Indian nationalists in pre-Independence days that the empires of Asok the Moghuls, were national Indian states, any m fifteenth century England or pre-Revolutionary were national states. In all these cases, Ind European, only the ruling castes of Magadha, England, or France, had any embryonic sense tionality; the outcome of the wars that they fou of dire importance to them, but only of indirect to the masses.

The "Indian nation" came gradually into b the first time in the minds of those nineteenth patriots who first conceived it; and as the stru independence intensified from decade to dec conception spread and came closer to reality did not reach down into the masses until G genius planted it there. After him, Pandit Ne done most to cultivate an Indian nationality an masses and, of course, the achievement of Indep in 1947, followed in turn by the great General of 1951, have nourished it—but I do not think t one with a sense of history, conscious of t passage, and the gorgeous panorama, of the c could argue that the tree is as yet more than a It needs to develop roots, solid, deep, anc spreading.

The smaller "nations" within the Indian s be sources of richness, but it is foolish to de they also contain the seeds of potential disunit tatorships, whether of the old-fashioned type guised as "of the Proletariat", will divorce the "nations" and peoples from the Indian states a mote discord that can end in disaster. It is im that democracy, which identifies the "natio peoples with their state, gives them "a stake state", be cultivated and strengthened.

We will elaborate these ideas next week.

A DELHI DIARY

MEA CULPA

BEFORE I delve into the numerous new events I must correct an error in the Delhi Diary of last week. When quoting extracts from a leading daily paper, I made an error in asserting that its Special Representative had said one thing one day and contradicted it the following day. It has now been drawn to my attention that the important words 'Reuter adds' should have been noticed by me on the latter occasion. This clears the Special Representative concerned of inconsistency and involves me (alas!) in a reporting inaccuracy. I tender my apologies for this particular factual error or for any other that that piece contains. But (obstinate man that I am!) I adhere to my opinions which have stirred many dovecotes amongst my journalist friends. Perhaps they would say—only they are polite—that only he that is without sin should throw the first stone. I am quite prepared to begin my own examination of conscience!

A WELCOME DOCTRINE?

The main interest, so far as I am concerned, this week has been the arrival, with great stimulus to economic discussion, of two brilliant foreign practitioners, of the dismal science, Prof. Colin Clark, Director of the Agricultural Economics Research Institute, Oxford, and Prof. A. P. Lerner of Roosevelt College, Chicago and now Economic Adviser to the Government of Israel. Prof. Lerner caused consternation when he unfolded the doctrine that inflation had no direct relationship to deficit financing. He was speaking on "Economic Development and Inflation" at a public lecture under the auspices of the Delhi School of Economics. One does not know whether he was attuned to the climate when delivering this revolutionary piece. But more than one member of the Governing Board of the Delhi School of Economics (which includes the Finance Minister and the Deputy Chairman of the Planning Commission among its members) will find in this thesis comfort and consolation for a bigger and better plan; can it be that economic theory is following hard on good economic practice?

Actually Prof. Lerner was misinterpreted in newspapers because of the omission of many of the qualifications to his original statement, such, for example, as the contribution of deficit financing to the full utilization of resources and the balance between scarce and unscarce resources. In any case he was held in check by Prof. Colin Clark who sounded a note of caution. He thought that a plan which provided for a rise of 5 per cent of real income per year was one which was possible but, in Indian conditions, likely to be very exacting.

GREEDY HOUSING

Prof. Colin Clark also expressed himself in private discussions against an undue allocation of resources towards housing, which, it appears, is an excessively greedy consumer of scarce capital in every country of the world. In India, with high figures of construction costs, construction is greedier than ever. He did not think it wise for the public sector to assign any considerable sum for this purpose. The issue was raised at one discussion whether the Government could possibly afford to be different in this matter. It was put brilliantly by a high authority when he said that, owing to pressure in resources, we may have to accept existing slums to some extent. But we cannot go on building slums. This sounded a crushing retort and was, for the moment, victorious, but I am wondering whether the issue was fairly and squarely settled by this declaration. The truth is that new housing—financed either by the private or public sector— is effectively capital withdrawn from productive purposes. The question is whether slum abatement, new or old, should be given priority over productive uses of capital for other purposes. It is arguable that industrial housing of certain minimum standards must be maintained for productive efficiency. If that is their major effect, it is conceivable that this is a productive cost; in other words, such housing is no detraction from the capital for productive purposes. If, however, the scale of housing is somewhat in excess of immediate needs for that purpose, it really is a measure designed to increase future unemployment. Would it be acceptable to the country that we should avoid slums by according a high priority to new housing at the expense of the solution of unemployment? This is a nice dilemma which I propose to leave hastily after having released it to add to the general economic confusion on the subject of capital priorities!

A NEW ASIAN OFFICE

My main interest was not in Colin Clark's assessment of capital priorities. Frankly it was in his more general discourse on 'Freedom and Economic Development' at 5 Hailey Road where the Congress of Cultural Freedom has opened its new Asian Office. This was the first meeting which is to be followed by discussion groups in which economic, social, and cultural problems will each receive due and detailed attention. I welcome the opportunity now afforded by the Congress of Cultural Freedom to get on with its cultural pursuits. Alas! there is some substance in the complaint that it has hitherto involved itself excessively in that (happily declining!) source of distraction called the Cold War.

At his address, Colin Clark pointedly referred to the comparative rate of economic progress in Communist and non-Communist countries. He asserted that there was no evidence whatsoever to show that, when its failures of its agricultural production were taken into account, the Russian rate of economic progress was much in excess of 2 per cent per capita, a rate which had been exceeded by many democratic countries and, in particular, by one Asian country, Japan, which had reached the highest rate of economic progress of any country of the world. Colin Clark was not allergic to the idea that India might be the country most likely to emulate Japan in the next ten years, although, as stated above, he thought that a figure of rise of 5 per cent per year was a little on the ambitious side.

WHAT IS AN OLIGARCHY?

I have wisely left to the end his blunt description of India's political system. He said, bold man that he is, that India today is governed by a benevolent oligarchy "which is slowly trying to convert itself into a democracy". This drew fire from Mr. Ashok Mehta who proposed an interesting vote of thanks. I wonder, however, whether the difference is really not a question of definition. I do not think that Colin Clark could have meant that our benevolent oligarchy was not responsive to criticism and is not based on consent. He was obviously referring to the concentration of power in a few hands instead of a democratic dispersal of authority. I fear that my definition of oligarchy does not allow me much latitude in opposition. But, being skilful at passing the buck, may I ask: What is an Oligarchy?

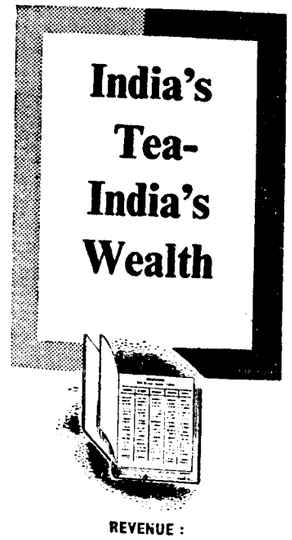
Economic Report from the U. S.

SOVIET INTEREST IN U.S. ECONOMY

(By Guy Sims Fitch)

NEW YORK, Aug. 2.—History often has a way of repeating itself. Events do not recur in exactly the same way, but sometimes the patterns are strikingly similar. This is being brought to American business men these days by the renewed Soviet interest in U.S. economic progress and methods. Soviet farm experts, touring the American midwest, are picking up ideas for boosting farm production at home. An American farm group is touring the Soviet Union, on invitation from Moscow, exchanging ideas with Soviet farm managers in the Ukraine and other agricultural areas.

The National Sales Executive Club, an organization of American marketing specialists, disclosed last week that it has received an "unofficial" invitation to send a team of experts to Moscow next year. Presumably, they will explain American sales techniques to the directors of the Soviet economy, and will help them improve their distribution of consumer goods. And now comes a report of broadening Soviet interest in peaceful trade with the United States. According to the U.S. Department of Commerce, U.S. trade with the Soviet 'bloc' of Eastern Europe showed a modest rise during the first quarter of 1953. Export license approvals included such new items as aluminium chloride, citric acid, and truck tires. In addition, an application to export 500 new automobiles to Communist Bulgaria was approved in the second quarter, and does not show up in first quarter data.



The serious lag in Soviet agricultural production has been cited by Soviet officials themselves. They also have complained openly of labour shortages and low worker productivity in Soviet industry. And they have publicly reprimanded economic managers for not giving enough consideration to consumer needs. The Soviet farm delegation in the U.S. is amazed at how few hands are needed on America's efficient family farms. According to reports, the U.S. delegation in the Soviet Union is equally amazed at the large number of people needed to work Russia's huge collective farms.

Business men here with some knowledge of Soviet industrial methods point out that industrial production goals in the U.S.S.R. have been met largely through the use of excessive manpower. But, now, labour has had to be drafted out of the factories to work in new agricultural areas because of the farm problem. This may well explain the Soviet interest in advanced U.S. industrial and agricultural techniques. It also may explain the increased Soviet interest in industrial machinery, farm equipment and other goods from the U.S., and other Western countries.

All this has a familiar ring to Americans who recall how U.S. technicians and equipment helped the Soviet Union overcome its economic difficulties some 25 years ago. At that time, when the Soviet leaders were struggling with their industrialization plans, American industry helped build Russia's basic steel industry. American engineers designed and supervised construction of the huge Dneiper River Dam, then one of the world's largest. American farm experts taught the Communists the know-how of large-scale wheat production. U.S. companies also built cement plants, grain elevators, flour mills, automobile factories and tractor plants in the U.S.S.R. American aid contributed to the development of many other Russian industries, including iron, coal, asbestos, aluminium, petroleum, paper, textiles, meat, chemicals and precision instruments.

Soviet leaders themselves concede, during the days of the World War II alliance, that American know-how and machinery were largely responsible for putting in place most of the big industries founded in the Soviet Union at the time of the War. In later years, Americans were no longer as welcome in the Soviet Union. Some U.S. companies have long since given up trying to collect payments owed them by the Soviet Government for services rendered.

Recalling these events and the post-war period of Soviet non-co-operation with the Free Nations, American business men want to be sure of the sincerity of the Soviet Union's interest in the peaceful exchange of ideas, goods and services. Moreover, they see two big hurdles still in the way of expanded U.S.-Soviet trade: the shortage of exportable goods in the Soviet 'bloc', and the difficulty of doing business with Communist State-trading nations. But business men are wondering whether the present Soviet leaders may not again be calling on American know-how to straighten out kinks in the Soviet economic system. This is a formula that paid large dividends to the U.S.S.R. a quarter of a century ago, and helped transform it from a relatively primitive to a relatively advanced industrial power.

WORLDGRAM

AGRICULTURE

Commonwealth Wool Production: Australia, New Zealand and South Africa have each marketed wool clips of record size in the 1954-55 season. Australia—which only a few days ago issued estimates foreshadowing that the coming season's clip would reach 4,016,000 bales—has achieved a 4,000,000-bale clip in 1954-55 season. New Zealand, for the first time in her history, has sold more than 1,000,000 in a a season, the figure for the 1954-55 season being 1,002,863 bales, compared with 941,320 bales in 1953-54. In South Africa in 1954-55 the season's clip was the largest in the history of the country, with sales exceeding 1,000,000 bales and realizing £58,833,245.

*

Increasing Production of Coconuts and Arecanuts: To meet the increasing demand for coconuts and arecanuts both from industry and the consuming public, the Union Ministry of Food and Agriculture has launched a campaign for increasing yields of these crops on the lines of the paddy and sugarcane promotion drives undertaken previously by this Ministry. Steps are being taken by the State Governments of Madras, Bombay, Travancore-Cochin, Assam, Mysore, Saurashtra, West Bengal, Orissa, Andhra and Coorg, where these crops are mainly grown, to popularise improved agricultural practices including adequate and timely manuring. Information on better cultivation methods is being made available to the growers by the distribution of instructional pamphlets through Agricultural department officials and village level workers.

*

Nicaragua's Cotton Production: Cotton production in Nicaragua during the 1954-55 crop year is estimated at 175,000 bales, an increase of 60 per cent over production of 109,000 bales in 1953-54. In the first four post-war years, 1954-48 cotton production averaged only 4,000 bales per year, but since then it has increased rapidly. As annual domestic consumption amounts to 5,000 bales, nearly all of Nicaragua's cotton is available for export. The principal purchasers have been Japan, Western Germany, the United Kingdom and the Netherlands.

*

World Agricultural Output in 1954-55: For the first time since World War II, total world agricultural production failed to rise above the level of the previous year. Small gains, in production in Western Europe, Latin America, and the Far East were offset by fall in North America and the Near East. According to a report of the United Nations Food and Agriculture Organisation, on the whole the world food position despite some progress in production still presents the long-standing problem of unequal rates of progress among different regions and wide disparities in consumption standards.

*

Rape, Mustard and Gram Crops Yield in Pakistan: The final estimate of the area under rape and mustard crop in Pakistan for the year 1954-55 is 1,803,000 acres as against 1,631,000 acres reported in the final estimate of the previous year, and shows an increase of 10.5 per cent. The final estimate of the area under gram crop for the year 1954-55 is 3,102,000 acres as against 2,767,000 acres reported in the final estimate of the previous year, and shows an increase of 12.1 per cent.

INDUSTRY

Crude Steel Production in Italy: Italy produced, 440,000 tons of crude steel in March 1955, a new monthly record. The previous record set in January 1955 was 427,000 tons. For the first three months of 1955, crude steel production totalled 1,265,000 tons, 28 per cent more than in the corresponding period in 1954; and pig-iron production was some 15 per cent greater than in the same period last year.

*

Industrial Output in Japan: Japan's industrial production is likely to reach a value of 8,232,000 million yen in the fiscal year 1957, according to blueprints of the Economic Council Board. The projected yearly rate of increased production will be 3.9 per cent in the current year, 4.1 per cent in fiscal 1956 and 4.7 per cent in fiscal 1957. It is claimed that with continued U.S. aid and expanding trade with the Republic of China, Japan's international accounts would be balanced in 1956 and 1957.

*

General Classification of Coal: The draft standard issued by the Indian Standards Institution prescribes a general classification of coals available in India. It also indicates the different uses of coals and the kind of coal suitable for each purpose. The general classification recommended in the draft consists of ten subdivisions of three main types of coals, namely, anthracite, bituminous coals and lignite. These subdivisions are based on graded varitions in four inherent characteristics, namely, volatiles, calorific value, moisture and caking nature.

*

Tentative Standard for Bicycle Chains: The Indian Standards Institution has published a tentative Indian standard specification for bicycle chains which covers the dimensions of full length chains and the tests to be applied to them. Only these dimensions which are considered essential for the purpose of facilitating the smooth working of chains on the chainwheels and for their interchangeability have been specified. It is intended that other dimensions should be left to the discretion of individual manufacturers.

*

Fertilizer Factory in Egypt: Six tenders submitted by nine foreign countries (including Britain, France, Italy and West Germany) are under study by a special Committee appointed by the National Development Council in connection with the construction and equipment of the proposed fertilizer factory at Asswam. The capital of the new company will be £E.15 million in which the Egyptian Ministry of Finance, the Production Council, the Agricultural and Co-operative Bank, Misr Insurance Co. and Supreme Agrarian Reform Committee will participate.

TRADE

Export Promotion Council for Plastics: An Export Promotion Council for Plastics has been set up to encourage the export of plastic goods. The Council which has been registered under the Indian Companies Act with its office in Bombay will undertake market studies in foreign countries, send out trade missions and appoint representatives in foreign markets to promote the export of Indian plastic goods. It will also collect statistics and other information regarding the manufacture or trade in plastics in other countries, lay down standards of quality and packing for export of plastics and investigate complaints received from foreign importers.

*

Foreign Sea and Air-Borne Trade of India in June 1955: The provisional figures of foreign sea and air-borne trade of India on private and Government accounts during June 1955, according to data so far available in the Department of Commercial Intelligence and Statistics, Calcutta, are as follows: Merchandise, excluding transit trade of Pakistan but including that of other land frontier countries: Exports: Rs. 4595 lakhs; Re-exports (transit trade—Rs. one lakh):

Rs. 62 lakhs; Imports (transit trade—Rs. two lakhs): Rs. 4933 lakhs; Total total trade: Rs. 9590 lakhs. Treasure: Exports of Currency Notes: Rs. 9 lakhs; Exports of others: Negligible; Imports of Gold; Rs. one lakh; Imports of Currency Notes: Rs. 83 lakhs; Imports of others: Nil. Balances of Trade: The merchandise import figures are exclusive of the value of certain consignments of Government stores awaiting adjustment. Subject to this deficiency in import figures and to the exclusion of figures for transit trade, the total value of exports (including re-exports) of merchandise, gold and silver fell short of imports by Rs. 276 lakhs.

*

Trade Agreement Between France and Lebanon: A trade agreement has been signed between France and Lebanon. According to the terms of the Agreement, France will credit the Lebanon with £L.45 million with which the latter will buy French goods. This loan will be repaid within five years. France has undertaken to supply the Lebanon with the goods needed for her projects and to import from her citrus fruit and tobacco. Further, French Government will encourage the exploitation of French capital in the Lebanon.

*

Indo-Malayan Trade: Total trade with India during December 1954, amounting to M.$16.0 million in value, was made up of M.$6.8 million worth of imports from India and M.$9.2 million worth of exports to India. This resulted in a trade balance of M$2.4 million in favour of Malaya, against an adverse balance of M.$1.5 million during December 1953. Indo-Malayan trade during the year 1954 resulted in a trade balance of M.$42.1 million in favour of Malaya, compared to a favourable balance of M.$13.6 million during 1953. While Malayan imports from India dropped by M.$12.5 million in 1954, compared to 1953, Malayan exports to India went up by M.$16.0 million.

*

Export Duty on Tea: The Government of India have issued a Notification fixing the price of tea, for the purpose of determining the export duty, at Rs. 2-9-9 per lb., as against Rs. 2-6-5 per lb. in force from July 1, 1955. The export duty at this price will be As. 6 per lb which means an increase of As. 2 per lb. as compared with the duty hitherto in force.

FINANCE

Tax Reduction in the ECCS: The treaty establishing the European Community for Coal and Steel authorised the High Authority to levy a tax, not exceeding 1 per cent, on the average value of the coal and steel produced within the Community. The proceeds of this tax were to be used mainly to cover the administrative expenditures of the ECCS and to constitute a Guarantee Fund, which would guarantee the borrowings of the High Authority. After a short transitional period, the tax was fixed, beginning with the second half of 1953, at 0.9 per cent. At the end of February 1955, the Guarantee Fund's resources totalled US$60.4 million. As this was considered a satisfactory amount, the High Authority decided to reduce the tax to 0.7 per cent for the second half of 1955 and to 0.45 per cent beginning January 1, 1956.

*

Subsidised Industrial Housing Grants: A sum of Rs. 9,72,000 as subsidy and an equal amount as loan has been granted to the Government of Bombay for the construction of 570 single roomed and 90 double roomed tenements. Government of Hyderabad gets Rs. 8,36,420 divided equally as subsidy and loan. The Government of West Bengal receives a subsidy of Rs. 6,48,000 and an equal amount of loan for building 283 single roomed tenements—at Motijheel, Dum Dum. A sum of Rs. 43,600 divided equally as subsidy and loan has been given to the Government of Travancore-Cochin for constructing 13 single roomed tenements at Karamana. Sri Jai Somnath, Co-operative Housing Society Ltd., Ahmedabad has been given a loan of Rs. 1,43,620 and a subsidy of Rs. 71,810 for constructing 26 single roomed and 60 double roomed tenements at Ahmedabad.

*

Grants and Loans for Increasing Food Production:: The Government of India have sanctioned a loan of Rs. 27 lakhs and a grant of Rs. 2.5 lakhs to Madhya Bharat for partially financing a scheme of sinking new and repairing old wells in the State. This forms part of the Centre's aid of Rs. 5.7 lakhs as grant and Rs. 63 lakhs as loan for the Grow-More-Food Programme of the State in 1955-56. The present target of the scheme, which will cost Rs. 41 lakhs, is 8,000 wells. For the construction of minor dams and the installation of 300 Persian wells, the State has also received a loan of Rs. 2.8 lakhs and a grant of Rs. 25,000.

*

MISCELLANEOUS

Employees' Provident Fund Scheme: The refixation of time limit after which the workers become entitled to employers' contributions at 15 years as against 20 at present, was recommended by the Central Board of Trustees of the Employees' Provident Fund Scheme. The meeting also recommended to the Union Government that advances from the Provident Fund accumulations may be granted to members for the construction or purchase of house or house-sites. The Trustees also recommended that members should be allowed a refund of the amount due to them under the Scheme after a waiting period of six months only against the present period of one year. Among other recommendations of the Board are: Scaling down of the period of membership for proportionate payment of the employers' contributions namely, 85 per cent after 10 or more years membership; 75 per cent after 5 to 10 years membership; 50 per cent after 3 to 5 years membership and 25 per cent after less than 3 years membership.

*

Pakistan's Six-Year Plan: Two hundred and sixty eight projects are now at various stages of execution in Pakistan under the six-year National Development Plan. Of these, 135 aim at increasing food production. Twenty-eight schemes are in hand for improving irrigation facilities. Industrial development comes next both 36 schemes, followed by power development with 27 schemes. Another 25 projects have been launched to improve transport and communications, while 17 schemes are being implemented in the social field. The Central Government's direct outlay on various projects up to March this year amounted to more than 444 million rupees.

*

More Steel Plants to be Set Up: The Minister for Commerce and Industry, has revealed that more iron and steel plants were proposed to be set up in the country, in addition to those for the establishment of which agreements had already been signed and construction work was in progress. Two schemes for establishment of steel plants to be owned and run in the public sector, had been approved by the Government of India. There were now three main steel works in the country. Two of them, the Tata Iron and Steel Co., and the Indian Iron and Steel Co. were big units and were in the private sector. The third unit which was smaller—Mysore Iron and Steel Works, was owned and operated by the Mysore Governmeit.

NEWS IN BRIEF

INDIAN

Under the Central Social Welfare Board's training programme for Gram Sevikas, a batch of 1,000 Sevikas is at present receiving training at Centres run by the Kasturba Memorial Trust.

*

It is reported that Bamboo forms over 60 per cent of the indigenous raw materials used for paper manufacture in the country, and the annual consumption of bamboo in the industry is about 3 lakh tons.

*

India's exports to the Soviet Union increased from Rs. 1.15 crores in 1953-54 to Rs. 2.11 crores during 1954-55, while her imports from that country increased from Rs. 59.7 lakhs to Rs. 1.61 crores during the same period.

*

There were 31 sugar factories employing 33,900 workers in the country in 1932 and the numbers rose to 170 and 91,997 respectively in 1953.

*

The total man-hours lost as a result of the recent labour strike in the Kanpur Textile Mills was 1,03,23,762.

*

The Government of India have decided to award during 1955-56 a limited number of Post-school scholarships of the value of Rs. 100 P.M. to the blind students for post-Matriculation education and for professional training.

*

The Union Education Ministry sanctioned a sum of Rs. 107 lakhs during 1954-55 for extending educational facilities to students belonging to the Scheduled Castes and Scheduled Tribes and other Backward Classes.

*

The Second International Soil Fertility Training Centre has been opened in Hyderabad. The centre has been jointly sponsored by the Union Ministry of Food and Agriculture and the F.A.O. of the U.N.

*

Thirty-two maternity and child welfare centres were opened in rural areas during the year 1954 and grants amounting to Rs. 5.69 lakhs were paid by the Central Government to the State Governments during 1954-55, for this purpose.

*

The annual production of Quinine Factory at Annamalai, Madras, is 60,000 lbs. of quinine sulphate and 30,000 lbs. of cinchossa febrifuge. The estimated annual production of quinine in the country was 1,40,000 lbs.

*

Twenty-two maternity and child welfare centres were opened in rural areas during the year 1954 and grants amounting to Rs. 5.69 lakhs were paid by the Central Government to the State Governments during 1954-55 for this purpose.

*

Four new Veterinary Colleges are to be opened according to the decision of the Planning Commission, in the States of Andhra, Orissa, Madhya Bharat, and Travancore-Cochin.

Special Articles

INDIA'S MARGINAL RATE OF CAPITAL FORMATION

THE figures placed by the Finance Minister on the table of the Lok Sabha on July 27 provide adequate data for determining the marginal rate of capital formation in India as money or real income increases.

The table below presents some relevant figures drawn from the paper in question. It will be seen that between 1948-49 and 1953-54 the percentage increase in capital formation in relation to an increase in national income was highest when the years 1948-49 and 1953-54 are taken as extremities for comparison. In this case, the marginal rate of saving appears to have been 17.6 per cent of increments of income. If we take the period from 1949-50 to 1953-54 the corresponding figure is 14.3 per cent and if we take the period 1950-51 to 1953-54 the percentage is as low as 11.6.

It is thus clear that official figures support the point made by 'The Eastern Economist' in a Special Article in the issue dated May 6, 1955 to the effect that the marginal rate of saving was not likely in official rendering to exceed 15 per cent.

The fact that these official figures have been advanced by the Central Statistical Organisation is very significant. This implies that Professor P. C. Mahalanobis, the head of this Organisation, admits that the marginal rate of saving in India has not in recent years been anything like 30 per cent of the increments of output postulated in the plan-frame. This is the strongest argument that has been advanced against this unreal assumption which is basic to the plan-frame.

It is now for advocates of the assumption that voluntary saving can rise to 30 per cent of an increment of output to advance evidence to indicate that their assumption is capable of implementation in the next six years.

DOMESTIC CAPITAL FORMATION AND NATIONAL INCOME

	National Income at 1948-49 prices	Domestic capital formation at current prices	Domestic capital formation deflated at 1948-49 prices (the ratio used being the same as used by National Income Committee for deflating national income)	Percentage increase in capital formation as compared to increase in national income
	Rs. in crores	Rs. in crores	Rs. in crores	
1948-49 ..	.. 8,650	446	446	
1953-54 ..	.. 9,950	719	675	
Increase ..	..+1,300	..	+ 229	
1949-50 ..	.. 8,820	524	513	
1953-54 ..	.. 9,950	719	675	
Increase ..	..+1,130	..	+162	14.3
1950-51 ..	.. 8,850	589	547	
1953-54 ..	.. 9,950	719	675	
Increase ..	..+1,100	..	+128	11.6

The estimates of domestic capital formation are those published by the Central Statistical Organisation, National Income Unit, in collaboration with the Economic Wing, Ministry of Finance.

PLAN FOR THE PRIVATE SECTOR

THE industrial programme under the second Five-Year Plan for the private sector, which was recently prepared and placed before the Central Advisory Council for Industries, contains only tentative proposals on the details of the schemes. But the total outlay of Rs. 750 crores proposed (in other than coal, sugar and small-scale industries) and the allocation of the proportions of this investment among the individual industries could be substantially maintained. The proposals now on hand—the major items of which are listed in the table below—involve investment of the order of Rs. 630 crores; the general nature of the schemes for the other Rs. 120 crores can be easily understood from these particulars. They reveal in concrete terms the irrelevance of much of the controversy about the character of the second Five-Year Plan argued so far in the abstract. The list consists predominantly of plans for metallurgical, engineering and chemical industries which avoid the usual polemics about hand industries. No one can say that any of these industries should be reserved for cottage industries for labour-intensive methods nor can they be ruled out as unnecessary during the phase of heavy industrialisation proposed under the second Five-Year Plan. It would be possible for the champions of the public sector to argue that many of these must be taken up by the State, were it not for the fact that the public sector will have more than what it can manage under other schemes, which were estimated in the 'Tentative Framework' to involve Rs. 1100 crores in all.

It has now been shown that the Plan-frame estimate of investment of about Rs. 300 crores only for the private sector for industry and minerals is too low, when some of the practicable proposals in the private sector carried over from the first Five-Year Plan and regarded as feasible in the second, are added up to new schemes. It was the general feeling in the Central Advisory Council, firstly, that the outlay proposed is well within the means of the private sector

and secondly, that there is no conflict with the public sector, large investment in which is a necessary condition for providing orders for the various lines of manufacture, directly or indirectly. There is here assurance that the supply of some of the main items of consumer goods, the demand for which will grow under the development outlay on the second Five-Year Plan, will not be placed in jeopardy. Bicycles, paper, lamps and lanterns, radio receivers, sewing machines, newsprint, rayon and staple fibre have thus been planned for. The list includes other lines which are essential for fostering cottage industries, like the provision of additional spindlage to provide employment for the handlooms or caustic soda which will help the cottage soap industry. In many engineering products, the small workshops can play an important role and special provision has been made in the case of bicycle and sewing machines for the small-scale sector.

This is a good beginning as far as planning for the private sector can go at the moment. It is a good basis for further discussions. The details can be filled in as the second Five-Year Plan takes shape. It is not pretended that the employment potential of this Plan is great; only about 335,000 will be employed permanently on the basis of normal working but the schemes cannot be ruled out on that account or substituted by labour-intensive methods. But employment can increase moderately above this figure when other industries, like sugar, coal, heavy machinery and machine tools (on which a provision of Rs. 60 crores has been proposed), drugs, electronics, plastics, plywood, glass, paints and abrasives, nylon and similar products (involving an outlay of Rs. 40 crores) and lastly, small-scale industries, are all added to this already large list.

It has been made clear that there is now some firmness about the fulfilment of targets, which did not exist before. This would involve that financial assistance will be assured and the Ministry of Commerce and Industry hopes to use the National Industrial Development Corporation as a powerful agency of development undertaking responsibilities to the extent of over Rs. 100 crores. The foreign exchange requirements estimated at over Rs. 300 crores need not also present any difficulty.

The investment estimates here presented are exclusive of expenditure on maintenance and normal replacement. As yardsticks of profitability of the investment, certain ratios between the outlay on fixed capital in new units and the value of gross output at current prices (while working full normal capacity) have been given which show a wide variation between 100 : 30 in the aluminium industry and 100 : 340 in electrical lamps. But excluding iron and steel on the one hand and cotton textiles on the other, an average ratio of 100 : 110 is indicated. But these ratios are only very rough approximations and very inadequate guides to policy decisions on the subject. The variations in the investment required per worker are interesting. Between an investment of about Rs. 50,000 to Rs. 70,000 per worker generally required in some chemical industries and of sums below Rs. 10,000 in light engineering lines, there lies a medium group—including cement, paper, dyestuffs, aluminium, ferro-manganese and steel foundries. Perhaps some useful comparisons may be possible when the industrial schemes in the public sector are also framed on similar lines.

INDUSTRIAL EXPANSION IN THE PRIVATE SECTOR, 1956-62

Industry	Investment (Rs. Crores)	Nature of Expansion	New Capacity Proposed	Employment
1. Iron and Steel	125.00	Expansion schemes of existing units	1.5m. tons	..
2. Refractories	5.00	New Units and expansions	400,000 tons	20,000
3. Steel Fabrication (Structural & Wagons)	30.00	Mainly new units	350,000 tons	34,000
4. Iron & Steel Foundries	5.00	3 New units :	(30,000 tons casting (20,000 tons forgings	1,000
5. Ferro-Manganese	9.34	4 New units and expansion of one unit	132,000 tons	1,704
6. Heavy Electrical Goods	2.79	2 units for Transformers	..	4,600
7. Automobiles & Motor Cycles	31.00	Expansion only	22,000 vehicles	..
8. Bicycles	0.48	3 new units and 5 expansions	700,000 cycles	..
9. (a) Electrical Lamps	1.20	Mainly expansion	30m. (Nos)	1,200
(b) Sewing Machines	1.20	2 new units	134,000 (Nos)	1,200
(c) Electric Fans	1.00	Expanded capacity	150,000 (Nos)	4,000
10. Aluminium	19.75	Two units of 10,000 tons each and expansion for 2500 tons	22,750 tons	4,800
11. Cement	66.34	Expansion of 16 units and 24 new units	7.3m. tons	15,000
12. Paper	66.00	19 new units and expansion for 158,000 tons	388,000 tons	28,000
13. Newsprint	12.00	New units	70,000 tons	2,200
14. Art Silk Yarn	18.20	4 new units and expansions	21.4m. lbs.	4,700
15. Cotton Textiles	98.00	Modernization + new spindles	1.75m. spindles) 14,000 looms) 50,000 powerlooms) 120,000 semi- automatic)	170,000
16. Jute	20.00	Modernization + 1 unit	..	900
17. Dyestuffs + by-products	13.70	New units mainly	42m. lbs.	3,400
18. Soda Ash:	14.65	Mainly new units + some expansions	260,000 tons	900
19. Caustic Soda, Chlorine and Bleaching Powder)	6.60	New capacity	87,000 tons) 34,000 tons)	
20. Sulphuric Acid	5.50	New units 237.00 tons: Expansion 95,000 tons	3,350 tons	1,500
21. Cotton, Jute, Sugar and Paper machinery	9.12	Utilisation of existing capacity except in jute	.. Rs. 26 crores worth	700

4%

Bombay State Development Loan, 1967

ISSUE PRICE Rs. 100 PER CENT

Open on the 16th August, 1955.

The loan will be closed as soon as a total of approximately Rs. 600 lakhs has been subscribed, and in any case not later than the close of business on the 31st August, 1955.

The applications will be received at the offices of the Reserve Bank of India, Bombay, Caclutta, Delhi, Madras and Bangalore; at Branches and Treasury Pay Offices of the State Bank of India within the State of Bombay and at the Government Treasuries and Sub-Treasuries in the State of Bombay at places where there is no branch or pay office of the State Bank of India.

Full particulars can be obtained at any of the offices of the Reserve Bank or Branches and Pay Offices of the State Bank of India or at any Government Treasury or Sub-Treasury in the State of Bombay.

The Business World

STATE PURCHASE OF DOMESTIC STORES

THE rapid increase in the range and volume of stores purchased on government account has raised a number of policy and administrative problems. A review of the functions and operations of the Central Purchase Organisation became imperative in the light of the progressive enlargement of the public sector. The Stores Purchase Committee appointed two years ago was charged with an extensive task covering a wide field of purchase activities, but among its assignments two stand out prominently as of basic importance. They are organizational changes necessary in the machinery of purchase and measures to stimulate indigenous industry by accentuating its role as a supplier of stores for the State.

The policy of conscious patronage to domestically produced stores under normal situation has become conventional everywhere and what the Stores Purchase Committee was really called upon to do was to propose ways and means to make the policy effective in practice. The aggregate value of stores purchased by the Government ranges at present a little below Rs. 315 crores of which 60 per cent is accounted for by the indigenous sector and 40 per cent by imported supplies. There is ample assurance from organized industry that a major part of its expansion will be directed towards substituting imported supplies. In the short-period context, the obligation to import capital goods and specialised materials will tend to impart some rigidity to the proportion of supplies from overseas. However, the ominous increase in the idle capacity of several engineering industries a couple of years go must serve as a rude reminder that liaison between State purchase organisations and home industry is poor. There can be no doubt that rationalisation of the machinery and methods of stores purchase will augment the share of domestic industry. The report of the Committee which was released last week makes certain useful suggestions in this behalf.

Organisational reform of the Government Central purchase agencies forms one valuable part of the recommendations of the Committee and probably the most useful suggestion in this respect is the constitution of a Purchase Advisory Council composed of non-officials representing business and industry at various levels. A major shortcoming of the Directorate-General of Supplies and Disposals is the unsatisfactory quality of the commercial experience of its purchase officials at all stages and their inadequate knowledge of the purposes and functions for which stores are required. This is the bane of practically all the government-managed commercial organisations. Lack of business experience and contacts makes the Central Purchase Organisation insufficiently responsive to the problems and requirements of business interests. The proposed Purchase Advisory Council would provide that much-needed liaison between the Government as buyer and the business community as supplier. The pattern of the Export and Import Advisory Councils which is suggested for the operation of the Purchase Advisory Council may prove inappropriate, and it is essential that it should function on the model of the Central Advisory Council of Industries if it is to be effective in its functions and influence.

This is not to underrate the part played by the Central Purchase Organisation. On the contrary the consensus of non-official opinion unmistakably recognizes the value of its services. Its emphasis is on further extension of the scope of its activities provided the resources in personnel and necessary authority are forthcoming. It will be premature for some years at least to broaden the base of the activities of the organisation. Any suggestion to centralise the purchase functions of the State Corporations, river valley project authorities, State Governments, municipal boards, and such other autonomous organisations in the Directorate-General of Supplies and Disposals, as was urged in the course of the evidence before the Committee, ignores the magnitude of the integrated task in relation to the present resources of this organisation. The status quo must, therefore, be maintained for the present and a far-reaching procedural overhaul, as proposed in the Committee's comprehensive recommendations, would prove adequate for the rationalisation of its work before it is enabled to assume new responsibilities. The Purchase and Development Board which is suggested as a supreme co-ordinating and executive authority involves a complex machinery and intricate methods of work. Co-ordination should not be difficult to be achieved at an inter-departmental level and a special Board is clearly superfluous either for this purpose or for serving as an instrument to encourage the development of domestic industries.

The Committee stands on weak ground when it urges what would appear to be a vigorous policy of price preference for indigenous industries. The margin of preference over prices quoted for imported stores is proposed as high as 15 per cent for organised industries (with permissible enhancement up to 25 per cent in exceptional cases), 25 per cent for cottage and small industries with an additional 2 per cent where tenders are submitted by co-operative societies. Economical bargaining is hardly a virtue of State purchase agencies and such preference margins would inflate their buying costs in an appreciable degree. The case for subsidies fails to carry conviction when it is recalled that ample safeguards are provided by protective tariffs and fortuitous aid is offered by import regulation. The policy of discretionary moderate preference was enunciated as early as 1931 and if the purchase officials feel great hesitation in exercising their formal powers, probably on the score of justifying the actual margins awarded, the real corrective is to specify in some elaborate detail the conditions under which discretion should be used. Preference ought to be confined within modest limits.

The issue of payments for Government contracts has proved vexatious and here the Committee's prescription for cure is only partial. The reliefs suggested by way of payment of the final 10 per cent of the price in the case of dispatch of stores by rail within 90 days and of the final price of 20 per cent in the case of supplies of plant and machinery in two instalments within eight months, subject to execution of appropriate indemnity bonds, certainly cannot remove the strain on the finances of suppliers. Unequal treatment is offered to domestic suppliers vis-a-vis suppliers from abroad and neither advance nor progress payments are made to the former. The Committee has suggested a retrograde procedure in recommending abolition of advance payments to foreign suppliers, except in special cases, as a measure to eliminate discrimination. Considering the large amounts of funds which home suppliers will have to invest in working capital in the light of the increasing demands of State projects, extension of advance payments to them is unquestionably essential.

THE CHALLENGE AND THE RESPONSE

By

CROESUS

AS I sat listening to Mr. G. D. Birla's address to the Democratic Group and the Commerce Graduates' Association at the Greens' Hotel, Bombay, last Friday evening, it was not the packed house that impressed me most—surely Mr. Birla has addressed much larger audiences—nor the pin-drop silence that prevailed throughout—who would want to interrupt such an interesting and illuminating address?—but the unanimous acclamation which greeted Mr. Birla's concluding sentences on the occasion: "I have great faith in this country. India is going to be one of the most powerful countries in the world".

That really provided a concrete indication to me—and I dare say to many who were present—of the hopes that people are having of the future of this great land of ours. To a public with this frame of mind what message had Mr. Birla to offer? Characteristically enough, his message took the form of a simple, yet solemn, question. He asked his audience: "What contribution are we going to make so that we may take pride and say later we too have helped in the country's growth and progress?" To contribute one's utmost to the country's progress and to take a just pride for doing so should, indeed, be deemed as the sacred duty today of every Indian, be he a business man or a bureaucrat, an employer or an employee. This explains why, unlike several of his less farseeing compatriots, Mr. Birla asked business men not to mind too much even such things as amendments to the Constitution or threats of nationalisation or irresponsible utterances, at times, of some back-bencher or other. He did not seem to be troubled in the least about the ceaseless controversy about the public and the private sectors either. To him all these have scant significance in the larger context of the vast problems facing the country such as poverty and unemployment, and he is fully convinced that it will take much more than the combined efforts of both the sectors—public and private—to meet this twin challenge. Hence his assertion that only those who are able successfully to meet this challenge will survive. And Mr. Birla voiced his conviction that business men could accept and meet the challenge. What a tribute to our business men! But Mr. Birla also warned them that they would not survive otherwise. "Do this in your own interests", he exhorted to them. I have no doubt that this straight and plain talk will produce the desired results.

Being realistic and practical, as Mr. G. P. Kapadia, Bombay's popular Chartered Accountant, who presided over the meeting, described him, Mr. Birla did take note of the prevailing trends. For instance, he said: "There is no doubt that the position of the private sector is taking a rather serious turn at present. It might mean anything. It might even mean that it will disappear altogether. But that does not depend on any legislature or any particular person. It depends entirely on us whether we are going to survive or whether we are going to disappear from the business world". He went on to explain what he meant by saying "it depends entirely on us". "When I say it depends on us", he said, "what I mean is: how are we going to behave? How are we going to function in the India of the future?"

Dwelling on the role of business men under the second Five-Year Plan, Mr. Birla summed up the problem briefly thus: 10 million jobs and a rise of 25 per cent in national income. It is noteworthy that he regarded this as not only achievable but also imperative. He must have made the authors of the frame Plan estimates sit up when he said that a 25 per cent rise in national income could be realised from an outlay of r Rs. 5,600 crores as they did, but from a more mod outlay, namely, Rs. 3,000 crores. It would be wor the while of the Planning Commission to discuss wi Mr. Birla how such is possible, because, in that ca their present headache about garnering resources the tune of Rs. 5,600 crores would vanish. Evidently, is the idea of this distinguished industrialist-cum-prac cal-economist that one could certainly think of a bett capital-output ratio than the planners have envisage Furthermore, he said that it was no easy task to inve Rs. 5,600 crores unless the requisite extent of forei exchange and personnel was there. Everyone, inclu ing the Union Finance Minister, has admitted that is these two that really constitute our most serio limitations.

About the menace of growing unemployment, e pecially among the educated classes, Mr. Birla showe a rare awareness and sympathy. Unlike most peop who blame young educated men for refusing to follo in the footsteps of their fathers and grandfathers b taking to their profession, he sought an explanatio for this break-away-from-the-past attitude, and rightl argued that such stemmed from the young men's desi to have a higher standard of life. Gone are the day he said, when people did not mind a big man's pros perity; everyone today would want to enjoy simila prosperity. The only solution for this, according t him, lies in making everyone a capitalist in one's ow way, so that one might have some stake and striv for its safety, maintenance and perhaps also enlarge ment. It goes without saying that the combined effor of many on this basis would greatly raise the nation' production and wealth.

To Mr. Birla the controversy between large scale and small-scale industries is a futile one For he expressed the view that in a well knit integrated economy there must be a plac for all—large-scale, medium and small-scale o cottage industries—each being complementary to th other. The big industries must feed the medium one and the medium ones, in their turn, must feed the small-scale industries. This, he said, was what wa happening everywhere and, in this connection, h instanced the example of Birmingham, where, he point ed out, out of some thousands of industries, only about a couple of dozens or so could really be termed as large-scale, all the remaining being either medium or small-scale, the small ones deriving sustenance from the little bigger ones and the little bigger ones from still bigger ones and so on.

While not ruling out the role or minimising the importance of small-scale or cottage or home industries in the country's economic set-up, Mr. Birla wanted his audience to have correct notions about their overall employment potentials. All too readily, there is a tendency among the protagonists of small-scale industries to make too much of the employment potential of small-scale industries and to underrate too much that of big industries. Mr. Birla conceded that, prima facie, small-scale industries provided relatively more employment, but he insisted that, in comparing the employment potential of large-scale and small-scale industries, one must not forget to take note of the allied employment which large-scale industries provide. Thus, he said: "We forget that a cotton mill consumes cotton that is produced by somebody in the field. This cotton again is transported by someone else. Similarly, the stores consumed by the mill give employment to a score or more. Even out of the profits that the

mill makes, taxes are paid to Government and, in the process of spending the tax-proceeds, the Government, in its turn, creates further employment. So, from bottom to top, the cotton mill which produces wealth is simultaneously creating allied employment. My own estimate is that, for every person that is employed in a medium type factory, four more are employed in this allied way. In the cottage industries, on the other hand, there is hardly any scope for such allied employment".

Another inhibition which Mr. Birla could not suffer was the constant dread of nationalisation and, more than that, the frantic effort on the part of some to secure something like an assurance or guarantee against nationalisation. It was his thesis that not much purpose would be served in asking the Government for a guarantee against nationalisation, because he said: "Today the Government which is in power may give a guarantee, but who can prevent its successor-Government from vetoing it?" Instead, all that he wanted of the Government was "tell me what is expected of me. Only after you have given the green signal, don't show the red". This is an understandable stand and the Union Finance Minister too appreciated that there was need for such an assurance at the last meeting of the Central Advisory Council of Industries.

After the Government had assigned a given task to the private sector, Mr. Birla wanted it to take certain further necessary and logical measures. The most important of these, of course, relates to credit. If the Government wanted producer goods industries to have priority under the second Five-Year Plan, Mr. Birla urged it to facilitate the disposal of producer goods by the indigenous manufacturers of these goods. What is happening now unfortunately is that such producers have to face unequal competition at the hands of foreign producers who are prepared to extend credit facilities for as long a time as the importer needs, provided he is known to be a solvent party. Because of this facility, some importing parties would be naturally averse to turn to the indigenous manufacturer of such goods, even when there are such manufacturers, for the simple reason that the indigenous manufacturers cannot extend to them similar credit facilities. This is the raison d'etre of Mr. Birla's proposal at the Central Advisory Council of Industries (which has attracted wide attention and which he reiterated at the Bombay meeting) for the provision of suppliers' credit. This would be feasible if, after making sure of the financial soundness of the indenting party, the Government of India were to ask the indigenous manufacturers of producers goods to supply the goods on credit for a given period against its (Government's) guarantee. The idea, it seems has appealed to the Government and, if implemented, should provide a welcome fillip to both the existing producers goods industries and those that would come into being under the stimulus of the second Five-Year Plan.

I would like to conclude this reaction of mine to Mr. Birla's notable address by only echoing his appeal that the challenge of poverty and unemployment in India today is a challenge to no one in particular but to all—Government, the public sector and the private sector, as also the people at large. Let us not quarrel about who is to meet the challenge but take it upon ourselves to do our best in the same spirit as Mr. Birla who could confidently declare: "This challenge must be met primarily by business men".

TWO SECTORS—TWO PRIORITIES?

By

CROESUS

WHEN I read the speech of Dr. John Matthai, Chairman of the State Bank of India, at the annual general meeting of the Trade Mark Owners' Association of India, Ltd., held some time back, I felt a sense of satisfaction which humble columnists like me always derive when they find that their views are endorsed by eminent men. It is only when one is faced with the realities of the situation that one can appreciate the peculiar problems that parallel ownership of industries give rise to. A State may be depended upon to be perfectly impartial only so long as it has no interest of its own. As between two citizens, for instance, it will judiciously determine as to who has the proper claim without any bias, but when it is called upon to adjudicate between the claims of an industry owned and run by it and those of an industry owned and run by an individual, one cannot be sure that the State will always hold the scales even. I can, therefore, very well appreciate Dr. Matthai's observation that, "as long as we are functioning in a mixed economy, trade marks and other industrial property rights should be adequately safeguarded not only 'inter se' between citizens but also between citizens and the State". He rightly opined that there was a danger that the State, which also participated in trade and industry, might assure for itself a position in regard to those varieties of industrial property which encroaches on the rights of private persons. Being in a privileged position, in that it is the State that has the sole right of registering trade marks and also of refusing to register any trade mark, it may at times tend, or be forced by political pressure, to uphold the claims of industries in the public sector vis-a-vis those of industries in the private sector. Perhaps visualising such contingencies, Dr. Matthai felt like laying down categorically "....the State should not put the rights in the various forms of industrial property it uses any higher than those of private citizens and that, in the adjudication of rights, the same principles should apply, whether the parties are private citizens or one of them is the State itself".

This is a very healthy tradition and deserves to be built up and cherished by India. In the field of trade marks, particularly, the need for protection is paramount, because it is the outcome of years of hard work and ripe experience. It is the State's moral duty to ensure that a person who has made a distinct contribution to this country's economic development in the form of the products he manufactures is afforded all facilties to protect the special brands and trade names of his products, especially after he has taken all the trouble to build up a market and a name for them.

It is not in respect of trade marks alone that the claim of the private sector should receive the same attention as those of the public sector. In the matter of allocation of raw material quotas, transport priorities, and taxation also, industries in the private sector must be treated on a par with trade in the public sector. But one has yet to see signs of complete recognition of this need. Thus, even though the Taxation Enquiry Commission, of which Dr. Matthai himself was the chairman, realised that exemption from taxation of Government enterprises amounted to an indirect subsidy, it was loath to recommend the doing away with this glaring instance of partiality towards the public sector. Similarly, there have been many instances of the transport demands of units in the private sector of the electricity industry being sacrificed at the altar of those of the public sector units of the same industry. Surely there can be no two priorities, one for units of an industry in the public sector and, another for those in the private sector.

BUSINESS NOTES

EXIT JUTE EXPORT DUTIES

QUICK ON the heels of Karachi's decision to devalue the Pak rupee, the Government of India has, with commendable promptness, abolished the export duties on jute goods with immediate effect. Two vital reasons have actuated New Delhi in making this swift move. The first is to counteract Pakistan's increased competitive strength in jute goods in foreign markets as a result of devaluation. Pakistan's lower exchange rate, resulting from devaluation, will now enable her to sell abroad all the burlap that she is in a position to export. Secondly, overseas jute goods manufacturers in Dundee and elsewhere are now placed in a more advantageous position, seeing that henceforward they will have to pay less for raw jute imported from Pakistan. It should be borne in mind that the quality of the Pak jute is superior to the Indian variety and this factor places the Indian grower in a disadvantageous position. The duty abolition may, to some extent, be expected to offset this by enabling Indian manufacturers to compete more or less on favourable terms with their Pakistani counterparts, without at the same time unduly hitting the Indian producer.

Even before devaluation, the Pakistan rupee, in relation to the Indian, remained "devalued" in black-market transactions, since it was quoted at a discount of about 35 per cent. While the legal exchange rate was 144 Indian rupees for 100 Pak rupees, in actual dealings the rate used to hover around 80 to 85 Indian rupees for 100 Pak rupees. Pakistan's devaluation will kill the thriving black-market, and, in effect, "appreciate" the value of the Pak rupee to the detriment of the Indian buyer of Pak jute through normal channels of trade.

When the Indian rupee was devalued six years ago, the export duties were stepped up with a view to mopping up the "excess" profits being made by Indian exporters. The subsequent Korean boom resulted in the export duty on hessian being steeply raised to Rs. 1,500 per ton and sacking to a less spectacular degree. With the end of the Korean boom and the consequent fall in U.S. buying, and the emergence of keener competition from European producers, prices again fell abroad, necessitating further cuts in the imposts. At the time of their abolition on the 2nd inst., the duties were Rs. 120 per ton on hessian and Rs. 80 per ton on sacking. Even these rates were actually hitting Indian jute goods in overseas markets where competition has remained keen, and this fact was brought home to the Government of India by Indian manufacturers who also pointed out that Pakistan had been exporting not only better quality raw jute but more and more of jute goods as a result of increased loomage. According to Pakistan's Finance Minister, his country will be in a position to export Rs. 7 to Rs. 8 crores worth more of jute manufactures as a result of devaluation. Already the value of his country's export of jute goods is about Rs. 125 crores annually. In view of these trends, the Government of India had, for some time past, been considering the question of abolition of the export duties on jute goods. The devaluation of the Pakistan rupee has only hastened New Delhi's decision to do away with the imposts. The decision may at least be expected to enable Indian shippers to maintain their position in the overseas markets, even if it does not help them to expand their trade. As for the outlook for Indian jute mills, it might improve to the extent they can get Pakistan raw jute cheaper, but the possibility of Pakistan raising its export duties cannot be ruled out.

NEW STATE LOAN

THE TIME chosen by the 10 State Governments for flotation of their loans, aggregating Rs. 35.75 crores has been very appropriate, considering the current easy conditions in the money market. Intended mostly to finance capital expenditure of development projects the loans bear 4 per cent interest and are redeemable at par in 1967, but the issue prices differ. Bombay and West Bengal are, for instance, issuing their loans for Rs. 6 crores and Rs. 5 crores, respectively, at par reflecting the financial strength of the States and the sound credit that they enjoy in the money market. Madras, on the other hand, is raising Rs. 7 crores with the issue price at Rs. 99-12 per cent, and Uttar Pradesh (Rs. 6 crores) at Rs. 99-8 per cent. Subscriptions for all the loans will be received from August 16 to 31 which means that enough time (a period of nearly three weeks) has been given to the States to canvas adequate support from the investing public.

However, the largest measure of support is, as usual, expected to come from banks, insurance companies and other institutional investors. Indeed, the present comparative calm in the gilt-edged market may be due to the paucity of dealings by institutional investors who are apparently preparing themselves for subscribing to the new State issues. The loans may be expected to prove a full success since, apart from the easiness of the money market, the Central Government, by not keeping its recent loan on tap as it did last year, and limiting its target to Rs. 100 crores, refrained from tapping the capital market in full and left enough resources for the States to absorb. It may also be noted that some States have announced conversion terms for their loans which mature this year. The 3 per cent 1955 loans of Bombay, Madras and Madhya Pradesh, for instance, will be accepted at par for conversion into their new loans now being issued.

TISCO'S ACHIEVEMENT

PRESIDING OVER the 47th ordinary general meeting of the shareholders of the Tata Iron and Steel Co., Ltd. Mr. J. R. D. Tata had warned the shareholders that there might be a decline of about 10,000 tons in production during 1954-55 and that the Company's scrap export might slow down. The first reaction of the investing public to the publication of the annual report for 1954-55 would therefore naturally be to seek a confirmation of this in the actual working results. According to the report there was a drop in the production of ingot steel by 27,000 tons compared to the peak output of 1,67,000 tons in 1953-54. But the total production of saleable steel, however, was 3,000 tons more than in the preceding year at 783,000 tons. The total supplies of saleable steel made by the Company during the year 1954-55, including the quantity used in the works, was even higher having exceeded the previous year's total by as much as 9,000 tons.

The year under report saw a number of records, especially in the operations of the Company. Thus, the Company's collieries achieved a record production of 1.56 million tons of coal. Similarly, the output of ferro-manganese at 43,363 tons represented the highest output in any year. Thanks to the improvements effected to the blooming mill the output of blooms and slabs in 1954-55 at 897,980 tons reached the highest of the post-war period. Several new records of shift production were also established during the year in the bar mill while production of Agrico tools was nearly doubled. As against this, there was a drop of about

2 per cent in the year's production of pig iron. But this synchronises with a fall in demand for pig iron, caused by the greater availability of scrap within the country, which explained the decline in despatches of pig iron of the Company from 103,000 tons in 1953-54 to only 79,000 tons in 1954-55. The figures of scrap export are not separately indicated. But the Directors state in their report that, in comparison with the previous year, sales of scrap were larger. This should come as a welcome surprise to the shareholders of the Company.

The Financial Picture

Now for a few words about the financial results. After providing for all taxes, Managing Agency commission and depreciation (inclusive of special depreciation for replacements allowed by the Tariff Commission), the profits for 1954-55 amounted to Rs. 3.29 crores as compared to Rs. 3.04 crores in the previous year. After providing for a slightly higher profit-sharing bonus and certain other adjustments, the amount available for disposal was Rs. 2.39 crores as against Rs. 2.18 crores in 1953-54. The appropriations out of the profits for the year under review show an increase under the provision of general reserve at Rs. 31,96,930 as against Rs. 24,25,375 in the previous year and a special provision to development reserve of Rs. 10 lakhs. This provision, it may be noted, is in fulfilment of the condition by which an extra price was granted to the Company from July 1951, with a view to providing for plant rehabilitation. Inasmuch as development rebate is applicable to plant and machinery which will have a life of many years, the Directors have thought it proper to spread the provision over a number of years on the basis of available profits. It is noteworthy that after the appropriations, the amount left to be carried forward stands at Rs. 5,52,548 as compared with Rs. 1,90,324 brought in from the previous year's account. The Directors have not recommended any change in the dividends for the year March 31, 1955, the dividend on ordinary shares continuing at Rs. 10-8 per share.

Explaining the higher profits for the year under review the Directors point out that the higher profits were due to larger sales of ferro-manganese and scrap coupled with a substantial reduction in the provision for taxes approximating to Rs. 40 lakhs. The profits were adversely affected, on the other hand, by a higher allocation in depreciation following the increase in the gross block during the year.

It is seen from the report that, out of the special advance of Rs. 10 crores sanctioned by the Government of India, to meet a part of the cost of the Company's modernisation and expansion programme the Company drew in 1954-55 a sum of Rs. 4.8 crores leaving a balance of Rs. 5.2 crores still to be drawn. However, the total capital expenditure incurred during the year under review on the various projects, including normal annual replacement and improvement to the plant, was of the order of about Rs. 9 crores. Referring to the programme of expansion under the second Five-Year Plan, according to which the Tatas' capacity will increase to a total of about 2 million tons of steel ingots or 1½ million tons of finished steel, the Directors state "technical details of this project are being worked out and negotiations have been initiated for procuring a part of the necessary finance abroad. The preliminary estimate for the project totals Rs. 60 crores, which will be financed partly from borrowings, partly from internal savings arising from the increased steel prices, and partly from the fresh issue of ordinary shares. Specific proposals for such an issue will be placed before the shareholders in due course as soon as the details of the project have been finalised". The Directors' comment on the benefits of the proposed expansion is that 'apart from playing an important part in the expansion of the Indian steel industry, this project will help to maintain or reduce costs, increase the Company's earning capacity, serve to absorb surplus labour, and, in general, add to the financial strength of the Company."

IRAQ—A GOOD BIRD IN THE HAND

IN VIEW of the steady increase in the 'per capita' consumption of cloth in Iraq, there is urgent need for mobilising exports of cotton textiles from India to Iraq. From a study of the statistics relating to imports of textiles into Iraq, it is seen that fortunately India is still second only to Japan in the matter of exports of piecegoods to that country, but the U.S.A., Hungary, the U.K., Mexico, Italy and Czechoslovakia are among the countries that have entered the textile market in Iraq recently. Dress habits of Iraqis also have changed leading to the traditional styles yielding place to European mode of dressing. It is, therefore, rightly felt by importers in Iraq that their offtake from India could be greatly augmented if handicaps to trade were obviated and some necessary improvements effected in Indian textiles.

The latest Bulletin of the Cotton Textile Promotion Council draws pointed attention to the difficulties of importers of Indian textiles in Iraq and observes that the terms of trade and the minimum quantity stipulated by Indian parties make it too stiff for small traders to buy directly from India. In sharp contrast, it is pointed out, India's competitors normally give all facilities to buyers, big or small, so that they are more inclined to patronise countries other than India. Secondly, we are told, there is a pull on duties which works in opposite directions. Thus, while Iraq's import duties favour coarser varieties, the export duty in India works against the export of coarse counts. This probably explains why, although India enjoys a natural advantage over Japan in this respect, it is the latter country which has been able to make relatively more headway in the export of coarse fabrics to Iraq.

Still More Handicaps

Another drawback voiced by importers in Iraq, as in most of our export markets, in regard to Indian textiles is the lack of variety to suit different tastes. Buyers in Iraq claim, for instance, that they can always depend upon a given quantity of dyed or printed material from, say, Czechoslovakia, Japan, Poland or the U.K., to contain many more varieties and colour patterns than what they would get from the same or similar quantity of material received from India.

It is by now a familiar complaint that Indian shipments of cotton textiles invariably reach their destinations, in a damaged and unsaleable condition. Pointing out this drawback, the Texprocil Bulletin recommends improved packing on the lines of the Japanese and the U.K. shipments which are able to withstand rough handling at the ports and the rigours of weather. If Indian exporters and mills would but follow the detailed code issued by the Indian Standards Institution most of the complaints in this respect could be easily obviated. Also in dealing with a country where fashions and buying habits are changing fast, as they seem to be doing in Iraq, it is imperative that an intensive study of the market is made by Indian manufacturers and exporters so as to enable them to exploit the market to the fullest extent.

Meanwhile, it is heartening to note from the latest report on the piecegoods market (for the last two weeks of July) that Iraq is the only bright spot on an otherwise indifferent export front. It would appear that there is a regular booking for Iraq in grey sheetings and bleached longcloth. It would be shortsighted in the extreme to neglect a bird in the hand with such potentialities.

"RETURN" TO POWER UNDERTAKINGS

THE NEED for enhancement of the standard rate of return and provision for deferred tax reserve in the ascertainment of "clear profit" (as defined in the sixth schedule of the Electricity Supply Act 1948) has been voiced by spokesmen of electricity undertakings. The Federation of Electricity Undertakings of India has been urging the Government to amend the Act appropriately. This demand found renewed support from the chairman of the Bombay Suburban Electric Supply, Ltd., while reviewing the working results of the Company for the year ended March 31, 1955, in the course of his address to the Company's annual meeting held recently in Bombay. After making specific mention of the fact that the statutory necessity to make allocations to the Consumers' Benefit Reserves and the Tariffs and Dividends Control Reserve this year—which amounted to Rs. 69,933 each—had made it necessary to withdraw Rs. 19,500 from the Equalisation of Dividends Reserve in order to maintain the dividend this year, he pointed out that that kind of position could only be remedied if the Electricity (Supply) Act was suitably amended to upgrade the rate of return permissible to the Company.

The Indian Taxation Enquiry Commission has made special mention of the issue of deferred tax in the electricity undertakings. The Commission, in its Report, has stated it considers that the best way out of the difficulty will be to allow the concerns to put into reserve any extra surplus that they get as a tax relief on account of the initial and extra depreciation allowances. It has recommended that the Act should be amended so as to permit the creation of such a reserve.

The Bombay Suburban Electric Supply Company has continued its contribution to the progress and development of the suburbs, now reaching out as far north as Bhyander. Sales of energy have been going up steadily, following the State Government's relaxation of restrictions on power consumption.

DHRANGADHRA CHEMICAL'S FRESH ISSUE

DHRANGADHRA CHEMICAL WORKS LIMITED, Dhrangadhra, Saurashtra, have announced particulars of their Plan to issue additional share capital. The subscription list will be opened on 8th August, 1955, and will close when the Directors so decide, subject to the condition that it will remain open at least for seven days thereafter. The authorised capital of the Company is Rs. 3 crores, divided into 2,00,000 Ordinary Shares of Rs. 100 each totalling Rs. 2 crores and 1,00,000 Preference Shares of Rs. 100 each totalling Rs. 1 crore. After allotment, the issued capital will consist of 21,500 Ordinary Shares of Rs. 100 each amounting to Rs. 21.5 lakhs, 43,000 new Ordinary Shares of Rs. 100 each amounting to Rs. 43 lakhs and 60,000 six per cent (tax-free) cumulative Redeemable Preference Shares of Rs. 100 each amounting to Rs. 60 lakhs. The 43,000 new Ordinary Shares have been offered to the existing shareholders. The 60,000 six per cent (tax-free) Cumulative Redeemable Preference Shares are offered to the public for subscription payable at par, of which Rs. 50 are to be paid on application and Rs. 50 are to be paid on allotment. The Preference Shares are an approved investment for insurance companies under Section 27A of the Insurance Act. The company has a bold plan of manufacture of soda ash and it will be one of the two units in this country to manufacture this basic chemical satisfying a large part of the domestic requirements. The company's chemical production programme envisages further expansion in more spheres.

"...for us a solemn occasion when we must look back in a spirit of thanks-giving and humility while viewing our success and achievement."

COMMODITY NEWS AND NOTES

BIRI TOBACCO: DUTY REDUCED

During the 1952-53 season, the production of tobacco reached an all-time record; but without a corresponding increase in demand, large quantities, particularly of the inferior grades, began to accumulate in the chief producing centres. The position became critical by the beginning of 1954, and as a measure of relief, Government announced, in April 1954, a reduction of 25 per cent in the duties leviable on all old stocks of tobacco produced in the 1952-53 or earlier seasons. This reduction in duty helped considerable quantities of these old stocks to find a market.

A reassessment of the situation recently carried out, however, indicates that a balance of about 70 million pounds of inferior biri tobacco is still lying in the hands of the trade. Government is satisfied that some further relief in this direction would be justified, and it has accordingly decided to make a further 25 per cent reduction in the tariff rate of duty of 0-14-0 per lb. This would bring down the duty on such stocks of biri tobacco to 0-7-0 per lb.

MARKETING OF SKINS

The annual production of raw skins in India is estimated at 368 lakh pieces, of which 293 lakhs are obtained from slaughtered animals and 75 lakhs from animals dying of natural causes. Of the total, 213 lakhs are goat-skins and the rest sheep-skins. The second edition of the report on the Marketing of Skins in India, which has just been brought out by the Agricultural Marketing Adviser to the Government of India contains a fund of information on the production and marketing of skins. The data in the report relates to the year 1951-52 and is based on 1951 livestock census. The position regarding the skin trade has undergone many changes since the publication of the first edition in 1943, and especially after the partition of the country. The sheep and goat population in a number of States like Punjab, Jammu and Kashmir, Rajasthan, Uttar Pradesh, etc., after the partition, has declined heavily due to various causes; thus bringing down the slaughtered figures as compared to the pre-partition figures.

The report also contains several suggestions for the improvement of the marketing of skins in India, such as converting goat-skins into leather before export, remodelling of slaughter houses and provision of facilities for flayers and butchers, scientific drying of skins of rural areas and standardisation of selling and buying skins.

FINAL MUSTARD ESTIMATE

According to the Directorate of Economics and Statistics, Union Ministry of Food and Agriculture, the all-India final estimate of rape and mustard, 1954-55, puts the current year's acreage and production at 5,665,000 acres and 962,000 tons, as against the partially revised estimate of 5,534,000 acres and 855,000 tons, respectively, for 1953-54. This shows an increase of 131,000 acres or 2.4 per cent in area and 107,000 tons or 12.5 per cent in production.

The increase in acreage under rape and mustard crop has been reported mainly by Punjab, PEPSU, Rajasthan and West Bengal due generally to favourable climatic conditions at the sowing time. This increase in acreage has, however, been offset to some extent by the decreases reported mainly by U.P. and Bihar. The increase in production has occurred in all States except Bihar where slight decrease in production has been reported.

COTTON TARGETS EXCEEDED

The fact that the cotton production target prescribed by the Planning Commission for the five-year period has been achieved a year ahead of the schedule was underlined by Mr. K. R. Damle in his address to the meeting of the Indian Central Cotton Committee held in Bombay last week. The official estimate of area and output during 1954-55 shows that 18.3 million acres were under cotton and nearly 43 lakh bales of cotton have been produced—which means that the target fixed has been exceeded. The trade estimate regarding cotton production in 1954-55 is much more favourable and, according to the trade, production is estimated at 53 lakh bales, including 2.7 lakh bales for extra factory consumption.

It is gratifying to note that, side by side with the increase in the production of cotton, there has been an upward trend in the offtake of indigenous cotton by Indian mills. Concurrently, the consumption of foreign cotton by Indian mills has been steadily decreasing. On the basis of the figures for the eight months ended April, 1955, it is expected that the mill consumption of Indian and foreign cottons during 1954-55 season would be around 41 and 6.5 lakh bales, against 38.9 and 7.2 lakh bales, respectively, during the year 1953-54. The prospects for 1955-56 are difficult to asses but the season has had a good start. In the second Five-Year Plan, the targets of area and production of cotton have been tentatively fixed at 20.42 million acres and 55.86 lakh bales, respectively, as was recommended by the Central Cotton Committee.

COMPANY AFFAIRS

HASTINGS MILL LIMITED

The Audited Accounts of the Company for the year ended 31st March, 1955, show the following results:

After providing for Depreciation and making necessary allowance for taxation there is a balance of Rs. 8,62,745 at the credit of the Profit and Loss Account including the balance brought forward from the previous account.

This credit balance is recommended to be dealt with as follows:

Final dividend on Preference shares @ Rs. 3 per share	Rs.	75,000
Dividend on Ordinary shares @ Rs. 11-8 per share	„	4,60,000
Carrying forward	„	3,27,745
TOTAL	Rs.	8,62,745

In accordance with the main and supplementary working time agreements of the Indian Jute Mills' Association 12 per cent of the total looms continue to remain sealed and the mills worked 45 hours per week from 12th July, 1954 and raised to 48 hours per week as from 18th October, 1954. The Company's Silk Department, Shree Ram Silk Manufacturing Co., resumed working from 24th October, 1954 after a long gap of closure.

HULDIBARI TEA ASSOCIATION, LIMITED

The Profit and Loss Account of the Association shows a gross profit for the year of Rs. 20,60,450 from which Rs. 6,43,032 have been provided for taxation; Rs. 83,590 for depreciation of assets; Rs. 15,700 for staff expenses and Rs. 50,000 for Staff Reserve. Allowing for these and the other adjustments shown there is a net profit for the year of Rs. 12,80,860 which together with the balance brought forward from 1953 gives a total available on this Account of Rs. 13,77,181. Out of this, payment has been made of an interim dividend of 5 per cent on the 25th January, 1955 and a second interim dividend of 25 per cent on the 28th March, 1955, absorbing Rs. 2,47,500 in all; and there remains a balance of Rs. 11,29,681 which is proposed to be dealt with as follows:

Transfer to Renewals and Additions Reserve	Rs.	1,50,000
Transfer to General Reserve	„	4,60,000
Pay a final dividend of 50 per cent making a total of 80 per cent for the year	„	4,12,500
Carry forward to 1955	„	1,07,181
TOTAL	Rs.	11,29,681

The estimates for 1955 are based on a crop of 21,500 maunds at a total cost of Rs. 23,91,434 equal to a revenue cost of production of 22.21 annas per pound of tea, including the increase in labour wages granted from the 1st January, 1955.

Very severe drought early in the season, followed by abnormally heavy rainfall, affected outturn materially, the crop made being 16,07,368 pounds of tea. Part of this was sold forward on Private contract and the balance disposed of on the very favourable market that prevailed during the year. The increase in production costs reflects the restoration of the estate to full normal maintenance after the enforced economies of the previous year, and the smaller crop made.

BROOKE BOND ESTATES INDIA LIMITED

The report and audited accounts of the above Company for the year ended 30th June, 1954, indicate that the net profit for the year before providing for taxation amounted to .. .. .. Rs. 17,37,519
Deduct Provision for Taxation .. .. „ 7,64,600

Net Profit after Taxation .. .. .. Rs. 9,72,919
Add—Net balance brought forward from the previous year after payment of last year's dividends and appropriations to Reserve .. .. Rs. 12,511

TOTAL .. .. Rs. 9,85,430

This balance was proposed to be dealt with as follows:

Less—			
Pay a dividend at the rate of 6 per cent per annum less income-tax at the current rate on the Preference Shares, absorbing	Rs.	1,54,875	
Pay a dividend at 12½ per cent on the Ordinary Shares without deduction of tax, absorbing	„	4,37,500	
Transfer to Contingencies Reserve	„	2,75,000	
Home Passage Reserve		4,963	
Reserve for Bad and Doubtful Debts	„	7,000	
Write off Leasehold Land and Development	„	80,000	9,59,338
Leaving a carry forward to next year of	Rs.		26,092

The crop harvested amounted to 32,97,535 as compared with our original estimate of 31,60,000 lbs. In this year of extremes the fact that the crop fell short of the record year of 1952-53 by only 38,887 lbs. can be regarded as most satisfactory. The crop estimated for the year 1954-55 is 32,55,000 lbs. The recovery in prices was maintained and the average sale price realised for the year after deducting all tea sale charges and cost of Export Rights was Rs. 1-13-7 as compared with Rs. 1-5-5 for the previous year.

The Directors have recommended payment of the usual Preference Dividend and an Ordinary Dividend without deduction of tax of 12½ per cent. They have also recommended the transfer of Rs. 2,75,000 to a Reserve for Contingencies. Last year it was mentioned that a Preference Shareholder had questioned if the Company was correct in deducting the standard rate of Indian Income Tax from the Preference Dividend; the Directors are arranging for the ruling of the Court to be obtained.

THIS IS AN ABRIDGED SUMMARY OF THE FULL PROSPECTUS FOR INFORMATION ONLY AND NOT AS A BASIS FOR SUBSCRIPTION

A formal Prospectus dated 26th July, 1955, has been prepared and filed with the Registrar of Companies, Saurashtra, Rajkot.

"Consent of the Central Government has been obtained to this issue of Capital by an order, of which a complete copy is open to public inspection at the Registered Office of the Company. It must be distinctly understood that in giving this consent the Government of India do not take any responsibility for the financial soundness of any schemes or for the correctness of any of the statements made or opinions expressed with regard to them."

"A licence has been obtained from the Central Government for the establishment of a new industrial undertaking for the manufacture of soda ash by the Standard Solvay Process of which a copy is open to public inspection at the Registered Office of the Company. It must be distinctly understood that in granting this licence the Government of India do not take any responsibility for the financial soundness of this undertaking or for the correctness of any of the statements made or opinions expressed in regard to it."

The Shares of the Company are officially quoted on the Native Share and Stock Brokers' Association, Bombay.

The Subscription List will open on 8th August, 1955, and will close as soon as the Directors may decide, but so that it shall remain open at least for 7 days thereafter.

DHRANGADHRA CHEMICAL WORKS, LTD.

(INCORPORATED UNDER THE DHRANGADHRA STATE COMPANIES ACT, 1939)

AUTHORISED CAPITAL

	Rs.
2,00,000 Ordinary Shares of Rs. 100 each ..	2,00,00,000
1,00,000 Preference Shares of Rs. 100 each ..	1,00,00,000
TOTAL	3,00,00,000

ISSUED CAPITAL

	Rs.
21,500 old Ordinary Shares of Rs. 100 each ..	21,50,000
43,000 new Ordinary Shares of Rs. 100 each ..	43,00,000
60,000 6 per cent (tax-free) Cumulative Redeemable Preference Shares of Rs 100 each	60,00,000
TOTAL	1,24,50,000

SUBSCRIBED & PAID-UP CAPITAL

21,500 old Ordinary Shares of Rs. 100 each .. .. Rs. 21,50,000

The said 43,000 new Ordinary Shares of the face value of Rs. 100 each have been offered to the existing shareholders.

NOW OFFERED

The said 60,000 6 per cent (tax-free) Cumulative Redeemable Preference Shares of the face value of Rs. 100 each are now offered to the Public for subscription payable at par in the following manner:

Rs. 50 per share payable on application.
Rs. 50 per share payable on allotment.

The new Ordinary Shares will qualify the holders to participate in the dividend proportionately both in respect of time and amount paid from the date of allotment and the new Preference Shares to be issued will qualify the holders to a fixed right to dividend at the rate of 6 per cent (tax-free) per annum from the date of the allotment.

APPROVED INVESTMENT

The Company is advised that the Preference Shares are an approved investment for insurance companies under Section 27A of the Insurance Act.

SPECIAL BENEFITS IN TAX

The Company is advised that exemption from Sugar-tax will be available under Section 56A(2) of the Indian Income tax Act on dividends payable to a company in respect of any shares subscribed by it in the proposed issue of shares. New scrips will be issued with a distinguishing mark or a note to this effect on such shares subscribed by a company in order to facilitate the securing of exemption. The Company will be writing to the Central Board of Revenue for getting their confirmation.

MINIMUM SUBSCRIPTION

The minimum subscription upon which the Directors may proceed to allotment is subscription of 6 per cent (tax-free) Cumulative Redeemable Preference Shares in the Capital of the Company of the nominal value of Rs. 30 lakhs.

Amount offered for subscription within two previous years	Nil
Amount issued otherwise than in cash within two previous years	Nil
Amount paid or intended to be paid to promoters within two years	Nil

RIGHTS OF PREFERENCE SHAREHOLDERS AND ORDINARY SHAREHOLDERS

The said Preference Shares (hereinafter called "the Preference Shares)" carry the right to be paid a fixed cumulative preferential tax-free dividend at the rate of 6 per cent per annum on the capital for the time being paid up thereon from the date of allotment. The Preference Shares, subject to the provisions of Section 105B of the Indian Companies Act, are redeemable at par at the option of the Company at any time after expiration of 10 years by 6 months' previous notice, but in no event later than 15 years from the date of allotment. The redemption may be whole or partial and if partial, shall be decided by lots drawn in that behalf. The Preference Shares carry a right on a winding-up to be paid all arrears of preferential dividend, whether earned or declared or not, down to the commencement of the winding-up and also to be repaid the amount of Capital paid-up or credited as paid-up on the Preference Shares held by them respectively in priority to any payment in respect of the Ordinary Shares, but shall not be entitled to any other rights in the profits or assets of the Company. Subject as aforesaid and to the rights of the holders of any other shares entitled by the terms of issue to preferential repayment over the Ordinary Shares in the event of the winding-up of the Company the holders of the Ordinary Shares shall be entitled to be repaid the amount of Capital paid-up or credited as paid-up on such shares and all surplus assets thereafter shall belong to the Ordinary Shares in proportion to the amount paid-up or credited as paid-up on such Ordinary Shares respectively at the commencement of the winding-up.

PROCEEDS OF ISSUE

The proceeds of the issue together with necessary borrowings and Company's own resources will be utilised for meeting the expenditure for putting up the said new undertaking.

FINANCIAL INFORMATION

The working results of the Company for the last four years are as under:

Year	General Reserve	Depreciation Reserve	Dividend Equalisation Fund	Rehabilitation of Plant	Profit	Dividend Declared at the rate of (per cent)
1950-51	15,65,000	20,47,544	1,86,000	..	11,41,885	15
1951-52	15,65,000	20,77,748	3,15,000	3,00,000	21,82,331	15
1952-53	15,65,000	26,77,742	4,40,000	13,00,000	11,46,208	12
1953-54	15,65,000	35,37,248	4,40,000	17,00,000	9.55,873	12

COMMISSION OR BROKERAGE

The Company will pay brokerage and/or commission at a rate not exceeding Rs. 2 per share to recognised brokers or banks on allotments made in respect of the application bearing stamp of such brokers or banks.

INSPECTION OF DOCUMENTS

The Copy of the Prospectus, Memorandum and Articles of Association of the Company, Managing Agency Agreement, the Licence for establishing the new industrial undertaking, sanction for the fresh issue of Capital, Certified copies of the Tripartite Agreement of the Company, Managing Agents and Industrial Finance Corporation and Deeds of 1-10-1952 and 30-6-1953 between the Company and the Industrial Finance Corporation and the original report and certificate of the Company's Auditors as set out herein, will be available for inspection during office hours on working days at Registered Office of the Company until the subscription is closed.

APPLICATION FOR SHARES

Applications should be made on the form accompanying the Prospectus or any typed or printed copy thereof. The said form must be sent together with the necessary remittance to the Company's Bankers, Punjab National Bank Ltd., Bombay, and all its branches and offices OR Devkaran Nanjee Banking Co., Ltd., Bombay, Dhrangadhra and all its branches and offices. All remittances not made in cash should be made either by Demand Draft or cheques drawn to the order of any of the aforesaid bankers. Wherever the aforesaid bankers' commission is payable for the collection of cheques, such commission shall also be paid along with the said remittance. Payments made by cheques by the applicants at their local branches of the Company's aforesaid bankers will be accepted at par. Any cheque not honoured when presented to the Bank shall not be deemed to be a payment. Where no allotment is made the moneys received on application will be returned without interest less remittance charges, if any. If allotment is made for a lesser amount than the amount applied for, the balance of the application moneys received will be utilised towards the amount payable on allotment on shares allotted and the balance, if any, will be refunded to the applicant, less remittance charges, if any.

Company Meeting

Bombay Suburban Electric Supply Ltd.

Speech of the Chairman, Mr. K. G. Milne

Gentlemen,

Sales of energy have gone up by nearly 24 per cent in the year under review. Last year the increase was almost 23 per cent. When it is considered that this substantial increase has been made possible by a limited relaxation of certain types of restrictions, even though stringent controls are still applicable to demands for New Industrial Power Supplies, which in the main are not yet sanctioned, one cannot help but ponder on how much greater your Company's growth would have been had an unrestricted supply of power been available for distribution. Further these figures of increase reveal the magnitude of the pent up, and as yet unsatisfied demand for electricity in the Bombay Region, and consequent on this, the arresting effect which has been imposed during recent years on the economic growth of the area. I make these remarks in no spirit of destructive criticism, and even less in that of the "I told you so" attitude. My purpose is to stress again the vital necessity of adequate power supplies being made ready for economic development always in advance and never in arrear of needs, if our cherished hopes of rapidly raising the standard of living are to be realised. I also want to emphasise the importance of drawing the correct conclusions for the future from past experiences.

The news which came just after your last Annual General Meeting that Government had finally decided to permit Tatas to instal a further 50 MW power plant at their projected Trombay Thermal power station, came as a momentous relief to the worst of our anxieties for the future; but of course the earliest that this Station could go into production to relieve the present shortages would be about October 1956.

Meantime it has been suggested recently that with the commissioning of all three sets at the Government owned Chola Power Station, more power would be available to industries both new and existing. I fear, however that at the most such extra releases would have to be confined to special hours for the time being, as it is understood that the working of certain parts of this Power Station continues to be unsatisfactory.

On the 6th November, 1954, we welcomed the formation of the Bombay State Electricity Board, with Mr. M. H. Hasham Premji, an experienced and successful business man, as its Chairman. I feel this to have been a notable, though too long delayed, step forward.

We do not think that we can be accused of any narrow vision with regard to our own arrangements to perform and extend the work we have to do, namely to provide steady and reliable distribution of all the power which our customers would like to have, to the extent we can procure it for them. The effect of our Six-Year, 1948-54 Development Plan is now being very beneficially felt. We are in a position to cater for load much in excess of that which can at present be released by the authorities, and furthermore to take on additional consumers with a relatively lower rate of annual capital expenditure on the Transmission system. The Distribution system continues to be expanded concomitantly. During the year under review, 25 new Sub-Stations were added and the transformer capacity of 12 existing Sub-Stations was reorganised. Further capacitors were added, as those installed last year brought about a considerable improvement in the overall power factor of the System, with a corresponding saving in costs.

The Company thus continues its contribution to the progress and development of the Suburbs, now even reaching out as far North as the village of Bhayander. Unfortunately the standard of Municipal street lighting in most parts of the Suburbs still leaves a good deal to be desired, and this has been the subject of adverse comment in the Press from time to time. We have no doubt that the Greater Bombay Municipality and the other authorities whom the Company is privileged to serve are well aware of the position, and will in the near future provide the necessary funds in their Annual Budgets to enable the street lights to be improved into line with modern standards. It will be of interest here to mention that a Technical Officer of your Company has been deputed to make a special study of street lighting developments abroad, so that we may make available the very best possible advice at all times.

Looking towards wider issues, I would like to repeat to you what I have already said elsewhere, namely that I myself see no reason to think that either the recent amendment to the Constitution or the projected new Companies Bill holds out any special threat to Electricity Undertakings such as yours, subject however, I must now add, to there being no more drastic changes introduced into the Companies Bill by the Parliament which is about to begin debating it.

There is I think still reason to hope that the "standard rate" of return will soon be upgraded, though I have yet to see the Bill which we were told was to be introduced into the present Session of Parliament. The question of our being allowed to create a Deferred Taxation Reserve is, I understand, also part of the considerations before Government in connection with this Bill.

There are some facts about this Company which I have been urged by shareholders to disclose, in order to assist in removing misconceptions. In the first place 91.7 per cent of the share capital of your Company is held by Indian Nationals, as are the majority of seats on the Board of Directors. Over 80 per cent of the share capital of the Agency Company is held by Indian Nationals, and again the majority of Directors are Indian gentlemen widely known and highly respected.

In the second place I would say that of the total number of shareholders of the Company, 23 per cent own between Rs. 100 and Rs. 500 of the share capital, and 45 per cent hold from Rs. 600 to Rs. 2,500. Only 7 per cent own over Rs. 10,000, and, of these, institutional investors (that is to say other companies also having many small holders) comprise almost the whole. I would commend the serious study of these figures by those concerned with the formation of new legislation and controls, in respect of joint stock enterprises and organised industry within the private sector, for they are true not only of our own Company, but of the general pattern of large concerns operating under free enterprise. What would be revealed by such a study is that far from there being an undue concentration of economic power, the truth is that the weapons of production are owned by a large and continuously increasing cross section of society, which is exactly as it should be in a democratic country poised for a vigorous advance of industrial expansion.

Seven demands were made on the Company during the year by the Union, including those for enhanced wages, and bonus for the 3 years 1950-51, 1951-52 and 1952-53. As no settlement could be reached, these questions have been referred to the Industrial Court for arbitration. The subject is now sub-judice, so I will not dwell any further on it. The Union have more lately also made a claim for enhancement of dearness allowance.

The Staff has continued to work for the maintenance of a high standard of service, and our thanks are as usual due to them for their efforts. I am pleased to report that it has been possible to give them a bonus this year amounting to a little over one month's basic salary.

During the year the scope of application of the Employees' State Insurance Act to your Company has been enlarged. Facilities afforded to the staff under the Act appear to be as yet somewhat unsatisfactory, but it is hoped that they will improve.

I have to report with deep regret the death of the Company's Doctor, Dr. Joseph D'Lima, who had been associated with the Company for many years.

Coming now to the Accounts which are before the meeting, you will be glad to know that the results have been obtained without passing on to our consumers any part of the additional 15 per cent surcharge on the cost of power which was introduced by our Bulk Suppliers from 1st April, 1954. With regard to Additional Income Tax we are hopeful of settling the issue in the Courts before very long, but I fear that any settlement of the question of shareholders' gross-up of dividends may still be a lengthy matter. The Matthai Commission commented and recommended on both these problems in their Report, which you have doubtless read.

The statutory necessity to make allocations to the Consumers Benefit Reserve and the Tariffs and Dividends Control Reserve this year, amounting to Rs. 69,933 each, has made it necessary to withdraw Rs. 19,500 from the Equalisation of Dividends Reserve in order to maintain the dividend this year. This kind of position could only be remedied if the Electricity (Supply) Act were suitably amended to increase the rate of return permissible to the Company, and it is somewhat too early yet to draw final conclusions about the future in that respect. I trust therefore that you are satisfied with the Directors having recommended a final dividend of Rs. 4 per share, making 7 per cent for the year, which is the same as last year.

I now propose that the Directors' Report together with the Audited Statement of Accounts made up to 31st March, 1955, be and the same are hereby approved, adopted and confirmed.

THE RAMAYANA
OF
TULSIDAS
IN ENGLISH VERSE

LATEST "HINDUSTAN TIMES" PUBLICATION

The famous Hindi epic regarded by many as "the greatest book in all devotional literature" is for the first time now available in English verse.

The translator, the Rev. A. G. Atkins, completed the book after ten years of devoted work. He has tried "to keep and express in English in the fine rhythm and music of the original in simple lucid language, and with as much of the vivacity, wittiness and picturesqueness that Tulsidas has put into his work." He has also followed in some measure Tulsidas's metrical variations such as **chhand, chaupai, doha** and **soratha.**

In a foreword Mr C. Rajagopalachari says: "Mr Atkins' monumental work and his Introduction are a revelation of hope for those who desire to see all the great religions of mankind come together. - - - - His service is not only to English-speaking people but also to that very large number of Hindus in India who do not speak the Hindi language and to whom English has become a very familiar medium."

The book is of special value to libraries, scholars and devotees of Tulsidas.

It has been issued in the following four editions:

I. Original text of Tulsidas with translation in English verse; three volumes; price Rs. 50 net.
II. Translation in English verse, without Hindi text, two volumes; price Rs. 40 net.
III. Special tissue paper edition of I, one volume, price Rs. 100 net.
IV. Special tissue paper edition of II, one volume, price Rs. 100 net.

POSTAGE EXTRA

The Manager,

THE HINDUSTAN TIMES,
NEW DELHI.

Resources for the Plan

AFTER Confidence, Despair. It is strange how psychology in New Delhi responds to waves of optimism and pessimism generated by vacillating arithmetical totals of Indian financial resources computed now from week to week. Three months ago, there was great confidence that the voluntary rate of saving in India could reach 11 per cent of income by 1961, and that a sum of Rs. 5,600 crores for investment in the Plan was well within our resources. Today, optimism has steeply declined, and, perhaps, with good cause. In a Special Article in this issue, it is pointed out that the basis of optimism was the unreal assumption that 30 per cent of an increment of output would be saved. It is now seen, largely from official figures, that the marginal rate of saving is not likely to exceed 15 per cent so that the rate of saving might conceivably go up to 8.5 to 9 per cent only by 1961. The reaction of deep pessimism is as unwarranted as was the original optimism. It is necessary that some new and neutral thinking should be done on the volume of resources which can be mobilised for India's second Five-Year Plan. In particular, the question needs to be asked: How large is the gap?

In the second Special Article in this issue it is suggested that a sum of Rs. 4,800 crores might be found from voluntary savings for both the private and the public sectors; it is argued a further sum of about Rs. 1,500 crores (to be initially deficit financed) would raise no problem, seeing that the stream of goods and services which it might generate would support it, and, in any case, a rise of this order in the money supply of the Indian Union will be necessary in order to sustain the higher level of activity. If these figures are accepted, they give some indication of the order of shortage of financial resources for the period of the Plan. Against Rs. 6,300 crores which might be mobilised in the manner proposed in the private and public sectors, the Plan in its present form requires the whole of this sum for development purposes.

Since private capital expenditure will still have to be incurred—it may be on an increasing scale—it would appear that something like another Rs. 1,500 crores will be required to sustain, with a fairly neutral price level, all the activities which it has now sought to sponsor. In other words, there is likely to be a real shortage of Rs. 1,500 crores in the resources for a plan of the order of that indicated in the plan-frame.

It is unthinkable at this late hour that the whole of this shortfall can be cut back from investment in the Plan. State Governments, as well as people at large, have now captured the spacious outlook of the Finance Minister and Prof. Mahalanobis all too well; and the provision of ten million jobs is likely to be a task which even expenditure of the order of Rs. 6,000 crores in strictly monetary form is not likely to attain. In other words, the political objective of a spacious plan with spacious employment targets makes a wholesale retreat from planned investment figures impossible.

What then can be done? Certainly, a new choice of projects in the Plan can be made so that productive undertakings receive higher priority and the time element in investment is somewhat reduced. It would appear, if educational expenditure and expenditure on housing is somewhat drastically reduced, the income targets may be attained with expenditure of Rs. 5,000 crores to be monetarily financed instead of Rs. 5,600 crores. This would still leave a gap of something like Rs. 1,000 crores from which there is no escape.

Some authoritative sources in New Delhi have arrived at this figure of a gap of Rs. 1,000 crores on quite different general assumptions. It may, perhaps, be assumed that some large measure of agreement exists that the financial problem set for the second Five-Year Plan is of the order of Rs. 1,000 crores, about half of which may be in foreign exchange. If it were possible for a spacious aid programme sponsored by capital exporting countries to provide India with Rs. 1,000 crores in five years, it is conceivable—and this view is entertained in high quarters in New Delhi—that India's capital formation activities by 1961 will have developed to a point at which no further foreign assistance will be required, and at which there will be no payments gap to be met in the third and subsequent Five-Year Plans. This agreeable outlook can be accepted as a working hypothesis.

While foreign countries hesitate about the extent of the aid which they can extend to India in the next five years, uncertainty will grow in regard to the measures which the Finance Ministry might take to close the gap in resources. It has become fashionable now to talk about 'normal' and 'abnormal' methods of finance and to assume that savings can be rigged, implying that the rate of savings of a country depends substantially on the degree of control which Government can exercise on consumption. In India, at least, this has been proved to be a major error. Official figures of the rate of capital formation in India show that it was lower both in absolute and relative terms under a regime of control than it has been since 1952 with decontrol.

The reason for this appears to be simple. A country which is so near the dreaded poverty line and, indeed, in which the great majority of people are below it, cannot afford to form capital by official decree without excessive privation to those least able to bear it. The obvious and only efficient method of forming capital in India is to generate income by public expenditure and by greater activity in all sectors. All the evidence of the last few years shows that, in India, capital formation rises fairly steeply with income. It is conceivable that if the income targets could be raised beyond those in the plan-frame, the burden of finance would become 'pro tanto' less. But, in any case, the emphasis should be on the creation of income with the corollary that consumption should be developed; not on the restriction of consumption by methods like compulsory saving, which, under Indian conditions, will be incapable of raising the sum required, and which, for a much smaller sum, would entail a cost in human suffering out of all proportion to the money received.

Confusion on forced saving grows worse confounded. War parallels are being quoted without understanding. It is clear that the confusion between development under war conditions, where controls were necessary because consumption was diverted, not lopped off, is misleading from the point of view of financing of a development plan. In war, it is not necessary to provide for additional personal consumption, because the goods which acquire high priority are instruments of destruction. In peace, and particularly with a plan, the objective is the raising of the standard of living of the people. There are limits, very easily reached, to the extent to which personal consumption can be cut in a plan; for, personal consumption—or the standard of living—is the prime purpose of the plan. Why should the people be denied the fruit of their labours when it can be given them without imposing on them the foolish hardships of war?

The more the matter is considered the more clear it is that the confusion which prevails on 'abnormal' methods of finding resources rests on the erroneous belief propounded by the Taxation Enquiry Commission that consumption and investment cannot rise together. Every year in the last four in India has been a denial of this thesis, and the whole history of dynamic economies in every country in the world, including the USSR, shows how consumption and investment can march together. Indeed, the highest rates of capital formation have always tended to be correlated with the highest rates of consumption growth.

If this central point is appreciated, solutions to the resources problem would be looked for far more in terms of creating income than of destroying it. In Special Articles to follow in 'The Eastern Economist', the precise problems set by the shortage of resources will be discussed with indications as to the easiest means by which they can be dispelled by an income-raising process rather than by the callous depression of the standards of living of the Indian people.

The Press Registrar

THE Bill seeking to appoint a Press Registrar, which has been introduced in the Lok Sabha, has caused undue concern in certain quarters. Even a usually well-informed London "source" has observed that the measure imposes a "Governmental grip upon the press of India as a whole and is a step which can only be viewed with extreme concern". Actually, the Bill—called the Press and Registration of Books (Amendment) Bill, 1955—not only incorporates the familiar provisions of an earlier Bill—which had been introduced in 1952 and which has now been withdrawn—but also makes certain further innocuous provisions in order to give effect to the recommendations of the Press Commission to set up an organisation under a Press Registrar, "for the purpose of registration of all newspapers published in India and for the collection, maintenance and publication of information concerning them". While some of the amendments are intended to remove certain doubts which judicial decisions have created about the Press and Registration Act of 1867, certain others are capable of being misused and call for adequate pruning.

The whole administration of the Act, however, requires to be overhauled and the measure in question has come none too early. The Bill, among other things, provides that a declaration in respect of a newspaper shall cease to have effect if the newspaper does not commence publication within a specified period, or if it ceases publication for a year or more, or if it publishes issues the number of which is less than half of what should have been published in accordance with the declaration made. It cannot be denied that a certain degree of laxity has all along existed in the filing and registration of books, journals and newspapers. The Press Commission has pointed out that, in the course of its inquiries, it found it difficult to get the files of copies for scrutiny of the contents and even to verify whether a paper was currently being published or not. It also found that in many cases no newspaper or periodical had actually come out, although a declaration had been made under the Act. The Bill, therefore, follows the Press Commission's recommendation that it should be the business of the Press Registrar to have a complete register of all newspapers and periodicals, news agencies and advertising agencies, and that it should be made obligatory on them to register themselves under the Act. The Act of 1867 provided penalties for keeping a press without making a declaration and making any false statement about the press, while the present Bill makes it clear that the provisions are applicable to all papers printed.

It is not understood why any responsible person or concern in the newspaper industry should object to this provision or to the one authorising the Registrar to ascertain "the average number of copies printed, the average number of copies sold to the public, and the average number of copies distributed to the public". There should be no secrecy attached to these matters and even a journal having a small circulation should flourish only on its merits and on the quality of its service to the public, and it should no longer be possible for any paper to bamboozle the public about its circulation and the nature of its clientele.

Apprehension has been rightly felt in respect of Section 19-F of the Bill in respect of the Registrar's powers to get access to the records and documents of newspapers. This has been incorporated on the strength of the Commission's recommendation that the Registrar should have authority to call for any additional factual information. It should, however, be observed that this power is intended to be exercised "for the purpose of the collection of any information relating to a newspaper under this Act". Actually, the provision embodies in toto the analogous provision (Section 6) of the Collection of Statistics Act, 1953. When such a provision, however drastic, has already been allowed to be incorporated in an existing statute, there is less ground to feel unduly concerned about a similar provision in the present Bill. Nevertheless, the measure will need to be recast so as to prevent any nominee of the Registrar from misusing his powers to inspect or take copies of the relevant records or documents.

There is also a provision (Section 19-H) which authorises the Registrar to supply to any applicant copies of any extract from the register on payment of the prescribed fee. It should not be forgotten that the press is a highly competitive industry and the right to enter the premises of any newspaper office and inspect any records therein might be exploited by unscrupulous people to serve their own interests.

The point to be borne in mind is that the powers of the Registrar are confined to the sphere of registration of the press and control of the publisher, and that they do not constitute any encroachment on the freedom of the newspaper from the editorial standpoint. As a public institution, there is no threat involved. The Bill aims at putting down calculated irresponsibility on the business side of the newspaper industry, but no regulation or control of news and views is contemplated. This issue may, however, crop up when the proposed Press Council is constituted. In the meanwhile, there is need for vigilance. Liberties tend constantly to disappear under executive encroachment conveniently disguised under a protective section of the law, the spirit of which was very different from that originally intended. The Press need not start crying "wolf' too early, but that does not mean that it should not note with regret that it is being forced into a strait-jacket intended for units whose activities have needed less flexibility and freedom from control than an independent press in all democratic countries enjoys.

Guest Editorial

Integration in University Education

ONE of the basic defects of the present system of education, to which the University Commission gave considerable attention, is the excessive specialisation of studies. The Commission stated that "among the suggestions for improving higher education which we have received..... scarcely any has been more frequently or more vigorously presented than the need to escape from the extreme specialisation which now prevails."

The trend towards specialisation is not, of course, peculiar to India. Complaints about "the fatal disconnection of subjects", about the increasing "diversification and parcelling of learning into a myriad of specialities" can be heard in educational discussions everywhere. Intellectual specialisation has yielded a vast fund of precise knowledge about physical, social and psychological phenomena. As a result, modern societies

possess an unprecedented technical competence. But the old integration has been lost. The consciousness of the organic unity, the inner relationships of the various components of knowledge and experience has been lost. The vivid sense of the subservience of all knowledge to some fundamental values has been lost. Information has overshadowed wisdom; technics has overshadowed ethics. Fragmentation of knowledge has begotten fragmented visions of reality. Specialists acquire a profound knowledge of one aspect of life but no sensitiveness to its total rhythm, no integral vision, no value-orientation. So when they are entrusted with the task of reforming social reality, they often succeed only in deforming it. Instead of a richer harmony, they create a worse chaos.

The University Commission saw the risk as well as the remedy very clearly. "If intellectual fragmentation and anarchy are to be avoided," they wrote, "the student must acquire a frame of reference.....There must be an intellectual integration of his varied knowledge.....If society is not to disintegrate into an aggregate of individual specialists, we should endow the youth with a central core of values, transmit to them a cultural heritage."

In the West, the growing awareness of the need for a balanced, value-oriented education has produced the concept of General Education. Many universities, especially Chicago and Harvard, have changed their courses and teaching methods in conformity with it. The University Commission recommended the introduction of General Education courses in India both at the school and college levels.

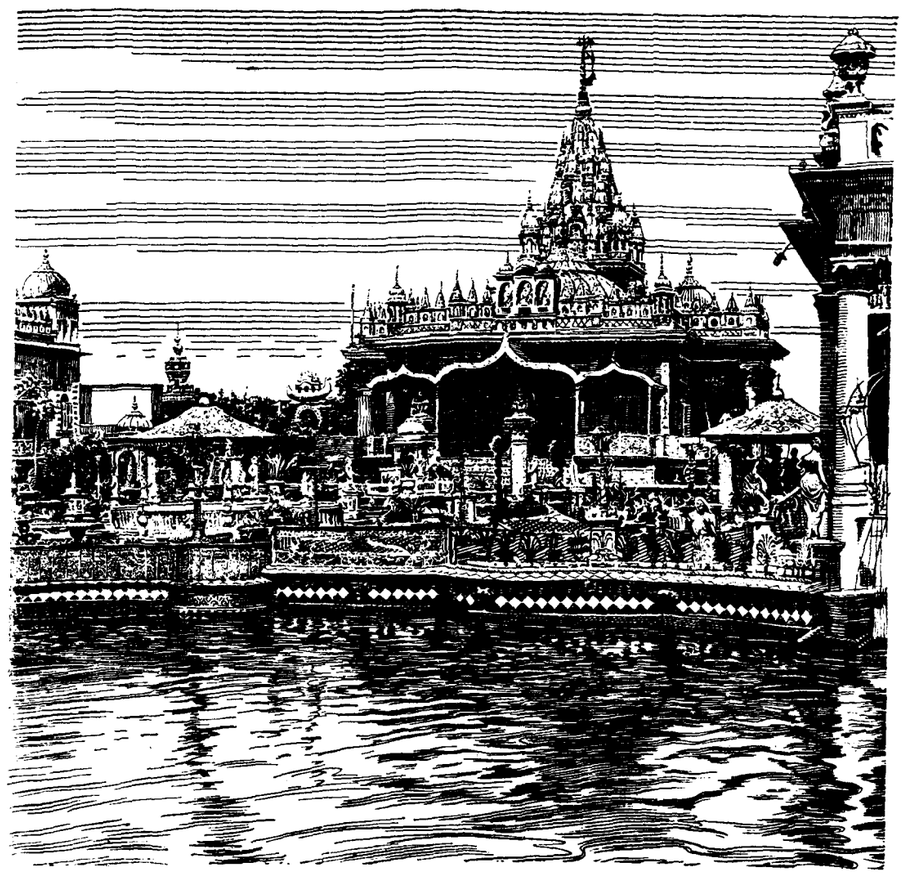
Now this task may be approached in two alternative ways. Either some General Education papers may be introduced which the students will have to take in addition to the normal papers in the subjects selected by them; or the present syllabuses of all the subjects taught may themselves be drastically revised in the light of the principles of General Education and additional compulsory papers introduced to provide an analytical knowledge of the 'inter-relationships of the fields of knowledge' and a historical knowledge of Indian civilization.

There can be little doubt that the second is the right choice. The first can hardly be considered as a proper method of introducing General Education; the only reason for considering it here is that it has been so regarded by authorities in India, and its futility must be shown.

A well-balanced education does not merely mean that science students should be made to attend some arts lectures and vice versa. It means adopting a radically new way of selecting what is to be taught (and, of course, ceasing to teach a lot that is now taught); a radically new way of teaching whatever is taught; and making students aware of the organic interconnections of the various branches of knowledge, and of their cultural heritage.

The University Commission realised that "the introduction of the principle of General Education cannot be successful without material change in the contents of the courses offered." But in making their concrete suggestions, they seem to have slipped, perhaps unconsciously, to the narrower approach. Thus when they suggest that there should be "ten to twelve 3-month General Education courses of 20-25 hours" or "one course per term for the three years of undergraduate education"; that "of the General Education courses the student may select just those which cover the ground not effectively covered by his special subject and leave the rest"; that General Education courses should not require "more than a fair share of the students' time"—they clearly give the impression that the General Education courses are to be nothing more than some optional, supplementary lectures covering subjects not covered by the papers ordinarily selected by the students.

Educational authorities may find in these suggestions just the facile programme they need in order to pay their formal homage to General Education without having to undertake the troublesome overhauling of existing syllabuses and teaching methods which its true spirit would require. That this is more than probable can be seen from the circular which the Ministry of Education sent to the universities in February last year. In this the Ministry drew their attention to the recommendations of the University Commission regarding General Education and asked for "concrete schemes for the institution of the course with the proposed curriculum mentioning the stage at which the General Education course is to be introduced as a compulsory|optional subject."



The last words are significant. The Ministry seems to think that General Education is just a 'subject' like geology or anthropology, to be added to the existing courses! But, to quote the Harvard Report on General Education "it is most unfortunate if we envisage General Education as something formless—that is to say, the taking of one course after another; and as something negative, namely, the study of what is not in a field of concentration..... (We) envisage General Education as an organic whole whose parts join in expounding a ruling idea and in serving a common aim." Again, according to a Chicago study, "great as the value of.....departmental disciplines may be,.....no mere piecing together of a number of them can constitute General Education." A General Education curriculum must consist of "an integrated system of courses covering the major areas of knowledge rather than a collection of departmental elective courses."

This is a far cry from the mechanism of course-making now in vogue in this country; and it will be a long time before course-makers can be persuaded to change their conceptions, and reformers to distinguish between 'integration' and 'aggregation.' Still, it would be interesting to know if any universities have taken any steps even in pursuance of the Ministry's circular, and the results achieved. As far as the Delhi University is concerned, the circular has been before its Faculty of Social Sciences for over a year, but no concrete decisions have been taken so far. Nothing has been done to initiate a serious study by the teachers of the theory and practice of General Education; or to develop the necessary literature; or to undertake the revision of syllabuses.

A reform of this kind cannot be imposed from above through official directives. The first requirement is a reorientation of the outlook and attitudes of the teachers.

Administrators can at best provide congenial material conditions; but the essence of educational progress is the remaking by teachers of their own and their students' minds.

Around India with Brooke Bond

The Jain Temple at Calcutta ...

Built in 1867, the Pareshnath Temple in Calcutta is a well-known Jain sanctuary. Set amidst a garden adorned with a miniature lake, fountain and statuettes, the main shrine is of curious and interesting architecture. Its filigreed railings, its elaborately worked pillars and walls, set with multi-coloured crystals and stones, its gilded spires ... all combine to make the shrine look like an intricately wrought massive jewel box. The main shrine has three accessory temples, built in the same style.

Here, as everywhere in India, fresh Brooke Bond Tea is made available through a unique system of fast distribution from factory to shop.

Brooke Bond have thousands of acres of their own tea gardens—more than any other firm of tea distributors in the world. And Brooke Bond is the only tea firm with five blending and packing factories, each serving its own part of the country, from which fresh stocks are rushed to every shop.

Interesting facts: More people buy Brooke Bond Tea than any other brand, and over 55 million cups of Brooke Bond Tea are drunk everyday in India.

THE WEEK'S NOTES

THE LAW COMMISSION

NEARLY A year after the need for a Law Commission was accepted in principle, the Government of India has now announced its personnel and terms of reference. The latter are as they should be. The first task of the Commission will be an inquiry into the system of judicial administration which has long been overdue. The last occasion on which such an inquiry was undertaken was over 33 years ago when the Civil Justice Committee was appointed and much has happened since. Procedural laws have multiplied and the system of organisation of the subordinate judiciary leaves much scope for improvement. To these questions, the Government has added that of the organisation of the legal profession. It has been arranged that this part of the inquiry should be undertaken by the Chairman and three other members of the Law Commission sitting separately for the purpose.

The second aspect of the Commission's work is not less important. The other seven members of the Commission are to examine all the existing laws which come within the scope of the Union and Concurrent lists of legislative powers with a view to revising them in the light of India's Constitution and of judicial decisions. There is much weeding to be done and many laws can still be found which are repugnant to the letter and spirit of the Constitution and would deserve to be scrapped. Law Commission II can also consider suggestions for reform of minor acts and rules which ordinarily do not catch the eye of the zealous reformer.

While these objectives are commendable, the choice of the members and the manner of the constitution of the Commission are not what they should have been. Supreme Court judges—those in office as well as those who have retired but are still happily fit to help with their experience—have been excluded. This is probably an echo of the controversy over judges heard at the time of the amendment of Constitution and presumably Supreme Court judges have been deemed to have disqualified themselves for such positions by their refusal to conform to the wishes of the executive. Any Supreme Court judge chosen for the Commission may not have served as member with the Attorney General as Chairman and if the latter was deemed essential to ensure compliance with the wishes of the Government, the exclusion of the best experience and knowledge of judicial administration in a field where it is most needed became inevitable. In time, such steps will not fail to have the desired effect of destroying among lesser men the will to differ from an executive which does not hesitate to use its patronage to show where the non-conformists get off. Thus with every addition to the list of 'persona non-grata', there will be an increase in the 'personae grata', which will suit those in power, even though it should result in the exaltation of mediocrity.

SUCCESSION IN PAKISTAN

THE PROBLEM of succession in Pakistan has been solved in as orderly a manner as can be expected, without any surprises. It would allay the apprehensions of those who, having watched the assumption of wide powers by Mr. Ghulam Mohammed, were anxious that they should not fall into the hands of less responsible persons when the Governor-General's declining health forced the choice of a successor. Maj-Gen. Iskander Mirza is perhaps a much stronger man than Mr. Ghulam Mohammed and he lacks his predecessor's velvet glove as his regime in East Bengal revealed. But it is doubtful whether he would alienate any political group, if he can avoid it, though he may not have respect for the wayward ways of the Pakistani politicians. Except during the brief period of office of Khwaja Nazimuddin, the office of Governor-General has been the most powerful in Pakistan and the danger is that with every strong personality as Chief Executive, the office may tend to dominate politics of Pakistan making remoter the chances of restoration of a stable and working parliamentary system.

The fact that even so, the position of Prime Minister Mohammed Ali has become untenable shows that the politician does not acquire the administrator's relative immunity from odium. In recent months, the Premier's position has been unenviable, especially since the reconciliation with Mr. Fazlul Huq during the Constituent Assembly elections. Mr. H. S. Suhrawardy, who seemed vanquished at first by this alliance has regained his importance and was likely to become Prime Minister through an understanding with the new leader of the Muslim League, Finance Minister Chaudhari Mohammed Ali. That would be as stable an arrangement as any that Pakistan can find for the present while the Constituent Assembly goes to work on the Constitution. However, the latest position is that Chaudhari Mohammed Ali has been invited to form the Government. Difficulties may arise because of the clash of opinions on the one-unit plan (especially in the N.-W.F.P. where Khan Abdul Gaffar Khan is still strongly opposed) and from any conflict with the East Pakistan administration. On questions of Indo-Pak relations, these political changes will not make a serious difference. The postponement of high-level talks between the Prime Ministers of India and Pakistan will now ensure that the discussions are held with persons who can now better represent Pakistan.

CONFUSION ON COMMONWEALTH CITIZENSHIP?

THE DEPUTY HOME MINISTER, Mr. Datar's intervention in the debate on the Citizenship Bill did not help to clarify the implications of Commonwealth citizenship mentioned in the Bill among the supplemental provisions. Clause 11 provides that every citizen of a Commonwealth country shall, by virtue of that citizenship, have the "status" of a Commonwealth citizen. What that status implies is a question that rises to the lips of every reader, but in view of the increasingly perfunctory manner in which Notes on Clauses are drafted, there was no clue found in the Bill itself. In fact, the Home (or is it the Law?) Ministry adds insult to injury by saying that these clauses are "self-explanatory". Mr. Datar pointed out that mere Commonwealth "status" would confer certain facilities and concessions. But Clause 11 does not provide for reciprocity and the Commonwealth includes such countries as the Union of South Africa. It would be good to clarify the privileges that such recognition of Commonwealth status would confer.

It is only in Clause 12, which provides for the conferment of all or any of the rights of a citizen of India on any Commonwealth citizen, that the principle of reciprocity has been laid down. It is certainly not implied in the earlier clause, though Mr. Datar urged that the two clauses should be read together. It may be argued that Clause 11 has no place at all in the Citizenship Bill if it only means "facilities and concessions", which can be granted by a declaration to that effect by the executive.

COMPULSORY RETIREMENT AT WILL?

THE PUNJAB GOVERNMENT often comes into the news for doing wrong things and the latest decision to amend the Punjab Civil Service Rules is one such. The proposal to invest the State Government with unlimited powers in the matter of promotions and forced retirements has rightly given rise to resentment from all quarters. The amendments would deprive the authority of the Punjab Public Service

Commission to consider the cases of officers for promotion to Selection Grade posts. In regard to compulsory retirements, the new rules provide the Government with the power compulsorily to retire "immediately after ten years' service or any time after fifteen years' service" any employee who may be considered inefficient or suspected of corruption, even though "no specific instance is likely to be proved". It will not be necessary for the Government to hold an inquiry before retiring an officer under this rule.

That such powers are prone to be misused for personal or political ends cannot be over-emphasized. The fears entertained by the State Government employees that no civil servant with any element of independent views can be safe from political pressure are justified, particularly in a State steeped in petty intrigues and political factions. Inevitably, the result may be quite the reverse of what may have been intended. The fear of losing the job and honour without any reasons being given is bound to take away the confidence and initiative from responsible officers, leading to confusion and unnecessary delays in the implementation of Government's policies. It is amazing that a measure of such vital significance should have been adopted by one State, marking a radical departure from the Central and other State Government services rules. It is immoral and illegal to deprive a civil servant of office without giving the grounds for such action and without his being given opportunity to show cause against it. No State Government can be allowed to deviate from the accepted principles of fair treatment in these matters, even in regard to employees under its own rule-making powers.

E.P.U. AND THE EUROPEAN FUND

THE EXTENSION of the European Payments Union (E.P.U.) for another year—until June 30, 1956—approved last week-end by the Council of the Organization for European Economic Co-operation, will necessitate a number of changes in the operation of the Union. With effect from August 1, surpluses and deficits incurred by member countries will be settled, under a system of quotas, 75 per cent in gold and 25 per cent in loans granted, instead of 50 per cent in gold and 50 per cent in credit. The modification of the percentage scale entails an adjustment of the quotas (which are doubled), so that the credit facilities or the total credit obligations of each country remain unchanged. A new clause has been adopted which provides that from now on EPU can be terminated in the course of a financial year if member countries whose quotas represent at least 50 per cent of its total notify the organization of their intention to terminate the Union when their currency again becomes convertible and of their willingness to bring the European Monetary Agreement into operation.

The European Monetary Agreement provides for the institution of a European fund and the establishment of a multilateral system for settlements. The fund will have a capital of $600,000,000, of which $270,000,000 will be contributed by the member countries. The purpose of the fund will be to provide the contracting parties with credits to help them overcome temporary difficulties in their overall balance of payments position, should these seem likely to jeopardize the maintenance of their level of trade liberalization in Europe. The fund will also serve to facilitate the operation of the multilateral system for settlements. Credits will be granted by the fund in gold, after the position of the member countries applying for credit has been investigated, and will be subject to repayment after a maximum of two years.

The multilateral system for payments is based on the principle that each country taking part will have three basic obligations vis-a-vis the other participating countries. First, it will inform its partners of the margins—valid until further notice—above and below which it will not allow the value of its currency, in terms of a given standard, to fluctuate. Secondly, it will make its currency available, within certain limits fixed by the European Monetary Agreement, to any other participating country which so requests. Lastly, it will agree to settle in U.S. dollars, in the monthly settlements to be made through the European fund, its net debt, if any, vis-a-vis all the other participating countries, and to accept U.S. dollars in settlement of its claims.

POLITICS IN THE PUNJAB

AFTER SOME days of hectic activity for the Congress High Command, the dust of controversy has settled down in the Punjab. Although this was not entirely unexpected, the dissidents' persistent flouting of the High Command's advice reveals a hard core of differences within the Pradesh Congress. The differences came to the surface with the Chief Minister's handling of the Jagat Narain affair and of the Akali 'Morcha', and the dissatisfied elements in the Congress Party attempted to bring about Mr. Sachar's downfall by exploiting these issues. They have failed now; but there is nothing final about the politics of the Punjab if the past is any guide.

Dissension can flare up again on the slightest provocation. Such provocation, however, may come only from outside, and if the Akali Dal persists in its course of agitation, Mr. Sachar may not find it possible to follow his earlier policy. These have, however, proved to be occasions to test the Congress President's capacity for conciliation and organisation, and Mr. Dhebar has so far proved himself more than equal to these demands on his skill and patience.

"EMERGENCY" AT PORTS

UNREST AMONGST port workers has gradually assumed the form of a periodical scourge. Recently, there was trouble at the Bombay port when lorrymen went on strike causing partial dislocation in Cargo transport. A Calcutta, the position became still worse with the 'go-slow' tactics adopted by the port labour, and the Government was compelled to take the extreme step of declaring a state of emergency to arrest further deterioration in a situation where work was already slowed down by about 50 per cent. The declaration of the state of emergency was made possible by an earlier amendment to the Dock Workers Regulation of Employment) Act, which gives wide powers to the Chairman of the Port Trust to deal with any such situation. It is heartening to find that the trade unions in the port have accepted that the 'go-slow' method is not a proper or recognized weapon to press demands. They have further offered their support for any measures that the Government may take to dissuade the workers from resorting to such unorthodox methods which only result in waste of national wealth.

NOTICE

"The Eastern Economist" is desirous of obtaining immediately the following back issues which are out of stock. These copies will be purchased from the subscribers at the rate of Rs. 1-8 per copy if available and preserved by them intact. Offers of sale may be addressed to the Manager, The Eastern Economist Ltd., 52, Queensway, New Delhi.

JANUARY to MARCH 1947 (Volume 8 No. 1 to 13) inclusive.

A Window on the World

PROBLEMS OF DUAL NATIONALITY

By

ODYSSEUS

LET US CONSIDER further the implications of the fact that a man may have two nationalities, that he may be a Bengali and an Indian, a Scot and a Briton, a Maori and a New Zealander, and he may be a loyal member of both the smaller and the larger group.

The individual finds himself subject to a number of loyalties: his family, caste, profession, religion, clan or tribe, language group, nation, and his state. It is the function of the state to harmonise these loyalties, to create conditions in which they can flourish for the common good and to prevent situations in which a clash of loyalties may arise to the detriment of the whole. It is obvious that the larger the unit, whether of the family, tribe, nation, or state, the greater the possibilities of clashing loyalties. Clearly in a state of the size and character of Britain which has only three "nationalities", the English, Welsh, and Scots, within it, the possibilities of differences are less than in a state of the size and character of India, which has a dozen or more groups within it speaking a variety of languages and making a variety of claims to individual recognition in the light of their histories as Bengalis, Sikhs, Tamils, etc.

The problem of reconciling these loyalties within a sovereign Indian republic is by no means insoluble, but it is difficult, and its difficulty has been increased by the cloud of propaganda which obscures clear thinking on the subject. This is because for many years the British sought to justify the prolongation of their rule by stressing India's racial and linguistic divisions, arguing that such peoples had nothing in common, and would fall apart into their separate historical nations if the British left. There was a substantial element of truth in this British contention, but the argument was vitiated by leaving out all the qualifications necessary to make it tenable. In refutation of this British propaganda, Indian Nationalists went to the opposite extreme in asserting the existence of a solid and homogeneous "Indian nation" over the centuries, and pointing to Asoka's kingdom of Magadha as but one example of the achievement of an all-Indian unity that had existed before the arrival of the British. There was a substantial element of truth in this contention, but it also was vitiated by omission of the necessary qualifications.

The element of truth in the British contention was that whereas the various peoples within India may, in the distant past, for relatively short periods with considerable gaps between each, have been under the overlordship of one emperor powerful enough to enforce his claims to tribute from lesser princes throughout the greater part of the sub-continent, these peoples had never been united in an integrated all-India state which had institutional means of giving reality to Rousseau's conception of the "sovereignty of the people" and thus had little opportunity of developing an all-India consciousness. The element of truth in the Nationalist reply was that, granting the foregoing, there was nevertheless (1) a unity in the culture spread over the sub-continent which was capable of being strengthened to the point of balancing the divisions, and (2) the unity enforced by rulers of an alien civilisation had served (a) to develop the conception of "India" and (b) to awaken the desire that "India" should be governed by "Indians".

SWISS, JEWS, GERMANS AND POLES

I suggested last week that a "nation" is not necessarily to be identified with a language or a single territory, or a state, but that it consists of a group of people who, for whatever reasons, passionately want to be a nation. Thus no one could assert that the Swiss, who are made up of people who speak German, French and Italian, or that the Jews who speak almost as many languages as there are in Europe (not to mention Asia) and who until after World War II had no sovereign territory, or that the Germans, who today are divided between the states of Western and Eastern Germany, or that the Poles, who in the nineteenth century were divided between the states of Prussia, Austria, and Russia, are, or were, not nations. We may also note that wherever efforts have been made to suppress nationalist feelings, those efforts have as often as not intensified them, as in Hitler's persecution of the Jews or in the severe Russian attempts to suppress nineteenth century Polish nationalism.

India owes its independence to the activities of a small group of sensitive and highly educated men who, reacting to the liberal democratic and nationalist ideas introduced into higher education by alien rulers, and who, having assimilated much of British culture, found themselves impelled to revivify their own, passionately desired to assert themselves as a nation, to embody such aspects of British culture as appealed to them in their own institutions in their own way, and to recapture and re-assert the glories of the old cultural heritage in the "India" that British rule had unified. I need not list these patriots (such as Gokhale and Motilal Nehru in former generations) but would point out how infinitesimal in numbers they were compared with the population of the sub-continent as a whole. They claimed to speak in the name of the "Indian people" but in fact it was their passion and determination which called "India" into existence. It is true, and important, that Mahatma Gandhi's appeals to the masses spread the conception of "India" to millions outside the ranks of the middle classes who gave it birth, but I suggest that it is unlikely that it was as "real" to the rural masses as it was to their educated leaders. If the Indian Institute of Public Opinion were to take a sample poll throughout India, I think that it might find that the higher that it went in the income and educational scales, the greater was the consciousness of "India" and the more concrete its reality, and that the lower that it went, the less meaning would "India" have and the more real would be such conceptions as Rajput and Marwari, or Bengali and Santal, or Madrassi and Panikkan (particularly in Tinnevelly!).

The risk in this situation is that the small number of middle class leaders to whom the "Indian nation" is a passionate reality may ignore the strength of the reality of the claims of the Sikh or Bengali or other smaller "nations", and by resisting them, or by imposing all-Indian rules on them (such as Hindi in the South which obviously does not like it), may strengthen local loyalties at the expense of the all-Indian loyalty; It is not that I deny the importance of the all-Indian loyalty; on the contrary, I regard it as vital to India's survival; but I do suggest that there is too great a tendency to assume (a) that the all-India concept is a powerful reality among what are vaguely called "the people" but who are more concretely envisaged as

diverse rural masses of Punjabis or Mewars or Beharis and so on, and above all (b) to assume that uniformity is essential throughout the Republic. I think that it is important (a) to cultivate the all-India sentiment through all-India educational and political channels, but (b) this should not be done at the expense of regional cultures or the smaller Indian "nations".

National consciousness is developed by sharing common interests and purposes through organised institutions (like those which in pre-Independence days gave concrete expression to their interests and purpose through the Congress party organisation). Where an institution does not exist, national feelings develop with difficulty or remain dormant. Local self-government in municipalities and then wider self-government through general elections to national parliaments, together with the discussion of national problems in the press and radio, lead to the evolution of national sentiment. Thus, it is reasonably certain that the men who fought in the ranks of the English and French armies which met in the battle of Crecy in 1346 had no consciousness of allegiance to a national cause. The battle came about because Edward III of England was (a) also Duke of Aquitaine in France and (b) considered that he had better claim than Philip VI to the French throne. The Hundred Years War was a struggle between hereditary chieftains and nobles; and the followers of the English fought out of personal loyalty to their lords. To the French masses, the Hundred Years War was a catastrophic civil war fought between two rivals to the throne.

WANTED: MULTI-NATIONAL STATES

It is probable that the sense of nationality was more widespread in Elizabeth I's England than in Yorkist and Lancastrian England, and still more widespread after the Whig Revolution of 1688, but that it did not begin to attain its widest reality until after the Reform Act of 1832 had paved the way to the sovereignty of the people. (I am aware of the qualifications needed to support this argument, which ignores the vitally important role played by the British monarchy in developing British national consciousness, but I think that it is broadly true).

In India, the General Election of 1951 was the first great exercise of democracy on an all-India scale, and I do not doubt that in the course of the decades the spirit of all-Indian nationality will spread and grow in the channels of federal democracy.

I am as anxious, however, that India should not lose the valuable contributions that should come from the smaller nations within the all-India nationality or state. And here I incline against the view of John Stuart Mill (outlined here last week) which holds that free institutions are almost impossible in a state made up of different nationalities and that the boundaries of governments should therefore coincide with those of the nationalities, and I incline towards the view of Lord Acton who urged, on the contrary, that the combination of different nations in one state is as necessary to civilised life as the combination of men in society. I am thus led to argue in favour of the retention of multi-national states such as Hyderabad or Madras and against the creation of purely linguistic states.

There is every reason why the Sikh or Bengali nations should provide themselves with cultural institutions like the Eistedfodd, the great national festival of Wales, but if they make the boundaries of the states of the Union coincide with these small nations, I suggest that there is a danger that the identification of these small (cultural) nations with political institutions may develop conflicts in all-India political loyalties. I suggest that a state legislature, such as Hyderabad, in which two or more languages may be spoken and nations intermingle, is more democratic and more conducive to the development of an all-India loyalty than a one-nation state such as Orissa. With Acton, I urge that, providing that the state is truly democratic, its frontiers need not coincide with those of its constituent nations.

Some with long memories may score a point by recalling that I argued the contrary view here in 1953. Well, reflection has led me to modify my views. In a nutshell, I believe in the value of nationality as a cultural force, but in the conduct of political affairs the longer I live, the more inclined to multi-national and the less to uni-national democracy I am.

A DELHI DIARY

DUELS WITH PENS?

I SEE that numerous papers are now taking up an issue, which I started, on the extent to which the Indian Press has been unduly influenced by authority. In the last of three pieces on this subject in these columns, I drew attention to one particular piece of reporting from Geneva which seemed to me to be inconsequential enough for the inference to be drawn that there was some unconscious influence working behind the scenes. This was merely an illustration and by no means intended to occupy the centre of the main argument, which was that the Press has to examine its conscience on its independent character. Still less was it intended to direct attention primarily to a particular person. He—I might say specifically here—was not one of those I had in mind when referring to senior journalists who would like a diplomatic assignment.

It seems to me strange that when a large impersonal issue is raised, its impersonal character is immediately by-passed for personal reflections. Accusations on personal character tend to be bandied out, and pens —the appropriate weapons for duels of writers—are hastily drawn out to establish honour. This is a pity. The Age of Duels is over. I, for one, do not propose to indulge in a much overdone form of manly sport!

THE COMPANIES BILL

Meanwhile, decks are being cleared for action on another highly controversial question. This is the Indian Companies Bill which this week was considered with some little hush-hush in a meeting of the Congress Parliamentary Party. Some nimble persons, with their ears to the key-hole, tell me that no major changes via the Congress Parliamentary Party are likely to take place. It will be remembered, some time ago there were excursions and alarums that Parliamentarians wished to make the Bill even more drastic. It would appear that wiser counsels have since prevailed and members of the Congress Party now recognise that, in a highly technical question of this kind, the best they can do is to trust the Finance Minister who has not merely far greater knowledge of detail but also has (unhappy man!) the responsibility of obtaining resources for the second Plan. It is not going to be any easier for the Finance Minister to obtain resources if an obstinate brake is now put upon the active agents of India's business sector.

My key-hole reporter tells me that there is, however, not much satisfaction at the compromise that production needs should now run parallel the whole way with distribution desires. There is no doubt that in the rank and file of the Congress Party the importance of a larger cake is too often ignored while people concentrate on the division of what there is. This is reflected in the attitude to a patent error. The Finance Minister told the Lok Sabha on Wednesday that Section 197, a drastic section of the Companies Bill which deals with remuneration of Directors and Managing Agents, may come under the discretionary control of the Finance Ministry, meaning now that Companies will have to go to the Finance Ministry for an exemption against the operation of the vicious clauses of that section, or else run the gauntlet, hoping that losses will never be incurred. I, for one, would prefer to keep out of business with that section hanging over me like a Damocles' sword!

Perhaps my informant tends to read too much into the deliberations. For one thing they were incomplete and another, and presumably fiercer, party meeting is to be held on Thursday at an hour (alas!) when this Diary has, by editorial decree, to be both composed and printed. The daily newspapers did not see in Tuesday's meeting any surrender of the party to the executive. The compromise is not, it would seem, between production and distribution as operating factors in the economic scissors, but merely one on political authority to accept amendments of the Bill. The Finance Minister wished the Government to be given a free hand within the general framework of the Draft Bill. Apparently, this has only been granted subject to there being no departure from the Report of the Joint Select Committee on the Companies Bill. If this is taken literally, it would imply that the Finance Minister would have no discretion at all on the floor of the House. The Prime Minister's intervention was necessary to make it clear that it was impossible to be so rigid and there must be some latitude for the Government to frame amendments whilst keeping the party's view in mind. It will be interesting to see how party feeling develops. It shows how dangerous it is to put a radical measure in haste before the party; all too soon the General's retreat is cut off by his own side.

GOOD NEIGHBOURLINESS

There has been friendly comment in Delhi of events in Pakistan. There is general regret that the health of the Governor-General, Mr. Ghulam Mohammed, has taken a turn which looks as though it involves his permanent retirement. The courage and determination with which, while seriously ailing, he held to office and gathered together all the strings of power must command respect even amongst those who do not appreciate the semi-totalitarian manner in which the retiring Governor-General chose to move his political wonders to perform. It may be taken for granted that while he has been replaced by a new "strong" man, there will not now be in Pakistan decisive single personal rule. For one thing, the Constituent Assembly has come back with a voice of its own. For another, particularly now that Chaudhari Mohammed Ali has become Prime Minister, there is likely to be a determined personality opposite, if not in opposition to the Governor-General.

DUOPOLY IN POLITICS?

What happens when we have a clash of two personalities instead of the rule of one? I draw an analogy from economic theory which, for all I know, may be very far off the mark. Profound economics students tell me that in the theory of monopoly or the theory of a single producing unit, it is always easy to establish equilibrium by maximising the advantage of that unit. In the case of duopoly—or the case of two producing units—the problem is very far from simple. It seems that a process of price-cutting goes on until one or other party is ruined. It may even be, under special circumstances, that both are irretrievably hurt and there are no victors, like the cheerful situation which obtains after a global nuclear war. Can I tactfully point to the dangers of excessive duopoly in politics, with no countries named?

ARGUS.

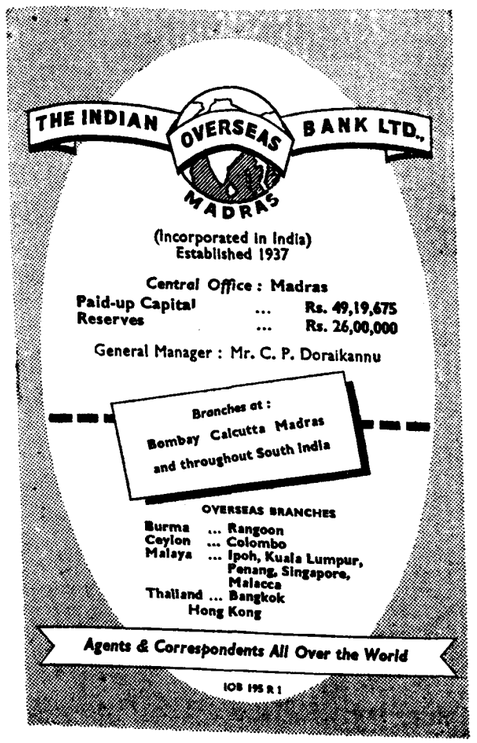
Economic Report from the U. S.

ATOMS-FOR-PEACE CONFERENCE

(By Guy Sims Fitch)

WASHINGTON, Aug. 9.—The United Nations Atoms-for-Peace Conference in Geneva has now come to grips with one of its most important subjects: industrial power and atomic energy. The debate is becoming progressively more technical, but in the background is always the question of new energy for factories and homes from city-sized central power stations driven by atomic energy. The reason is that civilian atomic energy—as the conference has already revealed—appears on the economic scene at exactly the moment when the world needs ever more industrial power and is faced with an early depletion of its conventional sources.

Some countries, for example, expect to reach the limit of goal and hydro-electric exploitation within 10 to 15 years. Among these are water-rich Italy and Switzerland—a stark reminder of the magnitude of the world's prospective power deficit.



The reports presented at Geneva show wide variations from country to country and even within individual nations—depending on natural resources and the state of economic development. But electric power consumption, on a worldwide average is doubling every 10 years—and the only sources in sight to provide such quantities of energy is the atom. Its attraction is not only potential abundance or the ease of transporting atomic fuel to regions now outside the main belt of industrialization. The attraction lies far more in a set of two facts: (1) cost of conventional thermal energy (with water providing but a fraction of total world power) is constantly rising; (2) by contrast, atomic energy is bound to become cheaper once large-sized central stations filled by uranium or thorium rather than coal or oil are technologically improved.

The great question of nuclear energy thus is how to reduce its cost. The answer has just barely begun to appear in the record of the Geneva Conference. It is the view of most of the experts there that the two curves—rising costs for conventional energy and shrinking costs for atomic energy—ideally interesect at a rate of about six-tenths of an American cent per KWh on a worldwide average. That is the generating cost (to the plant) rather than the end price (to the consumer).

Estimates on the present actual production costs of atomic energy vary. Firm calculations are expected to be possible only when full-scale plants have run for a while and have yielded actual operating experience. At the moment, however, many countries believe that atomic energy is coming close to the point where the cost curves intersect and atomic energy begins to be economically attractive. At the same time, others estimate generating costs at several times the six-tenths-of-a-cent rate. A more uniform estimate will perhaps be available when the experts have discussed the many variables that enter into the calculation. For it is the peculiar characteristic of atomic energy that it is almost fantastically variable. The fact is that a whole series of different type atomic furnaces, so-called reactors, each variable in itself, can provide propulsion for electric generators.

The United States, for example, has two different small-scale power stations in operation, one large-scale 60,000-KW plant under construction in shipping port, Pennsylvania, and five different types of experimental reactors—all for the sole purpose of determining the most economical one among them. In addition, some seven commercial stations are planned by private U.S. firms for the same purpose. The Soviets have one small-scale experimental reactor. It has been operating for about a year on about the same atomic principle on which the shipping port plant will operate, the so-called pressurized water principle. For a large 100,000-KW station reportedly under construction in the USSR, the reactor is to be changed in some important respects, although the pressurized water principle will be retained.

The United States now is apparently putting emphasis on pressurized water reactors (the shipping port type) and on the more advanced "boiling water" reactor. The latter type is about the simplest designed so far, with water serving as coolant for heat transfer and simultaneously as radiation block, with a resulting saving of a lot of steam pipes, valves and other such accessories. The Soviet pressurized reactor admittedly leaves something to be desired in the way of fuel efficiency, but experience gathered with the experimental power reactor will be applied to large stations. No indications on construction costs, a very important item, have yet come from the Soviet spokesmen. Americans expect to lower present construction costs, from two times the cost of modern coal-fired stations today, to one and one-half times that cost.

WORLDGRAM

AGRICULTURE

Agricutlural Credit Bank for Pakistan: Credit facilities will shortly become available for agriculturists with the establishment of the Agricultural Credit Bank in Pakistan. The way has been paved for the setting up of the Bank by an ordinance which gives special powers to the State Bank of Pakistan to give advance and loans to institutions specifically established for agricultural and industrial development on such terms as the Central Board may decide.

*

Paddy Cultivation in East Bengal: In the Daulatpur-Phultala Development Area in East Bengal the Japanese method of paddy cultivation is being introduced. Plots have been selected and prepared for transplantation of 'Aman' paddy according to the Japanese method which is expected to increase the yield by two or three tunes. The intensive work of the V-AID Programme has made the villagers community-development minded. On their own accord they have collected themselves into groups and cleared the villages of the encroaching jungles. Tanks full of water-hyacinth, which is a much dreaded growth in East Bengal have been cleared by the villagers voluntarily. They are now used for bathing and washing purposes.

*

Warehouses for Agriculturists: It has been announced that legislation to set up an all-India Warehousing Corporation and State Warehousing Companies would be brought during the current session of Parliament. All the preliminary arrangements for the setting up of the Corporation, a Warehousing board and a high-levelboard for national co-operative development were being made. Possible sites for the warehouses, without which grain banks could not be established, were being selected, design for which and the list of commodities to be stocked were being finalised. A pattern of the development of Co-operation, marketing and warehousing had also been laid down and this would be included in the second Five-Year Plan of State Governments.

*

Land Reforms: Two important land reform Bills—the Ajmer Bhoodan Yagna Bill 1955 and the Madhya Bharat Abolition of Jagirs (First Amendment) Bill, 1955 have received the President's assent. The object of the first Bill is to remove certain legal difficulties in respect of the donations of land made and to be made to the Bhoodan Yagna movement of Acharya Vinoba Bhave and its ditstribution to landless persons in Ajmer State. The second Bill amends the Madhya Bharat Abolition of Jagirs Act, 1951 and makes it possible for the Government to charge rent from all existing tenants and sub-tenants at the village rate assessed in the current settlement.

INDUSTRY

Electricity Output in April: During April 1955, 690 public utility power stations in India generated 688.6 million Kwh (kilowatt hours) of electricity of which 563.9 million kwh were sold to ultimate consumers. The new additions during the month were one diesel generating undertaking in Borgarh in Orissa and three purchasing undertakings at Rajangapur town in Orissa and at Nawsari and Rahalgaon in Madhya Pradesh. As compared to March, the electricity output descreased by 7.5 million kwh. The corresponding figures of output and sale for April 1954 are 604.9 million kwh and 504.4 million kwh.

*

Protection to Grinding Wheels Industry: The Government of India's Resolution on the Tariff Commission's Report on the continuance of protection to the grinding wheels industry has been published.The following are the main recommendations of the Commission:

1. The following types and sizes of grinding wheels should be excluded from the scheme of protection:
   (i) Grinding wheels having (a) more than 24 inches diameter or (b) less than 1/32 inch or more than 9 inches in thickness.
   (ii) Diamond impregnated wheels.
2. The protective duty on grinding wheels and segments of all kinds other than those to be excluded from the scheme of protection should be reduced from 50 per cent ad valorem exclusive of surcharge to 25 per cent ad valorem including surcharge. The protective duty should remain in force till December 31, 1957.
3. The varieties of grinding wheels excluded from the scheme of protection should be subject to a revenue duty of 25 per cent ad valorem including surcharge.

*

Pedestal Type Electric Fans: The Indian Standards Institution has prepared and circulated for comments, a draft Indian standard specification for pedestal type electric fans. This is the third in the series of Indian standards on different types of fans. The first two already published deal with ceiling and table type fans. The draft standard is an attempt to rationalize the sizes and types of pedestal fans and to lay down their minimum performance requirements. The draft recognizes only two sizes namely 16" and 24" and covers oscillating and non-oscillating types, as also fixed and adjustable height type? Besides laying down performance requirements, the draft standard covers design and general construction for satisfactory operation under tropical conditions, speed regulation, silent and trouble free operation, service value, permissible temperature rise, maximum permissible speed and such other requirements.

*

Draft Standard for Sodium Nitrite Technical: The Indian Standard Institution has issued a draft Indian standard specification for sodium nitrite, technical, mainly used in the dyestuffs industry. The draft standard prescribes the requirements and methods of tests for the characteristic of moisture and volatile matter, sodium nitrite content, matter insoluble in water, acidity and alkalinity, heavy metals and iron.

*

Cotton Yarn Production in Japan: The Ministry of International Trade and Industry has decided to slash cotton yarn production from the present 12 per cent to 16 per cent during the month of August for the purpose of stabilising the cotton yarn demand-supply situation. Production of cotton yarn in August will be held down to 163,800 bales as against 170,000 bales set for the previous three months. Prices of cotton cloth are still below production cost and cotton yarn stocks have failed to drop to the anticipated level as yet. MITI estimated that stocks at the end of June ran to an abnormally high amount of 496,000 bales.

*

Industrial Output in Yugoslavia: The volume of Yugoslav industrial production was notably higher in the first six months of 1955 than in the corresponding period last year. Yugoslav industry yielded 23 per cent more products in the first half of this year than in the January-June period 1954. The strong and steady upward bias in some of the basic industries primarily the electric power industry, petroleum industry, ferrous metallurgy, electric engineering and chemical engineering is a significant and characteristic

feature of industrial production in the first half of this year.

TRADE

Foreign Trade of India by Land with Pakistan, Afghanistan, Iran and Burma During June 1955: According to the land borne trade returns received in the Department of Commercial Intelligence and Statistics, the provisional figures of total value of foreign trade of India by land with Pakistan, Afghanistan, Iran and Burma during June 1955 are as follows:

Merchandise:

Exports	Rs. 89 lakhs
Exports to Eastern Pakistan	„ 47 „
Exports to Western Pakistan	„ 42 „
Export to other countries	Negligible

Merchandise:

Imports	„ 193 „
Imports from Eastern Pakistan	„ 185 „
Imports from Western Pakistan	„ 6 „
Imports from other countries	„ 2 „
Total Trade:	„ 282 „
Re-exports	Nil
Trade in Treasure	Nil
Balance of Trade	The total value of exports fell short of imports by Rs. 104 lakhs.

*

U.K. Oil Exports: The United Kingdom's exports of refined petroleum products during the first six months of the present year amounted to approximately 3,500,000 tons valued at £39,686,560. This compares with a figure of £40,747,949 for the previous half-year, and in view of the very considerable increase in home consumption over the same period the level of exports has been very well maintained. One interesting point in connection with the latest figure is that for the first time motor spirit has become the most important single product exports being valued at £9,793,775. It is thus slightly ahead of fuel oil, (£9,671,809) which has previously been the most important item in terms of total value. One major product to show a considerable increase as compared with the last half of 1954 was gas oil valued at £6,103,077, as against £5,574,227.

*

Franco-Indian Trade: Trade with India during the first two months of the year showed a credit balance in favour of France amounting to 1,967,035,000 Francs, while last years credit balance for the same period was only 276,841,000 Francs. The main progress registered in France's imports from India was in the case of textile raw materials (169,456,000 Francs) minerals, scoria, ashes and tobacco (143,062,000 Francs), hides and skins (118,743,000 Francs) and oil-seeds (89,686,000 Francs). France's main exports to India consisted of sugar and confectionary (1,425,376,000 Francs), steel alloys (180,828,000 Francs) inorganic chemical products (307,538,000 Francs), Yarn 120,997,000 Francs), iron and steel (162,344,000 Francs), tubes and pipes (180,328,000 Francs) and rolling stock material 97,901,000 Francs).

*

Trade Agreement between Sweden and Portugal: Swedish—Portuguese trade negotiations have recently resulted in the signing of an addendum to the current trade agreement in stockholm. The lists of goods now valid have been adjusted so as to confirm to the increased liberalisation carried through during the past year. For certain goods new and larger quantities have been fixed. New Swedish export quotas have thus been fixed for paints, varnishes, lacquers, skins and leather, machine felting, bicycles, tyres etc.

FINANCE

Grants and Loans to Small-Scale Industries: The Government of India have sanctioned further grants and loans totalling Rs. 32,99,713 to two-States—Punjab and Andhra for the development of small-scale industries. Punjab gets a loan of Rs. 28,50,000 which is to be disbursed as loans to small-scale industries in the State under the State Aid to Industries Act or other regulations in force for the purpose. Andhra has been given grants amounting to Rs. 3,71,073 and loans of Rs. 78,640, for the development of several small-scale industries in the State.

*

Loan for Irrigation Schemes: The Government of India have granted a sum of nearly Rs. 24 lakhs to promote the Grow-More-Food Programme of Jammu and Kashmir State, for 1955-56. Minor irrigation schemes have been granted a loan of over Rs. 22 lakhs. Among the main irrigation schemes for which loans have been granted are: The Roshipora Canal (Rs. 4 lakhs), the Mabind Canal (Rs. 2 lakhs), the Rakhi Littar Canal (Rs. 1.4 lakhs), two lift irrigation schemes (Rs. 7.6 lakhs) Ahij Nallah (Rs. 3 lakhs) and the Lolab Storage Tank (Rs. 1.2 lakhs). For the purchase of plant protection machinery a loan of Rs. 1,19,000 and a grant of Rs. 10,000 have been made.

*

More Aid to Khadi and Village Industries: The Government of India have sanctioned further grants and loans for the development of Khadi and village industries and handicrafts. Three institutions the Bihar Khadi Samiti at Muzafarpur, the Gandhi Ashram at Meerut and the Bombay State Village Industries Board have been sanctioned loans of Rs. 20 lakhs, Rs. 15 lakhs and Rs. 6 lakhs respectively for the development of the khadi industry. For the development of the village oil industry, Bhopal has been given a grant of Rs. 9,675 and a loan of Rs. 6,500. On the recommendation of the All-India Handicrafts Board, a loan of Rs. 16,125 has been sanctioned to Hyderabad for providing the share capital and the working capital for the development of the Paithan industry in the State.

MISCELLANEOUS

Data About First General Election: Eight and a half crores of voters casted their votes in the first general elections held in India in 1951. The total number of candidates of all political parties who contested the elections was 17,500 and the number of seats 3,862. The average number of candidates per seat would thus work out to 5. To facilitate the exercise of voting rights of so large a number of citizens, the authorities provided 25,84,945 ballot boxes. The total cost of the elections amounted to about Rs. 10.4 crores, of which the ballot boxes cost Rs. 1.22 crores. The average cost of the elections, however, was not high being annas 9.6 per voter for both Parliamentary and State elections. The cost per voter per election was still lower the figure working to about annas 4.8 only.

*

Reactors in World—20 More being Built: A survey of world development of atomic energy disclosed that 42 nuclear reactors are known to exist in the world—and 20 more are now being built. Forty-eight other reactors are being planned for construction. The survey was conducted by the Atomic Industrial Forum, a non-profit group of Americans from all fields working to encourage the peaceful development of the atom. The report, which took a year to complete and covers 32 nations, said reactors now exist in the following countries: 29 in the United States, five in Britain, two in France, two in Canada, and one each in the Soviet Union, Norway and Sweden. Of the 20 reactors under construction, nine are in the United States, three in Britain, three in Europe and one each in Australia, Belgium; Canada, India and the Soviet Union. Great Britain plans construction of 22 reactors and the U.S. plans 16.

NEWS IN BRIEF

INDIAN

In accordance with their policy of keeping export duties under constant review, the Government of India have decided to exempt with effect from August 2, 1955 all types of jute manufactures from the exporty duty leviable thereon.

*

The per-capita consumption of sugar, gur and khandsari for the 1954-55 season (November-October) is estimated at 27.58 lbs.

*

The first consignment of broad gauge locomotives being given by Canada to India under the Colombo Plan has been received in India and will shortly be put into service on the Indian Railways.

*

The total amount deposited in the Steel Equalisation Fund up to March 31, 1955 was Rs. 46,14,815. The total receipts into the Fund during the four years, 1951-52 to 1954-55 were Rs. 28,71,18,509 and expenditure from it Rs. 21,23,15,564.

*

The Planning Commission has approved three schemes costing Rs. 14.46 lakhs for the expansion of power facilities in rural and small towns in Rajasthan to increase employment opportunities.

*

The plant quarantine stations at the four-air-ports, Delhi, Bombay, Calcutta and Madras, which are proposed to be set-up under the second Five-Year Plan, are estimated to cost more than Rs. 2 lakhs.

*

The Government of India is examining an offer made by the French firm of Kerbs to instal a fourth oil refinery at Bhavnagar in Saurashtra, according to a report in the London "Financial Times". The capacity of the proposed refinery which is to cost about Rs. 12 crores will be 1 to 1½ million tons.

*

The Government of India have agreed to sanction a loan of Rs. 1 crore to the Bombay Government to be utilised for subscribing to the share capital of ten-co-operative sugar factories. A loan of Rs. 40 lakhs has similarly been provided to the Punjab Government.

*

The Government of India is considering the question whether they should participate in any negotiations for a reduction in customs duties that may be held in the near future under the aegis of the General Agreement on Tariffs and Trade.

*

An Indian concern is planning to start a factory in South India for the manufacture of rough synthetic stores. An agreement had been reached with a foreign firm for the purpose and sanction had been given for capital issue.

*

The total quantity of fertilizers imported so for under the Indo-U.S. Technical Co-operation Agreement was 2,39,400 tons as on June 30, 1955. A part of the amount was in transit.

*

The amount of aid received in the shape of materials and equipment by India during 1954-55 under the Colombo Plan was Rs. 2.76 crores. During the same period assistance by India to Nepal under the Colombo Plan amounted to Rs. 2,44,16,840.

FOREIGN

The U.S. has paid its annual U.N. dues for 1955. The figure totals more than $13 million. It represents one-third of the total U.N. budget and costs each person in the U.S. about eight cents.

*

In May, 1955 in America, personal income-wages, salaries and other types of individual income—had reached an annual rate $301,000 million, compared with $293,500 million in the first quarter (ending March 31) of this year, and a quarterly peak of $288,000 million in 1953.

*

Afghanistan has become the 57th member of the International Monetary Fund and the International Bank for Reconstruction and Development.

*

It is reported two atomic power stations would supply electricity to the London, Birmingham and Bristol areas by 1960.

*

Over 120 exhibitors, including leading manufacturers of radio and television receivers will take part in Britain's National Radio show to be held at Earls Court, London from August 24 to September 3, 1955.

*

The Khairpur State Government has launched a scheme to prevent diseases in sheep. A laboratory has been established with United Nations' help for this purpose.

*

Italy is now the world's fifth largest cement producer. Its output in 1954 amounted to 8.9 million tons. Italian consumption is expected to exceed 11 million tons per annum by 1957.

*

The fifth session of the Textiles Committee of the I.L.O. will be held at Geneva from September 26 to October 8, 1955.

*

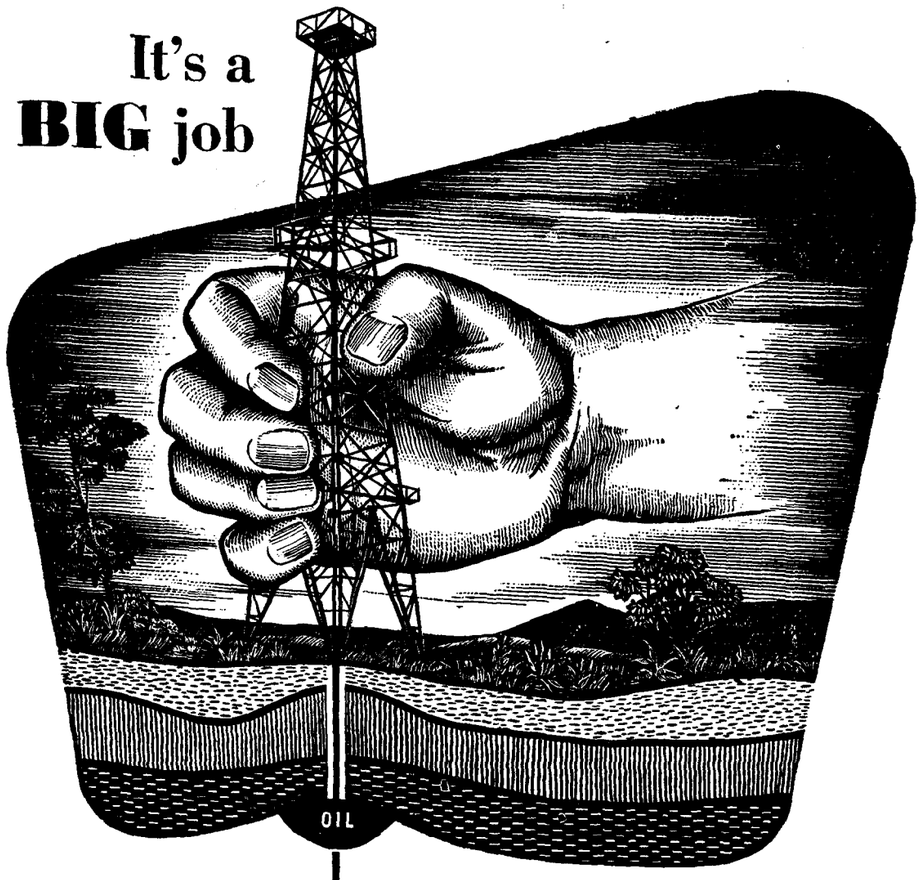
A new dry dock, to complement the existing smaller naval dock at Karachi, has been commissioned by the Pakistan Development Corporation. The dock, which will take vessels upto about 12,000 tons, is the first to be designed within Pakistan.

*

Three countries—Thailand, the Soviet Union and Yugoslavia—have so far offered scholarships for overseas study to students from non-self-governing territories, in response to a request by the United Nations General Assembly.

*

A reciprocal deliveries and payments agreement for 1955 has been signed by representatives of the People's Republic of Bulgaria and the Hungarian People's Republic. By the terms of the agreement Hungary will supply Bulgaria with harvestor-combines, oil products and chemicals in exchange for chemical products, artificial fertilizers, tobacco, etc.



*

During the first half of this year, production of crude oil in the Middle East totalled about 79 million metric tons—the highest figure ever recorded. It was nearly 10 per cent up on output in the previous six months.

*

The Government of Turkey has signed a contract with Krupp of Germany, for the construction of a 600,000 ton steel plant. The estimated cost of £T150 million will be financed by German long-term credits and Turkish banks.

It's a BIG job looking for oil

Have you ever considered what a long, elaborate and costly business it is looking for oil ? Although oil lies thousands of feet underground, the oil prospector may have to take to the air—to photograph the lie of the land and make aeromagnetic surveys. Or he may create artificial earthquakes, in what is called a seismic survey. Then the findings have to be interpreted, in geophysical laboratories, before a test well is bored perhaps to a depth of as much as three miles.

The Assam Oil Company, for many years the pioneer of oil search in India, discovered a fresh source of oil recently at Nahorkatiya in Upper Assam. Crores of rupees have been spent in the search and many more will have to be spent on the development of this discovery.

And all the time, remember, the search for more oil is going on—for further sources of this most elusive mineral are vital for India's industrial development. All the very latest scientific methods and technical equipment, including aeromagnetometers and even helicopters, are being employed. No effort in fact is being spared to reduce India's dependence on oil purchases from abroad.

PLANNING AND DEMOCRATIC FREEDOM

(A PLEA FOR ORGANISED RESEARCH IN PROBLEMS OF FREEDOM)

(Contributed)

THE economic development of an underdeveloped economy generally requires enterprise under different auspices than that of the private entrepreneur. The exact locus and distribution of the required entrepreneurial function would vary with the relative state of the underdeveloped economy vis-a-vis the developed economy which it seeks to imitate. The difficulties connected with the problems of saving, investment and the creation of market-demand inevitably result in the necessity of what is generally known as "Planning".

It is equally accepted that planning, particularly under State auspices, leads to a tendency towards curtailment of democratic liberties. The term "democratic liberties" is consciously meant to be contrasted with and distinguished from the so-called "real liberties" of the so-called real "people's governments". They cluster around such things as freedom of speech, freedom of press, internal autonomy of various learning-and-culture centres, opposition parties, independent judiciary, habeas corpus, free elections, different employment authorities, etc., etc.

Such a tendency can hardly be of any serious concern to those persons, parties or countries that have little value for the democratic liberties. Still less can it matter for those who are ideologically committed to a different set of values or who are convinced that this set of values was merely a natural resultant of certain historical conditions and would pass away with their passage.

The problem, however, can be fairly serious for those who cherish the democratic values and feel the necessity of some sort of developmental planning at the same time. Our country, undoubtedly, is in this challenging, though difficult, situation and the success or failure of the experiment may have significant repercussions in the countries of Asian and African continents.

The Prime Minister in his recent address to the Yugoslav Parliament reiterated his faith in democracy and individual liberty, and Prof. Mahalonobis has already submitted the draft-frame of the second Five-Year Plan and planning on that basis is proceeding. We, thus, stand committed both to democratic freedom on the one hand and to planning on the other.

Our democratic freedom is supposed to be guaranteed by the Constitution and safeguarded by the ever-watchful eye of the judiciary. India can, in truth, be proud of the fact that it has not liquidated a single person for political or economic reasons since the achievement of political independence or the launching of its first Five-Year Plan as against the millions that have met that fate in Soviet Russia, Communist China or the Cominform countries. No cultural confessions have yet been made and there is a fair amount of freedom of speech and organisation, though, perhaps, there seems to be a tendency for greater governmental blessing to the Indo-Chinese and Indo-Russian friendship Associations than for the Indo-British or the Indo-American ones.

It is, however, well-known to any student of politics, sociology or law that democratic freedoms are not guaranteed by constitutions or safeguarded by judiciaries, parliaments or newspaper-editors but by a living tradition nurtured by centuries of practice and thought which makes the legislator, the executive official and the general public feel almost intuitively when a wrong step is taken. India is an infant-democracy and, thus there lies a very heavy responsibility on its political, intellectual and cultural leaders to see that a healthy tradition is laid and that no tendencies are encouraged which may interfere with its sturdy growth. The role of the ruling party in power is crucial in this respect, though no little responsibility lies on the leaders of the opposition and the elite of the intellectual and the press-world also. Unfortunately, in an underdeveloped country the democratic entrepreneur has also to be the State.

The Planning Commission, the Panel of Economists, the Statistical frame-drafters, the Cabinet, the Parliament and the hundred-and-one groups are only interested in the targets of production and employment, the raising of investment funds, the division between private and public sectors, between capital and consumer goods, between large-scale and cottage industries, etc., etc. These are matters of immediate interest, discussion and dispute—for, the problems with which they concern are pressing and hard. The freedom-effects of these measures are hardly anybody's interest or business. In fact, it is presumed by everybody that freedom is already assured and that only economic ends need being achieved. The concrete necessities of the moment overwhelm human consciousness and it is natural that men be concerned with what strikes their immediate eye.

But planning means to see below the surface, look into the future and provide for possible dangers. And democratic freedoms are not something to be achieved for once and all but to be preserved and enlarged by a continuous vigilance that wanders not nor lessens a bit. It is imperative, therefore, that the preservation and enlargement of the area of democratic liberties be a part of the framework of the Plan itself. At least, there should be a conscious awareness of the areas where specific measures of planning curtail the existing democratic liberties and an open discussion whether alternative methods cannot be found that shall achieve the same ends. If the liberties are to be sacrified to economic exigencies, it should be done with full consciousness and public participation rather than covertly and in an unconscious drifting manner. Equally, it may be necassary to give up some types of ostensive economic ends for the sake of democratic liberties. The two values are equally important for us and in case of any specific conflict between the two, there is required a delicate balancing that shall decide as to which of the two is to be sacrified and in what measure.

This can only be possible if there is detailed, unimpeachable information as to where and how our democratic liberties are being strengthened or endangered by the various measures that the Union and the State Governments undertake. Men of undoubted integrity, high quality and committed to democratic values can, with the help of a research staff, easily perform this function. People all over the country can voluntarily write to them and, with proper weightage,

sifting and verification they can incorporate the information in their quarterly or half-yearly reports. They can give the country the danger-signal when measures have gone too far in a certain direction and provide to the government, which itself is committed to democratic values, data that will help it to come to a decision on broad matters of general policy.

It is, therefore, suggested that the Planning Commission or the Government should provide finances for the setting up of an Institute whose chief task would be to study the freedom-effects of the various measures or policies that the government undertakes and to provide information as to how, where and when the democratic liberties,which this country, its government and its people so much cherish, are endangered. Its reports should in every case be made public so that it may arouse the widest possible discussions in this country. The Institute should be completely independent and an autonomous body. The persons to be appointed should enjoy the conditions of pay and security of service equivalent to those enjoyed by the High Court Judges in this country.

The conditions, as everybody knows, are a matter of detail and can be worked out by experts more competent than ourselves. What is required, however, is the intense realisation on the part of our people and government of the imperative need of the function that this Institute is supposed to fulfil.

It will be an unfortunate and even suspicious circumstance if the government does not accept the need or the necessity of such an Institute. In case this happens, it is the duty of public-spirited persons who have any love for democracy to create such an institution themselves. Perhaps the easiest way, if we fail to find even such persons, would be to suggest it as a subject for Ph.D research in History, Politics and Sociology in different Universities. This would involve least cost, but we do not think it would be necessary to resort to it as an alternative to other measures but rather as a supplement to them. It will be a bad day for India's democracy when it remains the only alternative and then, perhaps, even it would be ineffective.

The Prime Minister has recently emphasised with reference to Goa that the area of Peace should be preserved and enlarged and that in the world of today Peace is indivisible. It should, however, be equally remembered that the area of democratic liberties needs as constant a vigilance for its preservation and enlargement as the area of Peace and that like Peace and Prosperity it too is indivisible in the world today. It may not be politic, according to the Prime Minister's policy of dynamic neutrality, to talk about the great danger that the deprivation of democratic liberties in the friendly totalitarian countries holds to the area of Freedom and Liberty all over the world. But it will certainly be suicidal if the same indifference is shown to the preservation and enlargement of the area of democratic liberties within our own country, for we are convinced that the values of democracy and individual liberties are as strongly held by the Prime Minister as by anybody else in this country.

We suggest, therefore, the creation of an institution which will serve, in terms of modern communication theory, as a negative feed-back in the political life of our country.

FINANCING THE SECOND PLAN

SERIOUS concern has been expressed in Delhi in the last month about the shortage of financial resources for India's second Five-Year Plan. In the draft plan-frame it was assumed that the rate of capital formation would rise to about 11 per cent in 1961 and as a result resources of the order of Rs. 5,600 crores would be made available for development expenditure. The precise formula by which this has been worked has not been previously described, and it is, therefore, useful to set out the details of this calculation. These are given in Table I below.

TABLE I.

Year	National Income Rs. Crores	Increments of Income I	Capital Formation	Increments of Saving I'	I'/I ×100
1955-56	10,800	..	641(5.9%)	..	..
1956-57	11.300	500	791(7%)	150	30
1957-58	11,825	525	946(8%)	155	30
1958-59	12,375	550	1,114(9%)	168	30
1959-60	13,000	625	1,300(10%)	186	30
1960-61	13,700	700	1,507(11%)	207	30
			5,658		

It will be seen that the calculation is based on the assumption that about 30 per cent of an increment of income is saved.

It is now clear that the rate of marginal voluntary saving in India is not nearly of this order. In a Special Article on "India's Marginal Rate of Capital Formation" published in 'The Eastern Economist' of August 5 it was shown that the marginal rate in terms of official figures does not exceed 15 per cent. If this figure is applied to the income figures of the draft plan-frame, the rate of capital formation might be assumed to move about from 6.6 per cent and 8.4 per cent, giving total capital formation at Rs. 4,813 crores against Rs. 5,658 crores in the previous case. In other words, the effect of applying the current rate of marginal saving is to reduce total saving by something like Rs. 800 crores.

TABLE II

Year	National Income (Rs. Crores)	I	Capital Formation	I'	I'/I ×100
1955-56	10,800		716(6.6%)		
1956-57	11,300	500	791(7.0%)	75	15
1957-58	11,825	525	870(7.4%)	79	15
1958-59	12,375	550	953(7.7%)	83	15
1959-60	13,000	625	1,047(8.1%)	94	15
1960-61	13,700	700	1,152(8.4%)	105	15
			4,813		

It would be foolish to deny that Rs. 800 crores, although it constitutes a fraction of the total expenditure, is a decisive quantity so far as the financing of the Plan is concerned. There is no doubt that with political hopes raised by the draft plan-frame and the very significant state of political pressures which now bear upon the Finance Minister a total development programme of less than Rs. 6,000 crores will be almost impossible to apply. The question therefore arises as to whether an expenditure of Rs. 1,200 crores over the rate of voluntary saving in the country constitutes inflationary pressure which will spell severe disorder.

The assumption that expenditure in excess of current saving is inflationary arises from the belief that the stream of resources for consumption remains constant while monetary pressure increases. To the extent that the stream of consumable resources increases it sets in operation a deflationary movement. An assessment of the total price situation cannot be obtained without reckoning in the force with which this deflationary movement will operate in the period of the Plan. Unhappily no studies have been made about the deflationary character of the investment process in the second Five-Year Plan.

There is, however, a strong belief that the Indian economic system can take an element of deficit financing rather larger than the Rs. 1,000 crores. A reason can be found for suggesting that this figure errs on the low side. India's money supply in relation to her annual net product is very low at about something like 20 per cent. Table III below shows the net national product and the money supply of various advanced countries in the world. It is generally assumed that a figure of money supply equal to 50 per cent of net product is neutral to prices in an advanced country. Prof. Colin Clark, Director, Agricultural Economics Research Institute, Oxford University, who was in New Delhi last week gave it as his opinion that over a period of about 30 to 50 years India's money supply could be raised to a similar figure without net inflationary consequences. If we assume that India's real national income is doubled in 20 years and is equivalent to Rs. 22,000 crores at the end of that time, this might conceivably justify money supply rising from about Rs.2,000 crores at the present time to Rs. 9,000 crores in 1975. The average rate of rise would then be less than 15 per cent per year. Applying similar figures over the next five years a figure of Rs. 1,500 crores might be suggested as the appropriate figure for deficit financing between 1956 and 1961. If deficit financing of Rs. 1,500 crores (outside true saving) is employed, it will be seen that the necessary finance for a development programme of Rs. 6,000 crores would be available. This figure would still require pruning in the plan-frame and for a drastic limitation on non-productive current maintenance so as to release funds for development. But it may be it provides a way out. This is a profitable line for investigation and deserves careful scrutiny, seeing that the country is in no mood for a reduced investment programme or for drastic compulsory saving.

TABLE III

Country	Year	Currency Unit	National Income	Total Money supply	Percentage of money supply to national income
1	2	3	4	5	6
Australia (a)	1953-54	million £A.	3,714	1,538	41.4
Canada	1954	million dollars	18,735	5,456	29.1
France	1953	1000 mill. francs	10,470	4,630	44.2
West Germany	1953	1000 mill. d. marks	103.7	23.44	22.6
India (b)	1953-54	1000 mill. rupees	106.0	18.43	17.4
Japan (b)	1953-54	1000 mill. yen	5,964.9	1,438	24.1
U.K.	1954	million £	15,543	5,720	36.8
U.S.A.	1954	1000 mill. dollars	300.0	134.3	44.8

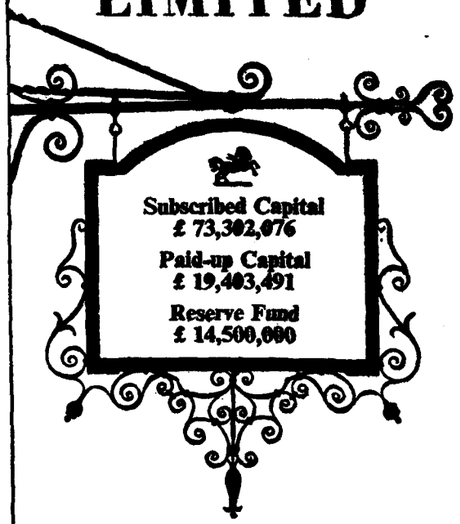
(a) Year beginning from July.
(b) Year beginning from April.

"The Eastern Economist"

BLUE SUPPLEMENTS

THIS is a new monthly feature of last issue in each month dealing comprehensively with a highly topical economic subject. The first of these supplements dealing with Indian Company Law appeared with the issue dated 29th July, 1955. The one that will appear this month will deal with "The Indian Coal Industry."

Subscribers to "The Eastern Economist" will receive these supplements free of charge. Single copies of the supplement are available at annas eight each or at separate subscription rate of Rs. 5|- for 12 copies in a year commencing from any particular month on or after July, 1955 for those who need the extra copies of the supplement alone.



Annual subscription to the weekly "Eastern Economist" inclusive of the Supplement and Special Numbers remains unchanged.

LOGIC OF LABOUR LEGISLATION

BY

CROESUS

IT is heartening to find that our Labour Ministers have at last begun to appreciate that the pace of labour legislation in recent years has been rather swift and also that the objective underlying labour legislation is not merely to give increasing benefits to labour but also to maintain production and all-round national prosperity. These sound views were expressed by Mr. Shantilal Shah, Minister for Labour and Health, Government of Bombay, last week, when the Committee of the Indian Merchants' Chamber and the Industries Sub-Committee of the same body met him to discuss certain matters connected with labour.

The spokesmen of the Chamber pointed out, and correctly, that, since the attainment of Independence, no other section of the community has received so much attention at the hands of the Government as industrial labour. They, of course, made it clear that they were not against the idea of social progress envisaged by the swift legislative measures to raise the workers' living standards. They only wanted to urge the imperative need for a greater degree of graduality, so that the rate of progress in one centre, apart from being correlated to the position and financial capacity of the industries concerned, could be adjusted to the rate of progress of wage earners in other centres. At the same time, they wanted it to be understood that employers have already done, and continue to do, a good deal for the welfare of labour and incidentally complained that this fact had not been fully appreciated either by the Government or by the workers. According to them, a proper appreciation of the stand of employers would lead to greater readiness on the part of labour as well as of Government to understand the handicaps that now prevent the industry from increasing its efficiency and output, and they rightly added that labour should march forward towards a happier and better life only by increasing its efficiency and output. Accordingly, the IMC spokesmen appealed to the Government, if the larger objectives of improving production, increasing output, reducing costs, and securing better efficiency were to be served, not merely to be guided by ideological considerations but to regulate the pace of legislation in terms of the actual conditions obtaining and to suit the requirements of the situation. They also pointed out in this connection certain aspects to be borne in mind in determining the pace and extent of industrial legislation by reason of the fact that such would go directly to add to the cost of manufacture. In the first place, according to them, the capacity of the industry concerned to bear the financial costs of these measures should be considered, and, in judging the capacity of the efficiency, they insisted, such must have reference to the capacity of the general mass of the population, in that they it is who ultimately have to bear the increase in the costs involved. They also wanted the problem to be viewed from the point of view of the effect on the structure of costs in industry in general.

It was in connection with this reference to the pace of labour legislation in recent years that Mr. Shantilal Shah replied that he too admitted it (the pace of labour legislation) to be rather swift. But, while he assured the employers that suitable remedial measures would be taken if any legitimate grievances were brought to his notice, he seemed more to justify the pace of legislation, swift though he admitted it to be. Thus he pointed out that such was necessitated by the fact that "we are in a dynamic society and Government has to take proper measures to suit the changing circumstances". "In the sort of society that we are trying to evolve", he added, "equitable distribution of wealth and removal of inequality assumes greater importance and it is necessary to give increasing reliefs to labour". This conviction doubtless explains his approach to the question of compulsion on newly started industries to provide housing for labour. The IMC spokesmen had made a specific mention to the compulsory provision to provide houses for labour even before a factory is started. They said that one of the reasons why new units were not being set up was this compulsion. They went even so far as to suggest that the labour policy of the Government had greatly contributed to the fall in employment in the country. It was their contention that numerous laws were passed conferring benefits on labour, which, in their turn, had imposed unduly heavy financial burdens on the employers, without any compensatory return from labour by way of increased production or otherwise and that some of the provisions contained in these laws tended actually to discourage new investments. In fact, they said: "the safeguards to labour are becoming so onerous that the employers are not willing to engage new hands and risk additional liability even in cases where there is scope for profitable expansion of industries and resulting employment". But Bombay's Labour Minister expressed the view that the compulsion about housing was essential in the context of the acute housing shortage problem in the State. He failed to appreciate why an employer who could invest huge capital on plant and machinery should consider it as a great burden to make an additional investment on housing for his own labour. The simple explanation, of course, is that, in a country where capital is so scarce and shy, any call, however desirable, to add to the meagre capital forthcoming would be unthinkable. Besides, if such outlay is not spread over a series of years after the industry is established when it could more easily meet the cost out of profits, it would amount to inflating the capital costs and making them topheavy. There is also the question of the return on the industry. While it is true that providing houses would make for a relatively more contented labour force, one has also to consider the rival claim of the shareholder, who contributes the sinews of the industry by way of capital, for a speedy and handsome return.

Latterly, as complaints about hardships arising from lay-off and strikes have been growing in volume, there would appear to be a greater awareness on the part of Government to these difficulties. As early as last May, when he inaugurated the 14th session of the Indian Labour conference, it may be remembered, Mr. Morarji Desai, Bombay's Chief Minister, referred to these provisions and observed that they weighed too heavily on the smaller establishments which had to close down for reasons beyond their control and stressed the need for a fuller consideration of this aspect of the matter. The IMC Chairman pointed out that it was only in exceptional cases and circumstances beyond one's control, such as shortage of raw materials, want of necessary finance, lack of continued business due to loss, and competition from imports, etc., that one would decide to retrench one's staff or workmen. At such a time, as he rightly pointed out, one would need help and assistance to carry on the business and not any additional financial burden in the form of retrenchment compensation to workers which would only make one throw up one's hands in despair and compel one to close down one's business. He also made the further pertinent point that there must be some distinction between established undertakings and new undertakings in regard to this matter. Just as new units are exempted from payment of income-tax, he argued it was necessary to ensure that new units were not burdened with the payment of retrenchment compensation for a good number of years. It would appear that Mr. Shah also shared the view that some of the provisions did weigh rather heavily, especially on smaller units. But it is not known what he said he was going to do in order to provide the relief required.

The necessity for uniformity in labour welfare measures throughout the country was another point that the IMC spokesmen raised in the course of these discussions. Under the law of the country as it stands, as every one knows, most labour matters are enumerated in the concurrent list which makes it possible for any State, Part A or Part B, to enact laws in respect of these matters. As a result, there has been a diversity of labour policy in different parts of the country and this, it was contended by the Chamber, was not conducive to good relationship between employers and labour. Unilaterial control on the part of different states thus without any regard to the conditions obtaining in other states would also result in a disparity in working conditions to labour which would cause unrest and discontent among workmen in the states where these happen to be less favourable. Again, the action taken, in particular by certain state governments under the powers vested in them in regard to central legislation such as the Minimum Wages Act, would affect the cost of production for the industry concerned as, for instance, in the salt industry in Bombay State. The recent application of the Minimum Wages Act to this industry in this State has had the undesirable effect of stepping up production costs in Bombay State, with the result that the consumer here is obliged to pay a higher price for his salt than his counterpart in other states. In order to get over this, it is only natural for the consumer in one state to prefer the cheaper products of another state. Hence the plea that it is essential that efforts should be made for bringing out uniformity in state legislations and also in the matter of implementing the provisions of certain central enactments.

To all these pleadings, Mr. Shah had only this to say, namely that uniformity in labour legislation was not possible in a vast country like India with diversity in local conditions, customs and manners. It is for this reason, he explained, that matters pertaining to labour have been included in the concurrent list. However, on the question of fixing minimum wages and disparity in different states in this regard, he disclosed that the Government of Bombay had already made representations to the Central Government indicating the desirability of, and the need for, effecting co-ordination in the matter of fixation of minimum wages.

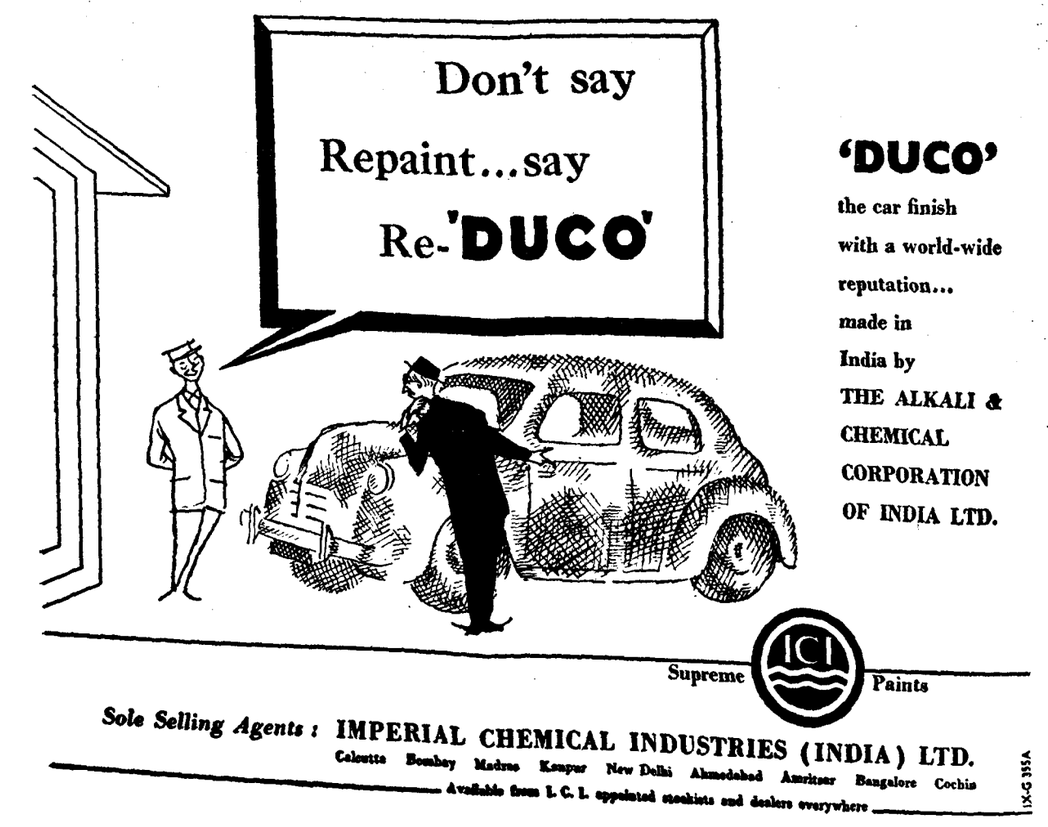
With regard to a few other points, such as the question of obtaining the consent of workmen for doing overtime work and difficulties experienced by the application of the Payment of Wages Act to establishments covered by the Bombay Shop and Establishments Act in the matter of deducting insurance premia from the salaries of their employees, Bombay's Labour Minister gave reassuring replies. Only on one point, namely, the plea of the employers for the removal of the prohibition of appearance of lawyers before labour courts and industrial tribunals did he not only not agree with the employers, but actually made a counter-suggestion. Mr. Shah stated emphatically that such a prohibition would not solve the grievance of employers and pointed out that commercial bodies and employers could help their members better by setting up a bureau for giving them advice on questions of labour legislation. Perhaps he is not unaware that even now, such bureaus do exist as, for example, the Labour Advisory Bureau of the Bombay Chamber of Commerce. But the fact that, notwithstanding this, the employers' spokesmen raised the question seems to suggest that these bureaus, helpful as they have no doubt been, are not an effective substitute for the service that specialised lawyers could give in representing the grievances of employers before labour courts and industrial tribunals.

GETTING OFF TO A GOOD START

By

CROESUS

IN the same week in which Mr. G. D. Birla was deprecating the disputation about the functions of the private sector and the public sector, Sir A. Ramaswamy Mudaliar, Chairman of the Industrial Credit and Investment Corporation of India, Ltd. (I.C.I.C.I.) was also telling another audience in Bombay—the statutory meeting of the Corporation—that it was unfortunate to hold, as some did, that the Government of the day was not in favour of encouraging development of industries in the private sector. "The most tangible proof of the intentions of the Government to see that the private sector develops pari passu and perhaps in a complementary way with the public sector", he declared, "is in the co-operation that they have extended in a very substantial manner to the establishment of the Corporation". It may be remembered that the Government of India, in accordance with the understanding with the promoters of the Corporation, has placed Rs. 7½ crores at the disposal of the Corporation free of interest. This, by the way, is Rs. 2½ crores more than the paid-up capital itself of the Corporation. The I.C.I.C.I. can count on other resources too, besides these Rs. 12½ crores. As the Chairman of the Corporation pointed out, the International Bank for Reconstruction and Development (the World Bank, for short) has agreed to make available to the I.C.I.C.I. $10 million in any currency that the Corporation may require to meet the cost of imported machinery in connection with the projects which it undertakes to finance.



Although the Corporation commenced business on March 1, 1955, it is only during the past three months that it could actually call for and deal with applications for help. Accordingly even the progress that it has been able to make, namely to "offer to provide substantial financial aid for two propositions—one of a new industrial venture and another the expansion of an existing industry"—must be regarded as gratifying. In addition, it is stated, there are more than 20 "promising propositions" on hand. We will know more about these when the first annual report is published. Meanwhile, Sir Ramaswamy Mudaliar has reiterated the functions of the ICICI. He said that it "is solely concerned with the promotion, expansion and modernisation of industries in the private sector. Such assistance as it can give, either in the form of finance or

technical know-how or managerial help, is confined to industries in the private sector and is not intended to be extended either to those industries which are in the public sector or under any public management."

The following further extract from the ICICI Chairman's speech dealing with the same aspect bears reproduction, as it would be needed for reference later on in judging the work of the Corporation:

"The Corporation, however, has no preconceived ideas on the subject of financial assistance and is ready to consider on their merits whatever proposals may be put before it whether they involve a loan, a subscritpion to Preference or Ordinary Shares, on the Underwriting of market issues of capital. In the applications before us, all these forms of assistance have come up for consideration. A pre-requisite for the operation of the Corporation in regard to any application or project is that it must be conceived on sound commercial lines. The Corporation is not interested in mere money lending—its ultimate objective is promotion and development of industries in the private sector and while the adequacy of the security offered and the competence of the personnel in charge of the industries concerned are two of the principal considerations, they are not by any means the sole criteria. One of the objects of the Corporation is to furnish managerial, technical and administrative advice and to assist in obtaining managerial, technical and administrative services to Indian industry. Here is where the fundamental difference lies between the scope and activities of your Corporation and the scope and activities of purely Financing Corporations which lend money on adequate securties. A more positive constructive and responsible duty is cast on this Corporation by its Memorandum and Articles of Association, and rightly so, to assist applications to qualify themselves for the proper management and conduct of industries in which they are interested. There is a reason why the Corporation undertakes this special task. If the private sector is to survive, it must be broadbased and not concentrated in the hands of a few industrialists of undoubted eminence and ability. The more enterpreneurs are drawn to the management of industries, the sounder will be the basis on which the private sector can stand and justify itself".

It is noteworthy that Sir Ramaswamy Mudaliar also laid stress on the problem of unemployment. "The unemployment of the educated classes', he averred, "is one of the gravest problems that is facing the Government and the country and has been a spur to the plan which the Government and the public have of promoting industrial development". In view of this, particular importance attaches to his plea for a synthesis between the schemes in the public sector and the private sector. Such is needed because of the scarcity of our resources, on the one hand, and the consequent likely danger of the Government appropriating to itself the greater portion of these resources to the neglect of the private sector, on the other. If this should happen, he did well to warn in unequivocal terms, "there is a great danger that development in the private sector will languish and will almost become impossible". It is to be hoped, therefore, that, in their understandable anxiety to have large schemes carried out in the public sector, the authorities will not be unmindful of the serious consequences to the country's economy of their enthusiasm getting the better of their discretion and judgment.

BUSINESS NOTES

SUSPENSE OVER COTTON EXPORT

COTTON HAS been very much in the news of late. With the uncertainty of the U.S. cotton policy hanging like Democles' sword—it has a nuisance value to cotton markets all the world over—one can only have a very hazy view of cotton export prospects in countries outside the U.S. That the uncertainty over the U.S. cotton surplus disposal Plan has been causing serious concern in cotton markets is evidenced by the recent statement of the President of the British Board of Trade in the House of Commons that Britain would use every appropriate method to bring home to the United States the urgent need for an early announcement of her cotton export policy for the coming season and that he would continue to urge America that she should not take any action as might endanger world trade in cotton. Following this, President Eisenhower's 'disclosure' at a Press conference that served to add further to the uncertainty.

Although there is evident anxicty in the minds of cotton men in India as to what shape the final U.S. disposal programme might take, they can have some consolation from the developments following the devaluation of the Pakistan Rupee, namely, reduction in the export duty on all exportable varieties of cotton of as much as Rs. 75 per bale. We had pointed out ere now in these columns that the comfortable statistical position of Indian cotton for the 1954-55 season would permit of a good quantum of exports, provided there were an extension of the validity period of licences. This latter too has since been effected by the Government of India. It has granted extension of the validity of the unutilised export licences issued for permissible varieties of Indian cotton during the present season till the end of December. Out of a total export quota of 4,50,000 bales, it may be noted here, about 2,50,000 bales have been shipped, leaving a balance to be exported of 2,00,000 bales. The granting of an additional quota for export of Zoda cotton to the tune of 5000 bales on the top of this is a clear indication of the bright prospects ahead especially in this style. As it is, export business has been brisk in this variety, inasmuch as the original ceiling of 30,000 bales fixed by the Government has already been reached. The trade response to the removal of the twin hurdles of high export duty and limited licensing period has been spectacular.

Although, presently, the prospects of cotton exports appear rosy enough, it must not be forgotten that everything depends on how America seeks to find outlets for her surplus cotton. According to Washington reports, it would appear that limited quantities of cotton in actual surplus with the Commodity Credit Corporation's stocks might be sold abroad at prices competitive with the present prices of foreign cottons. In the event of this report coming true, it would certainly affect our cotton exports and also tell upon cotton futures prices in this country, unless, of course the Government of India comes out with an announcement abolishing the entire export duty on cotton by acting as promptly as it has done in the matter of the devaluation of the rupee by Pakistan.

SWELLING SURPLUS WITH U.K.

INDIA'S EXPORTS to the U.K. for the first half-year of 1955 showed an excess, value-wise, of as much as £14,010,000 over those recorded in the corresponding period of the previous year. Tea continued to be the largest contributor, the value of exports of which amounted to as much as £43,094,000, as against only £27,940,000 for the first half-year of 1954. The increasing trend in exports has also been maintained in the case of cotton yarns and woven fabrics, the exports of which improved from £3,312,000 for the period January-June 1954, to £3,734,000 for the corresponding period in 1955.

The balance of trade for the six-month period under review has worked out in favour of India to the tune of £21,386,000, as against only £6,189,000 in the corresponding period in the previous year. On the import side, excepting for chemicals, India has shown modest declines in all the other major items of imports. Thus, the value of imports of machinery other than electric declined from £14,563,000 to £14,455,000, while that of electric machinery, apparatus and appliances at £7,480,000 for the current half-year compared unfavourably with £7,695,000 recorded in January-June, 1954.

It is too early to find any reflection of the recent steps taken by Britain to strengthen its economy in the figures of the principal exports and imports between India and the U.K., for the first half-year, but it is quite possible that the overall trade between the two countries for the next half-year will show definite change in the tempo of Britain's exports to India, what with the latter's helpful import policy.

AID TO ART SILK

THE EXTENSION of protection to the artificial silk industry for a further period of three years, that is up to December 31, 1958, has been generally welcomed, although the concerned interests had sought for an extension of protection for five years. By accepting the Tariff Commission's recommendation to extend protection to the country's artificial silk and cotton and artificial silk mixed fabrics industry, the authorities have shown that they are only too keenly alive to the needs of an industry which has yet to go a long way towards establishing itself. For there is still a wide gap between the capacity of the industry and its actual production. Thus, during the four years 1950-53 the actual output of artsilk fabrics ranged between 180 and 150 million yards as against the rated capacity of 375 million yards. Besides the under-utilisation of capacity, the industry's total domestic demand is also limited, the annual average being only 47 million yds. in the case of art silk fabrics and just a little over 3 million lbs. in yarn.

The industry, which is heavily concentrated in Bombay has, according to the Tariff Commission, a total loomage of 34,759 distributed over 1,569 mills. But the information provided by the Mills' Co-operative Organisations puts the total number of mills engaged in the manufacture of artificial silk fabrics even higher at 1,849 and the number of looms installed at 37,727. The capital invested by the members of the co-operative organisations alone amounts to more than Rs. 21 crores, while the total number of labour directly employed by the member-mills is more than a lakh. When so much of capital and labour is involved, it behoves the authorities to see that every assistance is given to keep the industry going. In this connection, it is significant that the recommendation of the Tariff Commission for the establishment of a Development Council has been accepted. As a matter of fact, the Government has just (on 8-8-1955) established a Development Council for the industry engaged in the manufacture of artificial silk and textiles and yarn. It was inaugurated by the Union Minister for Commerce and Industry in Bombay.

Two of the Commission's recommendation that are yet to be examined by the Government are: (1) need to control speculation in artificial silk yarn and (ii) regulation of exports of cotton linters after taking into account the domestic requirements.

HIGHER PROSPERITY PHASE FOR F.A.C.T.

IT WAS with a legitimate sense of pride that Mr. V. Seshasayee, Chairman of the Fertilisers and Chemicals, Travancore Limited, announced at the recent annual meeting that the company had entered upon a glorious phase of greater prosperity. The happiest news which the Chairman had to convey was the Government of India's final approval of the expansion scheme of the company and sanction accorded for provision of requisite financial assistance. The expansion scheme aims at raising the ammonia capacity by 100 per cent, increasing sulphate production by 50 per cent and going ahead with manufacture of ammonium sulphate.

It argues for the efficiency and vigilance of the management that in spite of power restriction which put a curb on production, output in the calendar year 1954 achieved a new peak at 31,741 tons of ammonium sulphate and 15,340 tons of superphosphate. The Central Fertiliser Pool arrangement was continued last year and the factory could succeed in obtaining a slight advantage in respect of price from the Pool. The headache of stock accumulation was avoided due to timely requisitions for supplies from the State Governments.

If labour-management relations in this enterprise were free from dislocation during the year, it must be remembered that the management had to buy peace at a heavy cost. The dispute raised by the employees and referred for conciliation could be settled by mutual agreement only on accepting additional commitment in the wage-bill of the order of Rs. 1 lakh. This contingency underlines certain serious problems. The indulgence which government policy has consistently shown to labour, even since before the acceptance of the socialistic pattern, cannot fail to act as a boomerang sooner rather than later. The limit of concessions has been reached in several industries and this industry is one of them. Any future increases in wages must be earned by labour by contributing its full share to increased productivity.

The Chairman could have been much more trenchant in his criticism of the tardiness of the Railway Ministry in handling hardships caused by shortages. But even his mild protest to the effect that while promises are profuse redress of grievances is appalingly sluggish should shake the Ministry out of its habit of slow tackling of pressing problems. It must certainly come as a news to many that F.A.C.T.'s minor request for opening a small railway station near Kalamassery has been promised prompt attention for the past six years, but action has not moved all these years. Why can a sense of urgency not be imported in tackling recurring transport problems?

FAIR PRICES FOR AUTOMOBILES

THE GOVERNMENT has referred the question of fair ex-works and fair selling prices for automobiles manufactured in this country to the Tariff Commission. Since May 1953 certain measures were taken to help bring these prices down. The reduction of customs duty on components so as to make its incidence equal to 40 per cent ad valorem on a complete CKD pack was the earlier among these steps. More recently, the commission allowed by manufacturers to their agents was reduced and the mark-up on spare part prices above landed costs was also narrowed down. These measures have not, however, helped to reduce consumer prices. A variation in prices has been necessary due to pressure of costs and an ad hoc increase has been granted by the Government in response to the request of manufacturers. In view of this development, the question of a scientific fixation of ex-works and selling prices has been transmitted to the Tariff Commission. The level of fair prices has to be related, of course, to the present stage of manufacture in the country. The second important term of reference requires the Commission to suggest a basis or formula for revision of prices as a larger number of components is produced with the progressive implementation of the programmes to which the manufacturers are committed. Such a formula can be suggested only on a broad principle as it is difficult to define how the different cost elements will react to varying conditions.

The expansion of the industry is undoubtedly dependent, in part, on lowering the selling prices since consumer demand in this country is much more sensitive to price increases than in other automobile manufacturing countries. The case of manufacturers is that the allround increase abroad in prices of automobiles has raised their costs of components and raw materials, the manufacturing costs of components in this country are higher than the landed costs of imported components and over-heads in this country are higher owing to low turnover. The ad hoc increase was granted because of these ingredients of higher costs. The issue of reducing automobile prices relates in a large measure to the central issue of turnover. Is it assumed that the Government has neither the means nor the responsibility to help raise the turnover? How long will indecision be allowed to persist and efforts will be put off to persuade the State Governments to adopt liberal and far-sighted policies on motor taxation and licensing as a direct aid to the development of motor transport?

PROTECTION FOR ALUMINIUM

THE CLAIM of the aluminium industry for continuance of protection beyond December 1955 is now being investigated by the Tariff Commission. This is a key industry whose rapid expansion in the near future is essential. India is undertaking a vast development of power projects and in view of her dearth of home resources of copper, it is only logical that aluminium output must be developed on a spectacular scale to meet the fast developing requirements of electricity. The indigenous resources of bauxite are considerable, distributed over wide areas and they are also of high grade. These are the primary considerations in examining the industry's claim to protection. In addition, it will have to be examined to what benefit protection has been put during the last six years in accelerating the progress of the industry.

On the second criterion, which is to be satisfied by evidence of actual performance, industry has a convincing case. It needs to be stressed that the special concession shown to this industry in the form of a subsidy on the sale of ingots was withdrawn after a brief span of about six months in October 1950. Except for this deviation, it had to rest content with a protective duty of 30 per cent ad valorem plus the surcharge of 5 per cent. The two producers of primary ingots, the Indian Aluminium Company and the Aluminium Corporation of India, will have expanded their capacity in the immediate future respectively from 5,000 tons to 15,000 tons and from 2,200 tons to 5,000 tons—an aggregate increase from 7,200 tons to 20,000 tons. It should not prove difficult to raise the capacity further to 34,000 tons which is the estimated increased demand in the near future. On the score of quality, there is some room for immediate improvement in the direction of purity in the case of ingots before full comparability with imported ingots can be conceded. But in so far as flat products including plates, sheets, circles and strips are concerned, they are of perfect comparability. Output has been on the increase on a continuous basis, but it is interesting to examine how it was pushed suddenly from 4,833 tons in 1954 (as against installed capacity of 7,200 tons) to 3,417 tons in the first half of 1955 which gives an annual rate of 6,800 tons and whether this tempo can be increased further. Production is now diversified over large varieties to cater particularly to the needs of industry.

4 PER CENT
STATE GOVERNMENTS LOANS 1967

(1) Government of Andhra	..	Rs. 250 lakhs	Issue price	Rs. 99	8	0 per cent.
(2) Government of Bihar	..	Rs. 150 lakhs	Issue price	Rs. 99	0	0 per cent.
(3) Government of Bombay	..	Rs. 600 lakhs	Issue price	Rs. 100	0	0 per cent.
(4) Government of Hyderabad	..	Rs. 200 lakhs	Issue price	Rs. 99	0	0 per cent.
(5) Government of Madhya Pradesh	..	Rs. 100 lakhs	Issue price	Rs. 99	8	0 per cent.
(6) Government of Madras	..	Rs. 700 lakhs	Issue price	Rs. 99	12	0 per cent.
(7) Government of Mysore	..	Rs. 275 lakhs	Issue price	Rs. 99	0	0 per cent.
(8) Government of Saurashtra	..	Rs. 200 lakhs	Issue price	Rs. 99	0	0 per cent.
(9) Government of Uttar Pradesh	..	Rs. 600 lakhs	Issue price	Rs. 99	8	0 per cent.
(10) Government of West Bengal	..	Rs. 500 lakhs	Issue price	Rs. 100	0	0 per cent.

The loans will open for subscription on 16th August, 1955 and close on 31st August, 1955 or earlier without notice as soon as subscriptions approximate to the amount of each issue.

Each loan will bear interest from 1st September, 1955. Interest from the date of application to the 31st August, 1955 inclusive, will be paid to the applicants at the time of issue of new securities at the rate of 4 per cent per annum on the nominal value of the loan applied for and accepted.

Subscriptions will be in the form of cash/cheque in respect of all the loans.

3% Bombay Government Loan, 1955, 3% Madras Government Loan 1955 and 3% Madhya Pradesh Loan, 1955 will be accepted at par and 5% Mysore Government Loan, 1955 at Rs. 100-8-0% for conversion into the new loan of the Government concerned; interest on the securities of the respective loan tendered for conversion will be paid upto and including the 15th August, 1955.

Applications for all the loans will be received at the offices of the Reserve Bank of India, Bombay, Calcutta, Delhi, Madras and Bangalore.

Applications for any particular loan other than Hyderabad and Mysore Government loans will also be received at branches of the State Bank of India and at Government Treasuries and sub-Treasuries within the State issuing them loan as indicated in the relevant loan notifications. Applications to Government of West Bengal Loan will not be accepted at Treasuries and Sub-Teasuries.

In the case of Hyderabad Government Loan applications will be received at branches of the Hyderabad State Bank and at Government Treasuries and Sub-Treasuries in the Hyderabad State. For Mysore Government loan applications will be received at branches of the Bank of Mysore Ltd. and at Government Treasuries and Sub-Treasuries in the Mysore State.

N.B.—Copies of Notifications and Application Forms may be obtained at any Receiving Office.

COMPANY AFFAIRS

INDIAN COPPER CORPORATION LIMITED

The Report with the audited accounts for the year ended December 31, 1954, shows that the total footage driven was 5,223, compared with 5,356 feet for the previous year, a decrease of 133 feet. 4,605 feet were sampled, against 4,458 feet in 1953; 1,983 feet or 43.1 per cent were payable, with a sampled value equivalent to 2.39 per cent copper over a stopping width of 59 inches, compared with 1,726 feet, or 38.7 per cent and a sampled value equivalent to 2.94 per cent, copper over a stopping width of 56 inches for 1953.

Ore Reserves show an estimated decrease of 47,284 short tons, at 3,369,286 short tons compared with 3,416,570 short tons at the close of the previous year with an average reduced value of 2.4 per cent. It has been possible, owing to the increase in the world price of copper to work on a pay limit of 1.80 per cent copper as in previous years, but as reported last year it may be necessary with increasing costs of production to increase the pay limit thus reducing the estimated ore reserves, should the world price revert to its former level. The mill treated 367,737 short tons of ore, averaging 2,352 per cent copper, with 254,072 short tons, averaging 2,295 per cent copper, for the previous year. The output of rolled products, which includes 3,211 tons of cold rolled brass and 90 tons of cold rolled copper, was 6,261 long tons as compared with 3,491 long tons in the previous year.

8,800 long tons, including 4,290 tons of copper ingots, were despatched for sale during the year as compared to 7,583 tons including 3,879 tons of copper ingots during the previous year. The operating costs as compared to the previous year decreased considerably due to the increased production and the absence of any prolonged strike.

Profit and Loss account shows a profit for the year amounting to		£ 898,382
Add—		
Unappropriated profits as at the 1st January, 1955		„ 76,278
		£ 974,660
Less—		
Depreciation of Building Machinery etc	£ 100,000	
Taxation on Profits	„ 264,395	
General Reserve	„ 150,000	
Provision for Gratuities and Superannuation	„ 120,000	
Proposed Dividend No. 27 of 15 per cent and Bonus of 10 per cent free of Income-Tax Payale by the Company	„ 228,500	„ 862,945
Unappropriated profits carried forward		£ 111,715

The Directors recommend the payment of Dividend No. 27 at the rate of 15 per cent and a Bonus of 10 per cent both free of Income-Tax.

THE ORIENTAL FIRE AND GENERAL INSURANCE COMPANY, LIMITED

The Report together with Audited Accounts and Balance Sheet for the year ended 31st December, 1954, shows that in five departments the net premiums after deduction of refunds and reinsurances amounted to Rs. 11,59,113 and the net claims paid and outstanding to Rs. 3,10,573. Commission Expenses of Management and Taxation amounted to Rs. 5,30,167. A balance of Rs. 3,55,827 being profit is transferred to the Profit and Loss Account after setting aside as Reserve for Unexpired Liability the sum of Rs. 4,97,110 being 40 per cent of the net premium income for the year, and an additional reserve of Rs. 1,24,278. In Marine Department the net premiums after deduction of refunds and reinsurances amounted to Rs. 1,18,697 and the net claims paid and outstanding to Rs. 31,560. Commission and Expenses of Management amounted to Rs. 41.681. After providing a Reserve for Unexpired Liability of Rs. 1,18,697, being 100 per cent of the net premium income, and an additional reserve of Rs. 25,000 a sum of Rs. 35,590 being loss is transferred to the Profit and Loss Account. In Accident and Miscellaneous Department the net premiums after deduction of refunds and reinsurances amounted to Rs. 5,26,220 and the net claims paid and outstanding to Rs. 1,83,690. Commission and Expenses of Management amounted to Rs. 2,15,231. A Balance of Rs. 64,307 being profit is transferred to the Profit and Loss Account after setting aside as Reserve for Unexpired Liability the sum of Rs. 2,10,488 being 4 per cent of the net premium income for the year, and an additional reserve of Rs. 52,622.

Profit and Loss Account shows that net interest, dividends and other income not applicable to any particular funds or account amounted to Rs. 2,07,306 to which has been added Rs. 3,55,827 transferred from the Fire Revenue Account and Rs. 64,307 from the Miscellaneous Revenue Account. After deducting the sum of Rs. 35,590 being loss from the Marine Revenue Account, Rs. 4,651 being Indian Taxes, Rs. 231 being loss on sale of investments, Rs. 292 being loss on sale of funiture and Rs. 5,000 being the Reserve for Bad and Doubtful debts, a credit balance of Rs. 5,81,676 being profit for the year has been carried to the Profit and Loss Appropriation Account. After bringing in the amount carried forward from the 1953 account (less Dividends since paid Rs. 1,50,000) amounting to Rs. 51,673 and transferring Rs. 2,25,000 to Reserve for Taxation and Rs. 1,50,000 to General Reserve, there remains a balance of Rs. 2,58,349. The Directors recommend payment of a Dividend for the year at the rate of Rs. 20 per share free of income tax, which will absorb Rs. 2,00,000. It is proposed to carry forward the balance of Rs. 58,349 to the next account.

COMMODITY NEWS AND NOTES

FIRST SUGARCANE ESTIMATE

According to the Directorate of Economics and Statistics, Union Ministry of Food and Agriculture, the All-India first estimate of sugarcane, 1955-56 puts the current year's acreage at 3,970,000 acres, as against 3,647,000 acres of the adjusted first estimate for 1954-55. This shows an increase of 323,000 acres or 8.9 per cent in area.

The increase in acreage under sugarcane during the year has been reported mainly by Uttar Pradesh and to a lesser extent by Punjab, West Bengal, Rajasthan, Madhya Bharat and Saurashtra and has been attributed to favourable season and better irrigation facilities during the current year as compared to the previous year. This increase in acreage has, however, been offset to some extent by the decreases recorded by Bihar, Madhya Pradesh and Hyderabad.

GRAM ESTIMATE

The All-India final estimate of gram for 1954-55 puts the year's area and production at 20,991,000 acres and 5,125,000 tons, as against 19,754,000 acres and 4,775,000 tons in the partially revised estimate for 1953-54. This shows an increase of 1,237,000 acres or 6.3 per cent in area and 350,000 tons or 7.3 per cent in production over 1953-54.

The increase in acreage during the year has been shared mainly by Punjab, PEPSU and Rajasthan and to a lesser extent by Hyderabad, Delhi and Bombay due to sufficient and timely rainfall received at the time of sowing.

WHEAT AND BARLEY ESTIMATE

The all-India final estimate of rabi cereals (wheat and barley) for 1954-55 puts that year's area and production at 34,841,000 acres and 11,325,000 tons, as against 35,031,000 acres and 10,777,000 tons in the partially revised estimate for 1953-54. This shows a negligible decrease of 190,000 acres or 0.5 per cent in area, and an appreciable increase of 548,000 tons or 5.1 per cent in production over 1953-54.

The breakdown figures are: Wheat 26,842,000 acres and production 8,539,000 tons, barley 7,999,000 acres and production 2,786,000 tons.

The decrease in acreage during the year has been shared mainly by Bihar, Uttar Pradesh, and Bombay and to a lesser extent by Vindhya Pradesh, Kutch and West Bengal. The decrease in acreage in Uttar Pradesh is attributed to low prices of barley crop prevailing at the time of sowing, whereas in other States it is due to unfavourable weather conditions. This decrease in acreage has been to some extent offset by the increases reported mainly by Punjab, Rajasthan and PEPSU.

In spite of an overall negligible decrease in acreage the production has shown an appreciable increase as compared to last year. The increase in production reported by almost all the rabi cereals growing States except Bihar and PEPSU has been shared mainly by Punjab, Madhya Pradesh, Rajasthan, Uttar Pradesh, Madhya Bharat and Hyderabad.

TEA IMPORTS INTO U.K.

Latest available figures go to show that there has been a fall in the exports of tea from India and Ceylon to the United Kingdom. For the first five months of this year total imports of tea into that country were 230,791,000 lbs., against 213,613,000 lbs. in the same period last year. Out of this, aggregate imports from India and Ceylon were 181,351,000 lbs., against 185 million lb. a year ago. The increase is reported to have come from other countries such as Pakistan, Nyasaland and Portuguese East Africa.

Concern has been expressed in this connection by the foreign shareholders of Pakistan tea companies, following the failure of the Pakistan Government to provide remittance facilities to certain tea estates which have made handsome profits—the Buchanan group being a notable example. As a result, the companies have been compelled to postpone payment of dividends to their shareholders. An idea of the extent of exchange difficulties felt in this regard could be formed from Karachi's decision to devalue the Pak Rupee mainly with a view to boosting the export trade and tiding over the aggravating foreign exchange shortage.

U.S. JUTE GOODS CONSUMPTION

There has recently been a steady increase in the consumption of burlap in the United States. The total consumption for the first six months of this year is estimated at 409 million yards, compared with 375 million yards for the same period last year—an approximate increase of 8 per cent. U.S. burlap stocks, which have been increasing over the past several months, were nine million yards less at the end of June than they were at the end of May. At an estimated 252 million yards, 157 million yards were spots and 95 million yards were afloats.

U.S. COTTON POLICY

The U.S. Administration, according to Dow Jones and Co., has shelved, at least for the present, a plan to subsideis cotton exports in the 1955-56 crop year. The decision against cotton subsidies was reached at a recent meeting of the U.S. President's council on foreign economic policy. The Administration veto of cotton subsidies does not mean, Dow Jones adds, that the Secretary for Agriculture, Mr. Benson, will rule out all possibility of a cotton subsidy scheme later in the crop year.

MORE SYNTHETIC RUBBER

In their first two months of private ownership and operation, American synthetic rubber plants turned out rubber at the highest peacetime level in the industry's 15-year history. Announcing this, Goodrich-Gulf Chemicals, Inc., stated that during May and June the industry produced about 160,300 long tons of synthetic. Approximately 130,700 long tons was GR-S, the general-purpose tyre rubber used extensively in tyre manufacture. This production was 73 per cent higher than that of May and June 1954. Another synthetic plant is in standby and not operating now.

Company Meeting

THE FERTILISERS AND CHEMICALS, TRAVANCORE, LTD., Alwaye

Speech delivered by Shri V. Seshasayee, Chairman of the Fertilisers and Chemicals, Travancore, Ltd., at the Eleventh Ordinary General Meeting held on 29th July, 1955.

Gentlemen

I have great pleasure in welcoming you all to this the Eleventh Ordinary General Meeting of the Company. The Directors' Report and the Statement of Accounts for the year 1954 have already been circulated to you.

As you would have seen from the Report, the year under review has shown a profit of just over Rs. 30,000. Admittedly this is an infinitesimal surplus and has very little bearing on the total capital employed by the Company. But I am happy to say that in the past few months there has been a heartening improvement in general conditions and the revenue accruing to us has appreciably been increased. The nominal profit can be said to mark a turn for the better in the affairs of the Company and to that extent it is satisfactory and significant. Results would have been better if there had been no power restriction and consequent curtailment in production during the summer of last year. In spite of these handicaps, the factory was able to produce 31,741 tons of Ammonium Sulphate and 15,340 tons of Superphosphate which, as you would have no doubt observed, is a record for any year since commencement of business.

As a result of the many representations made by us, the Central Fertiliser Pool continued to function in 1954, and our entire production of Ammonium Sulphate was taken into the pool as was done in the previous year. We had also better luck in 1954 in regard to despatches, as instructions were received from respective Governments in good time thereby saving us from the embarrassment of having to carry large accumulated stocks. On price realised, however, our experience was not so good. Our factory being a very much smaller one than Sindri, our costings, compared to those of latter, are necessarily higher and we had to struggle hard to make the Central Government appreciate this aspect of the problem. Luckily, they have seen our point and have granted us a slight advantage in price. Sindri, by its location and size and its immense resources, is in a class by itself and the only way we can bridge the difference between their costings and ours is by expanding the capacity of our own plant. With this object in view and, further, to prepare for the increasing demand in nitrogenous fertilisers in the South, we submitted a proposal to the Government of India for permission to expand our plant and sought of them financial assistance. The expansion proposals envisaged doubling the ammonia capacity and the utilisation of the additional ammonia for increasing sulphate production by 50 per cent and diverting the rest for the manufacture of another fertiliser, namely, ammonium phosphate. This scheme has already been examined and approved by an Export Committee appointed by the Government of India.

Towards the end of 1954 the Ammonium Chloride Plant, with a capacity of 25 tons per day, was completed and trial production started. It gives me real pleasure to bring to your notice that the erection and commissioning of this plant was done entirely by our own personnel. The plant has been designed with ample capacity; it will meet not only present needs, but all possible increased requirements for this chemical in the forseeable future. Synthetic ammonia from our own factory and hydrochloric acid from the neighbouring plant of the Travancore-Cochin Chemicals Limited render it possible for us to produce ammonium with the highest purity. We can take pride in the fact that we are pioneers in the production in India of this Chemical. While making another step in the industrialisation of the country, this development also offers us an opportunity of increasing our earnings. The factory went into commercial production on the 1st of January, 1955, but was officially opened by Shri Panampilli Govinda Menon, the Chief Minister of this State on the 4th of June, 1955.

The Travancore-Cochin Chemicals Limited in which your Company holds Rs. 25 lakhs worth of shares has shown this year a profit of Rs.3,93,275. Though no dividend was declared by the Company for 1954, the carry-over of this figure with the improved prospects for 1955 should result in a valuable contribution to our next balance-sheet.

The labour situation was fairly satisfactory during the year under review. Demands put forward by the Employees' Association were referred to adjudication but, later, an agreed settlement was arrived at through negotiation. The concessions granted under the settlement involved us in an additional commitment of nearly a lakh of rupees over the year. The decision of our Government to shape the country's economy on a socialistic pattern has a profound significance to industry generally. The Union Labour Minister rightly stressed that there are certain industries in which any further expenditure on labour can only be justified by securing greater productivity. If the private sector is to consolidate itself and to reach out for the new targets set for it, we have to ensure that not only do we pay our way through, but that we put by from current earnings some monies which would enable us to grow in strength. What is now needed is vision on the part of Management and a realisation on the part of labour that success calls for the workers and Management to pull together. Government on their part should recognize that in the present context of things the limits beyond which capital cannot go are soon reached. Unrealistic claims by labour on the resources of industry are likely to have a crippling effect on the latter with the attendant danger to the country's economy. It is well within the knowledge of many that existence in India is mostly marginal and even the slightest rise in the price of an article leads to abridgment of demand out of all proportion to the price increase. Therefore, our endeavour should be to maintain prices at the level where maximum demand can be secured thereby assur-

ing continuity of production with all the economies which that means. It is not our intention to deny to workers their legitimate rights, but it should be recognised we cannot mortgage the future for satisfying present importunity.

One of our most pressing problems is that of transport—transport by water, by road or by rail. If the ambitious second Plan is to succeed, most urgent attention must be given to the question of transport. But judged by our actual experience, we find that in spite of the many assurances given in authoritative quarters, the pace of rectification and improvement is dishearteningly slow. I may mention here, for instance, our request to the Railway Board for the opening of a small station near Kalamassery which would help this factory not only by assuring quicker transport of our products but in effecting small economies as well. Correspondence covering this subject has been going on intermittently for over six years and while every Minister and high official has promised speedy attention, the work on this small Station is yet to commence. Myriads of such complaints are heard all over the country. While we do appreciate that development of transport demands materials which may be in short supply today, it is inconceivable that a minor project like this should be held up indefinitely. The sum of many such arrears would break the back of our economy, particularly when production is to be stepped up at the rate which the second Plan envisages. Roads have to be widened and better surfaced, bridges made capable of meeting the demands of heavier vehicles and railways should not only improve their rolling stock but should also provide better handling facilities and more spacious yards. Wherever bottlenecks have appeared, drastic action is called for. To the cynic it may appear that while promises are galore, the only reality has been a rise in freights and fares. It is, therefore, a good augury that our energetic Commerce and Industries Minister is working in close association with the Railway Minister to cope with this stupendous problem of transport.

We firmly believe that the period of loss and poor return is now behind us. We do greatly appreciate the patience and this forbearance you have shown during these years. We are confident that when the next year's accounts are presented, there will be a much better showing and this hope is based not only on the present improved working but on the prospect of expansion for which the Government of India have sanctioned requisite funds. This bit of happy news has been communicated to us only within the past few days. Shortages in power and in supplies of sulphur are things of the past. Barring accidents, we should be able to maintain uninterrupted production at rated capacity. The plant is well tuned as is proved by the record production of the first 6½ months of this year and our staff have gained greater confidence and experience in facing up to their tasks.

Before I conclude I wish to offer my grateful thanks to the Union Government and the Governments of Travancore-Cochin and Madras for their unstinted support and their ready assistance in enabling us to overcome the many difficulties that confronted us during the year.

Bombay State Development Loan, 1967

ISSUE PRICE Rs. 100 PER CENT

Open on the 16th August, 1955.

The loan will be closed as soon as a total of approximately Rs. 600 lakhs has been subscribed, and in any case not later than the close of business on the 31st August, 1955.

The applications will be received at the offices of the Reserve Bank of India, Bombay, Caclutta, Delhi, Madras and Bangalore; at Branches and Treasury Pay Offices of the State Bank of India within the State of Bombay and at the Government Treasuries and Sub-Treasuries in the State of Bombay at places where there is no branch or pay office of the State Bank of India.

Full particulars can be obtained at any of the offices of the Reserve Bank or Branches and Pay Offices of the State Bank of India or at any Government Treasury or Sub-Treasury in the State of Bombay.

BOOK REVIEWS

QUEST FOR FREEDOM?

QUEST: A bi-monthly of arts and ideas: Edited by Nissim Ezekiel: 148 Mahatma Gandhi Road, Bombay: Re. 1 per issue. Sponsored by the Indian Committee for Cultural Freedom.

Perhaps, there is no other country where the writer is so much at the mercy of Fate as he is in India. Writers work to order under totalitarian regimes and in return their bodily needs are looked after. How they make their peace with their Maker is a matter of conjecture. Perhaps the Body is the more important. But a writer by the very nature of his vocation is one who has defied convention more or less in becoming a writer. If he justifies himself, Society should find a place for him and provide him with more than bare shelter. This somehow or other he does find and has found through the ages. What a writer (or an artist for that matter) needs more than anything else is a place in society. As a pariah he will continue to pour out his lamentations or paeans as the case may be but he will not give of his best.

It was expected that with Independence writers would receive better recognition at the hands of the country. But except for the creation of Akademies and the institution of some paltry prizes, some of them going to authors for works published decades ago, the State has done little to encourage the writer in a free society. Unlike in England, France, America and Australia, in India there are no awards, scholarships, prizes the receipt of which helps to make a writer famous. The number of writers who can make a living from literary journalism in India can be counted on the fingers of one's hand. Nor does AIR act as fairy godmother to the Indian writer as the BBC does to British writers. In any case AIR's strait-laced policy will not allow it to encourage any but the most timid writers. Recently W. H. Auden giving a series of talks on Poetry—The Dyer's Hand—quoted a poem by D. H. Lawrence which one cannot imagine AIR ever allowing to be transmitted. One of the casualties of Independence has been free comment. A fettered writer (or journalist) is useless except in a regimented society.

It is therefore encouraging for us who believe that it is better to starve if only we have the freedom to shout "Down with Something or Someone" when we feel like it that the Indian Committee for Cultural Freedom have sponsored "Quest" under the able editorship of Mr. Nissim Ezekiel. The first issue of the magazine is good to look at and better to pore over. The editor is modest in his claims. He admits that most of the articles which have found their way into the first issue might have found a place in the Sunday Press. Not most: a few perhaps. The editor has done a fine job of selecting and one must applaud him when he says that for another such story of Narendra Mitra's ("Sap", translated from the Bengali) he would willingly sacrifice many pages of intellectual provocation. The story of a young man who tapped palm juice which he boiled into sugar, or rather which a woman boiled for him, has excellent descriptions of the moods of a woman as depicted in her talk. The smell of the Indian earth breathes through the words of Mitra's characters. It is a first-rate piece of writing. Poems, articles of a provocative nature, one particularly, "The Future of Indian Music" by Comolata Dutt, give a nice balance to the contents of the first issue of "Quest".

May it flourish and serve the writer, both Indian and non-Indian.

FAIR DEAL FOR THE VILLAGER

Industrial Development: A New Approach: By Sushil Dey: Thacker, Spink & Co., Ltd.

Until the inauguration of the Five-Year Plan our attitude towards village crafts and cottage industry was either one of paternalism or indulgence. It was mixed with a vague feeling that arty-crafts and the village were synonymous. The villagers were there to be looked at and to produce quaint things which we urban dwellers bought much as tourists buy souvenirs at Niagara Falls. We tolerated the village, waiting for its eventual dissolution in the urban set-up.

Now Mr. Dey comes along and routs all these pet theories of ours. He tells us, particularly on the strength of his experience with the village of Kulkuri (Birbhum District) with its 581 inhabitants, that the Indian villager is active and dignified, is anxious to improve the standard of his living, and eager to improve his crafts and industries, but that he is hindered in his ambition by the primitive village economy which is India's general legacy.

In order to change this pattern Mr. Dey does not advocate model villages built under official patronage; nor does he translate rural uplift solely in terms of better drinking water, sanitation, education, and other amenities. Welfare and wealth, he argues, must go together. The wealth may not be in cash necessarily but in increased production of consumer goods, and later, maybe, even of capital goods,

It is, however, not enough to say we must expand production in industry. How is it to be achieved within the existing village economy where the labour of blacksmith, carpenter, weaver and potter is in terms of the limited needs of the community? It can be done not by an unilateral stimulus but by a multilateral urge for production. "This need," says the author, "and local capacity for its satisfaction can be brought together as soon as each of these people agrees to produce for exchange with what the others are willing to produce." At the beginning production must be for use in the community. This is not the old-established system of barter, nor does it amount to taking in each other's washing. To quote Mr. Dey, "For those who feel secure only behind learned labels, we can suggest a sophisticated name for this essentially simple arrangement. It is a commodity and service exchange with a clearing house device for credits." Self-sufficiency is not the aim but a progressive extension of the village economy with that of the outer world. "As the wealth of the village increases, it will find a greater surplus for trade in the open market." Though this process may seem slow, it is, nevertheless, an industrial advance. The extension of democracy to the economic sphere means inevitably evolution of the Indian village economy from "the simple to the diversified and increasingly complex" whereas according to Marxist theory the criterion of progress is conformity with technological advance. But high living and sane living are two quite different things. Our social planning must be directed to the creation of communities with a balanced economic growth.

According to Mr. Dey this can be achieved by our ceasing to be hypnotised by "the few large-scale modern installations we have been able to set up" and by a reorientation of our attitude to small-scale undertakings. If the author is to be believed Kulkuri has proved his thesis. The network of Community Projects and Extension Blocks can stimulate the remaining Kulkuris of India.

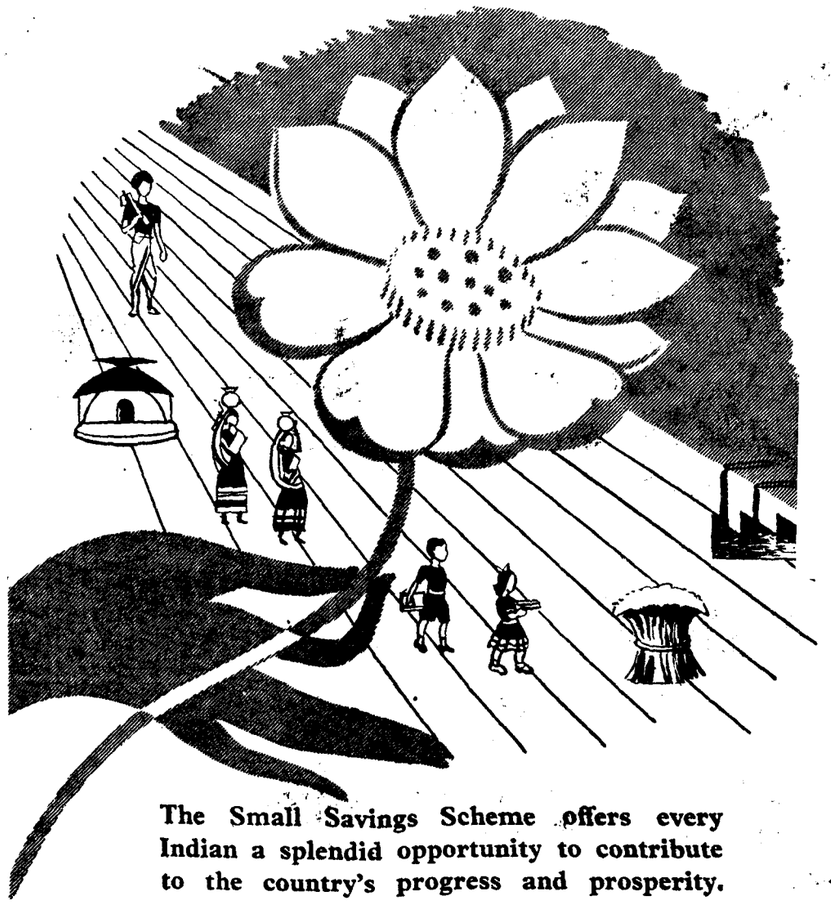
THE RAMAYANA
OF
TULSIDAS
IN ENGLISH VERSE
LATEST "HINDUSTAN TIMES" PUBLICATION

The famous Hindi epic regarded by many as "the greatest book in all devotional literature" is for the first time now available in English verse.

The translator, the Rev. A. G. Atkins, completed the book after ten years of devoted work. He has tried "to keep and express in English in the fine rhythm and music of the original in simple lucid language, and with as much of the vivacity, wittiness and picturesqueness that Tulsidas has put into his work." He has also followed in some measure Tulsidas's metrical variations *such as* **chhand, chaupai, doha** and **soratha.**

In a foreword Mr C. Rajagopalachari says: "Mr Atkins' monumental work and his Introduction are a revelation of hope for those who desire to see all the great religions of mankind come together. - - - - His service is not only to English-speaking people but also to that very large number of Hindus in India who do not speak the Hindi language and to whom English has become a very familiar medium."

The book is of special value to libraries, scholars and devotees of Tulsidas.



It has been issued in the following four editions:

I. **Original text of Tulsidas with translation in English verse; three volumes; 1468 pages; price Rs. 50 net.**
II. **Translation in English verse; without Hindi text, two volume; 898 pages; price Rs. 40 net.**
III. **Special tissue paper edition of I, one volume, price Rs. 100 net.**
IV. **Special tissue paper edition of II, one volume, price Rs. 100 net.**

The Outlook on the Companies Bill

THE general trend of parliamentary opinion on the Companies Bill has been revealed in the debate in the Lok Sabha during the last few days and in the private discussions within the Congress Parliamentary Party. 'There is probably no element of surprise in the opinions so far expressed by various members. It has been well-known for some time that the Companies Bill is coming before Parliament in a political climate which is none too propitious. The managing agency system remains the easy target of criticism, and the fact that it is being condemned by invective rather than on a balance-sheet of its achievements and drawbacks shows the hard core of prejudice; and if prejudices alone could kill the system, the managing agency is already as good as dead.

The question still is what stand the Government proposes to take on the general issues raised on the Companies Bill, particularly after it has

emerged from the hands of the Joint Select Committee. The Prime Minister has, according to press reports, advised against the fixing of any deadline for the termination of the managing agency system and underlined the differences between the theory of abolition of the managing agencies and the actual practice of it through legislation. This counsel of restraint may moderate the more extremist demands but on the large dose of radicalism that has already been injected into this legislation, the effect may tend to be largely neutral.

This, anyhow, is the impression created by the Finance Minister's lengthy speech on the Bill last week. Mr. Deshmukh appropriately pointed out that the subject of Company Law reform had been before Government in one way or another for about nine years and that no charge of haste could be laid against those concerned. But considering the number of major changes in the Bill made recently by the Joint Select Committee, and the number of other issues on which the Finance Minister revealed himself to be not yet committed to definite views, this long period has been unprofitable. If the Bill had been based on the investigations of the Company Law Committee which preceded it, and on the Government's policy laid down clearly on a consideration of the issues arising from its recommendations before the Bill was drafted, the Finance Minister's defence would have been quite sound. It is not indeed accepted parliamentary practice that legislation should be drafted and presented to Parliament before Government firmly decides upon its policy. But that seems to have been the case with the Companies Bill; the interval between the Company Law Committee's Report in 1952 and the presentation of the Bill late in 1953 seems to have been a period of drift in which no firm decisions were taken.

The Finance Minister has now argued that the changes proposed by the Joint Committee cannot be viewed as going beyond the principles of the Bill as originally conceived because what the Joint Select Committee had before it was "the consideration of the entire subject of Company Law reform on the broad pattern outlined in the original Bill". Was this the right course for the Government to take? When one expert committee had examined the issues and a Bill obviously embodying official policy was on the anvil, should the whole issue be again thrown into the melting pot for still different and drastic conclusions to emerge? If a Select Committee of Parliament should, besides its normal function of effectively scrutinising the translation of accepted policy into proper law, be also free to alter the bases of that policy, then something of the American practice of legislation by Congressional Committees is being imported into our system, with all its attendant risks.

It may be wrong to generalise on this one instance. But the Finance Minister in saying that the whole subject of Company Law reform was before the Joint Committee ignores that the subject was already before another Committee specially constituted for the purpose. It was at no time the Government's declared or implied opinion that that Committee's work was perfunctory or unacceptable; and, indeed, there may be many occasions during the passage of the Companies Bill for invoking that Committee's Report also for supporting many provisions. What then prompted Government to throw the whole question open once again at a late stage, if the eight preceding years of consideration did not lead to firm conclusions about the future? It may be that the Finance Ministry did not either have the time or was too reluctant to assume responsibility at that stage for accepting many of the recommendations of the Company Law Committee and for taking a firm stand in implementing them in the face of ideological opposition. At the same time, there might have been difficulty in foreseeing the exact measure of concession needed to meet the wishes of this section. Some amount of indecision might thus have become inevitable; that would not mean that there is now confusion in the minds of those who, following accepted canons of legislative procedure, were entitled to expect some degree of certainty in these matters at least at the stage at which Government decides on legislation.

The Finance Minister's approval of the Joint Committee's approach to the subject of managing agents—as not only pragmatic but also as "the only correct and realistic attitude to take in the present circumstances of this country"—makes vain the hope for substantial modifications on this aspect of the Bill. In the actual administration of these provisions, there are some indications that decisions would be taken on a practical basis, in an atmosphere which is not charged with prejudice in one way or the other. There has been an insistence on prescribing a period of good behaviour for managing agents; the disabilities threatened at the end may, apparently, be warded off partly by good conduct, on the one hand, and partly by the substitution, on the other, of the new kind of managing agency without its teeth—the system of secretaries and treasurers. But, as on the question of the period for nationalisation prescribed in 1948, practical considerations may intervene more effectively than unprecise guarantees of liberal treatment which may be given now.

Similarly, there has been no inclination to accept any compromise on the extent of the powers assumed by the Government under the Bill for administration of the affairs of companies. Power, it has been said, is itself a deterrent and would obviate the necessity of its exercise; but that precisely is the reason why it should be considered harmful because it can destroy flexibility and deter a good many desirable things along with the bad. An element of uncertainty is being introduced in company administration if official approval is made essential at too many stages of operation. The latest proposal of the Finance Minister to make even Clause 197 (in which he has conceded that real difficulty is involved under the existing version) subject to the exercise of wide discretionary powers by the Company Law Administration would so greatly add to the scope of State control that the working of companies can become a very speculative business.

The criticism of the Bill by company managements has not been adequately met but the Finance Minister has been quite as helpless as Indian business men in making the political majority listen to moderation. The Finance Minister's position is perhaps of his own making; at an earlier stage he might have wrested the initiative and held it effectively to steer clear of impractical demands from either side.

Atoms for Peace

DURING the past twelve days, more than 1,200 delegates from 72 nations, comprising a galaxy of scientists from both the East and the West, have been brought together for the first time. This conference, held in Geneva, is of a new type and very different from normal conferences because, in the words of our Prime Minister, "it leads us to the threshold of the atomic age". Civilisation is confronted with a grave challenge demanding an adjustment of the relationship between nations to ensure that unprecedented and unpredictable horrors can be eliminated and all people in common can strive for the fulfilment of the promises offered by modern science for the promotion of human welfare. The conference is the result of a unanimous decision made by the U.N. General Assembly on December 4, 1954, that "the benefits arising from the momentous discovery of atomic energy should be placed at the service of mankind", and that the Assembly should "promote energetically the use of atomic energy to the end that it will serve only the peaceful pursuits of mankind". The resolution concerned further authorised the Assembly to convene an international technical conference to study the development of atomic power and consider other technical areas—such as biology, medicine, radiation, protection and fundamental science—in which international co-operation might most effectively be accomplished.

This resolution has since proved a turning point in the development of atomic research, for, there has been remarkable progress in the "atom-for-peace" field, and governments and industrialists have, especially in the big technically advanced countries, embarked on vigorous development programmes. Considering the fact that the U.N. conference in 1949 on conservation and utilisation of resources was boycotted by Russia, the active participation by that country in the present conference is indicative of the significant improvement in East-West relations in the recent past, brought about by the emergence of the atomic and hydrogen bombs. Atomic energy is no longer shrouded in military secrecy. People everywhere have begun to evince keenest interest in the possibilities of utilising atomic power as a means of increasing production and raising the level of living. For underdeveloped countries such as India, the Geneva conference is of added importance in that it is the first major step in their march to obtain widespread applications of atoms-for-peace. It is they who need most the energy which can change barren and desert lands to fruitful areas and enable them to raise living standards.

From the purely destructive quality of the A-Bomb, advanced nations have been making sustained efforts to harness the energy for constructive purposes by means of the fission reactor so as to yield almost unlimited power and peace-time products. Simultaneously, success has been achieved in exploding the Hydrogen Bomb, and efforts are being directed towards the mastering and controlling of thermonuclear, or fusion, reactions for humanity's benefit. This reflects the growing realisation on the part of the Great Powers that none of them can seek security by military supremacy alone and that each must demonstrate its constructive intentions and capabilities with comparable emphasis. The fact that industrial uses of the atomic power are immense has been demonstrated by the international atomic "trade fair", which is being held concurrently with the Geneva conference. The exhibition, in which many Government agencies and private manufacturers participate, has demonstrated the use of isotopes in testing steel, curing disease and analysing food, and revealed the extent to which atomic energy is already being used in the manufacture of precision instruments and cigarettes, in heating, power plant and electrical engineering. Actually, a race for future atomic markets of the world has started, and at least Britain and the U.S., who have been assiduously showing off their atomic wares, are planning for the coming competition to sell the world their atomic power plants, instruments and components. These activities stem from the realisation on the part of the great industrial countries of the political importance of being the first among the nations to build practical atomic power plants capable of being assembled in components and shipped overseas.

Fears of a fuel famine in the not-too-distant future and the yet undetermined dangers of atomic radiation are two of the vital issues with which the experts at Geneva have been confronted. The anticipated world shortage of fuel and power supply by the end of the present century makes the development of mass-scale nuclear energy no longer a distant dream but a dire necessity. There is widespread concern about the effects of atomic radiation on human health and safety, and the conference will have achieved one prime purpose if it sets up the proper machinery for the systematic gathering and international dissemination of all information on this matter. The need for pooling of atomic knowledge by every nation for the common benefit of all is imperative. It was precisely with this object in view that President Eisenhower, in December 1953, proposed the setting up of an International Atomic Energy Agency. The present conference, however, is practically confined to the presentation of scientific papers by the invited governments and the specialised agencies of the U.N., and avoids the political aspects of the problem. And yet it is obviously vital to bring about democratic control over the production and use of nuclear power so as to ensure the prevention of any misuse of this great source of energy. So every nation, however small and backward, must be ensured free access to fissionable materials for peaceful purposes. This is possible only if an international agency, in which all members of the U.N. and its specialised agencies will have equal voice in the determination of policies, is established without further delay.

Mr. C. Rajagopalachari is right in warning that mere exchange of atomic information might be misused and cause grave threats to peace. It has been pointed out that the production processes of nuclear fuel for peaceful or for destructive purposes are identical and inseparable up to a very advanced phase of manufacture. Thus, materials may be diverted from non-war to war purposes at a late stage in processing. Without continuous and really effective inspection, under an international control agency, it is likely that, under the guise of shipping "peaceful" atomic power plants and equipments from one country to another, a new and more destructive form of gun-running than has been witnessed ever before may come to operate.

In the Valley of Decision

[*Introducing a new feature devoted to men and matters in the Capital—Ed.*].

THE PRIVATE LIFE OF THE PUBLIC SECTOR

QUITE a flutter has been caused lately by the publication in a Delhi daily of a very disparaging account of the Government's venture into the machine tool industry which shows up the public sector in unfavourable light. This criticism was inspired by no Indian apologist of the private sector. It was the work of a British machine tool expert, Mr. J. D. Scaife, who was attached to the Engineering Capacity Survey Committee. This forthright and unpalatable criticism was presumably one of the reasons why the Committee's Report submitted as early as October, 1954, has so long remained in the dark recesses of official shelves, and was gently placed before the Central Advisory Council of Industries at its session last month. Even now official opinion tends to view the expert's remarks as highly unbalanced, and to regard anyone quoting his report as somewhat malicious. By laying such flattering unction to their souls, the men in charge of the public sector can, it seems, withstand and wipe out all that is said against the working of State enterprises.

But what is intriguing is the easy assumption which is common in the Capital, that the public sector can as a matter of right expect the maximum allowance being made for its shortcomings and to be judged by its good intentions rather than by its good performance, while no such tolerance is practised or considered necessary towards the private sector. Whether it is the Companies Bill or the schemes under the second Five-Year Plan, the tendency has been (with notable exceptions) to minimise and to decry the record of achievement of private industry by invective and generalisations. One company's misdemeanour is held forth as proof enough to indict all company managements; and on what has been achieved by way of investment, production or expansion in the private sector the motto is "silence".

In such an unequal contest, there seems to be no need to pull one's punches when the public sector is thus delicately involved as in the machine tool mess. There is no need to be unfair or to withhold credit where it may be due—as in Sindri, Chittaranjan or the Shipyard—but it is only fair and honest to realise that the Machine Tool enterprise is not one among them. Mr. Scaife was, perhaps, rather hyperbolical when he said that Jalahalli and Ambernath were, like the British African Groundnuts Scheme, "founded on fantasy and wishful thinking" and that they have "provided a wide open drain down which has been poured crores of public funds". But it is difficult to see how a similar conclusion can be resisted unless one approaches the subject with the generous instincts of the zealous lover of the public sector who can afford to turn a blind eye to all its faults. Mr. Scaife may be unrealistic when he propounds the generalisation that a "prosperous machine tool industry cannot be created synthetically but must grow naturally, along with the general industrial development of the country concerned". The object of Indian development planning is to telescope the growth, not merely to re-enact the experience of the developed countries and some unorthodox methods would be permissible here. But on the whole, his assessment is not unsound.

"One-fifth of the Government's outlay at Ambernath and Jalahalli would have produced" declared Mr. Scaife, "five times the effective result if it had been carefully invested in the private sector". This is not mere wishful thinking. The Machine Tool Manufacturers' Association had in the past made representations for help from the Government by way of returnable loans for developing new designs which were refused on grounds of financial stringency even though the loan would hardly have amounted to Rs. 25 lakhs. The Panel estimated the idle capacity in the private sector of the machine tool industry to have been 60 per cent. A danger is now feared even for this 40 per cent working of private capacity because Government, which is the biggest customer for machine tools, may in future meet its demands from its Jalahalli factory, if only to make the best of a bad bargain.

But that is not all. The Panel, which included the private machine tool manufacturers and representatives of the Government factory, could find in 1953 (four years after the Government's agreement with the Swiss firm) no figures at all "to arrive at even an approximate assessment of the country's requirements of different types of machine tools. The private units (consisting of 15 graded and a large number of ungraded manufacturers) were naturally helpless; the new market in machine tools has to be found only through the replacement of imports and no details of the types of demand for the imported products are available. Thus Government seems to have entered the field of machine tool manufacture on the apriori assumption that it is a great good in itself. On the other hand, the existing machine tool units had grown up in response to demands, especially during the war. While their capital investment—estimated at Rs. 1.25 crores on machine tool production alone—is nearly equal to the value of their output at full capacity, the outlay on the Hindustan Machine Tool Factory so far, of about Rs. 3 crores, has not yet shown results. When its full production of lathes (8½" type) is attained, the total outlay would have more than doubled for an output valued at less than Rs. 1.5 crores, giving a very high ratio of investment to value of the product.

That roughly is the business aspect of this adventure which is not quite edifying. The Hindustan Machine Tool Factory may not have to be scrapped as a failure because it will have public funds to prop it up as a strategic industry until it can pay its way. A search for foreign markets for a part of the 400 lathes, when they are produced, has already begun. The plant is still under construction at Jalahalli, but apparently as a concession to public impatience, it has begun assembling parts imported from Switzerland manufactured by Oerlikons and this process may continue indefinitely because the training of Indian technicians at the present pace may take a considerable time. There is perhaps nothing seriously wrong in these arrangements but it is a point which those who have sneered in the past at private industry for example, at the slowness of the Indian motor manufacturers to increase the percentage of indigenous parts—would do well to note and remember.

Some day, the Government machine tool unit may 'break even'; also some day, it may cease to thrive at the expense of the tool makers already in the field, when the Indian economy grows big enough to absorb the products of both sectors and to demand still more. It is that liberal distance view through a telescope that the public sector demands for itself before it is judged on a business, which to all appearances now is a misadventure. But it is possible to question the order of priorities which decreed this enterprise at this stage, before the economy was ripe with a market or with the personnel. There is no need to shy at failures, which indeed are the stepping stones to success. Like the experiment with the Housing Factory—which today stands among Delhi's many old monuments—this would induce more cautious planning in the future. But the lesson will not be learnt if there is a tendency to dismiss all criticism as unworthy.

Cool filtered water
for office or factory
'Tushar' WATER COOLERS
— by the makers of the famous 'Crystal' air conditioner

A 'Tushar' water cooler increases staff efficiency, helps to improve quality of work — quickly pays for itself in goodwill

- **Instantaneous cooling:** Continuous supply of instantly cooled water at the touch of a button — no unhygienic refilling or storing
- **Filter:** A large and efficient built-in filter — easily replaceable
- **Two models available:** Model R-10, capacity 10 gallons per hour (180 cupfuls per hour); and Model R-40, capacity 40 gallons per hour (720 cupfuls per hour)
- **Easy to install:** Needs only a water supply, a drainpipe and an electric plug point
- **Economical to run:** Cools to the temperature you choose, then switches off automatically

THE WEEK'S NOTES

THE POLITICAL ALLIANCE IN PAKISTAN

THE SUDDEN shift in the political alliance in Pakistan, which has left Mr. Suhrawardy in the wilderness, is still unexplained. The Muslim League, it is said, went back on its assurances to the Awami League, presumably on the question of accepting Mr. Suhrawardy as Prime Minister. Mr. Fazlul Huq has been adroit in exploiting the situation to his own advantage and at the moment he has only to fear the possibility of opinion in East Bengal supporting Mr. Suhrawardy's view that an established political convention has been broken. All argument now centres on the question whether Mr. Iskander Mirza belongs to East Bengal or not but this exercise in geneology may prove irrelevant if Mr. Suhrawardy can establish that not origin but popular backing, should decide the question. This controversy, and the Awami League's changed attitude to the one-unit plan, may reduce the chances of a broad-based national government being formed with the participation of the Awami League as desired by the new Prime Minister in his message on his assumption of office. But the present Ministry may be able to function effectively in spite of this opposition if Mr. Fazlul Huq plays the game.

The advantage of Mr. Fazlul Huq's co-operation lies not only in his larger following but also in the fact that the Government of East Pakistan is his own creation and full co-operation between the two wings would be assured. But considering the dramatic change in the political situation which falsified prophets, it would be rash to assume permanence for the present arrangements. Chaudhry Mohammed Ali's leadership will satisfy Punjab and may prove less irritating to the other ambitious aspirants for Muslim League leadership than that of any other person. There is also growing emphasis on the economic betterment of Pakistan—of which the devaluation of the rupee was the chief example—on which the ex-Finance Minister may be able to take a practical view. If Punjab and East Bengal are satisfied by the present set-up, there may be stability despite some discontents in Sind and the Frontier Province.

PACIFYING THE SOUTH

SOME RECENT happenings have drawn attention to India's problem of the South, which like that of the United States may long continue to be spoken of as such. The foremost issue in this problem is the question of language, on which there has been some resentment in the South, especially over the desire of the Hindi enthusiasts to force the pace of its adoption by making it the langauge of the examinations of the all-India services. India's leaders have acted wisely in giving the largest degree of latitude in the matter of adoption of Hindi as official language. It is now the declared policy that examinees for all-India services can choose to use Hindi, English or any of the recognised regional languages. Those who choose Hindi have to pass in English also later on, just as those with English medium have to pass in Hindi. Candidates answering in the regional languages have to take an examination in English and, later, another in Hindi, as soon as possible.

The President reiterated this policy last week at the opening of the Hindi Exhibition in New Delhi and his speech reflected in full measure the realisation of the strength of the sentiment behind the regional languages. It remains to be seem whether the States Reorganisation Commission would also come to similar conclusion, but even linguistic provinces may seem less important in the southern areas than the likelihood of disabilities being imposed through the adoption of Hindi. It may be that many of these fears are not well-founded but apprehensions have to be allayed and another gesture in this direction is the establishment of a Rashtrapathi Nilayam at Bolarum in Hyderabad State and the decision of the President to spend about eight weeks in the South every year, and celebrate Independence Day in a southern city. The second Five-Year Plan may have to reinforce these gestures by making provision for balanced development of all regions.

The President chose to be as modest as possible about the claims made on behalf of Hindi. He said that Hindi was unanimously adopted as the language to replace English "not because it was the most advanced of the languages of India but because it was the most common and most widely understood of them." The use of Hindi, he declared, will be confined to certain well-defined spheres of activity, leaving the other languages to have full sway in their respective regions. The emphasis, he added, was on learning Hindi rather than on the time factor involved. "Sheer practical necessities have driven us to have an all-India language." Maulana Azad spoke to the same effect on this occasion. The leaders have thus disarmed the critics of Hindi. The champions of Hindi are probably disappointed but they have to thank only their own ignorance of the power of language for their belief that legislation can succeed in making Hindi not only the official langauage of the Union but the "national" language as well and that such a consummation, even if practicable, was desirable for the country.

NEW CABINET IN INDONESIA

INDONESIA HAS now found a new Cabinet and the long domination of the Nationalist-Communist coalition has at last been terminated. Dr. Hatta, the Vice-President, has taken a leading part in the formation of the new government and it is significant that all this happened during the absence of President Soekarno. So long as the Nationalists remained in power with the support of the Communist groups, their policies were bedevilled by the extremist outlook of the latter and frequent crises became inevitable. The Masjumi party and the Socialists have always felt nearer to each other but they have not been able to maintain a coalition in power long enough, because of a large number of smaller political groups which tilted the balance. Even the present coalition comprises as many as twelve groups and is for that reason unwieldy and unstable. The only solution all along was to hold general elections but the government has lacked the capacity for organising elections quickly besides being uncertain about the result.

It has been the view of some observers that the elections will return the Masjumi and Socialists with a sufficient majority. Governments dominated by the Nationalists have, therefore, been slow to think of elections and even President Soekarno once said that the West Irian issue should be solved before elections. Critics of the government even criticised the Bandung Conference as the Nationalists' bid to win popular support at home before they faced elections. The decision of the new government to hasten the elections and hold them at the end of next month is right one in the circumstances. It must, however, remain a matter for regret that the issues had to be forced by the stiff attitude of army officers. It is a dangerous precedent to establish, however justified their case might have been. The taste of political influence can sharpen the

desire to exercise it oftener. Only a decisive electoral verdict can now set right the political balance.

Shorter Notes

Controversy Over the NNSC

FOLLOWING the assurances of protection given to the Neutral Nations Supervisory Commission by the U.N. Command, and disapproval by the U.S. of the line of action adopted by him, Dr. Syngman Rhee has at last counselled his followers to exercise patience in their attempt to expel the NNSC from South Korea. It may be that the Polish and Czech members on the Commission could not be perfectly neutral in the sense that the other two members of the Commission have been. The Swedish and the Swiss have all along exhibited a keen sense of discharging their delicate duty in accordance with their terms of reference, but because there is no fifth member to give the casting vote, the difficulties have been aggravated. Recognizing these difficulties, the U.S. is now of the opinion that the terms of reference of the Commission can stand some modifications.

This, however, does not reduce the irresponsibility of Dr. Rhee in arousing anti-Commission feelings in South Korea which has resulted in violent demonstrations, particularly at a time when the Geneva negotiations had entered a crucial phase and all the major Powers seemed to be trying to ease tensions in the international situation. It is, however, very unlikely that South Korea will be able to take any step of grave consequence in the absence of any support from the U.S. The present attitude of Dr. Rhee may only suggest that politically he is losing ground.

Buganda Agreement

WITH the unanimous acceptance by the Buganda Lukiko of the new Constitution, the future development of Uganda as a united whole has been safeguarded. This opens the way for the Kabaka, Mutesa II, in exile since 1953, to return home as a constitutional monarch, instead of as a feudal ruler, six weeks after the new constitutional arrangements have been brought into effect. The agreement is the outcome of patient statesmanship, and the restraint and wisdom shown by the Kabaka himself in the face of the great wrong done to him by Mr. Lyttelton's high-handed action in deposing him summarily.

The fears of the Baganda that, with the development of democratic government in Uganda, they would be politically submerged by the far more numerous Ugandans, who are not Baganda, have been somewhat allayed, thus averting the threat of separatism that faced the existence of Uganda. The British Government has promised that Uganda will not be included in any East African Federation, unless its people so desire, and that it is to be a self-governing "primarily African" State, unlike the multi-racial governments in Kenya and Tanganyika. These two undertakings have won the confidence of the Baganda, which has made all else possible. Buganda is to have a ministerial form of government with considerably increased powers and it is to be adequately represented in the reformed and more democratic Uganda Legislative Council.

Inside 'Azad Kashmir'

IN an appeal, signed by four influential 'Azad Kashmir' leaders and circulated among the members of the new Pakistan Constituent Assembly, the "tale of woe" in 'Azad Kashmir' has been brought into bold relief. The appeal speaks of the worst form of political and economic persecution and the gruesome happenings there. It is alleged that, while local talent is available, the administration is under the totalitarian control of the Pakistan Ministry of Kashmir Affairs, which has made it corrupt and unpopular. Very little has been done towards settling, even on a temporary basis, the refugees that may still be left there and whatever may have been done appears to be not free from political partiality.

Kashmiris have always exhibited a high degree of political awakening and have relentlessly fought against heavy odds for the assertion of their rights. It may be that the people in 'Azad Kashmir' can remain suppressed for some time. But the prosperity and freedom enjoyed by their brethern across the border will be a constant reminder to them that they continue to labour under the burden of an inefficient administration. It is very probable that if people in the Pakistan-held portions of Kashmir are given an opportunity to express themselves on the accession issue, the result would not be what most political analysts readily assume on the subject of Kashmir's future.

Trouble in Patna

IT is unfortunate that student-police clashes have become frequent occurrences in this country. It is still worse that the latest of these, which started in Patna on August 12, could not be localized and has been allowed to spread to other towns, involving loss of life among the public. The air is thick with accusations and counter-accusations and no verdict can be passed until the inquiry commission, now promised, makes its findings public. Meanwhile, doubts arise as to why such incidents are permitted to happen. It is true that in the student community there is often a tendency to indulge in rowdyism at the slightest provocation. But this fact should have caused the authorities to ponder on methods of dealing with the students who can always be impetuous and volatile. However, the findings of similar inquiry commissions for Gwalior, Chuikhadan and Indore firings in the past tend to create the impression that the police cannot totally escape blame for being trigger-happy. It looks as if the use of measures other than firing, such as tear-gas, are either not tried or are singularly ineffective in this country.

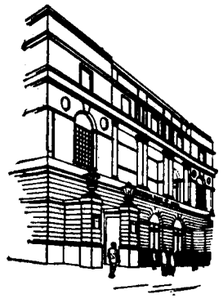
STATE BANK OF INDIA



Successors to the Imperial Bank

Security for generations to come

On July 1, 1955, the State Bank of India came into existence, taking over the business of the Imperial Bank. It offers you all the services you require and expect.

You will continue to benefit from the guidance of experienced officers, and your business will receive the same personal, completely confidential attention that has been given in the past.

Not only have we inherited the sound banking traditions of a century and a half, but we have also inherited the public goodwill that has been so marked since 1806, when our first constituent bank was founded. And our policy, as always, will be guided by this ideal —to further your interests and those of the entire nation, now and in the years to come.

The State Bank's branch at Delhi, one of more than four hundred offices waiting to serve you throughout India

STATE BANK OF INDIA

Largest of the Indian Joint Stock Banks

A Letter to the Editor

ECONOMICS OF TOURISM

Sir,

When the Government of India as well as authoritative papers like yours extol tourism, it is presumptuous on my part to doubt its wisdom; still will you or any of our valued readers be kind enough to clear the doubts of laymen like myself?—I am sure that there must be many more people that share my scepticism.

Does tourism really pay us? I do not mean to say that it does not pay countries like England and Switzerland; but about India, I am not sure. It is true that on the credit side we have a good amount of foreign exchange earned but what about the debit side? (I am not concerned here with the indirect advantages like understanding between the countries growing etc., but only with its economics). In the first place, unlike England and Switzerland, almost all the goods on which the outsiders spend in this country are imported goods, and that too from the hard currency countries so that most of what we earn on the one hand we have to spend on importing goods for their consumption here—I mean wines, butter, cheese, etc. Secondly, worse than that, some of the things on which they spend are goods 'subsidised' by the Government of India, for example, air travel and air-conditioned rail travel. Again, what about the cost of special roads constructed and the special 'tourist class rest houses' we maintain at a tremendous loss of upkeep? All this might mean that we earn the foreign exchange at a very great cost, at a devalued rate of the rupee. Is it worth while? Are we so badly in need of this foreign exchange? Can we not, for instance, gain the same amount by restricting imports of luxury goods, or better still by restricting the pleasure trips abroad of Indian nationals, especially to hard currency areas? As an example, according to the Deputy Transport Minister (as reported in a newspaper) India earned Rs. 2.5 crores of foreign exchange through tourists, in 1952, while during the same year Indian tourists spent Rs. 10.72 crores abroad.

As I said above, it is only to clear my doubts that I raise this point but not to raise any controversy. Will you kindly go into the question (as you have all the statistics, etc., with you) and give an authoritative answer of the net value of economic gain, taking the credit and debit sides?

Yours faithfully,
K. V. RAO,

Head of Economics Department
S. C. College,
Puri.

Accountants tell me -

"You're welcome on all accounts"

Here is the Powers-Samas punched-card, part of the system that makes all other accounting methods out of date, keeps figures really up to date. Powers-Samas speed and efficiency keeps pace with figures and events as they occur; indicates trends as they start to develop. For large combines and small concerns Powers-Samas methods handle invoicing, statements, stock-records, payroll, costing and statistics of all kinds with unequalled speed, neatness, accuracy and economy.

There is a range of Powers-Samas punched-card equipment for every type of application.

LINOLEUM

is NOW manufactured in India

Another important stride towards India's industrial self-sufficiency has been taken with the establishment of India's first Linoleum factory. LINOLEUM—the smart, hygienic, and durable floor-covering—is now made in India by India Linoleums Ltd.

Modern machinery and expert craftsmen in our factory produce Linoleum that is comparable in quality to the finest foreign makes. Apart from meeting India's entire demands, this pioneer factory is manufacturing enough to export its products to foreign markets.

LINOLEUM floors give :

MODERN LOOK—Linoleum floors help shops and stores to look more efficient, more attractive.

MORE COMFORT—For the ultimate in underfoot comfort, remodel your homes, offices and factories with resilient Linoleum floors.

LONGER LIFE—The strong burlap base lasts longer. Ideal for use in railways, steamships, automobiles, public institutions etc.

To cover your new floors and to protect the old ones lay Linoleum from wall-to-wall because it makes the floor itself as well as a carpeting.

Show Rooms :
7, Chowringhee, Calcutta.
1/155, Mount Road, Madras

Available in colourful designs, Plain Pastel Shades and in other pleasing effects Linoleum is most suitable floor-covering for

A DELHI DIARY

GLOOM, OUTSIDE AND INSIDE

INDEPENDENCE Day was heavily clouded, both literally and metaphorically. It opened with sunshine but by noon heavy black clouds had gathered, and this became the most gloomy Independence Day that I remember. By the time 6 p.m. arrived, and the hour for the Vice-President's 'At Home' at Rashtrapati Bhavan, the problem of transport up to the alighting steps had become grave for owner drivers. With the advent of the socialistic pattern of society, this one-time select class has been augmented quite considerably. There was a scuttling of personal cars and numerous acquaintances of mine found refuge in old models and some new ones which had the privilege and convenience of a driver. My old transport, I am proud to say, arrived safe through many impediments including a foot of water in Dalhousie Road. It rendered great public service. But escape from torrents of rain did not imply that there was no damping of spirits. Inside Rashtrapati Bhavan, the atmosphere of gloom continued to deepen.

I wonder whether this was what people call telepathy. There was, somehow or another, a sense of something impending, and before we left Rashtrapati Bhavan there was enough to confirm our worst forebodings. The news then was that ten satyagrahis had been killed on the Goa border. By the next morning the figure had mounted to thirty so far as the (leading!) newspapers were concerned although Government asserted the figure was only half that number. They used to say that where there were six economists there were seven opinions, Mr. Keynes having two. On Tuesday, from six sources of statistics on deaths I got seven figures, the Government of India having two. There was only one silver lining to these statistics. On one sublime event, the statistics chose to fail. This was a most welcome drop; for, it contained news that Mrs. Subhadrabai Sagar, who was believed to have been shot at Banda, was alive in Vengurla hospital and making a good recovery.

The fact that Mrs. Subhadrabai is alive has done nothing to dim the story of her bravery. The Prime Minister who was then unaware of her good fortune spoke of her extraordinary courage of which he said: "It was something which should fill anyone even though he may not be an Indian with pride. More so for those who are Indians". The story of how this brave woman clung to the Indian Flag under fire is a story of heroism as great as any in the illuminated pages of the Indian nationalist movement.

WHAT NEXT?

While glory is being written into our histories, personal and impersonal, there are less happy questions which need to be faced. The question was asked throughout Monday and Tuesday how the present stalemate on Goa was to be broken. Both the Prime Minister and the Home Minister (who spoke in like terms to the Prime Minister in the Rajya Sabha) seemed to imply that there was some automatic force at work inside Goa and perhaps in Portugal itself which would bring about the downfall of the Portuguese Colonial Rule. I do not think that they suggested that world public opinion was this force and that it could work on the Goa Government in a very short time. If so, it is fair to say that this optimism is not shared. There is no doubt that criticism has tended to mount against the Government's present policy on Goa. I myself do not see how any other policy can be put into force without destroying, perhaps, in one brief week the reputation for restraint and an ardent desire for peace which it has taken us eight years to build up. It is obvious to me that the Prime Minister's policy, so far as holding the armed forces entirely outside the battle, is patently right. It is not merely patently right, but it is by the very opposition that it has raised, supremely courageous. The Prime Minister is at his best when he is standing up to what might be called a popular current. There is no doubt that the popular current desires the exercise of force meaning, bluntly, the use of the Indian Army. It is good that the Prime Minister, the outstanding hero of the Indian Union, is at this moment restraining, and not leading popular sentiment which on every other issue he abundantly reflects. He can, it seems, still bid the waters of the ocean stop, even if he cannot turn them back.

A SOUTHERN CAPITAL

The news that the President had entered into residence in India's Southern Capital spread slowly in New Delhi. It would not, perhaps, have recorded at all but for the fact that the Vice-President was host on Independence Day. I cannot say that I am happy about the choice of Hyderabad for a South Indian Capital, nor has it given satisfaction to the many passionate Southerners among whom I circulate. The truth is that Hyderabad, if anything, is a citadel of the North set in the South. It is traditionally Urdu and Muslim in a Telugu and Hindu area. With the hard memories which it connotes, how can it look like a concession to Southern nationalism? Residence for two months in Hyderabad cannot (alas!) make the people of the non-Hindi South really feel that the President of the Indian Union had entered into their lives. I suggest Bangalore for climate and Hospet or Vijaynagar for glory!

STRIP-TEASE IN DELHI?

It would appear that alongside the sublime concern on the Goa situation, the Government of India has been unduly distracted this week by a somewhat ridiculous threat of strip-tease. Third division clerks are employing a novel form of peaceful satyagraha to draw attention to their unhappy condition. They propose to enter on their duties with clothing to be progressively reduced as satyagraha develops. On Tuesday about two hundred and fifty clerks attended office in vests and pants. Seeing that they had already come down to this somewhat inadequate level, one dreads to contemplate the effect of further abridgment of attire.

The Home Ministry has taken a very grim view of these somewhat comic proceedings. It has called for figures of these unfortunate persons and is even taking a severe view of slogans raised by clerks when they took out a procession last Saturday. The Home Ministry now entertains the doctrine that the third division clerks are custodians of the dignity of India's civil service. Seeing that they are paid in some respects less than Chaprasis, one wonders whether this dignity has not been destroyed largely by the Government itself. But, in any case, there is something grotesque in Government's fierceness with its own employees whilst it continues to lavish encouragement on the labour movement designed to bring just this kind of pressure on employers. If the demands for a living wage must be conceded in a Welfare State whatever happens, surely, the third division clerks' case is one which cannot be evaded. They really are in a most miserable plight. There is widespread feeling in Delhi that what is sauce for the goose should be sauce for the gander. The public sector should not be allowed to get away with its usual clever act 'Heads I Win, Tails You Lose'. If the Government cannot pay the price of the Welfare State, it should not occupy the pulpit so often!

ARGUS.

Economic Report from the U. S.

COTTON FOR EXPORT

(By Guy Sims Fitch)

WASHINGTON, Aug. 15.—The U.S. Government has reaffirmed basic stockpiling policies in the announcement that it will continue to price its surplus cotton for export at the same level as domestic sales prices. This decision took more than the usual amounts of courage and foresight. Government holdings have risen to about 8.2 million bales in just the past few years. With the government-supported U.S. price well above world prices, U.S. exports have shrunk to 3.5 million bales, compared with a much larger volume in past years. And American cotton growers depend on export markets for a substantial part—more than 25 per cent—of their output. This problem might have arisen sooner had it not been for World War II and the immediate post-war period, when foreign demand for American cotton was exceptionally high. Since the war, however, cotton production in other countries has doubled, and is now at the highest level on record and still going up. Thirty years ago, the U.S. supplied 50 per cent of the world's cotton; today it supplies less than 30 per cent.

One way of handling this troublesome situation is by reducing output at home. This has been tried, with the government sharply restricting acreages sown. This year, little more than 17 million acres were planted under cotton, the smallest area on record and nearly 3 million acres fewer than last year and 8 million fewer than the year before that. As a result of this action, it has been thought that the 1955 cotton crop output would be below normal requirements, thus reducing the carry-over—now estimated at 11 million bales, including private holdings. Good weather and more efficient farming methods, however, have combined to increase the official production forecast, now placed at 12.7 million bales. Domestic consumption and exports last season totalled 12.4 million bales. If these do not rise this season, there may well be another slight increase in surplus holdings.

It is little wonder, therefore, that the government has been under pressure from cotton growers and some members of Congress from cotton-producing states to sell off much of its surplus cotton, at competitive world prices if need be, but government officials are aware of the fact that other friendly countries also have supplies on their own for sale. Any U.S. action, therefore, will have to be undertaken in accord with longtime government policy of not disrupting normal marketing channels.

With these facts in mind, the U.S. Department of Agriculture has reserved the right to offer for export sale up to a million bales of short-staple stocks on a competitive bid basis after the first of next year. These offerings are entirely discretionary; they may or may not be forthcoming. And sales, if made, may or may not be consummated at prices below domestic levels. Obviously, a lot will depend on developments between now and next year. By that time, the major part of the 1955 crop will have been harvested, and trends in U.S. production, consumption and exports will have been more firmly established. Significantly, the Agriculture Department's announcement stresses that such sales as are arranged will be made only at times and in quantities that will avoid material interference with regular marketings here and abroad. The Department believes its plan may help to clarify the cotton situation, on the theory that the very existence of huge U.S. stocks as a residual supply has been a highly disturbing factor in the cotton world. There is the further fact that world supplies of low-grade short-staple types are heavy; the additional quantities the U.S. may offer for sale are likely to have little over-all effect on international markets.

If competitive sales of low-grade stocks are made, the Government will face another problem. Textile mills and other industrial consumers in the U.S. may urge the imposition of import quotas, on the ground that foreign competitors then will be able to get American cotton at prices lower than American manufacturers will have to pay on the domestic market. But Agriculture Department officials are confident that import quotas can be avoided. They point out that foreign textile manufacturers already can get lower priced cotton anywhere in the world, and they do not believe that the moderate broadening of U.S. export plans will make it either necessary or desirable to impose special quotas on the import of cotton textiles.

WORLDGRAM

AGRICULTURE

Forestry Commission: The Government of India is considering the question of setting up a Forestry Commission. When the Commission is set up, its main functions would be: the scrutiny of major working plans and deviations from their prescriptions; the collection, standardisation and timely publication of forestry statistics and intelligence; carrying out market studies; and the pooling and dissemination of technical information derived from States and foreign countries. It may also undertake extension work for popularising forestry.

*

Japanese Method of Rice Cultivation: The Minister for Food and Agriculture, Sri Ajit Prasad Jain has revealed that the total amount spent by the Government of India for the propagation of the Japanese method amounts to Rs. 2,30,141 since the beginning to the end of 1954-55. In 1952-53, the expenditure was Rs. 3,007 and in 1953-54, Rs. 37,500. This whole amount of 40,507 was spent mostly on preparation of publicity material and its distribution. Out of Rs. 1,89,634 spent in 1954-55, Rs. 40,555 were spent on publicity material and its distribution; and the rest was given to State Governments in the shape of subsidy, grants or loans.

*

Rubber Production in Cambodia: Although rubber production was introduced only recently in Cambodia, it has already become of great importance in the agriculture of the country, employing 10,500 workers. It is especially important in the province of Kompong-Cham and Kratie where the soil is particularly suited for the crop. The acreage planted to rubber in 1954 was 26,800 hectares, a substantial increase over the acreage of 11,700 hectares in 1946. Production in 1954 was 24,400 metric tons compared with the pre-war production of 17,000 metric tons.

*

Paraguay's Cotton Crop: Cotton production in Paraguay during the crop year August 1954—July 1955 is currently estimated at approximately 62,000 bales (1 bale=500 pounds gross) or, about the same as the 1953-54 crop. Cotton acreage was increased from 150,000 acres in 1953-54 to 173,000 acres in 1954-55, but unfavourable weather and extensive replanting caused the crop to get a late start, approximately half the new crop had been harvested by the end of April, 1955, but no exports of new cotton crop had been made. Paraguay's cotton consumption averages approximately 15,000 bales per year; the balance of the crop is available for export. Export during the crop year 1953-54 amounted to approximately 57,000 bales, compared with 43,000 bales in 1952-53.

INDUSTRY

Protection to Artificial Silk Industry: The Government of India's Resolution on the Tariff Commission's Report (1955) on the continuance of protection to the Artificial Silk and Cotton and Artificial Silk mixed Fabrics industry has been published. Government have accepted the Tariff Commission's recommendation that the protection to the industry should be continued for a further period of three years, i.e. up to December 31, 1958 and the protective duties on the various types of artificial silk fabrics, including fabrics manufactured from staple fibre yarn and other synthetic yarns should continue to be levied at the existing rates. The Commission has made certain anciallary recommendations for assisting the industry, which have also been accepted by Government.

*

Handloom Cloth in Second Five-Year Plan: The All-India Handloom Board, has approved the draft Five-Year Plan prepared by the Board Secretariat under which a target of 3,000 million yards of handloom cloth is to be achieved at the end of the second Five-Year Plan. The draft Five-Year Plan envisages an expenditure of Rs. 100 crores, about Rs. 60 crores in grants, and Rs. 40 crores in loans. The major items of expenditure are Rs. 21.78 crores for providing working capital to weavers co-operative societies, Rs. 15 crores for rebate, Rs. 11 crores for starting a Thrift Fund for weaver members of co-operative societies and Rs. 19 crores for building weavers housing colonies. The Plan envisages that two-thirds of the total production of 3,000 million yards would come from the co-operative sector.

*

Development Councils for Artificial Silk and Woollen Textiles: Two more Development Councils have been set up for artificial silk and wollen textiles. The Council will recommend targets for production, co-ordinate production programmes and review progress made by the industries from time to time. They will suggest forms of efficiency in order to eliminate waste, obtain maximum production, improve quality and reduce cost. The promotion of arrangements for better marketing and standardisation of products will be among the Council's other functions. They will also promote the adoption of measures for increasing the productivity of labour, including measures for better working conditions and provision and improvement of amenities and incentives for workers.

*

Use of Structural Steel: The Indian Standards Institution has circulated for comments a draft Indian standard code of practice for use of structural steel in general building construction. This draft contains recommendations for good practice in the design of steel buildings, providing for efficient, economic and modern methods of design and fabrication, fulfilling the long felt need for a national standard code for design of steel structures. The code gives guidance on the loadings to be considered and the stresses which are permissible for steel produced in India to Indian standard specifications.

*

Cement Factory at Gresik: The Cement factory project at Gresik in Indonesia is likely to be completed and start production by September 1957. The factory would be capable of turning out an annual production of 250,000 tons or 5 million bags of cement, worth US$7.5 million. After completion the factory will be operated with the assistance of 43 foreign experts. Those foreign experts have concluded a contract binding them for 28 months.

TRADE

Export of Maize: The Government of India have decided to permit the export of 30,000 tons of maize outside India against advance registration of sales, subject to a maximum of 500 tons by each exporter from all ports. Detailed licensing procedure is being notified by the Export Trade Control authorities at the ports.

*

Export Duties on Raw Cotton: In accordance with their policy of keeping export duties under constant review, the Government of India have decided to reduce, with immediate effect, the export duty on certain varieties of raw cotton viz. Bengal Desi, Mathias, Kalagin, Dholleras, C.P. I, C.P. II, Central India Desi, Oomyas, and all other varieties, up to and inclusive of 25|32 inches in staple length, from Rs. 125 to Rs. 50 for bale of 400 lbs.

Adverse Trade in First Half Year: During the half year ended June 1955, the value of India's foreign trade rose to Rs. 6 03,14,00,000 as compared with Rs. 5 20,12,00,000 in the corresponding period of last year, according to official figures available here. In the first half of the year, India's imports amounted to Rs. 3 19,22,90,000 and exports to Rs. 2 83,92,00,000 disclosing an adverse trade balance of Rs. 35,30,00,000. During the period under review India's balance of trade has always been on the deficit side, except for the month of January, when there was a small surplus of about Rs. 2 crores. The following table briefly summarises the position of India's foreign trade:

January	52.72	54.75	+2.03
February	59.14	50.70	—8.44
March	55.36	47.26	—8.10
April	51.23	39.57	—11.66
May	49.51	44.13	—5.38
June	51.26	47.46	—3.80
TOTAL ..	319.22	283.92	—35.30

*

U.S. Curb on Copper Exports: The Department of Commerce has clamped export restrictions on refined copper of foreign and on shipments of domestic copper scrap. The work stoppages continuing for a month, have resulted in a production loss of about 50,000 tons of copper. U.S. foreign trade deals this year will reach a record figure predict statisticians of the National Foreign Trade Council. They expect the total to reach $36,800 million with a strong favourable balance. Exports are estimated to touch $19,500 million and imports $17,300 million. These figures do not include military aid exports. The previous biggest import-export total was $33,800 million achieved in 1951.

FINANCE

Egypt's, 1955-56, State Budget: The new State Budget of Egypt for the 1955-56 financial year, balanced at L.E.315,259,572, is the biggest budget in Egypt's history. Last year's budget amounted to L.E. 303,333,000. It is divided into three parts—the ordinary budget estimated at L.E.238,300,000 and an extraordinary budget which in turn, is sub-divided into a budget for projects to be carried out by the National Production and the Public Services Councils which have been balanced at L.E.54,248,072 and L.E.22,710,600 respectively.

*

World Bank Loan to Guatemala: The World Bank has made a loan of $18.2 million to Guatemala to assist in financing the completion of the new Atlantic and Pacific Highways and in the execution of a programme to improve and maintain existing roads. The Bank of America of San Francisco is participating in the loan without the World Bank's guarantee, to the extent of $576,000 representing the first maturity which falls due February 1, 1959. The new Atlantic Highway will provide an alternative route to the single track railroad which is now the only Connection between Central Guatemala and the Caribbean.

*

Excise Duty Realized on Tobacco: The amount of excise duty realised on tobacco used for the manufacture of biris during 1953-54 and 1954-55 was Rs. 10.30 crores and Rs. 9.25 crores respectively. It is reported manufactures of biris were not licensed as such, but all wholesale dealers in tobacco, whether they manufactured biris or not, were licensed and the amount realised as licence fees from such dealers during the calendar years 1953 and 1954 was Rs. 14.10 lakhs and Rs. 13.47 lakhs respectively.

General Sales-Tax Legislation in T.-C.: The President has assented to the Travancore-Cochin General Sales-Tax (Amendment) Bill, 1955. The object of the Bill is to exempt handloom goods from sales-tax, and to make up the loss incurred by an enhancement in the rates of tax leviable on mill-made cloth. Under this Bill, a single point system of taxation will also be introduced in the case of certain export commodities so as to ensure liquidity of trade and help intermediate dealers in those commodities to carry on business more freely. It is also proposed to amend the earlier Act to provide for the constitution of an independent appellate tribunal which will hear appeals against assessments made by departmental authorities.

MISCELLANEOUS

Training Centre for Mechanised Fishing Craft: India's first training centre to train up personnel for manning mechanised fishing craft, was opened at Satpathi (near Bombay) on August 9. The centre is a joint effort of the Union Government and the States of Bombay and Saurashtra with technical assistance by F.A.O. and T.C.M. and is the first of its kind in South-East Asia. The F.A.O. has deputed an expert to organise the training programme. The centre will train 20 candidates in six months. Ten from each of the States of Bombay, and Saurashtra. It is proposed to open two such centres at Cochin and Tuticorin next year.

*

Extension of Employees' State Insurance Scheme: Another 2.25 lakh factory employees were brought under the Employees' State Insurance Scheme from mid-night of August 13, 1955, when the provisions were extended to Calcutta City and Howrah districts in West Bengal. Sixteen medical offices, 9 in Calcutta 7 in Howrah have been set up for the administration of the Scheme from where the cash benefits will be paid. Medical care will be provided under the Panel System and 542 doctors, 352 in Calcutta and 190 in Howrah, have been taken on the panel. Seventy-three Chemists have been selected in Calcutta and Howrah district for dispensing drugs on the special list. The scheme is already in operation in Delhi, Kanpur, Nagpur, Greater Bombay, Coimbatore, Gwalior, Indore, Ujjain, Ratlam, Hyderabad and Secunderabad covering nearly 7.25 lakh employees.

*

Atomic Research Reactor: Eight American companies have announced a co-operative Plan to build and operate a nuclear reactor for use in industry and medical research. The reactor would cost between $1,500,000 and $2,000,000 and is to be erected near New York city. The project is planned under the U.S. Atomic Energy Commission (AEC) programme for licensing private firms and research organisations to construct and operate nuclear facilities.

*

Indian Railway Electrification Scheme: A contract to assist the electrification scheme of the Indian Railways has been awarded to a British firm. The contract, which involves about £300,000, covers converting plant, switchgear and control gear for the first stage in the mainline electrification of the Eastern Railway of India. The contract covers six sub-stations and three-track section cabins on the main line from Howrah, Calcutta, to Burdwan (a distance of 66 miles) and one track cabin at Kamarkundu, which is on the branch line to Tarakeswar. The converting plant consists of 12 mercury are rectifiers. The contract also covers low-tension switchgear and certain sub-station auxiliaries.

NEWS IN BRIEF

INDIAN

In regard to the area brought under the Japanese method of paddy cultivation, Madras claimed 493 thousand acres, Hyderabad 165, Punjab 93, Bombay 92 and Mysore 90 thousand acres. While Assam had the highest average yield of 70 maunds per acre, Madhya Pradesh was next with 57 maunds, followed by Manipur and Travancore-Cochin with 48 maunds each.

*

The actual birth rate during the decade 1941 to 1950 was estimated to be 39.9 per mille roughly as against a registered birth rate of 27.5 per mille.

*

The production of automobiles in the country during the period January-March 1955 rose to 5,357 from 4,601 in the preceding quarter and 3,785 in the corresponding quarter of 1954.

*

During the first quarter of 1955, the total production of cloth by the mill industry increased by 11 million yards (to 1,262 million yards) as compared with the previous quarter.

*

The Sindri Fertiliser Factory produced 1,54,121 tons of ammonium sulphate during the first six months of 1955. This was 29,496 tons more than the production during the same period last year.

*

India has procured 49 semi-diesel engines from Sweden, costing approximately rupees five lakhs for the mechanisation of fishing craft.

*

The production of sewing machines during the first quarter of 1955 was put at 21,519. This recorded an appreciable increase over the production of 19,152 machines in the previous quarter.

*

According to a report from the Tata Iron and Steel Company Ltd., the total approximate production of iron and steel at the Steel Works at Jamshedpur during the month of July 1955 was: Pig-iron 94,400. Steel ingots 84,300 tons.

*

The total amount realised from export of Indian tea was Rs. 131.28 crores in 1954 as against Rs. 103 crores in 1953 and Rs. 80.9 crores in 1952.

*

The scheme to expand the total production of Sindri by the production of two new fertilisers, urea and ammonium sulphate-nitrate, by using coke oven, gas is now under execution.

*

It is reported a suitable site for the setting up of the Security Paper Mill is being selected with the assistance of Messrs. Pertals, a British firm from whom our currency note paper supplies are obtained.

*

All types of Penicillin required by hospitals, physicians and surgeons and private practitioners in India, will be produced at the State-owned Penicillin Factory at Pimpri, near Poona, it has been decided by the Government of India on the recommendation of a Committee of Experts.

*

It has been decided to release a further quantity of 20,000 tons of groundnut oil cake (expeller variety) for export up to the end of September, 1955. Exports will continue to be licensed freely as hitherto.

*

The Tariff Commission has taken up for investigation the question of continuance of protection to the ball bearings industry beyond December 31, 1955.

FOREIGN

Steel prices in the U.K. have been raised by 5 per cent per ton bringing the British prices for most steel products up to the level established by the Brussels Export Cartel at the beginning of July when it raised its minimum charges.

*

The Ford Motor Company of the U.S. has decided to build a new glass factory, a multi-million dollar project, at Nashville Tenn. The plant will turn out 50,000 tons of car safety glass annually. Construction of the factory will begin this summer and production will start by 1957.

*

It is reported the International Business Machine Corporation (U.S.) is renting its "electric brains" to business men for an hourly fee.

*

Rubber production in Malaya rose to 304,573 tons in the first six months year, an increase of 15.4 per cent, over the output in the corresponding half-year of 1954.

*

The United States 1955 cotton crop is estimated at 11,865,000 bales. Yield per acre is placed at 342 lbs.

*

Atomic energy is now being used in the United States to make radioactive plastic needles that are used in the treatment of cancer. The new needles are made by irradiating ytlrium oxide, one of the rare earth minerals, in an atomic reactor.

*

The Yugoslav Union of Trade Chambers in co-operation with the republican chambers has drawn up an investment Plan for the technical equipment of the market for the period 1956-60. The total investment means would be over 132 million dinars.

*

The provisional estimate for the year 1953-54 released by the Central Statistical Office of Pakistan show the national income of Pakistan as Rs. 19,308 million. The per capita income in 1953-54 was Rs. 245.

*

The Government of Pakistan is constructing seven Agricultural Workshops in various parts of the country started last year. The construction programme is expected to be completed in 1957.

*

Tanganyika Cashew nuts, which formerly were shipped direct to India for processing and marketing, are now to be handled locally. Now Tanganyika is to have her own processing plant capable of handling the bulk of the crop, which has increased from 6,000 tons in 1950 to 16,000 tons in 1954.

*

An all-time high in transportation of passengers across the Atlantic by air was achieved by Pan American in June when 14,760 persons were flown from the United States to Europe. The figure represents a 33 per cent increase over the same period last year.

Special Articles

RATE OF GROWTH IN THE PUBLIC SECTOR

THE rapid march of industrial production in this country in the last five years has been associated largely with the performance of the private sector and, if the public sector does not come into the assessment in a significant manner, it is because of its small contribution to the total output as well as because most of the industries in the public sector do not find a place in the official index of industrial production. These factors, however, should not be allowed to underrate the share of the public sector in building the strength and vitality of industry in the economy. It is not adequately realised that the public sector has already started revealing its dynamism and by relative tests the speed at which it is progressing appears very promising.

The spread of enterprises in the public sector covers a restricted range of lines of production including heavy industries manufacturing capital equipment as also key industries producing basic resources and essential goods. In this article five public projects have been selected for analysis as to their pace of expansion primarily because of the availability of comparable data during the period of the present Five-Year Plan. Projects of similar or greater magnitude like machine tools, steel, heavy electrical equipment and the like have to be left out of the present discussion either because they have gone into production only recently or because they are still in the preliminary stages prior to production. The five projects represent a diversity of basic requirements.

Sindri Fertilizers has a substantial part in the transformation of agriculture in the brief period of its career. This giant factory, on a reasonable estimate, has helped to step up the production of food grains by a substantial margin in the short run. It is easy to demonstrate the high ratio of output on the basis of the initial year of production, but even after the factory made some progress, the increase in 1954 over 1952 has been of the order of 60 per cent at 275,500 tons. The target of 320,000 tons fixed for the end of the present plan-period is assured of fulfilment without difficulty. Easily the most remarkable achievement of Sindri is the substantial reduction in the selling price from Rs. 350 per ton to Rs. 275 per ton which places ammonium sulphate within the reach of the average peasant.

The post-war ordeal exposed the vulnerability and insecurity of the railway transport system arising from excessive dependence on imported stock and especially on imported locomotives. The contribution of Chittaranjan Locomotives has not been very significant in easing the problem of rehabilitation, but this factory deserves credit for pushing up its rate of production beyond the expected speed. The hundredth locomotive which steamed out of the factory on January 6, 1954, represented hundred per cent indigenous manufacture as regards its components. A rate of output of 64 locomotives in 1953-54 offers guarantee that the 100-loco-mark is within achievement in the current financial year. It is premature to think in terms of locomotive self-sufficiency for some years and it should be obvious that the ambitious scale on which railway expansion must be planned in the immediate future introduces a factor of delay in this goal of self-sufficiency.

Any assessment of the progress of Hindustan Shipyard must take first cognizance of the fact that the shipyard is passing through the transition of revitalisation. The decline in output in the second year since Hindustan Shipyard took over the enterprise was temporary and it discloses a year of special strain. There was a shortfall in orders for new construction due to the inability of shipping companies to launch their plans of expansion on the terms of purchase loans offered by the Government. Subsequent liberalisation of those terms resulted in assuring the yard of a full order book until 1957. Delays in procurement of imported components and essential materials—engines and boilers not excepted—have put a brake on output. Their recurrence will depend on the world position of shipbuilding and a period of some years must inevitably elapse before the growth of the steel industry and of the ancillary industries at home removes this handicap.

Manufacture of telephone equipment represents a comparatively light industry and here the Indian Telephone Industries shows confident progress in respect of telephones, but the same degree of assurance is not held forth in the case of exchange lines. The output of telephones in 1952-53 surpassed the target of the first Five-Year Plan by 2,000 units and the subsequent raising of the target to 60,000 is well warranted by the tempo of production in 1953-54. The fall in the production of exchange lines after 1951-52 does not indicate sustained deterioration, nevertheless the lost ground has not been retrieved. It is difficult to feel convinced about the optimism in doubling the target of exchange lines for 1955-56 to 40,000 units.

In the financial context, the working results of the four projects for which data have been given in the table in this Article do not all show a phase of prosperity. Sindri stands out as the most successful public venture as a commercial proposition. Its profit of Rs. 47.52 lakhs in 1953-54 exceeds the previous year's figure by Rs. 20 lakhs and it is obtained after making appropriate provision for depreciation, additional allocation for repairs and renewals, and interest on loans from Government, which between them account for Rs. 2.68 crores. The profit of Indian Telephone Industries in 1953-54 shows a decline of Rs. 2.39 lakhs below the preceding year. Hindustan Shipyard represents a typical case of heavy loss of the order of Rs. 7.66 lakhs in 1953-54. In the year before, its magnitude was of the order of Rs. 15.48 lakhs. In the latter year the cost of idle labour was as high as Rs. 16.45 lakhs, but the Directors could heave a sigh at long last that this dead-weight problem was eliminated in 1954-55. Liabilities on account of retrenchment benefits and payment of wages for the strike period in terms of the mediator's award together add up to a little more than the loss of Rs. 7.66 lakhs in 1953-54. Subsidies were deemed necessary to wipe out these deficits.

The financial management of industrial projects in the public sector has been a hardy annual in parliamentary discussions. It need not be disputed that a considerable waste, and in some degree extravagance, have been allowed to be committed from the inception, but it needs to be considered whether criticism has not failed to take adequate notice of teething troubles in a situation where a tradition of experience was lacking. The conclusion can now be reasonably advanced

that by and large a start has been made in imparting a new tone of efficiency to the management of public enterprises in this country of which Sindri, Chittaranjan and Visakhapatnam are representative instances.

Project	Products	Unit	Progress of Production		Paid-up Capital	Profit(+) or Loss(—) (1953-54) (In lakhs)
1. Sindri Fertilizers and Chemicals	Ammonium Sulphate	Tons	1952 .. 172.514 1953 .. 265,704 1954 .. 275,529	Rs. 17	crores	+Rs. 47.52

THE FUTURE OF EUROPEAN MONETARY CO-OPERATION

(Contributed)

AS a member of the sterling area India has a direct interest not only in the exchange policy pursued by the U.K., but also in the continuation of European co-operation in the monetary field, from which its own trade has greatly benefited since the U.K. has settled the balances of the whole sterling area with Western Europe through the European Payments Union (EPU). The weakness of sterling in July was caused largely by continental doubts about the future policy of the U.K. and it needed Mr. Butler's strong declaration that the parity of $2.80 to the pound will be maintained "either in existing circumstances or when sterling is convertible" to put an end to the rumours. As he also made clear, the U.K. will not make a move towards convertibility until internal balance is restored and this inevitably will take some time. Nevertheless, the decisions taken by OEEC at the end of last month concerning the prolongation of EPU and arrangements after convertibility are of great importance since they ensure the continuation of European co-operation in the field of payments and fully bear out Mr. Butler's contention that the introduction of a freely fluctuating pound is not contemplated.

The decisions—as always in OEEC unanimously agreed upon—fall in two parts—the prolongation of EPU to June 30, 1956 and the arrangements, embodied in the European Monetary Agreement, which will come in force upon the return to convertibility. The prolongation of EPU caused little difficulty. The main change is that all settlements within the quotas and rallonges will be effected on the basis of 75 per cent gold and 25 per cent credit as from August 1, 1955 instead of the 50|50 ratio, which has been applied since July 1, 1954. This further "hardening" of the conditions is an important step in preparation for the move towards convertibility. It will reduce the financial incentive for discrimination against imports from the dollar area and it reduces the automatic credit facilities, which will cease altogether when convertibility is achieved.

The real problems arose in connection with the so-called "termination" clause and the arrangements for co-operation after the termination of EPU. Under the existing provisions EPU could be terminated at any time by unanimous decision or on any renewal date if on that date countries holding at least 50 per cent of the quotas in EPU were unwilling to continue their membership. Admittedly, since 1953 there was a special provision that a member's obligations should be re-examined if that member adopted convertibility before the renewal date, but this too would have required a unanimous decision. There was general agreement that EPU in its present form could not continue when members holding at least 50 per cent of the quotas introduced convertibility and it was clear that the existing provisions were too restrictive. The new termination clause provides that EPU shall be brought to an end at any time before June 30, 1956, when countries holding at least 50 per cent of the quotas adopt convertibility, provided that the new European Monetary Agreement comes into force at the same time (i.e. that countries responsible for at least 50 per cent of the contributions to the new European Fund indicate their willingness to make their contributions available). These conditions will be fulfilled when the UK, Germany and the Benelux countries adopt convertibility and wish the replacement of EPU by the European Monetary Agreement. There is no doubt that Germany and the Benelux countries will wait for the U.K.'s lead. As it is impossible to foresee when the U.K. will be ready, the conclusion of the European Monetary Agreement does not foreshadow any action in the immediate future. It has been laid down that if the termination clause has not brought to an end EPU by March 31, 1956, there will be a review of the conditions for a further prolongation of EPU after June 30, 1956, and if possible amendments to the Agreement.

The European Monetary Agreement provides for the establishment of a European Fund and of a Multilateral Settlements System, which are complementary to each other. The Fund will provide all members with a potential source of short-term credit (up to two years) in order to withstand temporary overall balance-of-payments difficulties. The Fund thus continues EPU's credit function, but its credits will be non-automatic and subject to examination of the borrower's needs. In contrast with EPU, it will consider the overall balance of the country in question and thus take a world-wide view. The capital of the Fund will be $600 million, of which $272 million will be transferred from the capital of EPU with the consent of the U.S. Government and $328 million will be derived from members' contributions. The Fund will facilitate the Multilateral System; the bilateral claims and debts brought into the settlement will be transformed into a net claim or debt due to or from the Fund and the Fund will carry the first $50 million in the unlikely case of a default by a debtor.

The Multilateral System will facilitate the settlement of transactions between member countries by enabling them to obtain very short-term ("interim") finance and the settlement of their claims on terms laid down in advance. It is designed to facilitate settlements through the exchange markets and between central banks and it is not expected that the amounts brought into it will be large. But its very existence will provide a framework for monetary co-operation in Europe and it will make it easier for the countries remaining inconvertible to maintain their trade liberalisation.

It required long and complex negotiations to arrive at a satisfactory scheme. It was necessary that the scheme should be compatible with different methods of determining exchange rates which may be adopted by individual members and that it should make available interim finance, but not on a scale imposing an undue strain on any member. The first condition implies that membership should be possible for convertible and inconvertible countries as well as making it possible that some countries would adopt wider limits for fluctuations than the narrow margins hitherto laid down. This means that provisions had to be made for regular settlements at known rates of exchange if countries with inconvertible currencies were to be protected from a loss of assets through fluctuations in those convertible currencies for which wider margins had been fixed. It is known that the U.K. originally pressed for a wide latitude in margins, but a change of its policy made general agreement possible in the end. Each member of the System has the obligation to declare margins—valid until further notice—beyond it will not allow the value of its currency to fluctuate. These margins—if wider than 1 per cent on either side —have to be fixed after consultation with the IMF (of which all participating countries with the exception of Switzerland are members) and remain binding until notice is given of their change. It is the intention of all participating countries "that the margins adopted by them will be as moderate and as stable as possible". No figure is stated about the latitude, which this implies. It is, however, generally understood that magins up to 3 per cent would come under this definition; thus "the accepted rule will be a high degree of de facto stability in the rates for all currencies" as Dr. Per Jacobsson points out in 'Skandinaviska Banken Quarterly Review'. One can conclude from Mr. Butler's remarks that the IMF would agree to such a widening of the margins and there can be little doubt that the margin of 1 per cent as laid down in the IMF agreement would be insufficient after convertibility.

In addition to the declaration of margins each country undertakes to make interim finance available and to settle in U.S. dollars its net claims and debts towards all other participating countries in the monthly settlement. Interim finance is limited to 10 per cent of the credit element in a country's EPU quota (for some small countries the proportion is higher) for both lending and drawing; this limitation does not exclude the possibility of discretionary ad hoc arrangements between central banks outside the System.

The monthly settlements will provide for the settlement of all interim finance not been repaid before the end of the month and any balances held by one member in the currency of another which the former decides to bring into the settlement. Settlements will be in U.S. dollars at the lowest (buying) rate announced by the debtor and the highest (selling) rate announced by the creditor. (If a country changes its margins a special settlement will take place at the previous rates; a special settlement would also be called should the U.S. gold price be changed). This will be an incentive to settle through the free markets (particularly for convertible debtors where wider margins have been announced) and the actual amounts settled through the System may be quite small.

Although the provisions of the European Monetary Agreement have been designed to remain in force for an indefinite period, there will be a comprehensive review of the Multilateral System not later than three months before the end of the first year of its operations and of the whole Agreement before the end of the third year. Thus the Multilateral System will remain in force for a minimum of one year and the European Fund for a minimum of three years.

The Fund and the System will be under a single Management Board and as for EPU the Bank for International Settlements will act as agent. The tried methods of European co-operation will thus be continued. To reinforce the machinery of co-operation a special Consultative Committee of high officials will be set up to examine problems arising out of the new system, including the effects of the exchange rate policies of any member particularly if they were likely to be detrimental to the trade of other members. The Code of Liberalisation will remain in force with certain amendments, including special provisions for Europe's "underdeveloped" countries.

At a moment when it is impossible to foresee the date of the coming in force of the new Agreement, it would be unwise to attempt to forecast how it will work in practice though it is clear that the Multilateral System will become superfluous when more and more participating countries adopt convertibility. It can, however, be said even now that the Agreement, which embodies the idea of a "collective" approach to convertibility, first proposed by the Commonwealth early in 1953, is laying a firm foundation for continued economic co-operation within Europe and between Europe and the Commonwealth after the return to convertibility.

For offices and industrial establishments

Greater efficiency in cool working conditions

—with **Carrier** self-contained air conditioners

WHEREVER a *Carrier* self-contained air conditioner is installed, the staff begin working better than ever before. The cool, noise-free atmosphere leads to greater efficiency; even a small increase in efficiency will pay for the cost of the *Carrier* in a couple of years!

You can change the action of your *Carrier* to suit the weather, to get extra coolness on hot days, extra dryness on damp days!

Available in sizes varying from 3 tons to 15 tons

Works silently, cuts off noise

Your *Carrier* self-contained air conditioner works as quietly as a whisper. At the same time, since you shut windows and doors, it helps to cut off street noises, lets you work or relax in silence and comfort.

Circulates clean, filtered air

Your *Carrier* sucks in air in a steady stream, filters it, then spreads it gently and evenly. So you get an equally cool temperature throughout — no dust, no unpleasant draughts.

Cools better at less cost

Specially designed fins and filter make your *Carrier* more efficient, help it to cool better at lower cost.

Removes more moisture

Your self-contained *Carrier* not only lowers the temperature, but removes moisture from the air — gallons of it! A new 'Humitrol' regulates the rate at which moisture is removed.

Remember — the Carrier self-contained air conditioner is remarkably compact, and takes up little floor space. The sale of these units in India is backed by Voltas' unique after-sale service and their engineers' unmatched experience in the line.

VOLTAS LIMITED *Head Office:* Ballard Estate, Bombay 1
71, Ajmeri Gate Extension, New Delhi
Calcutta * Madras * Cochin * Ahmedabad * Secunderabad

HANDS OFF RESERVES

BY

CROESUS

BY giving a sound, judicious, and well-reasoned decision, in the appeal against a fantastic judgment of the one-man Special Industrial Tribunal of Madras in the Madras Electric Tramways case, the Labour Appellate Tribunal of India (L.A.T.I.) has fully vindicated the stand of those who have been arguing for the retention of this useful institution, which several champions of labour, including even some of those who were themselves responsible, to a considerable extent, for its establishment, are so eager to see abolished today. The Madras Tribunal, it may be recalled, had, in an award, granted the workers of the Madras Electric Tramways, Ltd., following its closure in April, 1953, a 50 per cent share in the reserve funds of the Company and half a month's basic wage for every completed year of service up to a maximum of six months' salary as retrenchment relief. Your readers should, of course, be familiar with the circumstances in which the closure was brought about. In a way, it was almost forced upon the Company by the stand taken up by the Madras Government in its dispute with the Tramway Company on certain issues.

The L.A.T.I. summarily rejected the claim of the workers to a share in the reserve fund of the Company, even as it had done, on an earlier occasion when an Industrial Tribunal in the U.P. had made a similar award—which has become notorious as the Ahsan Award—as the one-man Special Industrial Tribunal of Madras conceding to the workers a share in the reserves of the Kanpur Electricity Co., Ltd. One is struck as much by this consistent attitude of the L.A.T.I. as by the convincing reasons adduced by the Appellate Tribunal to establish that workers cannot lay claim to a share in the reserves of a Company. Besides holding that the contention that workers are entitled to a share in the reserve funds "as if by right has never been conceded, much less allowed in the past", the L.A.T.I. gave the sensible ruling that the property of a company can be distributed only among its members or shareholders and that employees cannot be deemed as members. Clarifying further the respective rights and privileges of employees and shareholders in this behalf, it said: "Employees are in a privileged position as regards their salaries, wages and dearness allowances, while the shareholders are in a privileged position in regard to distribution of assets".

I am happy to find that the L.A.T.I. has made the further point—which I had made whilst commenting elsewhere on the Ahsan Award—that the labour force which contributed to the building up of reserve funds of a concern was 'not a constant factor'. It is not that, even if such were the case—for the sake of argument—the workers would become entitled to a share in the reserves. The only point sought to be made here, I think, is that there would be at least some semblance of equity in such an event. In reality, however, there is a succession of workmen, some of whom who actually toiled earlier may be no more, having either retired or died, and the L.A.T.I. was, therefore, justified in holding that the employees who follow them or those who happen to be in service in a given year in which a company may cease to function cannot be regarded as representatives—perhaps the better term would have been 'heirs'—of the older generation of workers. "What justice is there", as the Appellate Tribunal rightly asked, "where the claim is, in essence, a claim to share the fruits of others' labour by persons who happen to be in the employment of the company in the particular year in which its business is wound up?"

It is significant that the L.A.T.I. felt it necessary to impress upon the workers, who nowadays seem facilely to take so many things for granted, that the profit-sharing scheme was still in a "nebulous state" in India, resting delicately on the tentative report of a committee which had not yet been implemented by the Government of India. Not until the Government of India does so can workers have, according to the Appellate Tribunal, any legal claim to a share in the assets of a company at the time of its winding up. The questions naturally arise as to when and whether the Government will implement the profit-sharing scheme and as to what will happen thereafter.

Be that as it may, if the L.A.T.I. reversed the lower court's decision in the matter of the workers' claim to the Company's reserves, it not only upheld but enhanced the scale of retrenchment relief to the workers. The Madras Tribunal had awarded half a month's basic wage for every completed year of service but only up to a maximum of six months' salary. The Appellate Tribunal decided, however, to enhance this relief—despite the Company opposing it—on the grounds that the workers had now been denied a share in the reserves and that many of the employees might have to remain unemployed for the rest of their lives. It is not clear (from the reported version of the judgment) as to how this extra drain on the assets of the Company is suggested to be met.

EMPLOYMENT—DIRECT AND INDIRECT

(A Statistical Study)

By

CROESUS

WHEN, the other day, in the course of his address to the Democratic Group and the Commerce Graduates' Association in Bombay, Mr. G. D. Birla made an interesting point about allied employment in factory industries, I could see that many people desired fuller information on the extent of such allied employment. With a view, therefore, to getting some clearer idea on this point, I made an effort to get comparative figures of investment, employment,and earnings per head, both direct and indirect, in (1) a full-fledged textile mill, (2) a unit with factory spinning and handloom weaving and (3) a unit with hand spinning and hand weaving. Let me straightaway admit that, being a layman, I am not in a position to vouch for the cent per cent accuracy of these figures, although, let me add, I have spared no effort to get as reliable information

as possible under all the heads. Maybe, these figures need to, and would, be verified. But, subject to this, I make bold to say, the figures give a fairly correct perspective.

Here is the statement I have referred to:

Comparative study of three principal means of cloth production

Investment	Factory	Factory Spg. & Hand Weaving	Hand Spg. & Hand Weavig
Direct	Rs. 1,90,00,000	Rs. 1,40,00,000	Rs. 46,00,000

Direct & Indirect Total	10,37,000	Factory	4,30,000	
		Hand	7,31,500	12,66,000
Direct & Indirect Average	86-7	Factory	82-4	
		Hand	14-0	
		[Average	48-2]	3-12

NOTE: The factory data are on the (average) basis of 26 days' work per month. If hand operatives work for 30 days a month, their number and earn ings will be as below:

(i) Number of hand workers	..	40,200	2,57,200
(ii) Average earning per head	..	18-4	4-14

Arising from the above statement, certain conclusions follow. Thus, for a monthly production of 47 lakh sq. yds. valued at an average rate of 8 as. per sq. yd., or, in the aggregate, of Rs. 22½ lakhs, the investment needed in a full-fledged textile unit would be Rs. 3.65 crores; in a unit with factory spinning and handloom weaving, Rs. 2.5 crores, and in a wholly handspinning and handweaving mill, Rs. 46.25 lakhs. The employment provided by the first, namely, the factory unit, would be 12,000, consisting of direct employment 3,000, and allied employment 9000; in the second category, the total employment would be 57,475 made up as follows: direct employment in factory: 2,325, handweaving: 50,400; allied employment in factory: 2,900 and handweaving: 1850; and in the wholly handspinning and handweaving unit, the total employment would be 3,35,250 consisting of 3,33,300 directly employed and only 1,950 indirectly employed. The investment per head of labour in the three different units would be Rs. 3,000, Rs. 435 and Rs. 14, respectively, but the earnings per month in the case of the full-fledged factory, both direct and indirect, would average Rs. 86-7 as compared to Rs. 48-2 (thanks, here again, to the factory employment component) in the case of a unit with factory spinning and handweaving, and only Rs. 3-12 in the case of a wholly handspinning and handweaving unit.

It is thus seen that the statement fully underlines the point made by Mr. Birla that it is very important, when considering the employment potential of a factory industry, to take into consideration the question of allied employment as well. For it is seen that, as against the allied employment of 1950 provided by a wholly handspinning and handweaving unit and of 4750 (including 2900 on the factory side) provided by a unit with factory spinning and handweaving, a full-fledged textile factory accounts for allied employment of as much as 9000! Roughly, the proportion would be 1 : 2 : 4 for handspinning and handweaving, factory spinning and handweaving, and full-fledged factory, respectively.

Mr. Birla, it should be mentioned here, did not underestimate in his address the employment potential of hand industries. On the contrary, he categorically stated that the total employment in hand industries was much larger than the total direct and allied employment in a factory unit. But what he proceeded to convey—a point which has been fully borne out by the statement above—is the fact that, whereas, in handspinning and handweaving, the addition to national wealth is extremely poor, it is sizable in the case of a factory. In other words, although it may be possible for hand industries to provide larger employment, they will not be able to raise the standard of living of the people to an appreciable extent. The fundamental problem, as Mr. Birla emphasised, is not just employment alone—mere employment is of little consequence—but also a rise in the standard of living. He reminded us that the problem facing this country today is to provide 10 million jobs and also a rise of 25 per cent in the standard of living, according to the authors of the Plan-frame. Creation of wealth becomes very important in this context, because, if there is wealth, employment can be created in hundred and one ways.

From the way in which the Plan is proposed to be patterned at present, it does not seem that the twin aims of employment and a rise in the standard of

living are going to be achieved. Accordingly, there must be a reorientation in the planners' approach to the pattern of industrialisation. It is Mr. Birla's thesis, based on his experience and observation of conditions in other advanced countries, that we must have an integrated industrial structure, a structure in which there is a place, and a definite one, for heavy industries, medium-scale industries and small-scale or hand industries. Ultimately, as he said, both the small-scale and the heavy industries would have to depend upon medium-scale industries. The heavy industries cannot produce on the strength of hand industries alone. They have necessarily to sell their products to large or medium-scale industries. Heavy industries cannot also come into existence, unless there are large-scale and medium-scale industries to be fed by them, and the same principle applies to the small-scale industries as well. The small-scale industries can exist partly as feeders to medium and large-scale industries and partly as caterers of decorative and luxury products. But, for the latter, there must be enough wealth in the country. Without adequate purchasing power, one cannot very well afford to go in for luxury goods.

Let me now sum up. First, it is not possible to raise the standard of living by relying wholly on small-scale industries although it may be possible to create large-scale employment. The word 'may' used here may be objected to by the protogonists of small-scale industries. But I have used it advisedly, as I have my own doubts about enough workers forthcoming for the jobs that the unduly expanded (as proposed) small-scale industries, especially handloom and handspinning, might have to offer. For, in the first place, the income is not by any means attractive. Secondly, it must not be forgotten that it is only a particular caste that is doing weaving today, even among them many have slowly begun to lose their hereditary professional skill by disuse. It is extremely doubtful if others, most of whom are from the educated classes, will take to these industries even if attractive wages are offered. Incidentally, it is worth emphasising here that the problem of unemployment is relatively more among educated middle classes, to whom jobs that handspinning and handweaving may have to offer do not provide an effective solution.

My second point is that it is not enough if any kind of employment is provided. If you really come to think of it, you can create employment in a number of ways provided there is wealth, which means that creation of wealth is a prerequisite to employment. What is as important as, if not more important than, providing employment is providing productive employment.

My third and final point is that, without a satisfactory provision for large-scale and medium-scale industries, heavy industries cannot thrive, even as small-scale industries cannot thrive without large-scale and medium-scale industries, to feed either of which is one of the primary functions of the small-scale industries.

I am sure these conclusions, which are merely a projection of Mr. Birla's ideas put out the other day, with the help of figures, would interest our planners and economists. If they do, I hope, the latter would carefully examine my conclusions. Needless to say, I would welcome further enlightenment on the issues raised.

Company Meeting

ORIENTAL GOVERNMENT SECURITY LIFE ASSURANCE CO., LTD.

Eighteth Annual General Meeting

Speech by Sir Cowasjee Jehangir, Bart

Presiding over the Eighteth Annual General Meeting of the Oriental Government Security Life Assurance Co., Ltd., held at the Head Office, Oriental Buildings, Bombay, at 4 P.M. on Wednesday, 10th August, 1955, Sir Cowasjee Jehangir, Bart, G.B.E., K.C.I.E., J.P., Chairman, referred to the resignation of Sir Purshotamdas Thakurdas, since the close of the year under report and quoted 'in extenso' the Resolution passed by the Board while accepting the resignation in which the Board has placed on record the long and meritorious services rendered by Sir Purshotamdas to the Company during the 36 years he was a Director out of which for 22 years he served as the Chairman of the Company in recognition of which service his bust has been put up in a prominent place in the Company's premises. Continuing he said:

I have pleasure in presenting to you the Report and Accounts for the year ended 31st December, 1954, a copy of which has been in the hands of the Shareholders and such of the Policy-holders as had asked for one before the date of the meeting and may, therefore, I hope, be taken as read.

NEW BUSINESS MORE THAN DOUBLE

The New Business completed last year amounted to an all-time record of 1,24,476 Policies assuring a little over Rs. 47¾ crores, which shows an increase of 46,201 policies assuring Rs. 24-1/3 crores as compared with the New Business of the preceding year. The Company thereby achieved the unique feat of more than doubling the volume of New Business during the last year. The average amount assured under a Policy also registered a significant increase of Rs. 3,837 as against Rs. 2,989 in the preceding year.

During last year, our total Premium Income crossed the Rs. 10-crore mark, the actual figure being over Rs. 1,046¼ lakhs as compared with Rs. 952½ lakhs in 1953 showing an increase of Rs. 93-2/3 lakhs.

The Claims by Death last year amounted to a little less than Rs. 108½ lakhs. The Claims by Maturity amounted to slightly less than Rs. 322½ lakhs. The Company's Mortality Experience has registered a further improvement, the ratio of Actual to Expected Deaths during the year being 37.0 per cent, as compared with 41.7 per cent, in 1953.

RENEWAL EXPENSE RATIO REGISTERS IMPROVEMENT

The Expenses of Management last year amounted to 25.4 per cent of the Premium Income as compared with 23.4 per cent in 1953, showing an increase of 2.0 per cent. Practically the whole of this increase, 1.9 per cent, to be exact, is accounted for by the provision of Rs. 20 lakhs made in the accounts for the liability in respect of future Gratuities to Staff. The Renewal Expense Ratio for last year was 11.67 per cent, as against 14.40 per cent for 1953 showing a decrease of 2.73 per cent.

As a result of the year's operations, the Funds of the Company increased to a little over Rs. 78¼ crores at the end of the year.

Demand for Policy Loans continued more or less at the level of the preceding year. The total amount of Policy Loans (excluding Automatic Premium Loans) standing on the Company's Books at the end of the year was a little over Rs. 592-1/3 lakhs.

The net rate of interest after deduction of Income-tax at the source earned on the Funds during 1954 was 4·12 per cent, as compared with 3.57 per cent for the preceding year. The difference is mainly due to the fact that while in 1953 we received refund of Income-tax for one year, in 1954 we received refund for two years.

The Lapse Ratio improved from 5.5 per cent in 1954 to 5.3 per cent in 1954.

The year under report was the last of a Triennial period at the end of which the Valuation of the Assets and Liabilities falls to be made to ascertain the profits for distribution between the Shareholders and the Policyholders. The Valuation is now in progress and the results will be available shortly.

POLICYHOLDERS' DIRECTORS

On 1st June, 1955, the usual triennial Policyholdes' Meeting in terms of Section 48 of the Insurance Act, 1938, was held and Messrs. Dahyabhai Vallabhbhai Patel, Pashabhai Patel and Chandrakant Chottabhai Patel were re-elected Directors.

MUTUALISATION OF THE COMPANY

Now a word about the idea of the Directors to mutualise the Company. As policyholders might be aware, an Extraordinary General Meeting of the Company was called on the 15th June last when the Directors put before the meeting a scheme for mutualisation prepared by them which was after some discussion unanimously approved by the Shareholders. It was as far back as the year 1948 when the Directors felt that, looking to the large size of the Company at that time and also the rapid progress which it was making during the preceding few years, it would be desirable to mutualise the Company, thereby leaving its management entirely in the hands of the Policyholders. As I stated in my speech before the Extraordinary General Meeting above referred to, the Directors felt that although the share capital played a very important role in the initial stages of the Company, the time has now come when the Shareholders should be paid off and the management of the affairs of the Company should be left to such of the Policyholders as are elected by them. It is with that idea

in view that the entire mutualisation scheme was considered in all its bearings by the Directors step by step with the result that we have now come to the stage when the scheme for mutualisation as put before the Extraordinary General Meeting and approved by them has been forwarded to Government. The scheme is being published in all the important newspapers of the country and the Government of India are also publishing it in the Government 'Gazette.' The scheme is thereby given the widest publicity possible and also any objections or suggestions are invited from interested parties and these should be addressed to the Controller of Insurance so as to reach him before 30th September next, which gives as long a period as 2 months for Policyholders and Shareholders to send their objections or suggestions, if any, after careful consideration. The Directors gave their utmost and very anxious consideration to the vital question of holding the scales even between Policyholders and Shareholders. To have their hands further strengthened they took the opinion of a highly respected legal luminary of top rank in India as regards the figure of compensation putting before him what they have arrived at as fair compensation. He fixed the compensation at Rs. 8,800 after carefully going into all the aspects of the problems. The sum of Rs. 8,800 is not what falls to be paid straightaway, but its payment will be deferred for or spread over a period of years. Again, it is not and cannot be secured on any tangible asset of the Company but only on 15 per cent of the emerging surplus of the periodical valuations of the Company. What is more important to consider is the fact that practically during all the years in the past the Shareholders had forgone a substantial part of the amounts that would have gone according to the Articles of Association of the Company to augment their dividends but which instead were allowed to augment the Policyholders' Life Assurance Fund. If the amounts the Shareholders had forgone in the past had been taken to a fund to their credit and invested, the amount standing to the credit of that fund itself would have provided a significant part of the compensation now sought to be paid to them. What is even more important to consider is the fact that the figure of Rs. 8,800 does not allow for any future increases in the dividend due to the progressively satisfactory functioning of the Company judging from how it has been functioning during the past few years.

Even from the date mutualisation is given effect to, the Debenture-holders' Directors will be reduced from the present number of 9 to 5. To enable the policyholders take over an increasing share in the management of the Company, there is provision for the number of Debenture-holders' Directors progressively diminishing further and the number of Policyholders' Directors correspondingly increasing as and when Debentures are redeemed.

To avoid any sudden strain falling on the Surpluses of a few trienniums only the redemption of the Debentures is deferred for or spread over a period of years.

These are some, if not all, of the points to which the Directors had to give their careful consideration before deciding on the principle of mutualisation and also the quantum of compensation. I thought it best to go to the length I have done in explaining how the Directors' minds have been working for a few years in the past on this important question of mutualisation.

The advantage that would be secured by Policyholders once the Shareholders are paid off will be very great indeed. Apart from the fact that the entire management of the Company will pass into their hands, there will also be a financial advantage in that there will not be any future liability, once the shares are paid off, for payment of dividends and the entire Surplus would be available for distribution amongst Policyholders alone. Taking all these factors into consideration, I cannot but wholeheartedly recommend to the policyholders the acceptance of the scheme as forwarded to Government.

NATIONALISATION OF INSURANCE

I now take up the highly vexed and topical question of Nationalisation of Insurance. In this connection, I cannot do better than quote fully what my predecessor in Office said at the time of opening the Oriental Building, Ahmedabad, on 17th March, 1953. Since this speech was not delivered before a meeting of policyholders and shareholders, I think it appropriate that his weighty words in this respect should receive your careful consideration:

> "It is surprising that in spite of the grim warning furnished so unequivocally by nationalisation of the coal industry in the U.K. in the shape of diminished output per man and increased cost of raising, our Ministers in power talk lightly of socialising or nationalising as applied to a business least fitted for nationalisation and whose progress depends upon research in several fields of intellectual activity which can be fostered only under conditions created by healthy competition as a private enterprise. I, therefore, cannot allow this occasion to pass without putting out most respectfully a warning to these advocates of socialism. 'Hands off those for whom we insurance companies are trustees, particularly as they are normally widows and orphans'. I make an appeal to Ministers in power in all humility but with the utmost sincerity to be consistent in their policy declarations bearing in mind the great harm that will be done to the country's economy by inconsistent pronouncements of policy."

Since then, Chairmen of almost all companies have gone fully into the question and I cannot do better than says that I whole-heartedly agree with every bit of what has been said in this respect.

In my statement as Chairman at the Annual General Meeting of our Subsidiary, the 'Oriental Fire,' I have already expressed my considered opinion regarding this disturbing development as it affects the future of Indian general insurance companies. I make no excuse for reiterating that I consider it a most retrogressive move and I am of the opinion that even the threat or rumour of nationalisation may be sufficient to damage the prestige of Indian companies in those overseas territories in which a number of us are seeking to establish outselves.

On that occasion, I also amplified the details of the progress of our Subsidiary, the Revenue Accounts and Balance Sheet of which are shown separately in the accounts now before you. Steady progress was again recorded in all departments and it was possible to increase the dividend from Rs. 15 to Rs. 20 per share free of income-tax after substantially strengthening the Reserve position and making adequate provision for all contingencies. With our Subsidiary firmly established, I am satisfied that we are now in a position to offer insurance service second to none in the best 'Oriental' tradition, not only so far as life insurance is concerned but also in all other departments of our business.

Before concluding, I should like to convey our appreciation of the steady performance of our Active Agents which has enabled the Company to complete a New Business of over Rs. 47¾ crores.

Finally, I wish to convey our appreciation to our Officers and Staff at the Head Office and at our Branches of the helpful service rendered by them during the year.

BUSINESS NOTES

FROWNING ON DONATIONS?

REPORTS FOR some time past indicate that instances are on the increase where income-tax authorities frown on donations given by assessees for religious or charitable purposes. The object, it is obvious, is to exert a sort of pressure on assessees to reduce donations, if only because the exchequer stands to gain by such a course. Little thought is given to the vital issue: At whose cost is the exchequer made to gain?

The law on the subject of exemption of religious and charitable donations from income-tax is contained in Section 15B of the Indian Income-tax Act, as amended by the Finance Act of 1953. Before any part of the income of a donor-assessee qualifies for exemption from income-tax, the following conditions are required to be satisfied: (1) The income of the institution or fund, which is the object of the religious or charitable donation, must be entitled to exemption under the comprehensive provisions of Section 4(3)(i) of the Indian Income-tax Act. (2) The institution or fund must not be intended for the benefit of any particular religious community, except where the benefit is to accrue to scheduled castes, scheduled tribes and other specified categories. (3) The institution or fund must maintain regular accounts of receipts and expenditure of its monies. (4)(a) The institution or fund must be constituted as a public charitable trust or it must be registered under the Societies Registration Act, 1860, or it must be a university established by law or an educational institution recognized by Government or a University; or (b) it must be an institution financed wholly or partly by the Government or a local authority. (5) The aggregate sums paid by an assessee by way of donation must not be less than Rs. 250. (6) The exemption will hold good only up to 5 per cent of the assessee's total income as reduced by any portion thereof exempt from tax or Rs. 1,00,000 whichever is less.

The following assortment of business enterprises typifies the philanthropic part played by business and industry in general. The amounts represent donations made by them for religious or charitable purposes during the last accounting year.

Tata Iron & Steel Company	.. ..	Rs. 2,11,520
Rohtas Industries	.. ..	„ 1,04,131
Nizam Sugar Factory	.. .. ..	„ 68,275
United Commercial Bank	.. .. ..	„ 19,958
Shri Ambica Mills	.. ..	„ 19,297

These donations go to finance institutions or causes of national importance which could not subsist without them, nor are there probabilities of alternative finance available to them. So long as the law provides safeguards to ensure that donations are chanelled in the right direction, why should any attempt be made to discourage them?

CONSULTATION ON RAIL PROBLEMS

ALL OF a sudden, we seem to have become conscious of our transport problems. Official spokesmen admit, more freely than they were prepared to do ever before, that there are quite a few bottlenecks that need looking into and do not seem averse to discussing these. One sees almost a keen anxiety, as it were, on their part, both to understand the hardships and difficulties of the users of railways and to explain to the latter their own difficulties and limitations. Only recently, the question of improvement in goods train operation was discussed at a Conference (in Delhi) between the Railway Board and the Chief Operating Superintendents of the Zonal Railways. In Bombay, last week, again, transport bottlenecks and ways to overcome them formed the subject-matter of discussions between the General Managers of the Central and the Western Railways and the Indian Merchants' Chamber at a meeting held on August 10. Mr. B. M. Chinai, President of the Chamber, drew the attention of the railway chiefs to the difficulties experienced by the mercantile community in the matter of non-availability of wagons and booking facilities over the two railways and pointed out that the goods booking situation, which had already become difficult in the past few months, might become worse still if effective steps were not taken immediately. Stating that manufacturers, traders, and consumers had all been equally affected by this non-availability in booking facilities, Mr. Chinai also dwelt on certain administrative drawbacks, such as delay in the announcement of opening and closing of bookings, as also in the issue of Railway Receipts, and irregularity in the allotment of wagons at the City goods depots.

The General Managers of the Railways replied that they were conscious of the fact that they were not in a position to meet the entire needs of transport of the country because of obvious limitations. They, however, pointed out that the Railways had been strenuously trying to handle more and more traffic by improving administrative efficiency, by adopting certain short-term measures, and by accelerating the overall turn-round of wagons. The adoption of these measures, they felt, would mean an improvement of about 25 per cent in the handling capacity of the railways by November, 1955. In the matter of railway receipts, they disclosed that instructions had already been issued to see that these were issued to consignors within 24 hours from time the goods were offered for booking. In this connection, they drew the attention of the business community to the fact that any real expansion of the Railways could only be expected after the completion of the second Five-Year Plan, under which the Railway Ministry intends to spend more than Rs. 1500 crores on improvement of railway assets and capacity. The first Five-Year Plan, according to them, aimed only at rehabilitating the Railways.

FUTURE OF COIR

SIX AD-HOC COMMITTEES were constituted by the Indian Coir Board nearly a year ago to examine the various aspects of the Board's functions laid down under the Coir Industries Act. Four of them have submitted their reports whose recommendations have now been released to the public.

Coir provides the West Coast with one of its major economic activities affecting a larger number of people than perhaps any other industry and its products form an important export item or foreign exchange earner. But arbitrarily splitting an integrated problem and assigning it to different committees as was done last year seems to have only succeeded in preventing any particular committee from looking at the problem as a whole. Besides, the Committees were uniformly handicapped in their discussions by the complete lack of reliable data concerning the various aspects of the industry. In this context, the conclusion of the Committee for Research and Statistics that research should be undertaken under the heads of technology, statistics and economics, is of vital importance. The urgency of

this matter is no doubt felt because coir producers are the least organised and hence incapable of providing reliable information. The Yarn Committee has been frank enough about the anarchic conditions that prevail in the internal trade and the widespread adulteration of the product. Though the Committee has stressed the need for organising the producers of yarn to stabilise the industry, it has suggested no specific measures to achieve this end. If, as recommended by the Yarn Committee, the Board takes over the administrative control of the coir co-operatives, now run by the State Governments, it would, of course, provide closer and more immediate supervision, but it would require a vastly enlarged Coir Board with a much bigger budget. But in an industry where there are over five lakhs of primary producers, the enrolment of 22,620 in 142 co-operative societies in five years is not an impressive record.

One of the two committees whose report has not been submitted is the External Marketing Committee, but now that Dr. Franz Wilhelm, President of the Union of the European Coir Industry, is in India, it would perhaps be advisable to defer the drafting of the report till the Committee has had an opportnuity of meeting and exchanging views with him and his colleagues.

The development of the industry depends on knowing more accurate facts and an immense effort to organise the producers. Coir has many substitutes and rivals like sisal, manila and henequen. The idea that is commonly held in certain quarters that we can dictate the price of coir to overseas buyers with impunity may land the industry in serious trouble. For, out of the total fibre output of 1,20,000 tons, about 54,000 tons are internally absorbed, leaving as much as 66,000 tons to be marketed abroad. The total production of mats, mattings rugs and carpets is about 21,000 tons of which as much as 20,000 tons are exported. Fortunately for India, however, there is wide scope for the expansion of internal demand both for coir yarn and coir products. As the Committee on Internal Marketing suggests, if the consumption of yarn in India is increased by another 10 to 15,000 tons, it will have a great stabilising effect on the price factor. Now hardly five per cent of the production of coir products is consumed within the country. The present undue dependence on foreign markets is a serious weakness and so long as it continues, it is bound to reflect considerably on the fortunes of the industry with every fluctuation in the external demand.

FRESH QUOTA FOR GROUNDNUT EXPORT

NEW DELHI has sprung yet another surprise by releasing a further quantity of groundnut oil for exports. Although it is almost second nature for shippers to expect export quotas, usually at fixed intervals, the announcement did provide a pleasant surprise for the trade was lately becoming restive over the prolonged silence of the authorities on this issue. The simultaneous decision of the Government to raise the export duty on groundnut oil from Rs. 100 to Rs. 150 per ton did not prove to be a disturbing factor, inasmuch as shippers were confident of their margin of profit not being greatly affected in view of the remunerative nature of export business in this commodity. There has been a steadily growing demand for Indian groundnut oil in the overseas markets, especially in the U.K. and on the Continent where prices have been ruling at between £108 and £110 per ton c.i.f. in bulk. Far Eastern buyers have been quoting even higher at £121 per ton in drums, the main centres being Hong Kong, Singapore, and Rangoon.

The actual quantum of the quota on the basis of 7½ per cent of the best year's exports works out to between 10 and 12,000 tons of groundnut oil. In view of the trade's conservative estimate of the stock position of groundnuts during the season remaining at around 1½ lakh tons and taking into account the late monsoon and the consequent delay in crop arrivals, marketmen have been accumulating lines more and more with a view to be prepared in advance for the export quota which was generally expected to be announced at this part of the year. Prior to the announcement, overseas buyers were quoting around £9 and £10 higher per ton due to scarce offering. Since the announcement of the export quota and with the added burden of a rise in the export duty, it has now turned to the lot of Indian shippers to quote lower rates of between £4 and £7 per ton to attract foreign buyers. It is this pull working from opposite ends that was responsible for checking the initial uptrend in prices. Thus, groundnut oil, which quoted Rs. 12-13 prior to the announcement, went up to Rs. 13-6 immediately following the quota announcement, but only to relapse to Rs. 12-14 on Friday. How the market trend will turn out to be in the days to come is very much dependent on the extent of business that Indian shippers are enabled to do in the overseas markets.

ORIENTAL'S PROUD PERFORMANCE

AS THE Oriental Government Security Life Assurance Company stands on the threshhold of its great transformation into a mutualised company, it is pleasing to find that it attained a new peak in business in the calendar year 1954. A noteworthy record was attained in respect of the new business completed in 1954 which amounted to 1,24,476 policies assuring a little over Rs. 47¾ crores—an increase of 46,201 policies assuring Rs. 24-1|3 crores over the previous year. This outstanding record of doubling the volume of new business is in keeping with the general trend in life insurance business in 1954 and in some degree it is the outcome of the policy of reduction of premium rates widely adopted over the country.

But it is significant to note that the average amount under a policy registered an increase to Rs. 3,837 in 1954 as against Rs. 2,989 in 1953. Total premium income rose to Rs. 10,46¼ lakhs last year as compared to Rs. 952½ lakhs the year before. Claims by death amounted to a little below Rs. 108¼ lakhs and claims by maturity were slightly less than Rs. 322½ lakhs. There was vital improvement in the mortality experience and the ratio of actual deaths to expected deaths stood at 37 per cent in 1954 as contrasted with 41.7 per cent in 1953. The expenses of management in 1954 were 25.4 per cent of the premium income at which level they show an increase of 1.9 per cent over 1953 virtually due to the provision of Rs. 20 lakhs for liability in respect of future gratuities to staff. The renewal expense ratio last year was 11.67 as against 14.40 per cent in 1953. The lapse ratio recorded an improvement from 5.5 per cent in 1953 to 5.3 per cent in 1954. The funds of the company reached the level of a little in excess of Rs. 78¼ crores at the close of the year.

Sir Cowasjee Jehangir, delivering the presidential address before the eightieth annual meeting of the company once again explained in brief the principal features of the scheme of mutualisation. This issue has been discussed thread-bare before, and it only needs to be mentioned here that compensation to shareholders has been proposed at the rate of Rs. 8,800 per share spread over a period of years. Sir Cowasjee has made a fervent appeal to policy holders to accept the scheme, now pending government's approval, since it strikes an even balance between the interests of shareholders and policy holders.

ASHOKA CEMENT'S FRESH ISSUE

ASHOKA CEMENTS LIMITED, who were incorporated on May 27, 1954, with an authorised capital of Rs. 2.5 crores, have approached the capital market with an additional issue of share capital. Out of the authorised capital which is divided into 50,000 Preference Shares of Rs. 100 each and 20,00,000 Equity Shares of Rs. 10 each, 1,50,000 Equity Shares have been issued already. The present fresh offer of issue of capital consists of 4,50,000 Equity Shares of Rs. 10 each at par. Of these 1,50,000 Equity Shares have been agreed to be subscribed and they will be allotted accordingly. The balance of 3,00,000 Equity Shares of Rs. 10 each are offered for subscription by the public at par payable in the amounts of Rs. 2-8 per share along with the application and Rs. 7-8 per share on demand against offer of delivery of share scrips. Since obtaining the certificate of commencement of business except acquiring land on lease and placing orders for machinery. Its immediate plan is to establish a cement plant at Dalmianagar, Bihar, with a kiln-capacity of 775-850 tons per day. With the loan of Rs. 50 lakhs which the Industrial Finance Corporation has sanctioned in favour of the company, it can make a confident start in the new venture.

LOWER PROTECTION FOR GRINDING WHEELS

IN CONCURRENCE with the Tariff Commission, Government has decided to reduce the quantum as well as range of protection to the grinding wheels industry in this country. Grinding wheels of more than 24 inches diameter, or less than 1|32 inch or more than 9 inches in thickness, and diamond impregnated wheels are excluded from the scheme of protection. For the time being, the excluded categories will suffer no disadvantage as a revenue duty at the rate of the new protective duty is to be levied on imports of these two categories. In respect of other types of grinding wheels, protection has been extended for a further period of two years up to December, 1957, but the rate of duty has been reduced by a little more than half to 25 per cent ad valorem including surcharge. The concession of duty-free imports of synthetic abrasive grains is to be continued during the extended period of fresh protection. The existing policy of priority to indigenous grinding wheels and segments for government requirements is to continue provided price quotations are not unreasonable. This proviso may allow in certain cases price preference to domestic products.

The Government resolution on the Tariff Commission's recommendations does not mince words. It states bluntly that the high tariff wall was not put to proper use and the consumer of this vital product—engineering industries—has not derived benefit from protection. Caution has been issued that price control or other appropriate regulatory measures will be clamped to protect the consumer if necessary. The sole producer—Grindwell Abrasives Ltd.—has been exhorted to reduce production costs, concentrate on economical range of products and to provide better after-sale service. Reduced protection and the emergence of competing units as anticipated in the near future are trusted to exert wholesome influence on the present only unit in the sphere.

STEEL PIPE AND TUBE INDUSTRY IN EUROPE

A STUDY of the above industry conducted by the Secretariat of the Economic Commission for Europe demonstrates that the industry's consumption of world crude steel production, excluding the iron curtain countries, rose to 10 per cent in 1954 as against 8 per cent during 1936-38. The industry is expanding at a faster rate than the flat products industry. The study makes a forecast of the demand in the near future and arrives at the conclusion that Western Europe's tube requirements are likely to rise from 3.7 million tons to 5.1 million tons between 1954 and 1960. This estimate may turn to be an understatement. The study discloses that the per capita consumption of pipe and tube steel in the USSR is now higher than in the U.K. and Western Germany. This is indicative of the rapid progress in that country's industrialisation from an underdeveloped stage. Underdeveloped countries now entering an era of quick industrialisation will push up their demand, but part of it will be satisfied by indigenous production, leaving undoubtedly a fair share to producers from Western Europe. Pressure of local demand must necessarily offer wider market for the producers in the region.

LABOUR IN ART SILK MILLS

THE FOURTH ANNUAL Labour Report of the Silk and Art Silk Mills' Association deals exhaustively with the labour situation in the silk textile industry during 1954-55 and the various legislative measures enacted by the Government.

The year under review was a comparatively quiet one, the prices of art silk yarn and cloth being steady unlike in the preceding years which witnessed frequent and violent ups and downs. This is evident from the fewer closures, both partial and total. Notwithstanding this, there was increasing indiscipline on the labour front, judging by the sharp rise in the number of lightning strikes, the number of workers involved and the man-days lost by 14 per cent, 60 per cent, and 143 per cent, respectively, compared to the previous year. There was a further increase in the financial burden imposed on the industry, especially in Bombay, according to the Report, such having been occasioned by labour legislation, the amendments to the Factories Act, 1948 and the implementation of the 'Employees' State Insurance Scheme in Greater Bombay, Bhiwandi, Thana and Borivli talukas.

SHREE KRISHNA GYANODAY SUGAR LIMITED

NOTICE

The Board of Directors of the Company in their meeting held on the 13th August, 1955 have decided to pay an ad interim dividend of Re. 1|- per share without deduction of income-tax to the shareholders whose names stand in the Company's Register on the 1st October, 1955. Issuing of dividend warrants will commence immediately thereafter.

The Share Transfer Books of the Company will be closed from 26th September, 1955 to 1st October, 1955, both days inclusive.

By order of the Board,

For Shree Krishna Gyanoday Sugar Limited,

SAHU JAIN LIMITED,

Managing Agents.

CALCUTTA,
13th August, 1955.

THIS IS AN ANNOUNCEMENT AND NOT A PROSPECTUS

The Subscription List will close on Monday, the 22nd August, 1955 or earlier at the discretion of the Directors.

A copy of this Prospectus has been filed with the Registrar of Joint Stock Companies, Patna as required by Section 92(2) of the Indian Companies Act. VII of 1913.

Consent of the Central Government has been obtained to this issue by an Order of which a complete copy is open to public inspection at the Head Office of the Company. It must be distinctly understood that in giving this consent the Government of India do not take any responsibility for the financial soundness of any scheme or for the correctness of any of the statements made or opinion expressed with regard to them.

"A license has been obtained from the Central Government for the establishment of a new industrial undertaking for the manufacture of Cement of which a copy is open to public inspection at the Registered Office of the Company. It must be distinctly understood that in granting this licence the Government of India do not take any responsibility of the financial soundness of this undertaking or for the correctness in any of the statements made or opinion expressed in regard to it."

The Company is already on the official quotation list of Delhi Stock Exchange Association Limited and applications have been made to the Calcutta Stock Exchange Association Limited and The Native Share & Stock Brokers' Association, Bombay for enlistment.

1. State Bank of India.
2. Chartered Bank of India, Australia & China.
3. The Punjab National Bank Ltd.
4. Allahabad Bank Ltd.

Registered Office:

Dalmianagar, Dist. Shahabad (Bihar).

PROSPECTUS

The Company was incorporated on the 27th May, 1954 for the objects set out in the Memorandum of Association generally and in particular to produce, manufacture, purchase, sell and to deal in all kinds of cement, cement products, lime, limestone and to establish, maintain and work cement factories and other works.

The immediate plan is to set up at Dalmianagar in the State of Bihar a Cement Plant with a kiln capacity of 775-850 tons per day. In pursuance of this objective about 7 acres of land have been secured on 99 years lease from Messrs. Rohtas Industries Ltd., on a rental of Rs. 2,100 per annum. Limestone deposits are abundant in the neighbourhood of Dalmianagar and judging from the results of the existing cement factories, the location provides excellent advantages.

Main plant and machinery have been purchased from Messrs. Fried Krupp Maschinen-und Stahlbau Rheinhausen, West Germany. Installation work is in progress. The factory is expected to go into production in about six months. Even on the basis of an average profit of Rs. 10 per ton at a normal annual production of 2,50,000 tons of Cement it is expected

that the Company would be able, after making requisite provision out of its working profits for redemption of loan capital, to declare fair dividends on its equity shares from the very first year of operation. The Company has the advantage of a small capital base and low capital expenditure per ton of Cement.

It is well-known that in the years to come there will be progressively increasing demand for cement. The following table shows the present position in respect of Ordinary Shares of a few cement companies.

Name of the Company	Face Value of Ordinary Shares Rs. a.	Market Quotation (Around) Rs. a.	Dividend per cent per annum on face value
Associated Cement Cos. Ltd.	100 0	190 0	8.5
Dalmia Cement (Bharat), Ltd.	10 0	16 8	10.0
Sone Valley Portland Cement Co., Ltd.	5 0	7 8	7.5
Shree Digvijay Co., Ltd.	100 0	205 0	8.5

The Directors do not propose to issue any further Capital until the Company declares a dividend on the present issue.

TAX BENEFIT

The Company is advised that companies subscribing capital under this issue will be entitled to obtain exemption from payment of Super Tax as provided in Section 56A of Income Tax Act.

PREVIOUS ISSUES AND MINIMUM SUBSCRIPTION

The Company, incorporated on the 27th May, 1954, issued and allotted to the subscribers of the Memorandum and Articles of Association, Directors and their friends Equity Shares of Rs. 5 lakhs. The Company obtained Certificates of Commencement of Business on 23rd August, 1954. Thereafter further shares of Rs. 10 lakhs have been issued and allotted to the Directors and their friends. The Company has not carried any business except placing orders for machinery and acquiring land on lease. The Industrial Finance Corporation of India has sanctioned a loan of Rs. 50 lakhs against the 1st mortgage Debentures secured on the fixed assets of the Company. The shares allotted and subscribed as aforesaid together with the loan of Rs. 50 lakhs are in the opinion of the Directors sufficient to provide in respect of matters specified in Sec. 101(2) of Indian Companies Act in relation to the present issue.

PRELIMINARY EXPENSES

The preliminary expenses exclusive of brokerage are estimated to be not more than Rs. 50,000.

VOTING RIGHTS

No member shall be entitled to be present or to vote on any question either personally or by proxy for another member at any general meeting or upon a poll or be reckoned in quorum whilst any money is due from him alone or jointly with others to the Company in respect of any shares in the Company.

Every holder of an Equity Share not disqualified by the preceding Article or Articles and who has been duly registered in the books of the Company before the date of General Meeting shall be entitled to be present and to speak and vote at such meeting and when present in person shall have one vote on a show of hands and on a poll when present in person or by proxy shall have one vote in respect of every Equity Share held by him in the Company. The holders of Preference Shares shall not be entitled to voting rights, but shall be entitled to be present at any meeting of the Company.

No member, not personally present, shall be entitled to vote on show of hands unless such member is corporation present by a proxy or a Company present by a representative duly authorised under Sec. 80 of the Act, in which case each proxy or representative may vote on the show of hands as if he were a member of the Company.

The right to exercise the vote of a lunatic, idiot or a minor shareholder shall be exercised by his duly constituted curator, committee or other legal guardian. In absence of any such duly constituted curator, committee or guardian, if more than one person claim to exercise the right of vote, the Chairman of the Meeting will accept the vote of such person only as he may select in his absolute discretion.

Any person entitled under the transmission clause to transfer any share may vote at any general meeting in respect thereof in the same manner as if he were the registered holder of such shares, provided that at least forty-eight hours before the time of holding the meeting or adjourned meeting, as the case may be, at which he proposes to vote, he shall satisfy the Directors of his right to transfer such shares unless the Directors shall have previously admitted his right to vote at such meeting in respect thereof.

If there be joint registered holders of any shares, any one of such persons may vote at any meeting either personally or by proxy in respect of such shares. If more than one Joint-holders be present at any meeting either personally or by proxy, that one of the said persons so present whose name stands first on the register shall alone be entitled to vote in respect of such shares but the other joint-holders shall be entitled to be present at the meeting. Several executors or administrators of a deceased member in whose name the shares stand shall for the purpose of these Articles be deemed Joint-holders thereof.

DIRECTOR'S QUALIFICATIONS AND REMUNERATION

The qualification of a Director, other than an Ex-officio Director, shall be the holding of in his own name or jointly with any person whether beneficially or as a trustee for any Company or person or otherwise at least one share of any class in the Company.

The remuneration of the Directors shall from time to time be determined by the Board of Directors. At present the Directors have fixed Rs. 100 per Director for attending each meeting.

The Directors shall be paid their travelling and other expenses (including hotel expenses) of attending and returning from meeting of the Board or Committee

or Sub-Committee as fixed by the Board from time to time.

If any Director shall be called upon to go or reside abroad on the Company's business or otherwise perform extra services (which expression shall include work done by a Director as a member of any Committee or Sub-Committee formed by the Director) the Board may arrange with such Director for such special remuneration for such services, either by a fixed sum or by a percentage of profits or otherwise as may be determined by the Board. This remuneration may be either in addition to or in substitution of the remuneration above provided, and the Directors shall be entitled to be paid any travelling or other expenses incurred in connection with the business of the Company.

BORROWING POWERS

The Directors or the Managing Agents (within the limit or limits fixed in that behalf by the Directors and subject to the previous approval of the Directors) may raise or borrow any sum or sums of money for the purpose of the Company and may secure payment or repayment of the same in such manner and upon such terms and conditions as may be prescribed by the Board and in particular by the creation of any hypothecation or charge on and over the Company's stocks, stores, book debts and other movable property, provided that the Managing Agents shall not exercise the power to issue any debentures.

Provided further, that the amount borrowed by the Company (exclusive of the amount borrowed by hypothecation, pledge or mortgage of the stock-in-trade, book debts and movable assets to the extent not exceeding the full value thereof) and outstanding at any one time shall not, without the sanction of the Company in General Meeting, exceed the issued capital plus Reserves of the Company, but so that no lender or other person dealing with the Company shall be concerned to see or enquire whether this limit is observed or not.

RESTRICTIONS ON TRANSFER OF SHARES

The Directors may, at their absolute and uncontrolled discretion, and without assigning any reason, decline to register or acknowledge any transfer of shares other than fully paid-up shares.

RIGHTS IN RESPECT OF PREFERENCE AND EQUITY SHARES

The Preference Shares shall confer on the holders thereof the right to a fixed cumulative Preference Dividend as will be determined by the Directors at the time of their issue and shall rank both for capital and dividend, in priority to Equity Shares, but will have no further rights to participate in the profits or assets. The Company may by a resolution in the General Meeting issue Preference Shares, which are, or at the option of the Company are to be liable to be redeemed on a premium which will be determined by the Compay in General Meeting.

No issue of Preference Shares is, however, contemplated for the time being.

INTEREST OF DIRECTORS

Directors are interested in the promotion of the Company as shareholders and to the extent of the remuneration payable to them as hereinbefore specified. Shri S. P. Jain is also Director of Rohtas Industries Ltd.

BROKERAGE

Brokerage at the rate of annas 4 per Equity Share will be paid by the Company to Bankers, **bona fide** brokers and members of the recognised Stock Exchange in respect of all shares allotted against applications received bearing their stamp.

APPLICATION FOR SHARES

Application for shares may be made on the form accompanying the *Prospectus* or any typed or printed copy thereof or on the form which may be obtained from the Registered Office of the Company or its Branch Office at 11, Clive Row, Calcutta or from any of the branch offices in India of the following Banks:

1. State Bank of India.
2. Chartered Bank of India, Australia and China.
3. The Punjab National Bank Ltd.
4. Allahabad Bank Ltd.

Application together with the necessary remittance for the shares applied for may be made at any of the above-mentioned places. In case of applications to the Company's offices direct, cheques drawn on any bank in India will be accepted at par. In the case of applications through banks, outstation cheques or drafts should include collection charges and all payments (not in cash) tendered to banks should be drawn to the order of the bank. Where no allotment is made or where the number of shares allotted is less than the number of shares applied for, the full deposit or the balance of deposit, as the case may be, will be returned without interest.

The shares will be issued subject to the Memorandum and Articles of Association of the Company, a copy of which can be inspected at the Registered Office or the Branch Office of the Company during office hours.

THE RAMAYANA
OF
TULSIDAS
IN ENGLISH VERSE

LATEST "HINDUSTAN TIMES" PUBLICATION

The famous Hindi epic regarded by many as "the greatest book in all devotional literature" is for the first time now available in English verse.

The translator, the Rev. A. G. Atkins, completed the book after ten years of devoted work. He has tried "to keep and express in English in the fine rhythm and music of the original in simple lucid language, and with as much of the vivacity, wittiness and picturesqueness that Tulsidas has put into his work." He has also followed in some measure Tulsidas's metrical variations such as **chhand, chaupai, doha** and **soratha.**

In a foreword Mr C. Rajagopalachari says: "Mr Atkins' monumental work and his Introduction are a revelation of hope for those who desire to see all the great religions of mankind come together. - - - - His service is not only to English-speaking people but also to that very large number of Hindus in India who do not speak the Hindi language and to whom English has become a very familiar medium."

The book is of special value to libraries, scholars and devotees of Tulsidas.

It has been issued in the following four editions:

I. Original text of Tulsidas with translation in English verse; three volumes; 1468 pages; price Rs. 50 net.
II. Translation in English verse; without Hindi text, two volume; 898 pages; price Rs. 40 net.
III. Special tissue paper edition of I, one volume, price Rs. 100 net.
IV. Special tissue paper edition of II, one volume, price Rs. 100 net.

COMMODITY NEWS AND NOTES

WORLD GRAIN PRODUCTION

"The contrast between yields of rice in tropical countries and those in semi-tropical and temperate regions is very marked", says a review of world grain crops just issued in London by the Commonwealth Economic Committee. The report, in its survey of rice production, underlines a fact not generally known: That cooler countries are now obtaining yields of this cereal higher than those attained in tropical lands where rice is mostly consumed.

The review explains that the milder temperatures apparently contribute to these higher results, but that intensive and better methods of cultivation and more widespread use of selected seed and fertilizer are chiefly responsible for the present position. Highest returns are achieved by Italy where the average over the past five years is 26.6 cwt. per acre. The five-year averages of other principal rice-producing countries are: Australia, 25; Japan, 22.6; United States, 14; Brazil, 8; Burma, 7.6; Thailand, 6.8; India 6.1.

COMMONWEALTH RICE OUTPUT

Nearly one-half of the rice grown outside China and the Soviet Union is produced in Commonwealth countries due to the fact that, despite the low acreage yield, there is a greater outturn in India and Pakistan.

"The production of rice", the review continues, "has shown considerable expansion in recent years, largely as a result of the higher level of output in India and Pakistan. The world total reported in 1953-54 outside China was one-fifth above the pre-war figure, although a somewhat lower level is indicated for 1954-55. On the other hand, the volume of rice shipped in post-war years has been considerably smaller than formerly, as a result of fall in exports from South-East Asia. Last year both India and Pakistan had a record area under rice cultivation, the total of 101,000,000 acres being nearly one-third above the pre-war figure for the sub-continent.

WHEAT OUTPUT

Dealing with food-grains generally, the review says that world grain production declined in 1954-55, though in the five preceding years it had risen continuously to some 20 per cent above the pre-war average. The fall was mainly due to the reduced output of wheat, maize, and rice. This was in great measure due to lower wheat production in North America and the smaller output of maize in most countries. The review shows that the Commonwealth countinues to supply one-quarter of the world output of wheat, although it has a smaller acreage than before the war. By the adoption of improved agricultural practices and use of selected seed, some Commonwealth countries have obtained striking increases in yields per acre. In Canada, output per acre is one-third above pre-war, while yields in Australia have gone up by nearly one-half.

COST OF GRAIN PRICE SUPPORT

Replying to a question in the Lok Sabha, Dr. P. S. Deshmukh, Minister for Agriculture, stated that the total value of wheat and jowar purchased by the Central Government in different States under the price support scheme, during 1955-56, was Rs. 2,08,28,742 and Rs. 51,99,278, respectively. Wheat was bought at Rs. 10 per maund, the largest amount purchased being in Uttar Pradesh. Jowar was purchased at Rs. 5-8 per maund, the largest amount purchased being in Uttar Pradesh and Madhya Pradesh.

Dr. Deshmukh stated that no commission or remuneration was being paid to the State Governments for these purchases. He also said that there was no scheme to distribute corn so purchased as seed. But, at its request, the U.P. Government had been authorised to sell jowar for seed purposes to those who may wish to buy it. Similar requests from other State Governments would be considered on merits, he said.

EXPENDITURE ON JAP METHOD

The Food and Agriculture Minister, Mr. Ajit Prasad, stated in Parliament that the total amount spent by the Government of India for the propagation of the Japanese method amounted to Rs. 2,30,141 since the beginning to the end of 1954-55. Out of Rs. 1,89,634 spent in 1954-55, Rs. 40,555 was spent on publicity material and its distribution.

SUGARCANE ESTIMATE

The all-India first estimate of sugarcane 1955-56, puts the acreage at 3,970,000 acres, as against 3,647,000 acres of the adjusted first estimate for 1954-55. This shows an increase of 8.9 per cent in area. The increase has been mainly reported by U.P., and to a lesser extent by Punjab, West Bengal, Rajasthan, Madhya Bharat and Saurashtra.

The Gajendragadkar Award

HINDSIGHT is as commonplace as imaginative foresight is rare. It is a great pity that the lack of appreciation of this fact sometimes produces judgments which are grossly unfair. The humiliation which the Government of India is undergoing as a result of the notorious Bank Dispute case arises primarily from this simple fact that Justice Gajendragadkar has written after the event while the Government's modification of the previous Industrial Tribunal's Award was made before it. The event in question is the sudden return of vitality to India's banking system. After many years of stagnation, within twelve months, demand and time liabilities of banks have risen by something like Rs. 100 crores. It is easy enough to say that the Government of India should have anticipated this rise seeing that the tempo of its own expenditure

was scheduled to rise in similar proportion. But there is no close or certain relationship yet proved between the volume of Government expenditure and that of bank deposits and inexplicably for some years Government expenditure was comparatively neutral all round. In other words, the conditions under which the Gajendragadkar Award was framed were fundamentally different from those which operated at the time the Government of India's award was passed and for some years previously. There is therefore no reason for the general public to feel that the Government of India and particularly the Ministry of Finance, were not justified at the time they made their decision. All that has happened shows that their judgment of the future erred somewhat on the side of caution, being based on the only experience then available.

It may well be that the present award errs somewhat on the other side. This is no cause for its non-acceptance and indeed it is good that all parties have declared their intention of abiding by the results without further protracted controversy. Almost all that need be said on this particular matter is that the present Commission's Award is the result of a painstaking study, and whether it errs in detail or not, it is an excellent bench-mark from which the discussion of similar issues can proceed. Justice Gajendragadkar is entitled to the credit of having produced a document of no emphemeral kind.

On the other hand it is to be remembered that not all parts of this Report can be of equal worth. The Commission has chosen, greatly daring, to make certain recommendations relative to the cost structure of the banking system, such as a possible upward adjustment in the rates charged on loans and advances, concerted actions by banks to enforce floor rates on some categories of advances as well as ceilings on deposit rates. Whether it should come within the field of an Industrial Tribunal to suggest measures designed to increase the revenues of institutions at the expense of persons unheard such as the banks' clients, whether as lenders or borrowers, is a matter on which opinions may well differ. It is a wholly unhealthy precedent that judicial findings should cover issues on which no judicial decision is possible by the nature of the uncertainties which attend the particular business on which these easy pronouncements can be partly made.

It may well be that there is justification for the view that some salaries being paid to the top-most executives in the banking world are a little out of line with current trends set in motion by the approbation generally accorded to the doctrine of a socialistic pattern of society. To say that the costs should be reduced wherever possible by a reduction of excessive payments does not imply that markets can always be increased by raising sale prices. Whereas the Industrial Tribunal might hold a judicial view, therefore, on the structure of existing costs, it cannot surely hold that it has any precise evidence on the likely behaviour of deposits and advances under conditions which have not come under review. In paragraph 82 of the Report, it is stated that the Commission consulted some economists and they appeared to be of the opinion that the earnings of banks in the next two or three years would not be lower than they were in 1954. A similar question was asked of bankers who also agreed. There is justification enough for the views of both economists and bankers on this trend based on existing conditions. But would these economists or these same bankers be equally unambiguous if the proposition were put to them that profits should be made larger than they currently are by imposing on the banking system conditions not relevant to existing trends? It surely would be dangerous for any economist and, indeed, for any banker to prophesy with any assurance that a fundamental change in interest rates would not have a heavy impact on profits. There is more than a little evidence that the rate of interest is a highly sensitive lever in regulating the volume of deposits and advances. How otherwise could the Bank Rate have acquired its tremendous reputation as an instrument of financial control?

It is obvious that when the Government states that "these matters are separately under the consideration of the Government and appropriate action will be taken in respect of them" that all that is intended is a routine examination of the possibility of altering the rate of interest when circumstances justify that course. This is actually done by the Reserve Bank of India week by week and, by and large, in the last year one must applaud the firm grasp the Reserve Bank has shown in handling interest rates in the country. Does the Labour Minister's statement on the Bank Award imply that a super-enquiry on banking charges is now to be placed in operation? If so, the country has a right to know by whom such an enquiry is being held.

The moral of this unhappy episode is now clear. When stagnation overtakes in any sector of the economy, internal stresses increase and, with the best will in the world, and, even in the presence of neutral parties like the Government, it is extremely difficult to find a solution. When, however, the economy expands it is possible to find a remedy much more easily. This is not because the nature of employers or employees has changed or that the attitude of Government is different in any material way. It arises simply from the fact that there is more to be distributed and, therefore, the obstinacy with which different sectors resist the claim for larger payments by others is considerably reduced. The banking sector, like every other sector of the Indian economy, will be released from internal strains largely to the extent to which it becomes truly prosperous. In the last analysis, prosperity is the only solvent for a wide range of distribution problems.

It is obvious in this sense that production problems are the answer to distribution problems. So long as additional per capita income is given to every member of a system, the individual percentage which in any case cannot be determined for some years belongs to the second order of smalls. The real danger implied in such doctrines as compulsory saving or control of outtendency of the Indian economy to expand at this time may be restrained with the result that additional stresses are set up in just the manner in which, during the period of the stagnation of the banking system, they arose on the question of salaries. There is here a supreme political argument in favour of the expanding economy. But, of course, the expanding economy does not need a political argument to justify it; it is its own best reward.

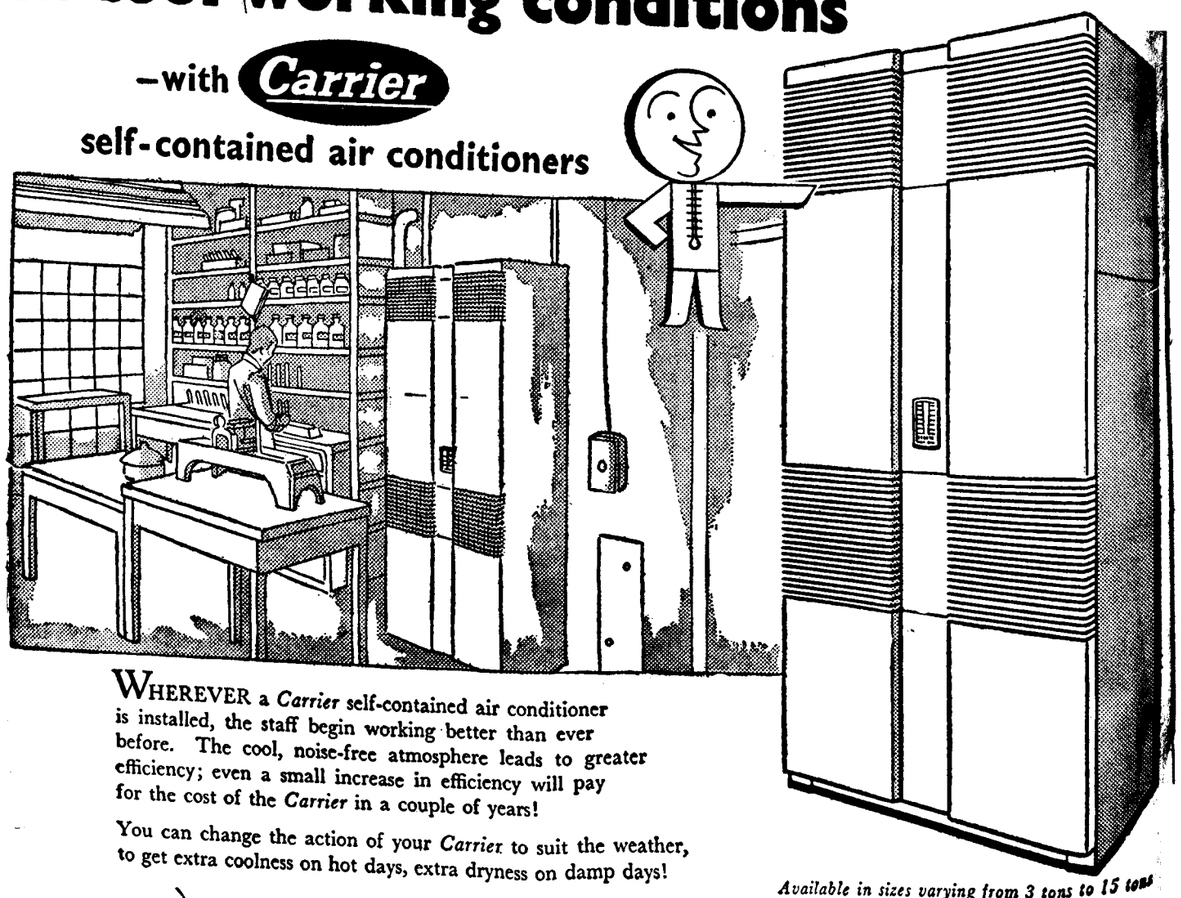
Goa—Stalemate or Success?

NOW that the first phase of the Goa satyagraha is over, there is time to take stock of the situation. The satyagraha, being confined to small batches, has happily resulted in fewer casualties than would have been the case had mass satyagraha been adopted. Even though public passions have been running high, following the Portuguese firing on Independence Day, and sections of the foreign press have tried to discredit the motives of Mr. Nehru's international policies, there is no doubt that the peaceful and cautious approach of the Government of India is slowly and painfully winning the day so far as Indian opinion is concerned. This does not mean it will be equally effective on Portuguese opinion.

As the passions of the moment die down, it will become increasingly evident to every thinking person that the Government of India's steadfast adherence to non-violent methods has been the wisest under all circumstances. While it is true that India is in a position to free the pockets by force in a matter of hours, there could be no doubt that police action would be a complete betrayal of all the principles that India has stood for and would also bring many undesirable consequences in its train. A telling exposition of Portuguese tactics was given by the Prime Minister when he said: "There is little doubt that what took place yesterday (Independence Day) was perhaps deliberately meant to provoke the Government of India into some action which might draw a veil over Portuguese misdeeds and wrong action in Goa. But Parliament and the Government should move with dignity as well as firmness in this matter".

Having prudently ruled out force, the Government, without being inactive, has proceeded to take other means in its possession. Economic sanctions, such as suspension of postal and railway communications and monetary remittances, have been already imposed and some more might follow, including the recall of Indian mining labour. It has, however, to be conceded that there are severe limitations to economic sanctions and that even those now imposed are bound to cause hardship to the people inside the enclaves. But the very thought that these hardships have been foisted on them by the misdeeds of the Portuguese is sure to add impetus to their urge for the overthrow of the autocratic regime. Diplomatic rupture has also become complete, even though it has closed a vital source of information for us regarding the goings-on inside the enclaves. No one expects the Portuguese to give in soon as a result of these measures; in fact, they are already seeking support from Pakistan and Ceylon. Yet the question arises: How long will they be able to hold on in this manner against the will of their own citizens? It is significant that enquiries conducted by foreign correspondents, by no means converted to the Indian view, prove that the forces desiring merger are much larger than they seemed earlier. One particular correspondent places them as high as between ninety and ninety-five per cent.

The Congress and the Government of India have shown exemplary courage in courting unpopularity—albeit temporarily—by refusing to yield to the popular clamour for the use of force. In the eyes of Asia, the shootings have placed Dr. Salazar wholly in the wrong. In fact the conscience of the entire civilized world has been shocked by the Portuguese brutalities. Not only history but time is on our side, and it is vital that India's international reputation should be fruitfully availed of, if possible, to solve the Goa tangle. Since the Portuguese have spurned all attempts at direct negotiations, it might be helpful to seek the good offices of the Bandung Powers to bring pressure on Lisbon. The Ceylon Prime Minister's reported offer to mediate should be availed of. It is futile to expect European colonial powers voluntarily to step forward on the side of India.



If the table is to be turned against Lisbon, the first requisite is for our overseas public relations machinery to wake up from its habitual slumber and state its case in sound moral principles acceptable to the Christian world. There is a duty here for Christians in particular; this was all too tardily recognised at the public meeting of Christians convened in New Delhi last Sunday. India's External Affairs Ministry has yet to prove its capacity for drive and imagination; under its directions, its publicity apparatus abroad has always fought shy of facts and proved a deplorable flop in times of crises. It would do well to take a lesson from Portugal and Pakistan in this matter. If these two smaller countries have been able to enlist widespread sympathy from more quarters than we have in respect of Kashmir and Goa, it is certainly due to their vigilant, vigorous and efficient propaganda and our failure on the propaganda front. The justness of our cause in Goa at least should not be allowed to go by default.

For some days past, the public mind in India had been exercised over press reports that Pakistan nationals in Goa had concerned themselves improperly with taking sides on the Goa issue. It is heartening to know, on the authority of the Pakistan High Commissioner in New Delhi, that there are no Pakistan nationals serving in the Portuguese police or armed forces and that there are no Pakistan civilian officers in Goa. In the present strained atmosphere, both in India and Pakistan, the press has the public responsibility to ensure that nothing likely to exacerbate feelings between the peoples of the two countries is published. Political parties and particularly their spokesmen in Parliament should exercise restraint, and show evidence of constructive statesmanship in their speeches on the Goa issue which is to be debated shortly in Parliament. Meanwhile, it would contribute much to allaying Indian apprehensions if the Pakistan Government clarifies the character and extent of its trade relations with Goa and its stand on the reported launching of an air service between Lisbon and Goa, via Karachi, as these are bound to hit India's economic sanctions against the Portuguese regime and, to that extent, go counter to the spirit of the Bandung declaration against Asian aid to imperialism.

For offices and industrial establishments

Greater efficiency in cool working conditions

—with Carrier self-contained air conditioners

WHEREVER a *Carrier* self-contained air conditioner is installed, the staff begin working better than ever before. The cool, noise-free atmosphere leads to greater efficiency; even a small increase in efficiency will pay for the cost of the *Carrier* in a couple of years!

You can change the action of your *Carrier* to suit the weather, to get extra coolness on hot days, extra dryness on damp days!

Available in sizes varying from 3 tons to 15 tons

Works silently, cuts off noise

Your *Carrier* self-contained air conditioner works as quietly as a whisper. At the same time, since you shut windows and doors, it helps to cut off street noises, lets you work or relax in silence and comfort.

Circulates clean, filtered air

Your *Carrier* sucks in air in a steady stream, filters it, then spreads it gently and evenly. So you get an equally-cool temperature throughout — no dust, no unpleasant draughts!

Cools better at less cost

Specially-designed coils and filters make your *Carrier* more efficient, help it to cool better at lower cost.

Removes more moisture

Your self-contained *Carrier* not only lowers the temperature but removes moisture from the air — gallons of it! A new 'Humitrol' regulates the rate at which moisture is removed.

Remember — the Carrier self-contained air conditioner is remarkably compact, and takes up little floor place. The sale of these units in India is backed by Voltas' unique after-sale service and their engineers' unmatched experience in the line.

THE WEEK'S NOTES

ATOM BREAKS THE BARRIER

THE 12-DAY Atoms-For-Peace conference in Geneva has ended on a note of gratification and restrained optimism. If this biggest-yet meeting of scientists has, in the words of Dr. Bhabba, "succeeded beyond all hopes and expectations", it is due in no small measure to the absence of any recrimination or any desire to hush up any information, and more so because of the liberal and enthusiastic manner in which the participants exchanged every information at their disposal and endeavoured to put their knowledge and experience into a common pool. The conference has broken the extreme secrecy which had surrounded most atomic energy research for the past one decade and revealed the fact that the Big Powers had been following more or less parallel paths of research and had arrived at almost the same stage of progress.

The more important results of the conference are worth recording: It has been established that fusion power is the next major frontier for atomic scientists. While it is premature to predict when atomic fusion would become practicable as a source of energy for power, experts acknowledge that their countries estimated that it might come within 20 years. They agreed that the problem of harnessing the H-Bomb principle for peaceful purposes was largely an engineering challenge. The immediate benefits of the atomic era for mankind will be found in the extensive and ever-increasing use of radioactive isotopes in the fields of medicine, agriculture and, possibly, with radioactive wastes from reactors. It has also been agreed that, while the world is on the threshold of atomic power era, nuclear power plants are not going to sprout all over the world immediately. The period of further experimentation to settle upon a most efficient reactor system and fully to master technology of material and reactors is generally estimated at five years.

The conference has also paved the way for the setting up of an international atomic agency, an important function of which will be to guard against the spread of atomic secrecy in the sphere of commerce. It is good that delegates from many countries have welcomed the idea of another conference as soon as sufficient additional knowledge on atomic energy has been accumulated.

MASSACRES IN MOROCCO

FRENCH NORTH AFRICA witnessed the worst form of violence last week-end, the second anniversary of the deposition of Sultan Mohammed Ben Youssef, when nearly 1,000 people, both African and French, were butchered and entire towns were burnt and pillaged in Morocco and Algeria. The bomb outrage of July 14 in Casablanca and other tragic developments before last Saturday had made it abundantly clear that trouble was brewing, but the French Premier's move in deputing M. Grandval as the Resident-General of Morocco, with the intention of securing peace through agreement with the Nationalists, failed to avert the tragedy.

It may be some time before the reinforcements of French troops can gain complete control over the Nationalists who also are receiving fresh support from warrior tribesmen. The African peoples' passion for freedom from colonial rule is so intense that even their leaders may not succeed in bringing them under control. Meanwhile, the present Sultan, installed by the French, has put up many lists for the proposed Cabinet, which have failed to receive acceptance of the French, because of the Sultan's obstinacy in excluding the Nationalist leaders. It may, however, be true that even if he succeeded in forming a cabinet, he cannot continue in his present position in the face of overwhelming Nationalists' demand for the return of the former Sultan. Simultaneously with their launching of a fierce offensive against the Nationalists, a high-powered committee of the French, including the Prime Minister and the Foreign Minister, is now negotiating with about 40 leaders of the Moroccan political parties in an attempt to arrive at a settlement for the future of the North African Protectorate. If there is a desire to restore peace to this unhappy land, the French must recognise the demands of the local population and snatch the unreasonable privileges of the French settlers who, in many cases, indulge in violence and terror. Punishment of those responsible for the violence should not degenerate into vindictive reprisals which will hinder all proposals for settlement.

DISCUSSIONS ON DISARMAMENT

NOT FOR a long time has world attention been so sharply focussed on disarmament efforts as it will be when the U.N. Disarmament Commission's Five-Nation "London Sub-committee" reconvenes in New York on August 29, in an attempt to bring an early opportunity to translate the frank and friendly mood of the summit talks into practical action on one of the world's major concerns. In his dramatic offer to the Soviets to exchange military information, President Eisenhower sharply illuminated the crux of the whole issue, which always has been the necessity for establishing reliable inspection controls over any disarmament arrangement and providing adequate verification of its fulfilment. Further emphasis was provided by the U.S. Secretary of State, Mr. Dulles, in welcoming Moscow's announced intention to reduce the Soviet armed forces by 640,000 men—the first such reduction of any size in eight years. He pointed out that the Soviet Government has never provided any information on the size, disposition, or arms of its forces.

The sub-committee first went to work in London on May 13, 1954, but a series of meetings brought no settlement of the differences which have existed since 1946, though there were some important developments. The debates were always overtaken by the conflict between the Russian insistence on first banning and destroying nuclear weapons and the Western insistence on setting up a control organisation first. The four Foreign Ministers' meeting in Vienna, however, decided that the sub-committee should recess until after the projected meeting at the summit. This has resulted in the present optimism, that an agreement may be reached, arising from the considerable relaxation in international tensions and somewhat changed attitude of both sides on their positions, held tenaciously till now. The four heads of government have held their frank discussions in Geneva and President Eisenhower has made his unique offer to Premier Bulganin. Resumption of the disarmament sub-committee's meeting on August 29 will be watched closely for practical results of the Geneva Conference.

Shorter Notes

Controlling the Floods

THE flood havoc repeats itself every year, taking a huge toll of life, crops and property, and annual statements of the havoc have been made to Parliament.

However, this year's deluge in eastern U.P. was the severest in 90 years, and at certain places the water level was higher than any recorded in previous years. Some 80 lakhs of people living in the flooded area spreading over thousands of villages have been affected and nearly three lakh houses have collapsed. More than the major rivers, which often swell in mountain ranges, the heavy downpours this year were responsible for bringing about this devastation by swelling comparatively smaller rivers in the lower reaches, which did not cause much destruction in previous floods, and breached embankments, inundating vast areas of land. Bridges, culverts and canals obstructed the free flow of water and were washed away at many places.

Allegations of neglect, on the part of authorities, in the maintenance of bunds and delay in taking necessary steps even when the danger to bunds was brought to their notice, have been made and the U.P. Government has done well in setting up an inquiry commission to go into the circumstances that led to these breaches. The task of controlling this nature's fury is, no doubt, stupendous and requires vast financial resources to cope with the situation. The Central Flood Control Board is meeting next month, and relevant data will have to be collected to be placed before them to enable the Board to decide upon the proper course of action. Meanwhile, the Pakistan Prime Minister has also expressed a desire to explore the possibility of setting up a joint commission to recommend preventive measures for floods in the Himalayan rivers that pass through both India and East Pakistan. However, the proper approach to the problem would be for the authorities to enthuse the public concerned to extend their active co-operation in the ambitious programme of training the rivers, without which hardly anything substantial can possibly be achieved.

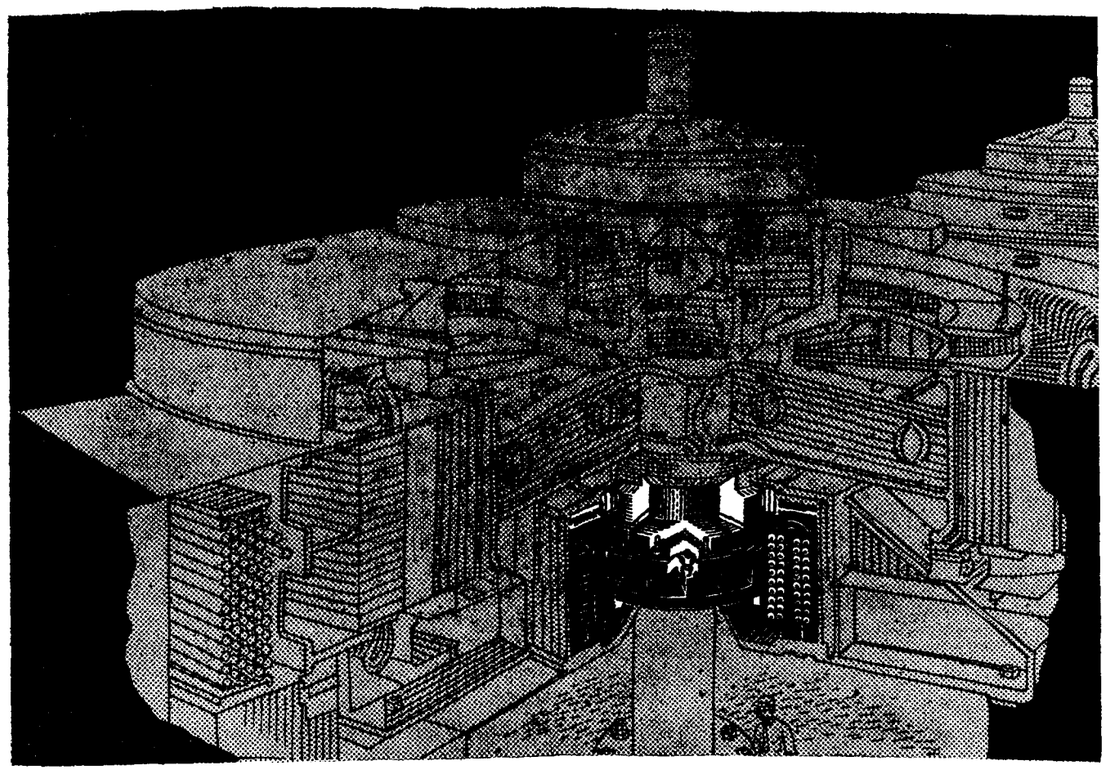
Report on Restrictive Practices

THE question of "restrictive practices" in Britain has been agitating the minds of public since 1944. All along it has been subject to conflicting opinions. In 1948 an Act was passed to provide for the investigation of monopolies and restrictive practices in industry and trade and to give the Government special powers for dealing with those found to be working against the public interest. The Monopolies and Restrictive Practices Commission was appointed in 1949. The Commission which has been carrying on investigations into the arrangements of various industries has completed one enquiry, on the general effect on the public interest of exclusive dealing, collective boycotts and aggregated quantity rebates, published in a report on "Collective Discrimination". A minority of three (against seven) is of the view that the restrictive practices should be prohibited only if they are found after individual investigation, to be against the public interest. They also do not object to the compulsory registration and publication of such restrictive agreements. On the whole, they do not regard the practices as generally injurious. But, the majority considers that these practices affect the public interest adversely and believes that most of them should be prohibited with limited categories of exemption.

The Government announced its proposals on July 13. Broadly, the proposal is for the Board of Trade to have the power to specify certain restrictive practices and make it obligatory for persons operating such practices to register them. After registration they may be considered by a specially appointed tribunal. The merit of this approach is that it is not dogmatic, but empirical.

The Future of Sudan

THE tragic incidents in Southern Sudan, following the unanimous decision of the Sudanese Parliament on the evacuation of foreign troops do not detract from the widespread desire in the Sudanese people to work out their own destiny independently. The desire was expressed by the Sudanese Premier when he appealed to both Britain and Egypt to accept without delay the independence of Sudan. The agreement of 1953, however, provides that the country elect a constituent assembly which would decide the future status of Sudan. Though this may mean at least another year of transition and, perhaps, some trouble, yet ultimately the advantage will be that the decision of the constituent assembly will be final and indisputable.



It is true that the Nile waters link the prosperity and interests of Egypt with those of Sudan. But, for Egypt, an independent Sudan may prove to be a better and more useful neighbour than if she is coerced in any way into a union. For both Britain and Egypt, the wise course would be to win the friendship and good will of the Sudanese people.

Only a thin film of oil protects these huge hydro-turbines!

How Gargoyle Lubricants are helping India's river-valley projects

AT INDIA'S river-valley projects, huge hydro-turbines turn ceaselessly to convert water-power into electricity. Only a microscopic film of oil protects the turbines and alternators from destruction; without it, they would grind to a stop — valuable equipment would be ruined!

That is why correct lubrication is vitally important. In India, as in so many other countries, Gargoyle Industrial Lubricants — famous for 89 years — are chosen to protect crores' worth of equipment.

There's a *right* Gargoyle Lubricant for each industrial need. Backed by our experience, correct lubrication — with Gargoyle Lubricants — can help to reduce costs and protect machinery in your plant.

For details, write to Standard-Vacuum Oil Company . . . Bombay, Ahmedabad, New Delhi, Lucknow, Calcutta, Madras, Secunderabad, Cochin.

WHAT DO YOU READ ON SUNDAYS?

By

ODYSSEUS

WHAT TOPICS does the editor of a "quality" Indian newspaper think will interest his readers on a Sunday? Do these topics differ from those chosen by the editor of a corresponding British Sunday paper? I have just spent two days analysing the contents for August 7 of the "Observer", one of Britain's two "quality" Sunday papers, and of an Indian newspaper which, to avoid any invidiousness, I will not name.

Here are the tabulated results of my investigation:

SIZES OF NEWSPAPERS

"OBSERVER" of London

Pages	Total Columns	Total Column Inches	Total Inches of Advts.	Per cent Advts. to Reading

Foreign News	10.27	7.5
TOTAL	98.27 approx. (plus & minus)	100.2 approx. (plus & minus)

The "Observer" has 8 pages less than the Indian newspaper but its circulation is 564,000, while that of the Indian is 47,000, so that the British newspaper uses between seven and eight times more newsprint.

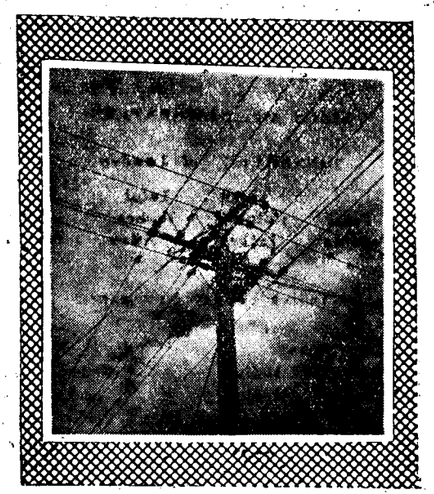
What enables a newspaper to sell cheaply is the revenue from the advertisements: these take up 42.2 per cent of the "Observer" and 31.8 per cent of the Indian paper.

Although the percentage of space occupied by each topic differs in each paper, the order of interest that the editors of both papers think their readers want is identical: (1) feature articles, (2) home news, (3) the arts, and, most significantly last, comes (4) foreign news.

The relative lack of interest in foreign news in all countries is a world phenomenon not grasped by the average man in any country, which simple fact plays a great part in causing international misunderstandings and irritation. At the present time, for example, Indians are (or, judging by the space allocated in the press, editors think they are) passionately interested in the Goanese and Kashmir problems, and they complain that the Indian viewpoint is not appreciated abroad. My tables explain why this is so. A few foreign experts may be interested in Goa but the gaze of the multitudinous many in all countries is concentrated on feature articles and home news. And please note that the editor of this leading Indian Sunday paper thinks that his readers (you) are even less interested in foreign affairs than the British editor, for whereas the "Observer" devotes 10.27 per cent of its space to foreign news, the Indian paper offers only 7.5 per cent. Moreover, these figures are perhaps misleading since of the Indian paper's 254.5 column inches of foreign news, no fewer than 49 are devoted to Pakistani affairs which might virtually rank with home news.

These tables suggest that Indian and British tastes in Sunday reading differ in some details, for whereas the Indian editor offers 204 inches on politics, 229 on miscellaneous news (mostly deadly serious home news—Congress party meetings, disturbances in university cities, the latest flood reports, etc.), and no less than 223 inches on finance, industry and markets, the "Observer" offers no political news at all—admittedly parliament was on holiday—(although 22 inches out of the 44 occupied by editorials dealt with two current political problems), miscellaneous news was only 71.5 inches (and much less stodgy than its Indian counterpart), and finance and industry a mere 33.5, whereas sport was 177 inches to India's 124.5. It is probable

that on a weekday British papers carry as much news about finance as any Indian paper—but not on Sundays.



Both editors agree, however, that on a Sunday the bulk of their readers want to relax. Features and art together occupy 31.8 of the "Observer" and 36.2 per cent of the Indian space. But within these categories there are differences. Out of its 277 inches on the arts and 946.5 of features (a total of 1,223.5 inches), the Indian paper offers as much as 719 inches of feature articles, whereas the "Observer" spreads its 672 inches (arts 283 inches and features 390 inches) over a far greater variety of sub-heads. Criticisms of the ballet, of art exhibitions, of television and radio programmes, essays on country life (gardening, nature study, and hints for farmers on the care of cattle) have no place in the Indian paper, which also obviously has no woman on its staff to write the "Observer's" deft articles on clothes and cooking. (Do no Indian women read newspapers? If so, is this the fault of exclusively masculine editors?) Nor does the Indian paper offer relaxation by means of crossword puzzles, or bridge or chess problems to which the "Observer" allot 42 inches.

In contrast, the "Observer" has no short story or comic strips. The Indian paper offers 136 inches (i.e. 6 columns and 10 inches) of comic strips of which only one column originates in India—the rest are all American importations dealing with people and situations which I for one have never encountered in India.

Out of the Indian paper's 12 feature items, as many as 7 appear to emanate from the United States Information Services. These articles are unobjectionable and the propaganda is discreet, but I think it wrong to publish such articles without disclosing their origin so that the reader knows with what purpose they were written and can assess them accordingly. It is relevant to note that newspapers do not have to pay for articles received from foreign Information Services and the market for professional writers who have their livings to earn is narrowed to that extent. I might add that I have never seen a foreign "hand-out" published in any British or American newspaper.

Statistics tell you about quantities, not qualities, and another difference between the "Observer" and the Indian paper is that whereas most of the Indian news columns are filled with factual reporting, there is relatively little interpretative comment, and that little, with one or two exceptions, does not strike one as being on a high level. Too much political interpretation in all Indian papers follows slavishly the official lead given by the External Affairs Ministry or other official spokesman. On the other hand, the "Observer's" diplomatic and other special correspondents distinguish as a matter of course between (1) the facts, (2) what official policy is, and (3) what their own view is, and their interpretative comment is informed and experienced. This is a weakness that will, I anticipate, rectify itself in time as Indian newspaper circulations rise with increasing literacy, for then newspaper revenues will also rise and proprietors will be able to afford to attract a higher calibre of university graduate by offering salaries comparable to those earned in London or Washington. The diplomatic correspondent of the "Observer" is reputed to earn a salary of Rs. 20,000 a year plus the same amount again from free-lance broadcasting and television.

Study of my tables will reveal many other interesting points of contrast between British and Indian Sunday reading. I have only space left to point out that whereas the British press is often alleged to be unduly pre-occupied with crime, the Indian paper gives 41.5 inches to crime for which the "Observer" finds no space at all. Finally, I must apologise for a small margin of error that the eagle-eyed will detect in my percentages. This arose because my wife, myself, and the dherzi, were competing for the use of the one and only tape measure available to measure the newspapers. Some of my wife's dress measurements have got into this column and some of mine into her new dress.

A DELHI DIARY

FAIRPLAY, PLEASE!

I WOULD like to have said that the proceedings of Parliament this week have provided reward enough for those of us who, for our past sins, have to follow proceedings there from day to day and even from hour to hour. Unhappily, this has not been a rewarding week. This was by no means because Parliament did not have matters of great interest both for jest and gestation. There has been the Press Commission's Report on which many good speeches were possible. On this, in particular, Members of Parliament have tended not merely to be unconstructive, but one might say that two members, in particular, were not a little naughty. Mr. T. N. Singh and Mr. Jaipal Singh chose the floor of the House to make accusations against the Chairman of the Press Trust of India, Mr. Devadas Gandhi, which seem to me to be both irrelevant and unfair. Readers of this Diary in the last few weeks will admit that I am not a loyal member of the profession, in that, unlike a good Trade Unionist, I do not stand up for my guild in season and out of season. In the present case, I must stand wholly with my side; I cannot help feeling that the Press and, in particular, Mr. Devadas Gandhi, who was not present to answer back in the House, should have received far more courteous treatment.

In the first place, it seems to me wholly irrelevant now as to what omissions and commissions were made in framing the Press Commission's Report. I have said before that, in my opinion, this is a fundamentally reasonable document although there are many particular sections of it, notably that which deals with the Press Trust of India, on which my appreciation would be qualified. But, in any case, the issues at stake are impersonal issues. They cannot be made to depend upon the point whether Mr. Devadas Gandhi was called once or called twice or called not at all, or that he said something about the Commission or did not say something about the Commission which was derogatory or otherwise. In his dignified statement which appeared in the papers of August 25, the Chairman of the P.T.I. has denied that he ever avoided seeing the Commission or declined co-operation, and in any case his written replies are judicial evidence of the fact of co-operation. Why then do two Members of the Press Commission who are also Members of the House choose to divert attention from the great theme of the reform of the Press to a personal attack?

I am not very concerned about the final decision on the Press Commission's Report. It may be that the Press is putting up a case which will not be acceptable to the country as a whole. But this is a democracy, and while the discussion is proceeding on the lines of civilised debate, the Press must resist the big stick of insinuation and personal bad faith. It is wholly right to make vigorous attacks on persons present in the House, preferably on those seated on what is called the Treasury Bench. But is it fair to hit at someone who is not there? I think not, even if the allegations are relevant.

BUSINESS AND LOVE

I fear that this was not the only instance when Parliament seemed to lose its sense of proportion. It seems to me that the clause in the Companies Bill providing a disqualification on a director's relatives becoming agents for a company was a wholly unjust, and even impractical, decision which is likely to do much damage unless the meaning of the word 'relative' is now redefined so completely as to make the clause redundant. I have been recently confronted with three or four happy possibilities, which are by no means imaginary. Consider the case of two directors not related in the manner suggested, but who become so related when, say, the son of one director elopes with or even (with due consent and form) marries the daughter of another. In the former case—with which I expect most Members of Parliament would be in sympathy, for all the world loves a brave lover—both parents might have no part in producing the relationship against which they are now to be penalised. Under the present clause, the whole structure of a company's business which always depends on personalities might be injured by this rigid exclusion. Boards of Directors might be broken up for no better reason than there was love at first or second sight! And is this not a terrible incursion into the private lives of sons and daughters?

I take off my (mythical) hat to Mr. Tulsidas Kilachand who fought a splendid rearguard action quite alone, moving a number of amendments to the clause that relatives should be excluded from the scope of the definition of "associates". He also asked the Finance Minister to consider whether the proposed definition of "associates" would not violate Articles 19(1)(g) of the Constitution which provided that citizens should have the right to practise any profession or carry on any occupation, trade or business. He said—in my opinion most properly—"if relationship is not a bar to any employment in Government service, it should not be a bar in the private sector". The Finance Minister made a clever interjection when he said that nobody is related to the Government, and Mr. Kilachand caused laughter by replying "What about the Ministers?" But under cover of this cheerful give and take, the fundamental point that a great injustice is being perpetrated by a wholly unnecessary piece of ideological tyranny was unhappily lost.

Who is to save small minorities in this country from this ideological tyranny which seems to start from the presumption that everyone rich or fortunately connected should be penalised by some means or other? If I might employ a Spoonerism—which Mr. A. C. Guha, Minister of Revenue and Defence Expenditure, emitted in the debate on the working of the Industrial Finance Corporation—I would say that, correct to subjection, I consider that it is grossly incorrect to employ subjection in this manner!

For the rest, the debate on the Companies Bill was notable only for the amazing progress recorded on Thursday. Dealing with less contentious sections of the Bill, 69 clauses went through in one day. As an example of planning, it was also announced that the programme for Friday was 55 clauses. Only one of the 69 clauses on Thursday produced an ideological stumbling block. The battle between the private and public sectors was represented by stalwarts, Mr. G. D. Somani on one side and Mr. Asoka Mehta on the other. Mr. Mehta seemed to think that if surplus funds could be utilised by industrial concerns for expanding in fields outside their original business a handful of companies could control all the industrial units in the country. The implication surely is that nobody else (not even the public sector) was likely to start industrial units. Was this a fair statement of the case? Curiously, the unfairness of it passed unnoticed when Mr. M. C. Shah replied. He supported the freedom of companies, but did not point out that the danger of concentration of power was much more with the State than in the hands of any possible group of companies. Could it be that the Finance Ministry chose not to see the mote in the private sector's eye only because of the beam in its own?

ARGUS.

4%

Bombay State Development Loan, 1967

ISSUE PRICE Rs. 100-4-0 PER CENT

Open on the 30th August, 1955.

The loan will be closed as soon as a total of approximately Rs. 300 lakhs has been subscribed, and in any case not later than the close of business on the 1st September, 1955.

The applications will be received at the offices of the Reserve Bank of India, Bombay, Calcutta, Delhi, Madras and Bangalore, and at Branches of the State Bank of India within the State of Bombay.

Full particulars can be obtained at any of the offices of the Reserve Bank of India or Branches of the State Bank of India.

WORLDGRAM

AGRICULTURE

North India's Tea Output: For the second month in succession, North India produced a large tea crop in July 1955. The outturn for August 1955 is estimated at 99,600,000 lb. against 63,500,000 lb. in the previous month and 77,700,000 lb. in July last year. The total outturn during the current season up to the end of July is estimated at 194,900,000 lb. compared with 191,000,000 lb. in the corresponding period of last year, showing an increase of 3,900,000 lb. The outturn for the seven months ended July 1955, however, is 2,900,000 lb. lower than the average for the past three years, amounting to 197,800,000 lb.

*

'Isotopes' Use in Agriculture: Dr. R. A. Silow, of the Agricultural division of the United Nations Food and Agriculture Organisation has revealed that the value of atomic radiations lay partly in their ability to induce inherited changes in the germplash of plants and partly in their sterilizing effect on biological tissues. The plant breeder using isotopes was able to extend disease resistance and obtain a higher yield and earlier ripening. Radiation as a weapon in insect pest control had also been successfully demonstrated and storage life of foodstuffs increased by inhibiting such things as the sprouting of potatoes. Radioactive tracers had enabled studies which would have been otherwise impossible to be carried out on the relationship between animals, plants, soils and water.

*

Cotton Output in PEPSU and Punjab: Final figures now available of cotton production in Punjab, Pepsu and Ganganagar (Rajasthan) circle show an increase of 18.7 per cent over the last year. Total pressing in the 1954-55 season stood at 8.1 lakh bales as against 6.82 lakh bales in 1953-54. While production of staple varieties has shown an increase of 39 per cent, Desi cotton output shows a fall of 23 per cent over their respective figures of the last year. Production of staple varieties in 1954-55 stands at 6.40 lakh bales as against 4.60 lakh bales in the previous year. Figures for Bengal Desi are 1.7 lakh bales for the 1954-55 season as compared to 2.20 lakh bales in the preceding year.

*

Tobacco Production in Iraq: A long-term policy designed to develop tobacco cultivation in Northern Iraq and improve the manufacture of cigarettes, both for local consumption and for export has been put into force by the Government's Tobacco Monopoly Administration. The Iraqi Government is working hard to train tobacco farmers, to produce better quality tobacco, introducing agricultural machinery, sending young Iraqi farmers to Turkey and Greece for training and visiting tobacco farmers from Greece and Turkey in order to develop the cultivation of tobacco.

INDUSTRY

Ferro-Manganese Plant: The first plant to produce ferro-manganese in Bombay State will be erected in Dandeli in North Kanara. The factory which is expected to go into production by the end of next year will have an initial capacity of 12,000 tons but when energy from the Kanya project becomes available by 1960, the capacity will be stepped up by another 50,000 tons per year. Orders for the necessary machinery have already been placed with Norway. A new company by the name of Electro Metallurgical Works Ltd. is to be shortly floated to undertake the venture.

*

Protection Granted to Steel File Industry: The Government of India have accepted the Tariff Commission's main recommendation that the industry should be granted protection up to December 31, 1959. The rates of specific duties on steel files and rasps suggested by the Commission have been brought into force with immediate effect. The rates range from Rs. 7 per dozen for files of not less than 4" but less than 6" to Rs. 34 per dozen for files of not less than 16" and up to 18" inclusive. Steel files and rasps on which these specific rates of duty can be levied include saw files, but exclude jewellers' files, watch-makers, files, other needle files, mill tooth files, rotary power files and ampoule files. Government have also accepted the Commission's recommendation that the above rates of duty should be reviewed at the end of two years.

*

Sound Insulation of Houses and Schools: The Indian Standard Institution has circulated for eliciting comments, a draft Indian standard code of practice for sound insulation of houses, flats and schools. This standard code which has been prepared for adoption in India explains the principles of sound transmission and insulation and recommends methods by which recommended standards of sound conditions can be achieved by different types of construction. Optimum noise conditions for houses, flats and schools have also been recommended. As adjuncts to this code, the Functional Requirements of Buildings Sectional Committee, which prepared this draft code, is also engaged on the preparation of codes dealing with heat-insulation of buildings day-lighting, orientation, fire safety and structural safety of buildings.

*

Output of Coal in June 1955: The output of coal in collieries in India decreased from 3,174,749 tons in May 1955 to 3,074,672 tons in June, 1955, according to official statistics released by the Chief Inspector of Mines. Despatches of coal amounted to 2,658,339 tons in June 1955 as against 2,743,951 tons in the preceding month. Coal stocks at pitheads increased from 4,094,949 tons at the beginning of the month to 4,122,174 tons at the close of the month. Coke plants at collieries and elsewhere produced 342,104 tons of hard, soft and other kinds of coke during the month and despatched 146,761 tons.

TRADE

Britain's Oversea Trade in July: British exports recorded for July were worth £223,100,000, an increase of £66,100,000 over the figure for June but four per cent below the average monthly rate of exports in the first half-year. Figures for the balance of visible trade continued to be substantially affected by the recent strikes. Imports recorded for July were valued at £338,800,000—£44,800,000 more than in June, and seven per cent above the monthly average rate in the first half year. Recorded excess of imports (valued c.i.f.) over exports and re-exports (valued f.o.b.) was, in consequence, 107,800,000 compared with £128,900,000 in June and the monthly average of £75,600,000 in the first half year.

*

Iranian Foreign Trade: Iran's exports, excluding oil, in the fiscal year 1954-55 were valued at $130.2 million, an increase of 43 per cent over exports in 1953-54. Imports were valued at $210.8 million, having increased by 27 per cent. In order of importance, Iran's main suppliers were, Western Germany, Japan United Kingdom, the U.S.S.R. and India, and its principal customers were the U.S.S.R., France, Germany, Italy, the United States and Japan. The most important exports were cotton, dried fruits, carpets, petroleum, and rice and the chief imports were sugar, transportation equipment, cotton textiles, machinery and electrical appliances.

Sweden's Foreign Trade: Sweden's foreign trade in the first half of 1955 resulted in an import surplus of Kr. 985,000,000 as compared with Kr. 600,000,000 in January-June last year. Imports, which showed a peak of Kr. 926,000,000 in March and since then have gradually dwindled totalled Kr. 5,109,000,000 as against Kr. 4,395,000,000 for the first six months of 1954. Exports, on the upgrade since March, registered a peak of Kr. 774,000,000 in June and reached a total of Kr. 4,124,000,000 as against Kr. 3,795,000,000 last year.

*

Rising U.K. Bicycle Exports: Britain's exports of bicycles, motor cycle engines, electrical equipment, and tyres were substantially greater in the first six months of this year than in the corresponding period of 1954. Bicycle exports increased from 997,431, worth £13,600,000 to 1,096,926 worth £14,400,000. Exports of motorcycle engines, electrical equipment, and tyres were nearly £412,000 higher, at £2,181,826. During the same period, the number of complete motorcycles exported totalled 34,890, which, with parts, were worth £6,800,000.

*

Scotland's Export of Knitwear and Hosiery: Exports of hosiery and knitwear from the Border textile areas of Scotland totalled over £4,000,000 in value last year—an increase of £373,000 on 1953. These figures are given in the annual report of the South of Scotland Chamber of Commerce, which states that the demand for cashmere knitwear remains at a very high level. Commenting on the tweed trade, the report says that the U.S.A. and Canada are still the best export markets, and between them account for nearly 60 per cent of the area's exports. Western Europe comes next, with just over 30 per cent.

FINANCE

National Income of Middle Eastern Countries. During the post-war years national income in the Middle Eastern countries increased more than population, progress being more rapid since 1950, and mor marked in the oil industry than in any other sector of the economy. This report which was prepared by the U.N. Department of Economic Affairs includes a survey of post-war developments in selected countries, namely, Egypt, Iran, Iraq, Israel, Lebanon, Syria, and Turkey. It also includes a detailed, country-by-country study of transport in the reglon.

*

Capital Issues Control: Government of India granted consent to 48 applications from Joint Stock companies in the country for issue of capital amounting to about Rs. 36.15 crores during the quarter ended March, 1955. Of the 48 applications, 20 were from new companies for the total issue of capital amounting to Rs. 21.09 crores. The Indian Viscose Corporation Limited, with a total issue of Rs. 10 crores capital, figures prominently among the 20 companies.! The Rajasthan Udyog Limited, the Bharat Development Limited, the Assam Jute Mills Limited, and the Sahu Rayons Limited, with a capital issue of Rs. 3 crores, Rs. 1.25 crores, Rs. 2 crores and Rs. 1.5 crores respectively are among the 20 new companies which also include sugar factories, a concern manufacturing sodium and hydro sulphate, cotton spinning and weaving mills, manufacturers and dealers in milk products and printers and publishers etc.

*

Japan's Balance of Payments: According to Japan's Finance Ministry estimates, foreign exchange accounts—in July resulted in a surplus balance in succession to Jun of $40 million, there-by bringing the foreign exchange holdings at the month-end up to over $1,300 million, which is the post-war high and compares with $1,260 million at end-June and the previous peak $1,180 million at end-September, 1952. Balance of payments for the first half of the current fiscal year (April-September) is likely to end in a $130 million surplus.

*

Central Aid for Development of Handloom Industry: The Government of India have sanctioned further grants and loans totalling over Rs. 1,29,08,600 to eleven States for the development of the handloom industry. Madras gets a loan of nearly Rs. 63,94,000 and two grants of Rs. 26,10,500 and Rs. 66,200. Orissa has been sanctioned a loan of Rs. 6,96,000 and a grant of Rs. 3,81,692. Madhya Pradesh gets a loan of Rs. 6,40,500 and a grant of Rs. 3,42,500. Travancore-Cochin has been given a loan of Rs. 5,03,475 and a grant of Rs. 2,25,000. A loan of Rs. 4,65,000 and a grant of Rs. 36,600 have been sanction to Rajasthan. Punjab gets a grant of Rs. 1,30,000. Andhra gets a grant of Rs. 36,600. Ajmer has been given a loan of Rs. 32,250 and West Bengal a grant of Rs. 13,700. Delhi has ben sanctioned a grant of Rs. 11,425 and a loan of Rs. 9,625.

MISCELLANEOUS

Grow-More-Food Campaign: The increase in the country's food production due to the Grow-More-Food Scheme during the year 1953-54 was of the order of 7,21,569 tons over the base figure of 1952-53. The target for additional production during 1954-55 was 12,74,379 tons. The figures of actual achievement had, however, not been received so far. The amount spent on the Grow-More-Food Schemes during the year 1953-54 was Rs. 20,29,17,000. The amount sanctioned during 1954-55 was Rs. 33,37,17,000 but the actual figures of expenditure were not known yet. The total amount of loans and grants sanctioned as on August 1, 1955, was Rs. 23,30,69,000. Out of this, the biggest amount was given for irrigation, 1,371.64 lakhs having been given as loans and Rs. 146.64 lakhs as grant. For manures and fertilizers, Rs. 397.67 lakhs had been granted as loans and Rs. 27.20 lakhs as grant. For land improvement, loans amounting to Rs. 201.14 lakhs were given in addition to grants of Rs. 4.19 lakhs.

*

Thirty-sixth Lausanne National Fair: Once again Swiss manufacturers will be showing the world their latest lines at the Lausanne National Fair, which is to be held in the traditional month of September, this year from 10th to 25th. This grand exhibition will be based on the four principal groupings of the Swiss productive system: agriculture, from which the others took their rise, industry, whose products figure so largely at the Fair, and trade and handicrafts, where the emphasis will be on consumer goods. In 22 halls on a site measuring 134,000 sq. yards in area, 2,300 exhibitors from all parts of the country will show what the manufacturers, farmers and craftsmen have achieved in the course of the year and bring home to visitors the excellence of the Swiss design and workmanship. The 36th Lausanne Fair will include a fascinating pavilion where the astonishing possibilities of the new science of cybernetics will be exhibited in unprecedented detail.

*

Self-Sufficiency in Transparent Film Production: The Travancore Rayons Limited announce that their Expansion schemes in Transparent Paper production, taken up in 1954, are nearing completion. Improvements and modifications were carried out to their original Transparent Film plant, thereby putting up their production from 1¼ tons to 2 tons a day, with effect from March 1954. Now their second plant has begun functioning from March, 1955, the current production being in the neighbourhood of 3¾ tons a day. With the full development of their Preparatory and Auxiliary Plants, the production of transparent film is expected to exceed 5¾ tons a day by mid-September this year. It is reported that the Travancore Rayons are endeavouring to make India self-sufficient in this important packaging material.

NEWS IN BRIEF

INDIAN

Since 1949, 1,257 families, comprising some 4,900 persons, had been taken from the States of West Bengal, Travancore-Cochin and Madras and settled in the Andamans. Of these, 1,182 families came from West Bengal, 71 from Travancore-Cochin and 4 from Madras.

*

It is reported before the introduction of uniform retention prices, the average retention price allowed to Tatas was Rs. 331 per ton and to the Indian Iron and Steel Company Rs. 378 per ton. This retention price included production cost, depreciation, over-heads and a profit of 8 per cent on block.

*

A sum of Rs. 155 lakhs had been allotted to the Assam Government by the Government of India for the Welfare of the scheduled tribes in Assam during 1955-56.

*

The Government of India have sanctioned Rs. 16,48,000 for the construction of new buildings, renovation of existing buildings and for developing grounds at the site of the Indian Industries Fair to be held in New Delhi in October this year.

*

The Government of India have released 30,000 bales of Indian cotton stapling 26|32", as a special case, for export to China.

*

The Government of India have decided to exempt with immediate effect all articles of iron and steel falling under item 10(a) of the second schedule to the Indian Tariff Act, 1934, from payment of the whole of the export duty leviable thereon.

*

A vigorous programme for finding out new mineral oil deposits in Rajasthan, West Bengal and Assam has been launched by the Government of India.

*

During April and May this year, 1,769 goods wagons, 58 passenger coaches and 26 locomotives were manufactured in India.

*

A British firm has been provisionally selected as consultants for the construction of a dry dock at Visakapatnam. The firm has been asked to prepare a preliminary project Report.

*

The Central Government had incurred an expenditure of Rs. 1,02,32,926 on the development of small-scale industries up to August 12, 1955, since the beginning of the year.

*

An Indian firm is manufacturing tennis balls on an experimental basis and results of the experiments are reported to be encouraging.

*

About 80 per cent of the civil engineering works, required for setting up the Silver Refinery Plant was completed by the end of June, this year. Nearly 97 per cent of equipment required for the plant has been received from abroad and the rest is expected shortly.

FOREIGN

The co-operative agreement between Pakistan and United States covering research in the uses of atomic energy has been signed. The agreement was initiated on June 15, 1955.

*

A food processing company in America has developed a successful method of shipping frozen foods without supplemental refrigeration.

*

World production of natural rubber in the first half of this year, at 870,000 tons, was 75,000 tons below the consumption figure of 945,000 tons.

*

The United States has sent $1,068,315 to the United Nations Children's Fund as the second contribution to the fund for 1955. The initial U.S. payment for $2,048,025 was transmitted on 23rd May.

*

Coal production in the Republic of Korea amounted to 431,482 metric tons during the first months of 1955, an increase of 100.855 metric tons over the same period in 1954.

*

About 25 members of co-operatives from African countries and territories will attend a group training course in economic co-operation at Elsinor Denmark, under the Joint auspices of the Danish Government and the International Labour Organisation.

*

For the first time since the war, world agricultural production failed in 1954-55 to show an increase in comparison with the previous year, according to the 20-nation committee on Commodity Problems of the Food and Agriculture Organisation of the United Nations.

*

The International Bank for Reconstruction and Development reports a net income of $24.7 million for the fiscal year ended June 30, 1955 (compared with $20.3 million for the preceding year).

*

It is reported Canada's wheat acreage has this year dropped to a 12-year low at 21,504,000 acres, but coarse grain plantings have been higher.

*

British imports from Holland in the first half of the year increased by over £11 million to £61.8 million, compared with the first half of 1954. U.K. exports to Holland rose approximately £4 million to £53.9 million.

*

The U.S. gross national product—the annual output of goods and services—in the second quarter of 1955 was at an annual rate of $385,000 million.

*

During the first six months of this year, about 30,000 wireless sets were produced in Yugoslavia. Before the war, Yugoslavia did not make wireless sets, and the annual production in the 1948-54 period ranged between 23,000 to 37,000.

Cool filtered water

for office or factory

'Tushar' WATER COOLERS

— by the makers of the famous 'Crystal' air conditioner

TUSHAR

A 'Tushar' water cooler increases staff efficiency, helps to improve quality of work — quickly pays for itself in goodwill

- **Instantaneous cooling:** Continuous supply of instantly cooled water at the touch of a button — no unhygienic refilling or storing
- **Filter:** A large and efficient built-in filter — easily replaceable
- **Two models available:** Model R-10, capacity 10 gallons per hour (180 cupfuls per hour); and Model R-40, capacity 40 gallons per hour (720 cupfuls per hour)
- **Easy to install:** Needs only a water supply, a drainpipe and an electric plug point
- **Economical to run:** Cools to the temperature you choose, then switches off automatically

Silent working–Anti-splash construction–Handsome design

CONTROVERSY OVER MUTUALISATION

BY

CROESUS

IT does not look as though the course of 'Oriental's mutualisation scheme is destined to run smooth. After the publication of the scheme and the lengthy circular issued recently by the Chairman of the 'Oriental' explaining the terms of mutualisation and the strong rumours that the Government of India in the Finance Ministry had already approved of the scheme, it was assumed that all was well with the mutualisation move, although there have been murmurs that the terms are far from fair to the policyholders. There were also reports that differences of opinion on the subject existed among the directors of the company and it was being strongly rumoured at one time that Sir Purshotamdas Thakurdas, the then Chairman of the Board, was not in favour of the idea. This has since been confirmed by a letter (published in the "Times of India") which Sir Purshotamdas has written to the Controller of Insurance categorically stating that he had to sever his connections with the Company owing to differences with the Board over the procedure adopted in respect of the mutualisation scheme. The ex-Chief of the 'Oriental' has made it clear that his letter to the Controller is in his capacity as a policyholder.

Sir Purshotamdas' objection, according to his letter, it is significant, is to 'the procedure' adopted in respect of the mutualisation scheme. It is his contention that, inasmuch as a very large amount that the 'Oriental' holds today in its life fund belongs to its policyholders, it is grossly unfair that the scheme should not have been even referred by the Directors of the 'Oriental' to the policyholders of that Company before applying to the Government for final sanction. There is point in this contention but an equally strong point on which one would have thought Sir Purshotamdas to object to the scheme was the terms of the mutualisation scheme which offer to the shareholders of the Company a compensation of as much as Rs. 8,800 per share. One would have very much liked to know his views on this aspect of the mutualisation scheme.

It might be argued, as indeed it would appear to have been done, according to Sir Purshotamdas, that the Directors were not under an obligation to refer the matter to the policyholders under the Articles of Association. The Board might as well have argued that, since the Company was in any case going to be made over to the policyholders and the policyholders would become the sole proprietors under the scheme, there was no need whatsoever to refer the matter to them. But all insurance companies, it should be remembered, do certain things even when they are not required to do so under the law, presumably to win the goodwill of policyholders. For example, every insurance company makes it a point to send premium notices to its policyholders and the notice prominently features the fact that the Company is not bound to issue such notices. This only shows that, by reason of the vital importance of policyholders to an insurance company, insurers consider it in their own interest to seek and secure the goodwill of policyholders. Accordingly, even though the Articles of Association of the 'Oriental' may not make it obligatory on the part of the directors to refer the mutualisation scheme to the policyholders, they might have it only, as a gesture, convened a meeting of policyholders, even as they convene meetings for electing policyholders' directors, and got their approval or blessings to the scheme. Possibly the directors did not feel that this was called for after they had fully convinced the Government of the 'bona fides' of their scheme. After all, Government and, in particular, the Controller of Insurance, are supposed to be there to safeguard the interests of policyholders. However, according to strong rumours prevailing in Delhi, the mutualisation scheme does not have the unqualified approval of even all the Cabinet Ministers. Some of them believed to be of the view that the scheme is nothing short of robbing the policyholders.

It is admittedly against this known undercurrent of distrust of, and resentment towards, the mutualisation scheme that the present Chairman of the 'Oriental' Sir Cowasji Jehangir felt it necessary to devote a major portion of his speech at the last annual general meeting of the shareholders to explain at length the terms of the mutualisation scheme. But, this speech would have been more appropriately addressed to a meeting of policyholders. Surely, Sir Cawasji could not have expected any shareholder to object to the mutualisation terms, which are admitted on all hands to be extremely favourable to shareholders. All the same, it must be said to the credit of the present Board of Directors of the 'Oriental' that they have not completely barred the door against the policyholders' right of approach to the concerned quarters on this subject. As Sir Cawasji made it clear in his speech, the scheme is being given the widest publicity and it is open to any policyholder of the 'Oriental' to write to the Controller of Insurance voicing his objections to the mutualisation scheme, and enough time has also been given, in that the last date for sending any objection is to be September 30th. The precise extent of opposition to the 'Oriental's' mutualisation scheme will only become known after September 30th. But, in the absence of any organised body of policyholders as in the case of shareholders such as the Bombay Shareholders' Association, it is doubtful whether there would at all be much effective opposition.

More light has been thrown on this issue by Sir Cawasji Jehangir who has released to the Press a letter addressed by the Company, on behalf of the Board of Directors, to the Controller of Insurance, in which he has categorically declared that the reason given by Sir Purshotamdas Thakurdas for his resignation is not the refusal of the Directors to refer the mutualisation scheme to the policyholders as has been alleged by the latter. On the other hand, he points out that not only did Sir Purshotamdas preside over most of the meetings which considered the mutualisation scheme but was also present at the last meeting that finally decided on mutualisation. Accordingly, he states, "the directors are surprised that he (Sir Purshotamdas) should now contend that this was the reason for his resignation. Our records show that this is not a fact". Further, Sir Cawasji points out that "the question of placing the scheme before the policyholders for their approval is raised for the first time in his letter to yourself" (Controller of Insurance).

In the light of this high-level controversy which, to say the least, is most deplorable, it would be difficult for policyholders to know the precise position.

Since, in any case, the matter has now been referred to the Controller of Insurance, may it be suggested that this Official not only considers any protest that he may receive from policyholders but also looks into the allegations and counter-allegations of the ex-Chairman and the Chairman of the Company and places before the policyholders a true and correct statement of the position?

HURDLES BEFORE EXPORT INDUSTRIES

By

CROESUS

RECENTLY the Union Ministry of Commerce and Industry issued a Press note seeking information from Indian exporters regarding the extent to which exports of Indian goods are being seriously handicapped by high tariffs in other countries with a view to considering the desirability of offering tariff concessions to secure a lowering of such duties by the importing countries. This should have brought in a flood of literature on the subject because pratically every exporting interest has one or other handicap, some minor and some major, to contend with.

Broadly speaking, the difficulties of exporters may be classified under two heads, (1) those that are peculiar to old and established industries and (ii) those that relate to new but highly promising export industries. It is needless to say that, when attempts are being made to diversify the country's exports, greater attention must be paid to the problems of the second category of industries. If these industries have to be encouraged to maximise their exports and thereby add to the foreign exchange resources of the country in a substantial measure, a detailed study must be made of the internal demand for their products, the competition between foreign producers and Indian producers in the indigenous market and the extent of competition in markets which might hold out potentialities for the Indian industry. Unfortunately, however, one does not as yet see much evidence of such an integrated approach to the problem of new export industries in the country.

Let us take, for example, the linoleum industry. In less than five years of its establishment, it is noteworthy, this industry has shown clear evidences of its export potentialities. Given adequate encouragement, therefore, one can visualise that this industry will be a very important source of earning of foreign exchange in the near future. Of course, there are limits even to what the Government may do in respect of foreign markets which show preference to non-Indian goods. It may, however, be submitted that, if such discrimination exists amongst Commonwealth countries, it should not be impossible for the Government of India at least to take it up with the governments of the countries concerned primarily and with the U.K. Government generally so as to remove any glaring discrimination that may exist against Indian goods. This task assumes special importance if it is established in respect of any industry that the presence of such discrimination is the main stumbling block in the way of the exports of that particular industry. All these, it may be mentioned, apply in the case of the linoleum industry.

After a survey of the markets for linoleum in the South-East Asian regions and Australia and New Zealand, the spokesmen of the industry have come to the conclusion that, in the whole of the region, the biggest importers of linoleum are Australia and New Zealand. It would be pertinent, therefore, to study the trend of linoleum exports to these countries over the past two years. The table at the end shows exports of linoleum from different countries to Australia and New Zealand:

It will be seen, whereas there has been a strident increase in export of linoleum from India to New Zealand over the period, there has been hardly any progress in regard to exports to Australia. For the same period, however, the U.K. has not only increased its exports to New Zealand but also doubled (nearly) its exports to Australia. The explanation for this glaring disparity in performance between the U.K. and India is not the inferiority of the quality of Indian linoleum, nor is it, for that matter, the lack of energetic measures to build up a market in Australia by the Indian linoleum interests, but it is the existence of a very heavy import duty of as much as 42½ per cent which includes a primage of 10 per cent on Indian linoleum. As against this, the U.K. linoleum have only to bear a duty of 17½ per cent. Surely, the older and relatively better established linoleum industry in the U.K. does not require to be sheltered by protection in the form of a 25 per cent lower duty as against the infant Indian linoleum industry, It must, however, be conceded that this is an anomaly of the Imperial Preference times. It is interesting to point out here that, at the time Imperial Preference was negotiated, India was not a manufacturer, and so not an exporter either, of linoleum. As a result of the change in the conditions since, it seems necessary to review the whole position, in consultation with the Government of Australia and the British Government. Fortunately, India's relations with both these countries today are most cordial, and so a tripartite talk on the question should not fail to yield quick and satisfactory results.

THE RAMAYANA
OF
TULSIDAS
IN ENGLISH VERSE

LATEST "HINDUSTAN TIMES" PUBLICATION

The famous Hindi epic regarded by many as "the greatest book in all devotional literature" is for the first time now available in English verse.

The translator, the Rev. A. G. Atkins, completed the book after ten years of devoted work. He has tried "to keep and express in English in the fine rhythm and music of the original in simple lucid language, and with as much of the vivacity, wittiness and picturesqueness that Tulsidas has put into his work." He has also followed in some measure Tulsidas's metrical variations such as **chhand, chaupai, doha** and **soratha.**

In a foreword Mr C. Rajagopalachari says: "Mr Atkins' monumental work and his Introduction are a revelation of hope for those who desire to see all the great religions of mankind come together. - - - - His service is not only to English-speaking people but also to that very large number of Hindus in India who do not speak the Hindi language and to whom English has become a very familiar medium."

The book is of special value to libraries, scholars and devotees of Tulsidas.

It has been issued in the following four editions:

I. Original text of Tulsidas with translation in English verse; three volumes; 1468 pages; price Rs. 50 net.
II. Translation in English verse; without Hindi text, two volume; 898 pages; price Rs. 40 net.
III. Special tissue paper edition of I, one volume, price Rs. 100 net.
IV. Special tissue paper edition of II, one volume, price Rs. 100 net.

Economic Report from the U. S.

"ESCAPE CLAUSE" IN U.S. TRADE AGREEMENTS ACT

(By Guy Sims Fitch)

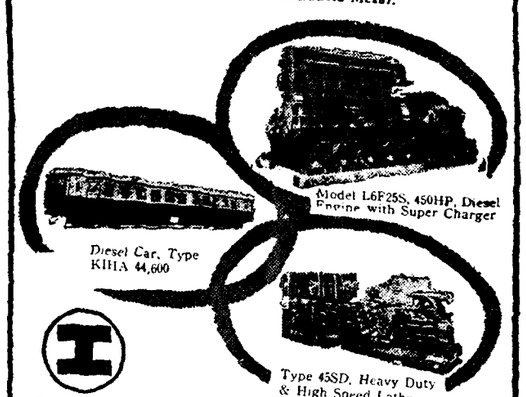
WASHINGTON, August 23.—Attention of world traders has focussed once again on Section 7 of the United States Trade Agreements Act. It was under this section, embodying the so-called "escape clause," that President Eisenhower a few days ago authorized an increase in U.S. tariffs on imported bicycles.

In itself, the escape clause is a simple statement to the effect that reciprocal tariff reductions negotiated by the United States with other countries may be modified if these reductions cause or threaten serious injury to domestic producers. It first appeared in a Trade Agreement in 1942. By executive decision in 1948, negotiators began to include it in other agreements. By Act of Congress in 1951, its inclusion in all reciprocal agreements was made mandatory. In a sense, the escape clause is merely an extension of other types of national protection—involving such matters as health and welfare—that have been written into U.S. Trade Agreements since the start of the reciprocal trade programme in 1934. There is little doubt, however, that many traders in the United States and other countries view it as a particularly onerous form of protection—one that robs the trade programme of the stability it needs for the steady expansion of international commerce.

But in the eyes of American manufacturers, the clause gives a measure of needed flexibility to trade relations. More than a few proponents of liberalized trade programmes are willing to concede that governments might be more reluctant to make substantial trade concessions if their commitments could not be modified when necessary. It is well to remember, in this connection, that Article 19 of the 34-Nation General Agreement on Tariffs and Trade (GATT) also contains an escape clause similar to that found in the U.S. Trade Agreement Act. Like Section 7 of the U.S. Law, Article 19 is an emergency measure to cope with special and unforeseen circumstances—the rare exception to the basic and continuing policy of reducing trade barriers. The U.S. escape clause record bears this out. Since 1948, tens of thousands of tariff concessions have been granted by the United States, while fewer than 60 applications for relief have been investigated by the Tariff Commission—the agency that rules on the extent of domestic injury. Of these, the Commission has recommended relief in only 17 cases, and the President—the final judge—has approved only six. Since taking office in January 1953, President Eisenhower has rejected eight and approved only three affirmative recommendations by the Commission—those on clover seed, watches and bicycles.

In the bicycle case, as in nearly all the others approved, the American manufacturers were granted far less in the way of relief than they had requested. Instead of a tariff increase that would restore the full 30 per cent in effect before 1939, the President approved new rates ranging from 11.25 to 22.5 per cent. And he and the Tariff Commission flatly rejected any idea of import quotas—that most restrictive of trade barriers. Ad hominem arguments seldom meet the merits of any case. But American bicycle makers have claimed that most other nations accord far greater protection to bicycle manufacturers in the way of tariffs, subsidies and licences than does the United States.

All this may be small solace to foreign interests who may feel that a broad American market they helped create for themselves is being narrowed. But it may help put into better perspective the fact that the escape clause is a legitimate mechanism to prevent serious injury, not a device to relieve domestic producers of the incentive to meet foreign competition. It also is worth noting that the United States has made it a practice to grant compensatory concessions to other countries for those withdrawn or modified under escape clause procedures. U.S. officials have made it clear that they intend to negotiate compensatory tariff reductions with bicycle exporting countries as soon as practicable. This can be done bilaterally or as part of a new round of multilateral negotiations under GATT.



The United States, which has been a party to the General Agreement since its inception in 1947, already has announced its willingness to take part in a new round of GATT negotiations early next year. This also will present the U.S. government with an opportunity to put to broad basis the new tariff-cutting powers authorized by Congress last June, when it extended the U.S. Trade Agreements Programme for another three years.

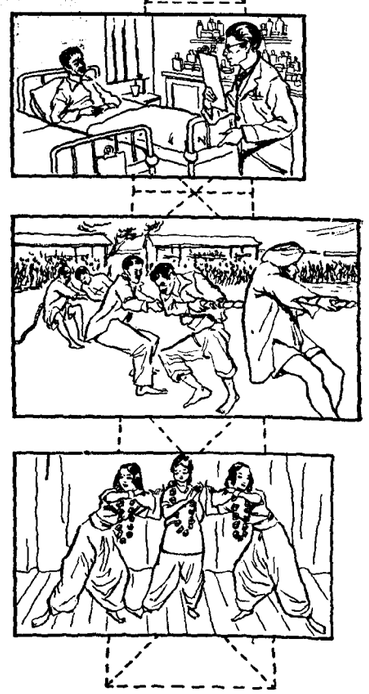
it's a GREAT job...



keeping thousands of workers fit and happy

Over 8,000 people are on the payroll of the Assam Oil Company—a great community, drillers and doctors, truckdrivers and typists, whose lives are centred round the winning, refining and distributing of oil. Helping to keep contented minds in healthy bodies—both in their leisure and their working hours—is indeed a formidable task.

Taking physical well-being first, Digboi Hospital is one of the most modern and best equipped in India. There are maternity centres and clinics readily accessible and a fully staffed Welfare Office. Malaria, which at one time affected three out of five workers, has been virtually stamped out.

More than 4,300 children attend the company's nine schools, which have a high record of Matriculation successes. Social clubs, sports clubs and playing fields cater for every kind of sport. Vegetable and flower shows, arts and crafts, stage plays, concerts—every form of hobby and recreation is encouraged.

In these ways the Assam Oil Company is glad to acknowledge the loyal service of its family of workers, engaged as they all are in a great national effort to satisfy India's oil needs from her own resources.

BUSINESS NOTES

ESCAPE FOR BICYCLES

YET ANOTHER breach was caused in the United States "firmly rooted policy" of expanding and liberalising international trade, when, on August 19 last, President Eisenhower gave approval to the Tariff Commission's recommendation to effect a substantial increase in the rates of duty on imported bicycles. This deviation from avowed policy, coming so soon after the historic case of high tariffs on watches (hitting the premier export industry of a small country, whose economy is delicately balanced on export industry) raises the number of occasions on which emergency powers under the escape clause were invoked to six since 1948. It ought to be recorded in fairness to President Eisenhower and President Truman, however, that they resisted all pressure from influential champions of high protectionism and kept the number of compromises to six only.

The crucial issue, however, is; Was the case of the bicycle industry of such vital and strategic importance to the economy of the United States as to merit the application of special reserve powers in flat contradiction of a policy which the U.S. Government is urging so forcefully on other countries? Nor does the trend of foreign competition in the U.S. market for bicycles offer any cogent defence for the extra-ordinary course adopted. It is fallacious to emphasize that the share of imported bicycles in the U.S. market shot up from 2 per cent in 1949 to 40 per cent in 1954. In 1949 European economies were too submerged in the task of rehabilitation to think seriously of their export industries. It is significant that the U.S. tariff rates on bicycles have remained unchanged at 15 per cent since 1939, except for the fact that the rates were cut down to 7.5 per cent for certain types which were relatively immune from competition from abroad. If, therefore, home-made bicycles lost 25 per cent of their share of the market in 1954, as compared to the previous year, the explanation is to be sought in the competitive efficiency of the industry abroad. To invoke the plea of serious injury or threat of serious injury to domestic industry from imports in the case of a minor industry will easily open the way for practical reversal of a sound policy.

STATE LOANS' SUCCESS

THANKS to the proper timing and to the large developmental outlay under the Five-Year Plan, the ten State loans had a splendid response. The success of these loans for an aggregate amount of Rs. 35.75 crores speaks for the soundness of the credit structure in India. This success was particularly marked in the case of the Bombay and the Madras loans (Rs. 600 lakhs and Rs. 700 lakhs respectively), which were oversubscribed on the opening day itself (16-8-1955) and that notwithstanding the fact that banks, markets and other financial institutions were paralysed in Bombay by a city-wide hartal of unprecedented magnitude.

All the loans carry 4 per cent interest and are repayable in 1967 on the individual credit of the States. The terms vary from par issue in the case of Bombay and West Bengal to a discount of one rupees in the case of Bihar, Hyderabad, Mysore, and Saurashtra, and the amounts from Rs. 1 crore for Madhya Pradesh to Rs. 7 crores for Madras. There were conversion facilities for the Bombay, Madras, Madhya Pradesh, and Mysore loans.

The pull on funds on account of the loans were reflected in a jump in the inter-bank call money rate from 2¼ per cent to 3 per cent during the week. The early closure of the loans is ascribed partly to the intensive drive for several weeks before their offer to the market. The reutrn of cash on small holdings of the Imperial Bank also materially helped the issues.

The overnight decision to close the list of the Bombay loan disappointed many prospective investors but it was possible that a part of the unfulfilled demand for the Bombay and the Madras loans may have been diverted to the remaining loans. Hardly four days after the floatation dates, the Bombay loan started to command a premium of 12 annas (buyers) (that is on Saturday 20-8-1955) and the Madras loan had buyers around par (which implies a premium of four annas). Saurashtra changed hands at a premium of two annas. The exceptional response to the Madras loan was probably due to the technique of broadening mass support, initiated by Rajaji a few years back. Though it was originally planned to accept only applications up to one lakh of rupees, it has now been decided that subscribers in cash over one lakh of rupees also will receive allotment; the former course of action would, of course, have meant the penalisation of institutional investors albeit unwittingly.

The following table indicates the response to the loans, including the four cash-cum-conversion loans:

SUBSCRIPTION

Loans	Amount	Total	Cash	Conversion
		(Figures in lakhs of rupees)		
4% Bombay	600	869.868	821.535	48.333
„ Madras	700	1,418.954	1,363.414	55.540
„ Mysore	275	353.029	277.153	75.876
„ M. Pradesh	100	144.845	111.372	33.473
„ Andhra	250	483.093	483.093	—
„ Saurashtra	200	260.628	260.628	—
„ U. Pradesh	600	677.620	677.620	—
„ W. Bengal	500	558.308	558.308	—
„ Hyderabad	200	211.574	211.574	—
„ Bihar	100	153.810	153.810	—

In the case of Bombay, allotment is 75 per cent, Andhra 55 per cent, Madhya Pradesh 70 per cent, Mysore 80 per cent and Saurashtra 85 per cent. Subscribers to West Bengal, Uttar Pradesh, Hyderabad and Bihar loans will receive full allotment. The State governments have reserved to themselves the right to exercise their option to retain 10 per cent in excess of the target figure.

Owing mainly to heavy withdrawals made to finance subscriptions to new loans, conditions in the Bombay short-term money market remained stringent during the week and banks had to turn either to the Reserve Bank or to the State Banks for temporary accommodation. The position will of course alter when the subscriptions tendered for the loans in excess of the requirements are released. From the total figures of response, it is evident that the institutional investors will get refunds to the tune of several crores.

COTTON CURTAIN LIFTED

WITH THE release of the American plan for disposal of its surplus cotton on August 13, the cotton curtain has at long last been lifted, almost but not quite. For the announcement has not made it clear whether there is going to be a U.S. export subsidy, an issue which has been mainly responsible for hampering dealings in cotton futures markets all the world over.

The actual announcement of the U.S. cotton policy contains nothing sensational. It is more or less in line with what has been generally anticipated by cotton men. Thus, it was thought, as early as in the middle of June last, that it was almost certain the disposal programme would provide for the sale of Government owned surplus cotton on world markets at world prices. It was also foreseen that the sale of Government-owned cotton in domestic markets would be so arranged as to protect the American cotton textile industry from the effects of selling cotton to foreign competitors at a lower price than the one at which

American mills could buy their cotton. Further, the Agriculture Secretary Mr. Benson's assurance that "dumping formed no part of disposal plans for the cotton year just opened" was only a reiteration of what President Eisenhower had said as far back as September last, when he emphasised that the United States would not allow the use of its agricultural surpluses in such a way as to impair the traditional position of friendly countries by disrupting world prices of agricultural commodities.

In these circumstances, it is no wonder that Mr. Benson's offer has been characterised as 'not very attractive'. Thus, the Director of the British Federation of Master Cotton Spinner's stated that Americans have been piling up stocks of their short-Staple cotton that nobody has wanted to buy, and, generally speaking, the offer of Mr. Benson does not sound very attractive. He further added that the American plan for the disposal of surplus cotton would not cause any great excitement in Lancashire. In sharp contrast to this rather cynical view, the American Ambassador to Egypt has hailed the U.S. cotton export policy as a stabilising influence on world cotton markets. He seems to derive comfort from the fact that there will be no dumping of American cotton on world markets in competition with Egyptian cotton. It would also seem that Mr. Benson's statement that there is to be "no material change" in export policy has been construed as an assurance that subsidization of exports will not be resumed, at any rate, not before August 1, 1956. However, the fact that the major question of U.S. export subsidy is still kept in suspense is a significant omission.

Meanwhile, the cotton futures market in Bombay, which had for long been subject to wide fluctuations on account of the uncertainty surrounding the American export policy, has completely ignored the U.S. cotton policy statement. Evidently, India, which can claim to have the cheapest of cheap cottons need have no fears consequent on America's decision to market 'gradually at competitive world prices' up to 1,000,000 bales of lower-quality short staple cotton. As a matter of fact, the market here witnessed a spectacular jump of nearly forty points in a single day on Thursday in the maturing August contract. To the extent, therefore, that the air has been cleared of much of the uncertainty about U.S. cotton policy, Mr. Benson's announcement may be said to have contributed towards stabilising world cotton markets. However, in the event of there being or export subsidy at all, the possibility of a gradual decline in world raw cotton prices cannot be ruled out.

The need for keeping a close liaison between exporters and importers with a view to bringing down the ultimate price to the consumer to the lowest level possible has been brought out by the Textile Export Promotion Council in the course of an admirable analysis of the Afghanistan market for cotton textiles in the latest issue of "Texprocil."

India, contributing nearly 70 per cent of Afghan requirements of cotton textiles, has been the leading supplier of cotton piecegoods to Afghanistan for many years. This has been possibly due to the age-old trade accord between the two countries, assisted, no doubt, by the large intake of Afghan produce like dry fruits by India. However, this happy state of affairs has been marred lately by the entry of rivals in the field such as the U.S.S.R., Japan, and Pakistan, textiles from which countries have started flowing also Afghanistan since 1954.

India's monopolistic hold on Afghanistan textile market has been especially and mainly challenged by Russia, closely followed, of course, by Japan. For obvious reasons, Pakistan has met with little success in her efforts to establish her textiles in Afghanistan. Thanks to her geographical proximity with Afghanistan, Russia is certainly in an advantageous position, in that she has no transport difficulties, unlike other supplying countries whose goods have to pass through Pakistan, which means a delay of atleast three to five months. The transport problem has been further aggravated by the political tension between Afghanistan and Pakistan. In the event, Indian goods are reported to be lying in Karachi for over three months now awaiting transhipment to Afghanistan. With a view to overcoming this bottleneck, Japanese textiles destined for Afghanistan are reported to have been shipped through the port of Dubai in Persian Gulf from where it is redirected to Afghanistan. The Textile Export Promotion Council has drawn the attention of Indian exporters to explore the possibilities of following a similar procedure, if feasible.

Apart from the advantage of geographical proximity that Russia has in relation to Afghanistan, trade between the two countries is also smoothened further, we are told, by the fact that the deals are mostly on a Government-to-Government basis, all the textiles imported from Russia being stored in a Government depot at Kabul. The Afghan Government then fixes a wholesale price, it is stated, and thereafter, the retailers draw their requirements from the Depot as and when needed. This system, it is claimed, ensures a reduction in the ultimate cost of cloth to the consumer and has been recommended for adoption by India by the Texprocil. When State trading is so much in fashion these days, this is understandable, but the implications need going into carefully.

As in this country, there are evident signs in Afghanistan also of a drive to eliminate middlemen from the trade by organising State monopolies. Only textiles from the U.S.S.R. have been brought under this scheme so far, and the limited experience thus far seems to have imposed both the Afghan Government and the retaile trade.

THE AHMEDABAD FORMULA AND AFTER

ALTHOUGH THE general provisions of the bonus agreement of 27th June between the Ahmedabad Millowners' Association and the 80,000-strong Textile Labour Association have been opposed by thirteen member-mills, news of a similar accord at Indore seems to show that the principle has apparently caught on.

According to the formula laid down by the Labour Appellate Tribunal decision of 1950 in the case between the Millowners' Association, Bombay and the Rashtriya Mill Mazdoor Sangh, and the decision of the Supreme Court in Civil Appeal No. 135 of 1951 (Muir Mills Ltd., Kanpur Vs. Suti Mill Mazdoor Union and the State of U.P.), it may be remembered, the claims of the employees for bonus arise only if there is an available surplus of profit after making provision for all the prior charges, including a fair return on paid-up capital (six per cent) and on reserves employed as working capital (two per cent). The Ahmedabad agreement, however, provides that a mill whose profit is not adequate form meeting the prior charges or even a mill which has made a loss, will, as a special case, pay its employees a minimum bonus of 4.8 per cent of the basic wages. One provision of the agreement, however, lays down that such a mill shall be entitled to set off the amount thus paid against the amount of bonus payable in subsequent years; on the other hand, if a mill has an available surplus adequate to pay bonus at a higher rate than the ceiling of 25 per cent, it should set aside a part of the residue (not exceeding 25 per cent of the basic wages) as a reserve for purposes of "set-on" in later years.

The agreement between the Madhya Bharat Millowners' Association and the INTUC signed on Independence Day (15-8-1955) broadly follows the Ahmedabad pattern, which itself, according to a press report, seems to have been borrowed from an earlier accord at Indore when the textile workers were paid bonus

for 1950, 1951 and 1952. It is to be given effect to retrospectively from 1953 and will ensure a minimum bonus of 15 days' basic wages (or 4.8 per cent) for five years to the 25,000 textile workers of Indore. It will involve a total additional bill Rs. 35 lakhs to the millowners for five years. The agreement is significant because, it seeks to establish by precedent and not a judicial industrial tribunal award for a second time, the principle of paying bonus to workers, irrespective of considerations of profit or loss by the management. The Bombay textile strike of 1950 was due to labour's demand of a similar nature, that is, for the creation by the industry of a bonus pool out of which bonus was to be distributed to all the workers whether the constituent units individually made profits or not.

TREND OF TEXTILE OUTPUT AND EXPORTS

IN LINE with the great strides that have been made in the production of cotton, the production of both cotton cloth and yarn has also been steadily mounting up. In fact. the latest provisional figures for the month of July put both cloth and yarn production at a record level for the year at 446 million yards and 144 million lbs, respectively.

The performance on the export front has also been, on the whole, satisfactory, though the total quantum of exports has not yet reached the pace witnessed in 1954. Thus, during the first six months of 1955, the offtake of cotton piecegoods aggregated only 398.36 million yards as against 425.37 million yards recorded in the corresponding period of 1954. However, it is significant to note that, as against a decline in the first quarter of 1955 of 42.67 million yards, the second quarter accounts for only a fall of 27.01 million yards.

A varietywise break-up of figures relating to exports of cotton piecegoods for the period between January and July, 1955, discloses that greater preference is being shown by overseas buyers to medium cloth, the export of which has improved from 52.08 million yards in month of June to 54.54 million yards in July. Again, the aggregate total export of medium cloth for the seventh-month period at 370.13 million yards shows an excess of 14.13 million yards over the figure for the corresponding period in the previous year. In contrast, the quantum of exports of fine cloth has been steadily declining and is less than half of what was recorded in 1954, the relevant figures being 23.83 million yards and 54 million yards, respectively.

It is interesting to see that British East Africa and Indonesia have stolen a march over the traditional first and second placeholders among the ten main markets that account for Indian cotton piecegoods. Thus, during the month of June, British East Africa with 8.88 million yards and Indonesia with 8.54 million yards succeeded in pushing down the list both the U.K. and Sudan, the relevant figures of consumption of cotton piecegoods by the latter two being 7.16 million yards and 6.59 million yards, respectively.

HANDICAPS TO EXPORT-IMPORT TRADE

SOME Of the handicaps suffered by the mercantile community in export-import business were spotlighted on Friday by the Import-Export sub-Committee of the Indian Merchants' Chamber in Bombay, which met Mr. S. N. Bilgrami, Chief Controller of Imports and Exports, Government of India. The system of canalisation of imports through Government-sponsored agencies in respect of certain industrial raw materials was taken strong exception to by the commercial community, who maintained that such canalisation deprived the established trade channels of their traditional import lines and made short work of the element of healthy competition. Other matters that were brought to the notice of the Chief Controller of Imports and Exports included the procedure in respect of transfer of quota rights, ad hoc licensing, need for co-ordination between the Import Trade Control and the Customs authorities, procedure for grant of import licences under the import promotion scheme, system of grant of export licences and the need for simultaneous announcement of export policy at all ports.

A familiar complaint of the mercantile community in regard to exports has been the invariable delay in the announcement of export policy. And the the practice of announcing quotas by instalments—granted their merits—invariably spells considerable hardship to shippers. For new quotas are not usally announced sufficiently well in advance of the expiry of the validity period of the previous quotas, thereby preventing any continuity in the export policy. There is always a period between two announcements when the trade is in a state of suspended animation and is, therefore, unable to enter into fresh commitments with foreign buyers, with the result that suppliers from other countries are enabled to steal a march over Indian exporters. Unless the Government is quick in remedying this lacuna, the Government's oft repeated export promotion scheme will fall flat on the market. In this connection, the sudden outburst of export enquiries witnessed in the past few days in the spot cotton market, following the confidence of the market that the U.S. cotton subsidy plan is shelved 'finally', provides a green signal for a further export quota announcement in respect of cotton.

EMPIRE'S RAPID REHABILITATION

MR. R. VARADACHARI'S speech at the recent annual general meeting of the shareholders of the Empire of India Life Assurance Company strikes quite a different note from that of several other presidential speeches at insurance companies' meetings. The administrator scrupulously refrains from creating any feeling of self-complacency about the plausible prosperity in new business registered in 1954. On the other hand, he reminds the shareholders of a critical phase of cut-throat competition introduced by rate reductions and aggravated by the race for bonus declaration. If the performance of life companies in respect of new business in the last year is judged on the basis of what really amounts to conversion of old policies and genuine new business, the enormity of loss caused by the former would be clear. The hasty policy of rate reduction, impelled by short-sighted considerations, has inflicted injury especially upon smaller insurers which it must take several years to repair. There is no going back on it now and one way in which the vigour of competition can be mitigated is to tap the semi-urban and ruarl areas for new business.

Empire's rapid progress in reconstruction is to be read in the statistical account of the last year. But its major achievements deserve brief reference. The overall expense ratio was reduced in 1954 to 28.40 per cent (an improvement of 5.26 per cent in five years), the renewal expense ratio has been brought down to 18.61 per cent, the past four years have been devoted to restoring stability to the company's finances, a sizable reserve of Rs. 116 lakhs has been built as insurance against losses from investments, top-heavy administration has been rationalised and contentment of staff has been secured by conferment of graded scales of pay for the first time as also increased allowances. The legacy left by the previous management is being wiped out and rationalisation of its financial working is proceeding satisfactorily.

DHRANGADHRA CHEMICAL'S PROSPECTUS—A CORRECTION

A PRINTING error has crept in the abridged summary of the prospectus of the Dhrangadhra Chemical Works Ltd. published in the issue of this journal dated August 5, 1955, on page 212 in line 9 from the bottom in the first column. For "Sugar-tax" please read "Super-tax".

COMPANY AFFAIRS

TATA OIL MILLS LIMITED

The working results of the Tata Oil Mills Company Ltd., for the year ended March 1955 show a fall in disposable profits at Rs. 7.08 lakhs against Rs. 7.75 lakhs in the previous year. According to the Directors' reports this decline is mainly due to the heavy excise duty on soap introduced in the 1954 budget (total liability of the company on this account equalling Rs. 21.34 lakhs) and the prolonged strike at Tatapuram from November (costing about Rs. 1.5 lakhs) as well as reduction in the sales of glycerine. There was a higher provision for taxes at Rs. 2.49 lakhs against Rs. 1.35 lakhs in the previous year owing to an estimated reduction in depreciation allowances under the Income-tax Act.

The results would have been worse still but for the operation of one important favourable factor, namely a considerable fall in the prices of groundnut, coconut and mowra oils, the price of groundnut oil falling by as much as 38 per cent. This, by itself, however, was not able to save the situation, as prices of soap had to be cut following similar reduction by the company's main competitors.

The cumulative effect of all these was: (i) the managing agents' commission had to be pruned by Rs. 1.06 lakhs to Rs. 1.48 lakhs; (ii) the allocation to depreciation was reduced by Rs. 2.3 lakhs to Rs. 9.7 lakhs; (iii) bonus to employees declined by Rs. 1.3 lakhs to Rs. 3.1 lakhs; and (iv) the dividend recommended is lower at Rs. 2 against Rs. 2-4 in the previous year.

The operations of the solvent extraction plant were frequently interrupted owing to defects in the flaking mill and the company had, therefore, to curtail its purchase and crushing programme of seeds. Arrangements have now been made to replace the defective parts. A duplicate water cooling plant was eracted at the Tatapuram factory as a stand-by to the existing one. A new sea-water reservoir of bigger capacity was constructed at the Bombay factory for servicing the glycerine and hydrogenation plants. A modern high speed German printing and waxing machine has also been installed which may result in considerable saving in the printing charges of packing and wrapping materials.

During the year, the company introduced on the market a new toilet soap under the trade name 'Jai' and, according to the Report, it has had an encouraging reception. As compared to the previous year the production of Pakav doubled whilst sales rose by 175 per cent. In spite of adverse propaganda there has been a growing demand for vanaspati. The entire vanaspati industry registered a record output during 1954-55 when 2.2 lakh tons were produced against about 2 lakh tons in 1953-54.

The following table gives a summary of the balance sheets of the company for the year ended March 31, 1955 as also for the two years immediately preceding:

(Figures in lakhs of rupees)

	Liabilities							Assets				
Year	Subscribed Capital	Premium on Shares	Depreciation & others Reserves	Borrowings & Deposits	Other Liabilities	Profits Carried Over	Total	Net Block	Provision for Depreciation	Stores, Stocks etc.	Book Debts, Advances etc.	Cash & Other Balances
1954-55	99.96	14.94	124.15	107.12	61.93	7.08	415.18	76.97	107.20	172.57	41.73	16.71
1953-54	99.96	14.94	113.95	115.94	58.79	7.75	411.33	79.66	97.50	174.62	42.03	17.52
1952-53	99.96	14.94	98.60	129.92	61.36	6.35	411.13	73.69	85.50	200.27	36.80	14.87

The subsidiary company, Lakme Ltd., again incurred an approximate loss of Rs. 59,000. Its paid-up capital was increased to Rs. 5 lakhs by issuing 250 ordinary shares of Rs. 1,000 each, all of which are held by the Tata Oil Mills Company and its nominees.

JOT'S ENGINEERING CO.

The Forty-ninth Annual Report together with Audited Balance Sheet and Profit and Loss Account for the year ended March 31, 1955, of this company, shows that, after meeting all expenses of operation and management and after allowing for Depreciation of Stocks, Furniture, Tools and Plant, a profit of Rs. 1,17,554 has been made. This amount, together with Rs. 7,839 brought forward from last year makes a total of Rs. 1, 25,394 which sum has been appropriated as under:

	Rs.	Rs.
Total amount brought forward		1,25,394
To Staff Gratuity Fund (making a total of Rs. 43,124)		5,000
To Provision for Bad and Doubtful Debts (making a total of Rs. 40,000)	3,000	
To Provision for Bonus to Employees	21,000	
To Provision for Taxation	43,000	72,000
This leaves a balance of		53,394
From which the Directors recommend payment of a Dividend, free of income-tax, of 8 per cent for the year ended March 31, 1955		48,000
Leaving a balance of		Rs. 5,394

The Stocks have been carefully taken and fully insured

Company Meeting

EMPIRE OF INDIA LIFE ASSURANCE COMPANY, LIMITED.

The Revenue Account and the Balance Sheet of the Company with Auditors' Report appended hereto relate to the year ended 31st December, 1954.

The year has been an eventful one for the insurance world characterised by the rate-war, the bonus war and the staff insurance scheme war. The controversy regarding the last has now been set at rest but the repercussions of the other two are bound to be felt in future years. But so far as the present is concerned, certain unhealthy features, which had till now been largely confined to General Insurance, have made their appearance in the Life Insurance field also. The sudden reduction in the rates of premium by one of the big companies followed in a week by another company, created a very difficult situation for companies like the "Empire." It took us some time to work out the necessary data and consider the course to be adopted, but it was clear that a similar reduction was inevitable if "Empire" was to exist. After a full consideration of the pros and cons, we decided to follow the lead of the other companies and issued the revised rates on the 27th April, 1954. For nearly two months before that, the writing of new business by the Company was practically at a standstill. In issuing the revised tariff, we advised our field staff very strongly not to indulge in what the President of the Indian Life Assurance Offices Association described as "the pleasure of rewriting as new business a large amount of business which we had already placed on our books at enormous cost" and that we would be satisfied with the normal growth of genuine new business. This seems to have had some effect during the year 1954; but how long this will last in the face of the terrific competition prevailing in the field is not known! If the message of insurance, i.e., the thrift and savings movement, is to spread far and wide in the land, the insurance agent should penetrate into the rural areas and he will do so only if it is made worth his while. At the present moment, the field force is concentrated almost entirely on urban areas and the whole-time insurance agent has become a rarity.

As there is some misapprehension even in informed quarters about the "Government management" of the Company and its result, I wish to emphasize that the actual day-to-day working of its affairs, such as the procuration of new business, settlement of claims, etc., are almost entirely in the hands of the Managers and the field staff recruited from the usual actuarial and business circles and not from any Department of Government. The chief difference is that every effort is made to see that the Code of Conduct is observed in field appointments. We do not allow any intermediaries between the Branch Secretaries and the agent beyond what is permitted by the Code; but this is felt by our organisation as an unnecessary insistence upon the Code. As a matter of fact, even in some big companies, the hierarchy is Organisers, Inspectors, Divisional Superintendents, Branch Secretary and the underlying object of this can easily be imagined; even a few weeks back an Officer, who left the Company, wrote to some of our field-workers giving his hierarchy as that prevailing in his new company on that company's letter-head and offering them higher status and pay and less restriction than in "Empire." Another difference is that the Head Office in "Empire" frowns upon twisted business or any attempts to pinch men from other companies.

In some quarters it is alleged that after the "Government management" came in, the expenses have increased but this charge is entirely baseless; on the other hand, it was during the period when the Company was under private management that the expense ratio had been steeply rising from year to year, though the general trend for other companies was downwards. The salaries and allowances of the top Officers in the Head Office used to amount on the average to Rs. 22,106 every month in the year 1950 but in the year 1954, this has been brought down to Rs. 8,111. Various other measures of economy have been introduced, but it takes time to feel the full effect of these. In the year 1949, the overall expense ratio was as high as 33.66 per cent but during the year 1954 we have brought it down to 28.40 per cent. The renewal expense ratio also has shown an appreciable reduction from 21.38 per cent in 1949 to 18.61 per cent in 1954. The reduction would have been far greater but for certain extraneous factors. The graded scales of pay to the staff introduced in 1953 for the first time in the history of the Company and the increase in the dearness allowance increased the cost by over Rs. 80,000 per annum. To add to this, the cost of the law charges connected with the proceedings against the ex-directors, etc., is quite a big one and this has gone to swell the expenses. Though the Company is an old one, it has had to work during the last four years not only as though it was a new company beginning from scratch, but with the added handicaps created by the incidents which happened in the years 1950 and 1951 and which resulted in the action under Section 52A of the Insurance Act. Every effort is made by fieldmen of other companies to misrepresent the position of the Administrator as that of a Liquidator. The extent of the disruption of the organisation will be clear from the fact that, of the existing Inspectors, 75 per cent are entirely new men taken after July 1951. The same is the case in regard to the Branch Secretaries and the Officers at the Head Office. Considering these handicaps, the organisation has produced results during the year which should be considered quite satisfactory. In spite of certain deficiencies "Empire" can claim some achievements to its credit during the last four years—such as reduction in top heavy salaries, increase in the salaries of the subordinate staff, stabilising the finances, creating a big reserve of Rs. 116 lakhs to meet losses from bad and doubtful investments (very few companies in India

would be able to do this) increasing the dividends to shareholders and the bonus to policyholders, and with all this, lowering the overall and renewal expense ratio.

It is, however, unfortunate that, without any reference to these facts, some persons connected with insurance, in their anxiety to espouse the cause of "private management" as against nationalisation, have thought fit to publish disparaging remarks about the performance of this Company as well as the Jupiter General Insurance Co., Ltd. I do not desire to enter into the controversy for or against nationalisation, but would leave it to be judged by more competent persons in an objective manner. But so far as these two particular companies are concerned, I would submit in all humility, that an examination of their past history—their methods of business and investment, control of shares and hawking of the management rights and top heavy administration—as compared with the present position, by any person, official or non-official, will not lend any support whatever to the cause of "private management." Such an examination will also show how difficult it is and how long it takes to rectify inherited wrongs and at what cost to the policyholder and to the general tax-payer. We all like comparison and competition; but, the competition in the insurance business at present is neither fair nor equal.

The triennial Valuation as at 31st December 1954 is in the final stage of completion. I am glad to say that from the preliminary calculations made, the hope which I expressed in my last report about a sizable surplus has been amply borne out. The results of the Valuation will be published shortly and there is every prospect of an increase in the bonus to the Policyholders.

PROGRESS OF BUSINESS IN THE YEAR

NEW BUSINESS: During the year 14,897 proposals were received for assurances amounting to Rs. 4,80,01,000. Of these and others awaiting completion on 31st December, 1953, 11,887 proposals resulted in policies assuring Rs. 3,84,06,774, of which Rs. 8,19,500 was reassured. The new business after deduction of reassurances was accordingly Rs. 3,75,87,274 representing an annual premium of Rs. 20,04,744 and Rs. 7,458 by way of single payment.

EXPENSE RATIO: The overall expense ratio in the year was 28.40 per cent as against 28.55 per cent in 1953 and 26.93 per cent in 1952. The renewal expense ratio in the year was 18.61 per cent as against 19.80 per cent in 1953 and 19.63 per cent in 1952.

CLAIMS: Claims by Death during the year amounted to Rs. 19,32,760 representing an increase of nearly Rs. 1¼ lakhs over the figures of the previous year. The claims by maturity showed a decrease of nearly Rs. 5½ lakhs over those of the previous year.

INCOME AND OUTGO: The income for the year amounted to Rs. 1,53,62,124 (after deduction of taxes at source), of which Rs. 1,19,77,645 was derived from premiums. The outgo amounted to Rs. 1,08,03,439. The excess of income over the outgo is Rs. 45,58,685.

INVESTMENTS: The total assets have increased from Rs. 11,97,50,963 to Rs. 12,38,65,607. For reasons which have been explained in my previous reports, I have concentrated the new investments almost entirely in Government Securities. Since my taking over charge, I have up to date invested Rs. 2,48,51,397 in Central and State Government Securities, with the result that the total investment in Government Securities represents nearly 70 per cent of the total assets. The investments made by the previous management have been under continuous scrutiny and every effort has been made to recover them; suits have been instituted in the Law Courts in a number of cases to recover loans advanced on the mortgage of properties during the years 1948 to 1950.

RATE OF INTEREST: The net interest yield during the year comes to 3.32 per cent. Credit for interest on mortgages taken to Court has again not been taken into account. Such interest will come into the account when realised.

I wish to convey my thanks to all the officers, the staff and the field-force for the good work done by them during the year, sometimes under discouraging circmustances. I am sure that the Company and its workers have a bright future.

R. VARADACHARI,
Administrator.

Dated, 20th August 1955.

RECORDS & STATISTICS

(QUARTERLY BULLETIN)

Editor: R. V. MURTHY, M.A.

"The Eastern Economist" Bulletin of Records and Statistics surveys economic trends in each quarter in India and abroad with the aid of graphs and all available statistics. One of its special features is the Investment Supplement.

4 PER CENT

STATE GOVERNMENTS LOANS 1967

(SECOND ISSUE)

(1) Government of Andhra	.. ..	Rs. 200 lakhs Issue Price Rs. 99-8-0 per cent
(2) Government of Bombay	.. ..	Rs. 300 lakhs Issue Price Rs. 100-4-0 per cent
(3) Government of Madhya Pradesh	.. .. ..	Rs. 50 lakhs Issue Price Rs. 99-8-0 per cent
(4) Government of Mysore	.. ..	Rs. 50 lakhs Issue Price Rs. 99-0-0 per cent
(5) Government of Saurashtra	.. .. ..	Rs. 125 lakhs Issue Price Rs. 99-0-0 per cent
(6) Government of Uttar Pradesh	.. .. ..	Rs. 250 lakhs Issue Price Rs. 99-8-0 per cent
(7) Government of West Bengal	.. .. ..	Rs. 200 lakhs Issue Price Rs. 100-0-0 per cent

The loans will remain open for subscription from 30th August to 1st September, 1955 but may be closed earlier without notice as soon as subscriptions approximate to the amount of each issue.

Each loan will bear interest from 1st September, 1955. Interest from the date of application to the 31st August, 1955 inclusive, will be paid to the applicants at the time of issue of new securities at the rate of 4 per cent per annum on the nominal value of the loan applied for and accepted.

Subscriptions will be in the form of cash / cheque in respect of all the loans.

Applications for all the loans will be received at the offices of the Reserve Bank of India, Bombay, Calcutta, Delhi, Madras and Bangalore.

Applications for any particular loan other than Mysore Government loan will also be received at branches of the State Bank of India within the State issuing the loan.

In the case of Mysore Government loan applications will be received at branches of the Bank of Mysore Ltd. in the Mysore State.

N.B.—Copies of Notifications and Application Forms may be obtained at any Receiving Office.

COMMODITY NEWS AND NOTES

BETTER YIELD FORM SUGARCANE

At a speech in Coimbatore on August 21, Mr. A. P. Jain, Union Minister for Food and Agriculture, expressed concern at the increase in sugarcane area in some parts of the country. He warned that, if the price of sugar were to be maintained, it might be necessary to place restrictions on the area under cane wherever it showed a tendency to outreach the crushing capacity of the mills. The average yield of sugarcane per acre in India was only 14 tons, as against 25 tons in Australia and 40 tons in Indonesia. It was necessary, he stressed, that in India too the yield of cane must be increased, augmenting, at the same time, its sugar content.

Mr. Jain revealed that the yield of cane in the development zone was, on an average, 20 to 25 per cent higher than in areas undeveloped. The intensive development campaign initiated last year covered 1.75 lakh acres, yielding 26 tons of cane per acre. But he admitted that the development schemes undertaken by the Indian Central Sugarcane Committee had covered only a seventh of the total cane area so far in the country.

U.S. COTTON EXPORT POLICY

Announcing the marketing plans for the United States cotton year, which began on August 1, the Secretary for Agriculture said that the Administration might offer to sell for export up to one million bales of its lower-quality short-staple cotton stocks at competitive world prices "on a gradual basis". The rest of the eight million bales of surplus cotton stocks would continue to be offered at higher prices than the domestic markets. There would be no "dumping" of U.S. cotton on world markets. No material change was planned in the U.S. export policy for upland (Short-staple) cotton for the 1955-56 marketing year.

The bulk of the cotton stocks would still be offered for sale for export on a competitive bid basis, but at not less than the domestic market price, or 105 per cent of the current cotton price support level, plus reasonable carrying charges, whichever was higher. The announcement did not clear up the major question of whether there was going to be a U.S. export subsidy.

EXPORT OF INDIAN TEXTILES

The Minister for Commerce and Industry stated in the Lok Sabha that several measures to promote the export of Indian cotton textiles have been taken by the Cotton Textiles Export Promotion Council, which was formed about nine months ago. The Council, for instance, has collected statistics and other information about market conditions, import restrictions in the foreign countries etc., which affect export trade in textiles, and regularly publishes bulletins for the use of the trade. Samples of cotton textiles produced for export by over 60 Indian mills have been exhibited in the countries in South-East Asia which were recently visited by a delegation consisting of mill-owners and exporters.

TOBACCO EXPORT

The quantity of tobacco exported from India to China in 1954 was 6,441,000 lbs, valued at Rs. 37.68 lakhs. In the first five months of the current year, the quantity of tobacco exported to China was 3,628,000 lbs. valued at Rs. 13.55 lakhs.

PAK JUTE EXPORT: DUTY RAISED

When Pakistan devalued its rupee last month, it was pointed out that whatever benefits the Indian buyer of raw jute might obtain would be affected to the extent the Pakistan Government revises its export duty on the fibre. Karachi has now increased the export levy on jute from Rs. 3 to 4 per manud with immediate effect. There is, however, no change in regard to the cuttings or 'Habijabi'. The Pakistan Government has also announced an immediate increase in the export duty on raw cotton from Rs. 90 per bale to Rs. 135 per bale. The impost on desi cotton will remain unchanged.

SECOND POTATO ESTIMATE

The all-India second estimate of potatoes, 1954-55 puts that year's area and production at 6,39,000 acres and 1,600,00 tons as against the adjusted second estimate of 633,000 acres and 1,621,000 tons for 1953-54, according to the Directorate of Economics and Statistics, Union Ministry of Food and Agriculture. This shows an increase of 600 acres, or less than one per cent in area and a decrease of 21,000 tons or 1.3 per cent in production.

The increase in area has occurred mainly in U.P. due to favourable weather conditions. This increase has been offset to a large extent by a decline reported by Bihar due to unfavourable climatic conditions Despite slight increase in area, production has recorded a fall which is mainly shared by Bihar and West Bengal. Bombay, Punjab and U.P. States have, however, recorded some increase in production.

RABI PULSES ESTIMATE

The all-India final estimate of rabi pulses, other than gram and tur 1954-55, puts the year's area and production at 10,498,000 acres and 1,977,000 tons, as against the partially revised estimate of 11,214,000 acres and 2,089,000 tons for 1953-54. Thus the 1954-55 estimate shows a decrease of 716,000 acres or 6.4 per cent in area, and 112,000 tons or 5.4 per cent in production over 1953-54.

The decrease in both area and production has been shared by all the pulses excepting urad or mash and mung. The decrease in area has mainly taken place in Bihar, Bombay, Madhya Pradesh, U.P., Hyderabad and Bhopal due to unfavourable weather conditions at the time of sowing. The decrease in production has mainly taken place in Bihar and Uttar Pradesh. This decrease in area and production has, however, been offset to some extent by the increases reported by West Bengal.

Planned Eclipse of the Plan-Frame?

THE halcyon days have ended. For a period of nearly eight months, the current of optimism on the main objectives of the second Five-Year Plan has flowed full and strong. Since the notable speech of the Finance Minister in December 1954 on the second Plan, no official authority has been ready to question the possibilities of achieving a rise of national income of 25 per cent in five years together with the provision of new employment of ten million jobs. These objectives were enshrined in the plan-frame which assumed, without any proof or precise indication of ways and means, that its targets would bring forth both objectives. To non-official criticism that there was really no justification for the assumptions that the Mahalanobian figures would deliver the Deshmukhian goods, the Government of India consistently turned a deaf ear. This week, quite suddenly, the voice of the critics has prevailed. In an unobtrusive document described as "An Approach to the Second Five-Year Plan—Some Basic Considerations" by Mr. Gulzari Lal Nanda, the plan-frame has been put in its place. It now transpires that the employment targets of the plan-frame are impossible, and its income targets unreal at least with the order of contemplated investment.

It is not clear from Mr. Nanda's "basic considerations" whether the order of expenditure in the public sector should be raised for a 5 per cent increase or whether he considers that any possible adjustment in the structure of the Plan is

incapable of producing the rise of income required. It seems a pity that this fundamental paper, which is important because of the measures of critical thinking which it contains, should have tended to accept too readily as defeatist a picture on the income side as it does on the employment side. There is certainly no evidence that employment of the order of 10 million new jobs can be created. On the other hand, it is certainly not true that there is no evidence that an income target of 25 per cent in five years is impossible with practicable levels of investment suitably designed. Of course, if the public sector should choose to withdraw to itself resources—by reckless taxation or otherwise—on a scale designed to defeat the creation of income within the period of the Plan, it has the power—and it would seem the abuse of power—necessary to accomplish its task. It by no means follows from anything presented in Mr. Nanda's review, or from historical considerations based upon achievements in other countries or in India between 1952 and 1955, that the order of rise of 5 per cent per year is an overestimate.

It is right that mistakes in the plan-frame—and they are many—should be corrected. The plan-frame was not designed with sufficient knowledge of conditions in particular sections, notably transport, and it was also distorted by a personal philosophy which led to uncritical acceptance of directives which could not be consistently translated into economic terms. To correct the plan-frame of mistakes such as these should not lead one to destroy every particular target that the plan-frame contains. It is a matter of some considerable misfortune that the plan-frame itself has become an object of attachment or revulsion so great that emotion is now raised every time it is considered. The general line has been total support or total rejection. It is a pity that so much of Mr. Nanda's criticism has been designed to create the impression that the plan-frame needs to be well and truly eclipsed before a better plan is raised on its debris.

The mistake which Mr. Nanda and certain other critics of the income figures of the plan-frame make is to assume that the normal trend of growth of the Indian economy is the average of the last five years. In point of fact, there is evidence to show that both in agriculture and industry the year 1952 marked a "kink" in the rates of growth in the major sectors of the Indian economy. Such "kinks" in trend lines are by no means unfamiliar to economic historians. Time and again there can be, in the history of nations, sudden turning points at which, it would appear, a new set of assumptions must hold in order to describe the rate of growth of an economy. Such a trend, for example, came in the United Kingdom about 1760 with the great Industrial Revolution. Such a trend came again in the United States from about the year 1868 when the United States economy recovered from the bitter wounds of its Civil War. In India, economic historians have already pointed to the fact that after 1952 the country has entered into a dynamic spell both in agriculture and industry, which cannot be worked into the short-period trend of any previous three years in Indian history. Nor can it be reconciled with a long-period trend over any considerable period for which figures are available.

To generalise uncritically over a period which includes this major "kink" in trends of growth is to call forth all the dangers of arbitrary statistical choice. The trend line of the Indian economy after 1952 shows a current rate of growth of 4 per cent a year with a rate of planned investment roughly half that which is contemplated in the second Five-Year Plan. It is true that some considerable portion, possibly a fourth, might be due to "accidental" factors like particularly favourable rains. But it is also true that almost all the "multi-purpose" investment which, had it been designed for short-period gain, would have delivered "non-accidental" income, has been carried forward to the second Five-Year Plan. While, therefore, India will lose the gifts of Providence in the second Plan, she is not likely to lose on total account since the work of men will have compensated for the parsimony of Nature. With double the investment of the first Plan and the "overflow" of income, the income totals of the plan-frame are not unreasonable in total even though they are wildly out in some details.

There is no need—at least on the evidence so far adduced—to assert that financial considerations will limit progress severely. Again, there is no reason to assume that the stream of real income can only be developed slowly. While the steel plants may conceivably deliver late, it is to be remembered that the present programme for the Plan provides for the import of steel at a rate of a million tons per year; the fabrication and processing of this steel implies that the engineering industry will not be starved throughout this period. Again, the massive use of fertilisers and the extension of improved methods should give India a high return with relatively small capital investment. The facile assumption that the ratio, or volume of investment required to generate a given income, is likely to rise significantly because much of the income generated will fall outside the planning period has no foundation in fact. The ratio will be higher than in the first Plan. But the idea that somehow this Plan requires much more management and the inevitable —but undefined—"public control" than the first Plan is an error. The reduction of inequality—to which some importance must be attached—can be achieved with existing instruments.

Commentators in Delhi have been quick to draw conclusions from the emergence of this paper at a time so close to an A-ICC meeting. It has been firmly hinted in New Delhi that Mr. Gulzari Lal Nanda, the Planning Minister, has been assigned the task of "correcting" the high hopes which the plan-frame has raised. If this is so, it seems a pity that the Government of India should have adopted so questionable a course as to release a misleading document and then kill it by reversing the act of initial kindness. There will be some repercussions produced by the act of withdrawal. Now that high hopes have been raised, it will need very much more than an essay in moderation to hold them down; or if an essay of this kind is to be effective, it will need to be far better documented than is the current explanation. The plan-frame and Mr. Nanda's note are both in error in that they really are expressions of dogmas, not sound economic presentation. They may, indeed, have each a measure of truth. But neither carries conviction in itself. Will not the Government of India produce a document with chapter and verse on each point, instead of obiter dicta of persons, however eminent or well-meaning? A mere change in the oracle will never be a substitute for the facts on which policy is to be based.

The Press Debate

EXCEPT for Dr. Keskar's attempt to elucidate the issues involved in the implementation of the Press Commission's recommendations, the debate in the Lok Sabha last week cannot be regarded as having made a distinctive contribution to the subject. Members' speeches tended to concentrate on the few recommendations—like the Press Council, the price-page schedule or the conditions of working journalists—and even these were not argued with the depth of understanding which should have been promoted by the Press Commission's detailed discussions in the report. It has been shown that some members of the House were even wrong on material particulars in their enthusiasm to make more severe their strictures on what they regarded as the abuses in the Indian press today. This enthusiasm seemed to close their minds wholly to the outstanding virtues of the Indian newspapers of which their readers or publishers can be legitimately proud. Just as Bernard Shaw thought that practitioners of medicine tended to acquire a vested interest in disease and not in its prevention, the average politician tends to have a similar personal interest in social evils. Such evils give him the opportunity to campaign for votes and the excuses to rush to legislation—which are the ultimate ends of his vocation. He will have to invent evils where they do not exist, or magnify them if they are only minor in character, unless he abdicates his role. While deploring, therefore, the one-sidedness of the remarks in the Lok Sabha, it is possible to recognise its inevitability, especially during the present phase of our politics, when the conscious and deliberate Leftist orientation has given the excuse for emitting sound and fury on current issues.

The Minister for Information and Broadcasting had to make it clear that the report of the Commission was not in the nature of an award to be automatically implemented. The time and manner of implementation of the very wide range of recommendations may be spread over the next few years to the extent to which they are necessary and desirable. Dr. Keskar's assurance on the floor of the House that, in matters involving the freedom of the press, Government would "proceed carefully" was timely and necessary in view of the character of the preceding debate. The definition of the implications of that freedom, however, often gets mixed up. Freedom of expression seems self-explanatory. But no one in his right senses would identify it with criticisms of Government alone, because freedom to support authority is also involved in it. But the ultimate test of the existence of freedom would necessarily lie only in the extent to which freedom of criticism exists. The concept of freedom of expression, in its origin and development, is related to an inherent tendency of established authority to deny it in the course of its work. In modern societies when the dangers to freedom appear to be far more numerous than the safeguards for its existence, the attitude to criticism of Government naturally becomes the touchstone of the liberty of the press. Whether it is newsprint control or a price-page schedule, the indirect effects of regulation by the State may often prove undesirable, at least in practice, to the freedom of such criticism.

But freedom of expression is not the only, though it is a major, test. Newspaper production is recognised as an industry and it is a highly competitive industry. Many of the suggestions of the Press Commission, which do not lead to interference with press freedom as such, would nevertheless involve deliberate restrictions on the freedom of commercial operations in production, prices and sales. On these purely industrial aspects, decisions must be based only on the particular conditions which call for regulation in the public interest. Price and distribution controls are applied to other essential industries in the national interest even during normal times—like coal, steel or cement. The question is how far these considerations would be applicable to newspapers—if its industrial aspect is considered separately from that of its liberty. In times of exceptional shortages, newsprint control and price-page schedules have been in operation, just as similar regulations existed on a number of other products, including cloth, in which under normal conditions there are no reasons for restriction.

The onus of proving the case for introducing restrictions must lie on those who wish to establish that the conditions of competition in this industry are so unlike those in others or are so wholly opposed to public policy as to need firm intervention. The mere existence, or the possibility, of malpractices would not provide sufficient justification. The conditions of production of a modern newspaper are such as to require a large outlay on equipment and reporting and on distribution services. It would be idle to expect that by merely hampering the type of investor who can run a paper, smaller men will be enabled to come successfully into a field in which they can hardly operate with advantage. In spite of the existence of the tendency to form groups among newspapers, there is today no monopolistic trend either in views or in capturing for major newspapers a more than proportionate share of the market. The exceptions, if any, would not prove the rule.

It has become a commonplace to say that Indian journalism has declined in standards—merely because the sense of mission with which editorial writers had expressed their patriotic fervour is no longer there. Those who hold this view may be forgiven their nostalgia for the past but there is nothing more in it. It is remarkable how well the Indian press has risen to the needs of the times in the last few years of independence and the confidence with which it has learnt to approach its changed and changing role, even if such confidence has occasionally led to excesses. If the average journalist is not as versatile as he is reputed to have been once, it is because he lives in a world where the range of reader interests and social activity has widened far beyond the dreams of the most successful journalists of a quarter of a century ago in this country, when a small educated minority was interested mainly in sharing its ideas within its own class. It is only the large newspaper which is in a position today to seek out and provide a forum for those who have the professional competence, whether in special fields or in seeing the social picture as a whole, and who, because of their personal temperament, cannot ordinarily get themselves heard

above the din of politics. Large circulations are no more an unmixed evil, when they are obtained by a definite *quid pro quo* in the shape of better services, than large sales of any other product of good quality sold at a lower cost because of the economies of large-scale production.

A Family Planning Survey

POPULAR attitudes to family planning have not secured enough attention so far though a few preliminary surveys have been made. It is arguable whether the stage has been reached when the issues arising out of the enforcement of curbs on population gorwth can be discussed on a practical plane without importing prejudices. In the short run, no firm decisions on population policy have been contemplated; it would be just enough to hope that the tempo of expansion of the Indian economy will prove equal to the problem posed by growing numbers in the country. In the longer perspective, however, the population problem will demand positive solutions and organized researches on the subject in different regions governed by varying demographic trends would have considerable value. The Gokhale Institute of Politics and Economics, Poona, has brought out the results of a fertility survey conducted under its direction in three districts of Bombay State. Data yielded by the enquiries in respect of two districts—Nasik and Kolaba—have been compiled together in view of their comparability, derived from the simultaneous conduct of investigations there. The conclusions suggested by them are instructive, and reveal the prevailing attitudes to birth control in a limited context.

This intensive research in a restricted area touches upon various complex aspects of fertility trends, but most interesting are the data on the extent of the penetration of knowledge of contraceptives. In rural Nasik, male heads of families conversant with the subject were totally non-existent, while in rural Kolaba the percentage was insignificant with the exception of one village, where the percentage was as high as 10.2 and where the predominance of Brahmin population explained this high ratio. In the urban areas, though it rose to nearly 25.7 per cent in one town only, it ranged below 14.2 per cent in the rest. Among women, the ratio of persons with knowledge on the subject varied between 5.5 per cent and 3.6 per cent in the urban areas, while in rural areas it was non-existent but for a nominal percentage of 0.6 in one district. A major fact recorded in these samples is the virtual absence of knowledge among the agricultural classes. The correlation between this type of knowledge and education is established by the high rate of higher castes among those informed. Knowledge was confined to heads of families below 40 years of age as a rule. It is not clear what type of clinical facilities were accessible, but the environment in which knowledge seems to have been acquired would also reflect on the quality of knowledge. On this factor, however, data were not expected to be procured.

The actual practice of contraception should provide a measure of the magnitude of the time element that would perforce be required in achieving the aim of popular spread of birth control by positive devices. In rural Kolaba, among the male heads of families, 0.5 per cent took to actual contraception. In the urban areas, the ratio varied between 2.2 per cent and 4.1 per cent. The age composition of actual practitioners of birth control disclosed 40 as the point at which a majority of the males were drawn, although in the case of urban Kolaba it was lower at 35. It is not in the least surprising that the practice of birth control, in so far as the number of persons interviewed belonged to the female sex, was conspicuous by its virtual absence in the villages selected for the survey. In urban centres it varied between 1.7 per cent and 2.1 per cent among the sampled families. The very restricted coverage of the urban samples is indicated by the number of females questioned—536 in Nasik and 668 in Kolaba. The age composition of this category, which reflects majority preference for contraception from 37 years upwards, gives clear indication that there is little inclination to resort to birth control during the vital part of the reproductive period.

The analysis of data on persons who were uninformed on contraceptives proceeds to make certain sub-classifications of this broad category. The confusion in the minds of persons interviewed about the precise nature of contraception, coupled with a confirmed prejudice that identified contraception with induced abortion, carrying the stigma of immorality, detracts from the value of its conclusions. Interviewers apparently had their own handicaps. The proportion of those who were not sure in their minds whether or not they were informed on the subject is not negligible. No firm correlation is established between increasing number of children and the desire to acquire knowledge of contraception as an essential preliminary to its practice for family limitation.

Whereas the propensity to limit the size of the family with the addition of number of children was noticeable in Nasik district, it was not in evidence in Kolaba. But an outstanding fact observed in both the districts was a pronounced desire for contraception with the increase in the number of sons. Closer questioning disclosed that classification of uninformed males according to income showed a striking interest in contraception with increase in income. The age composition of males indicates, as is to be expected reasonably, that interest in contraception was increasing relatively fast in the younger generation in the urban areas.

This brief examination of the results yielded by this survey has, perhaps, tended to emphasize the limitations on the nature of conclusions to be deduced, but it errs on the safe side. The sponsors of the survey do not lay claim to have unearthed propositions of general validity from a survey of 10 villages and 4 towns and cities in 2 districts out of a total of 330 districts in the Indian Union. The spread of contraception at the present time to just a fringe of the urban section of population is patent from the information gathered. But the important aspect of the fruits of this research is the promise which the prospect of progressive spread of population control holds in the younger generation.

THE WEEK'S NOTES

GENERAL ELECTIONS IN CAMBODIA

GENERAL ELECTIONS to finalise the political settlement in Cambodia, as envisaged in the Indo-China Truce Agreement signed in Geneva a little more than a year ago, are scheduled to take place on September 11, 1955, in accordance with the present Constitution which has been in force since 1947. These elections, originally fixed for April 17 last, were postponed until now because of the developments which led to the renunciation of the throne by King Norodom Sihanouk, in order to lead the country to democracy. The International Commission for Supervision and Control in Cambodia has no direct concern with the conduct of the elections. It has, however, to safeguard the rights of the former members of the Khmer Resistance Forces (which had once taken up arms against the Cambodian Government) and satisfy itself that the secrecy of the ballot box is guarded. In pursuance of its commitments at Geneva, the Government of Cambodia has, since the armistice, announced general amnesty and taken measures for the integration and absorption of the liberated prisoners-of-war and civil internees and the demobilised personnel of the Khmer Resistance Forces into the national community to enable them to participate in the elections either as voters or as candidates. All arrangements have since been completed for elections to the 91-member National Assembly (Lower House of Parliament), which will be held on the basis of direct universal suffrage. The electorate is barely 890,000 as against a total population of over 3 millions.

Meanwhile, the Government of Cambodia has been greatly worried by what it considers to be very tendentious criticism about the receipt of military aid from the U.S.A. It has made it clear that no military alliance is contemplated by Cambodia or a cession of bases or military instructors. The aid is only a continuation of the assistance previously received through France, revised in the light of subsequent conditions. The International Commission has also examined these provisions and after hearing the protest of the Viet-Minh to the effect that it violated the Geneva Agreement, agreed to accept the assurances given by Cambodia that she will scrupulously and always respect the terms of the Geneva Agreement and follow a policy of neutrality. That settles the issue for the present.

OBITER DICTA IN THE BANK AWARD

IN HIS award on the Bank Employees' dispute, Mr. Justice Gajendragadkar has made some observations on the propriety of the Government's modification of the Appellate Tribunal's award, which raises some general issues. It is conceded that Government was fully justified in creating Area 4 and in making consequential changes and in the exemptions granted to some C class banks. The Judge has, however, expressed the view that the Government was not justified in interfering with the Labour Appellate Tribunal's decision in respect of A and B class banks. There were, he says, "infirmities in the approach adopted by Government." The observations in this respect are as follows:

"The limits thus imposed by Section 15 necessarily postulate that Government would not be entitled to interfere with the award even if they thought that the award is not as sound as it should have been or is otherwise capable of improvement in material particulars. The fact that an award is defective and can be easily improved upon would, in my opinion, not be a sufficient justification for interference by Government under Section 15. The defect or infirmity of the award which can justify the interference of Government must, in every case, amount to grounds which are in the nature of public grounds. In other words, the fact that Government, or in fact another judicial officer, might, on the merits, have taken a different line and might have different provisions would not always or necessarily constitute public grounds."

It has also been pointed out that the statutory life of an award is 3 years and that the appropriate Government has the power of limiting it to a shorter period both of which limit the period of any mischief arising out of an award. It follows, according to the Commission, that the public grounds against implementation must exist immediately after an award is given and not be based on real or hypothetical long-term considerations. In this particular case the modified decision of Government relates only to dearness allowance; was it really necessary, asks the Commission, to exercise the powers of interference under Section 15 in such case?

The short answer to this rather subtle argument would be that in such cases the Government alone must be the ultimate judge of public grounds—just as the judiciary has long ago conceded that "reasonable cause" in cases of detention cannot be judged by courts except when they are mala fide. The Government may be wrong in exercising the discretion vested in it by the law; but, it is the essence of any discretionary authority that it should permit even wrong decisions. Secondly, this interpretation of Section 15 would introduce a highly legalistic concept in a matter which is largely governed by considerations of social policy, which is the raison d'etre for the power of intervention vested in Government in the Industrial Disputes Act. It is conceivable that the intervention in some cases may be in favour of employees and it is difficult to prove that labour trouble was certain immediately after.

PROGRESS ON THE COMPANIES BILL

THE PROGRESS on the consideration of the clauses of the Company Bill which commenced last week has so far exceeded expectations. The Lok Sabha passed 144 clauses of the Bill in three days last week, and considering the lack of constructive criticism within the House, this was only to be expected. At one stage, a junior Minister went so far as to suggest that any issue decided by the Joint Select Committee was not worth pursuing in the House and though it received a fitting rebuke from the Chair, it reveals an attitude which is very undesirable.

Mr. Tulsidas Kilachand and Mr. G. D. Somani do not have a pleasant task facing them in having to fight at every stage for some sense of realism in reform in a generally hostile milieu. Mr. Kilachand's pleading for not including "relatives" within the scope of associates has fallen on deaf ears even though he pointed out that it would be inappropriate to many situations. There was nothing particularly objectionable to the relatives being appointed to positions, if it is not objectionable in Government service, where there have been numerous instances of such appointments with, or without the approval of the Public Service Commission. The question is whether anyone should be placed under a disability in respect of a vocation or position merely because of such relationship, and though Mr. Kilachand's extensive citation of constitutional points did not provide direct support, there can be no doubt that a very uncompromising attitude has been taken in this matter.

This process will go on just as before. It is only in respect of Clause 197 that any modification was at all expected though not a substantial one. But the discussion in the House this week revealed opposition even to reasonable modifications, which has vexed even some of the sympathisers of the reformers.

COLLECTIVE BARGAINING FOR WORKING JOURNALISTS

DR. KESKAR'S reply to the debate on the Press Commission's Report did not disappoint the working journalists who have been anxious all along to know Government's approach to the recommendations regarding their conditions of service. The Minister at first made it clear that there was no award to be implemented ipso facto; and this clarification can only have reference to the demands of press employees. They have already been given the benefit of the Industrial Disputes Act in response to the demand for trade union rights and among the trade unionist sections among newspapermen, there has been satisfaction over the grant of this privilege. Dr. Keskar reiterated last week that working journalists should work under proper conditions and should have a fair deal. But he emphasised that for the working journalists to be given the powers and the rights of workmen, the details of ameliorating their conditions should be worked out not purely by statute but also by themselves, through collective bargaining.

Dr. Keskar was on strong ground in saying so because the details of the working conditions cannot be left either to statute without making everything very rigid or to mediation by Government which would naturally involve many embarrassments. The working journalists have now to think of the implications of collective bargaining. Dr. Keskar was somewhat cryptic when he said, "A number of things will have to be done by them and I am sure they will do it; there is no need to encourage them to do it." Legislative action—the Services of the Working Journalists Act which has been promised—is intended only as a basic action which will give the greater bargaining power on working conditions. It is likely that this may not be well appreciated by those who are not quite confident of their bargaining capacity but it would not have been expedient for Government to do more.

BHAKRA-NANGAL POWER POTENTIAL

ACCORDING TO a press note, there is no change in th power potential of the Bhakra-Nangal Project due to any over-estimate as reported in certain sections of the press. No alterations will, therefore, be made in the power to be given to Delhi, or the Fertilizer Plant, or any other consumer benefiting from the project. It is also reported that the committee of engineers connected with the project which went into the question of phasing the installation of power units last week, recommended that along with the two additional units one each at the two Nangal power houses, five power units should initially be set up at the Bhakra main dam. These are to be followed up later with the installation of another four units as the demand develops. This scheme is in accordance with the proposals of the project authorities. The only difference in the recommendations of the committee and in the original proposals of 1949 is said to be the reduction in the number of units at Bhakra dam from ten to nine, with provision for a block-out for the tenth penstock to meet future requirements. The capacity of the units in both cases remains between 90,000 kw./53,000 kw. for high and low heads respectively. The reduction of one unit has been made possible on account of the Fertilizer Factory load which will operate at 100 per cent load factor as against 60 per cent load factor for the rest of the system.

This change has retained the full output of firm power from the Bhakra-Nangal project, i.e., 3,65,000 kw. at 100 per cent load factor or 6,20,000 kw. at 60 per cent load factor, as originally contemplated, though the installed capacity will be 9,54,000 kw. against 10,44,000 kw. as planned earlier. While there will be no change in the total energy output, this reduction of one unit will effect a saving of about Rs. 2½ crores in the capital cost. Even under the recommendations of the committee, the position of Delhi has been fully safeguarded and provision has been made for meeting the entire load demand from 1960 onwards to 1975, up to which year load forecast has been made. Even after 1975, the Bhakra project will be in a position to meet a substantial part of the future load demand in Delhi as sufficient excess power will still be available. The estimate of firm power as now recommended by the committee is based on the available water supply in the linked system of utilisation of supplies in the Punjab rivers. This arrangement does not in any way affect Rajasthan and PEPSU adversely and no extra cost is involved.

These are categorical assurances which cannot be intended merely to cover up the defects of over-ambitious planning for power, if there had been such planning at all before. These will be put to proof soon when those now assured start asking for the power, in addition to the needs of manufacture of heavy water which will necessarily take priority over other demands.

TAXES ON TRANSMISSION OF BOOKS?

A COMMITTEE to review the question of transmission of printed books by inland post has been set up by the Government of India, under the chairmanship of Mr. C. V. Cunningham,, Senior Deputy Director-General of Posts and Telegraphs. Under its terms of reference, the Committee will recommend to Government the rates of postage to be prescribed for transmission of books in the inland post, suggest a suitable definition of 'books' for the purpose of their being eligible for transmission at the rates recommended by the Committee, specify the various conditions under which articles classified as 'books' may be transmitted by post, and suggest effective safeguards against possible abuse of the proposed system.

An enquiry into this subject has been overdue, because the present rates of registration for book packets are so prohibitive that they penalise the publisher and the consumer—especially the smaller ones—alike. These rates constitute an important, though undesirable, tax on knowledge and it has been found that for cheaper books the transmission costs can be often as much as the price of the book. In a country in which publications, especially of textbooks, have to be concentrated in a few areas but distributed over large areas by post, high postage rates are a hindrance to dissemination of information. The question is whether concessions, if introduced, would become liable to abuse. The subject is not an easy one and the Committee should not overlook the fact that any tariff it devises should be easy to administer in all post offices.

THE CHANGEOVER IN THE PUNJAB

THE MANNER in which the Punjab is going to change over from English and Urdu to Hind and Punjabi in the predominantly Hindi and Punjabi speaking areas, while some areas remain bilingual may appear to be somewhat confusing. The changeover, to be effected after four years, is proposed to be introduced at and below the district level in the initial stage. In other spheres, such as the courts, the secretariat and the legislature, the Government has not come to any definite conclusions so far. Explaining the reasons that led to the move, the State Chief Minister has stated that the decision was based on a Congress Working Committee resolution and was taken as far back as 1949. The hope has been expressed by the State Government that the move would bring the people in the different parts of the State, speaking different languages, nearer and closer to each other. The reason for resurrecting this 1949 formula is linked in the public mind to the recent Akali agitation and the question is whether this would prove a good 'via media' at the present time.

A Window on the World

MR. MORARJI DESAI ON PUBLIC RELATIONS

BY

ODYSSEUS

MR. MORARJI DESAI, Chief Minister of Bombay, according to press reports has told the publicity officers of his state, assembled in conference the other day, that truth and fearlessness should be their guiding principles.

This seems to me as though a manufacturer of bicycles, or a film producer, were to tell their advertising managers to make no unjustifiable claims in their sales promotion of bicycles or of films. Surely the advertising managers would reply: "Your exhortation is admirable. It makes the technicalities of our task easier. It enables us to put our hearts into our jobs with clear consciences. But in order to carry out your wishes you must tell us the truth about your products. We must know not only the good points about your bicycles—their average expectation of life under reasonable treatment, and in what ways they are superior to your competitors—but we must also know their bad points—how, e.g., do their chains compare with those of foreign manufacture?" And the film advertising manager might ask: "To what audiences does your film appeal? Should we advertise it as emotionally and intellectually in the class of Tulsi Das and of Shakespeare? Or is it full of crude sex and violence? What would a conscientious parent think of it? Or a school teacher?"

Mr. Morarji Desai suffers from an illusion that is widespread not only among politicians but among too many industrialists and business men, namely, that you ought to be able to sell any governmental policy, or any industrial product, if your publicity is good, and contrariwise if your policy meets with general criticism or your product is not selling as much as you would like it to, this must be because your publicity men are falling down on their jobs.

In point of fact, a public relations officer, or an advertising manager, is only a technician who can exploit what is capable of being exploited in your policy or your products. He cannot eliminate the weak points that most policies and products cannot avoid in this imperfect world. If you manufacture a face powder that eventually causes a skin irritation, no amount of advertising can alter this fact or prevent the public from finding it out and comparing your product to the advantage of its competitors. Likewise, if your political party makes promises to the electors which are not fulfilled, or persists in policies which arouse antagonism, sooner or later the electors will vote your Opposition into office.

A few people in politics, who have a better grasp of these matters than the majority, have no difficulty in following the argument up to this point, but they fail to see that government's policy is only one half of its public relations problem. They think that to formulate an honest policy, sincerely held to be in the interests of the country, is enough, and that once this has been done the policy will sell itself and turn everyone into convinced supporters of the party in office. This is the familiar Socialist fallacy that the price at which a commodity sells equals the cost of labour that went into its making. "Would that it were!" groans the business man, for such a world would be a business man's paradise: Whatever money he put into a commodity he would be sure to get back. Unfortunately besides the Supply problems involved in formulating, or manufacturing, and advertising, a policy or a commodity, there is also the Demand side —the climate of public opinion, made up of a thousand factors of history, experience, custom, tastes and fashions that never cease to change.

UNPREDICTABLE CHANGES

Some of these factors are difficult or impossible to predict. Ten years ago when the price of coke for heating boilers for domestic hot water was Rs. 40 per ton in Britain, manufacturers of boilers heated by diesel oil, which cost much more than coke, found sales slow; they had to base their advertising policy not on cheapness but on convenience and cleanliness. Today when coke is selling in Britain at Rs. 112 per ton and oil is cheaper, manufacturers of diesel boilers' policy has changed and they emphasise not cleanliness but cheapness.

Likewise, one has only to recall the pronouncement made by Mr. John Foster Dulles, the U.S. Secretary of State, on January 12, 1954, when he announced a "new look" for American strategy, which would thereafter rely on America's "great capacity to retaliate instantly" on Communist forces in South-East Asia "by means and at places of our own choosing" and to compare it with the cautiously friendly noises that Mr. Dulles is currently making in China's direction, to realise how extraordinarily (1) official policy and (2) a national public opinion, can be modified within a relatively short period. Nobody in 1954, when Mr. Dulles was thundering threats around the globe, bullying France, hectoring Britain, roaring at the Soviets, and ignoring India, could have foreseen the recent "Summit" talks between Sir Anthony Eden, Marshal Bulganin, and President Eisenhower, still less the recent direct Sino-American talks on the exchange of prisoners and on Formosa (although I modestly recall that by the beginning of this year faithful readers of this column found me foreshadowing these possibilities. See the series that began with the article "One World" on January 14, 1955).

What has brought these and other changes about have not been the efforts, however honest and fearless, of the public relations officers of India, Britain, or the USA, but modifications of policy suggested by experience, by observing the reactions, and inter-action, of the various national public opinions to the current (and always evolving) policies of India, Britain, and the USA, and by the lessons of events, such as the Soviet realisation that they can no longer afford the cost of remaining armed on the scale that they had been maintaining since the outbreak of peace in 1945 if they hope to improve the standard of living of their people, and the realisation that the maintenance of Stalin's immense armies have much less sense in this atomic age, when it is not sheer numbers so much as the efficient use of atomic weapons that must henceforth count. Atomics have changed everyone's view of strategy, as witness for example the cheerful British withdrawal from the Suez Canal base. ("Utterly obsolete", the British War Minister declared on July 29, 1954).

SOVIETS LOSING DISARMAMENTS RACE

I cannot resist the temptation to open a parenthesis here in order to place on record the actual figures of Soviet and Anglo-American post-war disarmament which the enthusiastic followers of the "Hats off to Russia!" movement overlook. The present reduction of the Soviet forces by 640,000 leaves them with 4,100,000 under arms, as against 803,000 armed British and 2,949,000 Americans. In other words with a total of 3,751,000 men, the British and the Americans still have approximately 350,000 fewer than the Soviets. Moscow ended the war with 10,000,000 men under arms and reduced them to 4,000,000 by 1948, whereafter they raised them to 4,750,000 by May, 1954. American armed forces have already been reduced by more than 750,000 since the Korean war peak-strength of 3,700,000, and a further 90,000 Americans are to be disbanded in 1956. The British post-Korean reduction was 70,000, with another 35,000 to come off in 1956. Together these cuts exceed those recently annnouced by the USSR by some 350,000. If there is any Disarmaments race, the Soviets are not winning it.

I return to Mr. Morarji Desai to agree that fearlessness is a virtue that should be encouraged in public relations officers. No one is in a better position to appreciate the popularity or the hostility that official policy arouses, and while it is easy to tell the Minister when public opinion supports him, it requires courage of a high order in an officer who is usually ill-paid and who does not usually belong to the permanent civil service but works on a contract terminable by a few months' notice, to tell his Minister that opinion is critical of, or resistant to, his policy, and it is usually the last thing that a Minister expects to hear from his public relations officer. On the contrary, the Minister normally takes the view that criticism continues only because his public relations officer does not know his job.

In a nutshell, as I see it, it is not the duty of a public relations officer, or of an advertising manager, to formulate policy but to publicise the policy laid down for him, simultaneously reporting where this policy is favourably received and on what points it encounters hostility or sales resistance. Whether the government (or the industrial concern) sees fit to change its policy to exploit the favourable points more intensively, or to modify the points that arouse resistance, is a decision to be taken not at PRO level but at the highest level.

Finally, I heartily applaud Mr. Morarji Desai's conversion to the sound view that PRO's should not discriminate between friendly and critical newspapers or correspondents in providing news facilities. This is the beginning of wisdom in public relations, because obviously if you refuse to talk to a critic, you have no hope of modifying his views. Mr. Desai seems to have come a long way since he placed a martyr's crown on Mr. Frank Moraes' handsome editorial head (See this column, March 27, 1953) by refusing official advertisements to the "Times of India" because it was allegedly critical of the government.

Bharat Fire & General Insurance Ltd.

NOTCE is hereby given that the Board of Directors have decided to cease transacting Insurance business of all clauses with effect from 1st September, 1955. During the intervening period no one except the undersigned is allowed to cover any risk on behalf of the Company

By order of the Board,

L. N. MODI,
Director and General Attorney.

A DELHI DIARY

ADJOURNMENT FOR REGROUPING?

IT has been heavy going on the Companies Bill. On Wednesday this week there was a virtual stalemate on Clause 197. This was generally considered a coming battle line; it is known that forces were being arranged for the fray. One wonders, however, whether with so much attention given to the change in this clause, politicians are aware that the existing law allows remuneration of 15 per cent of net profits of a Company. The new clause cuts this down to 11 per cent of net profits, or, when there is no profit or no adequate profit, to a sum not exceeding Rs. 50,000 per annum. When the exchanges showed that the Finance Minister's steady trench warfare was not making much headway Mr. N. V. Gadgil—more recently in a conciliatory mood—suggested the adjournment of the discussion to the time when other clauses relating to managerial remuneration were taken up. This has reminded me of the sound advice of a skilful remark in one of Bernard Shaw's plays in which a retired administrator proclaims that the highest secret of administration when councils were divided is to be found in an adjournment. This was a concession, although the Finance Minister made it clear that the clause was being held over for convenience of discussion and he was contemplating no substantial changes in it.

Almost the only comment I shall make on the mass of confusion that exists on the problem of what is involved in establishing and running a Corporation was Mr. Sadhan Gupta's suggestion that the lower limit of Rs. 50,000 was "fabulous". Seeing that this might cover the remuneration of two or three Managing Directors what this implies is that the salary of Rs. 1,500 to Rs. 2,000 per month might be "fabulous". If this is "fabulous" so is the salary of every Minister of the Central Government. Perhaps I should give Mr. Sadhan Gupta credit for consistency. He would certainly answer in the same terms. What is less understandable is that members of the Congress Party while being quite ready to support existing salaries of Ministers—Hope springs eternal in the human breast!—fail completely to appreciate the point that salaries in business cannot be lower. Business men do not enjoy the prestige and the delight in the exercise of power which must be considered a highly valuable "perquisite" in a Minister's hands. They should, it seems, have more money by way of compensation.

AND THE USSR

Not a little interest in the discussion attached to salaries in the USSR. The Finance Minister replying to the debate said that "members of the Opposition are very careful on these occasions to forget what is paid to top managing directors in countries like the USSR or in countries in Eastern Europe. Their salaries were 10,000 to 15,000 roubles per month." Mr. K. K. Basu whose information on USSR struck me as being surprisingly quick, if not entirely accurate, said "The minimum wage there is 1,000 roubles". The Finance Minister proved himself fully equal to the occasion. He corrected Mr. Basu in one sentence and struck him with another. He said "I am aware that the wages of the labourer there are, perhaps 800 to 1,000 roubles", thus indicating that Mr. Basu's minimum figure was an error. He then went on to say that after everything has been said, 15,000 roubles is 15,000 roubles. There was laughter, and, this time, no dissenting voice.

LOUISIANA PURCHASE?

There has been interest in Delhi on a statement issued by Sir Mirza Ismail on Hyderabad's negotiations with Portugal for the purchase of Goa some years ago. Sir Mirza, who was President of Nizam's Council, said in a letter to "The Times" in London that in 1947 at that time he had made an informal approach to the Portuguese Government through British friends, suggesting that since Goa could not long remain in Portuguese hands it might be transferred to Hyderabad State for an "agreed" payment. At that time Portugal was not willing to transfer sovereignty but was prepared to associate Hyderabad in the administration of the port of Marmagoa. Sir Mirza takes the line that this furnishes ground for believing that "with mutual understanding and patience things might gradually come right". There are a few, but very few, people in Delhi who think that the possibility of negotiations is not entirely removed. I sometimes wonder whether there is a point in Sir Mirza's suggestion on joint administration of an area. I suppose the Portuguese like most distinguished Orientals (particularly the Chinese and ourselves) have some "face" to save on occasions such as these. They have protested too much about their sovereignty to suddenly back down without serious political repercussions. Would not a specific proposal of a joint administration of Goa at the present time be a convenient stepping stone to what is called the softening of defence on both sides?

I ask the question without knowing much about the dangers. I know that if the Government of India makes this suggestion of itself there will be a great howl from the Opposition parties. It seems to me obvious that this is a suggestion which cannot itself also come from Portugal for the same reason. Can the suggestion come in an authoritative form from nobody else? Since I am notoriously indiscreet, may I say that there can be no bar to the United States' making its leadership in the West effective in devising some sort of solution for this problem? After all, it is now freely admitted that India has been an effective go-between in the case of China and the United States. It is likely that the United States' good offices in the Goa case would receive appreciation from everyone except the Communists. Or am I mistaken? Would the United States interest in Goa read as interest in holding a possible base in Western hands for some longer time? The more one reads about foreign policy the more hesitant one becomes in describing what is described as the "popular" view. The popular view in India on the solution of Goa is—what? And is there a "popular" view in Goa about India? Who then will pull the chestnuts out of the fire?

ARGUS.

In the Valley of Decision

ON PONDERING OVER THE PLAN-FRAME

JUST when the dust kicked up by the controversy over the Mahalanobis Plan-frame looked like settling down, a fresh bout of debate is likely to get started on Mr. Nanda's latest note to the A.-I.C.C. members, who are due to meet on Saturday next. Throughout this long note there runs a pink thread of pessimism, revealing a mood of caution which borders on scepticism. Why should our planners thus alternate between moods of great optimism and of deep doubt, even within short periods? Mr. Nanda's note certainly reflects the current mood in the Capital of a certain helplessness in fulfilling the high expectations raised earlier. The Planning Commission has been engaged in recent weeks in trimming State Plans which have grown rather wildly by being fed on earlier promises. Since the Finance Minister's speech of December 21, 1954, finance was regarded as a secondary consideration in the great task of creating 11 million jobs. The first streak of doubt crept in only at the meeting of the Standing Committee of the National Development Council in July, when it was promptly settled by the Prime Minister's determination to seek abnormal, methods of raising finance. A declaration is one thing, but confronted by State Plans prepared in response to the directives of the Planning Commission, the latter has been at a loss for adequate reasons for the drastic scaling down which it had to enforce, and for the extra efforts in taxation which it has demanded of the States. If echoes are heard in the A.-I.C.C. to these decisions, the Minister for Planning, who alone has to interpret the party to the Commission and vice versa, has prepared the ground for providing ready answers.

But Mr. Nanda's note is no mere apologia for the planning body. He could not have overlooked that the effect of the document would be to act as a brake on the bold assumptions made earlier about the rates of progress assumed for the next Plan. Eleven million jobs was of course a rash promise, as all except the faithful knew. The vision of employment was nourished on the illusion that hand industries and domestic manufactures, created immediately and maintained just for the transition period of about ten years and no more—till modernised manufacture could take their place—would give the jobs and mop up inflation by creating consumer goods. Mr. Nanda points out that it would be a mistake to look upon these industries as a temporary expedient, since even short-term results cannot then be expected to follow. The thick-and-thin apologists of hand industries will now find criticism emanating from a quarter which they cannot malign as inspired by vested interests. That is some gain. Mr. Nanda emphasises the low levels of technique, poor organisation, high cost, low returns and the marketing difficulties. And unlike Prof. Mahalanobis, he fails to see the magic wand which would wave away all these difficulties and usher in just one decade of prosperous and obliging handicrafts. Like most men on terra firma, Mr. Nanda refuses to view such industries as a cure for unemployment or of inflation; he only sees them as an integral part of a stable and continuing economic structure.

Indeed, the keynote of Mr. Nanda's thesis is a plea for balance in planning, even though it tends to border on querulousness about the rate of progress, which he thinks may fall below the rate of 5 per cent per annum assumed earlier. The grounds for this fear are not quite convincing. The rate in the first four years of the Plan, it is said, only worked out to about 3 per cent, even when natural factors became suddenly favourable. So, without the prospect of the seasons becoming still more favourable, with possible shortfalls in resources for investment in the public sector and with the investment being high in proportion to output (in heavy industry, railways, etc.)—it has been readily assumed that the increase of national income would also be low, at any rate not as high as 5 per cent. This is an assumption which gives too much finality to current calculations of investment-output ratios—when it is well known that ratios can be altered considerably by right choices in methods of investment. There is no finality about external assistance and deficit financing being limited to Rs. 1,000 crores; and raising additional taxation of the order of Rs. 800 crores may be politically difficult with general elections round the corner, but much might depend on the financing techniques in the earlier years.

It is rather interesting to note that amidst the doubts about resources, investment and ratios, the figure of Rs. 4,300 crores still stands firm and unshakable. The demands of the States and Central Ministries, which amount to over Rs. 10,000 crores, have to be cut by half; and in the process, the Planning Commission has cut a sorry figure. Everyone else professes to be a bolder planner than the Commission has shown itself to be, ever since planning became a public pastime, in which the desire to excel in outlays became keen. In the private sector, too, there has been both optimism and pessimism. The Federation of Indian Chambers of Commerce and Industry has recently been giving itself a sound pat on the back for its intrepidity and for having thought of a total investment of Rs. 7,200 crores (against the Plan-frame figure of Rs. 5,600 crores). On the other hand, Mr. G. D. Birla, (like Mr. Nanda now) has warned against indulgence in such excessive optimism.

From the controversial cauldron, there is expected, in the end, to emerge a more balanced plan—balancing not only between resources and investment but also between the short and the long term, between welfare and sacrifice, and between one region and another. But the gain in balance would not be worth while if there is to be decline in enthusiasm. By all means, let there be no starry-eyed planning, but there need be no cold douche either, on the optimism over the pace of expansion of the economy. Transport, especially railways, and communications, will make large claims on the investment in the public sector and the heavy industrial projects on the balance left. But there is no inevitability, for example, about the development of coal in the public sector, when the private sector is now willing and competent to undertake it under conditions which are consistent with national interest. If the planners can trim such ideological trappings of the investment plan in the public sector—just as they are trimming the State Plans, there is no reason why they should not be able to show better results with available resources.

Mr. Nanda recognises that socialism elsewhere has tended towards concentration of power and resources in the State, reducing the area of freedom and local initiative. Mr. Nanda's note is a bold new essay on the question of means in relation to ends. In the midst of its acceptance of the conventional notions of the public sector, controls, welfare and the socialist pattern, a more practical approach is now visible. And as it takes shape, the Plan-frame which has already undergone change, may evolve into something as non-controversial as the first Five-Year Plan.

WORLDGRAM

AGRICULTURE

Food Production in NEFA: By the end of the second Five-Year Plan it is intended to make the North-East Frontier Agency self-sufficient in food. The Agency is at present deficit in food, which has to be imported into the interior areas for public sale mostly by air and at great cost. A batch of 30 tribal young men has begun a two-and-a-half month training course in improved methods of agriculture at the Agricultural Institute at Pasighat in Siang Frontier Division of North-East Frontier Agency. This course is expected to give the tribal people sufficient background to enable them to play an effective role in the plans of the administration to increase food production in the Agency. After completion of the course they will be employed as agricultural workers.

*

Cotton Production in 1953-54: India recorded a great stride in cotton production in 1953-54 and was well on the way to attaining self sufficiency in regard to her requirements of cotton of less than 1-1/16" in staple, says the annual report of the Indian Central Cotton Committee for the year ending August 31, 1954. The report adds that the area under cotton in 1953-54 was 17.0 million acres against 15.7 million acres (revised) in the previous year. On the basis of the official estimates, the production of cotton in the country during the year under report was 39.4 lakh bales of 392 lbs. each against 31.3 lakh bales (revised) in the previous year.

*

Conservation of Forest Resources: Two Himachal Pradesh Bills—the Private Forests Bill, 1954, and the Consolidation of Holdings (Amendment) Bill, 1955, have received the President's assent. The object of the first Bill is to help conserve forest resources of the State by providing for management of forests belonging to private owners in accordance with a working plan prepared by the State's forest department. When the owner fails or refuses to do so, the management of the forests would be taken over by the forest officers and the profits of the forests paid to the owners after deduction of 10 per cent. This Bill also provides for plantation of trees on waste lands.

*

Grain Crop in America: It is reported, total farm output in America this year would be the largest on record, and crops might match the 1948 record. The wheat crop is estimated at 911 million bushels and the maize crop at 3,478 million bushels. The July 1 wheat estimate was 860 million bushels. The maize estimate a month ago was 3,450 million bushels. Last year there was a drop in the estimate from 3,311 million bushels at July 1 to 2,824 million bushels at August 1 and the actual harvest turned out to be 2,965 million bushels.

INDUSTRY

Manufacture of Musical Instruments: An institute to provide training in the manufacture of Indian musical instruments is to be set up in Madras by the All-India Handicrafts Board. A pilot scheme for the establishment of the institute has been approved by the Executive Committee of the Board. The Institute will offer a course in musical instrument making on scientific lines so that instruments of standard quality could be supplied to the public. A selected number of students, who possess some knowledge of music as well as a taste for the study of musical instrument making will be taught the art of making musical instruments.

Output of Iron Ore in June 1955: The estimated total output of iron ore mines in India decreased to 313,700 tons in June, 1955, from 378,835 tons in May, according to official statistics released by the Chief Inspector of Mines in India. Returns received from 71 mines for the month of June show despatches totalling 236,174 tons to the iron and steel plants and 54,377 tons to the export market. The reported stocks at the end of the month amounted to 1,192,209 tons.

*

Filter Cloth for Sugar and Oil Industries: A draft Indian standard specification for filter cloth, grey, for sugar and oil industries has been prepared by the Indian Standards Institution. The draft covers general requirements such as quality of yarn and cloth and specific requirements for two varieties of filter cloth, such as ends per inch and picks per inch, weight per square yard warpway and weftway breaking strength, bursting strength, size content, length and width of cloth. References to relevant Indian standards for determining the values of characteristics given under the specific requirements have been mentioned in the draft.

*

Canadian Automobile Production: Canadian automobile production reached more than 58,000 vehicles in May, an increase of 4,000 over April, and 20,000 higher in May 1954. This was the third successive monthly increase, which more than counter balanced decreases in January and February. For the five-month period, the total was 225,000 nits, against 216,000 in 1954. Shipments also rose sharply in April after a three month decline, and at 67,000 were substantially higher than in April 1954.

*

New Fish-Drying Process: A new technique of fish processing which may prove of great value to the fishing industry, especially in tropical regions, has been developed by a Scottish firm. The process consists of vacuum-drying the fish to reduce it to a condition in which it can be conveniently packed for future use or transport. The completed product is a small block which, when placed in water for eight hours, becomes a slab of fish such as one might buy at a fishmonger's. The company, which has developed this process in its Aberdeen factory, believes that it will prove invaluable to the industry as a means of absorbing surplus catches of fish without incurring heavy cold-storage charges or suffering loss through deterioration.

TRADE

Trade Agreement with Indonesia: The Indo-Indonesian Trade Agreement has been further extended up to December 31, 1955 by an exchange of letters. The Trade Agreement between India and Indonesia which was originally signed on January 30, 1953 provides for the exchange of goods between the two countries subject to and within the scope of the general import and export regulations in force from time to time in each country.

*

Israel-Dutch Trade Agreement: The sixth trade agreement between Israel and the Netherlands was signed in Jerusalem recently. The new agreement provides for an exchange of goods between the two countries to a total value of 22,500,000 florins (approximately $6,000,000). The previous agreement was for an exchange of goods to the value of 17,000,000 florins ($4,500,000). The new agreement is for 12 months and is retrospectively valid as from May 1, 1955. It is

subject to automatic renewal. Israel's main purchases, as before, will be foodstuffs, eatable and industrial oil, chemicals, raw materials and machinery. She will export mainly citrus fruit and agricultural products, but increasing possibilities are opening for the export of tyres, fertilizers, glass and plywood.

*

China and Egypt Sign Cotton Contract: A contract, under which Egypt will sell to China 40,000 bales of cotton totalling over 13,000 tons has been signed in Cairo. The contract was signed after negotiations between the representatives of the China National Import and Export Corporation and the Cotton Commission of the Egyptian Government. In addition, the China National Import and Export Corporation has purchased 6,000 bales (2,000 tons) of cotton on the open market in Egypt.

*

Philippine's Foreign Trade: The foreign trade of the Philippines in the first quarter of 1955 was marked by relatively high imports and by exports below the usual seasonal high levels. When compared with the corresponding period of 1954, total imports rose by about $50 million while exports fell by about $15 million. The increase in imports resulted from the continuation of the liberal import policy first adopted by the Philippine Central Bank at mid-1954. The lag in exports is accounted for chiefly by delays in making shipments of sugar.

FINANCE

Customs and Excise Revenue for June 1955: The total gross sea and land customs revenue collected in the Indian Union during June, 1955 amounted to Rs. 1362 lakhs as compared with Rs. 1274 lakhs in the corresponding month of the previous year. Of the total customs revenue collections, import duties accounted for Rs. 1075 lakhs as against Rs. 1066 lakhs. Export duties for Rs. 277 lakhs as against Rs. 189 lakhs and land customs and miscellaneous for Rs. 12 lakhs as against Rs. 19 lakhs. The total gross collection of Union excise duties amounted to Rs. 1276 lakhs as compared with Rs. 777 lakhs.

*

Central Loans to the Shipping Companies: Rs. 215.42 lakhs have been given to shipping companies so far in 1955-56 for the purchase of ships outside India. Out of the total of Rs. 924.58 lakhs sanctioned during 1954-55, Rs. 496.42 lakhs had been drawn by the shipping companies so far. Seventeen ships had been purchased or ordered for purchase from abroad since April 1, 1954, with the aid of Government loans. Two ships each had been purchased from West Germany and Norway, one from Sweden and three from the United Kingdom. Orders for nine ships had been placed in West Germany.

*

Mysore Sales Tax Legislation: The President has assented to the Mysore Sales Tax (Amendment) Bill, 1955. The Bill extends the Mysore Sales Tax Act to Bellary district where a sales tax appelate tribunal is already functioning under the Madras General Sales Tax Act. The Bill also provides for the levy and collection of sales tax on sales effected by the State Government, and validates assessments and collections which have already been made under the earlier Act.

*

Grants for Rebate on Sales of Handloom Cloth: Grants of over Rs. 50 lakhs were sanctioned up to August 10, 1955 since the beginning of the year to various States for providing rebate on sales of handloom cloth. Madras gets Rs. 24 lakhs, while Andhra and Uttar Pradesh get Rs. 10 lakh each. Bihar gets Rs. 8 lakhs, Hyderabad Rs. 3 lakhs and Travancore-Cochin Rs. 2 lakhs. Other States which get grants less than one lakh include Assam, West Bengal, Orissa, Punjab, Madhya Bharat and Pondicherry.

*

Central Aid for Development of Village Industries: Further grants of about Rs. 10 lakhs and loans of nearly Rs. 6 lakhs have been sanctioned by the Government of India to the All-India Khadi and Village Industries Board and the States of the Punjab, Andhra and Mysore for the development of village industries. The Board has been given two loans of Rs. 4,75,000 and Rs. 15,000 and a grant of Rs. 3,75,000 for the development of the village leather industry. For establishing community production centres to develop village industries on an intensive basis, the Board gets a grant of Rs. 2,22,000 and a loan of Rs. 93,000. At the same time a sum of Rs. 1,50,000 has been sanctioned to the Board as grant for the development of the hand-pounded rice industry during the current financial year.

*

Excess Profits Tax Refunds: It was announced in 1951 that premature refunds of Excess Profits Tax deposits and part E.P.T. would be allowed for the purpose of being adjusted against income-tax demands outstanding before June 10, 1951. The Government of India have now decided to permit the issue of such premature refunds for the purpose of reducing tax liabilities which are outstanding out of the demands which had become due before June 1, 1953. Assessees who wish to apply for refunds in accordance with this decision may obtain necessary application forms from the Excess Profits Tax Officer concerned.

MISCELLANEOUS

Oil Refineries: Oil refineries throughout the world owned by British and associated Dutch interests had a total capacity, at the beginning of 1955, of 127,000,000 metric tons—an increase of about 8,500,000 tons on the comparable figure for 1954. British and Dutch-owned plant in the United Kingdom and Western Europe accounted for 44,000,000 tons out of a total of 111,000,000 tons. In Latin America, British and Dutch capacity totalled 28,000,000 tons out of 98,000,000 and in North America a further 28,500,000 tons. In the Middle East, British and Dutch interests owned some 13,000,000 tons, and in the Far East and Australia a further 14,000,000 tons. Announcing these facts, the Petroleum Information Bureau said in London on August 18 that only U.S. companies (with some 504,000,000 tons out of a world total of 820,000,000 tons) controlled a greater capacity. Russia and other countries of the Soviet bloc had refineries with an estimated capacity of 73,000,000 tons, and the refining capacity of all other countries totalled 116,000,000 tons.

*

Carp Hatchlings in Assam State: About 10 lakh carp hatchlings were obtained and reared for stocking the waters in Assam as a result of the assistance provided by the Fisheries Extension Unit of the Union Ministry of Food and Agriculture to the State Fisheries department of Assam during May and June this year. Hatchlings available for stocking in the previous year were about 8,000 only. The Unit provided technical help regarding the collection and hatching of carp eggs and rearing of fry. Operations were carried out at Nazira and Joysagar in upper Assam. The "Behundi" net generally used in Bengal, Bihar and Orissa, was suitably modified for use from adjustable bamboo scaffoldings erected along the steep banks of the river Dikhav in swift currents and rapidly changing water levels.

NEWS IN BRIEF

INDIAN

Under the second Five-Year Plan, the Delhi Road Transport Authority contemplates the purchase of a fleet of 400 buses for urban routes. Nationalisation of all suburban service is planned. Nearly 140 buses will be purchased this year.

*

Three ships now being built in Germany for the Scindia Steam Navigation Company are to be provided with British radio communication and navigational aid equipment.

*

The Government of India have decided to release quotas for export from the States of Madras, Andhra, Bombay, Bihar, Saurashtra, Punjab, Mysore and Hyderabad.

*

There are at present 32 Central Research Institutes and Laboratories engaged on agricultural research. The total expenditure incurred on them in 1954-55 was Rs. 144,41,352. The Central Government's contribution to these institutions amounted to Rs. 126,14,989 during that period.

*

It is reported a sum of Rs. 18.23 crores approximately has actually been sanctioned as loans to Indian shipping companies for the purchase of ships.

*

Provisional ceilings of Rs. 3.5 lakhs and Rs. 15 lakhs had been fixed for the current year for the schemes for removal of untouchability and the welfare of scheduled tribes and development of scheduled areas respectively for Madhya Bharat.

*

The production of razor blades in the country during the first quarter of 1955 totalled 59.2 million as against 48.8 million in the last quarter of 1954.

*

The Government of India have offered to award in 1956-57 five scholarships to candidates who by birth or domicile are natives of Part C States or of Andamans and Nicobar Islands.

*

The Hindustan Shipyard increased its turnover in 1954-55 by about 90 per cent as compared with the previous year. The total turnover during the year was Rs. 2.1 crores as against Rs. 1.16 crores in 1953-54.

*

At the beginning of this year 1,543 Indians were employed in technical posts in 1,208 foreign owned or controlled firms in India in the salary group of Rs. 1,000 and above per month as against 2,799 non Indians. In other posts in the same salary group, 2,324 Indians were employed as compared with 3,751 non-Indians in those firms.

*

The potential capacity of indigenous production of goods wagons in the 1956-57 rolling stock programme is between 15,000 and 16,000. At present eight firms are supplying goods wagons to the Indian Railways, most of them capable of supplying several types of wagons.

*

A sum of Rs. 3,70,245-4 has so far been spent on the Board of Editors set up to collect material for writing the History of Freedom Movement.

*

The Government of India have granted a sum of Rs. 5,90,000 to the State of Saurashtra to assist the Grow-More-Food programme of the State during 1955-56.

FOREIGN

The International Bank for Reconstruction and Development has made a loan of $4.2 million in various currencies to the Karnaphuli Paper Mills Ltd., of Pakistan, to finance part of the foreign exchange costs incurred in the construction of a pulp and paper mill at Chandraghona in East Pakistan.

*

A four-week technical meeting and training centre on farm-mechanization and workshop problems organised by F.A.O. in collaboration with the Government of Ceylon, for the benefit of Asian and Far East countries will shortly be held in Amparai, Ceylon.

*

The 100th irrigation project built with the aid of materials supplied by the United Nations Korean Reconstruction Agency (U.N.K.R.A.) was recently dedicated at Namkok in the Republic of Korea.

*

A U.S.-Peruvian joint technical commission has been established to carry out studies of public works, irrigation, transportation and industries.

*

It is reported the Egyptian Government will buy $28 million worth of machinery and equipment for a huge dam on the Nile, railways, steel and fertilizer plants.

*

The Italian Government has under consideration a Ten-Year Plan, expected to cost $50,000,000,000 and to create 3,200,000 jobs for the unemployed. Also called the Vanoni Plan, it envisages a 60 per cent increase in exports and 43 per cent increase in imports during the period 1955-1965.

*

Pakistan's $30 million scheme to irrigate 710,000 acres has been supported with an additional U.S. contribution of $2,504,600. It is likely that the irrigation project will be completed by 1957.

*

Uruguay is planning to substitute diesel engines for steam locomotives in its railroads. The Minister of Public Works, has also endorsed the idea of a Four-Year Plan to rebuild and improve the roads of each province.

*

Venezuela's new petro-chemical industry has acquired a 5000, acre tract of land in Moron, near Puerto Cabello, where it hopes to build a plant scheduled for completion by mid-1957 and for full operation by 1957.

*

Peru and Bolivia have agreed to set up a commission to plan construction of a railroad that would link the two countries and later lead to utilisation of a huge hydro-electric potential from Bolivia's Titicaca Lake.

*

Following years of fruitless drilling, oil has at last been found on the island of Maraji, at the mouth of the Amazon river.

*

Shipping freight rates between Australia and the Far East will be raised by 10 per cent from October 1, this year, because of the higher operating cost.

*

The Central Credit Commission of West Germany has decided to raise the credit charges on over drafts by 0.25 per cent to 8 per cent per annum (5 per cent interest and 3 per cent commission) and charges for non-approved overstepping of credit lines to 9.5 per cent per annum.

Economic Report from the U. S.

FEDERAL BUDGET

(By Guy Sims Fitch)

WASHINGTON Aug. 30.—The American people heard some cheering news last week: for the first time since 1951, the Federal Budget shows promise of being balanced in the current (1956) fiscal year, ending next June 30. This brings closer to realization the prospect of substantial tax reductions next year. Figures presented by Treasury Secretary George Humphrey and Budget Director Rowland Huges still show a deficit of $1,700 million for the 1956 fiscal year. But this is a sharp reduction from the previous year's actual deficit of $4,200 million, and there is good reason to believe it can be erased entirely. Both Humphrey and Hughes have stated flatly that the budget can and should be balanced in the next 10 months.

A look at the record shows why, in their traditionally conservative manner, the nation's fiscal experts have presented what may turn out to be rather modest estimates of Government receipts for the year ahead. Basing their assumptions on the current strength of the economy and the optimistic outlook, they have forecast tax revenues of $62,100 million. This would be a gain of $1,800 million over intake during the 1955 fiscal year, and of $2,100 million over the preliminary 1956 estimates presented to Congress last January. They assume that both personal and corporate tax receipts will increase, while excise levies will remain about the same. They look for personal income to maintain an annual rate of $300,000 million for the rest of the 1955 calendar year, and to continue into 1954 at a somewhat higher rate. Thus, they say, personal income-tax receipts should total about $32,800 million—about $300 million more than the January estimate and $1,200 million more than last year. It is noteworthy that personal income reached a record annual rate of $300,500 million in the second quarter of this year, and was higher than that in both May and June, the most recent months for which such data are available.

As for corporate tax receipts, the experts have estimated these at $19,200 million—some $2,200 million more than the January estimate and $2,600 million more than last year. This is based on an anticipated corporate profit level of $40,600 million in the 1955 calendar year—a conservative enough estimate considering that second quarter profits were up to an annual rate of $42,500 million from $40,900 million in the first quarter.

On the matter of expenditures, the experts have estimated Federal spending in the 1956 fiscal year at $63,800 million. While this is a reduction of $700 million from actual outlays in fiscal 1955, it is $1,400 million more than estimated last January. And it assumes that the nation's defence establishments will hold their outlays to no more than $34,000 million, saving about $1,000 million as the year progresses. Most of the big increases in spending are tied to programmes over which the Eisenhower Administration has little control—largely greater outlays for farm surpluses, higher interest payments on government securities, and increased benefits fixed by law for Korean veterans. But the Administration, which has described its philosophy as conservative in money matters and liberal in human affairs, also plans some substantial increases in outlays for public welfare, including school, hospital, highway, flood control, reclamation and power programmes.

With the budget so close to balance, it would take only slight changes in receipts or expenditures to end the six-year run of Federal deficits. The Administration already has advised executive agencies to cut unnecessary expenses. And Congressional leaders, who must pass on the Administration's budget requests, have expressed confidence that they can find additional room for economies, if needed. It is no secret that both the Republican Administration and the Democratic-controlled Congress welcome the opportunity to balance the budget and cut taxes in 1956, a presidential election year.

Will tax cuts have to wait until an actual budget balance is achieved? Humphrey and Hughes say no. All that is required, they note, is that the trend toward balance be continued, with the Administration knowing where the money is coming from. They take particular pride in the fact that the improved budget outlook has been achieved while both inflation and deflation have been avoided. "The cost of living and the value of the dollar", they point out, "have been held steady for the past 25 years.".

TRADE PACT WITH PAKISTAN

THE chief merit of the trade agreement between Indian and Pakistan which became effective yesterday is that the two-year old stalemate has been broken and a bilateral machinery has been set up to stimulate the volume of trade. After the expiry of the previous bilateral trade agreement in September 1953, a modus vivendi could not be evolved for smooth traffic by the two governments. Only a limited scheme could be approved for trade in raw jute and coal for a three-year period due to termination in June 1956. Whatever volume of trade was carried on in other commodities under the normal channels of international trade was limited in size.

This agreement brings great relief to the people residing in the adjoining regions on both the sides of the eastern frontier. The artificial barriers to trade between the border areas of East Bengal, on the one hand, and the border areas of West Bengal, Bihar, Assam and Tripura, on the other, have now been removed and after a long lapse of seven years unrestricted trade facilities have been opened up. Holders of A category visas are now at liberty, without being placed under any obligation to render compliance with import, export and exchange control regulations, to conduct trade in daily necessities and local products without having to pay the regular customs duties. This concession, based essentially on humanitarian considerations, is calculated to give a fresh impetus to the frontier trade in the East.

The basic trend of progressive shrinkage of the size of the trade between India and Pakistan is a matter of common knowledge, but the magnitude of the decline is not, perhaps, fully recognised. Table A below summarises the value of trade between the two countries since 1948-49:

TABLE A

Trade Between India and Pakistan

(Value in Lakhs of Rupees)

Year	Imports from Pakistan	Exports to Pakistan	Trade Surplus(+) or Deficit(—)
1948-49	107,37	76,69	—30,68
1949-50	44,05	43,30	— 75
1950-51	43,56	30,60	—12,96
1951-52	97,50	45,29	—42,21
1952-53	41,88	31,14	+ 9,26
1953-54	19,27	8,02	—11,25
1954-55	19,38	9,65	— 9,73

The sudden spurt in trade in 1951-52 which pushed India's deficit to an all-time peak was due to her heavy intake of jute. The normal tenor of deficit for India was upset only once in 1952-53. In that year, cotton textiles, jute manufactures, coal, edible oils, chemicals and drugs and medicines, tobacco and a few other items accounted for more than the usual volume of exports from India.

The significant fact about this table is the depressed level of the trade after the stalemate over a renewed bilateral agreement took place in 1953. During the last two financial years, the value of imports from Pakistan has been sustained at a steady, if marginally reduced, level by our intake of two categories of commodities—raw jute and fish. The value of our raw jute imports stood at Rs. 14.32 crores in 1953-54 and Rs. 13 crores in 1954-55.

An outstanding characteristic of the last two years' trade is the steep decline in India's exports to Pakistan by more than two-thirds as compared to the previous low since 1948-49. India has lost heavily on three fronts—cotton textiles and yarn, jute manufactures and miscellaneous goods including silk and silk piecegoods, metals, rubber manufactures and salt. The magnitude of the decline needs emphasis. Exports of cotton textiles and yarn fell from Rs. 4.98 crores in 1952-53 to Rs. 72 lakhs and Rs. 2.28 crores in the succeeding two years. For the same three years, the decline in exports of jute manufactures was from Rs. 3.26 crores to Rs. 7 lakhs and Rs. 4 lakhs. In the miscellaneous category, the drop was sudden from Rs. 2.67 crores to a negligible amount.

The question that arises in the light of this steep fall in India's exports is: What prospect does the new trade agreement hold for a revival of the trade in her staple exports?

There is a facile tendency on the part of the people in India to assume that the change in the pattern of Pakistan's imports from India is the result of a political twist intentionally given to it. Whatever truth there may be in this belief has been magnified out of all proportion. But one fact is quite clear. It is that there is in this country very insufficient appreciation of the strides which Pakistan has made in industrial production in the short span of seven years. Table B in this article highlights the rapid progress registered by certain industries in Pakistan most of which have been selected from the angle of their importance to India's exports:

TABLE B

	Unit	1948	1952	1953	1954
Surplus yarn	000 lbs.	6,203	19,981	52,540	100,452
Mill-made cloth	000 yds.	88,059	174,160	251,550	347,862
Art-silk Fabrics	000 yds.	—	3,697	10,185	12,566
Jute Manufactures	Tons	—	17,573	50,126	53,900
Rubber Tyres & Tubes	000 nos.	—	776	1,367	1,902
Tanned Leather (Upper)	000 sq. ft.	1,000	7,200	7,200	8,600
Sole Leather	000 lbs.	1,500	8,300	8,300	9,600
Steel Ingots	000 tons	2	7	10	10
Steel Rerolling	000 tons	3	27	25	60

This rapid progress over a wide range of industries relieves Pakistan of her reliance on imports in varying degrees. This factor needs to be considered in conjunction with Pakitsan's tight foreign exchange position necessitating restrictive import policy. Customs duties have been raised also on account of a vigorous policy of protective tariffs. Raising of import duty on diesel oil engines up to 50 h.p. from 5 per cent ad valorem revenue duty to 35 per cent ad valorem protective duty offers one illustration in which this country is concerned.

In so far as the major export commodities from India are concerned—jute manufactures, cotton piecegoods, art silk fabrics, engineering industry products, rubber manufactures, and so forth—it is difficult to cherish bold optimism. For one thing, domestic pro-

duction in Pakistan has altered the position as a permament feature of trade. This applies to jute manufacture in a large degree. The trade treaties that Pakistan has entered into with certain European countries, including West Germany and France, would divert the direction of the bulk of her imports of cotton textiles and art silk fabrics to these countries. India, therefore, will not find a return to the Pakistan market in these commodities an easy process.

The terms in this agreement relating to the two-way trade in cinema films at least assist the renewal of India's exports to East Pakistan, but in respect of West Pakistan there is a collateral obligation for India to import. In other material respects, the recent pattern of trade both ways gets an added measure of assistance for expansion. It may be considered a satisfactory performance if India is enabled to recover a substantial part of the ground lost in the last two years.

MARKET FOR MACHINE TOOLS

THE question of development of India's machine tools industry has hit the headlines following the unpleasant revelations made by the Colombo Plan expert, Mr. J. D. Scaife, in regard to the working of the State-owned factories at Jalahalli and Ambernath. The Minister for Defence Organisation has too readily taken shelter under Mr. Scaife's exaggerated language to cover up the extremely disappointing working of these State undertakings. The British expert has at least done the service of drawing public attention to the unbusiness like planning and the pitiful lack of statistics, relating particularly to the demand for machine tools in the country where a large percentage of idle capacity in the industry is ready to be made use of to minimise the country's dependence on imported tools. Whatever may be the Government's counter-criticism of Mr. Scaife's report, the fact remains that crores of rupees have been locked up in costly equipment, while Government continues to spend huge sums of foreign exchange for import of large consignments of machine tools for current requirements.

According to official sources, the total outlay on the Jalahalli plant is Rs. 4 crores so far, and it has given precious little in return. The capacity of the factory is 400 lathes of 8½ in. size to be achieved in two years—and, if and when this is actually achieved, private concerns already manufacturing lathes of similar dimensions may suffer unfair competition.

In its endeavours to assess, as accurately as possible, the country's requirements of machine tools, the Panel for the industry (which was constituted by the Engineering Capacity Survey Committee and which has submitted its preliminary report to the Government) has admitted its failure to obtain necessary data from any official or other reliable source. The largest single customer for machine tools is the Government, and its demand is met, to a preponderant degree, by tools imported from abroad. And the only available statistics of imports are the value of total imports of metal working machinery, including machine tools, which are given in the accounts relating to the foreign trade of India, published by the Department of Commercial Intelligence and Statistics. The statistics regarding total value give no indication of the numbers and types of different machine tools imported and, consequently, are of little use. The figures, however, show that there has been a steady rise in the value of metal working machinery, including machine tools, such as drilling, grinding, milling, planing and shaping machines and lathes. The value of these imports, which was Rs. 1.95 crores in 1952-53, rose to Rs. 2 crores in 1953-54 and further increased to Rs. 2.70 crores in 1954-55. There is every possibility of this rising trend being maintained in the current year. The bulk of these orders represents the requirements of the Railways and the Defence Departments of the Government of India. This raises the question: Could not determined efforts have been made to produce some at least of the large varieties of these foreign tools within the country by effecting modifications, wherever practicable, in the productive mechanism of the Indian factories and in the specifications for Government requirements.

It should be mentioned here that the Government's recent policy of inviting direct tenders abroad—the Panel mentioned instances of over Rs. 2 crores worth of machine tools for the Perambur Coach Factory and Bharat Electronics—is depriving the home manufacturers of knowing Government's requirements. The plea extended for placing tenders abroad was that the Government's foreign technical advisers had checked to see if machine tools to the specifications they required were made in India, and failing to locate Indian-made machine tools to the required specifications, tenders were directly placed abroad. Where specifications asked for are just a little different from specifications of machines made in the country, if the manufacturers had knowledge of the specifications of machines required, then in some of the cases it may have been found possible for them to offer similar machines by suitably modifying existing machines in production.

As regards capacity, it has been estimated, on the basis of answers received from certain factories to which questionnaires were sent, that hardly 60 per cent of the capacity would be utilised for peak production of tools. According to another estimate, the production and effective capital investment for machine tool manufacture will be about one-third of their total capital investment. At a rough estimate, the capital utilised for machine tool manufacture by all the factories concerned could be taken as approximately Rs. 1.25 crores. On an average in 1952, the machine tool factories were working hardly 50 per cent of their capacity, and not all this capacity was utilised for machine tools. As the total manufacturing capacity for machine tool manufacture has been estimated at Rs. 1.2 crores, and as the machine tools actually manufactured (taking the average of the last three years) amount to Rs. 0.45 crores, the idle capacity is estimated to be Rs. 0.75 crores, or approximately 60 per cent.

Full details of the country's machine tool requirements must be gathered if we are to draw up a rational programme of manufacture. In this connection, the Panel has made the notable suggestion that machine tools must be properly classified and coded, preferably by adopting the U.K. Code for standard classification of machine tools. Collection of such statistics will, no doubt, take time; meanwhile, the urgent requirements may be met by obtaining a classified coded list of foreign and Indian machine tools purchased by the Government through the D.G.S. & D. and directly by the Defence Department. This would represent approximately 60 per cent of India's foreign purchases.

A Letter to the Editor

THE COMPANIES BILL

Sir,

The powers intended to be conferred upon the Central Government under the Companies Bill now before Parliament in the matter of Control and Supervision of Companies and in regard to obtaining prior sanctions concerning various essential matters pertaining to the conduct of their affairs are so wide-sweeping in scope and so drastic in content that certain equally fundamental and drastic safeguards seem plainly necessary to prevent their abuse in furtherance of either the political ends of the parties in power or the private ends of the members of such parties or of Public Servants.

The following appear to be the minimum safeguards essential for this purpose:

(1) Contributions, Donations or Gifts (by whatever name called) by Companies to Central, State or Local Political Funds, Party Funds, Election Funds, and to "Purses" for political leaders (except to perpetuate their memories after they have passed on to the next world) should be totally prohibited. This will not affect any fundamental or constitutional rights of Companies because they can neither vote nor stand for elections; and the furtherance of political ends is rarely, if ever, among their objects in the very comprehensive Memorandum of Association which most Companies adopt.

(2) The above prohibition should be enforced by appropriate penal provisions (including imprisonment extending over not less than one month) directed not only against Directors, Managing Agents, Secretaries and Treasurers, Managers, etc. of the defaulting Company but also against the direct recipients and indirect beneficiaries of such contributions and those who solicit them.

(3) The seeking or offering, recommending or soliciting, of jobs in a Company, or in, with or under any Managing Agent, Director, Secretaries and Treasurer etc. of a Company by, to, for or on behalf of any person in whom a Public Servant or any member of the Central or State Legislature or Local Authority is directly or indirectly interested or deemed to be interested by reason of any relationship, however remote, by blood or marriage, should be prohibited.

(4) Every person directly or indirectly concerned, or deemed to be concerned, in such seeking, offering, recommending or soliciting of any such job to or for any such person should be liable to imprisonment extending over not less than one month.

(5) The Managing Agent, Directors, Secretaries and Treasurers, and Manager of any Company knowingly employing any person in respect of whom the seeking, offering, recommending or soliciting of jobs is prohibited should also be liable to imprisonment extending over not less than one month, quite irrespective of whether or not there was in fact any seeking, offering, recommending or soliciting of job in that case.

I feel confident that the above provisions, being demonstrably in the Public Interest, should not encounter opposition from any direction. They will not also contravene any fundamental rights or other provisions of the Constitution. However, if it should be subsequently held by the Supreme Court that they—particularly (3), (4) and (5) above—have that effect, the Constitution itself should be suitably amended because it cannot be allowed to afford shelter to malpractices and corruption.

Yours faithfully,
SHAREHOLDER.

The Business World

A PLAN FOR COTTON TEXTILES

By

CROESUS

EVEN in a socialistically patterned economy I do not think that a place would be denied to an industry which seeks not only to further its own prosperity but also to contribute to the well-being of the community and the country at large. Since this is the basis of the programme of the Indian cotton textile industry which it has just forwarded to the Planning Commission, it follows that the future of the cotton textile industry in this country is assured, provided, as the industry hopes, the Planning Commission, labour and the three sectors of the industry would give to these proposals the dispassionate consideration that they deserve, "so that the co-operative endeavour of that section of the community which derives its livelihood from the cotton textile industry should not only bring prosperity to itself, but also give back to the nation at large, a plentiful supply of cloth at reasonable prices." This is, indeed, the highest service that not only the cotton textile industry but any industry can render to the country as its part in the second Five-Year Plan.

The proposals relating to the role of the cotton textile industry in the second Five-Year Plan have just been submitted in a memorandum prepared jointly by the Millowners' Association, Bombay, and the Ahmedabad Millowners' Association. These two Associations, it may be noted, represent more than 76 per cent of the installed loomage and 66 per cent of the installed spindleage of cotton mill industry in the country. I mention these figures only to stress the point that their views must not only be regarded as weighty, which the views expressed by these bodies always are, but also sufficiently representative.

The millowners' targets to be attained by the industry and its two complementary sectors, namely, the handlooms and the powerlooms, by the end of the second Five-Year Plan, it is noteworthy, are not only more ambitious than the targets indicated by the Kanungo Enquiry Committee but also seem to be in conformity with the likely pattern of cloth consumption that is to emerge as a result of the estimated increase in the country's national income and the resultant per capita increase of cloth consumption. The memorandum (submitted by the two Associations to the Planning Commission) envisages a total production of 10,000 million yards of cloth by the end of the second Five-Year Plan which will be apportioned among the cotton mills, the handloom sector and the powerloom sector at 7,800 million yds., 2,000 million yds. and 200 million yds., respectively. This would necessitate, according to the memorandum, 15.5 million spindles (including an addition of 3.6 millions and 298,000 looms (including an addition of 90,000 looms). It has been estimated that the total finance required for the new equipment, as also for rehabilitation over the five-year period, would amount to Rs. 233 crores, while the total actual cotton production would have to go up to 60-65 lakh bales. It is needless to add that, coming as these proposals do from practical business men, every aspect of the problem has been so carefully studied, that all the details dovetail admirably into the presented pattern.

In having placed before the country a target of 10,000 million yards, I must say, the mill industry has effectively answered the charge levelled against the industry so often that it is not interested in making available to the people more cloth because of considerations of profit. But this is only incidental. The more fundamental consideration underlying the proposed targets is the anxiety of the industry not to allow a perpetuation of what the Planning Commission has called "pseudo-employment" (Vide Chapter II, Para 6 of the first Five-Year Plan) which leads to a rise in money incomes without a corresponding increase in the supply of the goods needed for sustaining the newly employed. Cotton textiles are a basic essential and, in order to ensure their availability at a reasonable price as well as to ensure an increase in the productivity of labour in the short run, it is essential, as the memorandum points out, to earmark for modern high productive equipment a major portion of the increase which is necessary in the productive capacity of the textile industry. This means a reallocation of the productive targets assigned to mill, handloom and powerloom sectors, but it seems to be called for, as, in the opinion of the two Associations, even the improved handlooms and the powerloom, thanks to their relatively low productivity, will noly help to create the type of pseudo-employment referred to already and not materially add to the total quantum of production.

The difference in the targets of cloth production as between the Kanungo Committee and the millowners is appreciable. Such arises from the fact that the latter consider the per capita consumption assumed by the Kanungo Committee as totally inadequate in the context of the impressive increase in national income that is expected under the second Five-Year Plan. As against 15 yds. which the Planning Commission has aimed at under the first Five-Year Plan by 1955-56 and the 18 yds. postulated by the Kanungo Committee by 1960, the Millowners' Association memorandum has assumed a per capita consumption of 22 yds. at the end of the second Five-Year Plan. That even this latter figure is not unduly ambitious is borne out by the fact that this increased per capita consumption of cloth would still be only slightly higher than Japan's about two decades ago (in 1926-27) and would continue to be almost the lowest. At 22 yds. per head for an estimated population of 400 million by 1960-61, the total requirements for internal consumption alone would work out to 8,800 million yds. To this must be added the minimum estimated exports, which are admitted, on all hands, to be between 1,000-1,200 million yds., or an average monthly export figure of 100 million yds., making a total in round figures of 10,000 million yds. According to the Kanungo Committee, mill production presently is at the rate of 5,000 million yds. while that of handloom and powerlooms is 14,000 million yds. and 200 million yds., respectively, making a total of only 6,600 million yds. While the Kanungo Committee plans to increase the total production by all sectors of the industry to only 8,200 million yds. by 1960, the Millowners' Association wants to raise it to Rs. 10,000 million yds. On this basis, it will be seen that, even after fully implementing the recommendations of the Kanungo Committee in regard to conversion of ordinary handlooms into improved handlooms and powerlooms, and assuming that the handlooms and the powerlooms yield the production allotted to either of them, there would still be a gap of 1,800 million yds. This atleast can be safely entrusted to the mill industry. But the two Associations are doubtful of the ability of the handloom-cum-powerloom industry to fulfil even the role assigned to it by the Kanungo Committee and are afraid that any expansion of the handloom sector will only multiply its present difficulties. In this connection, their memorandum to the Planning Commission makes a pointed reference to the observation of the Kanungo Committee itself which visualises (Para 137) a gradual withering away rather than an expansion of the handloom industry. As regards the powerlooms, the Associations think that encouraging them would only be boosting up the industry at great cost to the consuming public as well as to the national exchequer. Besides, it is contended that there is little difference, either on psychological grounds or on grounds of employment potential, between the cotton mill industry and the powerloom industry. In support of this view, the memorandum goes on to give details of the capital/output ratio of mill industry and powerloom industry (on the basis of the figures assumed by the Kanungo Committee, be it noted), and it is pointed out that the capital output ratio for the automaticlooms works out at only Rs. 30 per yard per day as against Rs. 50 per yard per day for the powerloom. For this reason, the two Associations do not see much point in expanding the production of powerlooms. They consider that a feasible target of production for the handloom sector would probably be 2,000 million yds. and they have taken care to point out that, even according to the calculations of the Kanungo Committee, it would be adequate to give full time utilisation for 300 days in a year to the existing 12,00,000 handlooms, capable of providing employment for 15,00,000 persons. In other words, under the proposals of the two Associations, there would not be even the net unemployment of 1,25,000 workers envisaged under the Kanungo Committee's proposals, all the 15 lakh workers now dependent on the industry in the handloom sector continuing to be employed. Similarly, the status quo would continue in the powerloom sector also, as it is not proposed to reduce the share of the powerlooms below its present manufacturing capacity of 200 million yds. If, therefore, the handloom sector is to account for 2,000 million yds. and the powerloom sector for 200 million yds. the mills' quota would have to be raised to 7,800 million yds. The implications of this increased production are fully worked out and indicated in the memorandum as reflected in the target figures referred to at the outset. A notable feature of the expansion plans in the mill sector is the attention given by the two Associations to the need to balance the uneconomic units, on the one hand, and to the advisability of dispersing all additional capacity over the country, having due regard, of course, to factors like proximity to cotton-producing areas and the existence of handloom and powerloom sectors nearby, on the other.

Eminently practical though the proposals of the Millowners' Associations are, I foresee at least two criticisms to the proposals. The first is that the powerloom interests (I am assuming that the handloom sector will be content with the modest increase that has been assigned to it under these proposals) would vigorously protest against the status quo proposed in respect of powerlooms and they will surely buttress their agruments with the need not only to maintain the powerloom sector but also to extend it so as to provide a readily available source of load to the existing hydroelectric and thermal power projects in the country. Secondly, the Associations have not indicated how they proposed to find the total outlay of Rs. 233 crores required for rehabilitation and expansion. There is no doubt a reference to the average investment of the industry during the last 15 years at Rs. 15 crores per annum. But this is proposed to be stepped up to Rs. 20 crores per annum, and it is not shown whether the industry itself will find the extra funds or expects them by way of assistance from the Government. Over and above these, there is the total expenditure on additional machinery required for expansion of Rs. 133 crores. How, again, is this going to be raised? The question becomes relevant because, even under the programme of expenditure for the private sector worked out by the Union Ministry for Commerce and Industry, only Rs. 100 crores have been set apart for expenditure, including rehabilitation, by the textile industry.

CREDIT INSURANCE FOR EXPORT PROMOTION

By

CROESUS

NOT long ago, the Government of India drew up a twelve-point programme for promotion of exports. One of the first steps in export promotion adopted by the Union Government has been the establishment of Export Promotion Councils. Two councils, one for cotton textiles and one for silk and art silk fabrics, have already started functioning. A few more such councils are proposed to be set up—for cashewnuts and pepper, tobacco, shellac, mica, sports goods, plastics and engineering goods. These councils are to undertake market research in foreign countries, appoint representatives, conduct publicity, disseminate market information, lay down standards of quality and packing and attend to complaints from foreign importers. In the case of cotton textiles, a certification trade mark scheme is also in operation, while in respect of hemp, tobacco and raw wool only exports covered by Agmark rules are allowed. The export promotion work of commodities like tea, jute, handloom cloth and handicrafts is being handled by special boards. The Tea Board has set up its own promotion councils in the U.S.A. and other countries with the help of trade interests in those countries.

The latest and, perhaps, the most important move on the part of the Government is the decision to start an export credit guarantee scheme on the lines of similar schemes in operation in the U.K., Canada, and Japan. Broadly, the scheme is in the nature of an insurance against risks that exporters have to face. It has been reported that the Government is likely to appoint a special officer to work out details of the scheme to be brought into operation by legislation. Recently a draft scheme, prepared some time ago, was circulated among commercial interests, but opinions thereon were divided. The larger interests in established lines like jute, tea and cotton piecegoods for example, seem to feel that, in any such scheme, they would only be subsidising their weaker counterparts. In view of this, it is now felt the Government may prepare a scheme limited only to a selected section of trade, in the first instance. A central insurance organisation may be set up for this purpose and a special law also enacted, so that the newly-formed organisation would be outside the purview of the Insurance Act, as it must needs be.

It will be of interest to study the working of the Export Credit Guarantee Scheme in other countries, such as the U.K., for instance. The Export Credit Guarantee Department (E.C.G.D.) of the United Kingdom is a separate Department of the Government, under the President of the Board of Trade, providing credit insurance for the U.K. exporters. In the beginning, that is between the world wars, E.C.G.D. was concerned only with insuring the risk of the solvency of the buyer. Later on, in the early thirties, it began to insure the sterling transfer risk for specific markets. But, since the last war, its standard policies have begun to provide, in a single document, comprehensive cover

against transfer, insolvency, default or any other risks of export trading. The chief export trading risks, generally, are the insolvency of a buyer or his default, and delay in payment due to exchange restrictions and difficulties in the importing country. The Department's Policies also cover risks due to causes outside the control of exporters and buyers, such as war or civil disturbance. Policies are issued to cover export business from the time a contract is made, or from the time of shipment, up to the time that payment is received. Sales of foreign goods through British merchants can also be covered, and even merchants having materials processed abroad for eventual export can insure against major risks. Further, E.C.G.D. policies provide cover against loss from the following causes: (i) imposition of new import licensing restrictions in the buyer's country or cancellation of a valid import licence; (ii) cancellation or non-renewal of a U.K. export licence, or imposition of new export licensing restrictions; (iii) additional handling, transport, or insurance charges due to interruption or diversion of voyage which cannot be recovered from the buyer; and (iv) any other cause of loss occurring outside the U.K., including presumably devaluation, and not normally insurable with commercial insurers. The extent of the cover normally is 85 per cent of loss through insolvency or buyer's failure to pay within 12 months of due date and 90 per cent of loss through any other cause. The short-term policies under which the exporter insures the whole of his trade are not generally applicable to transactions involving capital goods, such as plant, equipment or heavy machinery, and large-scale capital projects. In the latter case, special policies are written for each transaction. Many types of invisible exports also can be insured against the insolvency of the purchaser and against exchange difficulties. This cover applies to such invisibles as consultants' and other professional fees, royalties or film earnings.

In addition to all these, there exists a special range of policies designed to help exporters in tackling markets in North America and the Dollar Account Area by the use of market surveys, advertising and sales campaigns. One type of policy helps them to hold stocks locally and to give rapid service. In the particular circumstances of the Dollar Account markets, the exporter may face risk of loss in his efforts to break into the market. The exporter can insure against a percentage of the loss which may result if market surveys, advertising or sales promotion campaigns or stock-holding do not produce sufficient revenue to defray their cost over an agreed period. Under the Joint Venture Policy, the Department will share with the exporter in a comprehensive trading project over a period of time. If the project fails, the Department will share the losses equally with the exporter; if it succeeds, the exporter enjoys the whole profits of the venture. Some specialised goods are not suitable for the market survey technique, but must be demonstrated and tested on the spot. Consumer goods may need to be tested by distributing samples to prospective customers. The Market Survey Policy can be adapted to cover these "products tests" also and guarantee the exporter against 50 per cent of the cost of making, shipping, demonstrating and distributing the goods. The trade centre to be set up in New York by the All India Handicrafts Board, it is reported, will explore local markets on these lines—by test consignments of specific categories of Indian goods.

The Government of India's scheme for export credit insurance is similar to that in operation in the U.K. and France, but it incorporates one novel feature, namely payment of compensation to foreign importers for default on the part of Indian exporters. The proposed insurance organisation would utilise the services of the various Export Promotion Councils, who would be acting as its agents to carry out its functions for insurance and in the matter of daily contacts with exporters. The insurance body will issue guarantees to the extent of 80 per cent of the goods shipped or contracted for.

Under the scheme, the exporter gets more than insurance alone in return for his premium—he gets the benefit of a large and comprehensive organisation for export credit management. Reports from all over the world are constantly studied to interpret the first significant signs of an impending trouble in an apparently sound market, or of a better turn in a difficult market. It is because the expense of this service is shared among many exporters that it can be provided on a large scale without overburdening the premium rates. Export credit insurance operates to sustain the exporter in transactions with unproved buyers or in difficult markets in which he would not remain without insurance. It offers him assured contact with the widest circle of buyers whose creditworthiness has been thoroughly checked. Though the scheme doe snot itself provide finance for the exporter, the insurance it provides makes it easier for him to obtain, through the banking system, such finance as he may require. It thus allows more business to be done against existing capital but, at the same time, without overtrading. For each Rs. 100 of sales, the risk borne by the exporter is reduced to only Rs. 20. Provision is made for any policyholder to effect a simple transfer to his bank of his rights under the insurance. Where such an assignment is made, the exporter is often able to arrange for the discounting of his bills at a better rate. Contracts and shipments policies reduce the risk of non-payment to a very low figure and policyholders may find that their bankers will be willing to accommodate them with advance or discounting facilities. In some cases, it may be possible for the central insurance organisation to help by giving a guarantee to the exporter's bankers.

Planning is the fashion of the day—even in business management. By planning the export trade, which will be facilitated by such schemes as export credit guarantee, future earnings can be accurately assessed and further programmes based thereon, since such earnings are hedged by insurance against all the conceivable major hazards.

POLITICAL PRESSURES ON COMPANIES

By

CROESUS

Anything carried to excess is bound to provoke reactions, sometimes even extreme reactions. The powers intended to be conferred upon the Central Government under the Companies Bill now before Parliament in the matter of control and supervision of companies and in regard to obtaining prior sanctions concerning various essential matters pertaining to the conduct of their affairs are so wide-sweeping in scope and so drastic in content that a shareholder has sent on to us, for publication, a letter in which he says that "certain equally fundamental and drastic safeguards seem plainly necessary to prevent their abuse in furtherance of either the political ends of the parties in power or the private ends of the members of such parties or public servants". He is convinced that, since such safeguards are so demonstrably in the public interest, there should be no opposition from any quarter. Nor do these contravene—this he has taken the trouble

to make sure—any fundamental rights or other provisions of our Constitution. And if, perchance, it is held to be so by the Supreme Court at some later date, he is even for having the Constitution suitably amended for the purpose.

The following are the safeguards the shareholder in question demands:

(i) Contributions, donations or gifts (by whatever name called by companies to Central, State or local political funds, party funds, election funds, and to 'purses' for political leaders (except to perpetuate their memories after they have passed on to the next world) should be totally prohibited.

(ii) The seeking or offering, recommending or soliciting, of jobs in a company, or in, with or under any managing agent, director, secretaries and treasurers, etc. of a company by, to, for, or on behalf of any person in whom a public servant or any member of the Central or State Legislature or Local Authority is directly or indirectly interested, or deemed to be interested by reason of any relationship, however remote, by blood or marriage, should be prohibited.

(ii) The foregoing two prohibitions must be enforced by appropriate penal action against not only those officers of the company who allow these but also the direct recipients or indirect beneficiaries and the solicitors of the contributions and also those who seek, offer, recommend, or solicit jobs.

The righteous indignation of the shareholder is so great that he favours, even the punishment of officers of a company who make such prohibited contributions or employ such prohibited persons, irrespective of whether or not there was, in fact, any seeking, recommending or soliciting.

To some, especially those who believe in the theory of taking the line of least resistance, these suggestions might appear rather drastic, but many joint-stock companies which can ill afford to pay the contributions demanded by persons in power or influence and yet find themselves with no other alternative, if they have to save themselves from the wrath of the powers-that-be, would welcome the proposed prohibitions. So also the thousands of deserving applicants for jobs—recently there were 40,000 applicants for less than 1000 posts in an oil refinery company, it is reported—who find themselves unfairly pitted against sons or relatives of ministers or secretaries of Government and so become frustrated. If prohibitions on the lines indicated by the shareholder are on the statute book, the officer concerned too would be saved of much awkward embarrassment at times. After all, they also become victims to the frailties of human nature; if appeasement or propitiation of some one or other in power or authority could facilitate or smoothen their work, which is otherwise difficult, they might be tempted, even if only in their weak moments, to brush aside considerations of pure merit. Did not a well-known British paper comment, when the son-in-law of a distinguished ex-Prime Minister of England was appointed as a Minister, that "there was never such a thing as making an appointment on pure merit"?

THE RAMAYANA
OF
TULSIDAS
IN ENGLISH VERSE

LATEST "HINDUSTAN TIMES" PUBLICATION

The famous Hindi epic regarded by many as "the greatest book in all devotional literature" is for the first time now available in English verse.

The translator, the Rev. A. G. Atkins, completed the book after ten years of devoted work. He has tried "to keep and express in English in the fine rhythm and music of the original in simple lucid language, and with as much of the vivacity, wittiness and picturesqueness that Tulsidas has put into his work." He has also followed in some measure Tulsidas's metrical variations such as **chhand, chaupai, doha** and **soratha.**

In a foreword Mr C. Rajagopalachari says: "Mr Atkins' monumental work and his Introduction are a revelation of hope for those who desire to see all the great religions of mankind come together. - - - - His service is not only to English-speaking people but also to that very large number of Hindus in India who do not speak the Hindi language and to whom English has become a very familiar medium."

The book is of special value to libraries, scholars and devotees of Tulsidas.

It has been issued in the following four editions:

I. **Original text of Tulsidas with translation in English verse; three volumes; 1468 pages; price Rs. 50 net.**
II. **Translation in English verse; without Hindi text, two volume; 898 pages; price Rs. 40 net.**
III. **Special tissue paper edition of I, one volume, price Rs. 100 net.**
IV. **Special tissue paper edition of II, one volume, price Rs. 100 net.**

NEW DELHI.

BUSINESS NOTES

RAISING COCONUT OUTPUT

THE DELIBERATIONS of the Indian Central Coconut Committee at its twenty-second meeting, held recently at Ernakulam, are significant, especially because the industry today is plagued by various difficulties.

India produces 330 crores of coconuts annually, valued at about Rs. 50 crores, but this is only three-quarters of the country's requirements. Hence the Committee had self-sufficiency as its first objective in framing the Rs. 63.75 lakh draft scheme for inclusion in the second Five-Year Plan. This scheme envisages measures for increasing production like controlling pests and diseases and raising the cultivated area by developing coconut cultivation in the Andamans, Saurashtra, Kutch, Hyderabad and Coorg. Ambitious though the scheme thus appears, it goes without saying that not much progress can be achieved unless there is also evolved simultaneously a proper price policy to ensure a fair price to the producer and its essential prerequisite, adequate facilities for marketing. True, cultivation is now largely carried on in primitive fashion and needs to be put on a scientific basis. But the small growers will continue to be at the mercy of wholesale dealers unless they are enabled to organise themselves into co-operative societies, which can be useful not only in the field of marketing, but also in dealing with other problems like plant protection, etc. It is heartening that the Government of India is taking steps for strengthening and financing co-operative organisations under a National Co-operative Development and Warehousing Board, which is shortly to be set up by special legislation.

For some months now, there has been a fall in the prices of copra and coconut oil. Though this is not an isolated phenomenon in that agricultural prices generally have been declining, this may cause great hardship since coconut growers are largely concentrated in a particular area. It is in this context that one has to assess the appropriateness of the Government of India's coconut import policy in general and the effect of imports on Indian prices in particular. The Coconut Growers' Association, in a memorandum submitted to the Union Commerce and Industry Minister recently, it will be remembered, complained that the import of copra was greatly in excess of demand in 1953-54 and that the reduction of duty to Rs. 50 per ton was injurious to local interests. Latest statistics show that imports of copra and coconut oil were 64,186 tons and 22,750 tons in 1954-55, against 29,698 tons and 25,943 tons and 19,377 tons and 20,154 tons, respectively, in 1953-54 and 1952-53. Notwithstanding the substantial increase in imports, it cannot be established that the fall in coconut prices in this country was entirely due to higher imports; the price of copra is also influenced by other oilseeds in the market. All the same, the Coconut Committee has decided to recommend to the Government that imports should be reduced to 50,000 tons per annum in terms of copra. The Government will doubtless be influenced in regard to any decision it may take by the probable effect of such restriction on prices to Indian consumers. It is perhaps worth remembering here that, despite the steep fall from the boom levels, prices of coconut products are even now some seven to eight times higher than those prevailing in 1939. In other words, the rise in coconut prices has been more than the fall in the value of the rupee over the same period.

IMPASSE IN THE BULLION MARKET

THE SUSPENSION of forward trading in Bullion for well over a month now has been causing serious concern to bullion traders in Bombay. The absence of futures trading has meant a vacuum in the market, but the resulting hectic rise in prices in the spot market towards the last week of August, which provokes inconveniently prominent attention, has bestirred operators to explore possibilities whereby a resumption of forward trading could be effected at an early date.

The stalemate in bullion was occasioned by the alleged cornering of the entire floating stocks of silver in the country by a single operator. This operator, the bears are never tired of pointing it out, had been indulging, during the past six months, in squeezing the market in fits and starts. But, insofar as they allowed themselves to be squeezed thus, the bears cannot altogether absolve themselves of blame. Anyway, matters came to a head when, on July 11, this same bull operator was credited with having brought about 1000 bars and of having brought about, in the process, a sharp rise in the price of silver (Shravan settlement) from Rs. 158-11 to Rs. 162-6. If true, this was clearly a case of a single operator deciding the fate of the market. At any rate, the Bombay Bullion Association interpreted it accordingly and decided to declare an emergency in bullion. Between the decision and its implementation, however, there emerged a snag, in that the Association, which had suffered a decline in its membership from 575 to 425, did not have sufficient voting strength from among its reduced membership to declare an emergency, unless the relevant by-law was amended suitably. At a meeting of the Board of Directors of the Association, therefore, it was decided to request the Bombay Government to authorise the Board to keep the market closed till it received the Government's approval to amend the by-law in question. The Bombay Government promptly gave its accord to the proposal.

Trading was thereafter resumed—on July 22—that is, after a period of inactivity extending over a week, and the Board fixed the ceiling and the floor prices of forward silver and gold in Shravan settlement under the amended emergency by-law, but activity on the Exchange was next to nothing, as the leading bull operator, it is alleged, preferred to sit tight on his purchases and refused to liquidate his holdings. Apparently, even the Board's warning that penal action would be taken against members who failed to square up their outstanding positions went unheeded and the result was a stalemate in silver. This necessitated arbitration proceedings and a sort of settlement eventually. The arbitrators appointed by the Bullion Board gave their award on the rates at which the buyers and sellers had to square up their business and this was accepted by both the sections.

In the light of all this experience, the Board took it upon itself to consider fresh amendments to by-laws to govern trading in the new contract. This was done at an extraordinary general meeting of the Bullion Association held on August 4 and the by-laws as proposed to be amended were forwarded to the Government of Bombay for its approval on August 17. The broad features of these recommendations are:

The maximum rate in an auction should be determined on the basis of the prices prevailing in the normal market which, in turn, should be arrived at by taking into account the average of adjustment rate for surplus and shortage in weight in respect of gold or silver, as the case may be, from ten days preceding the day on which the "Chithi" rate is fixed. The auction will be continued until goods are available, or for three days, whichever is earlier. The auction will be allowed of such quantity of ready goods as is actually offered by sellers at the end of a contract. But all transactions in excess of this quantity for which buyers have failed to pay deposit and for which sellers have not been able to offer spot goods would be settled at the "Chithi' rate to be determined on the average of three days' spot as well as forward rates. The penalty will be Rs. 14 per bar in silver and Rs. 25 per 100 tolas in gold.

It would appear that the Government's approval to the above scheme may be delayed for perhaps another month. For it is probable that the authorities might insist upon the Board publishing the revised terms of the contract with a view to eliciting public opinion. Meanwhile, a move has been afloat suggesting the resumption of forward trading with some minor changes in the old contract. The Board, which has been apprised of this, is believed to be studying the proposal and a decision thereon is keenly awaited. Pending this decision, forward trading in bullion continues to remain suspended.

Crises such as these are not unfamiliar to operators in futures market. In fact, these have manifested themselves so often and with such persistence as to be almost regarded as a regular, if not normal feature. In view of the fact that a crisis in one commodity market always tends to precipitate crises in others, the concerned quarters should bestir themselves and take prompt and effective steps such as would prevent a repetition of similar impasses in future. It is rather intriguing that the Forward Markets Commission has not moved even its little finger so far, at any rate overtly.

TEA FOR AUSTRALIA

THE REPORTED decision to send a three-man Indian tea mission to Australia and New Zealand early in September under the leadership of Mr. U. K. Ghoshal, Chairman of the Tea Board, comes none too soon. It is just two months since tea was decontrolled in Australia and, following decontrol, the demand for tea has been mounting up there without a corresponding increase of stocks. With the return of trade to private channels, there is a very scramble for supplies.

Tea marketing in Australia was hitherto handled by a Government body called the Tea Importation Board and the retail price of tea was kept low by a Government subsidy amounting to as much as £5,500,000 during the year to June, 1955 compared to £4,200,000 in the previous year corresponding.

Australia is one of India's most promising markets for tea. Her per capita consumption is 6.6 pound which ranks among the highest in the world. While her annual import of tea is about 60 million pounds, India's share therein is very poor. It was hardly 6 million pounds in 1954, when Australia imported 51½ million pounds from Ceylon and 3.3 million pounds from Indonesia. Moreover, this meant a heavy decline from 1949, when tea shipments from India to Australia amounted to as much as 18 million pounds. Before the war, Indonesia was Australia's chief supplier of tea. It is thus apparent that Ceylon has already managed to secure a strong foothold in the Australian tea market, while Indonesia is making a bold bid to regain her lost position. And both these countries have certain definite geographical advantages over India. Their proximity to Australia makes for a sizable saving in freight charges. This apart, Ceylon's established connections with the Australian tea trade and the Australians' reported strong preference for Ceylon tea are likely to pose a serious problem to those in charge of India's tea export promotional programme. Ceylon has yet another advantage, in that the International Tea Market Expansion Board's Australian Bureau has been functioning in that country on behalf of Ceylon after India's withdrawal from that body. Having seized the initiative, Ceylon is verily becoming aggressive in its tea export drive. The latest news that confirms this is Ceylon's attitude to the new I.T.A. That country's insistence on the right to export vis-a-vis India at the ratio of 5 : 4 has led to a stalemate in the negotiations for the conclusion of a new International Tea Agreement. The old Agreement, it may be noted, lapsed in March last. Whatever be the raison d' etre of Ceylon's demand for higher export rights, it amounts to a claim for special privileges at the expense of other tea-producing countries. Here is a real threat that India must be prepared to face.

MORE LIGHT ON U.S. GIFT COTTON

THE REVIVAL of rumours in the cotton market in Bombay of U.S. aid cotton all on a sudden may perhaps be indicative of some immediate action by the Government in this behalf. Following the niggardly progress in the offtake of this cotton, there were suggestions in the market, early in July, that the licensing procedure for import of sterling area cotton would be linked to U.S. aid cotton with an obligation on importers of sterling area cotton to import a given quantity of the American cotton. The lack of pace in the offtake of U.S. aid cotton is due to the relatively higher prices that importers have to pay for this cotton as against the price of comparable varieties of sterling area cotton. Rapid absorption of the U.S. gift cotton is not feasible, therefore, unless the authorities can offer this cotton at competitive prices, or are prepared to allow importers to have the difference between the ruling prices of comparative styles of foreign cotton (East Africans) and the prices of U.S. aid cotton.

It is reliably understood that this subject of U.S. gift cotton disposal plan has been fully discussed and a decision thereon is due for announcement very soon. It is thought that the import of this cotton and the responsibility of storing, warehousing and insurance until the cotton is actually disposed of will rest with the Government. As the import of the gift cotton is to be linked to that of sterling area cotton, particularly East African cotton, it is expected that the Government would, in all probability, also sell the American gift cotton at a price comparable to those of similar varieties of non-dollar cotton, that is to subsidise importers to the extent of the difference.

NATURAL OR SYNTHETIC RUBBER?

RUBBER MANUFACTURING interests in India are agitated over the recent trend in raw rubber prices. Even in India, where there is a controlled price since mid-March last, there has been an increase from Rs. 138 per 100 lbs .to Rs. 150 per 100 lbs. Whether this Rs. 150 includes the recent levy in excise duty of Rs. 6-4 per 100 lbs. (or one anna per lb.) or whether it is exclusive of that is still not clear. But even if Indian raw rubber prices were raised by an anna as a result of this impost (that is, 1 anna 9 ps. per lb.), it would still be decidedly cheaper than raw rubber prices in other producing countries like Malaya. The gap between Indian prices and the steadily rising prices in other countries has been widening, making it difficult for consumers of rubber in India to go in for imported natural rubber. There is a gap of about 5,300 tons between the indigenous natural rubber production and the demand for raw rubber of the indigenous rubber manufacturing industry. A suggestion would, therefore, appear to have been made to the Government requesting it to permit imports of synthetic rubber, which, it is rather curious to note, is now available at prices lower than those for natural rubber. It is, however, believed that the authorities are not prepared to accede to the demand of the industry, on the ground that, if synthetic rubber is allowed to be imported and used by Indian rubber manufacturing interests, it may ultimately affect the plantation rubber interests. Obviously, the rubber manufacturing interests are not quite satisfied with this plea for not allowing imports of synthetic rubber. According to them, it is necessary to make up the gap between internal production and internal demand by permitting

imports of either natural rubber as at present, or imports of synthetic rubber which are not being allowed now.

Against this background, it is not known what fate awaits the proposals of the industry for expansion under the second Five-Year Plan. A few days ago, the interests concerned discussed this subject with the Planning Commission and, among the proposals put forward, it is understood, one was for the starting of a synthetic rubber plant and other for starting a plant to reclaim used-up rubber. According to the spokesmen of the industry, there would appear to be scope for both these propositions. The proposal, to begin with, at any rate, is understood to be to manufacture 5000 tons of synthetic rubber and recover 2000 tons from old rubber goods. The belief—referred to in these columns earlier—is not shared by the spokesmen that a 5000-ton plant would be an uneconomic proposition, although the initial capital outlay is put as high as about Rs. 5 crores. Offers for such a plant are believed to have already been invited from West Germany and America among other countries. An interesting disclosure is that synthetic rubber is not proposed to be manufactured out of waste products from the oil refinery—although that is not ruled out—as reported earlier, but from large quantities of molasses, especially in the Deccan, which are now going to waste. The idea, it is understood, is to convert the molasses into alcohol, which is to be converted, in turn, to synthetic rubber. Under this process, it is stated, even a 5000-ton capacity plant would not be uneconomical.

As regards reclaiming rubber, the question does not seem to be one of getting old rubber goods, thanks to the number of motor vehicles in the country which periodically discard used-up tyres. Moreover, the sponsors of the scheme appear to have already got assurances from State Transport organisations in more than one State to supply all the rubber tyres required for the rubber reclamation plant.

RUBY GENERAL'S CONFIDENT MARCH

MR. B. M. BIRLA'S objective assessment of the prospect for the insurance business in the immediate future is rightly couched in words of caution. But the counsel of caution which he gives in no sense detracts from the confidence with which he views the onward march of the Ruby General Insurance Company. The year 1954, saw severe strains of competitive pressures in the business, but in spite of their impact Ruby General recorded distinct improvement in every department of business—general as well as life. The slight set-back which the fire business of the company received in 1953 was not only rertieved but business in 1954 exceeded the level achieved in 1952 by Rs. 11.82 lakhs. In marine and misellaneous businesses, progressive trends were pushed ahead by good margins of Rs. 2.30 lakhs and Rs. 1.29 lakhs respectively. In the life sector, new business improved from Rs. 2.64 crores to Rs. 3.42 crores. The life fund has shown an increase of Rs. 43.18 lakhs over the previous year, while the increase in the premium income on the same basis was of the order of Rs. 5.06 lakhs.

The Chairman's speech at last Tuesday's meeting underlines the prospective hardening of competitive conditions. He seriously questions the wisdom of the reduction in fire rates introduced just recently and if he utters a warning that actual results which will follow from this policy will not fail to falsify the expectations of higher net income cherished by its advocates, it is a realistic estimate and not a gloomy forecast. The cut-throat competition in marine business is the result of unhealthy policies pursued by foreign insurers and the Chairman hopes that this month's World Marine Conference will take appropriate action. Automobile insurance has entailed a higher loss ratio in sympathy with trends in other leading foreign countries, but here the Chairman puts a poser whether the stage has not arrived to review the liberal policy regarding claims settlement. He characterises the threat of nationalisation as a bogey, but reminds High Authority that even a bogey, indulged in persistently, has the potentiality to demoralise industry.

TWO BURDENS OF PLANTATION INDUSTRY

AT THE last annual general meeting of the United Planters' Association of Southern India, the Chairman, Mr. J. L. H. Williams, found himself constrained to express strong views on two major issues which are adding uncalled for burdens to the financial and management problems of the plantation industry. In retrospect, the Chairman finds that the new tax burden imposed by the Madras Agricultural Income-tax transpires to be much severer than originally estimated. There was no question whatsover of a major industry like the plantation industry grudging its share of contribution to the State exchequer, but the quantum of that share cannot, in prudent assessment which must take note of the financial structure of the industry, cross the limit of capacity to bear. Total taxation demanded by the Centre and the State ought to be kept within this limit on a basis of rational understanding. Mr. William's criticism of the local taxes levied by the Panchayat Boards cannot surely be dismissed as carping criticism. The plain fact is that while the cost of all local services including water supplies, conservancy operations, medical arrangements and schools, are generally met by the plantations themselves, Panchayat Boards exercise the right to tax without the obligation to spend on services. Local taxation has little justification if it has nothing to show by way of benefits and amenities to the rate-prayers' areas.

The plantation industry in Madras State is undergoing, for the past three years, the pangs of protected proceedings before the Special Plantation Tribunal and while interim petitions are inflating the volume of the Tribunal's work out of all reasonable proportion, the settlement of the main issues seems nowhere within sight. The newly appointed Tribunal in Travancore-Cochin is faced with a more complex and voluminous task than the Madras Tribunal. The only results which have ensued so far from the Tribunal machinery are the growth of an attitude of enmity and a most objectionable type of labour indiscipline which is producing serious repercussions on productivity. The situation seems helpless at the present time and Mr. Williams' appeal for mutual understanding and resort to the arbitration machinery is unlikely to evoke the needed response.

COMPANY AFFAIRS

T.I.S.C.O.—THE SHAREHOLDERS ANGLE

THE annual meeting of the Tata Iron and Steel Company Ltd. on August 25, proved once again that shareholders are coming into their own and have begun vigorously to put forward their claims for a reasonable return on equity investment. Nearly every one of the shareholders that spoke at the meeting referred to the inadequacy of the dividend paid and some went even so far as to characterise the dividend policy of the company for the past few years as a raw deal to the shareholders in striking contrast to the benefits derived by the employees of the Company, the government and the consumers. This is no exaggeration here, for, as Mr. Dhirajlal Maganlal and Mr. H. T. Parikh of the Bombay Shareholders' Association pointed out, it is only the shareholders of the Company that do not appear to have derived any benefit from the expansion of the Company's operations during almost a decade, despite the large investment in plant and machinery that has come out of their own funds. In support of this contention, Mr. Dhirajlal quoted statistics culled out from the company's reports themselves indicating that, whereas the government obtained large sums in taxation, the employees got handsome increases in wages and the consumer paid lower price for his Indian steel than for the imported steel, the shareholders had, in fact, suffered a substantial reduction in the amount of dividends paid. In view of this, he demanded a definite assurance from the management that, at least in future, the Company should liberalise its dividend policy so as to ensure a fair deal to the shareholders. He also made in this connection the point that an effective capital market could be sustained only if a reasonable return was assured on investments in equities.

With a large expansion programme ahead of the Company, it is only natural for the shareholders to put forward, or rather reiterate, their point of view so that such might not go by default. Moreover, it would appear that, since the shareholders' claim comes only last in the priority list—that is after the claims of the government and the employees, not to speak of those of the consumers—it is necessary for them to become vocal at least at times. That the Tisco shareholders' grievances are genuine was borne out by the replies which the Chairman of the Company, Mr. J. R. D. Tata, himself gave to questions put by the shareholders. He admitted that the shareholders have not had a fair deal in the past. And he explained why this was so. According to him, the shareholders could not have as good a dividend as they deserved because the industry was closely controlled and steel prices were fixed on a grossly unfair basis by the Government, a point which, it may be remembered, he has reiterated several times at past meetings. The Tisco chief hastened to add, however, that the Government's latest policy in regard to steel prices as well as expansion had turned out to be more helpful. Incidentally, Mr. Tata disclosed that the Company had at one time hoped to raise the dividend to Rs. 11 for the year 1954-55 but did not do accordingly after due deliberations. Two reasons were given by him for these second thoughts on the issue of a higher dividend on the part of the directors: first, although the distributable profits were higher, the gross profit was actually lower; the distributable profit happened to be higher, because the provision for taxation was lower. Secondly, it was felt that, for the sake of a small increase in the rate of dividend, it was not advisable to create a wrong impression in the minds of the authorities which would certainly have happened if the dividend had been increased even if only by eight annas so soon after an increase in the retention prices of steel granted by the government.

About future dividend prospects, notwithstanding the categorical statement in the Chairman's speech itself that there was no reason why, pending the implementation of the expansion projects, the yield on capital at the present market values could not be maintained, some shareholders pressed for further clarification. Mr. Tata could only repeat what he has said, for obvious reasons. As he pertinently pointed out, no one could give a categorical reply on this point without knowing what price the Government might fix for the steel and how long the control on steel would last. But he gave reassuring replies to the shareholders on a number of points bearing on the future prospectus of the Company in the context of its own expansion and the coming into being of the three Government steel units. He said, for instance, that the Company would be able to compete successfully with the State units and that, even after all the State units went into production, there was no possibility of the production of steel in the country exceeding the total demand for it. He was confident that the growth of demand for steel in the years to come would be more than commensurate with that in steel output. As regards costs of production, it was Mr. Tata's considered view that, with the Company's 48 years experience in steel making, it ought to be possible for the Company to produce steel at a lower cost than the new State steel units. The estimated increase in the Company's steel capacity, he added, would result in spreading overheads and thereby reducing costs. And what was perhaps even more important, he said, the proposed expansion would solve the Company's most intractable problem for some years, namely that of its excessive labour force.

Now a few words for the expansion programme of the Company. It may be noted that the Company has already a current expansion programme which is expected to raise its capacity to 1.3 million ingot tons. With the new expansion project involving an additional capacity of 700,000 tons estimated to cost Rs. 60 crores, the total capacity would be raised to 2 million tons of ingot steel. Mr. Tata informed the shareholders how it was proposed to finance the new project. In this connection, he drew attention to the Government's resolution referring to the question of a revision in prices to the Tariff Commission and pointed out how it provided for the price to be such as to enable both the major producers to obtain a portion of their capital requirements for their current and additional expansion from internal resources and also as would enable them to raise the balance from outside sources. On this basis, he calculated that the Company would be enabled to accumulate, over four or five years, Rs. 20 crores on the new expansion projects, leaving a sum of approximately Rs. 10 crores still to be found (after, of course, taking into account the loan of Rs. 30 crores expected to be received from the World Bank or the Export Import Bank). The directors, he added, had decided to raise this sum of Rs. 10 crores by a fresh issue of equity capital. Anticipating the shareholders' possible criticism about the propriety of raising further equity capital, Mr. Tata volunteered a few observations himself in advance to prove that there was an overwhelming case for an increase in the share capital. Taking into account the existing and the new expansion programmes, he pointed out, the gross block of the Company would probably rise to Rs. 140 crores and its borrowing to about Rs. 50 crores. As against this, he went on to say, an amount of Rs. 3.74 crores which was all the total capital provided in cash by the shareholders including the premium on deferred shares, (or, for that matter, even the total of Rs. 27 crores, including preference and ordinary capital, plus the new issue), would be disproportionately low. He, therefore, felt that the best solution of the problem probably lay in

the capitalisation, from time to time, of reserves as they were built up and in the issue of bonus shares to a corresponding extent. With the recent decision of the Government to sanction bonus shares and the latest Appellate Tribunal's decision denying to the workers any right on the shareholders' reserves, this may well be the pattern of capital reorganisation in the future not only of this company but of several others as well.

It only remains now to sum up what Tata said about the merits of the new expansion project. This would bring significant benefits to all concerned, since it would increase the Company's steel capacity by 60 per cent, the result of which would be to spread the overheads and thereby reduce costs; it would further enable the Company not only to make an important contribution to the country's economic expansion but also to solve the problem of excessive labour, as already stated,—a problem, the existence of which has been admitted even by such distinguished trade unionists as Mr. V. V. Giri, the erstwhile Union Minister for Labour.

THE GANGES MANUFACTURING COMPANY, LTD.,

The Report and the Audited Accounts of the Company for the half-year ended March 31, 1955, show following results:

Profit on Revenue Account			Rs. 7,97,033
Adding thereto:			
Share Transfer and Sub-Division Fees	Rs.	588	
Provision for Doubtful Debts no longer required	,,	575	
Profit on Sale of Capital Assets	,,	1,24,784	,, 1,25,947
			Rs. 9,22,980
And Deducting:			
Retiral Gratuities to Workers	Rs.	26,746	
Balance of Calcutta Office and Establishment Expenses relative to previous periods reimbursed to Managing Agents	,,	42,450	
Provision for Doubtful Debts	,,	1,887	
Depreciation	,,	2,00,000	,, 2,71,083
The Balance			Rs. 6,51,897
Adding the amount brought forward			,, 5,930
			Rs. 6,57,827
And Transferring to Reserve for Machinery Renewals and Replacements			,, 3,00,000
There is available for disposal			Rs. 3,57,827
The Directors propose that this sum be dealt with as follows:			
By payment of a Dividend on Preference Shares of Rs. 4 per share or 8 per cent per annum	Rs.	24,000	
By payment of a Dividend on Ordinary Shares of Rs. 2-8 per share of 5 per cent per annum	,,	2,10,803	,, 2,34,803
Leaving to be carried forward			Rs. 1,23,024

In accordance with the I.J.M.A. Main and Supplementary Working Time Agreement then in existence the Mills worked 45 hours per week up to the 17th October, 1954 and 48 hours thereafter up to the 25th December, 1954. From 27th December, 1954, to 31st March, 1955 the Mills continued to work 48 hours under a new Working Time Agreement signed by members of the I.J.M.A. on 23rd December, 1954. This new agreement will remain in force for five years. 12½ per cent of the total complement of looms remained sealed during the entire six months in accordance with these agreements. For the first half of the period under review trading conditions were favourable. Latterly, however, raw jute costs rose disproportionately, making profitable working difficulties.

INDIAN STANDARD WAGON COMPANY

The Annual Report together with the Audited Accounts for the year ended March 31, 1955, of the above Company shows that:

After providing for taxation, depreciation and all other charges, transferring Rs. 1,00,000 to General Reserve and setting aside Rs. 12,00,000 on Plant Replacement Reserve, the profit on the year's trading amounted to		Rs. 6,33,193
To which is added the balance brought forward from the previous year		Rs. 28,820
Making a balance available of		Rs. 6,62,013
The Directors recommend that this balance be dealt with as follows.		
Payment of the dividend for the year on the 7 per cent Preference Share Capital	Rs. 1,37,655	
Payment of a dividend of 25 per cent for the year on the Ordinary Share Capital	Rs. 4,87,313	Rs. 6,24,968
To be carried forward		Rs. 37,045

The works of the Company were fully employed throughout the year and, with the co-operation of all the workers and staff, a substantial increase in output has again been recorded, which is reflected in the value of sales and, in turn, in the improved trading results.

Good progress is being made against the programme for the replacement and general rehabilitation and modernisation of the plant. The total cost of the full programme in this respect is now placed at approximately Rs. 30 lakhs, for the finance of which it is essential that funds be rapidly accumulated. While marking the improved working results for the year with the recommendation of a substantial increase in the rate of dividend on the Ordinary Share Capital, the Directors for the above reason have considered it essential to set aside from profits a sum of Rs. 12,00,000 to the Plant Replacement Reserve.

Company Meeting

THE TATA IRON & STEEL CO., LTD.

Speech Delivered by the Chairman, Mr. J. R. D. Tata, at the Annual General Meeting of the Shareholders on Thursday, the 25th August 1955.

Ladies and Gentlemen,

Since I last had the pleasure of welcoming you at this annual gathering, much has happened of special interest to our Company and to industry generally. Important policy pronouncements have been made, significant legislation has been passed, plans have been formulated, a report on taxation has been published, all of immediate or potential significance to us.

2. As our annual report and accounts are so detailed, there is no need for me to elaborate on them at this meeting except in answering questions from shareholders. I propose, therefore, to devote my speech today to two main subjects, namely, the pattern of Government's economic policy which has emerged from their statements and actions during the year and the proposed expansion of our plant to two million tons per year.

THE ECONOMIC PATTERN

3. At the last two annual general meetings, I referred at some length to the subject of a Mixed Economy and the role of the private sector in it, and took some pains to set forth what I felt was a fair and sound case for better opportunities to Free Enterprise to enable it to fulfil its task under the series of Five-Year Plan.

4. We all appreciate that bold planning and determined execution of large schemes of development are essential if we are to raise living standards, relieve unemployment, give opportunities to all and ensure a reasonable degree of social justice. Everyone, I believe, is agreed that the principal means of achieving these objectives is to increase the total production of the country as rapidly as possible since, without an increase in total wealth, there will be nothing to distribute but poverty. We realise that the task is a formidable one by any standards and that it requires the united effort of all and dynamic action by the State. I have thus welcomed the policy of creating a Mixed Economy in which both State Enterprise and Free Enterprise will, side by side, play their important roles.

5. It would seem, therefore, that there was little room for disagreement on general economic policy and that the stage was set for fruitful co-operation between Government on the one hand and industry and business on the other. Indeed, several pronouncements by spokesmen of the Administration have appeared to confirm this fundamental identity of sentiment and approach. No less a person than the Prime Minister has, on more than one occasion, held out the assurance that Free Enterprise would have an important place and effective role in the country's development and deprecated the outmoded idea that Socialism means nationalisation. Speaking to the Congress Parliamentary Party in May this year, he said: "I think there is really no choice before us between having a private sector and allowing it and encouraging it to function, and not having it at all. It is foolish to have a private sector and then undermine it and prevent it from functioning. .....I personally think that even for the proper functioning of the public sector it is desirable to have a competitive private sector."

6. Equally reassuring was the statement made in July this year by Mr. T. T. Krishnamachari, the Minister for Commerce and Industry, at the last meeting of the Central Advisory Council of Industries, that there would be no nationalisation for the sake of nationalisation. The Minister went on to say that the State could and would enter the field normally reserved to the private sector only if the latter was unable to develop certain industries. At the same time, the State might invite the private sector to co-operate in industries in the public sector.

7. Still more recently, in the course of the current debate in Parliament on the Companies' Bill the Finance Minister made this encouraging observation on the role of the Industry:

> "Having decided that we shall have the private sector, and having come to the conclusion that we should exert to extract the best out of that sector, it is our duty to consider how a private investor could be encouraged to put his money into joint stock enterprise. That seems to me a very legitimate and very laudable object....."

8. While giving full weight to these encouraging pronouncements, it would be unrealistic of us not to take note of certain events of the past year such as the recent amendments to the Constitution, the proposed amendments to the Companies Act, the fiscal policy of the country, particularly in relation to the Report of the Taxation Enquiry Commission, some aspects of the proposals for the second Five-Year Plan, and the way in which the Avadi resolution on the socialistic pattern of society is sought to be interpreted and implemented. Let us take them in turn.

CONSTITUTIONAL AMENDMENT

9. There is little doubt that the Fourth Amendment to the Constitution, by denying to the citizen recourse to Courts of Law, has seriously undermined the right to property, which has been recognised through the ages as one of the fundamental human rights and which the United Nations has solemnly affirmed in a declaration to which the world including India is a party. While it is reassuring to note that the present Government have every intention, as stated by the Prime Minister, of paying a fair price for any

undertaking they may decide to take over, there is every reason to fear that such sweeping powers, once acquired, may, some day, become an instrument of oppression in the hands of future governments. In addition, the passing of this amendment is bound to shake the confidence of industrialists and investors and thus adversely affect the ability of the private sector to fill its allotted role.

COMPANIES AMENDMENT BILL

10. The Companies Amendment Bill is now under discussion in Parliament. Since it was first introduced it has undergone in the Joint Select Committee important changes, some of which go much beyond the original scope of the Bill and would, if adopted, place serious impediments in the way of the smooth and efficient management of joint stock companies. It is encouraging to note, however, that as against some extreme proposals made during the debate which would change the entire character of the Bill from a constructive improvement of Company Law to a measure striking at the very root of the whole system of free enterprise, some moderating voices have been heard on the floor of the House, the most notable amongst these being that of the Finance Minister whom I have just quoted. We may thus hope that Parliament will refrain from placing on the Statue Book provisions which would permanently cripple elements otherwise capable of assisting in the country's economic development.

TAXATION COMMISSION'S REPORT

11. This is not an occasion on which to analyse the Report of the Taxation Enquiry Commission under the distinguished leadership of Dr. John Matthai, but I may say that I am not amongst those who can see nothing good in the Commission's recommendations. There are, in fact, from the point of view of the private sector, some recommendations in the Report as, for instance, in connection with the development rebate which are clearly beneficial to Industry. On the other hand, certain recommendations would lead to unfavourable consequences, notably those in respect of Section 23A of the Income Tax Act which may lead to a serious depletion of resources hitherto available for development purposes. What I am more concerned about, however, is the effect which the high level of taxation proposed and the emphasis laid on the need to restrict incomes and consumption in the early years may have on production. In Chapter 8 of their Report the Commission have themselves repeatedly stressed the need to avoid adverse repercussions on private productive effort and enterprise. I fear, however, as do many others directly concerned with the working of the private sector, that the abnormally high levels of individual taxation recommended will in fact act as a serious disincentive to productive effort and enterprise. This, coupled with the diversion of an undue proportion of total savings to Government, will impair the private sector's ability to meet the targets allotted to it.

SECOND FIVE-YEAR PLAN

12. A preliminary outline of the framework of the second Five-Year Plan has recently been released by Government for purposes of public discussion. This is a healthy move on which the Government of India are to be congratulated.

13. While the necessity for bold planning is unquestioned, for the needs of the country are both great and urgent, some of the proposals are such as to raise doubts in one's mind. For instance, considering the resources likely to be actually available, can the proposed targets be attained without recourse to a much higher degree of deficit financing than at present contemplated, with the consequent risk of inflation which would deprive the mass of the people of the fruits of their toil? Will the large scale development of heavy industry at one end and cottage industries at the other, without an adequate development at the same time of secondary consumers' goods industries in between, not lead to a lop-sided pattern of development which may result in inflation, scarcity of consumer goods, and also in a substantial part of the capital investment in heavy industry remaining unproductive for some years for want of a market? Is it wise to attempt to reverse the normal historical process by which the establishment of capital goods' industries has followed and not preceded the development of consumer good's industries? Has the argument that the position can be rectified by the development of secondary industries at a later stage any validity considering that owing to the continuing increase in population amongst other factors, there is bound to be a large amount of unemployment at the end of the second Five Year-Plan, and the same arguments will inevitably be used then as now for restricting the development of manufacturing industries? Will the consumer in urban and industrial areas be willing to pay the necessarily higher prices of goods produced by household and cottage industries, even when the quality is satisfactory? Finally, is it realistic to assume that household industries can be developed fast enough to provide all the additional consumer goods necessary to meet the increased demand and, more particularly, that the widespread organisation and the necessary financial-cum-marketing facilities can be built up in so short a time? I would urge, while there is still time, that these important aspects of the problem be considered before the second Five-Year Plan takes final shape.

SOCIALISTIC PATTERN

14. Finally, we have the goal of a "socialistic pattern of society" set before the country. If it means a society in which all have equal rights and opportunities, the underprivileged are protected and helped to a better life, economic activities are harnessed to constructive nation-building purposes and controlled by the State for the common good, and selfish abuses and anti-social acts are checked, then we should all support it. But if the means adopted were to lead ultimately to a society in which incentives and initiatives are impaired, the greater part of the industrial apparatus is owned by the State, economic power and responsibility are largely centred in the hands of government, and the individual loses freedom of choice, whether as producer or consumer, then, I submit, this kind of society will be incapable of producing the required volume of goods and services essential for the prosperity and happiness of our people.

15. Surveying these various trends in the country, one finds running through them two major currents of thought. The first is the belief that the profit motive or the desire for material rewards for individual effort, which has characterised man's progress from the beginning of his life on earth, is anti-social and that it can be replaced without loss of productivity by a selfless desire on the part of everyone to work solely for the good of the community. The second is the undue emphasis on Socialism as the only path to prosperity.

THE NEED FOR INCENTIVES

16. Apart from the fact that there is in my view nothing morally wrong in the yearning of individuals to better their own and their families' living conditions and to seek material reward and financial security in return for hard and productive effort, a remarkable aspect of the disparagement of material incentives and rewards is that, while they are regarded as unobjectionable in the case of the peasant and the worker, they are sought to be withheld from the professional man, the administrator, the manager, the enterpreneur and the investor—the very men from whom we expect the initiative and leadership required for the success of the country's plans of economic development. In their case incentives and rewards are sought to be replaced, it seems, only by a missionary zeal to serve the community.

17. It is true that many of the men who today lead the nation have dedicated their lives to the country's advancement and are motivated by a noble ideal of service. But, with great respect, I submit it is unrealistic to believe that more than a minute percentage of the people of the country in any walk of life can be expected wholly to eschew personal interests. For the vast majority of the people the removal of material incentives and rewards will merely act as a disincentive, and lead to a reduction of effort and efficiency and to an increasing tendency to let the other fellow do the job. We should face the fact, whether we like it or not, that most men will be driven to hard work only by material reward or fear, or a combination of both.

18. In a country pledged to the use of non-violent and democratic means, it is clear that our governments cannot and will not, as in totalitarian states, use the weapons of force or fear to drive people. But, if we are to eschew both reward and fear, and if selfless devotion to the community can impel only a minority so small as to be incapable of making any material impact on the country's productivity, is it not obvious that the activity of the nation will be retarded and our great Five-Year Plans jeopardised? Faced as we are with the imperative need to work, to produce, to build, to save and to invest, is it wise to lay so much emphasis at this stage on levelling down incomes and seeking to achieve an equalitarian society before we have created a reasonable quantum of wealth to distribute equally?

19. While it is true that there is still an undue disparity in incomes in our country, it is I feel not adequately realised that considerable progress has been made in recent years towards reducing inequalities. On the one hand, the income of peasants and wage earners has substantially increased while, on the other, the steep rise in taxation has drastically reduced the earnings of higher income groups.

20. A particularly unfortunate consequence of going too far in the direction of reducing earnings is the discouragement caused to foreign capital which might otherwise play such an important part in helping the development of our economy.

21. To sum up my analysis of this important, and too often overlooked, factor in our economic plans, I would earnestly urge that while retaining the ultimate objective of widely distributed wealth and social justice, and curbing abuses, anti-social activities, ostentatious spending and an undue accumulation of wealth and power in individual hands, we should make full use of the natural instincts of human nature as it exists and not rely unrealistically on the hope that they can be changed in a short time by executive act or legislation.

CAPITALISM TRANSFORMED

22. As regards the apparently growing trend towards a comprehensive form of socialism, as distinct from the more empirical form favoured in, say, Britain or the Scandinavian countries, there are some who hold the view that capitalism is wholly out of date. Considering the remarkable progress made in capitalistic countries particularly since the war, such a view can only refer to the nineteenth and early twentieth century type of capitalism which is, indeed, just as out-of-date as the nineteenth and early twentieth century type of socialism.

23. We are, however, no longer living in those days and should not close our eyes to the enormous changes which have occurred in capitalistic societies throughout the world since then. Modern capitalism has changed beyond recognition from what it was a century ago. It has shown a remarkable capacity to fit into the most modern concepts of the Welfare State, while creating wealth and prosperity unprecedented in human history. Statistics are sometimes used to obscure this truth; as an instance, I may mention the extraordinary figures of national income growth quoted in a working paper entitled "The second Five-Year Plan's Tentative Framework" circulated a few months ago for purposes of discussion. The picture presented would lead us to believe that the annual growth of national income in socialistic countries under totalitarian regimes is three to five times as great as in capitalistic countries. To suggest, even by implication, that economic progress is greater in, say, East Germany, Poland, Hungary or Bulgaria than in West Germany, Belgium, France or England, let alone America, is to place a severe strain on one's credulity. There is, in fact, overwhelming evidence that the conditions of living in Western Europe are far better than in Eastern Europe and also that the rate of post-war recovery and economic growth is greater. This contrast can best be seen in a visit to East Germany as well as West Germany. Though both these zones were severely damaged during the war, the enormous disparity which exists today in economic- activity and in the standards of living of the people is there for all to see—a West Germany humming with activity and abounding in consumer and capital goods of all kinds, where the Government have actually had to warn both management and workers not to work so hard and so long; an East Germany, where conditions are visibly worse than across the border and where small producers restrict their output and avoid expansion for fear that their business and the fruits of their enterprise will be taken over by the State.

THE CHOICE OF MEANS

24. If I have taken so much of your time in discussing these recent developments of our economic policy, it is because they seem to me to be of crucial importance to the future of our country. We all appreciate the outstanding achievements of our government in overcoming grievous difficulties and stabilizing our economy since the attainment of Independence. A tremendous opportunity for rapid development within the framework of a free and democratic society now lies ahead. On the choice of the means and methods of achieving our objectives will largely depend the success or failure of our plans, and in our hurry and impatience to get quick results, let us beware of the temptation to jettison economic systems or working philosophies based on human nature which have stood the test of time.

25. In conclusion, may I repeat that if I have expressed doubts, it is not because I fear that business or industry or the few well-to-do may suffer a contraction of their income or profit, but because I sincerely believe that the voluntary enterprise of our people, individually and in groups, has a great part to play

in ensuring the success of the plans on which the country has embarked.

TWO MILLION TON PROJECT

26. Let me now turn to our own affairs and particularly to the important project for the further expansion of our Jamshedpur plant to an annual capacity of two million tons of ingots or a million and a half tons of finished steel, about which most of you must have by now heard.

27. First let me give you a little background. As part of their estimates of the country's consumption of steel under the second Five-Year Plan, Government have set the target for steel production for 1961 at 6 million tons of ingot steel or 4½ million tons of finished steel.

28. Under the declaration of industrial policy of 1948, Government had decided that all major expansion schemes in the steel industry amongst others should thereafter be undertaken by the State. In pursuance of this declaration, Government propose to erect three separate steel works of about a million tons each and to operate them under State ownership and management.

29. The addition of this capacity to the existing or planned capacity of the steel works in the private sector will still leave the country short of the target. Instead of building a fourth steel plant, Government have, I am glad to say, agreed that the existing plants in the private sector should be allowed to expand further. This is a decision to be greatly welcomed both because the three projects already planned will by themselves place a considerable burden on Government's financial and managerial resources and because the existing plants can be expanded more quickly and at less cost.

30. As the present programme already under way at Jamshedpur will bring our capacity by 1958 to 1,300,000 tons of ingots, the new expansion project involves the creation of an additional 700,000 tons of capacity. Preliminary studies have indicated that the project is both technically feasible and economically sound, that it can be completed within three years and that the cost will be in the neighbourhood of Rs. 60 crores. This compares favourably with the cost of putting up an entirely new plant. The technical details of the project are at present under investigation by a firm of American consulting engineers and by our own Management.

THE PROBLEM OF FINANCE

31. The financing of such a costly project obviously poses a serious problem. When discussing the new expansion scheme with Government, we stated that, in order to maintain the financial stability of the Company, not more than half the estimated capital cost should be financed from borrowings. The balance of Rs. 30 crores should be financed from internal resources and from the issue of fresh capital.

32. I am glad to say that Government have recently decided on doing away with differential prices as between one producer and another, and, pending an enquiry by the Tariff Commission which is at present in progress, they have provisionally increased our retention prices by an average of about Rs. 54 per ton with effect from April 1955. A condition of this and any further increase that may be granted on the recommendation of the Tariff Commission is that the whole of the resulting accretion to our profits, after paying tax on it, should be taken direct to a development account and used solely for purposes of expanding the Company's productive capacity towards the two million ton target. A further condition is that, if we do not go ahead with the project, the net additional profits accruing from the increase in prices must be repaid to Government.

33. The Government resolution referring the question of a revision in prices to the Tariff Commission provides that the prices should be such as would enable both the major producers to obtain a portion of their capital requirements for their current and additional expansion programmes from internal resources and as would enable them to raise the balance from outside sources. We have made the necessary representation to the Tariff Commission for a substantial increase in the new retention prices. It is expected that the Tariff Commission will proceed with the inquiry quickly and make an early report to Government.

34. Even if the Tariff Commission's recommendation and Government's ultimate decision enable us to accumulate over four or five years, as I hope, Rs. 20 crores for the expansion project, there will still remain a sum of approximately Rs. 10 crores to be found.

CAPITAL ISSUE

35. The Directors have come to the conclusion that the only source from which this sum of Rs. 10 crores can and should be obtained is a fresh issue of equity capital. Detailed proposals are being formulated to this end and will be submitted shortly for your approval at an extraordinary general meeting. While I cannot obviously anticipate at this stage what dividends will be paid in future, there seems to me to be no reason why, pending the completion of the project, the yield on the enlarged capital on the basis of present market values cannot be maintained.

36. I have already shown that this major project cannot be financed wholly from borrowings or internal savings. Apart, however, from the need for additional funds, there is an overwhelming case for an increase in the share capital of the Company. Taking into account the present modernisation and expansion programme, the two million ton programme and various ancillary projects and the normal annual capital expenditure, the gross block of the Company, during the next four years or so, will probably rise to Rs. 140 crores or more and its borrowings to something like Rs. 50 crores. It is clear that, on the basis of such enormous figures, an amount of Rs. 3.74 crores, which is the total capital provided in cash by the equity shareholders, including the premium on deferred shares, would be disproportionately low. Even if we add up the preference shares, the existing ordinary shares and the new issue which we now propose to make, it is evident that a total share capital of even Rs. 27 crores will be on the low side for a Company in which not far from Rs. 200 crores will have been invested. This does not mean that I visualise further issues of capital for cash in the near future. The best solution of the problem will lie in the capitalisation from time to time of reserves as they are built up and in corresponding issues of bonus shares. The fact that for so many years shareholders have had to be satisfied with low dividends provides a strong case for such a policy and I hope that the Government of India will grant the necessary sanction as the occasion arises.

37. Taking all these factors into consideration, I am sure that shareholders will agree that the proposed issue of fresh capital is necessary if we are to go ahead with the project at all. On that assumption, let me now briefly analyse the merits of the scheme itself.

MERITS OF PROJECT

38. To my mind there can be no question that the proposed expansion of our plant will bring significant benefits to the Company, its shareholders and its employees, as well as to the country.

It will increase the Company's finished steel capacity by 60 per cent.

It will, as a result of the increased output and the better spread of overheads, help to reduce costs.

It will largely solve the intractable problem of excessive labour which has plagued us all these years.

Finally, it will provide the opportunity for the Company to make an important contribution to the country's economic expansion. I have, in previous speeches as well as in this, stressed that Free Enterprise has a major role to play in the country's regeneration. It would, therefore, be wholly inconsistent with such a view if, when Government did show their willingness to take our assistance, we were to withhold it.

39. As the implementation of this scheme must, apart from other considerations, depend on the availability of some Rs. 30 crores of foreign borrowings to pay for the plant and equipment to be purchased abroad, Mr. J. D. Choksi, Mr. A. D. Shroff and I, and later Sir Jehangir Ghandy, visited the United States to investigate the sources of capital and plant available there. We found, for reasons which need not be elaborated here, that American private capital which has unlimited opportunities in its own country and in other parts of the world where the climate for private investment is exceptionally favourable, would not be available to us to any appreciable extent either in the form of loans or of share capital.

40. We held discussions with the World Bank and the Export-Import Bank. Both these great financial institutions received us, and listened to our proposals, with cordiality, courtesy and responsiveness. We came away satisfied that the required long-term finance would be made available to us.

41. Finally, we took the opportunity of calling on some of the highest ranking officials of the American Government and I should like to take this opportunity of expressing our deep appreciation of the interest they took in our proposals. I believe that the United States Government is anxious to help India in her industrial development.

42. Further progress in negotiating the necessary finance in the United States must await the completion of the technical studies of the project now under way by consulting engineers and our own management. We expect that stage to be reached in the next few weeks, when negotiations with the U.S. Government, the Export-Import Bank and American manufacturers will be resumed. We shall spare no effort to ensure that the scheme as finally adopted is technically and financially sound and that, once it is approved, it is pushed through with the maximum of energy and speed. I am sure in this effort we can count on the support of our shareholders and employees.

LABOUR'S ROLE

43. I have specifically mentioned our employees because they have as vital a stake in this project as anyone else and because they will have also an important responsibility in its implemention.

44. We have in recent years made it clear to them that there was no room left for any appreciable increase in their emoluments except through an improvement in their productivity. We obviously cannot afford to embark upon a scheme of this magnitude if, at the end of it, we are still to be burdened with the gross excess in our labour force which we have today.

45. The new Government plants will be of the latest type, employing a much lower number of men per ton of capacity than we do at Jamshedpur. It is obvious that if Government pays the same wage rates as we do, their labour cost per ton of steel will be substantially lower than ours unless our output per capita is correspondingly increased. Fortunately, the proposed expansion will provide the opportunity to achieve smoothly and painlessly a substantial increase in the output per capita at Jamshedpur involving no retrenchment and ensuring job security and higher earnings to our workers in the years ahead. I sincerely trust that they will appreciate and seize the wonderful opportunity which the scheme will bring them of serving their own interests as well as those of the country.

46. As usual at these meetings, it gives me great pleasure to express to our Management and staff throughout the Company's vast organisation our appreciation of the excellent work they have put in during the year and our thanks for their co-operation.

Company Meeting

RUBY GENERAL INSURANCE CO., LTD.

Speech by Mr. B. M. Birla, Chairman, Ruby General Insurance Company Limited, delivered at the Nineteenth Annual General Meeting of the Shareholders of the Company on Tuesday the 30th August 1955.

Gentlemen,

I welcome you to the 19th Annual General Meeting of the Company.

The Report of the Directors and the Audited Accounts for the year 1954 have been with you for some time and I expect you would allow me to take them as read.

The following figures will reveal the progress of the Company.

TABLE A—GENERAL INSURANCE

Net Premiums

	1952	1953	1954
	Rs.	Rs.	Rs.
Fire	25,94,000	25,90,000	32,76,000
Miscellaneous ..	34,69,000	35,42,000	37,11,000
Marine ..	9,75,000	10,48,000	12,78,000
	70,38,000	71,80,000	82,65,000

TABLE B—LIFE ASSURANCE

	1952	1953	1954
	Rs.	Rs.	Rs.
New Business ..	2,49,99,000	2,63,63,000	3,41,57,000
Life Assurance Fund	2,02,78,000	2,39,91,000	2,83,09,000
Premium Income ..	56,07,000	57,67,000	62,73,000

Our total reserves have increased this year by Rs. 48,28,000|-, Rs. 41,61,000|- in Life and Rs. 6,67,000|- in General Department.

Under the competitive conditions that obtain today in our trade, the all-round increase in the income of our General Department is gratifying. The recent downward revision in Fire Tariff rates is yet another obstacle which general insurers will find rather difficult to meet and I for one feel that the results may well be the complete opposite to those envisaged by the sponsors of this move. Our efforts in respect of overseas business have yielded fruit and premium income from this source has substantially increased. There is still scope for further increase of income in this direction and a cautious policy of expansion in the overseas market followed by our Company, coupled with the correct underwriting policy followed by us at home, will make for increasing progress for this Company from year to year.

Marine Insurance business continued to face unhealthy competition due to rate cutting by foreign markets and increased demand for wider covers with nominal extra charge. Due to this, Regional Councils were obliged to withdraw tariff for many ports to enable Indian Companies to maintain their portfolio. I hope the World Marine Conference which is going to be held in September at Monte Carlo would take steps to put Marine Insurance business on sound footing.

The Miscellaneous Department has been consistently showing losses for the last many years, primarily because the Automobile section continues to show an increasingly unfavourable loss ratio. While it is regretted that this should be so, this unhappy experience is the feature of most general Insurers throughout the world. In this connection, it is pertinent to note that the 1953 experience of English Companies disclosed an underwriting profit of 2 per cent and odd only. Among the reasons for this state of affairs is the increasing consciousness of the right of the public to claim damages from Insurers whether the same falls within Policy Conditions or not. It is possible that if the losses are strictly surveyed and relative claims settled as per actual losses, the Department concerned should be able to show profits. This can only be possible if the various Insurers individually follow a stricter claims settlement policy. We on our part are following a strict underwriting policy in this regard and efforts are made to develop other miscellaneous business which would to some extent offset the results of the Automobile Department.

The working of the Life Department shows a distinct improvement in all directions as is evident from the comparative figures given above. The Life fund has increased by an amount of Rs. 43,17,000 as against Rs. 37,13,000|- and the premium income has increased by Rs. 5,06,000 as against Rs. 1,60,000 in the previous year respectively.

Your Directors have decided to have another valuation of our Life Department for the year ending 1954 and we expect that it will show substantial surplus to enable us to give higher bonus to our policyholders.

The report of Taxation Enquiry is before us and I am glad to see that it is recommended to allow larger abatement in respect of payment of Insurance premium from one sixth of the total income with a ceiling of Rs. 6,000 to one fifth of the total income with a ceiling of Rs. 8,000. They have also recommended to allow General Companies to add 5 per cent of their annual net premium to reserves every year free of tax until the reserves reach certain limits. I am sure that Government will accept their recommendations as such encouragement will give impetus to Insurance Companies.

NATIONALISATION

The bogey of Nationalisation is in the air. It is true that the Government has not categorically declared its stand on the subject as yet but Ministerial utterings in spare time are doing more harm than good. The Industry is labouring under a cloud. Utterences by those who should know better and their criticism of our trade, based on an insufficient knowledge of the subject, have made it impossible for us to pursue our course with confidence.

If our trade is to play its destined role in the building up of future India as envisaged in the Plans of Government, we should be assured that the future success and development of the Industry is bound up with free enterprise. State intervention to the extent that it is calculated to ensure the safety of the Public the Industry undertakes to serve, is good. State intervention is beneficial and justified till such time as it does not cross these principles of public safety, which is the legitimate limit to which a Government can interfere, with the working of a private enterprise. Acquiring the reins of the trade by the Government, where the absence of personal responsibility of its servants is proverbial, is sure to lead to abuses to which any Statemanned organisation is inherently inclined. Too much of any good thing is unhealthy for any growth in the long run and this applies with equal emphasis to State intervention in Insurance. The State has intervened to the necessary extent and still has the right to take over the administration of any unit, that may be calculated to work against public interest and any further infringement on the part of Government in this direction is bound to be suicidal in the long run.

I feel that before nationalising any new Industry, Government ought to take stock of what they have done up till now. If one goes into the working of nationalised undertakings, he will find that they are not properly managed and cost to the public has increased. Insurance is one of the few Industries which has been able to hold its own against foreign competition without any protection from State.

Out of Rs. 154.48 crores Life business completed in 1953 in India Rs. 137.46 crores business has been controlled by Indian Companies. Similarly in General Department out of Rs. 20.71 crores premium available in India Rs. 11.94 crores have been controlled by Indian companies.

Our Companies are also making headway in foreign countries. In the year 1953 Indian Companies acquired a premium of Rs. 8.29 crores in foreign countries against net Rs. 6.77 crores premium completed in India. Cost of insurance to public as you are aware, is going down from year to year due to competition among Insurance Companies. If Insurance Industry will be nationalised it would bring stagnant condition in this business which is developing every year and hence I hope Government will allow this Industry to play its successful part in the interest of our country.

Gentlemen, you have heard of the sad demise of our General Manager Shri Jwalaprasad Kanoria. He was associated with this Company right from inception and his absence will be felt by all those who came in contact with him. We record our deepest appreciation of the services he rendered to the Company and convey on behalf of the Board of Directors and Shareholders our heartfelt condolences and sympathies to the members of the bereaved family.

Before I conclude I wish to thank the Executives, Staff, Agents, Representatives and the field workers of the Company in India and abroad for their sincere cooperation and efficient services. It is due to this encouraging co-ordination of all of them, the Company has been able to make steady progress. I also convey my thanks to the policyholders whose support has helped the Company to achieve this position.

Thanking you.

COMMODITY NEWS AND NOTES

CEREALS TARGETS CROSSED

The agricultural year 1954-55, which ended in June, witnessed an increase both in the acreage and production of cereals in India as compared to 1949-50, the base year for the first Five-Year Plan. According to an official review of agricultural production for the year, the average yield per acre also went up considerably during this period. The total production of cereals during the year, according to the review, was 55.3 million tons representing an increase of 9.3 million tons over that of 1949-50. The area under cereals in 1954-55 was 209 million acres as against 193.6 million acres in 1950-51. Thus while during these years the acreage increased by 6.9 per cent production rose by nearly 20.2 per cent.

The total production to cereals during 1954-55 not only exceeded the quantity aimed at for the fourth year of the Five-Year Plan, but also crossed the target fixed for 1955-56 by 2.8 million tons. Similarly, the acreage under cereals during the year was higher than the target at the end of the Plan period by about 12 million acres. Both production and acreage, however, fell short of the record figures of 57.9 million tons and 215 million acres respectively achieved in 1953-54.

RECORD WHEAT OUTPUT

Wheat production established an all-time record at 8.5 million tons in 1954-55 exceeding the target for 1955-56 by about 0.2 million tons. The production of millet and other minor cereals during the year reached 22.6 million tons which was 5.6 million tons more than the target fixed for 1955-56. The yield of rice during the year was 24.2 million tons. This fell short of the calculated target of the fourth year of the Plan by 2.2 million tons. Set against the background of 1953-54, when production of rice reached its peak at 27.6 million tons, the review, said the setback appeared more pronounced. But the production in 1954-55 was still about a million tons higher than that in the base year.

The fall in rice production during the year took mainly in Bihar and West Bengal where heavy rainfall and floods in the northern districts and continuous drought in southern districts hampered the sowing and transplantation of both autumn and winter paddy. Out of the total shortfall of 3.4 million tons, these two States accounted for nearly 3.1 million tons. With a total production of 55.3 million tons and an estimated population of 378 million, the 'per capita' availability of cereals in India in 1954-55 works out to 14.4 ounces, which is 0.4 ounces higher than the balanced diet laid down by the Nutrition Advisory Committee. It also exceeds the target set for the first Five-Year Plan, i.e., 13.71 ounces per head for 1955-56.

IMPORTS SLASHED

The increased production of cereals has enabled the country to cut down its imports of cereals and to save valuable foreign exchange. In 1951, India imported 4.7 million tons of cereals costing Rs. 217 crores. In 1954, the total imports came down to 808,000 tons valued at Rs. 47 crores. In addition, 7,000 tons of rice worth about Rs. 51 lakhs were exported during that year. The total quantity of cereals imported in 1955 (up to July) is about 690,000 tons.

The increase in production, particularly the higher percentage of yield per acre, could not be attributed to kind weather conditions only, the review said. In the context of floods and droughts in large areas in Bihar, West Bengal and Uttar Pradesh in 1954-55, credit for the good crops must go to better irrigation facilities, distribution of quality seeds, progressively liberal use of fertilisers and improved agricultural practices.

PRICE SUPPORT FOR RICE

Encouraged by the success of the recent price support measures for wheat, the State Governments concerned, in co-operation with the Union Government, have decided to make purchases of coarse rice at selected mandees, if the prices of that quality sag below Rs. 11 per maund. This decision was taken at a conference of the State officials which concluded its two-day deliberations in Delhi on August 25. The conference, which was presided over by Mr. P. N. Thapar, Secretary of the Ministry of Food and Agriculture, was attended by representatives of 14 States, including Hyderabad, Madras, Bombay, Punjab and PEPSU.

Acting on behalf of the Central Government, which will provide necessary finance and also be responsible for the grain bought, the State Governments will have the option to buy either rice or paddy. In the case of the latter, the price will be fixed with due margin allowed for the cost of conversion of paddy, in the context of the above minimum prescribed price for coarse rice. The buying operations will follow the pattern set up earlier by the wheat purchase scheme and will be carried out through purchasing agents appointed by the States or departmentally.

In his opening remarks, Mr. Thapar said that the purpose of the meeting was to have an idea of the probable trend of prices of rice after the ensuing harvest, with a view to ascertaining whether it would be necessary to give support to the prices of rice. The Government of India, he disclosed, had decided to buy coarse rice at Rs. 11 per maund or paddy at an equivalent price if the price declined below that level.

CANE CRUSHING SEASON

The Central Government is considering the question of asking sugar mills to start crushing earlier this year. Disclosing this, the Minister for Food and Agriculture told the Lok Sabha that sugar-cane growers had made this suggestion recently, and that, if necessary, suitable concessions should be given to the mills for low recovery. The Central Government, he added, was now considering this question in consultation with the States and other interests concerned.

FINAL ESTIMATE OF PULSES

The consolidated all-India final estimate of pulses (gram, tur and other pulses), 1954-55, puts area and production at 54,004,000 acres and 10,474,000 tons, as against the partially revised estimate of 53,715,000 acres and 10,453,000 tons for 1953-54, according to the Directorate of Economics and Statistics, Union Ministry of Food and Agriculture. This shows a slight increase of 289,000 acres or 0.5 per cent in area, and 16,000 tons or 0.2 per cent in production over 1953-54.

TRAINING IN SEEDS CROPS

A scheme for organising two centres, one at Kanpur (U.P.) and the other at Tindivanam (Madras), for training research workers on oilseeds crops, has been approved by the Government of India.

Under the scheme which has been sponsored by the Indian Central Oilseeds Committee, Hyderabad, 30 workers will be trained at each centre for three months at a total cost of Rs. 40,000. Trainees will be drawn from official working in the Agriculture departments of various States. Since rape, mustard and linseed are chiefly grown in North India, training in these crops will be provided at Kanpur. The Tindivanam centre will give training in groundnut, sesamum and castor, which are mostly grown in South India.

The Philosophy of the Congress

THE periodical sessions of the All-India Congress Committee in recent years have not indeed been known for their positive contributions to Congress policy. They have invariably proved to be occasions on which the Congress leadership could secure ratification of its policies; and the resolutions passed at these sessions were mostly sponsored by the leaders at the top and beaten into shape in advance in the Working Committee before being presented for voting. The New Delhi Session of the A.-I.C.C. also shared this quality in some measure. The resolution on Goa, for example, which it acclaimed almost unanimously, was already crystallised in the Prime Minister's mind after the experience of the events of August 15, if not even before. This is nothing more than saying that on foreign policy the A.-I.C.C., like the rest of the country,

has been quite content to leave the responsibility to Mr. Nehru and accept all the detailed implications of his policies. In the domestic sphere too, the acceptance of the "socialistic pattern" of society which Mr. Nehru placed before the Congress a year ago has been so unanimous as to seem unquestioning. But here the philosophy of the Congress Party has been less exclusively the Prime Minister's responsibility. The party, it seems, was quite ripe for taking over the goal of "socialistic pattern" and differences, if any, have been only over its content and not on the principle itself.

There has since been a good deal of boldness in interpreting the content of the socialistic pattern in widely different terms which is in contrast to the few differences that arise over the details of India's foreign policy. In Parliament, for example, the discussions over the Companies Bill have shown that both moderate and extreme views prevail, though the latter seem to preponderate because of their very loud tones. Almost a similar divergence of attitude was apparent at the New Delhi Session of the A.-I.C.C. over the general discussion on the second Five-Year Plan. Mr. Gulzarilal Nanda's long note on some basic considerations relating to the second Five-Year Plan was a resume of the problems that confront the Congress politician in office who has to implement the Plan, while accepting all the implications of the socialistic pattern of the future. Mr. Nanda's stature in the party and his experience in planning should have weighed quite strongly in influencing opinion. Curiously enough, the result has been otherwise. The consensus of opinion has been definitely against all kinds of hesitation in the approach to the problems of planning and on this point the A.-I.C.C. has been quite unambiguous. It was not Mr. Nanda who gave the lead; he seems to have now taken the cue from the party to act more boldly.

It is possible to interpret this in two ways. This incident may be seen as a refusal of the lower ranks of the party to listen to counsels of prudence. Or it may be seen as a reluctance to rest satisfied with moderate doses of advance in the matter of economic progress and welfare. In a party which has too long been subject to direction from above, there is no reason to deplore a certain amount of impatience with the senior leaders, even if it was not warranted. In this case, however, there are reasons for taking a more hopeful view of the developments and assuming that the Congress Party as a whole is now deeply imbued with a belief in the desirability of economic progress. It need not follow from this that there is enough awareness of all ends and means and enough understanding to make conscious and reasoned choices between all the available alternatives at the present time. Most of the controversy now centres round questions relating to means and it is certainly no sign of wisdom to assume that the available means at the present time are unlimited or that the range of choice is so wide that almost anything can be attempted. But the first condition of all economic progress of a people is that they must desire it earnestly, and in the proceedings of the A.-I.C.C. one can find evidence that this desire has been shown beyond all doubt.

That, indeed, is a great good in itself. A political party, which is faced with an obligation to fight general elections on universal suffrage in less than two years, could not normally have been expected to seek sacrifices from the people for finding resources for development. Most State Governments, with a keener perception of the political problems involved in raising resources, have hesitated to agree to more taxes and Mr. Nanda's note similarly assumed a limitation of resources as inevitable. And yet, a Sub-Committee of the A.-I.C.C., with Mr. Nanda himself as Chairman, has rejected these conservative assumptions of resources and compelled its leaders to make a bolder search through more loans and other forms of mobilisation of savings, while pleading for token sacrifices from Congress men themselves. This was a downright rejection of Mr. Nanda's tone of pessimism shown even at the commencement of planning. The party cannot be wholly unaware that in practice many limiting factors may operate but it has been in no mood for the defeatism which prompted the planners to be overcautious even at this stage and accept limitations on the rates of advance.

The A.-I.C.C. has thereby confirmed the theory that in India belief in economic progress is not only consistent with the cultural and traditional patterns of thought but also that it can be politically sold to the people. A promise thus made in political terms cannot be wholly rash and unpremeditated because there is always a time for reckoning and for the people's taking stock of actual fulfilment. By making the promise in bold terms, the foundation has been laid for the effort needed for translating such promises into fulfilment. It is in respect of methods that the Congress Party appears to be working often at cross-purposes, because of the tendency to accept conflicting goals in quite unqualified terms. To plan for heavy industries and then to demand employment on a huge scale is one such example. Similar contradictions are involved in the demand, on the one hand, for the abolition of all mechanical methods of production and in seeking, on the other, larger production and a higher rate of economic progress. While realising the necessarily limited number of agencies for organising modern methods of production, there has been a readiness to hamper the efficiency of these agencies by restrictive legislation. These self-stultifying means would become disastrous if they were ends in themselves. They are not and so long as the ultimate goals are clearly held in view, the right means would emerge in due time.

All these methods will remain to be resolved in time. The Congress Party which has set for itself a special role in the matter of raising living standards must, of course, realise that the more quickly it succeeds in clarifying its attitudes on the means, the more capable it will prove itself in the short run in delivering the goods. The ideals of equality and social justice are integral to its aspirations for progress and would therefore constitute the mainsprings of all national endeavour. It is inevitable that they should always be kept in view and actions and policies judged by whether they are consistent with those ideals. But like most great ideas pursued by those who are initiated into their implications, these are capable of being employed in destructive ways too. They can be invoked to create political confusion and economic decline if they are seized upon by the demogogue, to whom long-term ends have no meaning.

Eternal vigilance alone can check such tendencies and there is no reason at the moment to feel that they will be left unchecked in the Congress organisation when criticism based on understanding gradually grows from within. There is, understandably, a resistance now to criticism from outside, which delays the development of a responsible attitude to economic affairs. This is not due to errors in the basic philosophy of progress. The will to achieve it is there. And when there is the will, we may expect the ways to be mastered in due time.

The Changing Capitalism

MR. J. R. D. TATA's speeches at the Annual Meetings of the Tata Iron and Steel Company have always been noted for a characteristic detachment from the more common problems which form the theme of the speeches of other company presidents. This year Mr. Tata has expounded a theme which the ordinary business man would hesitate to touch because of his greater difficulty in making the mental adjustments necessary to adapt himself to the prevailing climate of opinion. How appropriately Mr. Tata has chosen his theme of the role of private business at this time will be evident from another circumstance. Almost simultaneously, Mr. Gulzari Lal Nanda, Minister for Planning, was putting forward, in connection with the second Five-Year Plan, a plea for the reorganization of the private sector based on Gandhiji's principle of trusteeship, in somewhat hopeful terms. Mr. Nanda was not indulging in wishful thinking when he assumed that in the case of the private sector it would be possible to introduce the principle of service of the community in the place of private profit and control over the economic resources. That the same idea should have flowed from two different and unrelated quarters at one and the same time is a tribute to the power of the idea itself.

While on the one hand, the private sector has been chastised in connection with the clauses of the Companies Bill or in relation to plans for the public sector in the next five years, this strong belief, on the other, seems a sure sign of the capacity of the reformed private sector to survive these onslaughts. Mr. Tata's social philosophy stated in his speech is not, indeed, new in the history of private capitalism. Others before him have, despite the fact that business in the past was conducted and profits were earned without too much regard to fine scruples about principles, shown a similar tendency to be converted eventually to the idea of a social function for private business. Lord Leverhulme, for example, asserted the criterion of social well-being not because of a sentimental feeling of sympathy for the underprivileged but because he was convinced of the need for a more just division of the rewards of industry. Lever hit upon the idea of "prosperity sharing" even while he defended private capitalism as a basis for industry. It is in that sense that Mr. Tata also has refused to oppose the objectives of social justice, regulation of anti-social activity and undue accumulation of wealth and power. His plea for freedom to the private sector is conceived in a manner which is closely consistent with these larger social ends. Only, he insists, at the same time, on our "making full use of the natural instincts of human nature as it exists and not rely unrealistically on the hope that they can be changed in a short time by executive act or legislation". Faced as the country is with the imperative need to work, to produce, to save and to invest, is it wise, he pertinently asks, to lay so much emphasis at this stage on levelling down incomes and seeking to achieve an equalitarian society, before we have created a reasonable quantum of wealth to distribute equally?

In the second part of his speech relating to the affairs of the particular undertaking, the Tata Iron and Steel Company, Mr. Tata provides practical proof of his very optimistic assessment of the future of private business in spite of the criticisms to which it is being now subjected. The mere fact that Tata's plan for expansion of the Jamshedpur plant to an annual capacity of two million tons of ingots has been made at a time when the application of the Industrial Policy Statement of 1948 and the implication of the socialistic pattern of society might place the plan in jeopardy, is an indication of readiness of the neo-capitalist to work for the community's interests even when personal interests are not so safe. It is true that in enabling him to do so in the steel plant, Government has also been equally imaginative and ready to utilise private enterprise wherever it offered itself. It was not often that in Indian industry one came across a plan for investment of Rs. 60 crores in one unit, when conditions were relatively favourable. Hitherto, such a possibility had been ruled out as beyond the means and imagination of the private sector. The disproof of this theory has come in time, and provides the surest indication of the dynamism of the Indian economy which has shown itself during the last three years.

The Tatas have agreed to two exacting conditions in promoting a programme of expansion. The recent increase in the retention prices of steel has been granted on condition that the resulting addition to profits after paying tax should be taken directly to a development account and used solely for purposes of expanding the company's productive capacity towards achieving the two-million-ton target. The second condition is more onerous and runs to the effect that if the project is not undertaken the net additional profits arising from the higher prices must be repaid to Government. The implications of the acceptance of such terms are obvious.

Political exigencies have in all countries tended to discover in business in the private sector a scapegoat and that attitude can in a sense be justified if examples are taken from the earlier phases of evolution of corporate and individual business operations. In a period of transition it is difficult to discover examples which can generalise the state of things to come. The tendency has, therefore, been to compare Indian conditions with those where evolution has been more rapid, where the professional manager with his new conceptions of management has replaced the hereditary business man with a keener sense of self-interest. Mr. Tata and others who, like him, have now begun to think out new lines must be regarded spearheads of the new drive to reform private enterprise.

In the Valley of Decision

MR. NANDA'S PUZZLE

THE Minister for Planning, Mr. Gulzarilal Nanda, has appeared in a threefold role during the last one week. As the author of the famous note on "Some Basic Considerations to the Second Five-Year Plan" he became known for caution bordering on pessimism about the resources and employment targets of the Plan. It does not appear that he followed this lengthy exposition with arguments to support his note in his address to the A.-I.C.C. to focus its attention on all the implications of the Plan. Indeed, as reports go, he has been pictured in a different role altogether, as advocating that if the investment targets in the Plan do not provide eleven million jobs, additional investment should be made. This is at variance with doubts expressed in his note about the capacity of village and hand industries to provide the jobs and the goods in adequate volume, and the doubts about the availability and sufficiency of the resources. Then there is the Nanda of the Employment Plan for the educated middle class in which he seems to have isolated the more important political aspects of unemployment from its economic aspects. As Chairman of a Sub-Committee of the A.-I.C.C., Mr. Nanda looks like having repudiated his fears expressed only a week earlier on the basic assumptions of the Plan-frame. And finally, at a meeting of the National Development Council on Monday this week, Mr. Nanda played his official role as Minister and Member of the Planning Commission and seems to have said very little either about his fears or his later optimism.

To most observers all this has been bewildering. One interpretation of the proceedings of the A.-I.C.C. is that the Congress is now more conscious than ever of placing before the country an inspiring blue-print for progress and would not hear of fears and doubts. That certainly is true. But then, what made Mr. Nanda present his earlier note full of hesitation? Is he very much behind in feeling the pulse of the party? Later, as a Member of the National Development Council, why did he not take cognizance of the report of the Sub-Committee of A.-I.C.C. of which he was the Chairman? This can be explained on the technical plea that the report was made to the Congress Working Committee and cannot directly become the property of the National Development Council. But that is no more than a technical plea. The decision of the NDC to retain the Plan-frame substantially unaltered came as an anti-climax to the initial note of caution and the subsequent demand for expansion.

All these developments show how tentative yet is the Plan-frame. No one is quite clear of the objects of planning. The report of the A.-I.C.C. laid down that in a choice between a high rate of economic advance and a high rate of employment opportunities, the Plan should opt for the latter, showing how much thinking has to advance on this subject. Advocates were not wanting to plead the cause of hand industries who were even willing to countenance economic stagnation if that would help in providing employment. The most remarkable thing is that with the same breath they demanded heavy industries and more production and more welfare. As Minister for Planning, Mr. Nanda has a more practical problem on his hands. Even if the Planning Commission should succeed in containing State Plans within the scope provided by Rs. 2,250 crores of expenditure, the serious problem of limiting the investment needs of the Centre to Rs. 2,050 crores would prove a difficult enough task. It is now realised that transport would need half the amount as a minimum provision and when the reasonable demands of health, education and rehabilitation are also met, the balance available for outlay in industry and mining in the public sector would be too meagre to satisfy present ambitions.

There is no desire to accept these limitations at the moment. It is believed that the Industry Division of the Planning Commission has been engaged in the task of underlining the limitations to the public sector's aspirations. There have been conflicting reports to the effect that this Division has grown so daring as to suggest the staggering of the third steel plant with a view to minimising the demands on technical personnel and the strain on transport. The Ministry of Steel has now denied the report. The truth seems to be that both views are being held. The Ministry of Steel will naturally have no desire to present a reduced target for 1961. At the same time, the Minister has confirmed that the requirements in terms of technicians are so large as to make his task difficult. The Industry Division appears to be saying nothing more than this, and adding that as far as present transport plans go, a third steel plant would add to difficulties. This may seem an accountant's ambition to square the estimates of resources and outlay but it is unlikely to be fulfilled now.

It is not necessary to make final deductions from these inevitably tentative discussions at various levels. But there is no need either to make planning confusing by making impossible assumptions even in the start. For example, is a synthetic oil plant so important as to deserve inclusion among the investments in the public sector when it is admitted that its demands are high in terms of investment? Should the Ministry of Production seek Rs. 50 to Rs. 60 crores merely as a first instalment of investment in coal mining when the miners on the job are hopeful of achieving the target of production with about Rs. 25 crores which they hope to find for themselves? These schemes are in contrast with the wisdom shown in approving extensions to the Tata Steel Plant at a cost of about Rs. 60 crores; these other projects are being deliberately formulated on an ideological basis to extend the public sector, whether such extension can be justified on the basis of priorities or not.

The reason for such contradictions is not that there is lack of understanding but that there is no necessity to fix targets so precisely in advance except, of course, the targets relating to the bold promises of employment, which have political value. The question has been asked whether this tendency has increased of late due to the Prime Minister's preference for the Russian system of planning. At a Press Conference some time ago, Mr. Nehru revealed that in Russia long-period planning is separated from the annual policies needed to implement it by the establishment of two separate bureaux. This has apparently influenced the tendency now to leave precise figures of investment to be determined from time to time. This, of course, is not a Russian invention. Something of this division has existed in India between the Planning Commission and the Government. Under a parliamentary system of Government the agency that should determine day-to-day policies and budgets of expenditure should be the Government of the day. If in Russia a separate agency could work smoothly, it was because these agencies function without regard to the prevailing climate of opinion. On the other hand, the justification for planning in India is that certain long-term plans would always be undertaken, in spite of uncertainties. Priorities would certainly suffer and get distorted if available resources are now allocated to projects prepared purely on ideological grounds, thereby shrinking the plans in those sectors in which more rapid development is now practicable.

LEO.

THE WEEK'S NOTES

THE A-ICC ON GOA

IN LAYING down a clear-cut policy on Goa, the A-ICC was indeed taking a very courageous step, because it goes against the prevailing climate of opinion since the events of August 15. The Prime Minister's speech at Sitapur gave indications of this growing conviction among Congress leaders that mass satyagraha by Indians in Goa might not be a proper course for many reasons. The A-ICC has now expressed its opinion that "any mass entry into Goa in the name of satyagraha or otherwise is undesirable," and that even individual satyagraha by Indian nationals should be avoided. These are unequivocal statements which are in contrast to the very ambiguous stand taken by the Working Committee in July which seemed to permit satyagraha on a limited scale. It seemed at that time that the Congress party and the Government were making concessions to the strong opinions of the opposition groups. They now realise that such concessions can eventually lead the Government away from its own chosen path of peaceful settlement and force stronger courses of action which may become inevitable especially if the Portuguese behave as they did on August 15.

Once again the opposition groups will make capital out of this apparent retreat in Congress policy. If the Lisbon Government also interprets the present step as a sign of failure of India's policy, it may be tempted not to make any attempts to examine the scope for a settlement through negotiation, for which the A-ICC resolution keeps the way open. The initiative must, in any case, come only from third parties at this stage since any compromise formula which can serve as a first step to a peaceful settlement is unlikely to come from either Portugal or New Delhi. Portugal may consider any arrangement which can satisfy India only when the effects of the steps taken by the Government of India begin to tell. It will not be easy to maintain a garrison in Goa and maintain supplies in addition to normal movements which will be hampered by the Government's measures.

POWER NOT SO CONCENTRATED

"CONCENTRATION OF economic power" has been the most handy expression of the critics of the managing agency system who have participated in the protracted parliamentary debate on the Companies Amendment Bill. They have sought to show, firstly, that the problem of concentration of economic power is an evil to be found solely among the managing agents, and secondly, that this power has been widespread and intense in Indian industry. During Tuesday's discussion in Parliament, however, certain facts and figures given by the Finance Minister gave the lie direct to the contentions of the critics. Mr. Deshmukh pointed out that there were certain other systems also in the world which had given rise to concentration of power, and instanced the case of the U.S.A. where, though no managing agency system existed, the Administration had to bring in anti-trust laws to combat concentration of economic power. Therefore, the problem of concentration of such power was one which authority everywhere would have to deal with all the time. He added that the greater the extent of domination of any particular interest, the greater the danger to the common interest, and the Bill on the anvil was, as he said, "the first token of Government's inclination to keep this fundamental thing under observation by limiting the number of managing agencies to 10". The Finance Minister, however, had to admit that the Government's power of approval or notification would always be hanging over the business world like the sword of Damocles. The business man is concerned on how, and in what spirit, the Government would use or misuse this power in actual practice.

The figures given by the Finance Minister in respect of managing agents were really revealing. In respect of 1,720 companies, he said, there were in all about 1,330 managing agents. The number of one-company managing agencies in these 1,720 companies was 1,245. There were 26 managing agents who held two companies each, 36 who held three to five companies, 24 who held five to 10 companies, six who held between 10 and 20 companies, two between 20 and 30 companies, and one "resplendent" managing agent who managed between 30 and 40 companies. This means that the Government is really concerned only with 33 managing agents who have held more than 10 companies. These figures provide a complete refutation of the oft-repeated charge that too many managing agents each possessing too many companies, flourish. As for the fears expressed about the share capitals held by these companies, the Finance Minister observed that, even though some of the managing agents might be holding more than a proportionate share of capital, he did not think that there were grounds to rush to the conclusion that the managing agency system had led to concentration of economic power. It is not understood why the Finance Minister refrained from placing these figures before the House at the time the discussion on the Bill started. Had he done so, the speeches made on the floor of the House would certainly have assumed a straight perspective especially in assessing the powers wielded by managing agents, and enabled the critics of the measure to make a better contribution to the issues involved.

FOR CONCORD WITHIN THE CONGRESS

THE PANT COMMITTEE'S Report on the means of eliminating causes of friction between the Pradesh Congress Organisations and the State administrations does not contain any new solutions to this very old problem. The Conference of Pradesh Congress Committee Presidents and State Chief Ministers has merely endorsed these recommendations for the reason that it could not have done otherwise. Frequent meetings between the local Congress Chiefs and the Chief Ministers of States may make for better understanding but the conditions under which they meet and part, rather than the frequency, will determine the co-ordination. Where there is rivalry for power or in patronage, such meetings would add to friction. If policy is debated in wide gatherings including members outside the legislature, great understanding would be promoted and the leaders of the two wings would be in a position to assess their own party standing and behave accordingly. But, unfortunately, there have been far too many Chief Ministers who arrive, so to say, with a sense of mission which prevents their consulting others in the party entitled to be consulted. On the other hand, party chiefs have sometimes shown themselves to be lacking in fine scruples when it was a question of distributing patronage. It is only when both wings realise the importance of good and honest administration as a necessity as much in the interest of the party as that of the country that greater co-ordination may be possible.

A string of commonplace maxims for the local party leaders will not prove of much assistance. The central authorities must always promote the candidature of persons with tact and good sense to the posts of Chief Ministers, wherever it lies within their power. The problem has become somewhat serious only with the infiltration of

opportunist elements into the Congress fold, and these have no reason to feel afraid because their tactics have, by and large, succeeded. If the local organisations are not packed by interested persons, free choice by the rank and file of its leaders would most likely lead to harmonious working.

THE CONTINENTAL SHELF

THE PRESIDENT'S proclamation of August 30 establishes that India has, and always had, full and exclusive sovereign right over the sea-bed and sub-soil of the Continental Shelf adjoining its territory and beyond its territorial waters. Normally, such rights should have been implied in the rights over territorial waters of each country but the definition of territorial waters is itself in an uncertain state. A traditional limit of three miles has been hitherto accepted but the United States is reported to have extended it to 12 miles and international law is not clear on the subject. India has claimed 15 miles from the coastline as the area within its territorial waters. But a Continental Shelf is a different thing because it denotes, in effect, the extensions of the earth into the seas along the coastline of a country which really form part of the soil over which sovereignty is exercised by a Government. The term Shelf is derived from the nature of this projection of the coast under the shallow seas, until it abruptly gives place to the deep ocean.

The development of modern techniques for the exploitation of the natural resources which are known to exist along this Continental Shelf has given economic importance to such areas which formerly lay unclaimed, except for purposes of fishing and navigation, for which the conception of territorial waters sufficed hitherto. In the United States, oil-bearing shelves exist and have created a serious internal political problem because of the assertion of coastal States' rights: for purposes of international law, President Truman asserted American rights ten years ago. President Rajendra Prasad's proclamation last week invokes this established international practice to the effect that every coastal State has sovereign rights over the sea-bed and subsoil of the Continental Shelf adjoining its territory. One of the minerals, in exploring which there will be great interest, is oil in which Indian resources are poor. But it may take a long time for India to put new technological discoveries into use for the exploitation of such wealth.

POLITICAL DEVELOPMENT IN SOUTH ASIA

IN THE course of a recent speech delivered in Washington at the Conference on South and South-East Asia, Mr. G. L. Mehta, India's Ambassador to the U.S., dwelt at length on the problems of political development in this vast area. Pointing out that countries of this region gained their independence less than a decade ago, Mr. Mehta said that at the outset the "cold war" affected, in many ways, their domestic and political relations. For instance, local Communist parties in some of these countries tried to organise insurgent movements which, however, rebounded on them due to the fact that the Communist parties were believed to be owing loyalty to forces outside their countries and the people were not prepared to jeopardize their hard-won freedom. Economic and social conditions have influenced, and will continue to influence, profoundly political trends in these lands, and the peoples concerned will judge a system of government by the manner and speed with which it removes social and economic disabilities and ensures equality of opportunity. It may, therefore, be, as Mr. Mehta said, that political development in these countries, though based on the democratic principle of the sovereignty of the people, may not necessarily follow the Western conception of democracy, which is essentially a product of the industrial revolution.

It is significant that in Asia, the economy is based primarily on land and the village continues to be a predominant factor in the lives of millions. The introduction of democracy before industrialisation is an important departure from the manner in which democracy has developed in the West. It is, therefore, obvious that Asian countries which have their own traditions and culture and ways of living, radically different from those in the West, will evolve patterns of democracy suited to their environments and conditions. Citing the particular instance of India, the Ambassador said that her Constitution did not recognise any difference on the basis of caste, creed or colour; this, he said, was true also of Burma, Ceylon and Indonesia. In India, there are various opposition parties both in the Central Parliament and the State Legislatures, but he pointed out that, in the elections, the communal parties gave a poor showing as against even the Leftist parties. The Congress Party, which is essentially a secular and democratic organisation, has held power and gained strength since independence which indicates the strong desire of the people to usher in prosperity through peaceful revolution. Indeed, Mr. Mehta was expressing the highest ideals of democracy when he said that "Indian leaders want to lead, not to drive the people, to persuade them and not to coerce, to govern and not to enslave".

THE FAILURE OF A MISSION?

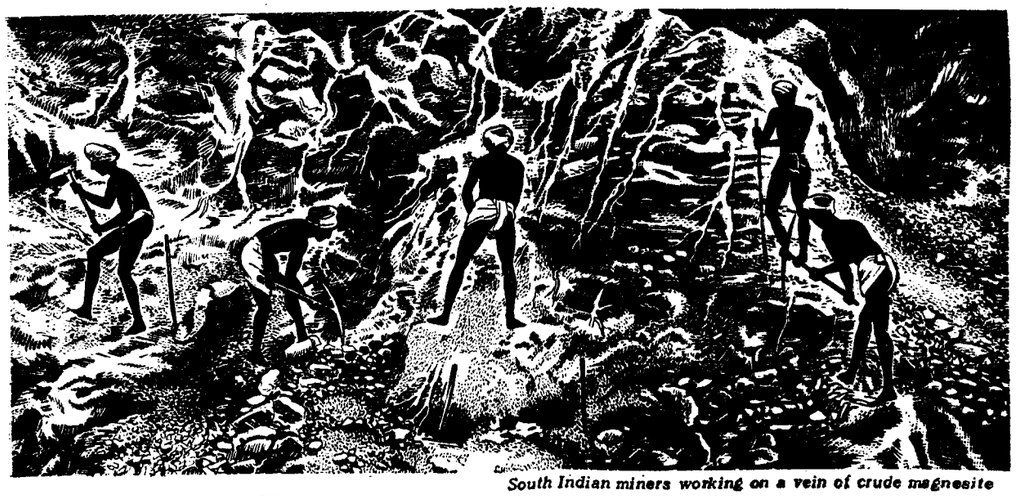
THE TALKS between the Japanese Foreign Minister and U.S. authorities may seem to have yielded results not as satisfactory as the Japanese would like them to be. Mr. Shigemitsu had gone to the United States with the hope of obtaining various concessions. Japan desires the U.S. to withdraw her troops and permit the Japanese army to take over the defence of the island. The United States is of the view that the Japanese defence arrangements, even with their proposed new army and air force, will not be "strategically adequate to meet a military threat". Again, Japan wants a further reduction in her financial contribution towards maintaining American troops on her soil, and though Washington has accepted this in principle, Mr. Shigemitsu has not been able to get any definite promise. In regard to other demands, like the restoration to Japan of the Bonin and Ryuku groups of islands which are still under American occupation, the release of Japanese war criminals and Japan's desire to trade with Red China and the South-East Asian countries, nothing beyond mere assurance that they would be considered at some future date was forthcoming, and no positive agreement could be produced.

Back in Tokyo, Mr. Shigemitsu will have a hard time answering some difficult questions, and suspicions have already arisen in the minds of the Japanese regarding any commitments that he may have made. But it is not that Mr. Shigemitsu is wanting in diplomatic ability or personal popularity in the United States that he has failed to win American support and sympathy for his country's demands. The reasons for the present seeming failure of his mission lie in the Prime Minister, Mr. Hatoyama's not only treading a neutralist course, but trying to normalise relations with Russia and Communist China, which the United States can hardly view with favour. Hope is held in the United States that should there be a change in the policies pursued by the Hatoyama Government, Washington may also change its present cold attitude and meet any reasonable demands sought by Tokyo.

How banking helps the MINING INDUSTRY

AN important part of India's mineral wealth is found in the South. From mines in South India come gold, magnesite, bauxite, iron, manganese and many other vital minerals.

The mining industry in South India employs about a lakh of people, and has an annual output worth Rs. 10 crores.



Banking has greatly helped the growth of the mining industry. The facilities and guidance of a good bank, such as the availability of ready funds when needed, and the collection of dues in any part of the country, are an essential part of good organisation in the mining industry.

We at Palai are proud that important firms in every field of business and industry in South India employ the *complete* banking service we offer:

Current Accounts—Demand Drafts—Telegraphic Transfers—Investments—Letters of Credit—Bill Collection—Deposits—Loans and Overdrafts—Confidential Credit Reports, etc.

If you have business interests in the South, it will pay you to open an account with us. Our 25 branches are strategically located, 23 in important South Indian business centres and two in Delhi and New Delhi; and we have correspondents in all important Indian cities. We offer a comprehensive banking service at each office.

Our clients can make deposits at any of our correspondent banks, situated in all important Indian towns, and have the amounts credited to their accounts at any of our branches.

SIKHISTAN IN ANDHRA?

BY

ODYSSEUS

THOUGHTFUL PEOPLE in government circles in New Delhi have been worried by the demand for linguistic states which they envisage as threatening to weaken the Union by encouraging separatist tendencies. They fear that the "national" consciousness of the non-Sanskrit speaking peoples of South India may be promoted, and a South v. North feeling intensified, recalling ominously the struggle between North and South in nineteenth century America.

I do not know what solutions to these problems the leaders of the Congress Party have in mind but I draw their attention to certain possible lines of policy.

Obviously one counter to local separatism is to promote by every feasible means the political and economic control of the Central Government, together with cultural infiltration, by which I mean the promotion of Hindi as the all-India language at the expense of the local languages. I believe that since the unification of the sub-continent by the British in the nineteenth century, there has been a tendency for Southerners to spread northwards rather than for Northerners to penetrate the deep South. Clearly then, this process needs to be reversed and a determined and organised effort made to colonise the South with Northern stalwarts. The key to the problem of imposing tighter central political and economic control lies in spreading the use of Hindi, and the obvious way to do this is to ensure that knowledge of Hindi is essential to open the doors to advancement in government service and in all professions.

Finally, although the ostensible object of these measures is to avoid the separatist tendencies that might follow from the creation of new ethnic and language states, I am not sure that their creation might not produce such an interlacing of frontiers in some areas as would make the new states economically weak and therefore dependent on the centre and therefore open to close central control.

As I speak, I see indignation on all countenances in all parts of the class and my voice is drowned in the rising hubbub of protest: "Fascism! Totalitarianism! The negation of democracy! The cultural enslavement of the South—exactly what every Southerner suspects and fears! The forcible promotion of Hindi is discrimination! If you want to break up the Union, that is the way to do it!"

I agree. I am glad that we are unanimous as to what is democratic and Indian and what is undemocratic and un-Indian, because this ensures that the measures outlined above will not be adopted here.

They have, however, been adopted by a country which we are apt to hold up to our friends in the democratic West as a model of good behaviour—I refer to the U.S.S.R. which follows these un-Indian (but perfectly good Soviet) methods in its efforts to Russify and Sovietise the Central Asian Republics of Kazakhstan, Turkmenistan, Uzbekistan, Tadzhkstan, and Kirgizstan which stretch from the Caspian Sea eastwards along the borders of Iran, Afghanistan, and China, an area of 1,500,000 sq. miles, which is 230,000 sq. miles greater than India's area, or the equivalent of India with Uttar Pradesh and Bombay counted in twice over.

NO NONSENSE FROM REBELS

Soviet policies towards these constituent Socialist Republics are imperialist. Autocratic political and economic controls over weaker peoples have been exercised, as some of us know, by imperialist powers in various countries and in some cases the foreign rulers have granted self-government after a longer or shorter struggle. But what marks out Soviet imperialism from all others is that it prevents its subject peoples from ever discovering what self-government is! This it does by an iron centralisation and control which stands no nonsense from rebels, and shoots down armed and unarmed with absolute impartiality, and by segregating them from all contact with the democratic world whence, as we in India were, they might be contaminated by bourgeois ideas about freedom and constitutional rights.

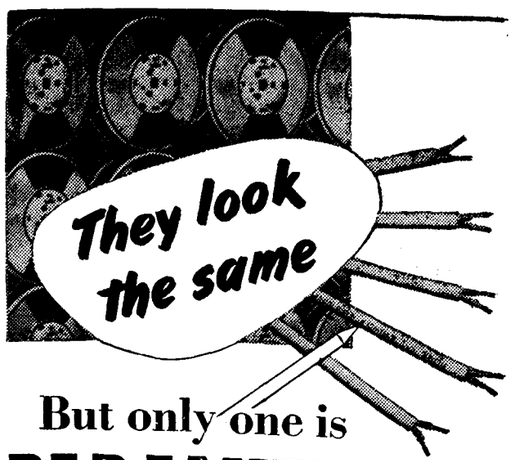
The Czarist imperialists conquered these Central Asian peoples in the nineteenth century but, by comparison with the Soviets, their rule barely touched the lives of their subjects who were free to live as they liked providing they did not interfere with the white settlers. Which reminds me that we seldom remember that Russians are Europeans. How successful they have been in selling us the idea that they are a sort of Asian elder brother, just across the border. The common people just across the border are indeed our brothers, but their rulers are not! Far be it from me to promote colour feeling, but in a world that is, alas, still extremely conscious of colour, I get tired of hearing the Soviet talk of themselves as though they were in a position to preach to others on this problem. Every time I hear the self-righteous voice of Moscow Radio deploring the white man's treatment of Asians, I remember the 18,000,000 Asians in Central and Eastern Asia under alien Russian domination.

The Czarists did comparatively little to develop this enormous area and it may be readily conceded that substantial material progress is taking place under the Soviets, who make much of this in their propaganda to India and to other backward neighbours who continue to languish under capitalist and bourgeois hangovers. But what is not mentioned in Soviet pamphlets and broadcasts is the imperialism by which this progress is being achieved and its effects on indigenous Asian traditions, ways of life, and languages.

The methods of this imperialism are those that I began by suggesting (with a straight face amidst your rising indignation) should be applied by the Government of India to solve the problems of its relations with Southern India.

COMMUNIST AND CONGRESS DISCIPLINE COMPARED

The present frontiers of the five Central Asian Soviet Republics were drawn up in accordance with local ethnical and language divisions, with the result that the zig-zagging frontiers are uneconomic and Moscow's help and control became inevitable and strong. The proportion of "non-natives" (that is imported Russians) to "natives" in the local administrations is



very high (according to evidence adduced by Lt. Colonel Geoffrey Wheeler in an interesting article in the July issue of "International Affairs", on which I am drawing freely) and would cause an explosion if the Government of India tried similarly to draft "reliable" Northerners into the governments of South India and to establish complete political and economic control through the Congress party as Moscow does through the Communist party. Indeed, a comparison between current standards of discipline and obedience to the High Command in the Congress and Communist parties suggests one more point of difference between life in a democracy and life in a "People's democracy".

In India, we believe that religion and traditional culture can co-exist with modern industrial techniques and that cultural development may be left to gather its own force. But the Soviets very soon realised from practical experience that the alien impact to Western industrialism and ideas on indigenous cultures is apt to end in the emergence of nationalism—as it did in India as a whole prior to independence and as, some argue, it is developing local "nationalist" tendencies in post-independence Southern India. To counter this, the Soviets use centrally planned and controlled education and technical training, as well as propaganda against the Islamic religion and against local customs, even going to the length of re-writing local history and allowing only the latest official version to circulate.

But their strongest and most efficient weapon is language. By ensuring that the language of government and of professional education is Russian, they are Russifying the younger generations. In addition, they have initiated a subtle attack on local languages which at first glance is not recognisable for what it is. Soviet apologists often point to the diversity of languages, and local universities, schools, and clubs for regional culture (dances, music etc), as proof of Soviet democracy. They emphasise that the first real provision of grammars and dictionaries of local languages was made not by the slothful and inefficient Czarists but by the Soviets. So they were. And for a very good reason. These grammars Russify the local languages as far as possible in the use of the Cyrillic script, and in grammar, syntax, and vocabulary. The object is to divorce the Central Asians from their links with the rest of Asia, from understanding the Turkic languages which form the common link between all the Turkic peoples inside and outside the Iron Curtain. With every succeeding year, the Turkic speakers in the U.S.S.R. are developing away from their kinsmen in Turkey, Iran, Afghanistan, and China, and in the end their language and ideas will be as Russified as South India would be if the Government of India imposed Hindi-ised grammars in the Devanagri script for the Southern languages.

Finally, the Soviets consolidate their hold by an organised programme of immigration into Central Asia, where the number of Russian settlers is now estimated at 5,000,000. If the Communist party were in power in New Delhi one can see what their solution to the recent effervescence in the Punjab would be. They would organise a mass emigration and set up a Sikhistan in the South to use up superfluous Sikh energies and to keep the South firmly under central control.

A DELHI DIARY

In spite of the A.-I.C.C. session—and much travel back and forth over and under the Plan-frame—the centre of interest was not on the Plan; it moved away from the Plan this week and settled firmly on Goa. The Prime Minister's statement on Tuesday was in part response to the demand that the A.-I.C.C. Resolution on restraining satyagrahis from entering Goa should be explained. The explanation which came on Tuesday was, perhaps, even more disingenuous than the A.-I.C.C. Resolution. The Government chose its own time and place. The Prime Minister's statement was made in the course of a foreign policy discussion in the Rajya Sabha and not in the Lok Sabha. This was the more interesting because the Opposition in the Lok Sabha was crying out loud for attention. On Monday, Mr. Hiren Mukherji, the effective leader of the Communist Party in the House, had one quite unkind fling at the Government. He reminded the Speaker that he had said that Goa should be discussed in a "calm" atmosphere. According to him, it seemed the atmosphere was now icy cold. I am inclined to believe that the point went home and called forth the Prime Minister's dignified statement though at a different time and place. Thus, the Communist Party still exercises what might be described as remote control!

The feeling that has been given in Delhi by the Prime Minister's opening speech was naturally not the same in different sectors of his audience as well as in different sections outside Parliament. There is no doubt that, notwithstanding the fact that the A.-I.C.C. has passed a Resolution in terms of the Prime Minister's statement, there is not a little restiveness in Congress ranks. Politically, the Government line is unpopular in all areas from which satyagrahis have come and, in particular, in areas in which there has been a loss of life. One has only to see the reception accorded to returning satyagrahi leaders to recognise the extraordinary gust of popular enthusiasm which stands behind the satyagrahi movement. It may be all wrong in the present circumstances and with the policy of the Government of India of promoting world peace. It is still, nevertheless, very attractive as a means of breaking the stalemate. The popular view is that other measures will be ineffective; I sometimes wonder whether the popular view is so obviously wrong.

I have said—and I need to say again—that the Prime Minister is at his best when expounding a view contrary to the popular current. He spoke slowly and deliberately on Tuesday but it was one of the most morally convincing speeches he has ever made. Sometimes, one speaks with a mundane voice and sometimes one speaks with a voice from another world. India's political practice is quite mundane; but this time it had a real ring from another world. I have a profound feeling that the Prime Minister was really drawing on the spirit of peace. I could not help noticing how lonesome leaders in the spiritual sense seem to be. It was noticeable that until he said that "it was natural and inevitable that Goa should become part of the Indian Union" there was no applause at all. At one stage it looked as if even his own party was against him. The atmosphere was definitely cold, though not icy cold in the Hiren Mukherji sense.

THE PROFESSOR RETURNS

I have been at great pains—moving in and out of the seats and symbols of power in New Delhi—to discover what is really happening on the Five-Year Plan. Just last week when Mr. Gulzari Lal Nanda produced his "Basic Considerations", one imagined that this was prompted by back-bench Congress feeling as well as by the critical feeling inside the Planning Commission. In other words, one assumed that the Nanda forces were temporarily in the ascendant versus the Mahalanobian forces which had been scattered far and wide. The proceedings of the A.-I.C.C. showed how mistaken this superficial estimate of the Professor's basic position is at the present time. The strong support given to the Plan-frame and the reiteration of its targets of incomes and investment by the National Development Council certainly make one feel that Mr. Nanda's effort, if designed for a particular short-period purpose, has sadly missed the political mark.

Reflecting (as wise men often do) now upon a result which seems to have been inevitable, one sees that just as on large economic issues, notably the Companies Bill, the political view must always prevail with politicians, so, obviously, must a political view win on the Plan-frame. Which member of the Congress Party wishes to face the electorate with a reduced promise of employment and a reduced level of income and investment? It is not that the Nanda view was wrong or that it was proved or disproved. It was enough that it was unpopular and must lose votes. The point that worries me is not that politicians choose the popular view—conceivably it is their only guide—but how a country can ever get an unpopular policy to work. Peculiarly enough, Mr. Nanda presided himself over his own discomfiture. Nobody seems to have thought this was grotesque.

I make one cynical comment. If decisions in India were capable of being translated into action with the speed and ease with which they are made, the situation would be happy indeed. At the moment, it seems that the events only refuse to oblige. Otherwise, the political consensus would rush us to—nowhere!

AU REVOIR

It is as well that I should show my hand. I, therefore, say Au Revoir for five weeks. This is not because I do not intend to write this Delhi Diary from afar, but because I need to make a strong departure from the local scene. Let me have no secrets from my friends. My wayward course is taking me on a study tour which is to cover the grandeur that was Greece and the glory that was Rome. I promise to dwell on the grandeur that is Greece and I hope that I will have something to say on the glory that is Rome.

ARGUS.

Economic Report from the U. S.

AMERICAN PRIVATE INVESTMENT ABROAD

(By Guy Sims Fitch)

WASHINGTON, Sept. 6.—The United States is becoming a prime recipient as well as a supplier of capital. Ever since World War II, American private investment has helped foster economic recovery and development around the world. But now other countries, particularly those of Western Europe, are resuming their role of capital exporters to the United States.

A new report by the U.S. Department of Commerce reveals that both American investment abroad and investment of other countries in the United States advanced at record rates last year. The character of these investments, moreover, showed some significant changes. Growing economic strength and confidence in many nations lent new impetus to purchases of securities and credits, apart from direct investments in productive enterprises. All told, foreign investment in the United States rose $3,200 million in 1954 to a new high of $26,800 million. Of the sum, $11,000 million was in long-term investments—a gain of $1,800 million during the year. Reflecting the attractiveness of the American market and the increased availability of gold and dollars abroad, new foreign purchases of American corporate stocks hit a post-war high of $135 million.

American private companies and individuals, meanwhile, were increasing their investments abroad by $2,800 million. This brought the total of such investments to $26,600 million, in addition to $15,600 million U.S. Government holdings. Half the private increase was in direct investments, as U.S. businesses continued to expand their foreign enterprises at a rapid rate. United States corporations have invested well over $10,000 million in other countries since the war. The expansion of foreign productive facilities represented by this investment has been of great importance in the improvement of economic conditions abroad. The new industries and increased supplies of essential raw materials fostered by this investment have generated, in turn, increased employment and higher living standards in the host countries. They also have led to greater capacity to produce goods for rising local consumption and for export to the expanding American market. But one of last year's striking developments was the increase of $1,400 million in American purchases of foreign securities and credits. Here is further evidence of the progress being made. For it must be obvious that American investors would not risk their money or their effort in a foreign land if they lacked confidence in its economic or political future.

It is noteworthy that many other nations have begun to relax their post-war restrictions on the entry of American capital and the transfer of earnings by American enterprises. The net result has been a two-way gain, benefiting both the U.S. investors and the host countries. The former have been able to expand their foreign operations, the latter to build up their economies. In line with these developments, earnings of Americans in their investments abroad reached a record $2,500 million in 1954, topping the previous record set in 1951 by $101 million. But this increase in earnings is modest, indeed, when compared with the $5,000 million in new long-term investments Americans have placed abroad since 1951. Not to be overlooked is the fact that American-owned enterprises left $650 million of their 1954 foreign earnings in the host countries, mainly to finance continued expansion. Fully half the American earnings from manufacturing investments abroad—about $350 million—was ploughed back into local economies.

There is every indication that the advance in private investment is continuing. Net U.S. purchases of European securities, for instance, were $100 million in 1954, and $55 million in the first half of 1955. Nearing the operational stage is the International Finance Corporation, projected affiliate of the World Bank which is expected to stimulate further the international flow of private capital. One impressive sign of current trends was the recent formation in the United States of a new private corporation—Appropriately titled International Investors—with the express purpose of investing in selected foreign securities. John C. van Eck, Jr., President of the new company, has pointed out that "many foreign securities offer attractive opportunities for growth. In my opinion we are entering a new era of private foreign investment."

WORLDGRAM

AGRICULTURE

Agricultural Production in 1954-55: The agricultural year 1954-55, which ended in last June, witnessed an increase both in the acreage and production of cereals in India as compared to 1949-50, the base year for the first Five-Year Plan. What is more, the average yield per acre went up considerably during this period. The total production of cereals during the year was 55.3 million tons representing an increase of 9.3 million tons over that of 1949-50. The area under cereals in 1954-55 was 209 million as against 193.6 million acres in 1950-51. Thus while during these years the acreage increased by 6.9 per cent, production rose by nearly 20.2 per cent.

*

Agricultural Warehousing Corporation: A comprehensive legislation for the development of co-operative credit, marketing, warehousing and processing will be introduced in the Parliament during the current session. In order to encourage warehousing and marketing, the bill will provide for the setting up of an All-India Warehousing Corporation with an authorised capital of Rs. 20 crores and a paid-up capital of Rs. 10 crores, subscribed by the Government, the Reserve Bank, State Governments, Co-operative Societies, etc. The Corporation will set up Central Warehouses at important marketing centres. The Bill will provide for the creation of a National Co-operative Development and Warehousing Fund with an initial contribution of Rs. 5 crores and a minimum recurring annual allotment of Rs. 5 crores for five years. This Fund will be at the disposal of the Board which will guide the activities of the Central and State Warehousing Corporations.

*

Price Support Measures for Rice: As a measure of price support, the State Governments in the rice growing areas would make purchases of coarse rice at selected mandies if the prices of that quality sagged below Rs. 11 per maund. The above decision was arrived at the conference of the State officials which concluded its two-day deliberations in Delhi recently. Purchases would be mainly confined to rail-head mandies. The price for purchases at markets in the interior, if made, would be determined after deduction of transport cost to the nearest rail station. The buying operations would follow the pattern set up earlier by the wheat purchase scheme and would be carried out through purchasing agents appointed by the States or departmentally. The cost of storage, staff and other relevant expenses would be borne by the Central Government in the form of fixed incidental charges.

INDUSTRY

Electricity Output for May: Electricity generation during May 1955, increased in India by 15.4 million kwh (kilowatt hours) as compared to April, 1955. The Ganguwal power house of the Bhakra-Nangal project mainly contributed to this rise. During the month, 691 power stations, including the Ganguwal power house, generated 704 million kwh., of which 569.3 million kwh. were sold to ultimate consumers. The corresponding figures of output and sale for May, 1954, are 631.9 million kwh and 515.4 million kwh respectively and for May, 1939, 218 million kwh., and 180.8 million kwh respectively.

*

Protection to Machine Screw Industry: Government have accepted the Tariff Commission's recommendation that the protection granted to the machine screw industry should be continued for a further period of two years i.e. up to December 31, 1957, and protective duty at the rate of 50 per cent ad valorem or 9 annas per gross, whichever is higher, should be levied on imported machine screws. This protective duty is being brought into force with immediate effect. Government have also accepted certain other ancillary recommendations of the Commission and will take suitable steps to implement them as far as possible.

*

Production of Starch and Glucose: The annual requirements of starch and glucose in India are estimated at 55,000 tons and 5,500 tons (both in liquid and powder form) respectively. The annual indigenous production of starch and glucose, at present, is about 36,900 tons and 215 tons. The present annual rated capacity for the production of starch and glucose was of the order of 80,400 tons and 3,700 tons. Fifteen factories were producing starch and two factories glucose in liquid and powder form.

*

Development of the Rubber Industry: It is reported that the Government had approved two schemes for the development of the rubber industry. One of the schemes was for rendering financial assistance to rubber growers spread over a period of 10 years, for replanting 70,000 acres of old and worn out areas with high yielding varieties of rubber. The other scheme, which was being implemented, was for the establishment of a Rubber Research Institute to provide technical advice and undertake research in rubber cultivation. A scheme for extending the area under rubber cultivation by 10,000 acres was also under consideration.

*

Two New Cement Factories in Andhra: Two new cement factories have been permitted to be established in Andhra, one at Panyam Reserve Forest in Kurnool district and the other at Macherla in Guntur district. This information was given by Shri T. T. Krishnamachari, Minister for Commerce and Industry, in Lok Sabha. Shri Krishnamachari said that the total capital proposed to be invested on those cement factories was Rs. 1 crore.

*

Nepa Newsprint Factory: It is reported the Nepa Newsprint Factory in Madhya Pradesh was now having trial runs and the average daily production might be taken as 15 tons of bleached newsprint. This newsprint, had been despatched to Bombay, Madras, Delhi and Madhya Pradesh. The Central Government had sanctioned so far over Rs. 1.8 crores as loan to the Madhya Pradesh Government for financing the Nepa Project.

TRADE

Export of Onions: The Government of India have reviewed the policy with regard to export of onions and have decided to release quotas for export from the States of Madras, Andhra, Bombay, Mysore, Saurashtra, Bihar, Hyderabad and Pondicherry. The details of the licensing procedure are being notified by the Export Trade Control authorities at the ports concerned.

*

Export of Raw Wool: The Government of India have decided to release a further quantity of wool for export till the end of October, 1955. Allotments will be made only to such parties as have fully shipped their April-September, 1955 quotas. Details of the licensing procedure are being notified by the Export Trade Control authorities at the ports concerned.

Indo-Pakistan Trade Agreement: The Trade Agreement which had been signed by the leaders of the delegations of the Government of India and the Government of Pakistan in Karachi on July 19, 1955, has since been ratified by the two Governments. The Agreement provides for the grant of certain special facilities by the two Governments in respect of border trade between East Bengal on the one hand and the Indian States of West Bengal, Bihar, Assam and Tripura on the other. It has also been agreed that the two Governments will grant import and export licences where necessary to facilitate trade in the following commodities.

1. Exports from India to Pakistan: Coal, stone boulders, hard and soft wood, mica, antimoney, bauxite, barytes (white), betel leaves, books and periodicals (Urdu, Bengali, Arabic and Persian), Ayurvedic and Unani medicines, lime and limestone, biri and hucca tobacco, biri leaves, mill board and straw board, chemicals and pharmaceuticals, spices and cinema films.
2. Imports into India from Pakistan: Raw jute, hides and skins, betel leaves, fish, poultry and eggs, dandasa, betel nuts, saltpetre, books and periodicals (Urdu, Bengali, Arabic and Persian), raw cotton, rock salt and cinema films.

*

Foreign Sea and Air-Borne Trade of India in July 1955: The provisional figures of foreign sea and air-borne trade of India on private and Government accounts during July 1955, according to data so far available in the Department of Commercial Intelligence and Statistics, Calcutta, are as follows:

	Rs. in lakhs
Merchandise, excluding transit trade of Pakistan but including that of other land frontier countries: Exports ..	5,100
Re-exports (transit trade—Rs. 1 lakh) ..	50
Imports (transit trade—Rs. 2 lakhs) ..	4,999
Total trade	10,149
Treasures: Export of currency notes ..	30
Exports of others	Nil
Import of gold	1
Imports of currency notes	76
Import of others	Nil

Balance of trade:
The merchandise import figures are exclusive of the value of certain consignments of Government stores awaiting adjustment. Subject to this deficiency in import figures and to the exclusion of figures for transit trade, the total value of exports (including re-exports) of merchandise, gold and silver exceeded the imports by Rs. 151 lakhs.

*

Trade Delegation to West Asia: The Minister for Commerce, Sri D. P. Karmarkar laid a statement on the table of the Lok Sabha recently. The statement contained the main recommendations of the Trade delegation which was sent to the West Asian countries. The main recommendations are as follows:

1. In respect of India's traditional exports, such as, tea, jute manufactures and cotton piecegoods, complaints in regard to quality, deliveries, etc., should be obviated by Indian exporters.
2. A market can be built up for non-traditional goods including engineering products and a wide variety of consumer goods by Indian exporters and manufacturers by sending out representatives from time to time to study the markets at first hand. Also, publicity should be given to India's ability to supply these products by opening show-rooms, holding exhibitions, etc.
3. Possibilities of opening branches of Indian banks and insurance firms in the West Asian countries should be investigated.
4. An endeavour should be made to build up an export trade in Indian films to West Asia.
5. With a view to further improving India's trade, the possibility of reducing ocean freight rates from India to the Persian Gulf ports should be studied.

FINANCE

Entertainment Tax Legislation in Ajmer: The President has assented to the Ajmer Entertainments Tax (Amendment) Bill, 1955. The Bill seeks to abolish entertainment tax in all cases where the rates of admission to an entertainment do not exceed one anna and nine pies. It also empowers the State Government to make rules regarding the refund of the tax which may have been erroneously paid or paid in excess.

*

Andhra Adopts Central Estate Duty Act: The Estate Duty Act has become operative in Andhra State in respect of agricultural lands with effect from July 7, 1955. The Government of Andhra has passed the necessary legislation under Article 252(1) of the Constitution authorising the Centre to regulate the levy of estate duty on agricultural land in that State. Fourteen Part 'A' and 'B' States, including Andhra, have so far adopted the Central Estate Duty Act, 1953, in respect of agricultural lands. Other States who have adopted the Act are: Assam, Bihar, Bombay, Madhya Pradesh, Madras, Orissa, Punjab, Uttar Pradesh, Madhya Bharat, Hyderabad, Rajasthan, Saurashtra and Travancore-Cochin. The Act has already been adopted in all Part 'C' States.

*

Concessions in Excise Duty on Tobacco: Since January 1954 the Government of India have announced the following concessions in the matter of the Central excise duty on tobacco:

(1) On the 10th April, 1954, the following concessions were announced:
   (a) A reduction in the rate of duty on low grades of flue-cured virginia tobacco, namely, LMG, B, DB, DG, PL, FS, FS-2 of the pre-1953-54 crop seasons from Re. 1 a lb. to |-9|- a lb.
   (b) On tobacco other than flue-cured tobacco of the pre-1953-54 crop seasons which had been bonded before the 1st January, 1954, a 25 per cent reduction in the prescribed rates.

(2) On the 5th February, 1955 a reduction of -|1|- per lb. was announced in respect of non-biri varieties of non-flue-cured unmanufactured tobacco pertaining to the 1953-54 crop seasons and lying with the curers on that date.

(3) On the 28th July, 1955, a further reduction of 25 per cent in the excise duty was announced for biri tobacco which was eligible for the earlier concession announced on the 10th April, 1954, and mentioned in (1)(b) above.

*

Linking the Northern and Southern Metre-Gauge Systems: The Rs. 9 crores Khandwa-Hingoli railway line in Madhya Pradesh when ready will provide the vital missing link between the northern and southern metre-gauge systems in India, consisting of 10,113 and 4,933 miles respectively. The new line will eliminate transhipment, enabling free movement of traffic between the southern and the northern metre-gauge systems. It will open up fresh areas in Madhya Pradesh and to a small extent in Hyderabad, passing through fertile regions producing cotton, oilseeds, foodgrains etc., serving important markets and trade centres like Akola, Akot, Basim and Hingoli. Last year's allotment of Rs. 25,00,000 for the project has been fully expended, and six times this amount has been provided in the current year's budget.

NEWS IN BRIEF

INDIAN

The increase in the country's food production due to the Grow-More-Food scheme during 1953-54 was of the order of 7,21,569 tons over the base figure of 1952-53. The amount spent on the Grow-More-Food schemes during 1953-54 was Rs. 20,29,17,000.

*

Till the end of March 1955, the number of community radio receiver sets installed in rural areas was 1,220. But the requirements of State Governments for 1955-56 as intimated so far, have risen to 13,340 sets.

*

The first locomotive produced at the Chittaranjan Locomotive Works costed Rs. 7.13 lakhs, while the last locomotive produced there has cost Rs. 4.81 lakhs.

*

Sleeping accommodation will be provided on India's first corridor train exclusively for third class passengers which will run between Delhi and Calcutta from October 2, 1955.

*

The Community Project Administration has allotted 116 new National Extension Service Blocks to 12 States in which the work will be taken up on October 2, 1955.

*

The Ministry of Education has decided to institute 30 National Fellowships of the value of Rs. 400 per month during the current year with a view to encouraging doctoral research work in science/technology in universities and institutions of advanced study which offer the required facilities.

*

Nineteen new railway lines totalling 764.42 route miles have been completed and opened to traffic since the end of the last world war. Another eight new lines are at present under construction with a total route mileage of 455.

*

A scheme for organising two centres, one at Kanpur (U.P.) and the other at Tindivanam (Madras), for training research workers on oilseeds crops, has been approved by the Government of India.

*

The Government of India have decided to set up a division in the National small industries corporation to undertake a survey of marketing activities for the products of small-scale industries.

*

The proposed scheme for the expansion of the Naval dockyard in Bombay is expected to be completed in 15 years. About 10 per cent of the work scheduled under contract No. 1 had been completed so far.

*

There are 331 co-operative marketing societies in Bombay State having membership of about 1,50,00,000 and working capital of over Rs. 443 lakhs.

*

A sum of Rs. 340,76,619 was allotted to the various State Governments during 1954-55 towards relieving educated unemployed.

FOREIGN

Denmark has ratified an agreement, sponsored by UNESCO exempting educational films, sound recording, maps and posters from customs duties.

*

Switzerland has ratified an agreement sponsored by ILO establishing uniform working conditions for boatmen on the Rhine river.

*

Euthiopia has nearly tripled its coffee exports within 10 years from 14,000 tons to more than 40,000 tons—according to the latest issue of Memo issued by the Near East office of F.A.O.

*

The U.N. Security Council at a private meeting on August 11, unanimously adopted its draft report to the forthcoming session of the General Assembly, which begins on September 20.

*

Some 17,000,000 children and mothers received direct aid in the first half of 1955 from health and nutrition programmes assisted by the United Nations Children's Fund (UNICEF).

*

The first six months of this year saw an increase of Yugoslav exports to the markets of Asia, Africa, North and South America. In this period Asian countries received 5.2 per cent of the exports, African 2.6 per cent, the North American countries 11.2 per cent and South American 5.6 per cent.

*

The workers of the Petroleum Institute, at Krosno produced in honour of Poland's National Day, several dozen Kilogrammes of crystalline iodine.

*

A protocol to a trade agreement regulating trade exchange between Poland and Norway until April 30, 1956 has been initiated in Oslo. Among the most important items of Polish exports mentioned in the protocol are coal, cement, sugar, textiles and chemicals.

Special Articles

RESOURCES FOR THE SECOND PLAN

(A CRITIQUE AND A SUGGESTION)

IN the issue of 'The Eastern Economist' dated August 12, 1955, a Special Article "Financing the Second Plan" indicated the total order of capital formation in the second Plan period on the basis of the national income figures presented in the draft plan-frame when a marginal rate of saving was assumed first at 30, and then at 15 per cent. It then appeared that the total capital formation with a marginal rate of saving of 15 per cent was only Rs. 4800 crores, showing a serious shortage. If development investment is Rs. 5600 crores and routine normal investment Rs. 1500 crores, the total shortfall would appear to be of the order of Rs. 2300 crores.

This is believed to be too pessimistic a conclusion. One reason for this is that the Ratio of the plan-frame at 1.93 is too high. The other, and for this purpose more important issue, is that the targets of income are too low.

The income figures of the plan-frame have been arrived at arbitrarily apparently with no larger purpose than to have a total income rise of 25 per cent. Investment on the whole Plan was then worked backwards to derive the ratio of 1.93 at each stage. If the ratio is in error, then a given investment might go further. But if the income is in error, saving possibilities may be better. This latter possibility needs consideration.

The manner in which real income will rise cannot at this stage be precisely calculated. There is, however, prima facie evidence that the average rate of growth of the Indian economy has been about 4 per cent in each of the last two years and that it is still rising. An acceleration in the rate of rise of half per cent per year would appear to be consistent with the current pattern of development.

In the table alongside the rate of real national income is assumed to rise at 4 per cent in 1955-56 beyond the figure of Rs. 10,348 crores in 1954-55. Thereafter a rise of half per cent per year is taken until a rate of 6½ per cent is reached in 1960-61. These are possible rates of rise. It has been ascertained by the application of Input—Output analysis with the Input-Output Table of the Indian Institute of Public Opinion, and by separate estimation of the stream of goods and services, that these figures are within the range of possibility. The table shows in column 2 what this means in real income terms.

The conclusions to be drawn from this discussion are heartening. They indicate that with a moderate rise in the rate of saving from 7.4 per cent to only 9.2 per cent of income, the total capital formation in this period might reach Rs. 5,315 crores.

This sum would not, indeed, finance the whole of current investment, seeing that development expenditure only is intended to be kept at Rs. 5,600 crores. If one made somewhat more generous assumptions in regard to the initial rate of capital formation and assumed that the marginal rate of saving went up from 15 to 20 per cent, rising 1 per cent a year, the corresponding figure would be of the order of Rs. 5,550 crores. This would suggest that a Plan which provided a total investment of Rs. 5,600 crores, would not tend to be violently inflationary if the components of real income shown in the second column materialise.

It would look as though it would be much more fruitful to concentrate on the creation of the targets of real income (and to avoid nice disputes of the rate of capital formation) than to depend on the rigging of the rate of saving by compulsory methods which are likely to be detrimental to income.

TABLE I.

Year	Real National Income at 1948-49 prices	I	Capital Formation	I'	I'/I × 100
	(Rs. in Crores)				
1955-56	10,762	—	794 (7.4%)	—	15

RELATIVE RATES OF GROWTH IN TWO PLANS

By
PROF. HANNAN EZEKIEL

IT has been claimed on behalf of the Draft Plan-frame that it sets out a bold plan for the second five-year period, in contrast with the first Plan which was relatively modest. Prof. Mahalanobis himself points out that in the context of the difficulties that existed at the beginning of the first Plan, "it is understandable that the targets of the first Five-Year Plan were kept modest." The implication is obviously that the second Plan need not be as modest as the first one was and that it must aim at achieving a much more rapid rate of progress.

That the second Plan is in fact a bold one is sought to be proved on the basis of two criteria: (1) that it proposes to double the rate of increase in the national income achieved during the first Plan, and (2) that it will solve the problem of unemployment or at any rate bring it under control by providing additional employment to the extent of 110 lakhs. Whether the Plan can in fact provide this volume of employment may be questioned if a careful examination of the Plan-frame is made. But, I do not propose to examine that question here. It is with the first criterion that I propose to deal.

Not many people are aware that in calculating the rate of increase in the first Plan to be taken for purposes of comparison, a reduction has been made in actual achievements to allow for the effects of the favourable monsoons in 1952-53 and 1953-54, though it must be added that this is clearly stated in the Plan-frame. Two different sets of figures of the rate of growth of national income in the first Plan, therefore, emerge from the calculations made.

In all cases, 1950-51 with a national income of Rs. 91.9 crores is taken as the base year. One set of estimates is based on the actual achievements up to 1953-54 and the other on a reduced figure that results from a scaling down of the actuals to allow for the effects of the favourable monsoons. In both cases, however, it is assumed, that the increases in the last two years of the Plan will be at the same rate as the scaled down figure for the earlier years. This cannot be conceded as valid if it is true that the tempo of the Plan has been rising throughout the period of the Plan and a considerable proportion of the investments is likely to fructify only during these two years. Apart from this, even if the rate of growth is calculated in each case not as a simple average for any given period over the base year for that period but as a compound rate, the results for the last two years would still be higher than the figures taken by Prof. Mahalanobis. In other words, conceding the allowance for the favourable monsoon and conceding further that the growth of the earlier years would be barely maintained at a compound rate, the set of figures that is obtained should still show a larger increase over the five-year period than Prof. Mahalanobis has allowed.

The estimate of the actual national income that is likely to be reached in 1955-56 as given in Table 7 in the draft Plan-frame is Rs. 180 abja in comparison with the national income for the pre-Plan year 1950-51 which is taken as the base year, of Rs. 91.9 abja, an increase of 16.1 abja in five years. This works out to an increase of 17.5 per cent over the period of the Plan in comparison with the base year figure.

It is here that attention must be drawn to an elementary arithmetical error in the Plan-frame which vitiates all the figures of national income and rate of growth assumed for the first Five-Year Plan, even that set of figures which is claimed to be the actual that will be reached in 1955-56.

The Plan-frame states, "the net domestic output at 1952-53 prices had increased from Rs. 91.0 abja in 1950-51 (the base year of the first Five-Year Plan) to about Rs. 103.1 abja (provisional estimate) in 1953-54. This represents an increase of Rs. 11.2 abja or 12.2 per cent in 4 years or just over 3 per cent per year." The increase that has taken place between 1950-51 and 1953-54 is obviously an increase in 3 years and not in 4 as has been stated by Prof. Mahalanobis. Correcting for this simple arithmetical error, the simple rate of increase for the three years works out to just over 4 per cent per annum and not 3 per cent as has been stated. Speaking of the favourable monsoons and other factors, the Plan-frame says, "if allowance is made for these factors the real increase would be probably about 10 per cent in 4 years." On this basis, Prof. Mahalanobis calculates the simple annual rate of increase to be 2.5 per cent per annum, but since the divisor in this case should be 3 and not 4, the scaled-down annual rate of increase in the first three years works out correctly at 3.33 per cent per annum instead of the figure assumed.

Various figures of the rate of growth of national income emerge from this discussion if different assumptions are made. These fall into two groups. The first group will be attempts to estimate the actual increase in 1955-56 over 1950-51, taking the actual increase in the first three years and adding to it some assumed but actually expected rate of growth in the last two years of the Plan. The second will be attempts to scale down the rate of growth in the first three years and add to it again some assumed rate of growth in the last two to get a figure which should be considered comparable to the targets for the second Plan. In each case, the absolute increase and percentage increase in five years and the simple annual percentage rate of increase is calculated. The ratio of the assumed percentage increase in the second Plan over the five-year period (which is calculated from Table 7 in the draft Plan-frame as 26.35) to the results of the above calculations on different assumptions for the five years of the first Plan is also calculated. This may be called "the index of the boldness of the second Plan". The complication introduced by trying to calculate a compound rate of growth has been avoided. The various alternatives are shown below:

I. Since this group attempts to obtain a figure of the actual increase by 1955-56, it takes the Rs. 11.2 abja increase in the first three years as given,

(a) If the same rate of growth as in the first three years at 4.07 per cent per annum is assumed for the last two, the increase in five years works out to Rs. 18.66 abja or 20.30 per cent. The annual rate is 4.06 per cent and the index of boldness is 1.32.

(b) If the corrected scaled-down rate of growth of 3.33 per cent per annum is assumed for the last two years also, the increase in five years works out to Rs. 17.2 abja or 18.72 per cent. The annual rate is 3.74 per cent and the index of boldness is 1.43.

(c) If the uncorrected scaled-down rate is assumed for the last two years, the increase in five years comes to Rs. 15.8 abja or 17.20 per cent. This is what Prof. Mahalanobis's figure should have been in view of the arithmetical error but his estimate of the actual increases is slightly different at Rs. 16.1 abja. The annual rate on my assumption in this case works out to 3.44 per cent and the index of boldness is 1.56.

II. In this group, a scaled-down rate is assumed for the first three years as well, but this may be the corrected or the uncorrected (Mahalanobis) figure. Again, for the last two years, the corrected or uncorrected scaled-down figure or the actual rate achieved in the first three years, or an intermediate rate higher than the corrected scaled-down rate of the first three years, but lower than the actual may be applied. The relevant figures are:

(1) The uncorrected scaled-down rate of 2.5 per cent per annum applied over the entire period gives an increase in five years of Rs. 11.5 abja or 12.5 per cent. The annual rate is 2.5 per cent and the index of boldness is 2.15. These are the figures used by Prof. Mahalanobis as providing a valid comparison between the second and first Plan rates of growth.

(2) The corrected scaled-down rate of 3.33 per cent applied over the entire period gives an increase in five years of Rs. 15.3 abja or 16.65 per cent. The annual rate is 3.33 per cent and the index of boldness is 1.63.

(3) The corrected scaled-down rate of 3.33 per cent applied in the first three years and the actual rate in the last two gives an increase in five years of Rs. 17.78 abja or 18.26 per cent. The annual rate is 3.65 per cent and the index of boldness is 1.47.

(4) The uncorrected scaled-down rate of 3.33 per cent applied to the first three years and a rate during the last two years assumed somewhat higher at 3.75 per cent, which would still be lower than the actual achieved in the first three years, gives an increase of Rs. 16.50 abja or 18.0 per cent. The annual rate is 3.60 per cent and the index of boldness is 1.49.

It is the last of these which would be the most reasonable to use for the index of boldness and not the one used by Prof. Mahalanobis. It should be, therefore, 1.49 and not 2.15. But even assuming that the rate in the last two years does not rise above the scaled-down corrected rate of the first three years, the index would be only 1.63. Why this should be so low is a different point over which it would be worth while to ponder. But it is a question into which I do not go here. It is enough to show that the claim of Prof. Mahalanobis that the second Plan as outlined by him in the draft Plan-frame doubles the rate of growth of national income of the first Plan is not really justified.

The Business World

A COUNSEL OF REALISM

By
CROESUS

IN the dynamic world we live in, everything changes, including concepts about socialism and capitalism. It is only jaundiced eyes which refuse to believe that capitalism today is a greatly changed capitalism compared to the capitalism of the 19th and early 20th century. But as all are entitled to their views under our Sovereign Democratic Republic, the only way to remove the prejudice that persists in some circles against even the enlightened capitalism of today is for our leading capitalists to declare that they are not only proud of being capitalists (in the enlightened sense of that term) but are also earnest about making others join and swell their ranks. I am glad that this is beginning to be done. Only a few weeks ago, Mr. G. D. Birla told a Bombay audience that he wanted everyone to become a capitalist in order that the country should progress economically. Last week, M. J. R. D. Tata, Chairman of the Tata Iron and Steel Co. Ltd., presiding over that Company's annual general meeting, which is always an event of importance, pointed out how modern capitalism has changed and changed so much, indeed, that it can well find a respectable place even in a Welfare State. This is to say that capitalism has enough imagination and vitality to adapt itself to the changing reqirements of the times.

Mr. Tata did well too to stress the point that the profit motive is not something to be ashamed of. "In my view," he said, "there is nothing morally wrong in the yearning of individuals to better their own and their families' living conditions and to seek material reward and financial security in return for hard and productive effort". At the same time, he alluded to a remarkable feature of the subject of rewards and incentives that seems to have conveniently escaped the attention of some people and, maybe, even of our vigilant constitutional pundits, who do not seem to have yet discovered that this might, in fact, tantamount to a form of discrimination. It is that, whereas material incentives and rewards are regarded as unobjectionable in the case of the peasant and the worker, they are sought to be withheld from the professional man, the administrator, the manager, the entrepreneur and the investor; instead, the latter are asked to be content with merely serving the community with a missionary zeal. This is not so much a question of how many can do it as of how many will really do it. As Mr. Tata observed, "it is unrealistic to believe that more than a minute percentage of the people of the country in any walk of life can be expected wholly to eschew personal interests. For the vast majority of the people, the removal of material incentives and rewards will merely act as a disincentive and lead to a reduction of effort and efficiency and to an increasing tendency to let the other fellow do the job". This may seem "of the earth, earthy", but it is facing the facts all right and, so long as we live on this "terra firma", it behoves us all to be "of the earth earthy".

In the course of his address, Mr. Tata referred with quite some concern, I feel—to the apparently growing trend towards a comprehensive form of socialism as distinct from the more empirical form favoured in Britain or the Scandinavian countries. To some extent, India may be said to be following these countries. Personally, however, I am tempted to assert that, as, in regard to our foreign policy, in respect of our economic policy also, we are evolving a unique policy of our own, which, for want of a better term in my limited vocabulary, I would call "socio-capitalism" or perhaps better still "welfare capitalism". It is my conviction that, besides being our own, this policy has already begun to yield results. To think of breaking away from it at this stage, therefore, is to me to miss a great opportunity that has come our way to make a contribution of our own to economic ideology. For this reason, I am bound to find myself in entire agreement with the view of the Tisco chief that the success or failure of our plans will largely depend on the choice of the means and methods of achieving an objective. To quote his, "in our hurry and impatience to get quick results, let us beware of the temptation to jettison economic systems or working philosophies based on human nature which have stood the test of time."

These observations of Mr. Tata have especial significance in the context of the ambitious plans that we have embarked upon. The voluntary enterprise of our people, individually and in groups, has a great part to play in ensuring the success of these plans. Hence it is that he chose to dwell on the implications of the draft frame work of the second Five-Year Plan. He did not question the necessity for bold planning in the prevailing circumstances, nor could he afford to do it especially after having been the co-author of the first and no less ambitious economic plan for India, but he noted that some of the proposals were such as to raise doubts in one's mind. For instance, he asked: "Could the proposed targets be attained without recourse to a much higher degree of deficit financing than at present contemplated, with the consequent risk of inflation which would deprive the mass of the people of the fruits of their toil? Would not the large-scale development of heavy industry at one and and cottage industries at the other, without an adequate development at the same time of secondary consumers' goods industries in between, lead to a lop-sided pattern of development which might result in inflation, scarcity of consumer goods, and also in a substantial part of the capital investment in heavy industry remaining unproductive for some years for want of a market? Has the argument of secondary industries at a later stage any validity, considering that, owing to the continuing increase in population amongst other factors, there was bound to be a large amount of unemployment at the end of the second Five-Year Plan, and the same arguments will inevitably be used then as now for restricting the development of manufacturing industries? Would the consumer in urban and industrial areas be willing to pay the necessarily higher prices of goods produced by household and cottage industries, even when the quality was satisfactory? Finally, was it realistic to assume that household industries could be developed fast enough to provide all the additional consumer goods necessary to meet the increased demand?

These are not the carping criticisms of an unhelpful critic but the genuine doubts of a farsighted and constructive industrialist. The public has a right to expect convincing answers to all these posers from the Planning Commission.

PROGRESS OF HANDLOOM INDUSTRY

By

CROESUS

IN the context of the role that has been assigned to the handloom industry under the Draft Framework of the second Five-Year Plan, the second Annual Report of the All-India Handloom Board (which actually covers fifteen months from January 1, 1954 to March 31, 1955) is of more than usual significance. The concluding remarks of the Report no doubt make encouraging reading. These are the remarks: "Production of handloom cloth increased during the period under review and sales kept pace with the increased production. The earnings of weavers have, on the whole, increased and stocks of cloth which had accumulated during the period 1952-53 have been cleared. On the whole, the period under review registered perceptible progress". After indicating the improvement, the Report states, one notices, that there is no room for complacency, however, as "not only has the improved situation to be maintained but it has also to be developed still further". The Report ends by saying that the All-India Board will have to address itself to this task of consolidating and developing the industry.

A closer study of the Report, however, cannot fail to occasion concern in the minds of those who honestly want the Indian handloom industry to progress and to make its expected contribution. Thus, even in regard to production, it is found that the handlooms produced only 1,318.21 million yards in the year 1954. On the basis of the figures of production for the first quarter of the current year, one may assume that the production this year would go up to 1,400 million yards. This figure, incidentally, is the figure assumed as the then level of production by the Kanungo Committee which reported in September 1954. On the other hand, production by powerlooms even for the year in which the Kanungo Committee reported was in excess of the level assumed by the Committee, being 242.83 million yards as compared to 200 million yards, while, for the current year, the production of this sector would be safely estimated to exceed 250 million yards on the basis of the figures available for the first quarter of the year.

It is interesting to study the progress made by the industry since the All-India Handloom Board was inaugurated on December 13, 1952. In fairness to the Board, it must be conceded that the production of both powerloom and handloom cloth has steadily increased as the following table of production for the two complete years 1953 and 1954 and for the first quarter of 1955, shows:

Year	Powerloom	Handloom
		(In million yards)
1953	221.06(18.42)	1,200.02(100.00)
1954	242.83(20.24)	1,318.21(109.65)
1955(Jan.-March)	64.69(21.56)	351.23(117.08)

Note: Figures in brackets represent monthly averages.

It would appear that, had the expenditure on handloom development schemes been on the scale sanctioned by the Government, the industry would probably have shown an even more impressive record on the production front. But the fact that neither the loans nor, for that matter, even the grants sanctioned could be expended fully is a clear indication of the enormous leeway, in the matter of setting up the requisite organisation, that has yet to be covered.

Even in regard to exports, a sphere in which considerable progress in setting up the paraphernalia required can be said to have been completed, the results do not seem to have come up to expectation. Indeed, according to the Report itself, "it was hoped that the record figures attained during the calendar year 1953, could be maintained in the year 1954 as well. Actually, however, only 56.07 million yards were exported, as against 62.45 million yards in 1953." From the point of view of foreign exchange earning, the performance on the export front was, in fact, the lowest for the three years ended December, 1954. Only Rs. 8.2 crores were realised by the export of handloom cloth in 1954 as against Rs. 14.7 crores in 1953 and Rs. 9.2 crores in the year 1952, when the total quantity of handloom cloth exported was actually lower at 53.9 million yards. The Report, however, gives a number of reasons for the fall in exports, such as (i) increasing competition from other exporting countries, notably Japan; (ii) restrictions or prohibitions imposed by foreign countries on the import of Indian handloom fabrics; (iii) absence of quality standards; (iv) failure to adhere strictly to delivery dates, and (v) faulty and unattractive packing.

The measures proposed to be taken by the Handloom Board to get over the last three difficulties may, be expected to improve the position somewhat. But, as the Report itself admits, the problem of facing increasing competition from other exporting countries, notably Japan, and the question of restrictions or prohibitions by foreign countries on the import of Indian handloom fabrics are not so easy of solution. In this connection, fact to which pointed attention has been drawn in the Report itself, namely, that, out of a decline of 5.73 million yards between the total exports in 1953 and 1954, as much as 5.07 million yards were in respect of Ceylon, is particularly revealing. Similarly, the drastic reduction in the import of 'lungis' by Burma to encourage the indigenous handloom industry of that country cannot possibly be helped.

One gets the impression—at least I do—from the Report that things have still not begun to move briskly, notwithstanding every conceivable encouragement that the Government seems prepared to extend, and has been extending, to the industry, such as assured supply of yarn, credit and marketing facilities and even provision of amenities to handloom weavers such as housing. A rather depressing feature of the whole business is that every additional concession made by the Government has only led to further requests for concession without there being any positive evidence to justify the grant of these concessions. It should not be forgotten that, in most cases, the reliefs provided are specifically intended to be temporary and have been declared as such.

The Government and the Board have pinned their faith on the co-operative agency for the salvation of the industry and the results of the experimental measure at converting the old handloom factories into industrial co-operatives are still awaited.

The Report is comprehensive enough. Still one would have appreciated some more information about sales of handloom cloth over a period and sales of handloom cloth during the first All-India Handloom Week. It is no use for the Board to pat itself on its back by saying that the sales of the handloom cloth during the second All-India Handloom Week amounted to the substantial figure of 64.83 lakh yards valued at Rs. 66.18 lakh without giving the corresponding figures for the sales during the first Handloom Week. It is also a matter for consideration as to what the total sales will be like when the ordinary and the special reliefs, which, again, are stated to be only of a temporary duration, are no longer there.

I am tempted to draw the attention of readers here to an interesting sidelight that the Report throws. It is that it was in the year 1954, which was the first year after the complete withdrawal of controls on the price and distribution of yarn, that deliveries of yarn improved considerably, there being no complaints from any quarter about non-availability of yarn or unreasonable prices. It is also after the withdrawal of controls that the Government decided to issue licences for export, albeit for a small quantity of yarn, and it is significant too that mills increased their packings of free yarn thereafter. According to the Report, the credit for this goes to the policy of quota allotment which restricted the quotas only to those mills that delivered more than the obligations due under Clause 12 of the Cotton Textile (Control) Order. Even after conceding this, I feel, the fact stands out that, in the absence of avoidable and inconvenient restrictions, the mill industry in India is not only capable of providing yarn for all its own requirements but also for those of the handloom industry, and for limited exports as well.

In passing, I should add that Mr. V. Nanjappa, the present Chairman of the Board, cannot, in fairness, be blamed for anything I have said about the Board. He only took charge on February 24 last, after which I find, there was no meeting either of the All-India Handloom Board or of the Standing Committee appointed by that Board. During the space of but five weeks, that is till the end of the period of the report, he could hardly have had time even to familiarise himself with the work of the Board. But I have no doubt that, with the energy, drive and imagination which Mr. Nanjappa possesses, and which he may be expected to bring to bear on this work, the next annual record of the All-India Handloom Board will have some spectacular progress to report.

ONE MAN BUYING SPREE

By

CROESUS

LAST Thursday's (September 1) settlement on Bombay Stock Exchange resulted in very heavy deliveries of shares, especially leading speculative scrips. This would ordinarily be regarded as a healthy feature if it reflected a preponderance of investors. But, judging from what stock brokers aver, one gets the impression that the market has not turned healthy, but is, in fact, heading towards a crisis. For it is alleged that genuine investment demand has practically dried up and that only a few speculators—if not one big operator actually—are busy trying to corner some shares. Those who have been closely following the fortunes of the Bombay markets could not have missed nothing that the stalemate in the Bombay Bullion Exchange followed a similar strategy adopted by a leading bull operator of that market. The same operator, it is suspected, has since turned his attention to the Stock market, as there is no forward trading in bullion now. At the rate at which this operator is believed to be taking delivery of all the shares offered, the market apprehends he might either bring about a similar crisis in the stock market or find that he has chewed more than he could digest and bring disaster upon himself. In either case, the resulting consequences, it is feared, would be serious.

If the Bombay brokers are aware, as they seem to be, of the serious possibilities of the present situation, why, it may be asked, do they persist in selling, especially when they know that the buyer in almost all cases is the same party or person. The Bombay brokers' reply is that, because share values have risen bringing down the yield at the ruling prices this works out to about 4½ per cent in the case of Tata ordinaries—they cannot possibly resist counselling their clients to sell.

What are the prospects of an end to this wave of one-party mad buying, with Calcutta especially indulging headlong in the mad spree? According to some Bombay brokers at least, the end is perhaps already in sight, considering the concern evinced by the Bombay Stock Exchange authorities and the twin curbs on individual margins and 'badla' charges imposed by them in respect of Tata ordinaries and Indian Iron, as also the banning of option business by the Indian Stock Exchange (the 'Mahajan' market as it is otherwise known in market parlance). But the question is whether these curbs are adequate and effective. According to one school of opinion, the curbs should serve to restore sanity, while another school holds equally strongly that they are hardly effective, in that the total number of operators to be affected by these curbs would be negligible. It is said for instance, that while the smaller fry would not be affected because of the limited volume of business they could indulge in, the margins are not such as to deter the big operators. However, a beginning in the right direction has been made, and it is to be hoped it will go some way atleast towards ushering in a more orderly behaviour on the stock markets.

turning oil into petrol

The crude oil that comes out of the well is no use to anybody until it is refined. Then it has a thousand uses. All over India, all through the year, people are using the hundred-and-one different products that come from the Assam Oil Company's " oil town " at Digboi, the site of India's first and most highly developed oil refinery — and the only refinery which processes crude oil produced at India's only oilfield.

You probably think first of petrol when oil products are mentioned. But don't forget that the food you eat was obtained with the help of oil — in the shape of tractor fuel and lubricants. Even the carpet in your house was made with the assistance of oil — the oil that keeps the mills running smoothly.

Oil is vital in the modern world. Though small by world standards, the Assam Oil Company's refinery at Digboi every day produces over 250,000 gallons of high quality products to help to meet India's ever-increasing needs. The Assam Oil Company is looking to the future, too. The company's extensive technical and financial resources are being used to the full to find new sources of oil and to bring into operation new methods of production and refining. If this is successful, the flow of Indian oil to Indian industry, transport and agriculture will increase year by year. The Assam Oil Company will make sure of that.

BUSINESS NOTES

ON THE COTTON TEXTILE FRONT

IN LINE with its excellent record on the production side, the cotton mill industry in the country—it not only achieved the target of production set for it in the first Five-Year Plan, but surpassed it by a comfortable margin and that two years in advance of the target date. The industry has been able to hold its own in the world trade in cotton piecegoods as well. Thus, despite a drop of slightly over 6 per cent in the quantum of her exports of piecegoods for the first half-year in 1955, India continued to retain the second place and, what is more, she fared better than both Japan and the U.K. The latter countries lost 21.5 per cent and 17.8 per cent, respectively, of their export turnover in piecegoods in the half-year under review.

Contributing about 96 per cent of the total world trade in cotton textiles, the ten main supplying countries of the free world, namely, the U.K., India, Japan, France, Belgium, Italy, Holland, the Federal Republic of Germany, the U.S.A. and Hongkong, it is estimated, accounted for 2325 million sq. yds. for the period January-June, 1955, as against 2556 million sq. yds for the corresponding period of 1954.

In an analytical study of the statistical position of world trade in cotton textiles, the Statistical Officer of the Cotton Textiles Export Promotion Council observes that the 9 per cent decline in world trade in piecegoods has stemmed, among other things, from the shrinkage in the volume of production in some of the main supplying countries. Thus, the U.K., India and Japan, controlling 50-55 per cent of the total export in cotton textiles, it is stated, have together registered a decline of 2.5 per cent in their production of cotton textiles, compared with their production level for the first half of 1954. In the case of India alone, it must, however, be noted here, there has actually been an increase from 2503.4 million sq. yds. in the first half of 1954 to 2504.2 million sq. yds. in the corresponding period for the current year. Besides India, both Belgium and the U.S.A. also registered improvements in cotton textile production.

The overall decline in the production in the main exporting countries, irrespective of population increase, we are told, may well be a factor adversely affecting the international trade. It is further stated that, to some extent, the reduced offtake in the first half of the current year could be explained as the result of an adjustment of the increased offtake of the various overseas markets in 1954. This apart, there has been a tendency, of late, for some of the cotton-growing countries, who have hitherto been large importers of cotton textiles for their domestic needs, to start manufacture of cloth themselves. Iraq is an instance in point. This means, invariably, the raising of protective walls to safeguard the interests of the new producing countries. The contraction in offtake was also occasioned by changes in import duties in a number of countries. It was only very recently that the Iranian Government was prompted to change the basis of duty with a view to providing protection to the local industry which is mainly engaged in the production of coarse and medium fabrics. As a result of this move, perforce, Indian mills and exporters had to shift the emphasis from coarse and greys to printed, dyed and fine fabrics. Then, again, the suspension of O.G.L. and the growing trend towards bilateral trading, as in the case of Burma, necessarily contributed to the shrinkage in offtake. As though these were not sufficient in themselves, there was the question too of continued dock labour trouble in the U.K. and India (Calcutta and Bombay), not to mention the dearth of shipping space for certain destinations. In the face of all these uncongenial factors, it is not surprising that world trade in cotton piecegoods could not make any headway.

AREA AND VARIETY—WISE DISTRIBUTION

THE AREA-WISE distribution of textile exports from the major exporting countries reveals that India was the second largest supplier in Asian and African markets, while she held the third and the fourth place, respectively, in the European and the Oceanic markets.

Although India's total exports fell short by 98 million yards as compared to those of Japan—the largest single exporter accounting for 497.8 million yds.—she was able to supply more than 10 million yds. each to ten individual overseas markets, the lead being taken by the U.K. with 59.06 million yards for the first half of 1955, as against only 53.81 million yds. for the corresponding period in the previous year. Although not to the same extent, Indonesia, Malaya, Iran, Canada and New Zealand also took more in this period than in the last corresponding period.

The increasing tendency for consumption of Indian medium varieties of cotton piecegoods noticed for some time past in most of the overseas markets has been further corroborated by the figures available in this regard for the first half of 1955. Thus, medium cloth exports from India amounted to 317.17 million yds. of the total 399.35 million yds., followed by coarse cloth with 58.23 million yds., as against the export of 269.9 million yds. of medium and 99.8 million yds. of coarse in the first half of 1954. The decline in the export of coarse cloth, despite the reduction of export duty on the coarse variety, is to be accounted for by the recent change in the classification of varieties on the basis of average counts resulting in some of the coarse varieties being categorised as medium.

In the case of Indian handloom fabrics also, there was an increase in the production from 632.63 million yds. for the first half of 1954 to 678.46 million yds. for the corresponding period in 1955. Similarly, a slightly higher quantity, although still only 24.67 million yards was exported overseas, as against 23.44 million yards for the January-June period of 1954.

EXPORT COUNCIL FOR CASHEW AND PEPPER

THE EXPORT PROMOTION COUNCIL for pepper and cashew, to be set up shortly, is the fourth of such bodies that the Union Ministry for Commerce and Industry has planned to establish. The Government of India has offered to contribute two-thirds of the estimated expenditure of the Council for the initial period of two years and the balance will have to be contributed by trade interests. It is estimated that pepper and cashew exporters will contribute Rs. 20,000 each. The Council will have 25 members, nine each from among pepper and cashew exporters, two each from among pepper and cashew growers, and one representative each of the Travancore-Cochin, Madras, and Central Governments. The Deputy Chief Controller of Exports and Imports will be the Chairman of the Council, which will have its headquarters in Cochin.

Now, what are the export prospects of these commodities? As regards cashew, it is true that New York offers for cashew nuts are high compared to those for other Malabar products, but it is doubtful whether our exporters will be able to meet even the existing, let alone accept further, commitments. This year's original estimate of the Indian crop was no doubt high,

but it failed to materialise owing to untimely rains and drought. This season opened with forward contracts up to as far as December, 1955, for a total quantity which cannot be processed out of the raw nuts available, including the imports from East Africa. By the way, India imports an appreciable quantity of cashew nuts from East Africa for being processed and exported. Developments in the countries which have so far supplied raw material for the Indian processing industry make future prospects quite uncertain. Of the total requirements of 120,000 tons, about 70,000 tons used to come from the East African territories. But both Portuguese East Africa and Tanganyika, the principal suppliers of rawnut, have now started developing their own processing industry, and supplies from those sources—especially the former, what with the Goa tangle—will naturally start diminishing and may even disappear altogether eventually. Imports even this year have been only about 60,000 tons, which indicates a considerable shortfall—20 per cent—from the last year's figure of 75,000 tons. It is reported that supplies of rawnuts have almost been used up and that eighty per cent of the factories may have to close down from October. So far only about three to four lakh cases have been exported out of a normal annual volume of 10 to 11 lakh cases.

In view of all these, the cashew nut industry requires very careful study and tending at the hands of the Government. One of the first steps that will have to be taken for increasing rawnut supplies will be the immediate and rapid expansion of cashewnut cultivation in India.

The situation is not so bad with regard to pepper, though pepper prices receded from their boom levels and were quoting around only Rs. 850 per candy. Subsequently, however, the prices moved up to Rs. 950 on August 29, due to reported purchases by Russia of 1,000 tons of Indian black pepper. However, during the last three years, the rapid recovery of Indonesian production has been proving to be somewhat of a menace to India's monopoly of nearly a decade. This year's world production is estimated at 52,000 tons. Even if there is no substantial rise in consumption from last year's 47,000 tons, demand and supply will be in close balance and the market is, therefore, likely to continue firm. Last year, against a sharp rise in supplies, there was a heavier demand from China and Russia. Still, the U.S.A. remains our largest importer. India's pepper crop, which is estimated at 19,000 tons this year, will begin to arrive on the market from November and the arrivals will continue until May, and the reduction of the Indian export duty to 15 per cent should place the Indian growers in a more competitive postion when the 1955 Sarawak and Lampong crops are harvested from June. The long-term prospects, however, are not quite satisfactory. It does not seem likely that export promotional efforts will greatly expand pepper consumption in the U.S.A. By these efforts, we can at best maintain the current level of consumption and India's share in the American market. But even this would not be a small achievement. On the other hand, a substantial increase in consumption is possible in countries where pepper is now hardly used provided the use of pepper is popularised in these regions. There would also appear to be a wide scope for expansion of the internal demand. While export promotion is urgently needed, therefore, the authorities will also do well to keep an eye on the potentialities of the home market.

MYSORE PAPER MILLS' BRIGHT PHASE

WITH THE expansion of its production capacity, the Mysore Paper Mills Limited, Bangalore, enters a new phase full of promise. Now that the pulp plant has been completed the new paper machine can be worked to full capacity from October next. On the financial side, proof of sound operation during the year ended March 31, 1955, is offered by a dividend of 6¼ per cent plus a bonus of 1¼ per cent, grant of bonus to staff equivalent to the basic salary or wages for 2½ months and appropriation of Rs. 2 lakhs to the Special Redemption Fund set up for repayment of the loan from the Industrial Finance Corporation.

Mr. K. Narayanaswamy's observations, in the course of his presidential address at the last annual meeting of the shareholders of the company, on the changing trends in industrial relations, deserve careful note by the Planning Commission and the Government. That the management of the Mysore Paper Mills was able to conclude a truce with labour for 2½ years and thereby terminate the long standing dispute, speaks for its conciliatory attitude. This is a gain for an individual concern. But in the larger context, the new demand of labour for participation in management raises vital issues. No quarter must be given to emotional attitudes nor must we allow ourselves to be hustled into a hasty policy decision, if only because we may not like to lag behind certain countries—red complexion—which have experimented with this scheme. Full thought must be given to this vital issue which threatens to create needless problems instead of paving the way for harmony between employers and employees.

EGYPTIAN'S COTTON POLICY

THE DETAILS of its revised cotton policy (announced on August 31) by the Egyptian Government suggest that the authorities in Egypt are apparently convinced that there would be no export subsidy on U.S. cotton. It was this factor, together with the uncertainty surrounding it, that was responsible for the Egyptian Government to keep its new policy in abeyance. (In the normal course, it should have been made known by mid-June).

That the Egyptian Government was quite justified in the stand it took became clear when the American Ambassador to Egypt actually greeted the U.S. cotton policy as indicative of the American Government's aim to bring about stabilisation in world cotton prices. The U.S. Ambassador doubtless took this stand because of the assurance given by Mr. Ezra Benson that there would be 'no material change' in the U.S. cotton export policy in the near future. Evidently, he interpreted this assurance to mean that there would be no cotton export subsidy.

Be that as it may, a significant feature of the official cotton policy announcement from Egypt is that it provides for retention of the entitlement on dollars while abolishing it in respect of Sterling and Deutch Marks. One of the most effective devices in the hands of the Government of Egypt, this entitlement account scheme grants a cotton exporter the privilege of selling 75 per cent of his foreign exchange earnings on the open market; the remaining 25 per cent of such earnings must be converted by him at the official rate of exchange established by the Bank of Egypt. As there is always a great demand for foreign currencies in Egypt for the purchase of many types of goods which that country needs, Egyptian importers do not hesitate to pay a sizeable premium for the desired currencies.

Egypt has also announced that the cotton export tax on Karnak|Menoufi has been reduced to 8 tallaries per cantar, as against the previous 15, while, on Ashmouni|Giza 30, it has been reduced to two tallaries as against the previous 10. The twin concessions of the duty cut and the continuation of the entitlement scheme in respect of the U.S. should enable Egypt to export more cotton to America. Conversely, it follows, the abolition of the entitlement scheme in respect of Sterling and Deutch Mark would lead to a reduction in the offtake of Egyptian cotton by the U.K. and Germany. As a matter of fact, the U.K., which held the second place among importers of Egyptian cotton in the 1953-54 season, dropped to the eighth place with only 39,000 bales. In the case of Germany also, there has been a reduction of about 50 per cent in her imports of Egyptian cotton; for the season 1954-55, she accounted for the import of Egyptian cotton to the tune of only a little over five lakh bales, as against over nine lakh bales received in the previous season.

In sharp contrast has been the rising trend in the intake of the U.S.A., and in those of Russia and Poland especially. The improvement in America's offtake of Egyptian cotton after all was not every much, but Russia's share moved from zero in the previous season to 41,200 bales in the 1954-55 season, while Poland's quota (21,000 bales) increased seven times.

With the announcement of both the U.S. and her own cotton policy, the way has been cleared for Egypt to reopen the Alexandria cotton futures market. It is, as a matter of fact, scheduled to commence trading on September 26, after a suspension which has lasted for about three years now. It may be noted here that, when futures trading is resumed in Alexandria, the first contract to be traded in will be for the December (1955) delivery.

It was reported early in June that the Egyptian Government would guarantee growers 55 tallaries for good Ashmouni, 59 tallaries for good Giza 30, 61 tallaries for good Menoufi and 65 tallaries for Good Karnak. According to the Government's announcement, however, the minimum basic price in regard to Ashmouni and Giza 30 remains the same, while there has been an upward revision in respect of both Karnak and Menoufi at 69 tallaries and 64 tallaries, respectively.

WEST COAST PAPER MILLS

THE WEST COAST PAPER MILLS, LTD., an announcement in respect of which is published elsewhere, has started under very good auspices. This is the first public issue which has been under-written by the Industrial Credit and Investment Corporation. It is also unique in another way in that at is perhaps the first instance of an industrial undertaking in the private sector to be favoured with a loan from the Industrial Finance Corporation within but four months of obtaining the certificate of commencement of business. Then, again, it has secured a valuable concession in the form of deferred payment for its plant through its machinery suppliers to the extent of Rs. 40 lakhs. In all thus, even to start with, the Company is fully assured of its, initial total estimated capital outlay of Rs. 3 crores (Rs. 1 crore, being the capital under-written by the Industrial Credit and Investment Corporation, plus Rs. 1 crore, being the loan from the Industrial Finance Corporation of India, plus Rs. 60 lakhs, being the value of 50,000 ordinary shares and 10,000 preference shares, taken up by the promoters, directors and their friends, and plus Rs. 40 lakhs, being the deferred payment of machinery suppliers).

All these obviously serve only to underline the large scope for, and bright prospects ahead of, the paper industry in India. At present, there are only 20 units in the country manufactturing both paper and paper board, with a total capacity of 1,85,000 tons, which compares with atleast 200,000 tons which the Planning Commission considers to be adequate to meet the anticipated domestic requirements by next year. In the second Five-Year Plan, the target proposed by the paper industry is higher still at 3,70,000 tons. Considering that the actual production of paper in 1954 was only 1,55,000 tons, the large leeway still to be mad up becomes apparent.

Another way of looking at the matter of probable paper consumption in the country is to compare the per capita consumption in this country with those in other countries. Even when the production reaches 3,70,000 tons by 1960-61 as envisaged by the Planning Commission, the resulting per capita consumption of paper in India of 1½ lbs. would continue to be the lowest. Such certainly pales into insignificance compared to the per capita consumption of about 400 lbs in the U.S.A., 175 lbs in Canada and 154 lbs. in the U.K. Apart from all these, the anticipated rise in the standard of living, consequent on the large-scale developmental programmes under way and the rapid progress in the country's campaign for the spread of literacy, should help to create a very large potential market for paper in India. The addition of a well-conceived industrial undertaking for the manufacture of paper to the existing units must, therefore, be welcomed, especially when it is sponsored by such a well-known business house as the Bangur-Somani group and is blessed, besides, with so many favourable features. By the way, it can claim to be the first company to be started without any managing agents. That is, indeed, looking far ahead.

In the matter of raw materials supplies, including water supply and availability of electric power which not all paper companies in the country enjoy, as also transport facilities, the Company is in the happy position of having secured a very favourable site in Dandeli in North Kanara District of Bombay State. According to the Chief Engineer of a leading German Machinery Supplier, "the Dandeli site is probably the most suitable of the comparatively few presently eligible locations in India for the establishment of a major pulp and paper making unit based on bamboo". It is noteworthy that, by an agreement with the Government of Bombay, the Company is assured of an uninterrupted supply of bamboos for a period of 30 pears, besides enough land (on lease or occupancy rights) for purposes of the factory and its housing colony. The latest processes proposed to be employed are expected to make for quality production at very low costs.

On the Board of Directors, there are eminent industrialists and financiers like the well-known Bangurs of Calcutta and the Somanis of Bombay, Mr. Ramnath Podar, Mr. Pranlal Devkaran Nanjee and Mr. Maneklal Premchand.

The authorised capital of the Company is Rs. 5 crores, of which only Rs. 1,60,000 constitute the present issue. Of this amount, shares worth Rs. 60 lakhs have already been taken up and paid for by the promoters, the directors and their friends, so that only Rs. 50,000 ordinary shares and a like number of 6 per cent (free of income-tax) cumulative preference shares remain to be taken up by the public. Incidentally, even these shares have been under-written by the Industrial Credit and Investment Corporation, as already stated.

THIS IS AN ANNOUNCEMENT AND NOT A PROSPECTUS. A formal Prospectus has been filed with the Registrar of Companies, Bombay.

"CONSENT of the Central Government has been obtained to this issue, by an order of which a complete copy is open to public inspection at the Head Office of the Company. It must be distinctly understood that in giving this consent the Government of India do not take any responsibility for the financial soundness of any schemes or for the correctness of any of the statements made or opinions expressed with regard to them."

"A LICENCE has been obtained from the Central Government for the establishment of this new Industrial Undertaking of which a copy is open to public inspection at the Head Office of the Company. It must be distinctly understood that in granting this Licence the Government of India do not take any responsibility for the financial soundness of this undertaking or for the correctness of any of the statements made or opinions expressed in regard to it."

The Subscription List will open on Monday, the 12th September, and will close on Thursday, the 22nd September, 1955, or earlier at the discretion of the Directors.

THE WEST COAST PAPER MILLS LTD.

(Incorporated under the Indian Companies Act, 1913)

AUTHORISED CAPITAL:

3,75,000 Ordinary Shares of Rs. 100|- each	**Rs.**	**3,75,00,000|-**
1,25,000 Cumulative Preference Shares of Rs. 100|- each ..	**Rs.**	**1,25,00,000|-**
	Rs.	**5,00,00,000|-**

ISSUED CAPITAL:

1,00,000 Ordinary Shares of Rs. 100|- each	**Rs.**	**1,00,00,000|-**
60,000 6% (free of income-tax) Cumulative Preference Shares of Rs. 100|- each	**Rs.**	**60,00,000|-**
	Rs.	**1,60,00,000|-**

The Company was incorporated on 25th March, 1955. On or about 2nd May, 1955, a Statement in lieu of Prospectus was filed with the Registrar of Companies, Bombay, and a certificate for commencement of business was granted on 5th May, 1955.

The Promoters, the Directors and their friends have taken up 50,000 Ordinary Shares and 10,000 Cumulative Preference Shares all of the aggregate face value of Rs. 60,00,000|- on which a sum of Rs. 50|- per share has been paid up.

The remaining 50,000 Ordinary Shares and 50,000 Cumulative Preference Shares are offered for public subscription.

The amount payable in respect of both the Ordinary and Preference Shares is as follows:

(a) **On application .. Rs. 25|- per share,**

(b) **On allotment .. Rs. 25|- per share**

(c) The balance of Rs. 50|- in respect of Ordinary Shares and Rs. 50|- in respect of Preference Shares is payable in such calls as may be determined by the Directors provided that no call shall exceed ¼th of the nominal amount of the shares and there shall be an interval of at least two months between two calls.

The Directors reserve the right to allot in advance of the opening of the subscription list not more than 20,000 Preference Shares out of the present issue.

By an Agreement dated the 23rd day of August 1955, the Industrial Credit and Investment Corporation of India, Limited, have agreed to underwrite the said 50,000 Ordinary Shares and 50,000 Preference Shares now offered for public subscription for an underwriting commission of Rs. 2 per cent. In addition to the said commission, the said Corporation is also entitled to brokerage at the rate of 1 per cent on the nominal value of all such shares as are either taken up by and allotted to them or have been subscribed for through them and allotted by the Company. In the opinion of the Directors the resources of the said underwriters are sufficient to discharge the underwriting obligations.

2. Messrs. Harkisondass Lukhmidass, 5, Haman Street, Fort, Bombay.
3. Messrs. Dhirajlal Maganlal Purshotamdass, Stock Exchange Building, Apollo Street, Fort, Bombay.
4. Messrs. Batlivala & Karani, New Union Bank Bldg., Dalal Street, Fort, Bombay.
5. Messrs. Kothari & Sons, Oriental Building, Armenian Street, Madras.

LEGAL ADVISERS:

1. Messrs. Payne & Co., Solicitors & Notary Public, Esplanade House, Waudby Road, Fort, Bombay.
2. Messrs. Kanga & Co., Solicitors & Notary Public, Readymoney Mansion, Nariman Road, Bombay.

AUDITORS:

Messrs. Batliboi & Purohit, Chartered Accountants, 204, Hornby Road, Fort, Bombay.

REGISTERED OFFICE:
SHREENIWAS HOUSE, WAUDBY ROAD, FORT, BOMBAY.

OBJECTS AND PROSPECTUS:

The Company has been formed, generally for carrying on all or any of the objects and purposes set out in the Memorandum of Association of the Company, and particularly to manufacture white printing and wrapping papers from bamboo and other raw materials.

There are at present 20 Units in the country for the manufacture of paper and paper board with a total capacity of about 1,85,600 tons. Heavy imports are necessary to meet the present demand, requiring valuable foreign exchange.

On the basis of the above figures the annual per capita consumption of paper in India is hardly one lb. This is very low in comparison with that in other countries such as U.S.A. having approximately 400 lbs., Canada 175 lbs. and U.K. 154 lbs.

With the growth of literacy, the expansion of trade and industry, the general rise in the standard of living and the increase in population, consumption of paper in India is bound to increase. The Planning Commission has envisaged a steady increase in the demand and the target fixed for the second Five-Year Plan for the paper industry is 3,70,000 tons compared with the production of 1,55,000 tons in 1954.

The present installed capacity together with the expansion already sanctioned leaves a wide gap to be bridged in order to meet the minimum requirements of the country. The industry, therefore, has bright prospects for further expansion.

The present rate of import duty on paper is 39⅜ per cent ad valorem which provides sufficient protection against undue foreign competition. Moreover, there are indications of world-wide shortage of paper as will be evident from the following observations made by **the President of the Newspaper Society, London, and the Indian Tariff Board as quoted hereunder respectively:**

"We face a famine, a real famine in paper not only newsprint but every form of paper. A new source of supply must be found."

"There is an overall world shortage of paper and pulp, making import of any substantial quantity of these products into this country from abroad, a remote possibility."

SELECTION OF SITE:

The promoters have selected Dandeli in North Kanara District of Bombay State as the site for the factory after a thorough investigation of all major factors which are briefly enumerated below:

RAW MATERIAL:

The various forest ranges around Dandeli have adequate resources of bamboos for a continuous output of 60 tons paper per day and there will be sufficient supply of suitable bamboo for any expansion of output that may be visualized in future.

It has been ascertained that supply of bamboo is available within an average lead of about 10 miles of the proposed site sufficient to supply a factory with a daily output of 100 tons.

WATER SUPPLY AND EFFLUENT:

Kalinadi, a perennial river, flows within a distance of about two furlongs from the factory site, assuring an abundant water supply all the year round. Permission of the State Government has already been obtained to discharge the effluent back into the river after necessary treatment.

AVAILABILITY OF CHEAP POWER:

Hydro-Electric power will be available from the Jog-Karnatak Electric Grid, a sub-station of which is situated just opposite the proposed factory site. It is also proposed to establish a thermal power plant for the generation of a part of the Electric power requirements and to make use of the steam from this plant for the process in the factory. Apart from the saving in the costs of operation this will assist in ensuring a continuous supply of Electric Power.

TECHNICAL PERSONNEL:

Qualified and experienced personnel required for the erection and in the initial period of operation will be obtained from the Machinery Suppliers.

TRANSPORT FACILITIES:

Dandeli is a terminus on the metre-gauge branch of the Southern Railways. Furthermore, it is a centre of a number of motorable forest roads. The factory site is about 133 miles by rail from Marmagoa Port, which may prove very useful in the long run for the dispatch of the products to coastal towns by sea route.

NATURAL MARKET:

The products of this mill will be sold primarily in Bombay, Madras and Andhra States, which are easily accessible by rail or sea from the factory site.

CONCLUSION:

Highly qualified experts have thoroughly examined the location from various aspects and have unanimously acclaimed the suitability of the project. The Chief Engineer of a leading German Machinery Supplier has observed in his report of 25th May, 1955, as under:

"The Dandeli site is probably the most suitable of the comparatively few presently eligible locations in India for the establishment of a major pulp and paper making unit based on bamboo."

AGREEMENT WITH THE GOVERNMENT OF BOMBAY:

By an agreement dated the 13th August, 1955, the Government of Bombay have granted to the Company necessary concessions for a period of 30 years, the royalty payable being Rs. 3-2-0 per ton on paper or pulp going out of the factory and subject to revision after five years and subsequently after every ten years; such revision at each stage shall not exceed 25 per cent of the basic rate of Rs. 3-2-0 per ton. They have further agreed to grant lease or occupancy rights of 200 acres of land for the Factory and Housing Colony.

CAPITAL OUTLAY:

On the basis of the quotations received from well-known machinery manufacturers, the Directors are of opinion that the capital outlay of the factory of the rated capacity of 60 tons including factory building, township, water works, etc., will be about Rs. 3 crores as under:

1—Plant and Machinery ..	**Rs.**	**2,40,00,000|-**
2—Buildings	**„**	**50,00,000|-**
3—Miscellaneous equipment vehicles etc.	**„**	**6,00,000|-**
4—Brokerage and underwriting commission	**„**	**3,00,000|-**
5—Preliminary Expenses ..	**„**	**1,00,000|-**
	Rs.	**3,00,00,000|-**

and the same will be provided as under:

By Share Capital:		
Already subscribed	**Rs. 60,00,000|-**	
Present Issue	**Rs. 1,00,00,000|-**	**Rs. 1,60,00,000|-**
By Loan from The Industrial Finance Corporation of India (already sanctioned)		**Rs. 1,00,00,000|-**
By way of Deferred Payment to Machinery Suppliers		**Rs. 40,00,000|-**
		Rs. 3,00,00,000|-

The working capital, when required, will be provided by borrowings from Banks and other organizations.

The minimum subscription in respect of the present issue on which the Directors will proceed to allotment is Rs. 1,00,00,000|-.

ESTIMATION OF PROFITS:

The Company intends to instal the latest Plant and Machinery which will effect a substantial saving as compared with older plants both in the cost of labour as well as of chemicals. Modern Soda Recovery and Recausticizing Plants are expected to effect a substantial saving in the cost of chemicals, and the recovery of steam will be another important economic feature.

Taking into account all these factors and leaving an adequate margin for contingencies, the costs of manufacture have been carefully prepared and examined by various technical experts and cost accountants. On the basis of existing selling prices and after allowing for all selling costs, freight, depreciation,

overhead charges, the Directors are satisfied that there will be an adequate margin to permit the payment of an attractive dividend on the Ordinary Shares after meeting interest on loans and on Preference Shares.

BROKERAGE :

Brokerage at the rate of Rupee One per cent will be paid to recognized Brokers, Banks or Industrial Credit and Investment Corporation of India Ltd. on allotments made in respect of applications bearing their stamps.

DIRECTORS' INTEREST :

By an agreement dated 25th day of July, 1955, Shri A. D. Chaudhari has been appointed Technical Director of the Company on a monthly remuneration of Rs. 2,500|- for a period of ten years from the incorporation of the Company and as such he is alone interested among directors.

The Company has paid to Shri A. D. Chaudhari a lump sum of Rs. 30,000|- and Shri M. G. Kotibhaskar a lump sum of Rs. 15,000|- in full and final settlement of the expenses incurred by them for preliminary survey, investigations and preparing the scheme.

DIRECTORS' QUALIFICATIONS AND REMUNERATION :

The qualification of a Director, other than a Debenture Director, shall be the holding of Ordinary Shares in the Company of the aggregate nominal value of at least Rupees Five Thousand.

The remuneration of a Director shall be not exceeding Rs. 200|- for each meeting attended by him, in addition to a fair compensation for his travelling expenses for attending Board Meetings. Such further remuneration may be given to a Director as by way of salary or commission on dividends, profits or turnover or by participation in profits or by any or all these modes. Provided that such remuneration by way of commission or by participation in profits shall not, without the sanction of the Company in General Meeting, exceed 3 per cent of the net profits of the Company as laid down in the Articles of the Company.

BORROWING POWERS :

No restrictions are imposed by the Articles of Association upon the Directors of the Company in respect of their powers of management save and except such restrictions as are imposed upon them by Article 61.

APPLICATION :

Application for shares should be made in the units of 5 shares of either class on the form accompanying the Prospectus of which may be obtained at the Registered Office of the Company, at the Office of the said Underwriters and at any of the offices in India of the Company's Bankers.

Where no allotment is made, the deposit will be returned in full and where the number of shares allotted is less than the number applied for, the balance of the deposit will be applied towards the amount remaining to be payable on the shares allotted and any balance thereafter remaining will be returned.

The shares when issued will be subject to the Memorandum and Articles of Association and Prospectus of the Company, copies of which can be inspected at the Registered Office of the Company during office hours.

Applications will be made to the Stock Exchanges of Bombay and Calcutta in due course for quotation for the shares.

(COPY OF THE PROSPECTUS CAN BE OBTAINED FROM THE COMPANY'S REGISTERED OFFICE, BANKERS & BROKERS)

THE RAMAYANA
OF
TULSIDAS
IN ENGLISH VERSE

LATEST "HINDUSTAN TIMES" PUBLICATION

The famous Hindi epic regarded by many as "the greatest book in all devotional literature" is for the first time now available in English verse.

The translator, the Rev. A. G. Atkins, completed the book after ten years of devoted work. He has tried "to keep and express in English in the fine rhythm and music of the original in simple lucid language, and with as much of the vivacity, wittiness and picturesqueness that Tulsidas has put into his work." He has also followed in some measure Tulsidas's metrical variations such as **chhand, chaupai, doha** and **soratha.**

In a foreword Mr C. Rajagopalachari says: "Mr Atkins' monumental work and his Introduction are a revelation of hope for those who desire to see all the great religions of mankind come together. - - - - His service is not only to English-speaking people but also to that very large number of Hindus in India who do not speak the Hindi language and to whom English has become a very familiar medium."

The book is of special value to libraries, scholars and devotees of Tulsidas.

It has been issued in the following four editions:

I. Original text of Tulsidas with translation in English verse; three volumes; 1468 pages; price Rs. 50 net.
II. Translation in English verse; without Hindi text, two volume; 898 pages; price Rs. 40 net.
III. Special tissue paper edition of I, one volume, price Rs. 100 net.
IV. Special tissue paper edition of II, one volume, price Rs. 100 net.

COMMODITY NEWS AND NOTES

COMMODITY PRICE MOVEMENTS

Wholesale prices as measured by the Official index (with the year ended August 1939 as 100) advanced by 3.8 per cent to 355.6 during July 1955, as compared with 342.5 (revised) for the previous month. The index was lower by 6.7 per cent when compared with 381.3 for July 1954. During the month under review, food articles advanced by 9.9 per cent to 309.7, industrial raw materials by 4.5 per cent to 408.1 and manufactures by 0.2 per cent to 370.9. The index for the miscellaneous group declined by 1.0 per cent to 561.9. The index for semi-manufactures, however, remained almost unchanged at 329.6 as compared with 329.7 (revised) for the previous month.

The index for cereals witnessed a further substantial rise of 11.1 per cent to 359 as a result of an all-round increase in the prices of rice, wheat, jowar and bajra. 'Pulses' also rose by 19.3 per cent to 272 due to an advance in the prices of both gram and dal-arhar. Higher prices of tea and gur were mainly responsible for an increase of 5.6 per cent to 246 in the sub-group index for other food articles.

The index for fibres rose by 2.0 per cent to 415 owing to an increase in the price of raw cotton, notwithstanding a decline in the prices of raw jute and raw silk. There was a general advance in the prices of oilseeds due to which the sub-group index for oilseeds moved up further by 11.7 per cent to 391. Minerals also showed a rise of 1.4 per cent to 421 because of higher average export prices of manganese ore; the prices of coal, mica and iron ore, however, remained unchanged at the previous month's level.

Vegetable oils maintained their rising trend and the index for this sub-group moved up by 12.1 per cent to 398. Cotton yarn, on the other hand, fell by 3.8 per cent to 406. Higher prices of billets, zinc, copper and brass raised the sub-group index for metals by 4.9 per cent to 256. Prices of groundnut cake moved down; the index for oil cakes increased by 4.4 per cent to 333.

The index for textiles declined by 0.2 per cent to 4066 due to a fall in the prices of cotton manufactures (—0.5 per cent to 402) and wollen manufactures (—1.1 per cent to 282), although the prices of jute manufactures (+0.5 per cent to 417) and rayon and silk manufactures (+0.70 per cent to 474) were marked up.

PIECEGOODS MARKET TRENDS

Inspired by rumours of an imminent change in the structure of excise duties, particularly affecting superfine qualities, the domestic piecegoods market experienced brisk-trading conditions all round, especially in Bombay, with an advance in prices of about 5 per cent in the case of superfine cloth, during the fortnight ended August 31. Even if rumours about a revision in the excise duty should fail to materialise, there would still appear to be sufficient inherent strength in the market to keep up the present trend. For, considering that mills have already sold their output till the end of December next, demand is expected to be well maintained.

The export front, on the other hand, reported dull trading conditions during the same period. Pending clarification of the inssurance of new licences, trading with Burma has been at a standstill. Yet, even in the case of Indonesia, which has been reporting brisk business with India, accounting for bookings on a large scale, especially in grey sheetings—20 to 30 million yards during the month of August—there has been some slackening in the trade lately. As for the East African market, unless the freight problem is solved immediately, it is feared, India may well have to write off this market, which too has been reporting good demand for grey sheetings and coatings, particularly from Mombasa.

U.S. COTTON SURPLUS MAY FALL

The Agricultural Department of the United States Government has cautiously predicted that the U.S. cotton surplus may fall, for the first time in five years, by mid-1956. It indicated that the carry-over of old crop cotton might shrink from 11.1 million bales on August 1—the start of the current marketing year—to about 10.9 million bales a year later. The carry-over has been growing steadily from 2.3 million bales in 1951 to 8.1 million bales on August 1, 1955. The Department reckoned supplies of cotton available this year at 23.9 million bales.

U.S. cotton consumption is estimated at around 13 million bales, as against 12.4 million bales in 1954-55. Domestic mills are expected to use more than 9 million bales in 1955-56, compared to 8.9 million in 1954-55. Exports are likely to exceed 3.5 million bales—the level reached in 1954-55.

BETTER TOBACCO CROP PROSPECTS

World production of flue-cured tobacco this year may be nearly 10 per cent more than in 1954, largely as a result of the record yield per acre of this type of tobacco in the U.S. The production of Oriental leaf in both Turkey and Greece is also expected to increase.

According to the Commonwealth Economic Committee, the total U.S. crop of all types is estimated at 2,175 million lbs or 64 million lbs less than last year. Production of flue-cured, at 1,413 million lbs, shows an increase of 98 million lbs despite a 5 per cent cut in the area under this type. In Canada, the Ontario Flue-cured Marketing Association has limited members' plantings to 70 per cent of the base acreage, as against the full base acreage allowed last year. There is a marked decline in Rhodesia, Nyasaland and the Union of South Africa.

Th second estimate of the area under tobacco in India, on the other hand, indicates an increase of 2.4 per cent over last year, with the increase in the Virginia-producing area of Andhra alone exceeding 20 per cent. Indian exports of tobacco in 1954-55 rose to 74 million lbs.—reversing the downward trend of the two previous years—with consignments to the U.K. again accounting for over 40 per cent of the total.

BUMPER WHEAT CROP IN PUNJAB?

The Punjab expects a bumper wheat crop during the current year, breaking all previous records since partition. According to a forecast by the State Agricultural Department, the total outturn of wheat is estimated at about 14 lakh tons, as against over 11 lakh tons last year. This year the total area under wheat crop is estimated at about 34 lakh acres, compared to an average of 30 lakh acres during the past five years.

Barley and other grains are also likely to show an increase in production.

EXPORT OF ONIONS

The Government of India has reviewed the policy with regard to the export of onions and has decided to release quotas for export from the States of Madras, Andhra, Bombay, Mysore, Saurashtra, Bihar, Hyderabad and Pondicherry. The details of the licensing procedure are being notified by the Export Trade Control authorities at the ports concerned.

COMPANY AFFAIRS

TATA LOCOMOTIVE & ENGINEERING CO., LTD.

The tenth annual report of the Tata Locomotive and Engineering Co., Ltd., (TELCO), shows a big drop in net profit, after providing for the Managing Agency Commission and appropriation to the Depreciation Fund, from Rs. 3,35,690 in the previous year to only Rs. 3,303. A study of the Profit and Loss Account for the year under review, however, shows that total profits actually increased from Rs. 3.32 crores to Rs. 4.65 crores, not taking into account, of course, the profits on sale of locomotives and boilers. But there was a sharp increase in expenses under sales, publicity and commission, royalty and other amounts payable to Messrs. Daimler-Benz A.G., and interest charges. The total of the item, "Other Expenses," including all these for the year ended March 31, 1955, aggregated Rs. 21,49,245, as against Rs. 8,13,467 for the previous year. It must, however, be added that, with the commencement of production in the Company's automobile division, a beginning has necessarily to be made in organising sales and publicity and also payment of royalty to the principals.

The appropriation for depreciation has had to be curtailed from Rs. 96.84 lakhs in the year ended March, 1954 to just Rs. 35 lakhs and the Directors have stated in the report that this is due to inadequacy of profit. They further add that the amount provided for depreciation is not in accordance with their past practice and below that permitted under the Income-tax rules (that is Rs. 43 lakhs for normal depreciation and Rs. 46 lakhs for initial and other special depreciation). Unlike in the previous year, when the Reserve Fund received Rs. 3 lakhs, nothing has been provided during the year under review.

Prima facie, this is a dismal picture but, in fact, the position would not appear to be as discouraging, for the reason that although the profit-earning period for both boilers and locomotives has already begun under the terms of the agreement with the Government of India, pending the settlement of prices for locomotives and boilers supplied during the year to the Railway Board, the Directors have not included in the profit and loss account the amount of profit earned on locomotives and boilers. According to the Directors' Report "the Railway Board consider that the Company's costs of manufacture are too high and have, therefore, not accepted the price suggested by the Company". As the Company does not share the view of the Railway Board, it has been agreed that "an independent enquiry into the Company's operation and costs should be undertaken." Meanwhile, the Directors have decided to provide only for the cost of manufacture, excluding initial and other special depreciation.

Some of the notable features of the Report are:

(i) the number of locomotives produced during the year increased to 47, as against 22 in the previous year;

(ii) the proportion of the indigenous content of the locomotive production, which was below 75 per cent., the level required to qualify the Company for profits in respect of locomotives from the Government of India, is now well over 75 per cent;

(iii) the Directors propose to increase the capacity of the locomotive division to 100 complete locomotives per year by January, 1958;

(iv) despite several handicaps, the number of locomotive boilers manufactured during 1954-55 was 92 units, as against 67, or an increase of approximately 50 per cent over the previous year;

(v) as indicated in the previous annual report, the manufacture of coaching underframes by the Company (which was found to be uneconomic) has come to an end with an output of 266 units, comprising 32 broad-gauge and 234 metre-gauge underframes, as against 289 broad-gauge underframes during the previous year;

(vi) remarkable progress has been recorded in the newly set-up automobile division—the Directors state that the progress of work in this division has, in fact, been ahead of schedule; (During the year ended March 31, 1955, a total of 443 units were assembled from imported parts against a target of 500 units. The target would probably have been reached, if not exceeded, but for delays in the receipt of materials following the congestion at the Calcutta port.)

(vii) satisfactory arrangements have been made for the distribution of the Tata-Mercedes-Benz trucks and chassis, as also for after-sale services; and

(viii) the steel and alloy iron foundries, the work on the construction of which has been progressing satisfactorily, are expected to be completed by the middle of 1957.

The following table gives a summary of the balance sheets of the Company for the year ended March 31, 1955 as also for the two years immediately preceding:

A CORRECTION

On page 338 of "The Eastern Economist" dated August 26, 1955, while giving a resume of the Annual Report of the Tata Oil Mills Co., Ltd., it was erroneously stated that there was a prolonged strike starting from November. The Report is for the financial year ending March 31, 1955, and the strike actually took place in February/March.

Around India with Brooke Bond

The Jantar Mantar at Delhi ...

Of great interest to astronomers the world over is the Jantar Mantar or the observatory at New Delhi. It was built in 1725 by Maharaja Jaisingh II of Jaipur, who was also responsible for the observatories at Jaipur, Banaras and Ujjain. To the ordinary man, the structures inside the Jantar Mantar would look a little puzzling, but certainly not uninteresting because they possess a simple, geometric beauty of their own. These structures were devised to study and observe celestial phenomena—the location and movements of the sun, the moon and the stars.

Here, as everywhere in India, fresh Brooke Bond Tea is made available through a unique system of fast distribution from factory to shop.

Brooke Bond have thousands of acres of their own tea gardens—more than any other firm of tea distributors in the world. And Brooke Bond is the only tea firm with five blending and packing factories, each serving its own part of the country, from which fresh stocks are rushed to every shop.

Interesting facts: More people buy Brooke Bond Tea than any other brand, and over 55 million cups of Brooke Bond Tea are drunk everyday in India.

Brooke Bond Tea

Company Meeting

The Mysore Paper Mills Limited, Bangalore

Speech delivered by Sri K. Narayanaswamy, B. Sc., I. A. S., Chairman, at the Twentieth Ordinary General Meeting of the Share-holders of the Company, held at Bangalore on Sunday the 21st August 1955.

Gentlemen,

I have great pleasure in extending to you a cordial welcome to the Twentieth Ordinary General Meeting of the Share-holders of the Company and in presenting for your consideration the report of the Directors and the Audited Balance Sheet for the year ended 31st March, 1955. These have been circulated already and with your permission, I shall take them as read.

I had the privilege to report to you at the last meeting that the second Paper Machine went into production in August last; and in consequence the rated production capacity of the Plant increased from 4,000 tons to 8,000 tons per annum. Production during the year was however 5,200 tons—only about 1,000 tons more than in the previous year. Naturally you would like to hear from me a word by way of explanation as to why there has been an increase only by a thousand tons. The erection of the second Paper Machine was completed well ahead of schedule, but the expansion of the pulp plant for the production of pulp from indigenous raw materials is not yet complete. The equipments ordered for further developing the production of pulp and reducing its cost of production have all since been received and their erection is progressing according to schedule. The full range of equipments are expected to be in service by October this year. It is for these reasons that for a larger part of the year both the Machines could not be operated concurrently and continuously. This slight increase in production has been made possible by the use of the imported woodpulp. Even in normal days, we were using a small quantity of woodpulp to give strength and character to the special varieties of paper which were fetching higher prices. A larger quantity of woodpulp was used this year partly to feed the additional Paper Machine. I am confident that from October onwards, the pulp production in our own Mills would be stepped up to meet the requirements of the two machines and the use of foreign woodpulp would be minimised to the extent necessary for the manufacture of special varieties of paper, should the markets demand the same.

Considerable difficulties were experienced during the year both for movement of raw materials, chemicals and coal, and also for despatch of finished products to centres in South beyond Bangalore on account of non-availability of wagons and railway booking restrictions. As a matter of fact, raw materials and chemicals had to be got booked from Madras to Krishnarajapuram, Bangalore Cantt. or Bangalore and transhipped at Bangalore at our cost. This caused not only considerable inconvenience and delay, but also added to the costs.

At the last meeting, I had stated that several of the established paper mills had increased their capacity and new mills had come into being in the result that the day of early and quick sales seemed past. The demand for our paper during the year was not as brisk as in the previous years. Suitable steps have been taken to meet the situation arising out of increased competition and these measures enabled us to market almost the entire quantity produced, in spite of continuous transport bottle-necks. I may assure you that these market trends are being carefully watched and appropriate actions taken to re-adjust our sales policy to changing market conditions.

Mention has been made in the last year's report of the Award given by the Industrial Tribunal and its implementation. The matter had been further taken up before the Labour Appellate Tribunal both by the Labour Association and the Company. I am glad to inform you that this Industrial Dispute which was pending since 1951 has been settled amicably and the Labour Appellate Tribunal has passed the Award on the lines of the Agreement reached. A special feature of this settlement is the provision in respect of Industrial Truce for a period of 30 months and the Labour Association has agreed not to raise any fresh demands in respect of grades, wages, gratuity and other conditions of service during the said period. I am confident that the implementation of this Award and the terms of Industrial Truce in the right spirit will prove a blessing to all parties concerned, resulting in increased production and reduced costs.

The general question of Labour-Management relationships continues to be a subject matter of controversy in the country, though the population as a whole is still at the commencement of the undoubtedly long and painful struggle for elimination of misery and poverty in the land. The latest demand put forward on behalf of Labour, viz. participation in management, is of a class radically different from the familiar pleas put forward till recently in respect of fair treatment of Labour in regard to reasonable remuneration, working conditions, amenities and social insurance. Labour participation in management is no doubt being tried with reasonable success in West Germany and Yugoslovia in the post-war period. Though there ought to be no objection whatsoever in basing industrial operation on the best possible degree of co-operation from workers, it must be clearly remembered always that mankind whether in Capitalist or Communist societies has not been able to devise any sanction other than the "fear of sack" in order to check unsocial instincts lurking in the sub-conscious layer of human brains and maintain discipline and order without which social or civilised existance itself would be rendered impossible. The present stage of economic development, social conditions, level of civic consciousness nurtured by our educational systems and the imperative need, above all, to secure a solution of the problem of poverty in the quickest possible period should receive the most careful and anxious consideration at the hands of policy makers before decisions are taken on such novel doctrines.

As already disclosed in the Directors' Report, the gross profit stands at Rs. 16.73 lakhs and is Rs. 1.3 lakhs higher than last year.

During the year, we have provided Rs. 8.98 lakhs under Depreciation and have paid Rs. 2.90 lakhs by way of interest as against Rs. 8.07 lakhs and Rs. 2.04 lakhs respectively in the previous year. In spite of this larger provision, the net profit for the year is almost the same as last year. I have every hope that with the increased output and consumption of substantially larger quantities of indigenous pulp, better results will be forthcoming in the coming years.

Your Directors have accorded sanction to the payment of Bonus of 2½ months' basic salary or wages to staff and labour as in the previous year. They have also appropriated Rs. 2.0 lakhs out of the net profits to the Industrial Finance Corporation of India Loan Redemption Fund specially created for the purpose and have pleasure in recommending declaration of a dividend of 6¼ per cent plus bonus of 1¼ per cent absorbing Rs. 1,87,500.

On behalf of the Board of Directors and the Shareholders, I wish to express our gratitude to the Government of Mysore for their keen and abiding interest in the development of this Industry.

In this connection, I also wish to express my sincere thanks to my colleagues on the Board for their able guidance and valued assistance, and on behalf of the Board of Directors and on my own, wish to express appreciation of the loyal and efficient co-operation of our employees.

Since we last met, Sri B. P. Ramakrishnan, who was the General Manager of the Mills for over 5 years, has gone on leave prior to reversion to Government service. Sri B. P. Ramakrishnan served the Company with great ability and zeal all these years and your Directors have placed on record their warm appreciation of his services.

Gentlemen, with these observations, I now beg to move that the Directors' Report and Balance-Sheet and the Profit and Loss Account for the year ended 31-3-1955 be approved and adopted.

The Chairman's Speech was followed by a brief discussion and questions and answers. The Meeting then adopted the Balance-Sheet and Profit and Loss Account for the year ended March 31, 1955.

The House then passed a resolution declaring a dividend of 6¼ per cent and bonus of 1¼ per cent, in all 7½ per cent.

Messrs. M. Ct. Muthiah, N. Narayanappa and C. Shivappa were elected Directors.

Sri S. R. Mandre and Messrs. Santhappa & Co., were appointed Auditors for the year 1955-56.

With a Vote of Thanks to the Chair, the Meeting terminated.

INDUSTRIAL FINANCE CORPORATION OF INDIA
KEELING ROAD, NEW DELHI

NOTIFICATION

In pursuance of Regulation 34 of the General Regulations of the Corporation, it is hereby NOTIFIED that the following valid nominations of candidates for election as directors on the Board of Directors of the Corporation are received, namely:-

(i) Nomination for election of one director representing shareholders referred to in clause (c) of Section 10 of the Industrial Finance Corporation Act, 1948 (Act XV of 1948), in favour of Shri M. Ct. Muthiah, Chairman, The Indian Overseas Bank Ltd., Madras.

(ii) Nomination for election of one director representing shareholders referred to in clause (d) of the said Section in favour of Shri L. S. Vaidyanathan, Manager, The Oriental Government Security Life Assurance Co., Ltd., Mahatma Gandhi Road, Fort, Bombay.

As the number of valid nominations so received is equal to the number of vacancies to be filled in, the above candidates validly nominated are, in accordance with the said Regulation, deemed to be elected at the Seventh Annual General Meeting of the Shareholders of the Corporation convened for the purpose on Saturday, the 17th September, 1955, at 4-00 P.M. (Standard Time) in the hall of the Constitution Club, Curzon Road, New Delhi.

2. It is further NOTIFIED that the following valid nominations of candidates for election as a director representing shareholders referred to in clause (e) of the said Section are received, namely:-

1. Shri V. P. Varde,
   C/o The Bombay State Co-operative Bank Ltd.,
   9, Bake House Lane,
   BOMBAY.

2. Shri B. Venkataratnam,
   President,
   Madras Co-operative Central Land Mortgage Bank Ltd.,
   MADRAS.

Election of one director representing shareholders referred to in clause (e) of the said Section will take place at the meeting referred to above.

3. It is further NOTIFIED that in pursuance of Regulation 60 read with Regulation 34 of the General Regulations of the Corporation, only one valid nomination for the election of one Auditor under Section 34 of the Industrial Finance Corporation Act, 1948 (Act XV of 1948), is received in favour of Messrs. S. B. Billimoria & Co., Chartered Accountants, 113, Mahatma Gandhi Road, Fort, Bombay, and as such they are deemed to be elected as an Auditor at the said Annual General Meeting.

(H. V. VENKATASUBBIAH)
Managing Director.

U. S. Hospital Building,
Keeling Road,
NEW DELHI.

India and China: Planning Parallels

FOR those who have indulged in the exciting speculation over the comparative rates of economic advance possible in China and India, there is enough grist in Vice-Premier Li Fu-Chen's Report on China's first Five-Year Plan submitted to the National People's Congress in July. The Report underlines some of the striking parallels which justify comparison. Planning in both countries commenced almost simultaneously, but in China the task, which began in 1951, was not completed until February last because of an extensive preparatory period. It does not appear that the Plan is consequently more impressive by its quality or thoroughness, but China has certainly broken with Communist tradition by making available to the rest of the world the main statistical assumptions of her Plan, in intelligible terms. Hitherto, all comparative assessments had depended on assumptions about the vast possibilities of the utilisation of manpower resources under

a totalitarian system of mobilisation. The limits to the effective use of such manpower could only be conceived in the abstract. There is now more tangible evidence of recent experience and the factual bases of the hopes for the future.

The leaders of China now claim that the phase of China's economic recovery ended in 1952, when the total value of her output was raised by 77.5 per cent over the level of 1949, the year of Communist victory. The landmark coincides, more or less, with the beginning of the dynamic spell in the Indian economy which has already shown results which are far in excess of the achievement in the other country. It has been recognised all along that China's industrial and transport base has been narrower in many respects, but even so, the results of the first two years of the first Five-Year Plan (1953-1957) have not been quite encouraging. The reason lies partly in the succession of bad seasons—the drought of 1953 and the subsequent waterlogging and heavy floods which caused a setback in grain and cotton production, particularly when the purchasing power of the people had presumably been increased by the outlay on the Plan. Li Fu-Chen has claimed that the total output value of industry and agriculture increased by 14.4 per cent in 1953 and 9.4 per cent in 1954 and that the proportion of the value of output in organised industries increased from 26.7 per cent of total output in 1952 to 33 per cent in 1954, while agriculture remained almost stationary in these first two years of the Plan.

Considering the character of China's proposed industrial investment under the Plan, it is not surprising that even this apparently impressive rate of increase should have led to difficulties. About 58 per cent of the total outlay on the Plan has been devoted to industry, of which only 11.2 per cent related to consumer goods industries. The result has been a shortage of consumer goods, which has not been denied but only regarded as inevitable in the short period. But since even the Soviet Union—on whom China has placed implicit faith for providing the model for Marxist planning and material assistance for successful execution of projects—has now gone back on the shortlived promise of more consumer goods, there should be no surprise if the long period also becomes a succession of similar short period shortages. These factors explain much of the current obsession with political saboteurs and with speculators who thrive on shortages. The ultimate question, however, is whether the projects and targets are commensurate with this apparently stupendous effort that is being put into capital construction.

There are as many irreconcilables in the statistics now put forth as there are imponderables. The total outlay during the five-year period on both economic construction and cultural and educational development has been estimated at 76,640 million yuan or the equivalent value of 700 million ounces of gold. Currency equivalents of this figure may not give a true picture but even if they only show the broad order of magnitudes, it would be difficult to accept that an outlay equivalent to Rs. 12,000 crores is now contemplated, of which 55.8 per cent is on investment in capital construction. The investment in industry on this showing would amount to about Rs. 4,000 crores or one-third of the total. But judging by the major indicators of increased economic activity, the targets do not appear commensurate with this high outlay. Steel output is expected to increase by 4.5 million tons, coal by 50 million tons, cement by 3 million tons and power by 8 billion k.w.h. Including the other targets in tractors, motor cars, fertilizers and all types of machinery, the total would show more than double the investment-output ratio estimated here for comparable achievement.

The investment targets of China include a substantial proportion of labour calculated in money terms, but this cannot obviously apply to the capital-intensive outlay in industry. It is estimated that "the actual amount of investment (namely, the amount of work) made in two years accounted for 32 per cent of the total investment for the five-year period." There is very little known yet about the means of mobilising this social capital. Among the sources of capital accumulation are mentioned only the negative benefits arising from cessation of imperialists' profits, landlords' exactions and private profits, and the taxation of other gains. There has been a frank acceptance that the planners cannot ignore objective limitations and indiscriminately expand the scale of construction. But even as they are, the figures of investment seem too high for an economy which has just been rehabilitated and in which the industrial base is low.

It would be far easier for China to show larger percentage increases from her present level of industrial output than for other countries with a wider industrial sector but much less unutilised capacity. Yet the rate of increase in industry—if the ambitious targets set are realised—will be 14.7 per cent, which compounded in five years is expected to show a total increase in gross value of China's industrial output of 98.3 per cent in 1957. This is comparable to a similar rate regarded generally as feasible in India at this stage, though Vice-Premier Li Fu-Chen assumes that it "has not been nor can it be achieved in capitalist countries". In the agricultural sector, the rate of increase assumed, of 4.3 per cent per year, is within easier reach in India than in China for the reason that there is a much larger scope for increase in productivity per unit of cultivation in India, while the limits to the extension of sown area by reclamation are common to both countries.

The intense dependence on Soviet assistance indicated in China's Five-Year Plan only proves the premium now placed on industrialisation. The dangers of this course in terms of hardships to the present generation of Chinese have not been overlooked. There has been no emphasis on welfare in the short term. And in spite of the increase of the new working force in larger numbers, the employment target at the end of five years has been fixed only at 4.2 million in contrast to the larger ambitions of our planners here. China's Plan is perhaps not ambitious in the context of her present population and the higher rate of increase of 2 per cent per annum disclosed by the census of 1953. However, the admitted facts about the setbacks in agriculture and the low priority to consumer goods for the increasing population indicate that the weakness of the Plan lies in its determination to force the pace in heavy industry; the very low proportions of investment in agriculture and transport, judged in the light of Indian experience, may not take long to tell on the economy.

Report on Convertibility

RECENT trends in international balances of payments have brightened up the prospects of multilateral convertibility. There has, of late, been increasing evidence that, following the rapid economic recovery and the resultant fillip to export trade, and the persistence of favourable payments balances throughout 1953 and 1954, many countries, and especially the European industrial countries, have found it possible to reduce their trade restrictions or even, in a few cases, virtually abandon them. In some countries, rising gold and dollar reserves have led to a reduction, to a low level, of restrictions imposed for balance of payments reasons on imports from any source. Other favourable factors have been the improvement in the relative scarcities of different currencies and the increasing desire to enjoy the competitive advantage of buying in the cheapest market. In Europe, the existence of the multilateral offsetting arrangements of the E.P.U. has also removed any incentive for most of its member countries to discriminate in their mutual trade.

It is the cumulative effect of these favourable trends that has enabled the International Monetary Fund to take an optimistic view of the prospects for convertibility. The annual report for 1955 of the I.M.F. published this week points out that, during 1954 and the first half of 1955, further considerable progress has been made in the direction of freer and less discriminatory trade, on the basis of freer and more multilateral payments arrangements. This, in effect means a continuation of the movement noted in the previous year when steps were taken, both in Western Europe and elsewhere, to relax the restrictions previously imposed, for balance of payments reasons, on imports, on currency transfers and on foreign exchange dealings. It is gratifying to note that many countries have shown a determination to advance further, step by step, towards the liberalisation of trade and currency convertibility. The current exchange control systems of the U.K. and West Germany have reduced the incentive for trading partners outside the E.P.U. monetary area to discriminate in favour of these countries as against non-dollar countries. Practically, all sterling balances held by non-residents have been unified into a single category of Transferable Sterling, which is freely transferable between account holders outside the dollar area. Equally noteworthy is the fact that such of those countries whose own payments situation is not yet such as to encourage them to dismantle restrictions are, the I.M.F. report points out, finding it more difficult to obtain from their trading partners that reciprocity without which mutual trade arrangements based on inconvertibility lose many of their advantages.

All this should not lead one to imagine that the road to free convertibility is clear. The existence of unfavourable factors must be taken cognizance of. It has to be borne in mind that the weakening of the reserves of several primary producing countries in the second half of 1954 has already led, notably in Australia and Thailand, to an increase in import restrictions. As the Report observes, the point seems to have been reached where the obstacles to further progress in the removal of quantitative restrictions in Europe lie as much in the desire to protect individual industries—especially in the agricultural sphere where social and strategic considerations play an important role—as in the continuance of payments difficulties. Further, the exports of the countries of the dollar area suffer most from discrimination on currency grounds elsewhere; these countries are, states the I.M.F. Report, excluded from the general measure of transferability mentioned above, and their currencies are those into which the conversion of other currencies is most reluctantly accorded. It is true that here too progress has reportedly been made in the past year towards non-discrimination. But dollar liberalisation has yet to be fostered on a universal scale.

However, in spite of the extension of non-discrimination and multilateralism in trade and payments, there is still a great network of bilateral trade and payments agreements which links the inconvertible countries of the world. After due account has been taken of all the factors that have either accelerated or checked the movement towards liberalisation and convertibility during the past year, the record can be regarded as fairly satisfactory. Prospects for continued improvement in the immediate future in the international payments situation are, in general, good. Economic trends in the U.S. inevitably continue to be a matter of outstanding interest to the rest of the world. By its effects on U.S. import demand, a high level of industrial activity in the U.S. should assure an increasing supply of dollars to the world and, in particular, an improvement in the position of many primary producing countries. Should the trend of international payments continue to be favourable, there is every reason to expect—as the I.M.F. does—an extension of non-discrimination, a weakening of the structure of bilateralism, and, thus, a further extension of de facto, if not de jure, convertibility.

The Fund's general policies regarding the use of its resources have been maintained without change. Unless there are overwhelmingly strong reasons for not doing so, the Fund invariably grants members' requests for gold tranche drawings. More substantial assistance is available in case of need to countries that are pursuing policies consistent with the objectives of the Fund; the larger the drawing in relation to a member's quota, the stronger is the justification required of a member. "Should the need arise", the Fund says "and should the justification be substantial, members need not doubt that drawings on subsequent tranches will be permitted. Foremost among the developments that the Fund foresees as justifying liberal approval of such drawings are transactions in support of the establishment or maintenance of convertibility.....in the formulation of national policies in relation to convertibility, the Fund's resources can confidently be regarded as important supplement to members' reserves." The Fund is now in a more liquid position than it has been for some time. The purchases in 1954-55 were only $48.75 million by three members. This indeed is the best indication of the improvement in reserves and payments that has been effected under the Fund's guidance which has reinforced faith in the feasibility of convertibility, though the current difficulties of sterling may give a different impression.

Haulage on the Railways

WHILE the problems of railway expansion during the next five years are still in the melting pot, the Railway Ministry, somewhat belatedly, seems to have given thought to the existing scope for improvement in goods haulage. At a conference between the Railway Board and the Chief Operating Superintendents of the zonal railways a month ago, the officials were daring enough to consider improvements in goods train operation so as to increase carrying capacity by about 15 to 20 per cent from November next. This follows a situation which has by no means been happy in recent months. Pitheads stocks of coal have continued to accumulate while many industrial units have complained of a precarious wagon-to-boiler position, especially in areas beyond Moghulsarai. There have been difficulties in respect of other raw materials and finished goods as well. In spite of increased loadings, outstanding registrations in terms of wagon loads had increased from 59,247 at the end of March 1954 to 89,413 at March-end this year. When unscrupulous speculative activities further add to the complications of the situation, the difficulties caused to genuine demands are best imagined. It is no solution merely to lay blame on such activities for the shortage and in such cases, as the Railway Corruption Enquiry Committee has pointed out, the temptations offered to the railway department officials have also often been involved.

With the increase in the tempo of development expenditure, there can obviously be no relaxation of this pressure on transport and execution of projects in all sectors can be greatly hampered by transport delays. Though agricultural production in 1954-55 indicated even a very slight fall from the previous season's levels, food movements have registered an increase of 8.8 per cent on the broad gauge, and 6.6 per cent on the metre gauge, over the previous year. In the first half of this year the tonnage lifted on the broad gauge was higher by 7.4 per cent over the corresponding period of 1954, while on the metre gauge it was still higher. But unsatisfied demands which have outstripped these improvements reveals something of the bottlenecks that will emerge in due course.

But to the extent to which there have already been improvements, the Railway administration would deserve a word of praise. During 1953-54 the Indian railways moved about 98 million tons of goods traffic and in 1954-55, an increase of about 9 per cent was estimated to have been achieved. If current expectations materialise, the volume of traffic to be carried may well reach a level of 120 million tons in the current year, involving an increase of about 12 per cent. An increase at this pace has not shown itself yet but may well be expected at the commencement of the busy season in November, for which the railway officials have now attempted to prepare in advance. This is also the average rate at which the railways will be under an obligation to increase their carrying capacity in the next five years. At a conservative estimate, the additional traffic at the end of the Plan is expected to be about 181 million tons, or 50 per cent more than the present level. Coal alone will account for more than a third of this additional traffic but the proportion of the rest of the traffic which will be offered must inevitably rise with the transport demands of the steel industries. Something of the urgency of the problem can be appreciated from the fact that a proposal has been seriously discussed whether a third steel plant should be staggered in view of the severe strain on transport, apart from the paucity of technical personnel for steel manufacture.

These considerations have already drawn attention to the necessity for taking a favourable view of the revised proposals of the Railway Ministry on the second Five-Year Plan. The moral of the present position is that the system has gone as far as it could conceivably go on its own strength and the relatively low priority set for it under the first Five-Year Plan. Even in the matter of the congestion in the main junctions, in which there will always remain some scope for effective scrutiny of reasons for bottlenecks, there is shown a steady, though slow, improvement. The daily average number of wagons passing through Moghulsarai from Eastern to Northern Railway has increased from 1,347 wagons in 1951 to 1,535 wagons in 1954 and to an average of 1,640 wagons in the first half of this year. When the additional scope for the increase of 15 to 20 per cent during the rest of the year is also explored, the rest of the improvement can only come with the additional rolling stock which will arrive in excess of the immediate needs of replacement.

The potential capacity of indigenous production of goods wagons in the 1956-57 rolling stock programme is estimated between 15,000 and 16,000, distributed among eight firms which have been supplying goods wagons to the Indian Railways of several types. Two years ago, this indigenous capacity had been assumed to be only about half this figure and before the Engineering Capacity Survey Committee's Report saw light, the available unutilised capacity became used up. Even so, orders on the first year of the second Five-Year Plan will be more than double this larger wagon production in India. The issue of augmenting the rolling stock is too often equated with the existence of local capacity. It is possible that this helps to compel a search for agencies which can undertake local building, like the one which has now revealed the existence of double the old assumed capacity. But at the moment, orders for railways cannot be too much dependent on these considerations. There is also the secondary consideration that even if there is building capacity, the shortage of steel cannot be relieved except with large-scale imports. There is no longer a buyers' market in steel. The most expeditious course would be to place orders abroad to the extent of the deficiency in current indigenous capacity, without staggering the orders.

Some of the routine improvements, now effected as a consequence of the recommendations of the Railway Corruption Inquiry Committee will help. The uniformity in the booking of goods, the elimination of the abliguities in the classification of goods and augmentation of goods shed facilities at important stations will alleviate existing hardships to industry and business. There has been, in all, a growing interest in the importance of railway transport as the key to development that there will be no repetition of the low priority accorded to transport in the first Plan.

Fly your Cargo

—it's swift, safe and economical

AIR-INDIA International enables you to tap new, faraway markets. Expand your business and increase your profits by cutting down delay, risk and costs — SEND YOUR CARGO BY AIR.

Six flights a week to London
New stations —Beirut and Zurich
Express service to London every Saturday
Weekly service to Singapore and Tokyo
Convenient connections to all the cities of the world

Fly it...they'll buy it!

Longer working life for your vehicles—

with MARFAK Lubritection SERVICE

The best way to reduce your operating costs is to reduce wear. Insist on MARFAK *LUBRITECTION* SERVICE for economic lubrication. You'll get fewer repairs, heavier payloads, quicker operation, smoother riding comfort and longer vehicle life. MARFAK *LUBRITECTION* SERVICE ensures that *every* moving part of your vehicle is correctly lubricated at proper intervals—with the *right* lubricant to prevent undue wear. MARFAK won't wash out, squeeze out, run off or dry. It keeps dirt and moisture out, lubricating—giving all-weather protection—even through the monsoon. Arrange with your friendly Caltex Dealer for MARFAK *LUBRITECTION* SERVICE at regular intervals.

CALTEX PETROLEUM PRODUCTS

THE WEEK'S NOTES

THE SUPREME COURT ON SALES-TAX

THE SUPREME COURT, in overruling its own decision on sales-tax on inter-State trade, has chosen not to follow the convention attributed to the Privy Council that it cannot overrule its own decisions. In this respect, the Supreme Court is in the same position as the United States Supreme Court which has reversed even its long-established decisions, the most outstanding case being the recent ruling on segregation laws. But one consequence of such reversal will be that some uncertainty will be caused in the public mind about the state of the law when conflicting verdicts follow in such quick succession as in the sales-tax case. In the present case, the Supreme Court's judgment was based on a majority of four (against three Judges, who have given dissenting views) and it is quite likely that in another later test of the same point, a different composition of the Bench would again lead to a different if not a wholly opposite view, The only moral of this judgment is that Parliament should take the earliest opportunity to clarify the legal position instead of leaving it to be settled by this uncertain judicial interpretation.

There can be no doubt that a prohibition of taxation of articles which enter in the inter-State commerce will be welcomed with great relief in business circles which have recently been subjected to unnecessary harassment by several taxing agencies. It is unlikely that State Governments would agree to a convention which cannot be reinforced by constitutional law. So long as the explanation of Article 286(1) stands in its present form to the effect that a sale or purchase shall be deemed to have taken place in the State in which the goods have actually been delivered for purposes of consumption in that State, it would be difficult to prohibit State Governments from further agitating their prima facie right to tax.

IRRECONCILABLES IN CYPRUS

THERE WERE all the reasons for the failure of the Cyprus conference. The expected has happened and the tiny island represents an embarrassing question mark. Had the tripartite conference succeeded only in making the three parties understand the widely divergent views held by each, it would have been surprising. The Greek demand of self-determination for the Cypriots and the Turkish desire to maintain the status quo or else to revert the little, yet strategic, island to Turkey on the flimsy strength of a 20 per cent minority of Turkish-speaking people, are irreconcilable. The British Government has repeatedly made it clear that it does not visualise the relinquishment of sovereignty over Cyprus which it has held under trust since 1878. However, it proposed to introduce a new and liberal constitution in which the government would be progressively transferred to the Cypriots, excluding foreign affairs, defence and public security, which would be reserved to the Governor. How far this measure of reform meets the acceptance of Cypriots remains to be seen.

Meanwhile, the suspension of the conference has aggravated the intensity of bitterness between the two traditional rivals, Turkey and Greece. Already, there has been fierce anti-Greek rioting in Istanbul and other cities of Turkey. The British decision to seek the participation of the Greek and Turkish Governments to search for a solution of the problem, excluding the Cypriots themselves, may seem to have been conceived with the idea of beating the restive Greeks with the Turkish stick. But they failed to anticipate the grim consequences that were bound to follow. One of the disastrous effects of the failure of the talks may be that the one-year-old Balkan Alliance between Yugoslavia, Greece and Turkey, which was conceived as an extension of the Atlantic Community, is powerfully shaken. Notwithstanding the Greek apprehension of Soviet expansion, the air is thick with the talk of reviving the Little Entente which will include Rumania and Bulgaria. It is possible that if the British Government had taken a more independent course, matters would not have taken this awkward turn. The strategic position of Cyprus and the contribution of the British military headquarters in the island towards maintaining peace in the region is recognised. Primarily it is the British Government that is responsible here, and it must find a solution which may be acceptable to the Cypriots.

WORLD BANK FORGES AHEAD
