In the draft Second Five-Year Plan, the private sector has to find Rs. 2,200 crores for the development programme and this has to be found alongside of more taxation and larger Government borrowings. Is it possible for the private sector to find this money when the individual is sought to be taxed so heavily as not to leave anything in his hands for investment? The institutional investors, such as insurance companies, banking companies etc., are restricted by law from investing their moneys in new industrial undertakings, and I fail to see how it will be possible for the private sector to find this money unless and until Government are prepared to reduce the burden of taxation on the individual.

The Plan contemplates that with the development of small scale and cottage industry, which is given greater prominence, suitable employment will be found for over ten million people. I doubt very much whether this objective will be attained in the manner suggested by the Committee. In my opinion the only solution of this problem lies in the development and expansion of basic and large scale industries in this country. My view is that there should be levelling up instead of levelling down: more production—more consumption—greater prosperity.

Drastic Changes in Finance Act

The Finance Act of 1955 has made drastic changes in the Income-tax Act. The definition of 'dividend' has been amended so as to include in the case of a company in which the public are not substantially interested of any sum by way of advance or loan to a shareholder to the extent to which the company possesses accumulated profits. Such a provision has caused great hardship to many as the time given by Government for

repayment of the loan was only up to 30th June 1955. Section 23A has been amended drastically with the result that many companies which were treated as public companies will now be considered as private companies for the purpose of application of that Section. One of the provisions of that Section is that a company will be treated as a company in which the public are not substantially interested if its affairs or the shares carrying more than fifty per cent. of the total voting power are controlled or held by less than six persons and for that purpose husband, wife, brother, sister etc. are treated as a single person. This provision, in my opinion, will prevent many companies of good standing from creating sufficient reserves for replacement of plant and machinery or for expansion of the industry. It is common knowledge that entrepreneurs or promoters before they start a new industry arrange for capital from their own resources and resources of the members of their family and friends before they invite the public to subscribe for capital. The public are very shy in investing their moneys in shares of a new undertaking and in most cases the requisite capital is obtained from private resources of the promoters. The new provisions contained in Section 23A will, in my humble opinion, retard the progress of rapid industrialisation of the country and will prevent the private sector from effectually playing its part during the period of the Second Five-Year Plan. I fail to understand why an invidious distinction has been made for granting relief in respect of earned income between a salaried person and a professional or business man. While there is no ceiling fixed for granting relief to a salaried person, a ceiling is fixed in the case of a professional or business man so that such a person earning an income of over Rs. 45,000/- will not get any relief. Is it suggested that a salaried person earns his income with the sweat of his brow while a professional or business man does not do so? I submit with great respect that no such distinction should be made for granting relief in respect of earned income.

Companies Bill Will Weaken Enterprise

The Joint Select Committee have made many major changes in the draft Companies Bill, some of which are of a very far-reaching character. While I welcome such of the changes in the Company Law as are intended

to ensure maintenance of standards of good behaviour in company promotion and management and to secure the conduct of company management on healthy and progressive lines, I feel that some of the provisions of the Bill as it has emerged from the Joint Select Committee are likely to retard the development programme assigned to the private sector in the draft Second Five-Year Plan. It is pertinent to point out that the private sector functions through joint stock enterprise in setting up the necessary organisation and securing financial resources involved in suitable development activities. In my opinion, the proposed amendments can hardly be said to be conducive to produce a psychological atmosphere favourable for giving a fillip to the private sector, but on the other hand are likely to dampen the enthusiasm of the investing public and produce effects which may shake the confidence of the public regarding the stability and future of private enterprise.

Undue Restrictions on Managing Agency

The definition of the term 'associate' has been made more comprehensive so as to include a number of persons firms and corporations who were not regarded as associates in the draft Bill. The promoters are even made liable for misstatements in the prospectus on immaterial matters. According to one of the clauses a member of a company will be entitled to appoint any person whether a member of the company or not as his proxy to attend and vote at any meeting of the company. Such a provision, in my opinion, is against all principles of joint stock enterprise. A new clause has been added by which the overall maximum managerial remuneration should not exceed eleven per cent. of the net profits of the company in any year. Drastic restrictions are proposed to be imposed upon the managing agency system. While I condemn the malpractices and fraud perpetrated in the past by managing agents of a few companies, I am of the opinion that undue restrictions on the system of managing agency will hamper the healthy growth of joint stock enterprise and are likely to defeat the objective of Government namely the rapid industrialisation of the country. The obligations imposed upon the directors of companies are so heavy and burdensome that after the Bill is put on the Statute Book, no honest man would

come forward to accept a directorship of a company.

Mr Shroff's Views Endorsed

Now I come to the most burning question of the day viz., the threatened nationalisation of insurance industry in our country. Mr. A. D. Shroff, Chairman of the New India Assurance Co. Ltd., in his speech delivered at the last Annual General Meeting of that Company, has in his own inimitable way made out a strong and unanswerable case against nationalisation of insurance industry in this country. His speech deals with the question of nationalisation of insurance industry in all its aspects supported by facts and figures and is a challenge to those in power to meet the case put forward by him. I do not propose to reiterate all the arguments and reasons advanced in that speech on this question. These arguments may be summarised as follows:

- A State enterprise cannot create and stimulate the insurance habit amongst the vast masses of the population by a highly efficient sales service at an economic cost;
- A State enterprise cannot set up a vast field force possessing the requisite qualities controlled by an inspiring leadership;
- A State enterprise cannot extend to the insuring public the same active, flexible, prompt, competitive and economic service as now;
- A State enterprise cannot operate in the foreign field with the same initiative, enterprise and success as is the case now;
- In the case of life assurance the coverage sold to the public is essentially a personal one suited to the requirements of the individual families concerned and calling for the utmost vigilance and servicing throughout the term of the policy;
- General insurance being of a highly complex character demands immense variation in insurance coverages which have to be adapted to different types of risks and calls for active, flexible, prompt and economical service and requires extensive spread of risk through international reinsurance.

I entirely and whole-heartedly endorse the views of Mr. Shroff on

this question and lend my unstinted support to all the arguments put forward by him as to why insurance industry should not be nationalised. I suggest that those who talk of nationalisation of insurance in a loose way should study that speech and before coming to any conclusion should weigh in an impartial manner the pros and cons of the case advanced by Mr. Shroff against nationalisation of insurance industry. I hope and pray that before coming to any final decision on this matter those in power and authority would judge this question on merits and from the point of view as to whether nationalisation of insurance is likely to benefit the country in any way or to attain the objective of improving the standard of living of its people. I should however like to deal with one or two aspects of this question.

Experience of Govt Management

It is argued by those who talk of nationalisation of insurance industry that if this industry is nationalised it would eradicate unhealthy methods adopted in the field of insurance and secure for the development programme envisaged in the Plan large funds. It is significant that the experience of concerns taken over by Government shows that instead of the expenditure in these concerns being reduced it has gone up and the business of such concerns has not progressed as well as it could have if it were in private hands. In this connection, I would refer to the cases of two big companies of which Government appointed Administrator to carry on their business under the direction and control of the Controller of Insurance. From the published accounts of these companies it will be seen that since the Administrator took charge of the business of these companies, there has practically been no progress and the expenses are abnormally high.

In the case of one of these companies, the Renewal expense ratio of Life Premium ranges between 19 and 19½ per cent. against 15 per cent. allowed by Law. Compared to the figures of other well established companies of equal standing, the new Life business secured by these companies has remained static and there has been hardly any increase in the total life business in force. As regards General business of one of these companies, the expenses are on the high side. In the Fire Department, which is the mainstay of indigenous companies transacting General insurance business, the percentage of expenses is abnormally high—

about fifty per cent. higher than that of any well established Indian company of equal standing. It is evident that in a Government managed concern there is no incentive to push up business or to control the expenditure. In a recent speech the Chief Minister of the Bombay State observed that if proper incentive could be made available to trade, commerce and industry, India would make tremendous progress in all directions and attain a very high position among the industrialised countries of the world. From the nature of things, such an incentive cannot exist in the case of nationalised industries with the result that the progress which could be made in the private sector can never be attained in the public sector.

Even Communists Oppose

I am not unmindful of the fact that Government's policy is based on the objective laid down in the Avadi Resolution viz., the socialistic pattern of society. The Second Five-Year Plan however contemplates the existence of private sector and in a mixed economy both sectors have to co-operate with each other and to flourish side by side. In my opinion, insurance industry has played a vital role in the development programme of this country. If you scrutinise the balance sheets of several well established insurance companies, it will be seen that large funds are invested in debentures, preference shares and equity capital of several joint stock companies. This clearly shows the very valuable part which insurance companies play in the economy of the nation by canalising the multitude of small contributions of individual policyholders into a substantial support of the industries from which many such policyholders derive their livelihood. Even the Central Committee of the Communist Party of India recently passed a resolution to the effect that for the present it was neither necessary nor advisable that Indian insurance and banking should be nationalised. Why then those in power should loosely talk of nationalisation of insurance industry when even the leftists in the country are opposed to it?

State Cannot Spread Risks

It seems to be forgotten that insurance is a highly technical matter. The principle of insurance is that the risk should be spread over as widely as possible. In fact it is international in character. From the nature of things it is not possible

to retain the entire risk in this country without ceding a substantial part of such risk to foreign companies in different parts of the world. If the threatened nationalisation of insurance industry is brought about, foreign companies operating in India will have to close their doors and in that event the nationalised corporation taking over the business of insurance will not be in a position to secure favourable treaties and arrangements for reinsurance. In my opinion, economic nationalism in insurance industry is neither possible nor advisable and will considerably retard the development programme envisaged in the Plan.

It is conceded that insurance companies admit and pay the claims arising under the policies whether life, fire, marine or accident as promptly as possible. It is common experience that policyholders make exaggerated claims under the policies but with the good will on both sides these claims are amicably settled without resort to a court of law. If insurance industry is nationalised, those at the head of affairs will not be as prompt in the investigation and payment of claims as our experience in the matter of refund of income-tax clearly proves. Red-tapism and strict adherence to the Letter of the Law will play their part in delaying the payment of claims of policyholders, some of whom may have to undergo untold hardships by reason of such delay.

No Large Funds to Grab

It is suggested that if insurance industry is nationalised Government would be in a position to avail themselves of large funds which are now in the hands of the private insurers. This, in my opinion, is a wrong view inasmuch as 64 per cent. of the total life funds of life companies operating in India are invested in Government or semi-Government Securities.

In the end I hope and pray that those in power will see the light of the day and will not rush in where angels fear to tread.

Satisfactory Accounts

The details of the accounts as well as of appropriations from the profits have been already dealt with in the Directors' Report which is before you. From the Revenue Account of the Fire Department it will be observed that there has been a slight reduction in the net premium income both from business effected outside India and also from Indian business. The fall in the Indian premium income in the Fire Department is mainly due to fall in commodity prices

and tendency on the part of the merchants not to maintain large stocks in hand. The premium income in the Accident and Miscellaneous Department also shows a slight reduction. The Marine premium income however shows a small increase which has necessitated increasing the unexpired risk reserve by about Rs. 20,000/-. Your Directors have considered it desirable to increase the reserves in the Marine and Accident and Miscellaneous Departments and have transferred a sum of Rs. 13,000/- to Additional Reserve in the Marine Revenue Account and a sum of Rs. 33,000/- to Additional Reserve in the Accident and Miscellaneous Revenue Account.

The total profits of all the Departments are Rs. 4,94,184/-, which, I am sure, will be considered quite satisfactory.

Investment Position Strengthened

It will be seen from the Profit and Loss Account that there is an appreciable increase in the income from sale of Investments. Your Directors have considered it desirable to write off a sum of Rs. 63,125/- as Depreciation on Investments. This has been done with a view to bring down the book value of some of our Investments to the actual market value as at 31st December 1954. As already mentioned in the Directors' Report, your Directors have continued to maintain the existing Investment Reserve of Rs. 1,00,000/- which goes to strengthen the Investment position of the Company.

After making the necessary provision for other expenses, repairs to property etc., a sum of Rs. 6,05,803/- has been transferred to the Profit and Loss Appropriation Account subject to taxation.

Handsome Appropriation to Reserves

As stated in the Directors' Report, Your Directors have transferred a sum of Rs. 1,50,000/- to General Reserve, Rs. 13,000/- to Marine Revenue Account and Rs. 33,000/- to Accident and Miscellaneous Revenue Account respectively for Additional Reserves. Your Directors have further thought it advisable to make a special reserve for granting Gratuity to the Members of the Staff and call it 'Gratuity Reserve Account' by transferring a sum of Rs. 40,000/- for the benefits of Members of Staff on retirement.

It will thus be seen that our General Reserve Fund has increased from Rs. 1,00,000/- to Rs. 2,50,000/- over and above the increases made in the Additional Reserves of Marine and

Accident and Miscellaneous Departments by a further 5 per cent. of the premium income of the year.

It will also be seen from the Accounts that the total net premium income of all Departments is Rs. 30,09,583/- and the total Reserves of the Company amount to Rs. 34,14,614/- against Rs. 32,95,395/- in the previous year which works out at more than 100 per cent. of the total net premium income of the Company during the year.

Your Directors have recommended a Dividend of Rupee One per share as in the last year.

In view of the satisfactory results of the working of the Company during the year, your Directors have recommended to grant two months' basic salary by way of Bonus to the Officers and members of the Administrative Staff.

Extension of Activities

The question of extension of the Company's activities in other parts of the country is engaging the serious attention of your Directors with a view to increase the premium income and the Directors are confident that the result of these arrangements will be reflected in the coming years.

In conclusion, on behalf of the Company I take this opportunity of thanking our clients, patrons, agents and field workers for the support they have given to us during the year and I again appeal to them to give us their continued and hearty co-operation in the years to come. I must also place on record appreciation of the work done by the Director-in-charge, the General Manager, other officials and staff both at the Head Office and Branches and it will be no exaggeration to say that but for the strenuous efforts made by them it would not have been possible to present to you the satisfactory results as shown by the Accounts.

Letter to the Editor

SHRI V P VARDE in his article on the "State Bank's shares" in the "Times of India" of July 8 rightly pointed out that the Reserve Bank's offer of State Bank shares at Rs. 350 per share may be technically correct but not necessarily right. What is important is to ascertain whether the offer is a formal one as required under the Act or whether the authorities are genuinely desirous of public participation. As the offer stands at present, without any indication as to the return that the investor would get, there is little hope of any response because no investor would knowingly take a decision involving serious impairment of his capital which any reduction in dividend below the current rate must involve, particularly when the alternative compensation in Government bonds ensures full safety of capital and a definite return. If the investor is to take shares in preference to the loan, he should at least be made to feel that he will continue to receive the same income. Admittedly no definite assurance is possible but the authorities owe it to the public to declare what their intention is likely to be.

When the State Bank of India is launched and shares are offered to the public at Rs. 350 even though the nominal value of the share may be Rs. 100, the effective issue price is Rs. 350 and a dividend distribution can only bear relation to such issue price. Any comment whether in Lok Sabha or outside which does not take this vital fact into account must be regarded ill-informed and distorted.

Shri Varde has well indicated the defects in the present legislation but, as the Act stands at present, one cannot share his view that maintenance of dividend at the old level would appear excessive and not in consonance with the new philosophy. It is fictional and misleading to regard the shares of the State Bank as of the face value of Rs. 100. The value paid by the Reserve Bank and demanded from the public being Rs. 350, the right course is to indicate in the Balance sheet of the State Bank that value as the nominal value, if necessary even by a suitable amendment of the Act. Maintenance of dividend, in terms of percentage, would then not give a false impression and by ensuring a

State Bank's Shares

moderate return on his capital would induce the investor to exercise his option in favour of State Bank shares.

Viewed from a wider perspective, the offer of minority equity participation in a State enterprise is an interesting and novel experiment in mixed economy. If desired it can well form a precedent for future capital issues even of State industrial enterprises. In that way a new channel can be opened by drawing savings of the public for develop-

ing State enterprises. This would however call for a more proper understanding of the investor's point of view than at present and an appreciation by the Government of the basic fact that the mass of the investors are common men and not capitalists seeking a reasonable return on their hard-earned savings in an atmosphere which inspires confidence.

West End 'IND' ALARM

You cannot buy a Better Timepiece

Rs. 21

Powerful 30-hour movement, heavy brass plates. Wheels solid hardened brass. Axles and pivots hardened steel cut from the solid. Long Continuous Alarm. Bright Nickel Case. Width 3 7/8" - Height 4 1/4". Plain White Dial Rs. 21. With Radium, Rs. 2 extra.

The West End 'IND' Alarm is all what the workman-ship and materials can make it. Every detail of movement, alarm mechanism and case is perfect. No breakdowns or distressing disappointments with it. So supreme is the West End 'IND' among its class that it can be confidently relied upon for years of long-lasting service and satisfaction.

Inflation and Sterling Reserves

THE expected has happened. Britain's gold and dollar reserves have fallen in an alarming manner. The Treasury has just announced the changes in the reserves for the first half of 1955 and for the month of July. Between June and July these reserves have fallen by \$136 million to a total of \$2,544 million. It represents the largest decline in any month since the heavy losses sustained during the post-Korean recession when the reserves dropped from their peak of \$3,867 million in the middle of 1951 to \$1,685 million a year later. The Treasury has stated one of the more important reasons for this decline. The heavy loss in July is attributed mainly to what it calls the "unfounded Continental and overseas rumours about the alleged pending alterations in the sterling exchange rate". Evidence for this belief is provided by the £25 million deficit which the United Kingdom had on its European transactions during July. It appears that the extent of the July loss was known to Mr Butler, the Chancellor of the Exchequer, when he reasserted Britain's policy to maintain the pound at the parity rate of \$2.80 and when he announced further measures to restrict domestic credit.

It is difficult nowadays to assess the extent to which speculative movements in sterling exert pressure on the gold and dollar reserves of the Bank of England. In the past, the free transferable sterling markets in foreign centres provided some indication of the extent of speculative pressures against sterling. However, since the Bank of England was given the right to intervene in support of the £ in these markets, this speculative indicator has been obscured. It is certain that when the transferable sterling exchange rate on the free markets dropped to \$2.71 = £1 in February last, the Bank of England intervened boldly and this must have involved some loss of gold and dollars. Since then, the free rate has moved up to the current level of \$2.75½ = £1 and stayed put at this rate, with variations of 1/16 of a cent (US), either way, for about a month. Nor can there be any doubt that the Bank of England must have lent its hand to support sterling in these markets and keep it steady for this length of time. This is all the more remarkable when account is taken

of the persistent pressure on sterling in the official exchange markets, where it has been limping between \$2.78 and \$2.78½ for some time now. That some part of the fall in the gold and dollar reserves can be attributed to Bank of England's intervention in the unofficial exchange markets in Zurich, Paris and New York is, therefore, a warrantable assumption.

More important, however, is the trend of exports and imports. The trade statistics for June and the first half of 1955 have been issued and from these it is clear that the worsening of the balance of trade is now having its inevitable effect on the country's gold and dollar reserves. In June, the value of recorded exports amounted to £157 million. This was about £90 million, or over one-third, below the April-May average of UK exports. Imports, on the other hand, were £293.9 million, which is only 3 per cent below the April-May average. Thus, from an average monthly trade deficit in the first and second quarters of 1955 of about £76 million, the deficit for the month of June shot up to £128 million. The increase in the trade deficit has, up to now, been explained in terms of the railway and dock strikes. Recently, however, the authorities have come round to explaining the adverse movement in the balance of trade by reference to the pressures of internal demand on the resources available in the economy.

In the first four months of the year, production in all industrial establishments was about 6 per cent higher than in the first quarter of 1954. Unemployment fell to less than 1 per cent of the working popu-

lation and, according to the Ministry of Labour, there were two vacancies for every unemployed person. The high level of economic activity was mirrored by the number of new factories under construction and new orders for machine tools. Factory building approvals and net new home orders for machine tools were about 70 per cent higher than a year ago. This expansion, as the Treasury Bulletin for Industry puts it, has placed "a heavy burden on the country's balance of payments".

Until the first quarter of 1955 the volume and value of imports was rising at a pace faster than exports. In February last, the bank rate was raised to 4½ per cent and, possibly as a result of this, the April and May volume of imports declined somewhat. By June, however, the influence of the heavier cost of borrowing was wearing out. More than that, new import commitments were being made by Britain. For instance, heavier imports of coal have had to be made (costing about £80 million, or £60 million more than in 1954). Steel imports, too, have risen and the prospective increase in imports of heavy cargoes has sent up tramp shipping freight rates. While the export trade continues to be brisk, it is reaching its peak. It can only be increased by a corresponding rise in export prices, and this is what is happening, judging from the favourable movement in the terms of trade (import prices have remained unchanged while export prices have risen).

And here a problem of some significance is emerging. A number of overseas markets are tending to become more sensitive to prices and are therefore diverting their pur-

chases from the heavier cost to the cheaper cost sources of supply. The German export drive shows no sign of slackening and now that most of the European countries are lifting their restrictions on dollar imports, the United States is emerging again as the most powerful trader in the world.

To add fuel to the inflationary fire, a number of basic materials have been subjected to sharp price increases. Coal prices have been pushed up by 18 per cent—this increase as the Times described it "was a serious matter for a country already in the tolls of a steady inflation of wages and prices". The cost of electricity will be correspondingly increased by some £20 million, while that of gas supply and railways will rise by £18 million and £9 million respectively. Similarly, steel prices have been increased by 8½ per cent.

The United Kingdom's balance of payments data for the period January to June will not become available until the beginning of September, but it is clear that a somewhat serious situation will be revealed when these statistics are published. Indeed, a serious crisis in UK's balance of payments during the autumn has already been forecast. The Financial Times has stated that "it would be remarkable if the month of August failed to show another substantial deficit in the gold and dollar accounts". The months of July, August and September are usually the ones in which heavy imports of tobacco and grain take place and when sterling commodity earnings are low.

In contrast, heavy pressures on the resources of the economy show no signs of abatement. Recent data on retail sales show a sharp increase over the first quarter of 1955 and it is believed that retail and wholesale stocks are being maintained at a relatively high level, in order to take advantage of the brisk rate of sales turnover. In spite of considerable increases in interest rates, house and factory building continues with some speed and, here again, would-be purchasers of houses, as well as those industrial enterprises borrowing funds to expand their plants, still appear to be insensitive to the heavier costs of borrowing. True, commercial banks have been asked to cut down on their advances "by a significant amount", but most of these reductions have been in respect of bank advances on professional and personal accounts. Banks are finding it difficult to discriminate

between those clients whose activities are "economic" and those whose activities are "uneconomic". The Economist's recent survey of company accounts for the year 1954-1955 shows an increase in the average gross profit by some 4 per cent over the previous year and it is clear that high profit margins are killing many of the restraints which a dearer monetary policy is designed to implement.

The credit squeeze, it is now hoped, will have its overall effect on the economy some time in the autumn. And yet, it is difficult to understand how so limited and mild a squeeze that was prescribed by Mr Butler recently could withstand the pressures of the current boom, against the foregoing background. The age of inflation is once again upon us and almost everywhere recourse is being had to monetary measures with the hope that equilibrium may be restored. It is reported that the United States Federal Reserve Bank

has increased its rate of discount (which it charges to four Federal Reserve Banks) to an average of 2¼ per cent from the previous limit of 1½ per cent. Similarly, the West German Bank Deutscher Lander has raised its rate of discounts by ½ per cent to 3½ per cent. It is also reported that the National Bank of Belgium is raising its Bank rate to 3 per cent from 2¼ per cent. In the case of West Germany, the danger signs noted by the Central Banking Council included strong expansion of short and medium term bank credits, boom in the building industry and demands for higher wages. It is precisely these dangers which the British economy has been facing, in spite of the steep rise in the bank rate in February of this year. Maybe 1955 will find some place in monetary history as the year in which purely monetary measures were again proved to be incapable by themselves of restoring balance in Western economies.

From the Calcutta End

Autumn Is Here

AUGUST is a month of holidays. That's what Calcutta's office-going people remind their colleagues as they trudge along to their offices every morning. Shravan, the month of heavy rains in Bengal, is nearing its end. It still pours. But it hardly ever rains incessantly in Bengal. There is a crisp brightness in the sunshine. The autumn blue sky is one of the most refreshing sights in Bengal. The snow-white clouds make the blue sky look bluer. The rains are almost over. There is an expectant awareness in the atmosphere. It's a feeling one can't escape while in Calcutta.

Calcutta is now paying homage to the Poet. Throughout the week, throughout Bengal, there will be celebrations in memory of Rabindranath. This is the week of the Poet's death anniversary. This is also the week of the birth anniversary of his illustrious brother, Abanindranath. Calcutta's Tagore societies are now staging famous Tagore plays like Sesh Varshan and Varshamangal. This is the week when Calcutta celebrates Janmashtami, the birth of Lord Krishna. This year's celebrations will be held at Deshapriya Park, and will be presided over by the Vice-President, Dr Radhakrishnan.

Hope Lingers

The seasons have changed. The seasonal periods also seem to have changed. If floods are now annual pests in Assam, northern West Bengal, Bihar and Uttar Pradesh, drought and scarcity of rainfall are now equal threats to many parts in these areas. Lower Damodar Valley is a region where rainfall has been uneven for the last few years. On Tuesday, the DVC Barrage at Durgapur was opened. The Durgapur Barrage will irrigate about one lakh acres of West Bengal's arid land. Tuesday's Calcutta dailies carry an advertisement released by the West Bengal Government. It tells the people that the Vice-President will be opening the Barrage on that day. It adds that the West Bengal Government's coke-oven gas plant will be set up at Durgapur in the near future. Durgapur, the people are reminded, will be the Ruhr of India.

West Bengal and Bengalis live in hope. There is much misery. There is too much poverty. Death never seems to take a holiday in West

Bengal. These dismal facts and their social consequences are discussed below. Findings of the all-India Institute of Hygiene and Public Health, Calcutta, are too gloomy. One wonders whether West Bengal will ever overcome her troubles and problems. It is difficult to shake off pessimism. But the only ray of hope is that hope still lingers. One has been agreeably surprised at the student community's curiosity and faith in the series of five-year plans. The younger generation is hopeful.

Are males or females the weaker sex? Women are popularly supposed to be weaker than men. Recent researches have exploded some of the popular beliefs. Some medical scientists are inclined to the view that females show more resistance to disease than males. It is only natural that females show a higher mortality rate in the age groups when the burden of reproductive hazard is heaviest. But that does not necessarily mean that the female mortality rate is higher than that of the male.

Mortality Rate

Investigations undertaken by the all-India Institute of Hygiene and Public Health, Calcutta, indicate, however, that the mortality rate for the city female is higher than that for the city male. According to the Institute's study, this is the case in the major cities of India. But the Institute's figures reveal that the comparative mortality rate is more unfavourable for women in Calcutta than females in any other big city in this country.

Tuberculosis and small-pox are the two diseases which generally affect city females more than city males. Tuberculosis is slowly spreading even into rural areas. According to the Institute, the proximity of villages to industrial centres is the main reason for the slow spread of tuberculosis in the rural areas. Rural people show lower resistance to some diseases. Those rural people who come to industrial towns to earn their livelihood show less immunity to infection.

T. B. and Poverty

It is not surprising to know that middle-class families suffer more from T.B. than any other class. Nor will it be surprising to know that the Institute has collected data which establish a positive co-relation

between the presence of T.B. in the family and the size of families. Poverty is the main cause of the rapid spread of T.B. in Calcutta. Though the middle-class is not, by definition, as poor as the poorest section of the community, it is understandable that the social pretensions of the middle-class are the main cause of its relative lack of nourishment. Here, the popular impression is confirmed by irrefutable data collected by the Institute.

If poverty is the main cause of the rapid spread of T.B., it is also responsible for the high rate of maternal mortality in Calcutta. A study of the trend of maternal deaths in the city reveals that anaemia is responsible for 30.3 per cent of the deaths in hospitals. To the Institute's foot-note that milk consumption in adequate quantities by expectant mothers has been found to maintain a better blood standard, the obvious reply is that if expectant mothers could afford milk in their diet they would, perhaps, not be bearing as many children as they do.

Fertility Pattern

This is where the reproductive pattern of the Bengali female enters into the picture. From the Institute's study, one clear fact emerges: No other influence has so close a relation to the fertility pattern as the economic factor. Among Hindu females, the fertility pattern has a direct co-relation with the economic status. Among Muslim females, on the contrary, the relation is inverse; the higher the economic status, the greater the female fertility.

From the Institute's study, it appears that both the Bengali male and the female hold positive views about planning the size of families, though there are substantial differences in the attitude to this problem between rural and urban groups and between Hindus and Muslims. Majority of women in the upper middle class urban group are willing to use contraceptives to maintain the size of families at certain levels. But the rural Hindu group and even the urban Muslim group are not willing to use contraceptives to plan the size of families. There is circumstantial evidence to suggest that this difference in attitude has something to do with female education in the groups concerned.

Post-Script to Draft Plan-Frame III

Capital-Intensity of Consumer Goods

D Ghosh

THE object of this note is to examine one of the basic assumptions of the Second Five-Year Plan-frame. According to the Plan-frame, increase of consumer's goods during the next five years should be achieved by an extension of hand industries rather than of mills and factories.

The argument used in support of this recommendation is, briefly, as follows: because of our low income per head we have a limited supply of capital. On the other hand, we have a large surplus of unemployed and under-employed workers. We can bring this labour into employment only if we use labour-intensive rather than capital-intensive methods in the production of consumer's goods and services.

I shall assume, for the purpose of this note, that capital intensive methods are, by and large, more efficient and, given any practicable wage-rate, can produce more cheaply than labour-intensive methods. The Plan-frame is then asking us to sacrifice efficiency for the sake of employment, implying that in the circumstances of an economy like ours, there is an unavoidable conflict between the two desiderata, or, to put it differently, that the volume of employment, in an underdeveloped economy, depends upon the technique of production employed.

The strangeness of this theory becomes patent as soon as it is stated in this manner. For neither orthodox economists nor the theorists of socialism associate the volume of employment with the technique of production. They speak almost always of over-saving, under-consumption, liquidity preference, etc. as factors responsible for employment in the short period, while for the long period, they regard increasing investment as the main instrument for expanding employment. Briefly, it is the manner in which a society distributes and uses its income rather than the technique it employs to produce it that has been considered as relevant to the determination of the volume of employment both in the short and long run.

The classical approach to the problem is simple. Liquidity considerations being abstracted—in any case the technique of production has no

thing to do, directly, with liquidity considerations—supply creates demand, so that the more efficient the technique of an industry and the cheaper its products, the greater the demand for the products of other industries and the wider the scope for employment in all industries taken together. Further, the increase of income per worker and the expansion of employment provide the source of extra saving necessary still further to improve the production technique and expand output and employment.

This argument is not affected by the fact that savings are, to start with, insufficient. Given the minimum investment in plants required by any form of technique, the scarcity of initial saving would limit the variety of the industries that can be established and of the goods and services that can be produced. But whatever is produced, would be produced more efficiently under capital-intensive methods and given the wage rate, the total employment provided would be no less than under labour-intensive methods. Indeed, if capital is conceived of as labour, the existence of surplus labour in an economy should make it easier and not more difficult both to increase the capital-intensity of its productive methods and expand the scope for employment. To employ this labour would not require any extra saving; only the portion of the national income that is being spent on feeding the unemployed worker for no work done would be handed over to him as wages for producing capital goods.

The only real snag in the above argument is that as the period of gestation for the more developed capital goods is longer than that for simpler tools and instruments, a society which adopts capital-intensive techniques would have to wait longer before it can enjoy the fruits of its investment in the form of consumer's goods and services.* The crucial question which it must answer is then: should it have a higher output at lower cost, but available only after a time, or a more imme-

*The acquisition of special skill needed by the higher technique of production is regarded as a problem of investment.

diately available smaller output produced at higher cost?

In a completely socialised economy in which future income is not discounted, there is a natural preference for the more capital-intensive methods because of their superior productivity. In societies where future income is discounted, investment in capital-intensive methods should extend up to the margin at which the discounted value of the larger output in the long run from superior technique is equal to the benefit from a more readily available increase of supply from labour-intensive methods. Evidently, the situation would be different for different consumer goods and industries depending upon the urgency of demand and the comparative efficiency of capital-intensive and labour-intensive techniques. There could surely be no case for a blank decision in favour of labour-intensive methods for all consumer's goods.

THE CENTRAL BANK OF INDIA LIMITED

(Established December, 1911)

Head Office: Mahatma Gandhi Road, Fort, Bombay I.

Authorised Capital	6,30,00,000
Issued Capital	5,77,50,000
Subscribed Capital	5,76,66,125

Farm Tenancy Legislation in Bombay State

H B Shivamaggi

AS a first step towards protecting the rights of the tenants, the Government of Bombay enacted the Tenancy Act in 1939. This Act was first introduced in the four districts of the State viz. Dharwar, Surat, West Khandesh and Thana in 1941 and was extended to the whole of the old Bombay Province in 1946. During the same year, it was amended and was replaced in 1948 by a new and more comprehensive legislation called the Bombay Tenancy and Agricultural Lands Act, 1948. To regulate the relationship between the landlords and the tenants, and to improve the social and economic conditions of the 'peasants', the Act provides for

- (1) fixity of tenure,
- (2) fixation of maximum rent and provision to determine reasonable rent,
- (3) abolition of feudal dues, levies and forced labour (veth), and
- (4) taking up management of neglected estates and farms so that efficiency might be raised.

The working of this Act, during the last six years has revealed that there is a wide gap between the promise and performance of the Act. Because of their weak bargaining power vis-a-vis their landlords, the tenants have not been able to claim and enforce the rights conferred upon them by the law.

Working of the Act

The regional surveys conducted with a view to studying the working of the tenancy legislation have shown that:

- i. The customary practice of paying half of the gross produce from land as rent still largely prevails and the maximum rent laid down by the Act is, by and large, ineffective;
- ii. Few tenants have purchased agricultural lands to become full-fledged owner-cultivators;
- iii. The area under owner-cultivation is gradually increasing; and that
- iv. Voluntary surrenders of leased lands have to a great extent remained at a low level. In the light of hope. There is much to be done to take a head-on view of the work.

ing of the Tenancy Law, the new Tenancy Bill, which is to be introduced during the Poona Session of the Bombay Legislature opening on the 17th of this month, will be examined below.

Tillers' Day—April 1, 1957

In view of the fact that the conversion of tenancy into ownership is proceeding at a very slow rate, the Government of Bombay seeks through this Bill to abolish unwanted tenancies in the State by declaring that "all permanent and protected tenants and other tenants, subject to the right of the landlord to recover possession for personal cultivation or for non-agricultural use, would be deemed to have purchased the land cultivated by them from their landlords on 1st April 1957 called the Tillers' Day at prices to be fixed within the prescribed limits". Within three months from the Tillers' Day, the tenant is to apply to the Tribunal for the determination of the purchase price of the land he is deemed to have purchased.

The maximum price has been fixed in terms of land assessment. In the case of a permanent tenant, the price of land shall not exceed 100 times the assessment levied or leviable in respect of that land and shall not be less than 30 times such assessment; and in case of any other tenant, the price shall not exceed 200 times the assessment on that land and shall not be less than 50 times such assessment. Thus the maximum price laid down comes to 6 times and 10 times the maximum land rent laid down in case of the permanent and other tenants respectively. The price fixed, it has also been provided should include the amount of the value of the unexhausted improvements carried out by the landlord on the leased land. Thus the landlords who have invested in the past on permanent improvements on their lands are not put to loss. While fixing the price limits, "the Government has taken into account the market rate at which the lands are generally sold, the need for maintaining the land as a security, the demand for land and the capacity of the tenant to pay".

The aims of the Bill are laudable indeed but why does the Govern-

ment want to declare tenants as purchasers of their leased lands on 1st April, 1957 and not on the day when the amended Act comes into force? The gap of nearly two years between the declaration of the Government's decision to make all the tenants owners of their leased lands and the date of the implementation of that decision is inexplicable. The only saving grace is Section 84A of the Bill, which restricts transfer or acquisition of any land before the Tillers' Day, to forestall the impending purchase-right given to the tenants.

Purchase Price

The other question is: Will the tenants be able to purchase the land they till? They have not been able to purchase the land they till because of their poverty. The new Bill no doubt declares that the tenant is deemed to have purchased the land on 1st April 1957, but does not make any specific provision to equip him with the needed land purchase money. As Prof. M. L. Dantwala has put it:

"In fact experience of land reform all over the world shows that unless tenants are actively assisted by a suitable arrangement for finance, a mere conferment of the right to purchase land will remain a dead letter" (vide this journal dated August 30, 1952.) The existing arrangement is that the tenant is required to pay the price in 10 instalments spread over 12 years. Once the tenant is declared to have purchased the land and he consents to pay the price, he ceases to pay rent on that land, but only pays purchase price instalment. This is a welcome change introduced in the new bill. The working of the tenant-purchase programme would be more effective if some arrangement is made to pay off the landlords' land price instalments on the Government account and collect the same from the tenants concerned in convenient instalments along with the land revenue. The amending Bill also lays down that no tenant can mortgage his land within five years from the date on which the certificate of purchase is issued. There is no reason, however, why the tenant should not be able to mortgage his land to a co-operative land mort-

gage bank to secure land loan. In fact, the absence of any such definite provision of financing the tenant purchase programme would certainly slow down the pace of progress towards tenant-ownership.

If the tenant does not want to purchase his leased land either because that land is poor in fertility or he is too poor to pay the instalments on purchase price or for some other reason, he has to intimate within three months from the Tillers' Day his unwillingness to purchase. In that case, the Collector is authorised to evict the tenant. Of course, no tenant would be foolish enough to intimate his unwillingness to purchase land and get evicted. It is provided, however, that in such an unlikely eventuality, that land or part of it which is surrendered by the tenant to his landlord cannot be taken up by him for personal cultivation if he already possesses a maximum holding (Section 321). The first choice of getting the land in that case will be that of a landless person and next that of a partially landless person. This order of priority, though desirable from the point of view of the landless, is unwelcome in so far as it gives preference to low income or uneconomic cultivators when we are anxious to convert the existing uneconomic holders into economic holders. It is more desirable that the first choice should go to one of the neighbouring cultivators with an uneconomic holding and the landless should come next. In this connection, it is necessary that the Government should consider the implications of Bhoodan and make statutory provisions regarding land allocation. On no account should scope be given to create new tiny landholders. Hence Section 321 of the Bill should be amended suitably.

In this context, attention may also be drawn to the fact that the Tenancy Act as it stands today or after the amendment proposed does not regulate the sale or transfer of the lands of owner-cultivators who do not come under the purview of the Act at all. The ceiling on land laid down in the Act neither affects the existing ownership of self-cultivators nor their future sale or any other kind of transfer of their lands. It need hardly be argued that statutory provision is necessary for applying uniform ceiling to the self-cultivated lands and to regulate their sale and transfer in future as in the case of rented lands.

The 1948 Act had fixed one-fourth and one-third of the gross yield as the maximum rent in case of irrigated and other lands respectively. Later in 1952 the Government reduced the maximum rent to one-sixth of the gross produce in respect of all types of land in the State, except in some selected areas where it was fixed in terms of multiples of land assessment. In the amending Bill, share rent has been abolished. The tenant has to pay rent annually and in cash. The rent shall not exceed 5 times the assessment of the land or Rs. 20 per acre whichever is less and shall not be less than 2 times such assessment in the case of areas where survey and settlement have been carried out. In other areas, the rent shall not exceed 3 times the assessment of such land and shall not be less than 1½ times the assessment of such land.

It is not necessary to discriminate between surveyed and settled areas and other areas in the fixation of levels of rent. The existing land revenue rates have been fixed on the basis of rentals that prevailed at the time of settlement. To fix rents on revenue rates which are themselves based on rental rates does not seem to guarantee reasonableness of rent. Hence what is required is revision of land revenue rates throughout the State which may be undertaken gradually. One might also question the wisdom of compulsory cash rent in view of the declining prices of farm products.

Rent and Other Dues

In the new Bill, the landlord is not expected to contribute anything to cultivation except of course his land for which he receives rent. The tenant is now required to pay land revenue, other Government land dues and local cesses, but his aggregate liability in respect of land revenue, land rent etc. should not exceed one-sixth of the value of the gross produce of land. If it does, he is entitled to deduct from the rent payable to the landlord the amount in excess of one-sixth of the total gross value of land. In practice, it will mean that the landlord, as before, can get one-sixth of the total yield as maximum rent from his land, the change being that hereafter the tenant has first to pay land revenue and other dues, and thereafter hand over whatever remains of the one-sixth of

yield as rent to the landlord. If the aggregate amount of land revenue, cess, etc. is less than one-sixth of yield, the tenant does not pay anything to the landlord. If the yield is less, the landlord's rent is reduced. But if the yield increases, the landlord does not get any share in increased yield. This does not seem equitable. The best course is to declare rent as 4 or 5 times the assessment per acre. If land revenue is reduced during years of scarcity, automatically the tenant also gets relief by way of reduced rent. Otherwise, for the negligence of the tenant, the landlord might be penalised in the form of reduced rent.

Since the Government policy is to discourage tenantry of lands as far as possible and to promote tenant-ownership, rent will have little significance. From this point of view, that rate of rent is the best which discourages tenancy and leaves adequate income to the tenant to enable him to improve his land after maintaining a minimum standard of living. The practical question is as to how the Government is going to make the statutory rates of rent effective. Because of the tenant purchase programme, the extent of tenancy is bound to diminish in years to come. It may be suggested that rent should be collected by the revenue department along with land revenue. Such arrangement was made in the Travancore-Cochin Land Reforms Bills. The Government may charge a small fee for this service rendered to the landlords. This would enable the Government to enforce the legal rates of rent strictly. The administrative feasibility of the proposal may be tried out in selected localities where tenant-cultivation covers less than, say, 20 per cent of the total cultivated area.

Owner-Cultivator and Maximum Holding

In future, the landlord cannot terminate the tenancy of a protected or permanent tenant even if he wants this land for his own cultivation. If he has leased out land to ordinary tenants, he can evict the tenant who was the last to take lease. He cannot, therefore, have a choice in taking land for self-cultivation. However poor the land that he has leased out last, he has to take it for personal cultivation subject to the ceiling and other conditions prescribed in the law. Notice will have to be given in writing to the

tenant before the Tillers' day if any landlord wants to exercise this restricted choice. Even when his tenant has more land than is necessary to constitute an economic holding, the landlord cannot take back this land if thereby his cultivated holding exceeds the maximum holding. If the landlord is to take back part of his leased land, the tenant will have the choice to retain whatever

type of land he wants till his holding comes to be of the prescribed economic size.

The ceiling has been fixed at three times the economic holding which is 16 acre of jirayat land, or 8 acres of seasonally irrigated or paddy land or 4 acres of perennially irrigated land. It may be noted, however, that even in jirayat land the quality varies so much that it is

doubtful whether a ceiling should be fixed in terms of acres. The suggestion that the ceiling should be fixed in terms of standard acres, assuring a fixed income to cultivators, is no longer an academic and impracticable one. It has been accepted and acted upon in Punjab and there is no reason why other States should not adopt it.

So quick, so convenient...

Travel by **INDIAN AIRLINES**

Meeting tomorrow? Yes, certainly. I'll come by air.

Wonderful to arrange a trip so easily — no fuss, no bother!

No crowds at the airport — and a cool, dust-free journey ahead.

Comfortable, relaxed — and oh! the wonderful free meals they serve!

Just time to read a magazine and have a nap — we're nearly there!

And I feel fresh and ready for that meeting. Yes, it's Indian Airlines for me — every time!

Oriental Government Security Life Assurance Company, Limited

Eightieth Annual General Meeting

Speech by Sir Cowasjee Jehangir, Bart

PRESIDING over the Eightieth Annual General Meeting of the Oriental Government Security Life Assurance Co., Ltd., held at the Head Office, Oriental Buildings, Bombay, at 4 P.M. on Wednesday, 10th August 1955, Sir Cowasjee Jehangir, Bart., G.B.E., K.C.I.E., J.P., Chairman, referred to the resignation of Sir Purshotamdas Thakurdas, since the close of the year under report and quoted 'in extenso' the Resolution passed by the Board while accepting the resignation in which the Board had placed on record the long and meritorious services rendered by Sir Purshotamdas to the Company during the 36 years he was a Director, out of which for 22 years he served as the Chairman of the Company in recognition of which service his bust has been put up in a prominent place in the Company's premises. Continuing he said:

I have pleasure in presenting to you the Report and Accounts for the year ended 31st December 1954, a copy of which has been in the hands of the Shareholders and such of the Policyholders as had asked for one before the date of the meeting and may, therefore, I hope, be taken as read.

New Business More Than Double

The New Business completed last year amounted to an all-time record of 1,24,476 Policies assuring a little over Rs. 47½ Crores which shows an increase of 46,201 Policies assuring Rs. 24 1/3 Crores as compared with the New Business of the preceding year. The Company thereby achieved the unique feat of more than doubling the volume of New Business during the last year. The average amount assured under a Policy also registered a significant increase of Rs. 3,837 as against Rs. 2,989 in the preceding year.

During last year, our total Premium Income crossed the Rs. Ten Crore mark, the actual figure being over Rs. 1,046¼ lakhs as compared with Rs. 952½ lakhs in 1953 showing an increase of Rs. 93 2/3 lakhs.

The Claims by Death last year amounted to a little less than Rs. 108½ lakhs. The Claims by Maturity amounted to slightly less than

Rs. 322½ Lakhs. The Company's Mortality Experience has registered a further improvement, the ratio of Actual to Expected Deaths during the year being 37.0 per cent., as compared with 41.7 per cent. in 1953.

Renewal Expense Ratio Registers Improvement

The Expenses of Management last year amounted to 25.4 per cent of the Premium Income as compared with 23.4 per cent., in 1953, showing an increase of 2.0 per cent. Practically the whole of this increase, 1.9

to the fact that while in 1953 we received refund of Income-tax for one year, in 1954 we received refund for two years.

The Lapse Ratio improved from 5.5 per cent. in 1953 to 5.3 per cent. in 1954.

The year under report was the last of a Triennial period at the end of which the Valuation of the Assets and Liabilities falls to be made to ascertain the profits for distribution between the Shareholders and the Policyholders. The Valuation is now in progress and the results will be available shortly.

Policyholders' Directors

On 1st June 1955, the usual triennial Policyholders' Meeting in terms of Section 48 of the Insurance Act, 1938, was held and Messrs. Dabhaibhai Vallabhbhai Patel, Pashabhai Patel and Chandrakant Chhotabhai Patel were re-elected Directors.

Mutualisation of the Company

Now a word about the idea of the Directors to mutualise the Company. As policyholders might be aware, an Extraordinary General Meeting of the Shareholders of the Company was called on the 15th June last when the Directors put before the meeting a scheme for mutualisation prepared by them which was after some discussion unanimously approved by the Shareholders. It was as far back as the year 1948 when the Directors felt that, looking to the large size of the Company at that time and also the rapid progress which it was making during the preceding few years, it would be desirable to mutualise the Company, thereby leaving its management entirely in the hands of the Policyholders. As I stated in my speech before the Extraordinary General Meeting above referred to, the Directors felt that although the share capital played a very important role in the initial stages of the Company, the time has now come when the Shareholders should be paid off and the management of the affairs of the Company should be left to such of the Policyholders as are elected by them. It is with that idea in view that the entire mutualisation scheme was considered in all its bearings by

Sir Cowasjee Jehangir,
Bart., G.B.E., K.C.I.E., J.P.

per cent., to be exact, is accounted for by the provision of Rs. 20 lakhs made in the accounts for the liability in respect of future Gratuities to Staff. The Renewal Expense Ratio for last year was 11.67 per cent., as against 14.40 per cent for 1953, showing a decrease of 2.73 per cent.

As a result of the year's operations, the Funds of the Company increased to a little over Rs. 78¼ Crores at the end of the year.

Demand for Policy Loans continued more or less at the level of the preceding year. The total amount of Policy Loans (excluding Automatic Premium Loans) standing on the Company's Books at the end of the year was a little over Rs. 592 1/3 Lakhs.

The Net Rate of Interest after deduction of Income-tax at the source earned on the Funds during 1954 was 4.12 per cent., as compared with 3.57 per cent., for the preceding year. The difference is mainly due

the Directors step by step with the result that we have now come to the stage when the scheme for mutualisation as put before the Extraordinary General Meeting and approved by them has been forwarded to Government. The scheme is being published in all the important newspapers of the Country and the Government of India are also publishing it in the Government Gazette. The scheme is thereby given the widest publicity possible and also any objections or suggestions are invited from interested parties and these should be addressed to the Controller of Insurance so as to reach him before 30th September next which gives as long a period as 2 months for Policyholders and Shareholders to send their objections or suggestions, if any, after careful consideration. The Directors gave their utmost and very anxious consideration to the vital question of holding the scales even between Policyholders and Shareholders. To have their hands further strengthened they took the opinion of a highly respected legal luminary of top rank in India as regards the figure of compensation putting before him what they had arrived at as fair compensation. He fixed the compensation at Rs. 8,800 after carefully going into all the aspects of the problem. This sum of Rs. 8,800 is not what falls to be paid straightaway, but its payment will be deferred for or spread over a period of years. Again, it is not and cannot be secured on any tangible asset of the Company but only on 15% of the emerging Surplus of the periodical Valuations of the Company. What is more important to consider is the fact that practically during all the years in the past the Shareholders had forgone a substantial part of the amounts that would have gone according to the Articles of Association of the Company to augment their dividends but which instead were allowed to augment the Policyholders' Life Assurance Fund. If the amounts the Shareholders had forgone in the past had been taken to a fund to their credit and invested, the amount standing to the credit of that fund itself would have provided a significant part of the compensation now sought to be paid to them. What is even more important to consider is the fact that the figure of Rs. 8,800 does not allow for any future increases in the dividend due to the progressively satisfactory functioning of the Company judging from how it has been functioning during the past few years.

Even from the date mutualisation is given effect to, the Debentureholders' Directors will be reduced from the present number of 9 to 5. To enable the policyholders take over an increasing share in the management of the Company, there is provision for the number of Debentureholders' Directors progressively diminishing further and the number of Policyholders' Directors correspondingly increasing as and when Debentures are redeemed.

To avoid any sudden strain falling on the Surpluses of a few trienniums only the redemption of the Debentures is deferred for or spread over a period of years.

These are some, if not all, of the points to which the Directors had to give their careful consideration before deciding on the principle of mutualisation and also the quantum of compensation. I thought it best to go to the length I have done in explaining how the Directors' minds have been working for a few years in the past on this important question of mutualisation.

The advantage that would be secured by Policyholders once the Shareholders are paid off will be very great indeed. Apart from the fact that the entire management of the Company will pass into their hands, there will also be a financial advantage in that there will not be any future liability, once the shares are paid off, for payment of dividends and the entire Surplus would be available for distribution amongst Policyholders alone. Taking all these factors into consideration, I cannot but wholeheartedly recommend to the policyholders the acceptance of the scheme as forwarded to Government.

Nationalisation of Insurance

I now take up the highly vexed and topical question of Nationalisation of Insurance. In this connection, I cannot do better than quote fully what my predecessor in Office said at the time of opening the Oriental Building, Ahmedabad, on 17th March 1953. Since this speech was not delivered before a meeting of policyholders and shareholders, I think it appropriate that his weighty words in this respect should receive your careful consideration:—

"It is surprising that in spite of the grim warning furnished so unequivocally by nationalisation of the coal industry in the U. K. in the shape of diminished output per man and increased cost of raising, our Ministers in power talk lightly

of socialising or nationalising as applied to a business least fitted for nationalisation and whose progress depends upon research in several fields of intellectual activity which can be fostered only under conditions created by healthy competition as a private enterprise. I, therefore, cannot allow this occasion to pass without putting out most respectfully a warning to these advocates of socialism. 'Hands off those for whom we insurance companies are trustees, particularly as they are normally widows and orphans'. I make an appeal to Ministers in power in all humility but with the utmost sincerity to be consistent in their policy declarations bearing in mind the great harm that will be done to the country's economy by inconsistent pronouncements of policy."

Since then, Chairmen of almost all companies have gone fully into the question and I cannot do better than say that I wholeheartedly agree with every bit of what has been said in this respect.

In my statement as Chairman at the Annual General Meeting of our Subsidiary, the 'Oriental Fire', I have already expressed my considered opinion regarding this disturbing development as it affects the future of Indian general insurance companies. I make no excuse for reiterating that I consider it a most retrogressive move and I am of the opinion that even the threat or rumour of nationalisation may be sufficient to damage the prestige of Indian companies in those overseas territories in which a number of us are seeking to establish ourselves.

On that occasion, I also amplified the details of the progress of our Subsidiary, the Revenue Accounts and Balance Sheet of which are shown separately in the accounts now before you. Steady progress was again recorded in all departments and it was possible to increase the dividend from Rs. 15 to Rs. 20 per share free of income-tax after substantially strengthening the Reserve position and making adequate provision for all contingencies. With our Subsidiary firmly established, I am satisfied that we are now in a position to offer insurance service second to none in the best 'Oriental' tradition, not only so far as life insurance is concerned but also in all other departments of our business.

Before concluding, I should like to convey our appreciation of the steady performance of our Active Agents

Tribals—Particular Case of General Problem

By a Semi-Tribal

THE contribution entitled "Tribal Welfare: A New Approach" by Shri Sankho Choudhuri in the issue of July 23 illustrates how our non-specialist and very often also the specialist "intelligentsia" think through their feelings. From the contents of the article, Shri Choudhuri appears to be an artist and your correspondent also vaguely remembers to have seen his name among the exhibitors in some art exhibition. The non-specialist has this advantage over the specialist: he can pose the question bluntly, without the terminological jargon and the pedantry of the specialist. Shri Choudhuri rightly says "We are alienating these people (tribals) from the core of their culture, where do we leave them?" "We must decide what we want these people to be."

Having presumed the author to be an artist, we do not expect him to be analytical. His examination (?) of what has been done by others in the field of tribal welfare is characteristic of his class—the sophisticated intelligentsia—which puts one argument against another without going into its relevance or significance and concludes the discussion with "I don't think so," "I think so," "I do not agree" or "I agree". Faithful to his class of high-brow sentimentalist, Shri Choudhuri suggests that what we want them to be should prevent them "from becoming landless labourers to flock to factories and mining centres and copying the worst habits of a large town" and "save them from the outside glamour of big cities and descent to a sordid life therein." His concrete proposals to achieve these aims are, "to open small craft centres to teach them silk spinning and weaving, and lac laboratories to train them in various uses of lac and promote centres for handicrafts," and to combine education with craft.

Surely, these measures would prevent the migration of the tribals to the city. But will they prevent the

which has enabled the Company to complete a New Business of over Rs. 47½ Crores.

Finally, I wish to convey our appreciation to our Officers and Staff at the Head Office and at our Branches of the helpful service rendered by them during the year.

migration of the city to the tribals? Actually Shri Sankho's suggestion amounts to this, that instead of the tribals migrating to the city, the city should migrate to them. This is his new approach. Is he sure that such a migration would enable them to lead "a healthy life in their own locality bringing in more spirit and zest into these desolate places"? Yes, if one believes that the city life that goes to the tribals has its canines knocked out and that it is as humane as Shri Sankho. A case can be made out that life in a small town is not as "sordid" as in a big city. But that may be true of certain secondary characteristics of the city. The basic relationships in a small town and the big town are the same and they are different from those of the tribal society. While there are problems peculiar to city life, what brings about misery to a group of people is the sudden change from one set of social relationships to another and their difficulty in adjusting to the latter quickly. This creates the state of normlessness which is called 'anomie' by sociologists and loss of nerve in common parlance. This happens to any group of people, tribal or civilized, not necessarily on account of migration but on account of sudden changes in society. That is

what is happening to-day to the large mass of non-tribal people in India. The relationships between various classes of people in the rural area are changing. A section of them is migrating to the city as industrial workers and as lower division clerks. Are they less miserable than the tribals? Do we not observe the state of normlessness in the new war-rich black-marketeer class? And why not observe the behaviour of the 'intellectuals' who have got sudden recognition as a class for the first time and who are flocking to the State and Union secretariats?

The intellectual has to answer the question, what he himself wants to be, before he decides for the tribals what the tribals should be. The tribal is a part of society which is itself in the process of change and what happens to it will decide what will happen to the tribals. The problem of the tribals is only a particular case of this general problem.

In the meanwhile Shri Sankho will have the petty bourgeoisie satisfaction of blowing the conch for the tribals to save them from the orthodox purist and from the impurities of city life. Busy looking up, did the petty bourgeois ever look where his own feet were?

Are Rivers in the Siliguri-Amingaon Section of N E Railway a Challenge to Engineers?

Kumud Bhushan Ray

NORTH-EAST India's ordeal by water begins with the beginning of the floods in July. The Assam Rail Link has again been snapped in more places than one. (Fig. 1). The Assam Access Road has also suffered a similar fate (Fig. 2).

As flood damage has become an annual phenomenon, the public appears to be under the impression that engineers do not fully realise the great force of a river, which they try to harness. It is widely believed that deforestation in the upper catchments of the rivers in the Himalayas is the cause of flood and that the Governments of Tibet, Nepal, Sikkim and Bhutan, where these catchments lie, should be persuaded to take up and maintain watershed management and afforestation works and only if this is done, India can be spared this annual ordeal.

The flood damages this year in Uttar Pradesh from rivers, whose catchment area lies in the alluvial plains, show that the deforestation in the upper catchments of the river cannot be the real cause of the flood.

Fig. 1 will show that the area of the catchment basins in the Himalayas, lying in Tibet, Nepal, Sikkim and Bhutan, is more than twice the

area of the river basins in Bihar, Bengal and Assam, lying between the foot-hills of the Himalayas and the outfalls of the rivers into the Ganga and Brahmaputra. Watershed management and afforestation in such desolate and sparsely inhabited regions, would encounter colossal difficulties and involve enormous costs.

Breaches and Loop Channels

It may now be studied why breaches occur in the Assam Rail Link. Fig. 2 shows in greater detail the Torsa and Kaljani Rivers, which cross the Assam Rail Link and the Assam Access Road. It will be seen that the Torsa River has developed, by erosion of banks, in its upper reach a channel about half a mile wide. From the point where it emerges from the foot-hills of the Himalayas in Bhutan on to the plains, it has many loop channels—Mujnai, Burhi Torsa, Chhota Torsa, Burha or Sili Torsa, etc. The Mujnai, Burhi Torsa and a few smaller loop channels have their outfalls into the Jaldhaka, while the Chhota Torsa, Burha Torsa and some smaller ones have their outfalls back into the Torsa. The Kaljani has also many loop channels.

The flow of water in these river

basins is not always restricted to any one loop channel. Sometimes the water flows through one channel and sometimes through another; the flow through these several loop channels is seldom kept under observation. It may happen that the flow through one channel goes on improving and consequently the flow through another, which was so long carrying the main discharge of the river basin, goes on diminishing. When the improving loop channel becomes the main river of the river basin, the bridge over it may not have sufficient waterway to pass the total discharge of the river basin. There is then damage to the bridge, or the approach embankments are overtopped and breached.

The usual procedure, while rebuilding the breached bridge, or making up the breached embankments, is to provide additional spans to the bridge. But it is found that this does not provide a permanent safeguard. In course of time, another loop channel starts improving, and ultimately the whole discharge of the River Basin may pass through it in which case similar flood damages will occur. Considering that all the rivers crossing this section of

the N E Railway and the Assam Access Road have several loop channels, breaches are likely to go on occurring, in the process of improvement of one loop channel and the consequent deterioration of another.

Vagaries of Rivers

The cause of these variations in a river channel may now be studied. Fig. 3 shows the several loop channels in the Manas Basin—Manas, Bholukadoba, New Hakua, Old Hakua, Beki, etc. At the time of railway construction in Assam in 1909, the main flow in the Manas River Basin was through the Manas Loop Channel. The bridges provided at the time over the three Loop Channels were:

- Manas 10 x 100'
- Bholukadoba 2 x 75'
- Beki or Mara (dead) Manas 4 x 12'

Between the years 1909 and 1945, more and more water started flowing through the Beki Loop Channel and consequently less and less water flowed through the Manas Loop Channel. It may now be examined why this happened.

The Manas had a more or less straight channel between A and K in 1948, (See Fig. 3). Below K, due to erosion of river banks, a tortuous channel K L M N developed, which continued below the railway bridge. The channel also became wider and shallower and had islands and sand banks. The greater length of the tortuous channel flattened the Slope of Water Surface (S W S), while the wider and shallower channel decreased the Hydraulic Mean Depth (H M D). Thus the velocity of flow and consequently the discharging capacity of the Manas Loop Channel gradually decreased.

As the Manas Loop Channel could not accommodate and drain away the discharge of the Manas Basin, there was backing up and rise of water level in the channel upstream, so that a part of the water found its way through the shallow but straighter Beki Loop Channel to its outfall at T (Fig. 1). A cataract action started at T, which dug back and back along the Beki Loop T S until it reached E, the railway crossing, and further upstream to A where a cut-off channel was established. More and more water flowed through this cut-off channel in the Beki Loop, which went on improving, while less and less water flowed through the Manas Loop, which went on deteriorating.

As the Beki Loop gradually improved, and its channel became deeper, the 4 x 12' span bridge with shallow foundation was undermined

and breached. Successive bridges with larger waterways were then provided over the Beki Loop Channel, from 1909 to 1945:

- (i) 4 x 12' (ii) 4 x 20' (iii) 9 x 20'
- (iv) 1 x 50', 1 x 30', 6 x 19' (v) 1 x 50', 2 x 40', 6 x 19' (vi) 2 x 40', 3 x 100', (vii) 7 x 150'.

As a result of increasing flow through the Beki Loop, less and less water flowed through the Manas Loop, so that in 1945, water flowed through only 4 x 100' out of the 10 x 100' spans, while the river bed had risen 14 feet in the Manas Loop Channel.

In the Beki Loop Channel, there was also erosion of river banks and development of a tortuous channel C D E F G, lengthening its course and flattening its S W S while the widening and shallowing of its channel gradually decreased the H M D. With consequent decreasing velocity,

change today to

CALTEX RPM

the only Motor Oil that gives **ENGINE** Lubrification

Caltex R.P.M. The Premium Heavy Duty Motor Oil is the only oil that gives engine lubrication. It protects as it lubricates. This unique double-service keeps new engines new and gives old engines a new lease of life. R.P.M. eliminates corrosion, reduces engine wear and provides round-the-clock protection to all engine parts.

Ask your friendly Caltex Dealer about **RPM** this wonder motor oil. He knows how good it is because it **LUBRICATES** and **PROTECTS**.

CALTEX
PETROLEUM PRODUCTS

the discharging capacity of the Beki Loop decreased, there was backing up and rise of water level in the Beki Loop Channel upstream, and water found its way through the Bholukadoba Loop Channel to its outfall at V (Fig 1). A cataract action from V upstreamwards gradually improved the Bholukadoba Loop, deepening its channel. Successive bridges with larger waterways had to be provided in the Bholukadoba Loop Channel:

(i) 2 x 75', (ii) 3 x 75', (iii) 1 x 250', 2 x 150'.

After the breaches in the bridges over the loop channels in the Manas River Basin, it was decided to stop the flow of water through the Beki Loop Channel, by the construction of the Motaguri Bund at A (Fig. 3). The aim was that there would be no flow through the Beki Loop Channel, so that the waters of the Manas River Basin would have to flow through the Manas Loop Channel, which had a bridge over it of 10 x 100' spans. As expected, the upper reach A H of the Manas Loop improved. But as the tortuous, wide and shallow length K L M N of the Manas Loop was not able to accommodate and drain away the increased flow, there was backing up and rise of water level, enabling it to find its way through the shallow but straighter channel of the New Hakua Loop, having an outfall into the Beki Loop, avoiding the tortuous part of the Beki Loop Channel C D E F (Fig 3). The cataract action at F dug back and back, improving the New Hakua Loop Channel. Manas water thus continued to flow through the Beki Loop Channel Bridge of 7 x 150' spans. The object of diverting the flow of water of the Manas River Basin through the Manas Loop Channel, having a bridge of 10 x 100' spans, was thus frustrated.

Belief in Undeveloped River Basins

This frustration gave rise to the belief that the Manas River Basin is still undeveloped and that vagaries of rivers in such a river basin cannot be stopped. This caused so much pessimism that there was a proposal to abandon the railway line between Bongalgaon and Amingaon, to have a diversion railway line from Bongalgaon to Joghghopa, to cross the Brahmaputra by a bridge, and to have a new railway line to Gauhati along the left or south bank of the Brahmaputra (Fig. 1).

That the belief in an undeveloped River Basin is unfounded, will be evident from the fact that Loop

Channels exist not only in the Manas River Basin, but also elsewhere.

Mention has already been made of Loop Channels in the Torsa and Kaljani River Basins in Bengal. Similarly in Bihar, there are several loop channels in the Kosi River Basin. Loop Channels also exist in the Yellow River Basin in China. Can all these River Basins be classed as undeveloped?

The Kosi River Basin

The Kosi has several loop channels (Fig 1). There is considerable erosion of river banks in the alluvial plains of Bihar, resulting in the development of a tortuous course and a wide and shallow channel. The velocity and consequently the discharging capacity in such a channel gradually diminishes. There is backing up and rise in water levels and overflow away from the channel, so that river-side lands are submerged and there is flood damage.

The choked up and abandoned eastern loop channels in the Kosi River Basin are not able to accommodate and drain away the overflow water. Hence practically the whole of the overflow water finds its way into a parallel western river. A cataract action starts at this point, which digs back and back, establishing a cut-off channel. More and more Kosi water flows through the western river, which goes on improving, while less and less water flows through the Kosi Channel, which is ultimately choked up and abandoned. The western river thus becomes the New Kosi.

Erosion of river banks continues in the New Kosi. The same process is repeated. Another western river is improved and becomes the Newer Kosi, while the New Kosi channel is choked up and abandoned. The westward movement of the Kosi has gone on in this manner.

It will be seen from Fig 1 that the Kosi now flows through the lower reach of the Tilajuga and Balan Rivers, and that there is no longer a parallel western river. With increasing deterioration of the present Kosi Loop Channel, in the process of erosion of river banks, with no western river to drain away the overflow water from the Kosi Channel, flood water level in the Kosi will become progressively higher, causing submergence of greater areas of river-side lands to greater depths and for longer periods. In this process, the higher level of Kosi water is likely to find its way through a former abandoned Eastern Kosi Loop Chan-

nel, which will improve and become the NEW KOSI.

The Yellow River Basin

It has been mentioned that in the Manas River Basin, a former abandoned eastern Loop Channel—the Beki or the Mara (dead) Manas—became the New Manas, while the Old Manas Loop Channel gradually deteriorated from 1909 to 1945.

Similarly in the Yellow River Basin in China, a former abandoned loop channel has at present become the main river. A careful record is kept of the many loop channels in the Yellow River Basin, as shown in Fig. 4. The water of the Yellow River Basin flowed through the loop channel A from 2278 B C to 602 B C, through B from 601 B C to 11 A D, C from 12 A D to 1048 A D, D from 1049 A D to 1194 A D, E from 1195 A D to 1494 A D, F from 1495 A D to 1855 A D, G from 1856 A D to 1938 A D and H from 1939 A D to 1946 A D. From 1947, the Yellow River is again flowing through its former loop channel G! Such vagaries of rivers are explained by uncontrolled erosion of river banks.

Erosion of River Banks

As already explained, erosion of river banks by the development of a tortuous alignment and by the widening and shallowing of channel, gradually decreases the velocity of flow, and consequently the discharging capacity of a loop channel gradually decreases. Overflow water finds its way into another loop channel, which is thus improved. If this improvement goes on, the latter becomes the main channel of the River Basin.

The flood damages from the rivers Gomti, Tons etc. in the U P are due to the deterioration of their channels, caused by the development of tortuous alignments and widening and shallowing of channel by erosion of river banks.

Similarly flood damages from the Teesta, Brahmaputra and other rivers in N. E. India are due to the very wide and consequently shallow channels developed by these rivers, as a result of erosion of river banks.

A Challenge to Engineers

The challenge to engineers from rivers cannot be met by building additional spans to the waterways in bridges in the Assam Rail Link, or in the Assam Access Road, or by having Watershed Management in Upper River Catchments by Afforestation etc. or by building check dams across the rivers in the hills.

A survey has to be made of all the Loop Channels, whether flowing or choked up and abandoned, in a River Basin. Action should be taken in the main flowing Loop Channel in the River Basin, so that its wide and shallow channel with a tortuous alignment is guided to a single, narrow and deep channel, having straight alignments, joined by flat curves. Such a channel maintains a stable alignment in good order.

This may be done by assisting a river to utilise the great force of its current of water—its power of transportation of silt and of erosion of the channel surface—to deposit silt to form new parallel river banks, having a single narrow and deep channel in between, with straight

alignments joined by flat curves. Such an improved flowing Loop Channel in a River Basin will then be able to accommodate and drain away quickly the maximum flood discharge through its channel. With adequate waterway, provided in the bridge over an improved Loop Channel, there can be no unexpected increase in discharge, likely to damage the bridge or the bridge approaches.

"Bandalling" has been used by Steamer Companies to maintain navigable depth in wide and shallow rivers in Northern India. As this type of "bandalling" is liable to be undermined in the flood season, an improved type known as "permeable screens" was used in 1949 by the author in the Beki River in Assam,

to straighten the river alignment upstream of the railway bridge, by assisting the river to reclaim an embayment 3000 feet long, with a maximum width of 1000 feet and a maximum depth of water of 40 feet, by laying a line of improved "bandalling". Fig. 5 shows photographic prints of "bandalling" used in the Beki River.

The challenge to Engineers by rivers in the Siliguri-Amingaon Section of the N. E. Railway can be met by assisting a flowing Loop Channel in a River Basin to improve its channel by the use of "Bandalling". The cost per running foot varies from Rs. 20 to Rs. 40 depending on the depth of water.

Agricultural Labour

I—Pattern of Occupation and Employment

(Continued from last Issue)

THE general rural occupational pattern and the employment status of agricultural labourers have been discussed in the last issue. An attempt is made below to analyse the findings of the Agricultural Labour Enquiry, regarding the extent of unemployment and self-employment among agricultural labourers and to examine how far these findings answer some of the issues posed earlier in the article.

Naturally, the most difficult part of the investigation was the measurement of the extent of unemployment and under-employment. The Enquiry does not go into conceptual difficulties. It takes the working day as the unit of measurement of labour time. Thus, variations in the hours of work during different agricultural seasons are ignored; but that is not so important as the distinction between employment and under-employment which the Enquiry found so difficult to measure precisely. Confining itself, first, to wage-paid agricultural and male labour only, it set out the number of days such labour was unemployed. That is to say, the information was collected only about visible unemployment which is defined as lack of wage-paid employment. It is recognised that unemployment defined thus also includes under-employment. But it is not quite clear whether this is always borne in mind; for instance, the opening paragraph in the section "Unemployment of men workers", reads as follows: "Data on the number of days during which the agri-

cultural adult male labourers were fully unemployed were collected month to month for a period of one year. In doing so, only those labourers were taken into account in any month who reported wage-paid employment for at least one day in that month" (emphasis ours). Here "fully unemployed" is deceptive as labour unable to secure wage-paid employment may yet get part-time work or be self-employed.

TABLE VI Unemployment Among Adult Male Labourers		
Month	% of Total employed on wages	No. of days unemployed per worker
March	86	7
April	84	7
May	83	7
June	85	6
July	87	6
August	86	7
September	84	7
October	83	7
November	84	6
December	83	7
January	80	7
February	78	7
Month average	84	7

An idea of the volume of unemployment, subject to above qualifications, can be gathered from Table VI which gives in the all-India averages. Zone-wise figures (Table VII) show wider variations, but even so, the most striking feature

of both the tables is the relative stability of unemployment from month to month. That is to say, in zones where a large part of agricultural labour is unemployed, quite a substantial part of it is unemployed during the whole year. The number of days in a month that labour is unable to get employment shows as great, if not greater stability. The picture of agricultural employment that emerges from these tables is quite different from the accepted picture of rural agriculture viz that of long spells of uninterrupted idleness alternating with short spells of brisk activity. The assumption, therefore, on which the case for supplementary rural industry is usually supported as part time occupation for agricultural labour as well as the basis of much of current thinking on agricultural problems would be seriously shaken by these findings.

Unemployment is well spread over the month. Where it is high, it is fairly high even in the peak employment period. Again, the number of days in a month that labour is unable to get job is larger in some states, and comparatively small in others. But whatever it is, it is the inter-zonal variations which are pronounced rather than the variation in the same zone as between one part of the year and another.

Equally striking is the extent of unemployment even at the peak period of agricultural activity. Taking India as a whole, 13 per cent

of the agricultural labour gets no employment at any time in the year. Subject to the qualification that allowance has to be made for sickness and other causes of absenteeism including self-employment, this hard core of unemployment indicates the magnitude of the man-power which can be withdrawn to other uses without any loss of productivity.

Monthly Variation

The highest percentage of labourers which finds employment any month ranges from 83 in South India to 97 in North India; there is similar disparity in respect of the period of wage-employment as between these two Zones: thus, while in North India an adult male worker finds employment for 27 days in a month, his counterpart in the South has work for only 20 days. Again, while the monthly variations in the demand for labour in the North is confined within narrow limits (from 93 to 97 per cent), in East India, the range is between 75 and 90 per cent and in West India, between 79 and 92 per cent.

In order to assess the extent of unemployment among agricultural labourers, one has to take into account not only the unemployment of those who have no employment whatsoever, i.e. the 13 per cent of agricultural labourers referred to above, but also the unemployment of those who have had varying periods of wage-paid employment during the months. And since absence of wage-employment may not signify complete idleness, the extent of under-employment has also to be considered. In the case of those who are partially employed, average annual unemployment amounts to 81 days in a year for All-India. While in North India, the average is lowest at 45 days in a year, it is very high in South and West India at 115 and 114 days respectively.

A comparison between casual and

attached workers shows that attached workers have more employment. Thus, for all India, 97 per cent of the attached workers reported wage-employment every month; and they were unemployed for only about 19 days in a year. The duration of unemployment among attached labour ranged from 11 to 16 days in North, East, West and Central India; it was highest in South India, where attached workers formed only 5 per cent of total agricultural labourers, being 64 days in a year.

Casual Labour

The problem of unemployment is essentially that of casual labourers, and since about 85 per cent of agricultural workers belong to the casual category, the trend of employment (and unemployment) analysed earlier for all agricultural labourers, may be said to reflect the position of casual labourers. For all India, on an average, 18 per cent of casual workers against 13 per cent of all agricultural labourers are unemployed per month and the average unemployment for casual labour during the year amounts to about 96 days as against 84 days for the average agricultural labourer, taking casual and attached together. These two components of unemployment, viz., percentage of workers employed and the duration of unemployment in any month, show considerable variations as between different Zones. Percentage of total labour unemployed is largest in East India (18 per cent) South India (20 per cent) Central India (22 per cent) and North-West India (25 per cent), while the average number of days in a year a labourer is unemployed is highest in South India and North-West India (120 days) and West India (132 days).

The most important reason for unemployment among casual labour is want of work, though sickness and other factors such as bad weather might also be responsible.

TABLE VII
Seasonal Variation in the Employment of Agricultural Labour
(% of total agricultural labour employed)

	Highest	Lowest	No. of Days Unemployed in a Month
North India	97 (Mar-Apr)	93 (Feb)	3-5
East India	90 (July)	75 (Feb)	5-7
South India	83 (Mar & July)	74 (Feb)	9-10
West India	92 (Oct)	79 (Feb)	9-11
Central India	86 (Mar & July)	81 (June)	4-5
North West	88 (Mar & Apr)	77 (Feb)	5-8
All India	87 (July)	78 (Feb)	6-7

On an average, want of work accounts for 77 per cent of the number of days unemployed. Among the other causes, malaria and other illness are responsible for about 7 per cent of total unemployed days. The percentage of days unemployed owing to want of work is the highest in West India (84) and lowest in North India (66).

Taking all the workers who worked for some time or the other during the year, though some of them may not have reported wage-employment, an attempt has been made to estimate the volume of employment, unemployment and self-employment among agricultural labourers (see Table VIII). It is to be noted that while data regarding unemployment and self-employment is available only for the 84 per cent of the workers who reported wage-employment at least for one day in a month; no data was collected for the remaining 16 per cent who did not report any employment. In the case of the latter, the Enquiry assumes that they were self-employed and unemployed in equal proportions.

TABLE VIII
Employment Status of All Adult Male Agricultural Labourers
(In days per year)

Census Zones	Employed on Wages	Self Employed	Unemployed
North India	289	26	50
East India	224	49	92
South India	181	71	113
West India	196	46	123
Central India	245	45	75
North-West India			
India	202	64	99
All India	218	49	98

Taking the whole of the Indian Union, an agricultural labourer is unemployed on an average for 98 days and self-employed for 49 days in a year. Unemployment is near about the All-India average in North West and East India, and West India shows the highest average (123 days).

As regards the States in the different Zones, unemployment is quite high and amounts to about four months in Madras (119 days), Travancore-Cochin (115 days), Bombay (118 days), Punjab (118 days) and Bihar (107 days), while it was comparatively low in UP (50 days) Orissa (58 days) and PEPSU (59 days). The incidence of unemployment, however, appears to have been mitigated to an extent

by a comparatively greater scope for self-employment in Mysore (131 days) and Rajasthan (82 days). The review of the employment position of agricultural labourers given in the preceding paragraphs indicates that the Agricultural Labour Enquiry has been able to establish for the first time in quantitative terms the extent of idle manpower in agriculture. This alone is sufficient to establish the chronic nature of agricultural unemployment. Since the Enquiry did not take account of those who did not report wage-employment even for a day in a month, the percentage of unemployed, viz. 13 per cent of the total, may not give the true picture of unemployment, and some allowance may have to be made for unemployment owing to self-employment or other reasons such as bad weather. And if all these allowances are made, the problem of statistical estimation becomes more and more difficult. In any attempt at seizing up the problem the idle days of the labourers who are regarded as employed have to be taken into consideration. If this is done we do not get any single firm estimate. But that is quite another story.

Around Bombay Markets

Technical Reaction to Lower Levels

Thursday, Morning

IN sharp contrast to the firm trend noticed last week, there was a general decline in values during the week under review. Partly, it was a technical reaction. The decline was initiated by bull liquidation on a large scale in Tata Ordinary, reflecting cautionary profit-taking following the recent high levels. The market tended to firm up a little, particularly after the budla session on Friday. In fact, the budla rates were thought to have provided the necessary shake-out prior to improving the technical position of the market. But this proved to be an incorrect reading of the pattern of trading. For, although the improvement was perceptible, it could not be sustained in the face of all round heavy bull liquidation towards the close of the week.

A notable feature of the market at the close was the persistence with which a leading bull in bullion was seen assiduously building up his long position in Tata Ordinary. Market circles credit the operator with holdings of 90,000 to 1,00,000 shares. The immediate future trend of the market may depend largely on how this operator behaves.

For the greater part of the week, Tata Ordinary remained fairly firm, recording a new high after the implementation of the conversion scheme. But, the loss suffered at the close erased all the earlier gains. The actual closing quotation at Rs 250-8 represented a net loss over the week of Rs. 3. The highest and lowest levels were Rs. 256-12 and Rs. 250, respectively.

In the case of Indian Iron, also, there was speculative support at the outset, leading to a rise of Rs. 1-3-6 over the week. But the Calcutta scrip did not suffer as much as Tata Ordinary and was able to close better at Rs. 38-15, as against the previous close of Rs. 38-8 although it represented a loss of Rs. 0-12-6 from the highest quotation for the week.

In the textile section, there was evidence of technical correction only towards the close of the week, the earlier part being particularly bright. Bombay Dyeing went up to a new high level of Rs. 520 at one time but closed at Rs. 503-2 as against Rs. 515 a week ago. The lowest

level for the week was Rs. 502-8. Centuries were the only bright spot in the textile group and closed relatively firm at Rs. 425-8, with a net gain of Rs. 4-12 over the week. Kohinoor suffered a decline of Rs. 14 to close the week at Rs. 342. Simplex and Swadeshi also lost considerably to close at Rs. 168-8 and Rs. 211-8, respectively.

With almost all the scrips in the miscellaneous section finding fresh low levels for the week, there was hardly anything to report. ACCs lost more than six points on heavy liquidation to close at Rs. 190-8. Belapurs, however, remained firm on higher dividend prospects, improving from Rs. 313 to Rs. 325, the closing quotation being Rs. 323. National Rayons, Premier Construction and Scindias closed lower at Rs. 215-4, Rs. 162-12, and Rs. 14-15, respectively. The decline in Scin-

dias and Premier Construction is to be explained by the reports circulating in the market that the freight earnings of Scindias during the current year have been adversely affected with consequent fears of lower dividend, if any.

Cotton

Export Quota Stimulates Activity

TWO important developments mark the performance of the cotton futures market during the week. The first was the prompt action taken by the Government of India in reducing the export duty on raw cotton by Rs. 75 per bale, following the devaluation of Pakistan rupee. This fillip alone enabled the market to rule firm throughout the week. Secondly, there was the extension of validity period of licences for export which further boosted up the export front.

THE LOANS WILL OPEN FOR SUBSCRIPTION ON 16TH AUGUST 1955 AND CLOSE ON 31ST AUGUST 1955 OR EARLIER WITHOUT NOTICE AS SOON AS SUBSCRIPTIONS APPROXIMATE TO THE AMOUNT OF EACH ISSUE.

Each loan will bear interest from 1st September, 1955. Interest from the date of application to the 31st August, 1955, inclusive, will be paid to the applicants at the time of issue of new securities at the rate of 4 per cent. per annum on the nominal value of the loan applied for and accepted.

Subscriptions will be in the form of cash/cheque in respect of all the loans.

3% Bombay Government Loan, 1955, 3% Madras Government Loan, 1955 and 3% Madhya Pradesh Loan, 1955 will be accepted at par and 5% Mysore Government Loan, 1955 at Rs. 100-8-0% for conversion into the new loan of the Government concerned; interest on the securities of the respective loan tendered for conversion will be paid upto and including the 15th August, 1955.

Applications for all the loans will be received at the offices of the Reserve Bank of India, Bombay, Calcutta, Delhi, Madras and Bangalore.

Applications for any particular loan other than Hyderabad and Mysore Government loans will also be received at branches of the State Bank of India and at Government Treasuries and Sub-treasuries within the State issuing the loan as indicated in the relevant loan notifications. Applications for West Bengal Government loan will not be received at Government Treasuries and Sub-treasuries.

In the case of Hyderabad Government loan applications will be received at branches of the Hyderabad State Bank and at Government Treasuries and Sub-treasuries in the Hyderabad State. For Mysore Government loan applications will be received at branches of the Bank of Mysore Ltd., and at Government Treasuries and Sub-treasuries in the Mysore State.

N.B.—Copies of Notifications and Application Forms may be obtained at any Receiving Office.

The extension of the validity of licences resulted in a spectacular change in the spot market which had been ruling rather indifferent for some time now. Licensing period having been extended upto December 31, 1955, shippers were eager to exploit the comfortable statistical position and the spot market brimmed with activity, particularly on the export front. The undertone was further helped by the announcement of additional export quota for Zoda cotton to the tune of 5,000 bales.

These bullish factors were clearly reflected in the volume of transactions in the spot market. Thus, on Saturday sales were reported to the tune of 15,000 bales mostly in Vijay, the price ranging between Rs. 170 and Rs. 200. The release of export quota for 30,000 bales of Indian cotton for shipment to China kept the export demand pretty firm bright. It was reported on Tuesday that business had been concluded with China for 18,000 bales.

At the close of the week, sentiment was so strong that traders were even prepared to face US cotton export subsidy, in case it were to materialise. The argument held out

was that, Indian cotton could well face the competition from any country, as current prices were sufficiently low to attract overseas consumers.

Oils and Oilseeds

Smaller Groundnut Yield

WITH a modest decline in all sections, the oilseeds market presented a bearish trend. If groundnut was more or less steady, at the beginning of the week, it was because of the unfavourable weather reports, and the reported fall of about 10 per cent in acreage. It was generally believed that the total crop this season may be smaller. Yet traders were not inclined to take delivery in groundnut August-September as the seeds that were delivered were found to contain broken seeds. So longs had either to square up their outstanding business in August-September or transfer their business to December-January delivery. The long position in December-January delivery is reported to have gone up to 20,000 tons while that in August-September has been correspondingly lightened. This straddle helped December-January

delivery to remain firm relatively to the August-September contract.

There was also evidence of straddle business in Castor futures. A leading bear operator, holding huge stocks in the interior, was reported to be ready to effect deliveries in September. This led to large-scale transfers from the September to the May contract and as a result, May contract gained by 6 as. and closed at Rs. 90-10 while the September contract came down by a rupee, closing lower at Rs. 88-14. The highest levels touched in May and September were Rs. 94 and Rs. 92-2 and the sharp decline in both cases from these levels is to be attributed to weak advices from Brazil and reports that the Argentine crop movement would start by about November.

With practically no enquiries from overseas, and arrivals continuing to be on the high side, linseed was naturally depressed, the closing quotation for August-September being Rs. 24-14 as against the highest of Rs. 25-4 touched during the week. Linseed oil, however, remained steady at Rs. 14-8.

Around Calcutta Markets

Second Thoughts on Pak Rupee

Wednesday, Morning

IN the week following that of the devaluation of the Pakistani rupee, the Calcutta Stock Exchange seemed to have second thoughts on recent currency and fiscal happenings in India and Pakistan. Though the spurt in Jute shares has been halted, Clive Street is not pessimistic about Jute shares. In the latter half of the current week, equities have developed easiness as a sequel to the irregularly lower trend in Indian Iron and Jute shares.

In retrospect, the behaviour of Jute shares in the last two days would seem to be puzzling. Though the abolition of all export duties on Indian Jute manufactures neutralises the possible effects of the devaluation of the Pakistani rupee, the Pakistani Jute Board's decision not to lower the export minimum price for raw jute should have had a bearish effect on Jute shares on the local stock market. This partly explains why Jute shares lack buyers at the current high levels.

Unfulfilled Hopes

Devaluation of the Pakistani rupee encouraged hopes that the Indian Jute industry would now be assured of cheaper supplies of raw jute. It was argued that, with lower raw jute prices, it would be possible for the Indian industry to quote lower prices for jute goods; that, cheaper jute goods would stimulate exports. These expectations have not materialised. Raw jute and jute goods remain firm. There has been no sudden increase in the demand for Indian jute goods since the devaluation of the Pakistani rupee.

Raw jute and jute goods started moving up immediately as it became known that New Delhi had decided to abolish all export duties on jute goods. Both continued to remain firm as it became known that the Pakistani Jute Board had decided not to lower the export minimum price, quoted in pound sterling, for Pakistani raw jute. And yet, Jute shares continued to move up along with the spurt in raw jute and jute goods!

What Bulls Say

Those who are "bullish" about Jute shares are not without arguments, though some of them lack logic or basis. It is argued that Pakistan's decision not to lower the export minimum price, quoted in sterling, for raw jute means that Dundee and Continental jute manufactures reap no benefit out of devaluation of the Pakistani rupee. But it is conveniently ignored that India, similarly, is deprived of any possible advantages out of Pakistan's decision to devalue the currency.

Consider, next, the problem from the Pakistani angle. Foreign jute manufacturers will not be getting raw jute at cheaper prices. But the Pakistani manufacturers of jute goods will continue to have an advantage in export markets. This theoretical possibility is not denied. But it is argued that Pakistan has no sizable surplus of jute goods to export. That is how Clive Street argues. But IJMA is apprehensive of the rapid emergence of Pakistan as an exporter of jute goods. Such apprehensions alone can justify New Delhi's prompt decision to abolish all export duties on jute manufactures.

Tea Shares

Despite the improvement in equities in general in sympathy with the spurt in Jute shares, Tea shares remained dull and inactive in the last few days. For about a fortnight now, no tea dividend has been announced. More than a month will elapse before tea dividends for the first half of the current year will begin to be announced. That will be a crucial time for Tea shares. Meanwhile, Tea shares remain listless as the stimulus of dividend payments is no longer in operation.

There are other reasons why Tea shares are gently falling. In the last few weeks, tea auction prices have been falling. Nor is the export demand very active. As the season progresses, tea auction prices are likely to fall. Though the fall in tea prices in the current season may not be as heavy as pessimists apprehended a few months ago, even the most

robust optimist concedes that tea prices will fall further as the second flush of tea becomes available to the market.

More Burdens

Increasing imposts on the tea industry are also having an adverse effect on Tea shares. The Plantation Enquiry Committee is now investigating the problem of wage increases to tea workers in the Darjeeling gardens. Recently, the West Bengal Government has imposed a tax of one anna per lb. on tea entering Calcutta, Howrah and 24-Parganas for use, consumption or sale. This will, naturally, affect Calcutta tea auction prices and, therefore, earnings and profits of the tea industry.

Bonus Issues

Continued strength in Indian Iron is having a steadying effect on Miscellaneous and Engineering shares. Simultaneous improvement in Tata Steel and Indian Iron is due to identical reasons. Both the companies are expected to raise capital by issuing right shares to finance expansion projects. Though Indian Iron developed some easiness on the eve of the fortnightly settlement, the undertone remains steady.

Steadiness in Miscellaneous and Engineering shares is partly a reflection of strength in Indian Iron. In the last two days, sugar shares have suddenly become active. Cement shares have also shown a tendency to move up in the last few days. Favourites in these groups, such as Texmaco, Jessop and Richardson and Cruddas remain steady to firm.

An interesting market feature is the issue of right shares by some companies. Indian Paper Pulp moved up some time ago as it became known that the Company would raise capital by issuing bonus shares. Rohtas have been moving up because the Company is raising capital through issues of right shares. There are reports that Jessop propose to raise capital through issues of bonus shares. It is, therefore, not surprising that these shares have moved up in recent weeks.

Weekly Notes Continued

Atomic Materials for Sale

FRATERNISATION among the atomic scientists at Geneva after the relaxation of tension following the summit talks almost reminds one of what was witnessed in the streets of Calcutta on the eve of 15th August, 1947, but let us hope the sequel will not be similar. At the international conference for the peaceful uses of atom that is still going on, blue prints have been freely exchanged, models demonstrated, exhibited and an immense volume of technical papers has been read. The reporting in the press, however, has not been such as to enable the average newspaper reader to get anything more than that. For those interested in the economics of it, however, the Chairman of the US Atomic Energy Commission has presented a poser in the shape of a price-list for atomic materials. These are the prices at which the US would be prepared to lease uranium enriched to 20 per cent for use in atomic research reactors, prices of normal uranium metal and prices of heavy water. Friendly nations can now have enriched uranium at \$25 a gram and normal uranium metal at \$40 a kilogram. Heavy water will be sold at \$28 per lb. How do these prices compare with those at which these materials were obtainable hitherto? Prices of shares of companies which have a stake in atomic development are now being regularly quoted both in London and New York. But prices of atomic materials are not yet within this range but the market reporter will soon have to find out or figure out as best as he can. Do these prices indicate an all-out attempt by US to capture foreign markets in this newest of tradeable goods? For uranium there is no price data available, but for heavy water, comparison is possible. When New Delhi was having its own little atom for peace conference in November last, the Prime Minister who is in charge of the department of Atomic Energy gave out some cost data. Norway, then the only supplier in Europe, was selling heavy water at Rs. 10 lakhs per ton but even at this price, it was difficult to get it in under a few years. India got some heavy water for the Atomic Energy Commission from the US, but that was an inter-governmental deal and the negotiated price, if any, would give no fair index of cost. During the

war years, US cost of production for heavy water was several times as high as that of Norway. As a result of improved processes it had come down to Rs. 7 lakhs a ton and was expected to go down still further to Rs. 5 lakhs. The price quoted now is equivalent to something like Rs. 3½ lakhs a ton. Does it mean that the US is making a bid for capturing the trade in atomic materials by selling them at "give-away" prices? This possibility has always bothered Britain which has been developing atomic resources with an eye to export markets.

C R and the Atom

RAJAJI has asked some searching questions on the peaceful uses of atom; he does not seem to be impressed or enthused by the fraternisation of atomic scientists at Geneva. What has been bothering him is the possible military potential of atomic development which is professedly for peaceful purposes. To this, of course, the answer is clear. No means can be devised by which anything which has any use at all can be prevented from being used for war. Atomic plants and piles can certainly be converted to war production in the same way as air-craft factories or chemical plants. Is the use of atomic energy for destruction more likely to be prevented if the development of such energy is restricted, by law, to the public sector? Pandit Nehru was very definite that it was "much too dangerous a thing" for private agency to develop. The US, however, has thrown it open to private enterprise and leading American industrial concerns have gone all out on some line or other of atomic development. It is now a pet theme in chairmen's speeches at all important company meetings.

Another question which Rajaji raised is about the deleterious effects of atomic radiation. This is rather a mild word to use when the effects could be so dangerous as to extend to the third generation of those who are exposed to such radiation. This is, however, a question to be dealt with on a high scientific level though one cannot but admire Rajaji's attitude and his assertion of the right of the layman to question the expert where human welfare is concerned. Idealists sometimes exhibit a streak of near lunacy. "The lunatic fringe" is a necessary background not only to the occasional religious genius who emerges from it but also to high principled and well

meaning people who continue to agitate against vivisection, vaccination or aluminium utensils. Does Rajaji's agitation against BCG or his present campaign against atomic radiation come under this category? The layman would not know for certain, until the scientist came to his aid and told him more about radiation.

Company Notes

JAYABHARAT INSURANCE

THE twelfth Annual Report of the Jayabharat Insurance Co. Ltd., for the year ending December 31, 1954, shows that profits before tax, despite the losses suffered by the Marine and Miscellaneous Departments, were substantially higher than in the previous year.

Net premium income of the Fire Department in 1954 amounted to Rs. 35.42 lakhs as against Rs. 33.21 lakhs in the previous year, and net claims paid and outstanding amounted to Rs. 11.56 lakhs. After providing for commission, expenses of management etc., and an allocation of Rs. 17.11 lakhs towards the Reserve for unexpired risks, the Department netted a profit of Rs. 4.92 lakhs.

During the year under review, the Life Department received proposals valued at Rs 175.53 lakhs, of which proposals (including those pending at the end of 1953) amounting to Rs 140.36 lakhs (reassurances Rs. 11.19 lakhs), resulted into policies.

Premium income for the year less premium on reinsurance totalled Rs. 18.28 lakhs, as against Rs. 14.9 lakhs in 1953. Net claims during the year amounted to Rs. 1.16 lakhs of which claims by death accounted for Rs. 1.04 lakhs.

After adjusting the losses incurred by the Marine and Miscellaneous Departments (amounting to Rs. 2.36 lakhs) the Company made a net profit of Rs. 6.66 lakhs; if the profit brought forward from the last year is added, total distributable profits amount to Rs. 7.36 lakhs. Out of this, the Directors have recommended the utilisation of Rs 3 lakhs for the payment of a dividend of Rs. 6 per share of Rs 100 (Rs. 50 paid up) free of tax.

During the year under report, the Company purchased a large number of shares of the Sentinel Assurance Co. Ltd., and Sentinel has become a subsidiary. The Company has decided to take over the life business of Sentinel Assurance, and the necessary steps in that respect have been taken by the two companies.

A.E.I. (INDIA) LTD. contributes to the first 3,000-volt D.C. railway electrification in India

A.E.I. (India) Ltd. are proud of the part they are playing in the electrification of the Howrah-Burdwan main line of the Eastern Railway.

This contribution to the electrification of India's railways follows a worldwide contribution to railway electrification by the A.E.I. Group of Companies for over half a century.

A.E.I. (India) Ltd. will supply the entire electrical equipment all manufactured by Metropolitan-Vickers Electrical Co. Ltd., England and A.E.I. Mfg. Co. Ltd., Calcutta, for thirty-four Three-Car Multiple Unit Trains and two spare Motor Coaches which are being supplied by Jessop & Co. Ltd., Calcutta.

A.E.I. (India) Ltd. will supply indoor equipment for all the six main line Traction Substations and all the four Track Sectioning Cabins on the Howrah-Burdwan main line. This includes twelve Pumpless Steel Tank Rectifiers totalling 32,000 kW and seventy-six High Speed Circuit Breakers all manufactured by the British Thomson-Houston Co. Ltd., England.

A.E.I. (India) Ltd. will supply one hundred Automatic Colour Light Signals and twenty-five Electric Point Machines in addition to other signalling equipment all manufactured by Metropolitan-Vickers—GRS Ltd., England.

Time for Action

RARELY has the world been witness to a spectacle of heroism and sacrifice, so spontaneous, so inspiring and so pregnant with meaning as was seen last week in the Portuguese enclaves—Goa, Daman and Diu. Nearly three thousand satyagrahis, drawn from various parts of the country and from various parties and armed with nothing more than a burning desire for freedom and dauntless valour, marched into the Portuguese hide-outs to face alien bullets. They had no wishful illusion about the end they were to meet, for they knew the Portuguese tinpot dictators too well to expect anything but cold-blooded murder; nor had they any illusion that their action would immediately bring down the primitive structure of colonial rule there. It was meant to be no more than a moral gesture, an assertion of the right of all people to freedom on the part of those who had already become free, a vindication of the oneness of this country and the inalienable title of every bit of its territory to the freedom that had been wrested from other alien exploiters. And what a grand gesture it turned out to be in reality! It might have left the outward shell of Portuguese tyranny unaffected; but the core is mortally shaken. What is more, it has released forces of purposeful action in India and within Goa too which cannot but lead to an early end of Portuguese authority and insolence on Indian soil.

The only pity is that such grandeur of human spirit and sacrifice should have been exercised over so pitiful an object as a third-rate European power. But our Government's finical devotion to peaceful methods of liberation and its gingerly policy had left no alternative. It is true that to the philosophy of satyagraha, as taught and practised by Gandhiji, there can be no object too small for the highest suffering and sacrifice; and no cost can be deemed too great. It is the assertion of moral principles rather than the immediate outcome of such action that is the true concern of a satyagrahi, be the sphere of action big or small. And his faith is that his gesture will work in unaccountable ways and in its own good time to achieve its end. But this has always appeared and still appears as a counsel of perfection to the workaday world; and in this particular instance, the scepticism is deepened by the fact that the Portuguese authorities are lost to all sense of justice and decency and impervious to public opinion.

The common folk feel that methods of non-violence and appeals to the better instincts of man are simply wasted on the cynical exploiters of Goa. And it was this scepticism, grief over the cold-blooded murders in Goa and growing frustration over the uncertain policy of Government that combined to find expression in an unrestricted outburst of mob indignation all over the country, and particularly in Bombay, Calcutta, Madras and Delhi, in the course of the week. The demonstration might have had its crazy fringe; but there is no ignoring the disturbed state of the public mind that was behind it all. It is too much to expect a free and not-so-weak nation to bear with composure the sight of its unarmed volunteers being felled down by alien bullets—a sight most disconcerting to any civilised mind.

Even in the face of such provocation, Government has shown great restraint, which certainly does credit to its power of judgment and

The Economic Weekly
Noble Chambers, Parsi Bazar St.,
Fort, Bombay. 23406
Annual Subscription Rs. 24.

passionate adherence to the path of peace. But there is a point beyond which this restraint cannot go; and that point has already been reached. With the best of motives and the most thoughtful of policies, Government today finds itself in a position where instead of fighting alien intruders, it has to resist and even fight the rising popular feeling in this country both against the atrocities of the Portuguese and the hesitant policy of India's own Government. This is most embarrassing to be sure; but it is an embarrassment for which Government has to thank itself. And it is Government that has to find a way out of it. The stage has passed when public opinion could have been placated by a mere assertion of good intentions and a bland expression of the hope that the alien oppressors would have to quit the land sooner or later. That has been said too often to carry much conviction. Far from being forced into a mood to quit, the Portuguese must be deriving considerable encouragement from the sense of extreme rectitude that actuates our Government, a factor that has caused much bewilderment among the ranks

of freedom fighters both in this country and within Goa. There can be no neutrality as between what is wrong and what is right. And even if Government has advanced from its former stand of absolute neutrality to one of sympathy, that by itself is not enough in the present rapidly deteriorating situation.

By shooting down unarmed satyagrahis, wounding hundreds of others and committing unspeakable atrocities besides, and thereby putting themselves beyond the pale of humanity, the Portuguese authorities have provoked Indian opinion to a point where Government of India is left with no option but to take more positive measures than it has done so far. Whether the satyagraha in its present costly form continues or not, Government from now on can lose no opportunity to bring every manner of pressure on the Portuguese oppressors so as to force them out of their footholds. It has to be an all-out drive, and if in the process, a little distress is caused to the people living inside Goa and a little anxiety to their kith and kin outside, it is a price that they may be expected to pay in preference to the night-

mare of seemingly interminable Portuguese iniquity. Between the agony of the present state of affairs, which threatens to be endless, and the passing pressure of a total campaign to drive the Portuguese out, with a time-limit set if necessary, the people of Goa should have little difficulty in making a choice.

To keep playing for time, as at present, and then hoping that in the interval something might happen to facilitate a solution, something so far-fetched as a change of heart in the Portuguese or even a change of regime in Portugal, is to trust to chance and yearn for the seemingly impossible instead of putting robust faith in the strength and good sense of the Indian people and their fettered brethren inside Goa and giving them the right direction and the necessary encouragement to strive towards their common end. The spirit of the martyrs who laid down their lives in an unparalleled display of courage and love of freedom inside Goa cries out for nothing less. It is a spirit that has electrified free India. And it can neither be quelled nor hindered in its march to the ultimate goal.

put has to a large extent been corrected by increased production in the Western Hemisphere and, as an example, it may be noted that Japan, having lost her former access to supplies of Korea and Chosen rice, is now buying as much from the U S A as from Burma. Of Japan's 1954 imports of roughly 1.5 million tons, 340,300 tons came from the U S A, 321,800 tons from Burma and 373,700 tons from Siam."

The increase in production by countries which had not formerly grown much rice might be regarded as a temporary wartime aberration that would pass in due course. But more fundamental changes appear to have taken place in the rice economy, which can no longer be ignored. One is the disruption of the old pattern of trade resulting from the growing attempt of rice consuming and importing countries to attain self-sufficiency. The emergence of wheat in the place of rice as arbiter among food prices is another. Both these are important developments but quantitatively none can be established beyond doubt. How far has self-sufficiency been attained by rice importing countries, if allowance is made for the increasing population to alter radically the pattern of trade? Self-sufficiency is an elastic term and in the absence of accurate population statistics, which many of these countries lack, it is not possible to get a precise measure of their progress towards national self-sufficiency. Asia, however, is consuming more of food grains both imported and home grown than before the war. Imports of food grains into Asian countries from one another and from countries of the West during 1952 and 1953 were more than double the pre-war volume. Yet, the intra-Asian trade in rice has not kept pace with the rising consumption of other food grains, notably wheat, much of which has to be purchased from countries outside Asia. Here the dependence on Commonwealth countries has grown, because though the Commonwealth continues to supply only a quarter of the world's wheat as before, it accounts for nearly one half of the world's wheat exports. Of the export of all food grains, Commonwealth countries account for about two-fifths of the world total, against less than one-fourth before the war.

There is no evidence either to show that changes in food habits in

South-east Asia are responsible for the abrupt swing in favour of wheat. Acute shortage of rice is now a thing of the past and exportable surplus has now become something of an embarrassment. Therefore, there is no longer any urgency to substitute wheat for rice. The production of rice, inspite of grow more food campaigns and the drive for national self-sufficiency, cannot have added a great deal to the net rice resources of the deficit countries.

Could the contraction in intra-Asian trade, then, and the domination of wheat be accounted for by the price of rice? The suggestion has been strongly challenged, though rice exporting countries, with a much smaller export surplus than before the war, are finding problems of disposal much more difficult than was the case with a larger surplus under pre-war conditions of relative abundance. Has rice priced itself out of some of the most valuable Asian markets? Those who challenge this suggestion contend that rice prices have not risen any more than the general level of other prices. They concede that high prices in the immediate post-war years might have led marginal importers e.g., India, to strive for self-sufficiency but this is no longer a continuing phenomenon. True, there is evidence also to show that rice prices are out of parity with prices of wheat which has been an aggressive and powerful claimant for new markets. An indication of the inroads which wheat has made in recent years into markets traditionally served by rice is given by the fact that seven representative rice countries are now participating in the International Wheat Agreement. Despite the freer availability of rice, these countries are active purchasers of wheat.

But apart from prices, there are more fundamental factors which can be hardly ignored. One such, disrupting the old pattern of rice trade, arises from the recent political developments, as a result of the South-east Asian countries emerging from colonialism. The changing pattern of Indo-Burma trade is as good an example as any. In the fifty years from 1880 to 1930, the acreage under rice in lower Burma rose from 3 million to 10 million. Two-thirds of the crop were exported, the bulk going to India which, in return met the bulk of the Burmese demand for cotton goods—other manufactures coming from the U. K. Burma's annual shipment of rice to India which had

averaged 1,651,900 tons before the war dropped to 304,300 tons in 1951, 358,000 tons in 1952 and 150,000 tons in 1953. A small quantity was shipped to Pakistan in 1952 and nothing in 1951 and 1953. Unless Burma can regain her export of rice to India, her whole economy will have to develop on altogether new lines. This applies with some modification to many other countries of the region and emphasises the vital necessity for the Bandung countries to work out some form of co-ordinated development, to promote mutual self-interest. But this is a theme that has been taken up many times and need not be repeated here.

Rice Economy of Bandung Countries

COOLER countries are now getting much higher yields of rice than the tropics, where rice is mostly consumed. This is a fact; but do milder temperatures contribute to these higher yields or is it intensive and better methods of cultivation, wider use of selected seeds and fertilizers that are responsible for it? The contrast between the yield of rice in tropical and temperate regions has been brought out in the Review of World Grain Crops just issued by the Commonwealth Economic Committee in the following average returns per acre over the past five years.

Yield of Rice per Acre (in cwt.)

Italy	26.6
Australia	25
Japan	22.6
United States	14
Brazil	8
Burma	7.6
Thailand	6.8
India	6.1

Nearly one half of the rice grown outside China and Soviet Union is produced in Commonwealth countries, due to the fact that despite the

low yield per acre, there is greater out-turn in India and Pakistan.

A feature of the rice economy of monsoon Asia is the sharp fall in exports. The highest post-war figure of 4.8 million tons reached in 1951 was less than two-thirds of the pre-war average. Shipments subsequently show a downward trend. This is despite considerable increase in production. The acreage under rice in India and Pakistan has gone up substantially. The expansion in Thailand has been particularly marked; the area under rice is nearly twice that of pre-war. There has been further increase in the acreage in Indonesia, Philippines, Korea and Formosa but there has been little change in Burma, Indo-China and Japan. But exports from South-east Asia which before the war totalled over 5.5 million tons, representing three-fourths of the world trade, had fallen in 1953 to 2.5 million tons.

A striking change in the rice economy of South-east Asia is the increased production and export of rice in the Western Hemisphere. In fact, the post-war decline in South-east Asia's production and export

must be set against certain significant developments which have been occurring all over the world. The N. B. I Review, published quarterly by the National Bank of India, a comparative newcomer among bank journals, does just this in its latest issue. It points out:

"Annual production of rice in the U S A which averaged 941,000 tons in the period 1934 to 1939 had increased to 2,349,000 tons in 1953-54 and is provisionally calculated at 2,627,000 tons for the 1954-55 crop season. Italy's production rose from a pre-war annual average of 741,000 tons to 919,000 in 1953-54, whilst the countries of South America raised their production from 1,792,000 tons (average) to 4,714,000 tons over the same period. These are some of the high spots of a rising curve of rice cultivation in the Western Hemisphere. As a result of increased crops some of the smaller producers are estimated to have sizable exportable surpluses in the current year of which Italy (200,000 tons) and Spain (100,000) may be taken as examples. Thus, the disequilibrium caused by the shortfall in Asian out-

Weekly Notes

Travancore-Cochin

THE immediate withdrawal by the Travancore-Cochin Government of all prosecutions launched by the previous Praja-Socialist Ministry, with the full support of the State Congress, against Travancore Tamil Nad Congressmen numbering about 500, including 12 of their 13 MLAs, should be viewed in the context of the impending meeting of the State Legislature and strength of the Congress in it. The meeting of the Legislature which was to have been called in the second week of this month was postponed to the end of the month on the plea that the Select Committee on the Land Reforms Bill had not completed its task. Looking back, the postponement was not so innocuous as it was made out to be. No party in the Legislature has an absolute majority. Though Congress has formed the ministry, it has only 45 members in a House of 118. The party affiliations of the rest are as follows—Communists 23, PSP 19, RSP 9, TTNC 12, nominated 1, other parties and independents 9. With the conditional support of the TTNC and a few independents, the Congress Ministry was able to survive the previous session with a precarious majority. When a direct question was put by the Opposition during the previous session whether Government had any such move under contemplation, the Chief Minister categorically denied it.

What has happened since then? No one will question the propriety of withdrawing political cases when the Government changes. If that were the case, they should have done it 8 months earlier when they came to power. But in this particular issue, there are certain extraordinary features. Congressmen should answer what their reaction would have been if Pattom had done this under similar circumstances? They would have made this an issue to oust the Pattom Ministry from office. The unsavoury aspect of it is that Pattom was made a scapegoat. There was no other way of bringing down the Praja-Socialist Ministry. One would have expected that after its recent resolutions on the purity of the organisation, the Congress would at least lay down a

certain code of conduct for Congressmen and strictly enforce the code.

Pattom's faithfulness and scruples cost him his office. Not only that; the issue of 'police firing' on unarmed Satyagrahis brought about a serious split in the all India PSP. It is quite likely that the Congress has not debased itself for the temporary gain of surviving the current session of the Legislature. The recommendations of the State Reorganisation Committee which is expected to be out in the course of two or three months may also have been an important consideration in arriving at the present decision.

Wage Commission

THOUGH the proposal for a second Pay Commission has been turned down, it has been announced that the appointment of a wage commission is under contemplation. The terms of reference are not known, but any wage commission will have to deal with fixation of minimum wages, standardisation of wages, wage differentials, equal pay for equal work and the working of the Payment of Wages Act. It will also have to resolve the long dispute about living wage and a fair wage, decide whether bonus is an ex-gratia payment or a deferred wage and settle the absorption of dearness allowance into basic wage etc.

The Minimum Wages Act was passed in 1948 mainly for the fixation of a minimum wage for agricultural labour and in sweated industries. Under this Act, minimum wages have been fixed for a number of small occupations in several States. Minimum wages in agriculture, however, remain to be implemented. The deadline for such implementation was extended on various occasions and is now altogether abolished at the request of the various States. The industrial courts and tribunals in the several States have also prescribed minimum wages for unskilled labour in a number of industries and industrial units. They have also prescribed graded scales of wages for different categories of skilled workers. The idea of enforcing a legal minimum wage is closely bound up with the idea that society has certain obligations to safeguard the living stand-

ards of its members. The evils of sweated labour first compelled governments to legislate for minimum wage rates. Another object of such legislation is to check industrial unrest. The principal difficulty encountered is that of determining a minimum which would safeguard the worker against privation and which, at the same time, is within the industry's capacity to pay.

Three different bases have been adopted in various countries for determining the minimum rates: (i) the living wage, (ii) industry's capacity to pay, and (iii) the level of wages obtaining in the locality. The various industrial courts and tribunals in India have more or less taken these considerations into account in awarding minimum rates of wages to labour unions.

Industry's Capacity to Pay

THE level of wages is necessarily conditioned by the capacity of industry to pay. Most of the minimum wage laws in fact acknowledge the importance of this factor, and try to harmonise it with the principle of a living wage. While the minimum is an elastic concept, there are certain limits to this minimum in a given community with a given productivity. A substantial increase in wages, unaccompanied by a corresponding increase in workers' efficiency and/or improved methods of manufacture, would certainly increase production costs leading to loss of markets which will, in its turn, lead to reduced production or even closing down of plant. The 'ability to pay' should, however, be construed as the ability of industry in general. The fixation of a minimum wage may result in the weeding out of inefficient individual establishments. It may also affect industries artificially propped up i.e. industries which are not suitable to the conditions of a country. Today, if a wage commission were to go into the question, productivity would loom large and labour's claims would have to be met for making it a co-sharer in the productivity of industry which has undoubtedly gone up substantially in the last two or three years.

(Continued on page 1011)

Managing Agency before Lok Sabha

FROM the discussion on the report of the Joint Select Committee on the Company's Bill, that has taken place so far in the Lok Sabha, including the opening speech of the Finance Minister, it is obvious that the controversial clauses relating to managing agencies are going to steal the debate. There appears to be general agreement that the conduct of managing agents has not been exemplary. No one has so far taken up the cudgels on their behalf, and defended their role as providers of finance and managerial talent to industry. While the deficiencies of the managing agency system are recognised, there is difference of opinion on whether the system should be ended or whether the deficiencies should be eliminated so as to improve the system and make it more useful. While it is difficult to foresee the final outcome of the debate, one would not be wrong in assuming that, at least for some time to come, no drastic step, calculated to end the system, would be taken.

Joint Select Committee

THE reform of company law was taken up for consideration in 1946, as it was felt that all was not well with company management. Though nearly a decade has passed since then and a number of changes have taken place in the country's economic structure, the basic aim of reform has remained the same, viz. that of "encouraging and reasonably safeguarding private investments in fields which are not marked out for the public sector," and it was with this end in view that the Companies Bill was put forward in 1953. The Joint Select Committee has made some drastic changes in the Bill, particularly in the clause relating to the managing agencies, but there is obviously scope for more changes, judging from the readiness with which Government yielded to the criticism regarding absence of any provision in the Bill to prevent relatives of managing agents being appointed as selling or buying agents. It may be argued, however, that the basic pattern of the Bill remains substantially unaltered, as more than 70 per cent of the 649 clause Bill has not been touched at all by the Joint Select Committee. Such a view would be misleading in the extreme, for it is unusual for a Bill to undergo such radical change in the Committee stage and still more unusual for Government to accept such changes.

The most controversial clauses are those relating to the managing agencies. Clause 323 gives power to the Central Government to notify that companies engaged, wholly or in part, in any specified industry or business, shall have no managing agents. In effect, this means that the Government will have blanket control over the form of corporate management in the private industrial sector. When any notified industry has managing agents, the latter shall cease to be so within three years from the date of notification or 15th August 1960, whichever is later.

An even more controversial clause in the Bill, is 329, which lays down that the term of the existing managing agents should expire on 15th August 1960, except in the case of re-appointments, which are, however, subject to Government's approval.

Another important stipulation made by the Select Committee is that relating to the remuneration of managing agents in those businesses where they are permitted to continue. While the original Bill (Clause 347) had provided a ceiling on the remuneration of managing agents (i.e. not more than 10 per cent of net profits), it

did not impose any restriction either on the total remuneration of a director or on the managerial remuneration of a company. The Select Committee has, however, changed this and laid down that not more than eleven per cent of net profits may be utilised for all types of remuneration to top management—managing agents, managing directors or managers. It is further provided that where a company makes no profit or earns inadequate profit, the maximum remuneration for all managerial staff should be Rs. 50,000 (Clauses 197 and 352). The Finance Minister, however, has agreed to qualify this provision in a subsequent amendment.

To Mend or to End?

SOME of the other provisions relating to managing agencies are those that provide (a) that a managing agency company cannot itself have a managing agent (324); (b) that all appointments and re-appointments of managing agents are to be approved by the Central Government (325 and 327); (c) that no person may be a managing agent of more than ten companies after 15th August, 1960 (331); and (d) that managing agency is not heritable.

Industrial

announces SUBSTANTIAL increase in

BONUS

WHOLE LIFE Rs. 18 per 1,000 per year

ENDOWMENT Rs. 15 per 1,000 per year

for the

Triennium ending 31st December, 1954

Observations of the Valuing Actuary

"The valuation results are Excellent (Surplus Rs. 66,48,698/-). It is a matter of great satisfaction that it has become possible to declare Higher Rates of Bonus after maintaining a Strong Reserve Position of the Company and the carry forward (Rs. 10,77,872/-) to the policyholders' account which I have recommended will enable you to maintain your Bonuses at HIGHER LEVELS in future years."

THE INDUSTRIAL & PRUDENTIAL ASSURANCE COMPANY, LIMITED

Industrial Assurance Building, Opp. Churchgate Station,
Fort, Bombay I

The discussion over the Select Committee's report in the legislature raises three main questions: (1) whether the managing agencies should be mended or ended, (2) what is the place of managing agents in the present corporate financial picture, and (3) are managing agents receiving remuneration out of all proportion to the contribution they make, and at the cost of the industries concerned?

As regards the future of the managing agency system, the trend appears to be against outright abolition. The Prime Minister himself has expressed the view that there is no point in fixing a target date for abolition, in view of the considerations arising out of the Second Plan. The lurking fear that the sudden termination of the system might disorganise industrial management and retard industrial development has tempered the critics.

Financial Contribution and Remuneration

FUNDS that managing agents provide for industry do not appear to be as important now as they were once. A study of Company Finances 1950-52, made by the Reserve Bank, goes to show that three-fourths of industrial finance is obtained from the internal resources of the industries themselves. Thus, for 746 public limited companies studied by the Reserve Bank, out of total capital resources of about Rs. 151 crores, during 1950-52, internal sources provided as much as Rs. 116 crores as against Rs. 35 crores obtained from external sources; of the latter, share capital and borrowings from banks provided Rs. 7.3 crores and Rs. 11.4 crores respectively. Managing agents do not appear to figure prominently in this scheme of corporate finance, their contribution being confined to the personal guarantees given by their directors, the value of which cannot be assessed from the small share of bank loans in the capital resources of the company. The managing agency system, however, it would appear, has to be valued as a source of corporate managerial talent rather than of finance.

As regards the remuneration received by managing agents, the ceiling (11 per cent of net profits) fixed by the Select Committee is a little less, but not much less, than what perhaps they are getting now. The study of the finances of 492 public limited companies made by the Taxation Enquiry Commission, for instance, shows that all forms of re-

muneration to managing agents in the period 1946-1951, amounted to about 14 per cent of profits before tax (including this remuneration). The Reserve Bank study of company finances referred to above, also shows that (for the 746 companies whose finances were studied) in the period 1950-52, managing agents' remuneration amounted to about 14 per cent of gross profits (after providing for depreciation). These figures are of course, derived from the published accounts of companies; the actual remuneration of managing agents, but it would be much more.

Bhoo dan — Collection But no Distribution

THE figures for land distribution under the Bhoo dan Movement made public recently brings to light how organisational inadequacy and lack of trained personnel hamper the progress of an otherwise inspiring movement. In an earlier issue, the progress of land collection was commented upon. As against the target of 5 crores of acres by the end of 1957, only 38,26,810 acres have been collected so far from 442,722 donors. Only 193,275 acres out of 38,25,810 acres received as

gifts, has been distributed so far to 52,134 landless families. That means that 95 per cent of the land collected is still lying with the donors. It is true that unless necessary legislative measures are brought forward by the State Government, transfer of title deeds would be difficult to effect.

But the delay cannot be attributed to legal difficulties alone. Even in a State like Bihar which has enacted the required land legislation, distribution does not appear to have made much headway. Out of the 23 lakhs of acres collected in Bihar, only about 3 lakh acres have been distributed. Moreover, as some portion of the collected lands, however small, has already been distributed in almost all the States, legal difficulties of the transfer cannot be the only reason for the delay. It is quite likely that one of the lands donated may be a waste and will require various investments to bring it into the plough. The landless labourers, whom lands are collected for, are in a position to bear the expenditure. The labourers for whom lands are collected will not be able to meet such initial wages by themselves around Vinayaka. Most explain this failure as part of the Movement.

Will the Cottage Sector Deliver the Goods?

—Is it Intended to?

WHILE on the one hand the role assigned to the "household and hand industries" in the Draft Plan-frame has been criticised as a clog on progress, a deliberate turning away from efficiency in favour of antiquated methods of production and a dishonest concession to tradition, it has been criticised on the other as a mere stop-gap arrangement, to be scrapped as soon as the emergency passes. Dependence on household and hand industry as a temporary measure has not satisfied those who, for ideological reasons, want the major role to be given to this sector. Prof. Mahalanobis had recognised in his Draft Plan-frame that hand-made goods might be costlier than factory goods of comparable quality and had recommended appropriate excise duties on factory products to maintain "desired price parities". Regarding the future of household and hand industries, however, he had hinted at developments on two different lines. "Once mass unemployment has gone," he said, "the aim would be to provide cheap power and small machines to the household sector and hand industries to increase productivity per worker". This might point to a continuing role and an established position for the cottage sector in the national economy, through the progressive transformation of this sector in the direction of greater efficiency and productivity through mechanization. But he had stated that "at this stage (once mass unemployment has gone) the factory production of consumer goods would also be increased". Since the latter could take place only by displacing the products of hand industries, the future of such industries would not be as assured as some of their supporters might want it to be. The ideological differences on the question of technical improvements of those industries by introducing a degree of mechanization are irreconcilable. But if this measure of reform is accepted, and at least some of the Gandhians would not object to the use of electricity or improved gadgets, provided these could be made available to all the village industries, the position will be somewhat like that envisaged by the Ford

team. Conditions would be created in which those of the cottage industries which showed promise of economic potentialities could be helped to come up, while labour engaged in others, which had no such potentiality, could be gradually diverted to more efficient and productive uses. This would be possible, and the transition could be made painless, when employment opportunities were expanding as they should be in the Third Plan period. That the cottage sector would receive the attention it deserves and that maximum effort would be made to organise production in this sector so that it could deliver the goods and smoothen the way for the success of the second Plan—both these presuppositions lack any basis in fact. True, a committee has been appointed by the Government to report on small-scale industries and to find out what could be expected of them in the second Plan period, how far the investment targets in any of the small-scale industries were likely to be realised and how much of the expected production of consumer goods could be expected from them. The Government, it appears, is going to guide its policy by the findings of the Karve Committee and not go by the Draft Plan-frame. This decision has been communicated to the Congress Parliamentary Party's Standing Finance Committee by the Finance Minister, Shri Chintaman Deshmukh himself. The Finance Minister, it is reported, told the Congress Members of Parliament that if the Karve Committee found that production or investment targets in any of the small-scale industries could not be fulfilled, the production of consumer goods concerned would be entrusted to factories and mills.

This disclaimer will not come as a surprise to those who had taken note of the agitation that had been worked up in the country against the ceiling that the Draft Plan-frame had proposed to put on organised factory industries producing consumer goods. Nor would it come as a surprise to those who had followed the recent change in the ministerial set up which, by no stretch of imagination, could be viewed as a set-up to exploit to the maximum the

potentialities of the cottage sector. The preliminary to any organisational effort to mobilise the cottage sector should be the unification of policy and administration at the top. But far from making a move in that direction, village and cottage industries have been transferred to the Production Ministry, as a compensation to Shri K C Reddy for the loss of steel and Shri Nityanand Kanungo in the Commerce and Industry Ministry has been put in charge of handlooms and the newly constituted Board of Small-scale Industries. Those who had expected that the promotion of Shri Nityanand Kanungo to the status of a Minister of State would be the first step towards mobilising all the resources of the cottage sector must have been disappointed to learn that it meant no such thing. This has been confirmed subsequently, as can be seen from the miscellaneous assignments

that Shri Kanungo has been lately given in Parliament.

The success of the Second Five Year Plan has been made to rest on the cottage sector in two ways. Hand industries have to supplement the supply of consumer goods coming from organised industry. In fact, it has to meet the bulk of the additional demand arising from increased public spending, for the expansion of organised consumer goods industries has been partially restricted in the second Plan. There is no general ban, however. In fact, for a number of products such as paper, sugar, vegetable oils and bicycles as well as woollen textiles, sewing machines and electrical goods, provision has been made for substantial expansion. It is only the expansion of factory production of consumer goods, which are likely to compete with and displace hand industries, that has been restricted.

In a mixed economy, physical balances could be very rough at best and uncertain. But considering the present organisation and character of cottage industries, planned production would be largely free from the uncertainties of response from innumerable small and scattered producers, which would have been unavoidable in a different, more highly commercialised set-up. The problem is administrative and colossal but not insuperable.

But by and large, the additional demand for consumer goods will have to be met from this sector and if it fails to deliver the goods, inflation will develop, deficit spending will have to be curtailed and the axe will fall first on construction industries and then on household enterprises on which the Plan depends largely for creating additional employment. In fact, of the total increase in employment forecast in the Plan period viz., 11 million jobs, as many as 3 million are expected to be provided by household enterprises and construction. This is by far the largest single employment creator in the plan. But of these two, supply of goods and creation of jobs, it is the first which is crucial. If it fails, the Plan will have to be slowed down, and employment in construction will have to be reduced forthwith. The employment aspect of household enterprises is not nearly so important. For if the cottage sector can keep up its supply of consumer goods, inflation will be checked and additional employment can be created in construction industries and in other sectors of the economy such as social services.

Congress has to its credit many years of village work, for what it is worth. The question has been discussed quite for some time and serious doubts have been raised about the ability of the cottage sector to meet the demand and interested propaganda has played upon these doubts and fears, and conjured up horrors of mounting inflation, fed on mounting deficit financing and shortage of consumer goods. Now

there is no reason to under-estimate the difficulties of organising this sector and of stepping up supply of goods fast enough and on the required scale. These present many problems. There is no reason, however, why it cannot be done. It is surprising, therefore, that no one in authority who commands respectful hearing has yet raised his voice and given the assurance that the country needs today.

From the Calcutta End

West Bengal's Benevolent Despot

AUGUST 15 started well in Calcutta. But the day ended on a sad note. West Bengal's Pradesh Congress Committee had made plans to celebrate Independence Day on a grand scale. Throughout this week, Calcutta will be paying tribute to seven eminent living Bengalis. Calcutta responded to these plans in its traditional manner. Processions and meetings were bigger. There was great rejoicing. By the evening, the spontaneous outburst of joy and gaiety seemed to have ended all of a sudden. Tragic happenings in Goa cast a shadow over Calcutta.

Before the news spread about the barbarous atrocities perpetrated by the Portuguese on unarmed satyagrahis, Calcutta was gay and joyous. Its citizens seemed happy over India's achievements since independence. India's contribution to world peace had been substantial. Her first Five-Year Plan had succeeded beyond expectations. On Monday last, the people were celebrating these welcome happenings.

Shadows

Brutal behaviour of the Portuguese on the Goa border on Independence Day was not the only reminder to this writer of problems New Delhi will have to solve to make the people happy. At about 4 p.m. on Monday last, one was caught in a terrific traffic jam near about the Museum. One noticed a well-dressed elderly gentleman looking at the procession. There was something in that gentleman that made one feel like starting a conversation with him. What one heard was another tragic tale.

To start a conversation, one began by suggesting that it was good to see people celebrating Independence Day with such joy and abandon. He looked at this writer for a few seconds as if to size up the person who had started a conversation with him. And then he replied, without emotion, without any trace of anger or resentment, in a matter-of-fact voice, "It's good, and it isn't. We left our homes and hearths so that India could be free. We live here as refugees from our homeland". He stopped suddenly. We two kept

standing together for a while, not talking to, or looking at, one another. And then one silently sneaked away.

He was not bitter. That was what he must have been thinking while watching the Independence Day procession. He just shared his thought and feeling with a sympathiser. One cannot live in Calcutta without being constantly reminded of the East Bengal displaced persons and their problems. They are not without blame for their incapacity to adapt themselves to new surroundings. But blaming them will not solve their problems. Plans will have to be made to help them fit in with new environments..

Successful Chief Minister

On Monday last, at 7 p.m., the West Bengal Pradesh Congress Committee presented a copy of his biography to Dr B C Roy, the State's Chief Minister. "He has grown", Pandit Nehru writes in a foreword to the biography, "into an institution, not only in Calcutta and Bengal, but in India". Dr B C Roy is the successful Chief Minister of a problem State. He has many qualities. He has grown in stature as he has grown in years.

West Bengal's Chief Minister is not a professional politician or an economist. He is an eminent physician. He became an all-India figure as Mahatmajai paid him the handsome tribute that, as a patient, he felt safe in Dr B C Roy's hands. As a physician, he has assuredly become a legendary figure for his sixth sense in diagnosing and curing diseases. It is a logical deduction that he is a good psychologist.

Like all successful men, Dr B C Roy thinks he knows everything that is worth knowing about everything. He has also developed a social philosophy of his own. In Bombay recently, he enunciated the principle of **Pran Dan**. West Bengal's Chief Minister is not, and does not claim to be, a Mahatma or an Acharya Vinoba. But those who know him intimately admit his Bombay claim that he has adopted **Pran Dan** as a principle of life. He works hard. He works for the people.

But there is a difference. He works for the people as he thinks

he should work for the people. This is where his social philosophy comes in. Age seems to have mellowed him. He acquired his social philosophy long ago. But it has changed its nuances as he has grown in years. It is probable that he retains his faith in aristocracy, not of birth, but of the intellect. But it is probable that he, now an old and mature man, believes in aristocracy not for the benefit of the aristocrats, but for the good of the masses.

Capital-Power

He has had the good sense not to propound any theory of social philosophy. But his social philosophy is apparent from his occasional obiter dictas. On Saturday last, he was discussing his Plan-frame for his State with the City's industrialists and business men. Readers of this page are familiar with West Bengal's second Plan. They also know the West Bengal Chief Minister's differences with Professor Mahalanobis. His address before the business community was interesting if only because of his revealing definition of capital.

Capital, as defined by Dr B C Roy, represents power. It may take the form of the power of the brain, the muscle, of money. Capital, which is the same thing as power, can be abused. If a man utilised the power of his brain for self-aggrandisement, the power was being wrongly used. But if the power of the brain was being used for the benefit of others, this use of capital, this exercise of power, could not be condemned.

For those who are naive enough not to understand the implications of the West Bengal Chief Minister's philosophic interpretation of the capital-power equation, it is necessary to add what Dr B C Roy really means. Dr B C Roy has brains. He utilises his brain power for the benefit of the community. He, which, in political terminology, means his Government, has assumed large powers. But that does not mean that he is a dictator. He is not a dictator because, by his definition, he is using his dictatorial powers for the benefit of the State.

Capital may take the form not only of brain power but also of money power. Dr B C Roy men-

tions a third form of capital, muscle power, only to reject it. Now, capital in the form of money power can also be properly used or abused. Dr B C Roy's dissertation on money power has some close relation to Mahatmaji's conception of the trustee relationship between millowners and workers. When an industrialist uses his capital to enrich himself or to crush his competitors, it becomes reactionary capital. When

he uses his capital for the development of the country, it becomes national capital.

West Bengal's Chief Minister is inclined to the view that to distinguish between private and public capital is to make a distinction without a difference. Both public and private capital can be properly or wrongly used. When properly used, both public and private capital can further the good of society. Dr

B C Roy has been accused of association or affiliation with private capitalists. So, now one knows Dr Roy's defence against the allegations made against him. West Bengal's people may not have the knowledge or the education to appreciate Dr B C Roy's theory of capital. But Calcutta's economists and City Editors seem to endorse enthusiastically the West Bengal Chief Minister's sophisticated economic philosophy.

Economic Study of a Malabar Village

Thomas Shea

MORAZHA village and the surrounding area constitute one of the chief strongholds of the Communist Party in Malabar. The Kisan Sangham (the peasant organisation sponsored by the Communist Party) has a large branch office there with 400 members. Morazha became famous in 1940 as the scene of what was referred to in the courts as the Morazha Conspiracy Case, in which a large number of persons were sent to prison, and a prominent Communist leader was sentenced to death. (He was subsequently released when the Congress came to power.) In September 1940, a Sub-Inspector of Police who was known to be a virulent anti-Communist left the area of his jurisdiction, which lay outside of Moraza, with a party of armed constabulary to smash up a Communist meeting being held there. On his arrival, he ordered the crowd of over 3000 which had gathered in the square to disperse instantly on threat of opening fire. The crowd became unruly, and in the ensuing period of confusion, the Sub-Inspector was murdered. Morazha has ever since been regarded popularly as a centre of turbulence and discontent. The following study of the economic causes of unrest in this village was carried out during the months of February and March, 1955.

Morazha Desam

Morazha desam is situated about 13 miles north-west of Cannanore in Chirakkal Taluk, Malabar District. It lies about 1½ miles from the main road to Taliparamba which has recently been converted into a national highway. It can be reached by a subsidiary road constructed by the Madras Government for military purposes during the period of widespread agrarian unrest which upset this part of the district following independence. It is one of the four desams which make up Morazha amsam, which in Malabar is the revenue village over which the authority of village officers extends.

The outline map shows the configuration of the village, and the location of paddy flats, garden lands and dry lands. Wet holdings (paddy flats) occupy 338 acres, or 21.9 per cent of the assessed lands in the village and account for nearly half of the total land revenue assess-

ment; garden lands comprise 443 acres or 28.7 per cent of the assessed area and pay 42.9 per cent of the revenue assessment.

Population and Land Use

The total area of the village is 1,591 acres and the population is, according to the 1951 census, 3,036—this gives a density of roughly 2 per acre, or about 9 per acre of paddy land. On the very extravagant assumption that each acre of paddy land in the village produces on an average 1000 lbs of paddy per year, this would provide just over 100 lbs of paddy, or 60 lbs of rice per person per year. On the equally extravagant assumption that each acre of garden land was planted with the optimum number of coconut trees per acre, 120, and each tree yielded the district average of about 25 nuts per tree per year, there would be 443 nuts per year per person, or 9 per week. There are, according to the census, 1316 persons classified as engaged primarily in agriculture, a density of almost four per acre of wet land. If the same assumptions regarding village production are used for purposes of calculation, each agriculturalist produces 250 lbs of paddy per year, or 150 lbs of rice—a daily allowance of less than 8 ounces per

person—and 1000 coconuts per year, or less than 20 nuts per week.

Not Producing Enough

These figures show that the village is not producing enough paddy and coconuts—the staple crops of the village—to feed itself. At one time 150 families were wholly or partially maintained on the earnings of those villagers who worked in the nearby Aaron spinning and weaving mills. This factory, one of the largest in Malabar, closed down about two years ago owing to mismanagement and the villagers who formerly worked there have been unable to find alternative employment. Apart from paddy and coconuts, the village produces several hundred lbs of cashew nut, and there are a few vegetable gardens, but in the aggregate this contributes little to village income. Some paddy is imported from Coorg; this is bought with the proceeds which a few families receive from members who earn money outside. The bulk of the inhabitants of Morazha are slowly starving to death.

Salt Water Damage

Natural causes are partially to blame. On the north, the desam is bounded by the Kuttikol River, a branch of the Taliparamba River;

MORAZHA DESAM

this river, which is really a back-water, is at Morazha, only four miles from the ocean, and is mainly composed of sea-water. Each year, during the monsoon it overflows its banks and submerges 1/3 of the paddy lands of the village in a foot or two of brackish water. Two dams have been built by some of the larger landlords to restrict the overflow of the brackish water, but one of these has in recent years been allowed to fall into disrepair, and each year, this brackish overflow spreads to new lands. Last October (1954) the Madras Government opened an extension service block in this part of North Malabar as part of the Community Project development scheme, and has in connection with this sanctioned 25,000 rupees for the construction of an improved bund. The bund chosen for improvement (B on the map) lies far south of the original bund (A). While it will prevent further encroachment on lands lying to the south, it will increase drainage problems for those lying between it and the river which amount to nearly 100 acres of paddy land. The villagers fear that the Government's plans, if carried out, may render the whole of this area uncultivable and force more than 100 cultivators to abandon their holdings.

Special Type of Cultivation

This annual overflow of salt water is responsible for a peculiar type of paddy cultivation found only in North Malabar in areas similarly situated near the coast, called Kaipad. In February or March, toward the end of the dry season, when the backwaters have receded

and the fields have become dry, mounds are raised on the fields at intervals of about one every two square feet. After they have been built up, during the month of April or May, water from nearby channels is allowed to enter the fields through sluices in order to decrease the salinity of the soil, for following the evaporation of the flood waters during the dry season, the soil is often coated with a layer of salt. In June, seeds which have been allowed to germinate are sown on top of the mounds. After a month or six weeks, when the seedlings have sprouted and the onset of the monsoon has further decreased the salinity of the water in the fields, the mounds are levelled over the fields, which then take on the appearance of ordinary paddy flats. The crop is harvested in October, when the floodwaters have temporarily receded. From then until February, the fields remain almost continually submerged by the channels and backwaters which are replenished by the north-east monsoon.

Cost Lower But Crop Precarious

This type of cultivation is slightly less expensive than ordinary cultivation. Although labour costs are substantially more, only 1/3 of the seed necessary in transplanted crops is required in Kaipad cultivation; this usually more than cancels out the increase in labour costs. However, the crop is an exceedingly precarious one; slight but unexpected variations in the level of water during the seedling stage can, and frequently do, destroy the entire crop. Moreover, much of this Kaipad land could produce two

instead of one crop yearly, were it possible to regulate the flow of water from the river.

However, the plight of Morazha is due chiefly not to the vagaries of nature but to the inefficient organization of agricultural production and this is, in turn, an outgrowth of the prevailing land tenure structure. The following picture may be duplicated in any one of Malabar's 2,222 desams and is largely responsible for low standards of agricultural production throughout the district.

Concentration of Holdings

Eight devaswoms, or temples, hold the janmam, or proprietary right to half of the land in the village. They pay more than 25 per cent of the land revenue, and hold 1/3 of the wet lands. Four of these devaswoms are managed by two of the five largest landholders of the village. Only one of the temples, however, is managed by a resident of the desam. All hold lands scattered through other villages as well. The largest proprietary holder, or janmi, in the village, one of the eight devaswoms, holds nearly 1/4 of the wet lands, and pays 13 per cent of the total land revenue. The five largest janmis hold 47.5 per cent of the wet lands, 49 per cent of all lands, and pay more than 40 per cent of the total land revenue. Janmam title to the remainder of the lands is held on more than 250 pattas by approximately 200 individuals*.

None of the large janmis hold their land in compact blocks. Like the holdings of the devaswoms, their

lands are scattered throughout this and other villages in haphazard confusion. Only one, the manager of one of the temples, who is also the village headman or adhkari, has any precise knowledge of the extent of his lands. Even he is unable to give detailed information concerning the actual cultivators, for the temple account books show only the names of the immediate lessees; as there is no restraint on sub-letting, it is impossible in most cases for janmis to say whether or not their immediate lessees are cultivators or intermediaries. No records are kept of yields, and no interest is ordinarily taken in raising standards of cultivation.

*For a discussion of the meaning of the term "patta" see my article "Travancore-Cochin Land Tenure Reform" in the *Economic Weekly* of September 18, 1954. In Malabar District, unlike in Travancore-Cochin, the janmi is the patta-holder; tenants, if they hold pattas, hold them jointly with the janmi. See also the Malabar Land Registration Act, 1895, as modified up to May 1, 1948, Madras, Government Press, 1948.

Janmi's Powers Restricted

The janmi is no longer the omnipotent landlord he was a generation ago. Successive tenancy legislation has curtailed his power to evict and to raise rents. He may evict tenants for the purpose of taking to direct cultivation himself, and this device has been resorted to frequently in recent years by janmis desiring to augment their incomes by appropriating the full economic rent. As a large number of leases are oral (of the leases of all types which I examined in this village, I found 85 to be oral and 94 registered) eviction, especially from wet lands, should normally be an easy task. Most janmis would be discouraged from evicting tenants from garden lands because of the fact that they would usually be obliged to pay heavy compensation for improvements made by the tenant during his period of tenure, such as newly-planted trees and buildings. In the case of paddy lands, however, no compensation need ordinarily be paid, because the only "improvements" ordinarily made on paddy lands are the annual routine tasks of bunding and levelling of the fields. My enquiries concerning evictions in Morazha village brought to light only four incidents, all of which involved evictions of sub-tenants by an intermediary.

Although the janmi is no longer a social menace, it is difficult to see what positive contribution he makes to agriculture as it is carried on today in Morazha. This, of course, is not true of the smaller janmis, who are often themselves cultivating tenants (see Table V); but it does apply to the five largest ones who own half the land in the village. Only one is a resident; none have ever taken any interest whatever in agricultural operations. Had they ever chosen to do so, they would have found the task of management staggering, since their lands are scattered in the most indiscriminate manner over the countryside. It is true that the rents which they charge for many of their holdings are nominal. Yet many of the cultivators examined by me who held leases direct from them were as bad-

ly rack-rented as those holding leases from intermediaries. The janmi, still called the "absolute proprietor of the soil" in the Malabar Tenancy Act as it stands today, has been shorn of much of his power. His very existence as a passive rent-receiver is, however, along with that of the non-cultivating intermediary, symptomatic of a misuse of economic resources.

Data on Concentration of Holdings

N.B.—The data showing concentration of holdings on the janmam level is the only portion of this enquiry not based on contemporary (1955) evidence. It was compiled from the village register which was prepared in connection with resettlement operations in 1936. Since that time, there has been a substantial change in the pattern of janmam holdings. I found it, however, impossible to keep track of

TABLE III

Towards a HEALTHIER TRAVANCORE-COCHIN!

Set amidst a picturesque landscape of evergreen coconut groves, paddy fields and verdant valleys, the Uloor Medical College Hospital is a big step towards a healthier Travancore-Cochin.

The Uloor Medical College spread over an area of 180 acres has 700 beds and 6 operation theatres. The X-Ray department, one of the most modern in India, includes General Electric's Maxitron 250 X-Ray Therapy

Unit. It incorporates the most advanced ideas and exclusive features... it is recognised by Radio Therapists as a true interpretation of their expressed needs.

Over 3,000 G.E. Diagnostic and Therapeutic X-Ray equipments are functioning throughout India today. G.E. Research and experience are making X-Ray Therapy more effective in offering greater relief to the sick.

the enormous number of sales, partitions, and re-combinations of janmam property which have taken place over the intervening 19 years, for many of the changes have never been entered in the village records. The first permissive legislation enabling partition of property belonging to Hindu joint families in Malabar to take place was first passed in 1933. It was several years before people generally began to take advantage of its provisions. Since 1936, when the register was prepared, however, courts in Malabar have been swamped with partition suits. When families often numbering two dozen or more sub-divide and partition holdings which even before partition were diminutive and fragmented, individual holdings often become too small to be workable and are sold. Partition has gone on not only the janmam level, but among all categories of tenants as well, and it further complicates a set of land tenure patterns already complex in the extreme. Two of the five largest janmis shown in Table II are devaswoms, whose property is impartible. One of the remaining three still holds an unpartitioned estate; partition proceedings are now in progress for the second and that estate has been placed in the hands of a receiver. The last of the three has lost virtually every scrap of his land either through litigation or sale during the past 19 years.

Subinfeudation

Table VI illustrates the prevalence of subinfeudation in the holdings studied. It is based chiefly on enquiries into paddy holdings of cultivators. At first glance, it would appear that tenure patterns in the village were on the whole quite simple, at least for paddy lands. In 63 per cent of the lands studied the janmi either held his land directly, or leased it to a cultivating tenant. In only 5 per cent of the lands studied were there two or more intermediaries between the janmi and the cultivator. However, 42 of the 67 cultivators whose holdings were studied in detail held some land in Morazha desam as subtenants. There are a few fields in the village—by no means the most productive or desirable lands—which have been parceled out by intermediaries into tiny fragments which are leased out on exceedingly high rents to an enormous number of petty cultivators. One such field, 16 acres in extent with an approximate yield of 750 lb per acre, was

let by the janmi to an intermediary, by the intermediary to two subtenants, and by these two subtenants to about 30 cultivators. Rents paid by these cultivators averaged 80 per cent of the gross yield. The two second intermediaries paid about 50 per cent of the gross yield to the first intermediary.

Extreme concentration

Extreme concentration of holdings prevailed not only on the janmam level, but in the case of lands held by intermediaries as well. The largest intermediary tenant resident in the desam held in all 22 per cent of the total wet lands in the village. Not all of this was held, however, as an intermediary, as Table III will show. In Malabar, a significant fraction of agriculturalists hold land in more than one capacity. Even the poorest cultivator may hold land under half-a-dozen landlords and be himself the landlord of one or two tenants. As is the case with the larger janmis, his holdings as a janmi, as an intermediary and as a cultivating tenant were not confined to the village. He held leases under two janmis in

this village, and had holdings in another revenue village as well under three other landlords. Forty per cent of the intermediaries holding lands in the village which were subjected to enquiry were non-residents, and others presumably had holdings in other villages as well. Seventy per cent of the 11 resident intermediaries of these lands held land in other villages. And all of the resident intermediaries examined held land in some other capacity—i.e., as janmi or cultivator—as well.

Type Case of an Intermediary

In his capacity as janmi, this intermediary had three tenants under him, and as an intermediary, 37 more. As his paddy holdings alone were studied, and only those held in Morazha Desam, a full statement of all land held by him would reveal an even more complicated pattern. Although his total janmam holdings in this desam aggregated only 11 acres, they were held under 5 patta numbers. In the annual jamabandi, or statement of revenue collection, frequently cited by Government officials as an indication of

TABLE V
PARTICULARS OF LEASES EXAMINED, AND TENURE STATUS OF CULTIVATORS INTERVIEWED, MORAZHA DESAM, 1955

Total No. of leases of all categories of tenants examined	179	
No of oral leases	85	
No of registered leases	94	
No of cultiv. who are also intermediaries	6	
No of cultivators who are also janmis	11	
No of cultivators who are both intermediaries and janmis	2	% of total cultivators interviewed*
Total No of cultivating tenants holding other lands in other tenure categories	19	29
Total No of cultivating tenants having lands leased out to other tenants	11	15
Total number of tenants holding lands in other desams or amsams	29	43
Total number of cultivators interviewed	67	

*These three entries are not mutually exclusive; for example, many of the cultivators holding land in other desams are also included in the list of cultivators holding lands in other tenure categories.

Total no. of lands for which undisputed information obtained	352	100

N. B. Definition of "land": a specific survey no., subdivision no. or portion thereof held by a cultivator. It corresponds to the item in a lease document. In most lease documents in Malabar, each holding in a distinct survey field or subdivision thereof is listed separately.

landholding patterns on a janmam level, he would thus appear as five separate "pattadars." The reason why his janmam holdings are not all listed under one patta number is that since the last revenue settlement in 1935, he has purchased land from several janmis who held it under other patta numbers, and continues to pay revenue in their names, or rather under their numbers. The difficulties of expressing the degree of concentration of holdings in Malabar in any meaningful form is amply illustrated by this case. In any statement showing concentration of holdings on a janmam level, he would appear to be a small janmi; only about 65 per cent of his land is held as an intermediary; the rest he holds as a cultivating tenant. However, neither he nor his family themselves work in the fields. The actual physical labour of cultivation is carried out by hired labourers. Unlike most intermediaries or cultivators, most of his land in this village is held in a single compact block, and is located near his residence. It is thus possible for him to exert effective supervision over lands in his direct possession. He has, however, made no attempts to introduce improved methods of cultivation. His best lands he has retained in his own possession; for the most part, the lands leased out are inferior. The bulk of his lands are located in the zone devoted to Kaipad cultivation. Most of them are held under one janmi, a devaswom, the largest janmi in the village.

Rent Paid to Temple Deity

To this janmi he pays a rent of 6,450 lbs of paddy a year which works out at 104 lbs per acre (very roughly 1/7 of the total yield) plus another 450 lbs of paddy and Rs 150 as perquisites. These perquisites, not mentioned in the lease document, are annual offerings to the temple deity which have been made for generations by his ancestors, who have been tenants of the devaswom from time immemorial. He receives a rent of about 8000 lbs of paddy from his 40 tenants, and another 17,000 lbs from holdings under his direct cultivation. From this 17,000 lbs gross yield, he must pay the wages of agricultural labourers, at most about 6,000 lbs in the aggregate. He obtains, therefore, a net income of approximately 18,000 lbs of paddy per year, provided the yields are normal and rents are paid in full, which is not often the case. At the pur-

n.i. (no information)

Block refers to separate holdings

Gross yield refers to the "anticipated" yield of the lands concerned—i.e., what informed persons in the locality expect the land to yield normally. It is not an average yield; as neither landlords, village officials, nor cultivators keep records of yields, mathematical averages cannot be constructed. As yields do vary greatly from year to year, it is not correct to speak of a "normal" year; hence I have chosen the more neutral term "anticipated" yield. All of the wet lands studied, and most of the lands in the village are single-crop lands.

chase price of paddy in Morazha in March 1955 of 3 annas 4 pies per lb, his net income from paddy lands would thus be Rs 3,750 per year, or slightly over Rs 300 per month.

Income from Fishing Rights

He derives, besides this, income from lands in another village, and from another source as well. The Kaipad lands, during flood periods, teem with fish, which together with toddy, were formerly the staple diet of most of the villagers. Two years ago (1953) the above-mentioned intermediary, who holds on lease most of the Kaipad lands in the village, leased for a 5-year period fishing rights over these lands, which were hitherto free to all villagers during flood seasons, to a Syrian Christian from Cochin on

payment of Rs 5000. This Syrian Christian has made a substantial capital investment in sluices, certain improvements in one of the dams, nets and drying arrangements and is now exporting most of the fish which was formerly an important component of the local diet.

Rents from Cultivating Tenants

Table IV is based on direct enquiries into rents paid by cultivating tenants for leases of paddy lands held under this intermediary. The 12 statements included in the table were carefully checked and were the most reliable that could be obtained. All of the leases in the table are of Kaipad land. Cost of cultivation was computed at a uniform rate based upon local en-

quiries; labour charges per acre for all operations were on an average 47 man-days at 3 lbs of paddy per day, and 40 man-days at 1½ lb of paddy per day, or a total of about 200 lb of paddy; seed rates were 1/3 the usual rate prevailing in the village of 100 lb per acre. Four of the 12 cultivators paid virtually their entire surplus as rent. In no case did rents conform to the rate laid down for Kaipad lands in the Malabar Tenancy Act of 1954, S. 6 (25 per cent of the gross produce)! Rents for this category of land were on the whole lower than rents prevailing generally, as reference to Table VII will show. This is, however, explained by the greater risk involved in this type of cultivation.

(To be continued)

Export of Electric Power from Yugoslavia

(Contributed)

ELECTRIC power as an export product has been a special concern of the Economic Commission for Europe. The subject has been touched upon in many of its publications but mostly in passing. Some sale of electric power across the national frontiers takes place in Europe even now; thus in 1951, total exports of electricity formed 1.6 per cent of total production as compared with 1.4 per cent in 1950. But this international trade has so far been in the nature of an exchange between hydro and thermal power. Schemes for expanding international trade in electric power are no longer a novelty. The proposal for laying transmission cables across the English channel for connecting the grid systems of Britain and France has been in the air for sometime. The scope of international trade in power, as in other things, rests on mutual advantage and depends largely on the seasonal variations in demand and supply. To the extent that natural conditions influence the latter in a favourable direction, there is scope for profitable trade. If two countries do not have peak demands at the same time and in addition, supply conditions also differ, one country may be in a position to spare power just when the other passes through its peak demand and also experiences, because of the freezing of its water-supply for its hydro-electric stations, for example, a decline in its power supply.

Export Prospects Unique in Europe

In this respect, the prospects of

exporting electric power from Yugoslavia are perhaps unique in Europe and it is not surprising that they should be studied by the E.C.E. The Committee of the E.C.E. on Electric Power appointed a group of experts for making this study on a request by the countries which are most likely to benefit from the export of power from Yugoslavia. This inter-governmental body, known as Yugelexport, carried on its study of the technical, economic, financial and legal aspects of the project during 1954. The final text of the study was approved by the liaison Group of the Committee on Electric Power at its meeting in Geneva on December 14, 1954. This is now a priority project.

The decision on it was taken by the Committee on Economic Power at its seventh session, confirmed at its tenth session and amplified at its twelfth session. The resolution adopted at the last session of the Commission reads as follows:

"Now that the technical, economic, financial and legal study of the prospects of exporting electric power from Yugoslavia has been approved, establishment at the inter-governmental level of a Co-ordination Committee consisting of two representatives each of Austria, the Western zone of Germany, Italy and Yugoslavia was agreed, with the following terms of reference:

"To study, in the light of developments in the situation, the various arrangements which might be con-

templated for the execution of the scheme;

"To facilitate the negotiation of inter-governmental agreements to match the bilateral contracts concluded between the undertakings of the countries concerned; and

"Generally, to co-ordinate the study and execution of the several stages".

Yugelexport Study

The Yugelexport study, it may be noted, was not only taken up by the United Nations Economic Commission for Europe on its own; it had been drawn up jointly by experts of the Governments of Austria, Germany, Italy and Yugoslavia, —countries which have a vital interest in the success of the project. For two full years, these experts had been successfully co-operating on a relatively complicated task, elaborating not only the technical side, but also the economic, financial and organisational—legal aspects of exporting electric power from Yugoslavia.

The study has established:

(a) That export of considerable quantities of electric power from Yugoslavia is technically possible;

(b) That such export could go on for decades; and

(c) That the export of power will not only benefit Yugoslavia, but will also help the economic development of the neighbouring states which purchase winter current from Yugoslavia.

The study goes into details and

is well illustrated graphically. Its thoroughness is guaranteed by the authority of both the Governmental experts, who are responsible for its contents, and of prominent technicians from United Nations Technical Assistance Programme, who solved the necessary geological construction and electro-technical problems. It was fortunate that these Technical Assistance technicians were from the countries which will in the future buy electric power (Italy, Western Germany, and Austria), for their positive conclusions make the study even more convincing.

Market Value of Power

The Yugelexport study consists of an introductory chapter and four sections—economic, technical, financial and organisational-legal. The economic section deals with the possibilities of exporting electric power from Yugoslavia separately to Austria, Western Germany and Italy. It also gives an analysis of the market value of power to be exported, on the assumption that winter current (from the beginning of October to the end of March) would flow from Yugoslavia at full capacity for 16 hours a day, with somewhat reduced capacity during the night hours, and the price of the winter power arrived at ranges from 0.82 to 1.62 US cents per kwh, the average being 1.20 US cents per kwh.

The technical section gives a survey of the potential power of Yugoslav waters and of the available fossilised fuels. It also gives the plans of four new projects and of the Perucica plant, which should be built quicker and on broader lines than necessitated by the present rate of increase in home consumption of power. Foreign credits, if granted in time to speed up the construction of the Perucica plant, would enable the export of several hundred million kwh. of power yearly from the 1957-58 winter onwards, which would improve the chances of realising the Yugelexport plans. This part of the study further gives plans of the necessary net-work of transmission lines, together with the preliminary expenditure for the construction of all projected installations.

Financial Section

The total expenditure for the five projects amounted to 309 million dollars for Plant and 70 million dollars for transmission lines.

The financial section deals with matters connected with the finan-

cing and amortisation of the projects, assuming that the necessary expenditures would be secured through long-dated credits, such as those granted by the International Bank (at 4% interest and with a moratorium of 5 to 7 years), through commodity credits and through re-investments of a part of profits from the sale of power.

Inter-governmental Corporation

The organisational-legal section of the study deals with the various possibilities for the realisation of the Yugelexport plans, considering them primarily from the viewpoint of international law. The proposed solutions are the concluding of ordinary contracts for power supplies between companies from the countries concerned and the possible setting up of an international enterprise on the basis of a multilateral inter-state agreement, which would finance the construction of the plants and transmission lines and conduct the selling and buying of power. That enterprise, which could be organised as an international corporation and in which the interested governments would be equal partners, owners and managers, could seek credits on the international money market, not only in the countries which would import power, but also in other places where favourable terms could be obtained as well.

In this way it would be possible to draw a clear line between the credits granted to Yugoslavia for the development of her own economy and those given to such an international enterprise which is to use them only for the construction of projects—in Yugoslavia and in the importing countries—which would serve their intended purposes, i.e. to enable to find, through the exports of winter electricity from Yugoslavia, the best possible solution to the serious power problem encountered in a number of European countries. Since the realisation of the Yugelexport idea would be of equal interest to Yugoslavia and to her neighbours, it is clear that what is involved is a real international project, whose financing should not prevent Yugoslavia from obtaining credits on its own account.

Bilateral Contracts

The Yugelexport Organisational-legal Committee suggested that the concluding of bilateral agreements should be entrusted to a special body, which would be set up for the purpose. This means that it would be possible to form an international

enterprise as explained above and, at the same time, organise another internal body, so that both of them could see that the export of electric power from Yugoslavia is carried out in a proper manner. One of the tasks of this special body would be to turn all bilateral contracts into a single workable system, and to couple them with multilateral inter-state arrangements, which would guarantee the continuation of supplies and the facilities of making payments, paying due attention to taxes and other duties which the concerned countries might impose on the imports and exports of electric power.

That effective and successful international co-operation took place during the drafting of the Yugelexport study, it is hardly necessary to mention. To overestimate its value would be going too far, but to underestimate the prospect thus opened out would be thoughtless, for it will be no exaggeration to say that it is possible to discern in the Yugelexport study the beginnings of a new system of integration covering the basic sectors of the economies of a number of neighbouring countries.

Yugelexport has completed its task, but its idea has not yet been realised. It is now up to the governments of the interested countries to do something if they wish to realise a plan which would be of interest to their countries. So as to reach practical results as soon as possible, the ECE Committee for Electric Power has unanimously adopted a resolution, recommending to the Governments of Yugoslavia, Austria, Italy and Western Germany the formation of a mixed Commission composed of two delegates from each country, whose duty would be to follow developments, to study various possibilities for the realisation of the Yugelexport plans, and to facilitate the concluding of inter-state agreements, which would serve as a basis for bilateral arrangements between companies concerned, and, generally, to co-ordinate both the study and the realisation of individual stages in exporting winter electricity from Yugoslavia.

At the session of 'Yugelexport' to be held in September in Geneva, Yugoslav experts will submit documentary material concerning the building of a system of water power stations in the Trebisnjica drainage area (in Yugoslav province of Hercegovina). On the basis of studies carried out in 1952 and 1953, this system was finally included in the

'Yugelexport' plan for the construction of water power stations in Yugoslavia for export of electric energy. The water power stations in the Trebisnjica drainage area would give in a medium year about 1-5 milliard kwh and would constitute the most important and most powerful plant in the 'Yugelexport' system.

At the recent consultation of experts at Trebinje, interesting data were given out about the geographical and other conditions under which this system is to be created. The Trebisnjica drainage area covers about 2000 square kilometres and receives a very large quantity of waterfall—from 1600 to 5000 mm annually. Trebisnjica itself, one of the most remarkable rivers for its underground currents, flows through Popovo Polje, and there is an accumulation of about 400 million cubic metres of water during the October-May period. The area is rich in vegetation and green with crops in the summer. Trebisnjica has an average flow of 100 cubic metres of water per second or about 3.3 milliard annually. Its total fall of 400 metres would be utilised by two water power stations. For ensuring water for the first power station, a dam 110 meters high would be erected in front of which an accumulation basin of about 1.3 milliard cubic metres would be formed. The power stations would be about 200 MW. The second water power station would be erected on the seashore near Plata, between Cavtat and Mline, and its power would be about 650 MW. Water would come to this power station through a tunnel 17 km. long.

The whole system of water power stations at Trebisnjica could be used, in the opinion of experts, both for meeting domestic needs and for the export of electric energy. At the same time, it would put an end to the flooding of 5000 hectares of the most fertile land around Trebinje and the Popovo Polje area, while 12,000 hectares of land would be irrigated—land which yields two or three harvests per year. The value of the increased yield from irrigation alone has been estimated at US \$185 mm. Yugoslav hydro-electric potential is estimated at approximately 60 billion kwh electric power annually, and export of 4.3 billion kwh annually to Austria, Italy and Western Germany are considered feasible. One of the first concern of the Yugelexport was to ascertain the potential export mar-

ket. It was found that Austria, Italy and Western Germany lack sufficient sources of electric power and that their requirements will exceed four billion kwh by 1960. It was also established that such export would be concentrated during the winter months.

To develop the above potential, it has been proposed to construct five giant hydro-electric plants and

a transmission net-work. This will be a six-year programme and cost \$380 m. (US). Yugelexport has selected four new projects which would harness the waters of Zeta, Trebisnjica, Lika-Gacko and Idrijca. Apart from this, the extension of the Perucica hydro-electric plant on the Zeta river which is currently under construction has also been suggested.

The basis data for the projects would be as given below

Project	Installed capacity (in MW)	Possible output (in Mil. kwh)	Cost of construction (in Mil. \$)	Time required for construction (Years)
Cetina	530	2,250	94	6
Lika Gacko	242	920	42	5
Trebisnjica	840	2,300	116	6
Idrijca	112	340	46	4

The expansion of the Perucica plant by new generators with a capacity of 144 MW necessitating a total outlay of 11 million dollars will enable the export of about 450 mn. kwh of winter current.

Moderate Optimism

Wednesday, Evening

UNLIKE the people, who were in a mood to celebrate the Independence Day because of the success of the first Five-Year Plan beyond expectations, the stock markets were not jubilant. From the current level of equity prices, it is clear that stock markets are not unaware of the economic progress made so far. But it is equally evident that investors are apprehensive of the shape of things to come.

Certain facts are beyond dispute. Though the Mahalanobis Plan-frame is likely to be amended, it will be the basis of the second Plan. It is, therefore, clear that heavy industries will receive top-most priority; that, these industries will be developed within the public sector; that, small-scale village industries will be expanded to supply consumer goods. Investors seem inclined to the view that such a pattern of development may lead to economic progress but not to buoyant markets.

Basic Factors

There is something in this argument. Industry in India mainly produces consumer goods. If factory production of consumer goods is to be discouraged, industrial equities are not likely to be supported by investors. Recent developments, however, are not unencouraging. There are indications that the second Plan, as it finally emerges, may provide for larger investment in the private organised sector than assumed hitherto.

Equities today are higher than they were immediately after the publication of the Mahalanobis Plan-frame. It is now better appreciated that large-scale expenditure, as envisaged in the tentative estimates for the second Plan, must necessarily increase employment and money incomes. As deficit financing gathers further momentum, money supplies will increase further. These factors are responsible for the moderate optimism now visible in stock markets.

Although the economic implications of the second Plan are now better appreciated, stock markets remain apprehensive of the Government's attitude to the private sector. At the moment, stock markets are anxiously following the deliberations in Lok Sabha on the Companies Bill,

1955. Proposals of the Union Ministry relating to worker-directors and to the formation of a Wage Commission are also affecting stock markets adversely. It was not without significance that last week's stock market developments partly reflected New Delhi's relenting attitude to the managing agents.

This is the wider background against which the market outlook has to be assessed. It is, of course, natural that particular factors should affect certain groups of shares. For instance, continued improvement in Iron and Steel shares are due to the belief that both Tata Steel and Indian Iron will issue bonus shares. Steadiness in Paper shares, again, is due to the issue of right shares by two manufacturing companies.

Tea Shares Better

Clive Street is now revising its attitude to Tea Shares. Auction prices were falling. But both demand and prices improved at this week's export auctions. A reputed firm of tea brokers expresses the opinion in its monthly report that tea auction prices may revive hereafter. It is argued that tea prices may rise from the end of August. Flood damage to communications are delaying arrivals of tea into Calcutta. This is a temporary influence.

But there are reasons to believe that the world supply of tea this year may not be, as anticipated earlier, much in excess of the world demand. Tea output in Ceylon has been affected by excessive cold weather rains. North Indian output to date is brighter this year. But, the firm argues, it is too early to gauge the trend of output of tea in north and north-eastern India. Possibilities are that the Indian output will not be as large as expected earlier.

Burdens on Tea

Though export duties on jute manufactures have been abolished and the duties on export of raw cotton have been reduced following devaluation of the Pakistani rupee, the export duty on tea has not been reduced. It is, therefore, a legitimate inference that the tea industry can bear the burden of export duties. Nor is it without significance that the West Bengal Government's proposal to levy a tax on arrivals of tea

into Calcutta, Howrah and 24 Parganas has had no "bearish" effect on Tea shares.

Tea shares, on the other hand, have remained steady in the last few days partly because of the withdrawal of demands for higher wages by tea workers of Doors and Cooch Behar plantations. Even so, it would be unwise to ignore that tea workers have not withdrawn their other demands, including the claim for bonus payments because of the fantastic profits made by the industry last year.

Jute Shares Hesitant

From the recent behaviour of jute shares, it would seem that Clive Street is inclined to the view that the abolition of export duties places the Indian industry at a slight advantage over the Dundee and Continental manufacturers. Non-Pakistani jute manufacturers will not be able to buy raw jute at cheaper prices. This is a common disadvantage. But the Indian industry now enjoys some advantage because of the abolition of the export duties on jute goods. Besides, the belief persists that Dacca may lower the minimum sterling price for the export of raw jute.

Firmness in raw jute is partly due to delay in arrivals from Eastern Pakistan. Jute goods remain steady mainly because of the continued strength in raw jute. Expectations, however, are that raw jute prices will gradually fall as the bumper crops in both India and Pakistan become available to markets. In this week, jute goods have developed an easier trend. This is a development which is not unwelcome.

Bonus Share Expectations Lift up Rates

Thursday, Morning

ALTHOUGH trading during the week was confined to just three days, Friday, Saturday and Wednesday, the sentiment remained steady to firm, with the closing quotations on Wednesday touching the peak in all the leading counters. True, earlier in the week, the market had turned bearish on reports of a fresh impost on cotton textiles for the development of handlooms and of labour representation on the board of management of industrial concerns. The scheme proposed for a bonus equalisation fund on the lines of dividend equalisation fund was another depressing factor. But there was a surprising change for the better later in the week, initiated by a spell of buying by a leading operator which, along with bear covering, halted the declining trend. The leading bull in bullion who was supposed to squeeze the bears has not entered the market yet. But persistent Calcutta support in Indian Iron and reports that certain companies, as for instance Srinivas and Belapur, might issue bonus shares free of tax did the trick. The trend was made firmer when Bombay Burma and National Rayon found buyers on yield considerations. Other shares moving up in sympathy, there was an all round improvement all the leading scrips closing at their peak levels.

Tata Steel Ordinary opened at Rs. 250-8 and after being taken up to Rs. 254-4 closed firm at Rs. 253-8. Indian Iron also closed firm at Rs. 39-8 as against the opening rate of Rs. 38-15 and the highest of Rs. 39-10-6 on the last day.

In the textile section, Bombay Dyeing closed at the highest level touched viz. Rs. 506-4 though at one time the scrip had gone down as low as Rs. 495-10. Century, Kohinoor, Simplex and Swadeshi closed a trifle lower than their highest rates for the week at Rs. 427-8, Rs. 343, Rs. 170 and Rs. 214-12, respectively. Srinivas Mills improved from Rs. 240 to Rs. 258 while Kaiser-i-Hind, which had been quoting below par only a couple of days ago at Rs. 95, found buyers on the last day of the week at Rs. 106, as these shares are now virtually cum-dividend.

In the cash section, bank shares

attracted considerable investment enquiry. Bank of India moved up from Rs. 150-9 last week to Rs. 151-12 and Central Bank from Rs. 50-8 to Rs. 51. Uco Bank improved, despite an early decline, to Rs. 49-8. New India Assurance went up to Rs. 45-12 at one time but fears of nationalisation brought them down to Rs. 43-12.

The electric section witnessed selective buying. Ahmedabad Electrics improved from Rs. 108-12 to Rs. 109-1 while Tata Hydros were fully steady at Rs. 146-8. Tata Power, however, declined on liquidation from Rs. 1495 to Rs. 1485. Andhra Valleys also were weak at Rs. 1375.

In the miscellaneous section while cement shares continued to remain fully steady, sugar shares were actively bid up by speculators. Belapur gained Rs. 15 and shot up from Rs. 322 to Rs. 335-8 on reports that the company might be permitted to issue bonus shares, tax free. Walchandnagar were taken up to Rs.

215-10. There was persistent enquiry for Phaltan Sugar on yield considerations. Bombay Burma Old which are to be quoted ex-div from today were bought up by shrewd speculators in order to take advantage of the dividend. As a result, they recorded a rise of Rs. 20 from Rs. 547-8 to Rs. 567-8. National Rayon was another favourite and closed about four points higher at Rs. 215-12. Scindia and Tata Chemical closed firm at Rs. 15-3-6 and Rs. 16-1 respectively. Calcutta showed interest in equities like Indian Copper, BIC and BB Petrol.

Cotton

Spot Market Active

AN event of importance to the cotton trade during the week was the announcement of the US cotton policy. The announcement made no mention, however, of export subsidy about which there has been so much speculation, leaving it to be inferred that the ques-

MARKET LEADERS DURING THE WEEK

	August 17, 1955	Week's Range		August 10, 1955

Castor Oil Com. (per quarter)	9- 7	9-10	9- 6	9-13
Groundnut Oil R.R.	12-12	13- 6	12-12	12-12
Linseed Oil	13-14	14- 8	13-14	14- 8

tion may be taken up in the near future. As the cotton futures market remained closed on the day of the US Policy announcement and had but a short session on Wednesday, there being no trading in the intervening period, fuller implications of the US cotton policy disclosure are yet to manifest themselves.

ICC February which reached the peak figure of Rs. 632 on Saturday, closed fairly steady at Rs. 626-12. The maturing August contract fared slightly better and closed at Rs. 613.

Tenders against the August contract were fairly heavy, aggregating 7,650 bales thus far.

The spot market at Sewri has been showing marked improvement. There has been persistent demand for cotton above 20s counts particularly from mills. Vijays, naturally, were the centre of attraction and jumped by over Rs. 50 per candy over the week from Rs. 210 'on' to Rs. 265 'on'. Continental shippers appeared to be keen on making the best of the recent reduction in export duty and bought freely. Rates for other styles also rose appreciably.

The release of a further 10,000 bales of cotton of 25/32" staple for the same destination, following the release of 30,000 bales of 13/16" for China only in the previous week, was warmly welcomed by the market. If the present rate of offtake by China continues for long, it is not unlikely that good quality cotton may become scarce enough for the bases of such varieties to harden.

Oils and Oilseeds

Indian Shippers Quoting Lower

TRADING in the oilseeds market was also confined to three days in the week. Following the announcement of export quota for groundnut oil for about 10 to 12 thousand tons for the period to October, the market opened firm but gave way later in the week and closed with the lowest quotations all round. Sentiment seems to have been affected adversely by Indian shippers quoting lower in overseas markets for Indian oil. This apart, Bombay shippers have not so far received any encouraging response to the quota announcement even though Madras has been reported to have received some. The question of stock in the country is also another contributory factor to the bearish trend. Delayed rains and the con-

sequent late movement of crop are undoubtedly bullish factors. But their effects are more than offset by the general belief that there is no fear of scarcity of stock. Hence the late monsoon was not only discounted but there was a scarcity of buyers as well, with the result that all the seeds and oils recorded sizeable losses over the week.

Castor futures September came down from Rs. 88-14 to Rs. 84-10 to close at Rs. 84-12. May futures lost Rs. 3-8 but closed slightly better at Rs. 87-8. The weakness in castor futures was particularly pronounced on the last day after the declaration of option at Rs. 85-10.

Groundnut August-September de-

clined from Rs. 24 to the lowest level of Rs. 23-8. Goundnut Oil R/R lost 10 as. to be placed at Rs. 12-12 at the close. Linseed August-September lost more than a rupee over the week to close at Rs. 23-10. Kardi and Niger seed also closed one rupee to eight annas lower. Linseed oil closed 10 as. lower at Rs. 13-14 for lack of export enquiry.

Bullion

Normalcy Returns?

Although the market remained closed throughout the week, a semblance of normalcy has been imparted with the compromise arrived at between the contending parties. The new by-laws framed by the Association in respect of the six-

SHALIMAR PAINT, COLOUR & VARNISH COMPANY, LIMITED
CALCUTTA • BOMBAY • MADRAS • NEW DELHI • KANPUR
Write to Post Box 68, Calcutta, for the latest copy of The Shalimar Standard SPW 261

monthly settlement with a fortnightly clearing have already been sent to the Government for approval. But the authorities have yet to grant their sanction. It is thought in market circles that the Government will take some time before they are convinced of the need for the change from monthly to six-monthly contract and hence the tempo of speculation in this market is expected to mount up in the days to come. Meanwhile, traders are busy receiving and paying out slips against Shravan settlement.

It is highly unlikely, however, that the Bhadarva settlement will commence before the end of August.

Company Notes

BONUS ISSUES

AMONG Miscellaneous shares, Rohtas had been moving up, in the last few weeks on two considerations. Sometime ago, it was hoped that Rohtas would be included in the expanded list of forward shares. This hope has not materialised. The authorities of the Calcutta Stock Exchange decided some weeks ago not to include Rohtas in the clearing list. This decision had a temporary adverse effect on Rohtas, but the scrip started moving up again as it

became known that the Company was contemplating an issue of right shares.

Last week, it became known that Rohtas proposed to double the capital by issuing ordinary shares at par to the existing shareholders on the basis of one for one held by them. Rohtas have since steadied up, and these shares are being talked up further.

The Company's expansion and modernisation projects will cost Rs. 3 crores. Capital is being expanded through issues of right shares to the present holders in order to finance the cost of modernisation. The directors are hopeful that the Company's earnings will improve as a result of modernisation. Figures disclosed by the directors are encouraging. As a result of improvements already implemented, the monthly output of paper now exceeds 2,000 tons.

Shareholders will welcome this year's increase in output. In the nine months to July last, the production of paper and boards amounted to 12,800 tons, compared with 9,520 tons in the corresponding period of the previous year. In issuing right shares, the directors explain that output data indicate a substantial increase in the earnings and profits

for the current year. Existing shareholders have thus an assurance that, besides the benefit of the right share, this year's dividend on the expanded capital will, at least, be maintained if not improved.

INDIAN PAPER PULP

BESIDES Rohtas, some other paper manufacturing companies have decided to raise capital by issues of bonus shares. Indian Paper Pulp received the sanction of the Controller of Capital Issues to raise the capital to finance expansion plans.

Indian Paper Pulp now produce 6,800 tons of paper per year. The Company intend to raise production capacity to 15,000 tons of paper per year. The cost of the expansion scheme is estimated at Rs. 1.60 crores. Completion of expansion projects will increase output capacity to 10,000 tons three years hence, and to 15,000 tons two years later.

A portion of the needed finance will be advanced by managing agents. Another portion will be secured through issues of debentures. At present, the Company propose to raise Rs 66 lakhs through an issue of ordinary shares—330,000 new ordinary shares of Rs 10 each will be issued at a premium of Rs 10 per share.

Utility of Windmills in India

THE impression had persisted, until recently, that pumping sets driven by wind power were unsuitable to Indian conditions. Lately, however, the Ministry of Natural Resources has taken a hand in it and an expert committee has found that properly constructed windmills are not only suitable to India but a necessity, for ensuring an abundant and cheap supply of water to the many villages which are beyond the reach of the benefits from any of the big projects.

The reason for the change, of course, is a result of the studies carried out by the Wind Power Committee of the Council of Scientific and Industrial Research, which has convinced the Government of India that not only are windmills suitable to India, they are also the cheapest means by which power for operating pumps can be readily made available to the remotest villages.

There is sufficient wind almost everywhere in this country to operate a modern windmill. For a windmill can be set to work by the gentlest of breezes, a breeze which is so light as to be hardly perceptible, that is to say by wind which has as low a velocity as 2.5 miles per hour. If the lightest breeze can turn them, the strongest gale will not over-turn them—so well are the modern mills constructed.

The greatest advantage of a wind operated pumping set is that the wind is harnessed to operate it—and therefore its motive power is free. Neither does a modern windmill need any attention beyond periodical inspections, mainly for lubrication—and this only once every 4 to 6 months.

Among modern windmills operating in India today is one of METTER—Australian manufacture, which was installed at the village of Jatheri, Delhi Province, at the end of October 1954. The best well in the village was chosen for it, the well was cleaned and sealed off before the windmill was erected on it. The result of this installation has been a decrease of 50% in the incidence of dysentery in Jatheri and the inhabitants of this particular village used to suffer badly from dysentery in the past.

From the actual data of its operation, we find that this METTER windmill supplies up to 3,500 to 5,000 gallons of water per working day of

10 hours, and it costs no more than Rs. 30 and that is inclusive of 4 gallons of gear oil.

The Government's policy, therefore, of installing windmill pumping sets all over the country is to be wel-

comed. For, when most villages have windmills, not only they get water for their fields at little or no cost, but like Jatheri, they will get drinking water that is clean and free from germ, which will bring down the incidence of disease.

Indian Central Cotton Committee Annual Review of Work

INDIA recorded a great stride in cotton production in 1953-54 and she was well on the way to attaining self-sufficiency in regard to her requirements of cotton of less than 1-1/16" in staple, says the Annual Report of the Indian Central Cotton Committee for the year ending August 31, 1954, just published.

The Report adds that the area under cotton in 1953-54 was 17.0 million acres against 15.7 million acres (revised) in the previous year. On the basis of the official estimates, the production of cotton in the country during the year under report was 39.4 lakh bales of 392 lbs each against 31.3 lakh bales (revised) in the previous year.

Production of Longer Staple

This increase had been mostly under long and medium staple varieties. The production of long and medium staple varieties increased from about 14 lakh bales or 64 per cent of the total production in 1947-48 to about 30 lakh bales or 76 per cent in 1953-54. The production of long staple cotton (7/8" and above) was over 13 lakh bales in 1953-54 against 3 lakh bales in 1947-48.

Target for Second Plan

The Indian Central Cotton Committee at its meeting in July, 1954, considered tentative proposals for the Second Five-Year Plan for cotton and recommended a target of 55 lakh bales to be achieved by 1960-61.

During the year, the Indian Central Cotton Committee made serious efforts to develop its publicity work. A number of popular charts have been prepared depicting the important results of research and progress of cotton extension work in India. A small show-room has been put up in the Committee's office wherein samples of improved varieties of cotton and suitable charts, maps, graphs etc. are displayed.

Research on Better Strains

Research on the improvement of cotton, is one of the major concerns of the Committee which has to its credit several improved cotton strains in different States which have helped to improve the quality of Indian cotton. The results of the crop improvement work financed by the

Committee are carried to the cultivators through the agency of various seed distribution and extension schemes that function in different States.

Seed Distribution

During the year under review there were 17 seed distribution and extension schemes in operation. Departmental arrangements also exist in the various States for the multiplication and distribution of improved varieties of cotton not covered by the Committee's schemes. The total area under improved varieties of cotton during the year 1953-54 was of the order of 10.7 million acres or 62% of the total cotton acreage.

The additional income that accrued to the growers of improved varieties during the year is estimated at nearly Rs. 22 crores.

Grow More Cotton

The production of cotton in the country during the year under review was 39.35 lakh bales according to official estimates and 46.78 lakh bales according to trade. Production during the year exceeded the Planning Commission's target of 37.3 lakh bales.

Wage Commission

(Continued from page 990)

The industrial tribunals in the Bombay State have accepted the position that bonus is a deferred wage. This is based on the contention that the present wage level is below the living wage level although the latter has nowhere been clearly defined. The continuation of dearness allowances will be equally difficult to defend since dearness can no longer be regarded as a temporary phenomenon. It is really absurd to go on paying a low level of wages supplemented by a dearness allowance. Apart from considerations of formal propriety, the question is of real significance to the overall earnings of labour. Payments of provident fund contributions, gratuities, pensions, etc., are based on basic wages excluding dearness allowance. When, therefore, basic wages are kept low and are supplemented by dearness allowance, the employees are virtually deprived of a part of provident fund contributions, gratuities, etc. Therefore, the determination of the level of basic wages has come up as an important issue in industrial relations.

The Indian Standard Wagon Company Limited

NOTICE is hereby given that the Thirty-Sixth Ordinary General Meeting of the Company will be held at the Registered Office, 12, Mission Row, Calcutta, at 11 a.m. on Monday the 5th September, 1955, for the purpose of receiving and considering the Directors' Report and Audited Accounts for the year ended 31st March, 1955, and to transact any other ordinary business of the Company. Subject to the Shareholders' approval the Directors have recommended payment of the dividend on the Preference Share Capital of the Company and payment in respect of the Ordinary Share Capital of the Company of a dividend of 25% or Rs. 6-4-0 per share.

The Share Registers of the Company will be closed from the 24th August, 1955, to the 5th September, 1955, both days inclusive.

Calcutta,
16th August, 1955

By Order of the Board
MARTIN BURN LTD
Managing Agents

NOTE—The dividend, if sanctioned will be paid only to Shareholders whose names appear in the Company's books on the 5th September, 1955, or to their mandatees. No application for dividend warrants is necessary.

Bank Award

THE decision of the Government of India to accept in full the recommendations of the Bank Award Commission on the substantive items of the Bank Award will be widely acclaimed as providing a workable and enduring basis of settlement of a dispute that has been pending for nearly a decade. The main recommendations of the Commission are:

(1) the restoration, with retrospective effect from April 1, 1954 and subject to certain modifications, of the Labour Appellate Tribunal's decision in the case of all Class A and B banks (except the Bank of Bikaner and the United Bank of India) and eight Class C banks; and

(2) the retention of the Government modification, also subject to certain modifications and exceptions, in the case of the remaining Class C banks and Class D banks.

Thus in effect neither the original decision of the Appellate Tribunal nor its modified version are retained in their entirety.

The following are some of the main modifications recommended by the Commission:

In the case of medical relief, the provision for accumulation provided for by the Appellate Tribunal is to be replaced by the corresponding provision in the Sastry Award. (The Government Press Note does not refer to this particular modification, which, however, forms part of the Recommendations of the Report).

While Area IV, as created by the Government Modification, together with its prescribed wage and dearness allowance structure, is retained, the total exemption from the Award granted to Area V, i.e., places with a population of 30,000 or less in Part B and Part C States (other than Delhi, Ajmer and Coorg), is altered so as to limit the exemption to such areas in Travancore-Cochin for a period of two years.

According to the Appellate Tribunal's decision, the quantum of dearness allowance was fixed as a certain percentage of the basic wage plus house rent allowance. This has been modified by the Commission on the lines that any increase or reduction in the dearness allowance for a rise or fall of 10 points should be worked out on the basis of a fixed percentage of dearness allowance admissible at the index level of 144 (1944:100).

Besides, the Commission has also made specific recommendations in the case of seven banks which have arrived at agreements with their employees. The United Bank of India which had been exempted under Government Modification will now have to implement the Sastry Award as a Class B bank with effect from August 1, 1955, subject to certain conditions. A noteworthy recommendation is the appointment of a special commission to review the entire banking situation in the Travancore-Cochin State. The precise nature of all these recommendations, however, will be known only after the necessary legislation is introduced.

The Commission has also made some pertinent observations on allied issues such as the excessive emoluments of higher executives, the possibilities of concerted action by banks to enforce floor rates on some categories of advances as well as ceilings on deposit rates. It should, however, be emphasised that the Commission is of the view that it should be possible for the banks concerned to meet their commitments following

its recommendations on the basis of their current paying capacity and without recourse to additional sources of income.

It would, of course, be a rare industrial award that satisfied both the disputing parties and the recommendations of the present Commission are no exception. Though no official pronouncements have been made on behalf of either the banks or the bank employees, it would appear as though the banks, judging from the statement of Shri C H Bhabha, have decided to accept the Commission's findings and recommendations with good grace. The individual press statements issued by some office-bearers of the All-India Bank Employees Association go to show that employees are likely to take exception to the implementation of the Award 'with cuts', to the retention of the Government Modification in the case of the remaining banks, and the total exemption granted for the next two years to banking offices in Area V in Travancore-Cochin. The overwhelming number of bank employees, however, will be beneficiaries of the increased emoluments under the terms of the recommendation. It is an inevitable incident of the implementation of industrial awards that a small proportion of employees should suffer some cuts in emoluments. Besides, a limited safeguard is provided for by the Commission's recommendation that the time for exercising the right of option to existing terms of service should be re-fixed and extended to three months from the date of pronouncement of the Government's final decision on the report of the Commission.

It should also not be overlooked that the wage structure of Indian banking is a legacy of past years of laissez faire and as such is not self-consistent or rational. The present Commission was not concerned with the rationalisation of the basic wage structure of bank employees but only with the feasibility of restoring in part or whole the Appellate Tribunal's Decision or the Government Modification. In fact, both the Decision and its Modification postulated the same basic wage and consequently, from one point of view, the present inquiry related essentially to the merits of the principle and quantum of dearness allowance admissible to bank employees.

The retention of the Government Modification in the case of the smaller banks appears to have been gov-

erned by the financial incapacity of these units, and consistently with its obligations under the terms of reference—"due regard should also be paid to the desirability of avoiding widespread closures of banking companies or their branches, to the necessity to promote development of banking in the country generally"—the Commission could not in all conscience have enforced a structure of emoluments beyond the reach of the smaller units. Admittedly, the problem of small banks is not wholly the negative one of economising establishment expenses but the more positive and fundamental one of attracting adequate deposits and securing remunerative outlets for employment of funds. Presumably, the employees' contention refers to banks whose financial incapacity is due not to shortage of working funds but to mismanagement in the use of these resources, and to this extent, their case appears to be well founded. Are employees to be deprived of a fair wage for the faults of the management? This is the familiar refrain of wage disputes in many industries. In the case of banks, in fact the Commission has proved decisively that there is no simple correlation between the size of working funds and the capacity to pay. On the other hand, it is difficult to visualise an alternative short of liquidating the units unable to pay a fair wage, and perhaps even a low wage is preferable to unemployment, a proposition which bank employees would find it difficult to refute. It is also up to bank employees in this country to avoid allegation of special pleading to claim a better start than that of comparable categories of white-collar employees in Government service or commercial concerns, even though there are a few precedents in other countries.

The Report of the Bank Award Commission raises several other important issues. Should the fixation of wages be wholly entrusted to Industry Tribunals which are not representative of all types of expertise and do not have access to all the relevant data? The Bank Award Commission, being a fact-finding body, had access to data such as secret reserves etc. which are not available to Tribunals. More immediately, there is also the problem alluded to by the Bank Award Commission, viz., the propriety of executive modifications of judicial decisions of properly constituted tribunals. In the specific case of the

Government Modification of the Appellate Tribunal's decision, the actuating principle was stated to be the maintenance of the solvency of the banks. This apprehension has been shown by the Commission to be wholly unfounded in the case of A and B Class banks as also some of the C Class banks. If the Government did not have the necessary data for an adequate assessment of the paying capacity of difficult classes and units of banking companies, the proper course would have been to appoint a Commission before rushing to modify a decision given by a tribunal. Besides, blanket relief to all banks irrespective of their status and financial capacity was hardly called for. Thus, whatever the legal and juridical merits of executive modification in this dispute, even in point of fact the action of Government was not justifiable.

On the purely economic plane, there have been apprehensions that if rates on advances are levered up as a consequence of a rise in the wage-bill of banks, it would amount to introducing an artificial element in the determination of interest rates. This reasoning appears to be based on the assumption of a perfectly competitive money market in which there are no institutional rigidities. Even in the absence of extraneous factors such as a rise in wage-rates, the structure of interest rates is not wholly dependent upon the fine adjustments of the demand for and supply of loanable funds, but is affected by a host of non-competitive factors. It is institutionally determined even in the most developed money markets.

The recommendations of the Bank Award Commission, it may now be hoped, will be accepted by the parties concerned with good grace and that the doubtful distinction which this country has enjoyed along with Eire of having almost perpetual labour-capital disputes in the sphere of banking will thus come to an end. There is, however, room for a Banking Commission which should undertake a complete examination of banking from all points of view even as the present Commission dealt with the specific issue of wage-disputes. It is more than two decades since the monumental labours of the Central and Provincial Banking Enquiry Committees were concluded.

Politics by Police Action

VIOLENCE breeds violence. This we can preach with a clear conscience to foreign powers. But what about substitution of force by more acceptable methods of political action at home when disputes have to be resolved, and opposition has to be overcome, whether such opposition is fair or not and based on justice and equity or not. The Indian flag was kept flying from the Bombay secretariat on Goa day, but the mass demonstration in front of the Secretariat was hardly handled on approved Gandhian lines of appeal to the moral sense of the people. No leader came forward to win over the opponents to his way of thinking. In Patna a small incident led to a police reprisal which is unfortunately not without parallel in the records of free India. What he saw and heard impelled Shri Jaiprakash Narayan to say that the British Raj was Police Raj and the police force was cast in that mould, and that the same mould was seen continuing till today.

But even in the face of such provocation as Jaiprakash had to face, it is not fair to castigate the police. The police merely carry out orders. The temper and conduct and the spirit of the police force are those of the administration, the tone of which is set by the Government. Jaiprakash was convinced that in Patna, "under the very nose of the topmost officers of the State and of Cabinet Members," grave excesses were committed. It pained him, however, that all the people of the State should treat the entire police force as their enemy. Such estrangement, he bewailed, bode no good to the people. The only silver lining was that a judicial enquiry had been ordered. But without waiting for the results of the enquiry, Pandit Jawaharlal Nehru has lashed out against the unruly mob. It is a poor specimen of a popular government that knows no other way of quelling mobs except by police action and by bullets. Patna is no isolated example though it was bad enough.

Demonstrations of mass discontent and protest should not be taken to mean that the Congress is losing the support of the people. Far from it. To-day, Congress is politically more powerful than at any time, perhaps, since it took office. It is the political opposition to the Congress which is disintegrating. Defection from opposition parties

to the ranks of the Congress goes on apace. So none of the accepted remedies of parliamentary government can possibly apply to these cases of popular discontent. The results of the series of by-election cannot tell the Government which

way the wind has been blowing and induce or force the Government to change its ways. Nor can mass discontent find a voice through dissenters within the Congress camp on whom party discipline has put a gag. What the Congress members say, or

All the advantages of . . .

HOLLERITH
Electrical PUNCHED CARD
ACCOUNTING

to help
you
when
you're
really
busy

If the size of your business does not justify the installation of HOLLERITH, you can still, at peak periods, have all the advantages of HOLLERITH services and methods.

Submit your accounting problem to a HOLLERITH Service Bureau and it will produce the results—tabulations, invoices, statements or other documents as may be required. Your original documents are returned to you and all the information, which is now on punched cards, is filed and treated with strict confidence, ready for you to call upon at any time.

Alternatively, you may hire or buy Punching and Verifying machines to record your information on Hollerith Cards in your own offices and then use the Bureau to produce the finished result.

Apply to us at any of the offices listed below, and we will send a representative, who, with knowledge and foresight, can help you when you're really busy.

how they vote, never escapes the whip. But why go so far? How many Congress legislators would risk their chances of office, or even of membership of committees or delegations, by championing causes that are frowned upon? Even the Prime Minister has no other advisers except the official bloc in the Congress which is one and the same as the

Government on which naturally he leans heavily. The fact is—and why should it be considered unfortunate?—there is no divine dispensation according to which people in this country have to be born either Congress or anti-Congress; and because of the position which it holds, if for no other reason, Congress has to be

responsive to the wishes of the people. The Congress Government has to apply in day-to-day working the very same techniques of meeting opposition in which it is supposed to believe firmly and which it holds up so confidently to others. Let no one take umbrage unto his soul that he alone is right.

Weekly Notes

State Loans — Consolation Issue

THE State Government loans, which in retrospect had been better called the first issue, were a thumping success. To say that, however, is not to say enough. In Bombay, there was a regular scramble for these loans leading unfortunately to unseemly bickerings. The loans were to open for subscription on the 16th, the day of hartal in protest against Goa. And the Reserve Bank insisted that behind closed shutters, it had carried on "business as usual". The list was closed as soon as it was supposed to have been opened. But how and when could the Reserve Bank have got so many applications since none, not even the Reserve Bank, could have kept its doors open and carried on business as usual on Goa day? Well, some applications had been received on telephone. This was given out in a press report. And some had been tendered on the previous Saturday by knowledgeable brokers in anticipation of the rush.

Those who could not submit their applications on the due date for reasons beyond their control were not prepared to be left out. The Reserve Bank was not prepared to deviate from the letter of the notification either. The disgruntled applicants, leading banks and insurance companies, could not be put off so easily. The situation could have been tackled with a little tact, but public relations have never been the strong point of the Finance Ministry, and people not used to being talked across the counter did not take it the way high officials wanted them to do. Applications for Bombay loans were the most numerous, but these loans having already been over-subscribed a way out could be found by diverting the applicants to the other

State loans. But when the Bank opened on Wednesday and applicants poured in, intimation came from its other centres that West Bengal, Punjab and Saurashtra loans had already been over-subscribed and no more applicants could be received. Hence the fix.

In Madras there was a different kind of fix. There was a small clause in the loan notification, which had escaped many, that all applications up to a lakh could be allowed in full. Now such applications amounted to Rs 7 crores, as against the Rs 7 crores in all for which Madras had entered the market. Applications above a lakh could not be rejected in toto; even such applicants were entitled to a pro-rata allotment. This was a curious situation but Madras got away with it, bagging a total of 9 crores in all. Actually instead of pro-rata, all applications above a lakh were allotted a lakh each. Madras netted 9½ or 10 crores out of a total of 14 crores for all the States put together.

Now when a loan proves such a thundering success, it is right and proper for the Government to capitalize on it. There have been successful floatations in the past but probably there is no precedent for a loan being followed in a matter of days by another, just because the first had been such a success and that, too, within a period during which the first loan was intended to be kept open. Madras, however, dropped out of the second issue because it had got enough; but so did Bihar, because the response to its first offer had been so poor.

Deshmukh Trips

HOW did the Finance Minister trip so badly over the remuneration of managing agents in the

debate on the Companies Bill in the Lok Sabha? What penance do the scriptures prescribe for such lapses on the part of the Finance Minister?

Shri Chintaman Deshmukh sought to establish that it would be a great sacrifice on the part of the managing agents to accept the cut in their remuneration provided for in the Bill. According to a Reserve Bank study, he said, managing agents received about 27½ per cent of the profits of the companies they managed in the three years 1950, 1951 and 1952. In the Companies Bill, this has been reduced to 10 per cent. For managing directors the ceiling has been put at 5 per cent plus salary and 7½ per cent for secretaries and treasurers, who will replace the managing agents if and when Government exercise their power to terminate managing agency in 1960.

Now 27½ per cent to 10 per cent would be a big enough fall in all conscience, if that was the intention of the Select Committee. The same Reserve Bank study, which the Finance Minister quoted, actually shows, as maintained in these columns last week, that if the Joint Select Committee's recommendations were accepted and the amended Bill were passed into law, the remuneration of managing agents under the new dispensation would certainly be lower compared to what it was in the three years for which Reserve Bank carried out its study of company finances, but it would not be very much lower, the actual decline being from 14 per cent to 10 per cent. Shri Deshmukh wants us to believe that the cut is much bigger, from 27½ to 10. But 27½ per cent of what? The Finance Minister says 27½ per cent of the profits but does

not stop to define what he has in mind—whether profits before tax but after the deduction of all expenses and depreciation, or profits net of tax. When the Reserve Bank says that managing agency remuneration was 14 per cent of the profits, it refers to profits after the deduction of depreciation and other expenses but before the deduction of tax. If net profit, that is net of taxation, is the basis of comparison, the Reserve Bank finding is that remuneration of managing agents was equivalent in those three years to about 27½ per cent. The comparison has to be either with profits before tax or with profits net of tax. It cannot be with net of tax in one case and with tax in the other. If the comparison is with profits net of base, the remuneration of managing agents would be about 27½ per cent in one case and about 20 per cent in the other, i.e., under the new Bill. Or the comparison should be with profits before tax, in which case the percentage fall will be from 14 to 10. In fact, in the Reserve Bank study, the percentage is worked out broadly on the same definition of profits as that of the Joint Select Committee when it recommends a ceiling of 10 per cent.

"Not Cowasji, but PT is my friend"

SOME one very close to Sri T T Krishnamachari, Minister of Commerce and Industry, has drawn attention to the Weekly Note "Don't Rob Policyholders" in the issue of August 13 in which TTK was quoted as saying that nationalisation of insurance would rob policyholders. This correspondent "understands that some statement was ascribed to (TTK) in the Bombay papers one day, but a correction was made the next day indicating that the word used was 'mutualisation' and not 'nationalisation'."

Now, no such correction appeared in the Bombay papers to the best of our knowledge; if it did, it must have escaped our attention and for this we are sorry, for it is unfair to hold anyone, not to speak of a Minister of the Government, responsible for a statement which he did not make. But does TTK really authorise this correction? Of course if he wants to jump, with eyes open, from the frying pan into the fire, no one can stop him. Having passed through the ordeal of fire in the struggle for independence, Ministers probably become fire-proof.

But what does it come to? Nation-

alisation will not rob the policyholders, but mutualisation will? Mutual Life Insurance Companies have no share-holders and are run by directors elected by the policyholders. There are critics of mutualisation who maintain that companies are not run any better because policy-holders own them for interest in company affairs and management and control fall into the hands of a small group who run the company the way they like. It is share-holders who take more interest in the working of the companies in which they hold shares, being more conscious of their interest. Into this dispute it is not necessary to enter here for the Commerce and Industries Minister could not have been thinking of the relative merits of mutual and share-holders' companies. So if mutualisation can rob policy-holders, it can do so only in the case of a company which is about to be mutualised and in which there is a dispute about the sharing of assets between its policy-holders and share-holders. With a battle royal going on between Sir Purushotamdas Thakurdas on the one hand and Sir Cowasji Jehangir on the other hand, surely it is not left to guess which company it is? Surely TTK does not want to back the one against the other in so blatant a fashion? If the discussion of public issues in public by Ministers, when the views expressed are not of the Government, is liable to create misunderstanding and confuse the public, what is one to say about Ministers openly taking sides in a dispute between the shareholders and policy-holders of a company which involves no question of public policy and which, besides, is under the examination of the Controller of Insurance?

Land Redistribution

A PROPOS of the note on Bhoo-dan in the last issue, a correspondent asks: What happens to land which is received as gift but has not yet been given away to the deserving? The question is of some interest, considering the amount of land which must be lying with the Bhoodan Samiti, for many years now, pending disposal. Perhaps the Samiti will throw some light on the question and dispel doubts which naturally arise and put an end to speculations. Without knowing all the facts it would be idle to speculate but the correspondent suggests that since, pending final disposal,

the land given away as gift cannot be lying idle, why not let it out to those who had already been cultivating it or to others more deserving, collect rent from such land and put into a fund? Such a fund could certainly contribute towards reclaiming the waste land among the collections which can be reclaimed at modest cost, and effecting other improvements. Before the land in the hands of the Bhoodan Samiti is allotted, it has to be divided into suitable plots for distribution. Perhaps the Samiti would be no party to renting out in any form, but what does it do then with the land in its charge?

It would also be interesting to know the attitude of the State Governments in this matter. Are they willing to co-operate not only in the matter of transfer of title deeds but in organising cultivation by the landless of the donated land? Perhaps the Samiti might not care for such help even if it is offered, and prefer, as a matter of principle, to rely on the self-help of the people concerned. It would be good to know, if that is the case.

The snail's pace at which redistribution is being effected robs the movement of a vital impelling force. For according to many, the real test of Bhoodan is: how far does it enable the peasant himself to participate actively in improving cultivation. Those who not only advocate a ceiling on land holdings but also insist that the ceiling should be fairly low, so that more land could be distributed to the landless, have this abiding faith in the good sense and co-operative spirit of the peasant that once they get land, in whatever tiny fragments, they will, of their own accord, evolve a workable system of cultivation. This is how the claims of social justice are reconciled with the requirements of productivity and economic utilisation. Whether in thinking thus, the advocates of land redistribution are flying in the face of facts and going against history, can no longer be answered on purely a priori grounds, if only because the claims of social justice are so pressing and so widely conceded. On the other hand, no measure of social justice can prevail for long, if it proves to be economically unsound. The final arbiter will be experience; hence the wide interest aroused by this social experiment which can put this faith to the test and also perhaps vouch for an answer.

An Error of Judgment?

JURISTS have a reputation for their austere verdicts on the frailties and hasty judgments of men and authorities. One can imagine Mr Justice Gajendragadkar taking judicial pride in his admonition to the Government for its interference with the Labour Appellate Tribunal's Bank Award. He questions New Delhi's legal right to modify this Award. Contrary to partisan criticism, Mr Justice Gajendragadkar does not question the Government's right to interfere with the Labour Appellate Tribunal's awards on grounds of public interest. On the legal point at issue, Mr Justice Gajendragadkar is not as much interested in denying the Executive's right to interfere with the Judiciary as in establishing his verdict that the Government's modification of the Appellate Tribunal's Bank Award under Section 15 of the Industrial Disputes Appellate Tribunal Act lacks legal justification. Even on the assumption that the Award was not as sound as it should have been or was otherwise capable of improvement in material particulars, the Government had no right, Mr. Justice Gajendragadkar contends, to take action under section 15 of the Act. It is Mr. Justice Gajendragadkar's contention that, instead of modifying the Award "straightaway", the Government should have taken action under certain other provision of the Act whereby the duration of the Award could have been limited. It does not require any expert legal knowledge to appreciate the legal point stressed by Mr Justice Gajendragadkar.

Mr Justice Gajendragadkar is convincing in his admonition to the Government on the double count of illegality and faulty judgment. It is where the learned jurist combines these two separate charges into a single count that he is devastating in his logic. While students of the law will appreciate his emphasis on the rider to the Government's legal right to modify or reject awards on public grounds, those who are familiar with the state of the economy and of the banking system at the time of the Government's decision to modify the Award will endorse Mr Justice Gajendragadkar's sequence of arguments against New Delhi. He quotes statutory provi-

sions to establish his thesis that the Government is justified in modifying an industrial award only if it is satisfied that the public grounds which may make the the implementation of the award inexpedient are "present in the immediate future". Was it the Government's considered opinion, he asks, that the implementation of the Appellate Tribunal's Award would be inexpedient on public grounds "in 1954 or in any subsequent year"? Mr Justice Gajendragadkar questions the validity of any such assumption. This is one of the main reasons why he recommends restoration of the Appellate Tribunal's Bank Award in its major aspects.

New Delhi's decision to modify the Bank Award was taken in August, 1954. This decision was unduly influenced by the bankers' pessimistic views about banking developments in 1953. Monetary and banking statistics up to August, 1954, clearly indicated an improving trend. It might be of interest to note that Shri G. D. Birla concluded his annual address, delivered long before August, 1954, as Chairman of the United Commercial, by taking comfort that developments since the last quarter of 1953 encouraged the hope that the falling trend in bank deposits might have been halted. Although the Government relied on a sample survey conducted by the Reserve Bank in its decision to modify the Bank Award, banking statistics up to August, 1954, made it abundantly evident that the falling trend in bank deposits had not only been halted by the end of 1953, but that bank deposits were expanding. Mr. Justice Gajendragadkar proves himself to be a sound economist by his emphasis that the Government's decision to modify the Award did not seem to take into consideration the inevitable effects of the first Five-Year Plan on the economy and on the banking system, and that a second Plan was in preparation. All those familiar with banking statistics were aware long before August, 1954, that bank deposits were expanding. The annual currency and banking reports issued by the Reserve Bank invariably stress the expansionist trend in bank deposits. In these reports, the opinion is confidently expressed that

the growth in bank deposits is only to be expected with the implementation of the series of Five-Year plans. This view was endorsed by all bank chairmen in their annual addresses a few months ago. It would, therefore, be wrong to make the criticism that Mr Justice Gajendragadkar is wiser by events.

In their review of events in 1953, bank chairmen were loud in their lament that the operation costs of banks were not only unduly high, but were rising. Elaborate data were furnished to show that operation costs of banks in India were higher than those in America or Britain. Bankers were combative in their criticism of Industrial Tribunal's awards which intensified the rigidity in the cost structure. Impartial observers were aware that a comparative analysis of operation costs between India and some advanced countries could not be pushed beyond certain limits. It was evident that in complaining against rising wages of bank employees, bankers were deliberately ignoring the other factors which were causing a rise in operation costs. It was equally evident long before August, 1954, that the rising trend in bank deposits and incomes should enable all sound banks to bear the burden involved in the Appellate Tribunal's Award without any undue financial strain. Besides these valid reasons and assumptions, Mr Justice Gajendragadkar relies on the willingness of a large number of banks to implement the Appellate Tribunal's Award in recommending its restoration. In accepting the Bank Award Commission's recommendation, New Delhi deserves to be congratulated on its honesty to admit its past error of judgment.

Events and Actions

FOR once the British summer threatens to be nice—indeed the country has had almost two months and a half of uninterrupted sunshine, and under the influence of this merciful event, everything has taken on a summery garb. Even the raids of the Irish Republican Army on two munition arsenals in this country has been taken with the light-heartedness highly unusual of the British state in such matters. More and more, the dry warnings of British Ministers and Treasury spokesmen that the economic situation spells crisis fall on deaf ears. And why not?—the holiday season with all the brightness and gaiety which English and Continental resorts can provide make such Government statements utterly unpleasant. Many ask—and with considerable justification, your correspondent thinks—why the authorities do not choose the English winter for their exhortations for economy, increased productivity and all those other things which come from the Treasury.

The New Statesman and Nation has, however, reminded us that "events are events" and thus need comment. And if that journal as also others like the Economist, should labour on two developments which, in their view, have a consequence of some magnitude, then there appears to be little alternative but to "comment".

Conclusion of Atoms for Peace Conference

In a recent despatch from Geneva, the Scientific Correspondent of the News Chronicle, Richard Calder, asked the 60-dollar question about the Geneva Conference on the peaceful uses of atomic energy. He enquires "where are the men of the M. I. 5, the F.B.I. and the NKVD?" That such a question should be asked surely indicates the fundamental turn which international relations have taken since the Geneva Conference of the Big Four Powers. If from the point of view of enquiry an assessment of the atoms for peace conference is required, then there can be little doubt that the most significant features of the conference were the three disclosures, each of which came from one or other of the participating countries at the conference. There was, first, what now everyone regards as the 'calculated indiscretion' of Professor Homi J. Bhabha, the Indian President of the

Conference. He said, knowing full well that the question he was moot-ing was outside the confines of the agreed agenda, that he ventured to predict.

".....that a method will be found for liberating fusion energy in a controlled manner within the next two decades. When that happens the energy problems of the world will have been solved for ever for the fuel will be as plentiful as the heavy hydrogen in the oceans."

To introduce the H-bomb into discussions was in itself a risky matter, and Professor Bhabha's statement has apparently caused considerable speculation that some important "break-through" in harnessing the fusion process had taken place recently. But, of course, India with its prestige and its reputation can very well afford to make speculations into the unknown when others know full well that both the Russians and Americans have placed this matter on their classified list.

In spite of this, the British apparently admitted that they were working on controlled fusion energy while the Americans were forced to follow the Russians in stating that they had gone some way in solving this fundamental problem. The second disclosure came from the British delegation. The principle of 'breeding' in reactors is fairly well known. What was, however, surprising and, indeed, startling, was that British research had already accomplished the task of 'breeding' two atoms for one. In other words, the British had ended up with twice as much plutonium as they started with.

The third disclosure related to what the scientists called "photosynthesis". This is a biological process by which a growing plant compounds the various elements of the air, water and soil into food on which both men and animals depend. If artificial photosynthesis were possible, food from growing plants could be supplemented to the extent that 'Malthus's ghost would be finally laid.' The Americans have gone some way in this field of nuclear research, but what surprised everyone was the Russian advance in photosyntheses and protein-syntheses with the help of radio-active traces. It needs little imagination

to acclaim the significance and far-reaching importance of this development.

Wages and the Balance of Trade

Recently your correspondent had the opportunity of examining in a despatch the contention unofficially advanced in various British circles that wage advances in the United Kingdom should be linked with the level of wages in Britain's export-competing countries. The Treasury's Bulletin for Industry has now directed its attention to the problem of labour costs in relation to exports, and notes that between 1948 and 1954 labour costs per unit of output in the economy had risen by about 27 per cent. The increase over the six years was, however, concentrated in the years 1950-52. Retail prices were forced up by the post-Korean rise in import prices, and quite significantly, 'wages rose in pursuit'. The increase in labour costs as a whole, therefore, took place largely between 1950-52. Since 1952 the wage advances won by British trade unions had all been in line with high productivity in British industry.

In spite of all this, the Economist has come round to suggest that "an impasse" between wages and prosperity has been reached. To quote from this journal, "so long as present circumstances in the labour market persists, Britain is faced either with eventual bankruptcy through inflation or with early near-bankruptcy through widespread strikes. The prospect is for a steady depreciation of the currency . . . The only sensible conclusion is that present circumstances have got to be changed and the present definition of full employment with it."

This interpretation is certainly disingenuous. The absolute increase in wages cannot by itself prove anything. The Treasury figures, however, show with remarkable clarity that labour costs per unit of output since 1952 have maintained a pace within that reached by productivity. In manufacturing industry, for example, output rose by 18 points between 1952 and 1954 while labour costs rose by only 2 points. For all industries, output increased from an index of 114 to 129 between the last two years (1948 = 100). In the same period wages and salaries per unit of output increased from 118 to 121.

From the Chair

The Tata Iron and Steel Company Judgment?

Speech of the Chairman, Mr J R

THE following is the speech delivered by the Chairman, Mr. J. R. D. Tata, at the 48th Annual General Meeting of the Shareholders on Thursday, the 25th August, 1955:

Ladies and Gentlemen,

Since I last had the pleasure of welcoming you at this annual gathering, much has happened of special interest to our Company and to industry generally. Important policy pronouncements have been made, significant legislation has been passed, plans have been formulated, a report on taxation has been published, all of immediate or potential significance to us.

As our annual report and accounts are so detailed, there is no need for me to elaborate on them at this meeting except in answering questions from shareholders. I propose, therefore, to devote my speech today to two main subjects, namely, the pattern of Government's economic policy which has emerged from their statements and actions during the year and the proposed expansion of our plant to two million tons per year.

The Economic Pattern

At the last two annual general meetings, I referred at some length to the subject of a Mixed Economy and the role of the private sector in it, and took some pains to set forth what I felt was a fair and sound case for better opportunities to Free Enterprise to enable it to fulfil its task under the series of Five Year Plan.

We all appreciate that bold planning and determined execution of large schemes of development are essential if we are to raise living standards, relieve unemployment, give opportunities to all and ensure a reasonable degree of social justice. Everyone, I believe, is agreed that the principal means of achieving these objectives is to increase the total production of the country as rapidly as possible since, without an increase in total wealth, there will be nothing to distribute but poverty. We realise that the task is a formidable one by any standards and that it requires the united effort of all and dynamic action by the State. I have thus welcomed the policy of

creating a Mixed Economy in which both State Enterprise and Free Enterprise will, side by side, play their important roles.

It would seem, therefore, that there was little room for disagreement on general economic policy and that the stage was set for fruitful co-operation between Government on the one hand and industry and business on the other. Indeed, several pronouncements by spokesmen of the Administration have appeared to confirm this fundamental identity of sentiment and approach. No less a person than the Prime Minister has, on more than one occasion, held out the assurance that Free Enterprise would have an important place and effective role in the country's development and deprecated the outmoded idea that Socialism means nationalisation. Speaking to the Congress Parliamentary Party in May this year, he said: "I think there is really no choice before us between having a private sector and allowing it and encouraging it to function, and not having it at all. It is foolish to have a private sector and then undermine it and prevent it from functioning. I personally think that even for the proper functioning of the public sector it is desirable to have a competitive private sector."

Equally reassuring was the statement made in July this year by Mr. T. T. Krishnamachari, the Minister for Commerce and Industry, at the last meeting of the Central Advisory Council of Industries, that there would be no nationalisation for the sake of nationalisation. The Minister went on to say that the State could and would enter the field normally reserved to the private sector only if the latter was unable to develop certain industries. At the same time, the State might invite the private sector to co-operate in industries in the public sector.

Still more recently, in the course of the current debate in Parliament on the Companies' Bill the Finance Minister made this encouraging observation on the role of the Industry:

"Having decided that we shall have the private sector, and having come to the conclusion that we

the growth in bank deposits is only to be expected with the implementation of the series of Five-Year plans. This view was endorsed by all bank chairmen in their annual addresses a few months ago. It would, therefore, be wrong to make the criticism that Mr Justice Gajendragadkar is wiser by events.

While giving In their review of events in 1953, encouraging bank chairmen were loud in their would be unrealistic that the operation costs of note of certain events were not only unduly high, but year such as the recession rising. Elaborate data were to the Constitution, shed to show that operation amendments to the Co of banks in India were higher the fiscal policy of those in America or Britain. ticularly in relation to this were combative in their the Taxation Enquiry Co of Industrial Tribunals' some aspects of the proposals which intensified the rigidity Second Five Year Plan, angost structure. Impartial in which the Avadi resolution were aware that a socialistic pattern of analysis of operation costs sought to be interpreted an India and some advanced mented. Let us take them in limits. It was evident

Constitutional Amendment

There is little doubt that bank employees, bankers Fourth Amendment to the Constitution ignoring the other tion, by denying to the citizen were causing a rise course to Courts of Law, has costs. It was equally ously undermined the right to ; before August, 1954, perty, which has been recognising trend in bank depositions through the ages as one of the fmes should enable all damental human rights and who bear the burden in the United Nations has solemr Appellate Tribunal's affirmed in a declaration to what any undue financial the whole world including India is ; these valid reasons party. While it is reassuring to not, Mr Justice Gajendragadkar that the present Government has on the willingness every intention, as stated by the of banks to im- Prime Minister, of paying a fair price Appellate Tribunal's for any undertaking they may decide mending its restoration to take over, there is every reasoning the Bank Award to fear that such sweeping powers, commendation, New once acquired, may, some day, be to be congratulated come an instrument of oppression to admit its past in the hands of future governments. nt.

In addition, the passing of this amendment is bound to shake the confidence of industrialists and investors and thus adversely affect the ability of the private sector to fill its allotted role.

Companies Amendment Bill

The Companies Amendment Bill is now under discussion in Parliament. Since it was first introduced it has undergone in the Joint Select Committee important changes, some of which go much beyond the original scope of the Bill and would, if adopted, place serious impediments in the

From the London End

FOR once the British summer threatens to be nice—indeed which country has had almost two months and a half of uninterrupted sun—im- and under the influence of this to a ciful event, everything has a root of a summery garb. There are, in fact, come the point of view of the private

There, some recommendations in the has, rt as, for instance, in connection "even the development rebate which com clearly beneficial to Industry. also the other hand, certain recommendations would lead to unfavour- in le consequences, notably those in sorspect of Section 23A of the Income to ax Act which may lead to a serious mpletion of resources hitherto available for development purposes. What I am more concerned about, however, is the effect which the high level of taxation proposed and the emphasis laid on the need to restrict incomes and consumption in the early years may have on production. In Chapter 8 of their Report the Commission have themselves repeatedly stressed the need to avoid adverse repercussions on private productive effort and enterprise. I fear, however, as do many others directly concerned with the working of the private sector, that the abnormally high levels of individual taxation recommended will in fact act as a serious disincentive to productive effort and enterprise. This, coupled with the diversion of an undue proportion of total savings to Government, will impair the private sector's ability to meet the targets allotted to it.

Second Five Year Plan

A preliminary outline of the framework of the Second Five Year Plan has recently been released by Gov-

ernment for purposes of public discussion. This is a healthy move on which the Government of India are to be congratulated.

While the necessity for bold planning is unquestioned, for the needs of the country are both great and urgent, some of the proposals are such as to raise doubts in one's mind. For instance, considering the resources likely to be actually available, can the proposed targets be attained without recourse to a much higher degree of deficit financing than at present contemplated, with the consequent risk of inflation which would deprive the mass of the people of the fruits of their toil? Will the large scale development of heavy industry at one end and cottage industries at the other, without an adequate development at the same time of secondary consumers' goods industries in between, not lead to a lop-sided pattern of development which may result in inflation, scarcity of consumer goods, and also in a substantial part of the capital investment in heavy industry remaining unproductive for some years for want of a market? Is it wise to attempt to reverse the normal historical process by which the establishment of capital goods' industries has followed and not preceded the development of consumer goods' industries? Has the argument that the position can be rectified by the development of secondary industries at a later stage any validity, considering that, owing to the continuing increase in population amongst other factors, there is bound to be a large amount of unemployment at the end of the Second Five Year Plan, and the same arguments will inevitably be used then as now for restricting the development of manufacturing industries? Will the consumer in urban and industrial areas be willing to pay the necessarily higher prices of goods produced by household and cottage industries, even when the quality is satisfactory? Finally, is it realistic to assume that household industries can be developed fast enough to provide all the additional consumer goods necessary to meet the increased demand and, more particularly, that the widespread organisation and the necessary financial-cum-marketing facilities can be built up in so short a time? I would urge, while there is still time, that these important aspects of the problem be considered before the Second Five Year Plan takes final shape.

Socialistic Pattern

Finally, we have the goal of a "so-

cialistic pattern of society" set before the country. If it means a society in which all have equal rights and opportunities, the underprivileged are protected and helped to a better life, economic activities are harnessed to constructive nation-building purposes and controlled by the State for the common good, and selfish abuses and anti-social acts are checked, then we should all support it. But if the means adopted were to lead ultimately to a society in which incentives and initiatives are impaired, the greater part of the industrial apparatus is owned by the State, economic power and responsibility are largely centred in the hands of government, and the individual loses freedom of choice, whether as producer or consumer, then, I submit, this kind of society will be incapable of producing the required volume of goods and services essential for the prosperity and happiness of our people.

Surveying these various trends in the country, one finds running through them two major currents of thought. The first is the belief that the profit motive or the desire for material rewards for individual effort, which has characterised man's progress from the beginning of his life on earth, is anti-social and that it can be replaced without loss of productivity by a selfless desire on the part of everyone to work solely for the good of the community. The second is the undue emphasis on Socialism as the only path to prosperity.

The Need for Incentives

Apart from the fact that there is in my view nothing morally wrong in the yearning of individuals to better their own and their families' living conditions and to seek material reward and financial security in return for hard and productive effort, a remarkable aspect of the disparagement of material incentives and rewards is that, while they are regarded as unobjectionable in the case of the peasant and the worker, they are sought to be withheld from the professional man, the administrator, the manager, the entrepreneur and the investor—the very men from whom we expect the initiative and leadership required for the success of the country's plans of economic development. In their case incentives and rewards are sought to be replaced, it seems, only by a missionary zeal to serve the community.

It is true that many of the men who today lead the nation have dedi-

Business Manager

cated their lives to the country's advancement and are motivated by a noble ideal of service. But, with great respect, I submit it is unrealistic to believe that more than a minute percentage of the people of the country in any walk of life can be expected wholly to eschew personal interests. For the vast majority of the people the removal of material incentives and rewards will merely act as a disincentive, and lead to a reduction of effort and efficiency and to an increasing tendency to let the other fellow do the job. We should face the fact, whether we like it or not, that most men will be driven to hard work only by material reward or fear, or a combination of both.

In a country pledged to the use of non-violent and democratic means, it is clear that our governments cannot and will not, as in totalitarian states, use the weapons of force or fear to drive people. But, if we are to eschew both reward and fear, and if selfless devotion to the community can impel only a minority so small as to be incapable of making any material impact on the country's productivity, is it not obvious that the activity of the nation will be retarded and our great Five Year Plans jeopardised? Faced as we are with the imperative need to work, to produce, to build, to save and to invest, is it wise to lay so much emphasis at this stage on levelling down incomes and seeking to achieve an equalitarian society before we have created a reasonable quantum of wealth to distribute equally?

While it is true that there is still an undue disparity in incomes in our country, it is I feel not adequately realised that considerable progress has been made in recent years towards reducing inequalities. On the one hand, the income of peasants and wage earners has substantially increased while, on the other, the steep rise in taxation has drastically reduced the earnings of higher income groups.

A particularly unfortunate consequence of going too far in the direction of reducing earnings is the discouragement caused to foreign capital which might otherwise play such an important part in helping the development of our economy.

To sum up my analysis of this important, and too often overlooked, factor in our economic plans, I would earnestly urge that while retaining the ultimate objective of widely distributed wealth and social justice, and curbing abuses, anti-social atti-

vities, ostentatious spending and an undue accumulation of wealth and power in individual hands, we should make full use of the natural instincts of human nature as it exists and not rely unrealistically on the hope that they can be changed in a short time by executive act or legislation.

Capitalism Transformed

As regards the apparently growing trend towards a comprehensive form of socialism, as distinct from the more empirical form favoured in, say, Britain or the Scandinavian countries, there are some who hold the view that capitalism is wholly out of date. Considering the remarkable progress made in capitalistic countries particularly since the war, such a view can only refer to the nineteenth and early twentieth century type of capitalism which is, indeed, just as out-of-date as the nineteenth and early twentieth century type of socialism.

We are, however, no longer living in those days and should not close our eyes to the enormous changes which have occurred in capitalistic societies throughout the world since then. Modern capitalism has changed beyond recognition from what it was a century ago. It has shown a remarkable capacity to fit into the most modern concepts of the Welfare State, while creating wealth and prosperity unprecedented in human history. Statistics are sometimes used to obscure this truth; as an instance, I may mention the extraordinary figures of national income growth quoted in a working paper entitled "The Second Five Year Plan's Tentative Framework" circulated a few months ago for purposes of discussion. The picture presented would lead us to believe that the annual growth of national income in socialistic countries under totalitarian regimes is three to five times as great as in capitalistic countries. To suggest, even by implication, that economic progress is greater in, say, East Germany, Poland, Hungary or Bulgaria than in West Germany, Belgium, France or England, let alone America, is to place a severe strain on one's credulity. There is, in fact, overwhelming evidence that the conditions of living in Western Europe are far better than in Eastern Europe and also that the rate of post-war recovery and economic growth is greater. This contrast can best be seen in a visit to East Germany as well as West Germany. Though both these zones were severely damaged during the war, the enormous disparity which exists to-

day in economic activity and in the standards of living of the people is there for all to see—a West Germany humming with activity and abounding in consumer and capital goods of all kinds, where the Government have actually had to warn both management and workers not to work so hard and so long; an East Germany, where conditions are visibly worse than across the border and where small producers restrict their output and avoid expansion for fear that their business and the fruits of their enterprise will be taken over by the State.

The Choice of Means

If I have taken so much of your time in discussing these recent developments of our economic policy, it is because they seem to me to be of crucial importance to the future of our country. We all appreciate the outstanding achievements of our government in overcoming grievous difficulties and stabilizing our economy since the attainment of Independence. A tremendous opportunity for rapid development within the framework of a free and democratic society now lies ahead. On the choice of the means and methods of achieving our objectives will largely depend the success or failure of our plans, and in our hurry and impatience to get quick results, let us beware of the temptation to jettison economic systems or working philosophies based on human nature which have stood the test of time.

In conclusion, may I repeat that if I have expressed doubts, it is not because I fear that business or industry or the few well-to-do may suffer a contraction of their income or profit, but because I sincerely believe that the voluntary enterprise of our people, individually and in groups, has a great part to play in ensuring the success of the plans on which the country has embarked.

Two Million Ton Project

Let me now turn to our own affairs and particularly to the important project for the further expansion of our Jamshedpur plant to an annual capacity of two million tons of ingots or a million and a half tons of finished steel, about which most of you must have by now heard.

First let me give you a little background. As part of their estimates of the country's consumption of steel under the Second Five Year Plan, Government have set the target for steel production for 1961 at 6 million tons of ingot steel or 4½ million tons of finished steel.

Under the declaration of industrial policy of 1948, Government had decided that all major expansion schemes in the steel industry amongst others should thereafter be undertaken by the State. In pursuance of this declaration, Government propose to erect three separate steel works of about a million tons each and to operate them under State ownership and management.

The addition of this capacity to the existing or planned capacity of the steel works in the private sector will still leave the country short of the target. Instead of building a fourth steel plant, Government have, I am glad to say, agreed that the existing plants in the private sector should be allowed to expand further. This is a decision to be greatly welcomed both because the three projects already planned will by themselves place a considerable burden on Government's financial and managerial resources and because the existing plants can be expanded more quickly and at less cost.

As the present programme already under way at Jamshedpur will bring our capacity by 1958 to 1,300,000 tons of ingots, the new expansion project involves the creation of an additional 700,000 tons of capacity. Preliminary studies have indicated that the project is both technically feasible and economically sound, that it can be completed within three years and that the cost will be in the neighbourhood of Rs. 60 crores. This compares favourably with the cost of putting up an entirely new plant. The technical details of the project are at present under investigation by a firm of American consulting engineers and by our own Management.

The Problem of Finance

The financing of such a costly project obviously poses a serious problem. When discussing the new expansion scheme with Government, we stated that, in order to maintain the financial stability of the Company, not more than half the estimated capital cost should be financed from borrowings. The balance of Rs. 30 crores should be financed from internal resources and from the issue of fresh capital.

I am glad to say that Government have recently decided on doing away with differential prices as between one producer and another, and, pending an enquiry by the Tariff Commission which is at present in progress, they have provisionally increased our retention prices by an

average of about Rs. 54 per ton with effect from April 1955. A condition of this and any further increase that may be granted on the recommendation of the Tariff Commission is that the whole of the resulting accretion to our profits, after paying tax on it, should be taken direct to a development account and used solely for purposes of expanding the Company's productive capacity towards the two million ton target. A further condition is that, if we do not go ahead with the project, the net additional profits accruing from the increase in prices must be repaid to Government.

The Government resolution referring the question of a revision in prices to the Tariff Commission provides that the prices should be such as would enable both the major producers to obtain a portion of their capital requirements for their current and additional expansion programmes from internal resources and as would enable them to raise the balance from outside sources. We have made the necessary representation to the Tariff Commission for a substantial increase in the new retention prices. It is expected that the Tariff Commission will proceed with the inquiry quickly and make an early report to Government.

Even if the Tariff Commission's recommendation and Government's ultimate decision enable us to accumulate over four or five years, as I hope, Rs. 20 crores for the expansion project, there will still remain a sum of approximately Rs. 10 crores to be found.

Capital Issue

The Directors have come to the conclusion that the only source from which this sum of Rs. 10 crores can and should be obtained is a fresh issue of equity capital. Detailed proposals are being formulated to this end and will be submitted shortly for your approval at an extraordinary general meeting. While I cannot obviously anticipate at this stage what dividends will be paid in future, there seems to me to be no reason why, pending the completion of the project, the yield on the enlarged capital on the basis of present market values cannot be maintained.

I have already shown that this major project cannot be financed wholly from borrowings or internal savings. Apart, however, from the need for additional funds, there is an overwhelming case for an increase in the share capital of the Company.

Taking into account the present modernisation and expansion programme, the two million ton programme and various ancillary projects and the normal annual capital expenditure, the gross block of the Company, during the next four years or so, will probably rise to Rs. 140 crores or more and its borrowings to something like Rs. 50 crores. It is clear that, on the basis of such enormous figures, an amount of Rs. 3.74 crores, which is the total capital provided in cash by the equity shareholders, including the premium on deferred shares, would be disproportionately low. Even if we add up the preference shares, the existing ordinary shares and the new issue which we now propose to make, it is evident that a total share capital of even Rs. 27 crores will be on the low side for a Company in which not far from Rs. 200 crores will have been invested. This does not mean that I visualise further issues of capital for cash in the near future. The best solution of the problem will lie in the capitalisation from time to time of reserves as they are built up and in corresponding issues of bonus shares. The fact that for so many years shareholders have had to be satisfied with low dividends provides a strong case for such a policy and I hope that the Government of India will grant the necessary sanction as the occasion arises.

Taking all these factors into consideration, I am sure that shareholders will agree that the proposed issue of fresh capital is necessary if we are to go ahead with the project at all. On that assumption, let me now briefly analyse the merits of the scheme itself.

Merits of Project

To my mind there can be no question that the proposed expansion of our plant will bring significant benefits to the Company, its shareholders and its employees, as well as to the country.

It will increase the Company's finished steel capacity by 60%.

It will, as a result of the increased output and the better spread of overheads, help to reduce costs.

It will largely solve the intractable problem of excessive labour which has plagued us all these years.

Finally, it will provide the opportunity for the Company to make an important contribution to the country's economic expansion. I have, in previous speeches as well as in this, stressed that Free Enterprise has a major role to play in the country's

regeneration. It would, therefore, be wholly inconsistent with such a view if, when Government did show their willingness to take our assistance, we were to withhold it.

As the implementation of this scheme must, apart from other considerations, depend on the availability of some Rs. 30 crores of foreign borrowings to pay for the plant and equipment to be purchased abroad, Mr. J. D. Choksi, Mr. A. D. Shroff and I, and later Sir Jehangir Ghandy, visited the United States to investigate the sources of capital and plant available there. We found, for reasons which need not be elaborated here, that American private capital, which has unlimited opportunities in its own country and in other parts of the world where the climate for private investment is exceptionally favourable, would not be available to us to any appreciable extent either in the form of loans or of share capital.

We held discussions with the World Bank and the Export-Import Bank. Both these great financial institutions received us, and listened to our proposals, with cordiality, courtesy and responsiveness. We came away satisfied that the required long-term finance would be made available to us.

Finally, we took the opportunity of calling on some of the highest ranking officials of the American

Government and I should like to take this opportunity of expressing our deep appreciation of the interest they took in our proposals. I believe that the United States Government is anxious to help India in her industrial development.

Further progress in negotiating the necessary finance in the United States must await the completion of the technical studies of the project now under way by consulting engineers and our own management. We expect that stage to be reached in the next few weeks, when negotiations with the U. S. Government, the Export-Import Bank and American manufacturers will be resumed. We shall spare no effort to ensure that the scheme as finally adopted is technically and financially sound and that, once it is approved, it is pushed through with the maximum of energy and speed, I am sure in this effort we can count on the support of our shareholders and employees.

Labour's Role

I have specifically mentioned our employees because they have as vital a stake in this project as anyone else and because they will have also an important responsibility in its implementation.

We have in recent years made it clear to them that there was no room left for any appreciable increase in their emoluments except

through an improvement in their productivity. We obviously cannot afford to embark upon a scheme of this magnitude if, at the end of it, we are still to be burdened with the gross excess in our labour force which we have today.

The new Government plants will be of the latest type, employing a much lower number of men per ton of capacity than we do at Jamshedpur. It is obvious that if Government pays the same wage rates as we do, their labour cost per ton of steel will be substantially lower than ours unless our output per capita is correspondingly increased. Fortunately, the proposed expansion will provide the opportunity to achieve smoothly and painlessly a substantial increase in the output per capita at Jamshedpur involving no retrenchment and ensuring job security and higher earnings to our workers in the years ahead. I sincerely trust that they will appreciate and seize the wonderful opportunity which the scheme will bring them of serving their own interests as well as those of the country.

As usual at these meetings, it gives me great pleasure to express to our Management and staff throughout the Company's vast organisation our appreciation of the excellent work they have put in during the year and our thanks for their cooperation.

From the Calcutta End

Seven Eminent Bengalis

SINCE August 15, Calcutta has been paying homage to seven eminent living Bengalis. Tribute is due to the West Bengal Pradesh Congress Committee for taking the initiative in this matter. There has been criticism of the Pradesh Congress Committee's selection of the eminent Bengalis. Anyone who knows Bengal and Bengalis will not be surprised that there has been criticism of the choice of the seven illustrious Bengalis. But the West Bengal Pradesh Congress Committee's initiative is widely appreciated.

It started with the presentation of his biography to Dr. B. C. Roy. West Bengal's Chief Minister has many critics. But even his critics will not deny that he is an eminent living Bengali. Dr. B. C. Roy is an eminent Bengali who has an all-India reputation as a physician and an administrator. Jamini Roy is known not only throughout the country as a great artist, but among Indian artists, he is probably the best known outside India. There are other living Bengalis whose paintings are no less famous. But Jamini Roy can claim to be honoured for his distinctive style. Alauddin Khan is equally honoured throughout India by the connoisseurs of Indian music.

The theatre is an art-form which is highly developed in Calcutta. There have been, there are, many illustrious Bengali actors. In technique, in presentation, in interpretation, some of the modern theatre groups are more advanced. But there has been no other Bengali actor who has dominated and influenced the Bengali stage as much, or as long, as Sisir Bhaduri. He is the idol of the theatre world in Calcutta. No other Bengali actor is so widely appreciated. All Indians who love the theatre have heard of him. In honouring Sisir Bhaduri, Bengalis have paid him homage which he richly deserves.

Tensing now lives in Darjeeling. He may or may not be a Bengali. But Bengal and Bengalis may be excused in honouring him as one of the seven eminent living Bengalis. Tensing is now known throughout the world as the Man of Everest. If ever the history of sport in modern India is written, Goshtha Pal, the veteran Mohan Bagan right-back, is sure to find his name

in the chapter on football. It was in the fitness of things that Goshtha Pal presided on the day Tensing was honoured.

All the Bengalis mentioned so far are not only famous living Bengalis, but can claim to be eminent living Indians in their respective spheres of life and activity. Suniti Chatterjee, President of the State Council, is certainly an eminent living Bengali. His knowledge of linguistics is profound. He is not a politician. But West Bengal's claim to some of the areas in the neighbouring States of Bihar, Orissa and Assam are based on Suniti Chatterjee's linguistic studies. Bengali is the most developed of the Indian languages. But it is not Suniti Chatterjee's fault that, in his sphere of knowledge, no one can claim to be an eminent Indian unless he is an authority on Sanskrit.

Alauddin Khan is from Tripura. Calcutta now holds every year more concerts of classical music than any other city in this country. Calcutta is cultivating a taste for classical Indian music. But Bengal has not yet produced a great singer. It is rather strange that Bengal has not yet produced either a famous classical singer or a classical Indian dancer, though Uday Shankar, who presided on the occasion when Alauddin Khan was felicitated, put Indian dancing on the world map.

Bengal may not have produced any illustrious classical singer or dancer, but Bengal and Bengalis are proud of their contribution to Indian literature. Even as Bengali is one of the richest Indian languages, Bengal has produced famous literateurs, poets and novelists. Kumud Ranjan Mallick, the last of the older generation of poets, was honoured as an eminent living Bengali poet. It is not this writer's intention to belittle the poetic genius of Kumud Ranjan. But all sensitive Bengalis must share this writer's deflated feeling that Bengal has not yet produced a famous classical singer or dancer, and is fast losing her cultural reputation established by eminent Bengalis like Vidyasagar, Bankim Chandra and Rabindranath.

If Dalhousie Square and its immediate surroundings still retain some of the make-up of the East India Company, social and political life in

West Bengal still reflect some of the undesirable characteristics and incidental consequences of British Rule. There are reasons why local authorities are less developed in West Bengal than in Madras or Uttar Pradesh. Similarly, there are reasons why in Bombay there are J.P.s among members of the public, but there are no Justices of the Peace among members of the public in divided Bengal. British Raj was unwilling to associate Bengalis with the system of administration. Bengalis reciprocated this feeling by non-co-operating with British Rule.

That was the state of affairs in Bengal during British Raj. To-day, Dr. B. C. Roy's Government does not seem to be unwilling to associate the people with the administration. But the Opposition in the State Assembly, and, to some extent, the people, do not seem to like these experiments. It is doubtful whether in any other State, the Government's efforts to have the co-operation and collaboration of members of the public in the administration of law and order would be so resented by the Opposition as in West Bengal.

In the last few days, the State Assembly had heated discussions on two Bills introduced by the Government. One of the Bills sought to amend the Code of Criminal Procedure, 1898, so that Justices of the Peace could be appointed from among members of the public. On Monday last, the Government introduced another Bill which sought to empower the Calcutta Police Commissioner to raise and maintain a permanent force of unpaid special police officers and special constables in the city and the suburbs.

Both these Bills, the Government emphasises, will benefit the people, will lead to increased association of the people with the administration and will foster a sense of civic duty amongst members of the public. Both these Bills were vehemently opposed. But the reasons for which the Bills have been criticised are revealing. These proposed measures, the Opposition argument is, will only help the State Congress Party in the coming elections. In the West Bengal State Assembly, Congress has a comfortable majority. So, the Opposition was not successful in its opposition. But the suspicions and fears expressed by Opposition members are widely shared by the people.

Processes of Marketing: An Investigation

The Marketing of cocoa in Western Nigeria by K. D. S. Baldwin, Oxford University Press, London, 1954.

Pages 51. Price 5 sh.

MUCH has been written in recent years about the marketing boards in some of Britain's African colonies and about their achievements or failures in the stabilization of incomes. Little has been done, however, to investigate the actual processes of marketing within the countries concerned and the attitude of the various sections of the community to these boards. Since it is the particular, and perhaps peculiar, price policies followed by the Boards which have led to the accumulation of the huge balances which have attracted attention, it is clear that appropriate changes in these policies would be adequate to rob the question of much significance, whereas the other sets of problems mentioned are of much deeper significance.

An attempt to fill this gap is made in this careful little factual study of the marketing of cocoa in one part of Nigeria. The marketing board in Nigeria operates in the purchase of cocoa through middlemen known as Licensed Buying agents (LBAs). Hence the sub-title, 'With Special Reference to the Position of the Middleman'.

A number of commercial firms which used to buy and export cocoa before the second world war, together with the Association of Nigerian Co-operative Exporters (ANCE) are recognised as buying agents and are paid a commission per ton purchased to cover their expenses and get a reasonable remuneration. One of the prime functions of the Board is to guarantee the farmer a fixed price throughout the season. While ensuring this and retaining the system of middlemen instead of dealing directly with producers through farmers' associations sponsored for the purpose, the Board exercises complete control over the sale and shipment of cocoa abroad as during the war.

To assure that the interests of farmers are safeguarded, the Board publishes the price which it will pay for cocoa at the ports of shipment. It also publishes the minimum prices payable by the LBAs to the farmers at different buying stations spread throughout the country, of which there are 112 in the Western Region. The difference between the price

payable at the Port and the minimum prices payable at the buying stations depends upon the estimated cost of transport to the port by the normal and most expeditious route. The farmer is thus completely protected. For he is free to go to the nearest or any buying station or to the port town and recover the price that is prescribed as the minimum at that point, if he gains by doing so rather than selling to sub-buyers or others at slightly lower prices. The LBAs on the other hand are free to offer higher than the minimum prices, if savings can be realized through more efficient transport, for example. The excess may also, however, be paid from the buying allowance permitted by the Board, which would reduce the margin of profit though it might increase a particular Agent's turnover.

The effectiveness with which this system operates to protect the farmer is clear, for farmers, as the author points out, "could easily find out the price in the nearest buying centre and from that work out within narrow limits the transport differential to their villages and farms." In consequence of this, the farmers receive a much larger proportion of the price prevailing at the port than formerly, as their bargaining position in relation to the middlemen is strengthened to that extent.

The Licensed Buying Agents perform a number of functions including purchase of cocoa at buying stations, arrangement for inspection and bagging at standard weights, finance of purchases and provision of suitable storage, conveyance to ports and delivery on board ship and insurance against all risks. In other words, the LBAs perform the function of buying in small lots cocoa which would be delivered to the Board or to its instruction in bulk after grading and transport. In doing this, they provide also the finance in cash in the shape of interest-free advances to middlemen who would collect the cocoa from farmers and arrange for its delivery at the buying stations.

While initially only those firms which were already in the trade

were licensed as LBAs, subsequently other firms have been licensed, provided they are in a position to handle a minimum of 250 tons of cocoa and have a certain minimum storage capacity at their command. The capital required is therefore fairly high, amounting to £10,000 on the basis of prices in 1951-52. Only a few new licences have, however, been issued and these mainly to Africans.

The LBAs themselves, whether European, Levantine or African, operate through African middlemen who, in turn, operate through sub-buyers. This elaborate organization is necessitated by the large number of small producers dispersed throughout the country, there being nothing to prevent the LBAs from dealing directly with farmers if they wish to do so. In fact even the sub-buyers find it necessary to employ what are known as runners to collect together the minimum amounts with which the middlemen (buyers) are willing to deal.

Mr Baldwin makes a "thorough study of the way in which this system operates, of the margins of profit and levels of income of different classes of intermediaries and of the methods by which the financial problem is solved. This part of his work should be particularly interesting to the calculator of national income for it throws lights on some aspects of the field about which little was known before.

The system of financing the trade in cocoa as revealed by the author is also of absorbing interest. The middlemen obtain their funds from the LBAs, some of whom obtain advance payments from the Board. But these funds are usually available fairly late in the season and the middlemen have to use their own capital or obtain funds in other ways. Money lenders play a part. But most interesting is the practice of what is called 'Gold Coasting' which is described by the author as follows:

"This system consists of buying goods in quick-moving lines such as cigarettes, milk or kerosene, on credit through the firms, and then selling them as rapidly as possible,

if necessary at a loss. Even if the goods are sold at a loss of say 5 per cent and if the buyer can advance the money at 30 per cent or 50 per cent he has obviously done very well. this sometimes explains why goods are very much cheaper when bought from women actually sitting on the doorsteps of the stores where they have been purchased."

A somewhat similar reason explains why firms which actually make losses in their work as LBAs

continue to function as such. It is found that firms which also import merchandise are "able to use the purchase of produce as a means of remitting funds to London. With the proceeds of their sales of merchandise they can buy produce for which the Marketing Boards make payment either in Lagos or London according to the wishes of the firm concerned and the heavy charges made by the banks and the West African Currency Board for the transmission of money are thereby avoided."

Mr. Baldwin's essay is a well-written presentation of the results of careful and systematic research work. Though the field of study might appear to be remote and the results achieved only of local utility, in fact they can be usefully studied by all those who are concerned with problems of agricultural marketing or of national income. The light the present work throws on one aspect of the structure of the Nigerian economy should in any case prove very useful to administrators and policy makers in that country.

4 PER CENT STATE GOVERNMENTS LOANS 1967 (SECOND ISSUE)

(1) Government of Andhra	Rs. 200 lakhs	Issue price Rs. 99-8-0 per cent
(2) Government of Bombay	Rs. 300 lakhs	Issue price Rs. 100-4-0 per cent
(3) Government of Madhya Pradesh	Rs. 50 lakhs	Issue price Rs. 99-8-0 per cent
(4) Government of Mysore	Rs. 50 lakhs	Issue price Rs. 99-0-0 per cent
(5) Government of Saurashtra	Rs. 125 lakhs	Issue price Rs. 99-0-0 per cent
(6) Government of Uttar Pradesh	Rs. 250 lakhs	Issue price Rs. 99-8-0 per cent
(7) Government of West Bengal	Rs. 200 lakhs	Issue price Rs. 100-0-0 per cent

THE LOANS WILL REMAIN OPEN FOR SUBSCRIPTION FROM 30TH AUGUST TO 1ST SEPTEMBER 1955 BUT MAY BE CLOSED EARLIER WITHOUT NOTICE AS SOON AS SUBSCRIPTIONS APPROXIMATE TO THE AMOUNT OF EACH ISSUE.

Each loan will bear interest from 1st September 1955. Interest from the date of application to the 31st August 1955 inclusive, will be paid to the applicants at the time of issue of new securities at the rate of 4 per cent per annum on the nominal value of the loan applied for and accepted.

Subscriptions will be in the form of cash/cheque in respect of all the loans.

Applications for all the loans will be received at the offices of the Reserve Bank of India, Bombay, Calcutta, Delhi, Madras and Bangalore.

Applications for any particular loan other than Mysore Government Loan will also be received at branches of the State Bank of India within the State issuing the loan.

In the case of Mysore Government loan applications will be received at branches of the Bank of Mysore Ltd. in the Mysore State.

N. B. Copies of Notifications and Application Forms may be obtained at any Receiving Office.

Economic Study of a Malabar Village

(Concluded)

Thomas Shea

DETAILED statements were taken from 67 cultivating tenants concerning their paddy holdings in Morazha desam. Twenty nine per cent of these tenants also held some of their lands either as intermediaries, as janmis, or as both; 15 per cent of them had holdings with tenants under them, and thus occupied the dual status of landlord and tenant. There is, in Malabar, no rigid division between different categories of landholders; a single individual may, even though all of his holdings total no more than 3 or 4 acres, hold land under four or five leases in more than one village, and himself let out land to one or two tenants. The holdings of individual cultivators are usually, like those of janmis and intermediaries, scattered in random fashion throughout one or more villages. Twenty nine of the 67 tenants interviewed, or 43 per cent, held land in other desams or amsams. Even in the case of the 22 cultivators in Table VII who had no holdings outside the village, and may therefore be presumed to be for the most part the poorest of the cultivators to be found in the village, 12, or more than half, held land under three or more landlords, and ten had land scattered in four or more separate blocks. Only one of these tenants had 4 acres or more of wet lands in the aggregate.

Fair Rent Clause Inoperative

The Malabar Tenancy (Amendment) Act of 1954 fixed fair rent for paddy lands at $\frac{1}{2}$ of the net produce, and specified 417 lbs of paddy per acre as the cost of cultivation to be deducted from the gross yield in computing the net yield. According to that formula, none of the 22 tenants in Table VII pay fair rent. The original Act, passed 24 years ago, fixed fair rent at $\frac{2}{3}$ of the net produce, and computed cost of cultivation at $2\frac{1}{2}$ times seed. Even if prevailing local costs of cultivation—the bare minimum of about $1\frac{1}{2}$ times seed—are taken as a basis for computing the net yield, only one of these tenants pays fair rent or less. Most (15) of the 22 tenants pay rents which exceed the net yield of their lands. These rents, if they are typical of Malabar generally, and there is much evidence to show that they are, show that

this portion of the Malabar Tenancy Act has remained inoperative for more than a quarter of a century.

According to the original Act, before it was amended in 1951, either a cultivating tenant (holding on *verumpattam* or simple lease) or his immediate landlord could file, in an ordinary civil court, a suit for fixation of fair rent; between 1930 and 1946, only 217 such applications were filed. The reasons are obvious. Each cultivating tenant holds land on many leases; to derive real benefit from the provisions of the Act, he would have to file perhaps half-a-dozen suits. As the Act provided no summary procedure, and allowed appeal, court costs would have been ruinously high for the average cultivator.

In 1951, the Act was amended to provide for compulsory rent settlement for each holding, and a Rent Settlement Authority with a staff of 1000 employees was appointed to take up the colossal task of fixing rents and preparing a record of rights of more than a million holdings. The Authority after six months of futile effort, was finally abandoned the following year.

Summary Rent Courts

The Malabar Tenancy Amendment Act of 1954 revived the provisions for a summary rent court, but made applications optional. The rent courts were introduced throughout the district in September, 1954. This time, as a result of persistent and methodical campaigns by the Kisan Sangham and other political parties and pressure groups, the courts were promptly deluged with applications—30,000 were received by courts throughout the district. More than a hundred were filed by cultivators residing in Morazha desam alone. In many cases, cultivating tenants who filed complaints against their landlords were themselves sued by tenants of their own who cultivated other holdings which they held as landlords. Many tenants who had heavy arrears of rent, or who held on oral lease were too afraid of eviction to bring forward complaints against their landlords, but should the trend of present court awards, which have been for the most part favourable to tenants, continue, it is likely that

applicants will continue to come forward in increasing numbers.

Majority Below Subsistence Standard

Rent fixation alone will not, however, rescue this village and others like it from starvation, although it is a step in the right direction.

A family of five, consisting, say, of three adults and two children, requires, if one assumes a standard of basic nutritional requirement, among those whose staple diet is rice, 1 lb. of rice per adult per day and $\frac{1}{2}$ lb. per child, 1460 lb. of cleaned rice or 2700-2800 lb. of paddy per year. Three of the 22 cultivators obtain a gross yield from their paddy holdings sufficient to meet these requirements. If one assumes a minimum requirement sufficient to stave off actual starvation of only 1000 lb of paddy per year for a family of five (and census figures indicate seven to be the average size of a household in Morazha), only 8 of the 22 cultivators produce on their holdings enough to survive, and only two have this amount left over from their gross produce after meeting rent payments. Thus, even if fair rent provisions were enforced, only a tiny percentage of the smaller cultivators would become self-sufficient even if they did their own field labour.

Pattern of Labour Input

Cultivation of paddy lands makes heavy seasonal demands on labour, but leaves it idle over much of the year. In the case of Kaipad lands, repair of bunds and the preparation of mounds requires a heavy input of labour over a short period; so does harvesting. In most of the other wet lands, seedlings are not transplanted from nurseries, for the seeds are sown broadcast. There is thus not the unusually heavy demand for labour characteristic of regions where transplanting is common. Most of the wet land soil of the village has a high percentage of clay and cakes easily. It is thus necessary, during the ploughing operations prior to sowing, to crush the clods which are not properly broken up by the plough. This work is ordinarily done by women working in teams. It is easy work, but requires much perseverance, for it

must be done quickly if seeds are to be sown on time.

Few cultivators who hold several pieces of land scattered throughout the village are in a position to give much personal attention to cultivation; most depend, therefore, partly or wholly on hired labour for assistance. Table IX shows, for the 67 tenants of all types interviewed, the percentage of cultivating tenants who do not work, who work themselves in the fields with the assistance of hired labour, who do all of their own work themselves, and who supplement their income by working as hired labourers. Table VIII gives the same information for 22 of the 67 cultivators with no holdings outside the village whose information on rent, etc., could be subjected to proper scrutiny. This latter table shows that the three who employ no agricultural labour are all in the less prosperous section of cultivators who obtain gross yields of less than 800 lb. per year, and hold land in only one or two blocks.

Status of Cultivator and Attitude to Labour

Although many substantial cultivators work their own land, there is still a strong disposition among well-placed villagers to look down upon actual physical labour; hence the tendency, even among poorer agriculturalists, to sub-let their holdings and content themselves with mere rent-receiving even when there is no monetary advantage whatever to be derived from it. Some work is regarded as more degrading than others. Even the cultivator who will make a point of doing his own ploughing will, if possible, have all of his harvesting done by hired labour and would not, except in the direst circumstances, send his wife and children into the fields to harvest the crop. There is a particular tendency for cultivators who are themselves janmis or intermediaries to shun agricultural labour. Of the 15 cultivators in Table VIII who do not work at all but rely entirely on hired labour, 12 occupy some status other than that of cultivating tenants. Of the 12 cultivators who also hold janmam land, for example, eight do no cultivation and of the five cultivators who also hold land as intermediaries, i.e., who are also landlords with tenants under them, three do not work. Only three cultivators were found who worked also as labourers on the lands of others. Most agricultural labourers hold small patches of garden land only,

on which their house-sites (*kudi-yiruppus*) are situated, as in the case of four in Table IX.

Hours of Work for Agricultural Labour

In Morazha desam, agricultural labourers, except during the heaviest part of the harvest season, work for half a day only. They ordinarily begin work at 8-00 in the morning, and usually finish by 12-00 or 12-30. Upon enquiry I received the same answer from everyone, including the village officers: the labourers were too weakened by malnutrition to put in a full day's work. It was, in fact, unnecessary to ask, for despite the apparent general absence of disease—like all Malayali villages, Morazha is clean, and the climate, though somewhat enervating, is not unhealthy—the physique of most of the labourers and cultivators is wretched in the extreme.

Daily wages are uniformly 3 lbs of paddy for males and $1\frac{1}{2}$ pounds for females. A few cultivators give mid-day kanji (a watery rice gruel) as well; some give half a pound of paddy per day more to the men, and a few pay in cash—a rupee for men, 8 annas for women. Moreover, at the time of harvesting, 10 per cent of the crop is universally given to the labourers.* This, plus their daily wages, is all that most of them ever get.

Slack Season Employment

Agricultural work keeps them busy for at most 120 days out of the year. A few families are fortunate enough to have members working in the tea plantations of Coorg. Some earn a pittance in the part-time manufacture of bidis. For

* This 10 per cent deduction is made before computation of the gross yields of paddy land.

TABLE VIII

* Holders of garden lands only. These are the four mentioned in the text as having recently been evicted from their wet holdings.

rise, standards of cultivation progressively declined. Owing to the scarcity of rice, villagers were obliged more and more to depend upon toddy and fish for their main source of nourishment. When in 1948 the Madras Government introduced total prohibition, although it continued to be produced illicitly, toddy ceased to be available in large quantities, and its price is now out of reach of the ordinary cultivator or labourer. The export of fish in large quantities from the village has likewise raised its price beyond the reach of most of the villagers. Six annas, which will now purchase one lb of fish, would, before the war, purchase 15 or 20 times that quantity. Prohibition and the setting up of the dried fish industry for export have thus exhausted the last important alternative sources of food upon which the villagers depend.

General Observations

The low standard of cultivation prevailing in Morazha is immediately apparent to the visitor. Fields look poorly cared for. The bunds around the individual kandams or paddy fields are in continual disrepair. Little attention is paid to proper weeding. Many acres of paddy land have fallen out of cultivation; some have been completely washed away by the gradually advancing river; others have just been abandoned. There is practically no source of manure. Green leaves, commonly used as manure throughout Malabar and generally regarded as the most suitable for soils in the district, have been unavailable since the war. Most cultivators, if they use manure at all, depend chiefly upon ash from small

quantities of dried leaves, which are gathered and burned on the fields themselves. Cattle, generally of nondescript quality throughout the district, are at their worst in Morazha; underfed and emaciated, they produce neither milk nor manure in appreciable quantity. Garden lands are in as bad a condition as or even worse than paddy lands. Coconut trees yield generally no more than 10 nuts a year. Much of the land classified in the village adangal or register of holdings as "garden" land is simply waste. The spindly, wasted bodies of the children which swarm the village presage a generation yet weaker and more enervated than the present one.

Economists have frequently speculated upon the eventual result of unrestricted population growth which is not matched by the provision of proper institutional and technological facilities to accommodate it. Let them visit Morazha. It will take much more than an agricultural extension block and planned parenthood to save Morazha. Conditions in Morazha and villages like it require simultaneous and massive attacks from several sides, if genuine improvement is desired; but most of all they need a thorough overhaul of the pattern of landholding.

Rent Courts Ineffective

The rent courts, if they carry out their functions properly and their decisions are enforced, will provide some incentive to cultivators by reserving for them a larger share of the produce. There were many complaints, however, by villagers on the manner in which these courts were then (March, 1955) functioning. The Cannanore Rent Court, which has jurisdiction over Morazha, was, they said, automatically rejecting all petitions filed by oral lessees. In the sample which I studied, nearly half of the leases fell into that category (See Table V).

Even in the case of registered documents, the applications are automatically rejected if any error whatever is found in the particulars contained therein. Particulars contained in deeds filed in registration offices are notoriously inaccurate. Much of this inaccuracy is due to the cumbersome procedures followed in State Registration Offices. When a deed is registered, the office is obliged to ascertain whether the area of land contained in the title deed corresponds with the area of

the survey number and sub-division number in which it is located. The survey number corresponds to the *janmam* holding; no record whatever is kept of the area or configuration of the cultivator's holdings which are generally smaller than the recorded survey or sub-division numbers. Thus, a dozen or so tenants holding lands in a field with a given survey number will each be shown as holding the entire field. Many of the older title deeds give the area of holdings not in acres and cents, but in the local measure. This measure, although it often corresponded neither with the area of the actual survey field nor with that of the actual holding, usually passed preliminary scrutiny. Now, if submitted for close scrutiny in a rent court, such leases would probably be thrown out and the tenant might have for his efforts not a reduction of his rents, but the additional expense of a suit brought either by one of his fellow workers or by his landlord disputing his title.

Determination of Yields

Another complaint brought forward to me by tenants is that the task of judging yields of lands for which fair rent applications have been fixed—work for which agricultural officers alone are competent—has been left to young and inexperienced revenue officials. These men, they point out, and my enquiries confirmed, are usually lower division clerks in taluk or district offices who are undergoing preliminary training as revenue inspectors. As they are both inexperienced and poorly paid, they are more susceptible to bribes than ranking officials would be. One tenant complained that he was obliged to pay a revenue official 30 rupees to get the yield of his land, which the official estimated at 30 times the seed sown, reduced to a realistic figure. Although the Rent Courts were set up for the express purpose of making applications as cheap as possible, there are a large variety of incidental costs which a tenant must meet in getting his case heard, and it is seldom that a tenant can get a decision without paying less than 10 rupees in miscellaneous fees for each application. As each tenant, to ascertain his fair rent, must file in most cases three or more applications—one for each lease—the costs become prohibitive. The provision of administrative machinery for alleviating injustice is of no use unless its proper functioning is assured.

It is difficult to see how really effective steps designed to raise production can be taken so long as these chaotic, wasteful, and unbusinesslike land tenure patterns—it would be wrong to term such a welter of confusion a system—are allowed to persist. Whether or not cultivator 5 in Table VII receives a free loan of improved seed, he will continue to be an inefficient cultivator so long as he has to wander all over the village in order to see that his 9 tiny plots are properly worked. And even if he pays fair rent, and gets back his toddy and fishing rights into the bargain, 682 lbs of paddy per year, even with these extras, would hardly be enough to keep him alive, let alone a wife and children. It will certainly not enable him to raise the wages he pays to his labourers sufficiently to get out of them more than a half day's slipshod work. In the unlikely assumption that he would even be in a position to file fair rent applications against the 7 landlords who are at present rack-renting him, he would surely emerge from the courts so deeply bound down in debt that even the most lenient agricultural credit society would consider him a poor risk. The willingness of the government to be content merely with grafting a superstructure of welfare services upon such an unsound substratum is, of course, partly because of the extreme difficulties and expense which any systematic attempt to introduce fundamental reforms would involve.

Record of Holdings Essential

Whatever programme of land redistribution the government or legislature might choose to adopt, whether it be the recommendation of the Planning Commission, or the conversion of each village in the district into a collective farm, so long as it involves depriving certain categories of landholders of their rights in the soil and the payment of compensation based either upon the value of their holdings or on the income derived therefrom, a reliable record of these holdings must be prepared. The task in Malabar is undoubtedly more difficult than in many parts of India. If the reader refers again to Tables III, V, VI, and VII, and imagines Morazha multiplied 2222 times, he may form some idea of the magnitude of such a task.

The attempt which the Madras Government made in 1951 to pre-

pare a record of rights was a failure for certain very clear reasons. In the first place, the work was undertaken throughout the district at once, without the benefit of a pilot enquiry which would have enabled the Government, at minimal time and expense, to determine in advance the defects, if any, of its proposed approach.

Secondly, production of evidence, written and oral, in defence of titles was not made compulsory, and no penalties were provided for failure to appear at hearings. Had rules been made imposing forfeiture of property for withholding of information or submission of false evidence, the Government's task would have been much easier.

Thirdly, the Government failed to impose a ban on transfer of landed property during the period of enquiry and provided the Authority with no power summarily to decide disputes over title. As landed property in Malabar changes hands with remarkable frequency and the volume of land litigation is enormous, information on holdings would often become obsolete long before it was ready for processing. Since the job of preparing a record of rights for more than a million holdings would have taken the staff of 1,000 special officers, clerks, etc., who were employed in the Rent Settlement Authority, at least three years or more, a general stay of all land transfers throughout the district might have imposed undue hardship, in which case, the task of settlement could have been taken up taluk by taluk. As there are 9 taluks in the district, the task could then have been carried out in each one in a matter of 5 or 6 months.

Public Opposition—No Positive Programme

Lastly, and perhaps most important, the task was undertaken without properly informing the public of its necessity. It was a costly undertaking—600,000 rupees were spent in the 6 months of the Authority's existence, and uninformed public clamour against the expense was in fact the chief reason for its abandonment. If the preparation of a record of rights were linked to a positive programme for land redistribution in the form of a comprehensive tenancy act or series of acts, it is highly probable that public outcry against it would have been reduced to the inevitable minimum which is a normal feature of parliamentary life.

Economic conditions in Morazha are unusually bad even for Malabar, which is economically one of the worst-off districts in India. Conditions in the northern taluks of the districts—a chronically food deficit area—are more unsatisfactory than in the south. The north too has been in recent years the centre of agrarian unrest in the district. It is noteworthy that in the last District Board elections (1954), in which a predominantly rural electorate voted, Madayi Firka, wherein Morazha is situated, gave a higher percentage of popular votes to the Communist Party (65%) than did any other constituency in the district, and in the 1951 general elections, in the Assembly constituency of Payyanur, of which Morazha was then a part, the Communist Party likewise polled a higher percentage of votes (68%) than it received anywhere else in Malabar.

There is no doubt that the chaotic land tenure arrangements prevailing in Morazha *desam* and throughout the district are the major underlying cause of its present poverty, and is a bar to effective rural economic development. Conscious planning could only with the most determined efforts at perversity succeed in creating a situation better calculated to destroy initiative and maximize the misuse and dissipation of human and natural resources. The general programme laid down in the Planning Commission's First Five-Year Plan for transferring land rights to the actual cultivators of the soil and of setting floors and ceilings to the size of holdings has the merit of possibility—it is supported by the Government of India and the Congress Working Committee—and of purpose; whatever its defects, it would be far more welcome to people of all political persuasions in Malabar than a continuation of the present state of uncertainty and confusion.

Empire of India Life Assurance Company, Ltd

Report Of The Administrator, Shri R Varadachari

THE Revenue Account and the Balance Sheet of the Company with the Auditors' Report appended hereto relate to the year ended 31st December, 1954.

The year has been an eventful one for the insurance world characterised by the rate-war, the bonus war and the staff Insurance scheme war. The controversy regarding the last has now been set at rest but the repercussions of the other two are bound to be felt in future years. But so far as the present is concerned, certain unhealthy features, which had till now been largely confined to General Insurance, have made their appearance in the Life Insurance field also. The sudden reduction in the rates of premium by one of the big companies followed in a week by another company, created a very difficult situation for companies like the "Empire". It took us some time to work out the necessary data and consider the course to be adopted, but it was clear that a similar reduction was inevitable if "Empire" was to exist. After a full consideration of the pros and cons, we decided to follow the lead of the other companies and issued the revised rates on 27th April, 1954. For nearly two months before that, the writing of new business by the Company was practically at a standstill. In issuing the revised tariff, we advised our field staff very strongly not to indulge in what the President of the Indian Life Assurance Offices Association described as "the pleasure of re-writing as new business a large amount of business which we had already placed on our books at enormous cost" and that we would be satisfied with the normal growth of genuine new business. This seems to have had some effect during the year 1954; but how long this will last in the face of the terrific competition prevailing in the field is not known! If the message of insurance, i.e., the thrift and savings movement, is to spread far and wide in the land, the insurance agent should penetrate into the rural areas and he will do so only if it is made worth his while. At the present moment, the field force is concentrated almost entirely on urban areas and the whole-time insurance agent has become a rarity.

As there is some misapprehension even in informed quarters about the "Government management" of the Company and its result, I wish to emphasize that the actual day-to-day working of its affairs, such as the procurement of new business, settlement of claims, etc., are almost entirely in the hands of the Managers and the field staff recruited from the usual actuarial and business circles and not from any Department of Government. The chief difference is that every effort is made to see that the Code of Conduct is observed in field appoint-

Shri R Varadachari

ments. We do not allow any intermediaries between the Branch Secretaries and the agent beyond what is permitted by the Code; but this is felt by our organisation as an unnecessary insistence upon the Code. As a matter of fact, even in some big companies, the hierarchy is Organisers, Inspectors, Divisional Superintendents, Branch Secretary and the underlying object of this can easily be imagined; even a few weeks back an Officer, who left the Company, wrote to some of our field-workers giving this hierarchy as that prevailing in his new company on that company's letter-head and offering them higher status and pay and less restriction than in "Empire." Another difference is that the Head Office in "Empire" frowns upon twisted

business or any attempts to pinch men from other companies.

In some quarters it is alleged that after the "Government management" came in, the expenses have increased but this charge is entirely baseless; on the other hand, it was during the period when the Company was under private management that the expense ratio had been steeply rising from year to year, though the general trend for other companies was downwards. The salaries and allowances of the top officers in the Head Office used to amount on the average to Rs. 22,106 every month in the year 1950 but in the year 1954, this has been brought down to Rs. 8,111. Various other measures of economy have been introduced, but it takes time to feel the full effect of these. In the year 1949, the overall expense ratio was as high as 33.66 per cent, but during the year 1954 we have brought it down to 28.40%. The renewal expense ratio also has shown an appreciable reduction from 21.38 per cent. in 1949 to 18.61 per cent. in 1954. The reduction would have been far greater but for certain extraneous factors. The graded scales of pay to the staff introduced in 1953 for the first time in the history of the Company and the increase in the dearness allowance increased the cost by over Rs. 80,000 per annum. To add to this, the cost of the law charges connected with the proceedings against the ex-directors, etc., is quite a big one and this has gone to swell the expenses. Though the Company is an old one, it has had to work during the last four years not only as though it was a new company beginning from scratch, but with the added handicaps created by the incidents which happened in the years 1950 and 1951 and which resulted in the action under Section 52A of the Insurance Act. Every effort is made by fieldmen of other companies to misrepresent the position of the Administrator as that of a Liquidator. The extent of the disruption of the organisation will be clear from the fact that, of the existing Inspectors, 75% are entirely new men taken after July 1951. The same is the case in regard to the Branch Secretaries and the Officers at the Head Office. Considering

these handicaps, the organisation has produced results during the year which should be considered quite satisfactory. In spite of certain deficiencies "Empire" can claim some achievements to its credit during the last four years—such as reduction in top heavy salaries, increase in the salaries of the subordinate staff, stabilising the finances, creating a big reserve of Rs. 116 lakhs to meet losses from bad and doubtful investments (very few companies in India would be able to do this) increasing the dividends to shareholders and the bonus to policyholders, and with all this, lowering the overall and renewal expense ratio.

It is, however, unfortunate that, without any reference to these facts, some persons connected with insurance, in their anxiety to espouse the cause of "private management" as against nationalisation, have thought fit to publish disparaging remarks about the performances of this Company as well as the Jupiter General Insurance Co. Ltd. I do not desire to enter into the controversy for or against nationalisation, but would leave it to be judged by more competent persons in an objective manner. But so far as these two particular companies are concerned, I would submit, in all humility, that an examination of their past history—their methods of business and investment, control of shares and hawking of the management rights and top heavy administration—as compared with the present position, by any person, official or non-official, will not lend any support whatever to the cause of "private management." Such an examination will also show how difficult it is and how long it takes to rectify inherited wrongs and at what cost to the policyholder and to the general tax-payer. We all like comparison and competition; but the competition in the insurance business at present is neither fair nor equal.

The triennial Valuation as at 31st December, 1954 is in the final stage of completion. I am glad to say that from the preliminary calculations made, the hope which I expressed in my last report about a sizable surplus has been amply borne out. The results of the Valuation will be published shortly and there is every prospect of an increase in the bonus to the Policyholders.

Progress of Business in the Year
New Business: During the year

14,897 proposals were received for assurances amounting to Rs. 4,80,01,000. Of these and others awaiting completion on 31st December, 1953, 11,887 proposals resulted in policies assuring Rs. 3,84,06,774, of which Rs. 8,19,500 was reassured. The new business after deduction of reassurances was accordingly Rs. 3,75,87,274 representing an annual premium of Rs. 20,04,744 and Rs. 7,458 by way of single payment.

Expense Ratio: The overall expense ratio in the year was 28.40% as against 28.55% in 1953 and 26.93% in 1952. The renewal expense ratio in the year was 18.61% as against 19.80% in 1953 and 19.63% in 1952.

Claims: Claims by Death during the year amounted to Rs. 19,32,760 representing an increase of nearly Rs. 1¼ lakhs over the figures of the previous year. The claims by maturity showed a decrease of nearly Rs. 5½ lakhs over those of the previous year.

Income and Outgo: The income for the year amounted to Rs. 1,53,62,124 (after deduction of taxes at source), of which Rs. 1,19,77,645 was derived from premiums. The outgo amounted to Rs. 1,08,03,439. The excess of income over the outgo is Rs. 45,58,685.

Investments: The total assets have increased from Rs. 11,97,50,963

to Rs. 12,38,65,607. For reasons which have been explained in my previous reports, I have concentrated the new investments almost entirely in Government Securities. Since my taking over charge, I have up to date invested Rs. 2,48,51,397 in Central and State Government Securities, with the result that the total investment in Government Securities represents nearly 70% of the total assets. The investments made by the previous management have been under continuous scrutiny and every effort has been made to recover them; suits have been instituted in the Law Courts in a number of cases to recover loans advanced on the mortgage of properties during the years 1948 to 1950.

Rate of Interest: The net interest yield during the year comes to 3.32%. Credit for interest on mortgages taken to Court has again not been taken into account. Such interest will come into the account when realised.

I wish to convey my thanks to all the Officers, the staff and the field-force for the good work done by them during the year, sometimes under discouraging circumstances. I am sure that the Company and its workers have a bright future.

Last Chapter in Freedom Struggle Background to Goa Satyagraha

S T Chary

BUT for the personality and popularity of Prime Minister Nehru the 'Goa Tragedy' would have cost the Government dear. People have faith in him, though they disagree with his policy on this particular issue. Probably for the first time in his life, he is confronted with challenge on a large scale. If he is too great to deviate from his convictions and principles, he is also too human to ignore the demand of the people. A born fighter for freedom, he cannot but bless other freedom fighters. That is why though mass satyagraha for the liberation of Goa is against the declared policy of the Government and Congress, he wished the Satyagrahis well.

Before examining the various aspects of the present movement for the liberation of Portuguese territories in India, it is necessary to have a broad picture of their historical, social and cultural background. Geographically, the State of Portuguese India comprises the territories of Goa, Daman and Diu with a total area of 1532 sq. miles, of which Goa accounts for 1309 sq. miles, Daman 219 sq. miles and Diu 14 sq. miles. The district of Goa is administratively divided into 11 talukas; Daman into two talukas, Daman proper and Nagar-Haveli including Dadra. The last one has already been liberated. The District of Diu constitutes a single taluka.

Low literacy

According to the 1950 census, the total population of Portuguese India was 637,591. On the basis of religion, the population distribution was: Hindus 388,488 (60.9%) Christians 234,275 (36.7%); Muslims 14,162 (2.2%); Parsis 339; Jews 50; Buddhists 56 and others 204. Of the population, 499,579 are illiterate. Of the literate, those who could read and write only in Portuguese was 1.43% while those who could do so in Indian languages was about seven times that number, viz. 10.56%. The Konkani dialect of Marathi, with a mixture of Portuguese words, is the spoken language of all non-Europeans in Goa, and Gujarati in Daman and Diu. The number of emigrants from Portuguese India who have settled in the Indian Union

is estimated at about 100,000, out of whom about 80,000 are in Bombay.

According to the 'History of Goa' by Father M. J. Gabriel Saldanha, which is supposed to be a reliable book by Goans, the whole of the territory did not come under Portuguese rule at the same time. On 25th November, 1510 A.D., Alfonso-de-Albuquerque seized the city of Goa from Adil Shah, the Muslim king of Bijapur, on the pretext of protecting Hindus from him. The same year, he conquered Goa and its adjacent islands of Divar, Chorao etc. Diu fell in 1546 A.D. and Daman in 1559 A.D. The enclaves of Dadra and Nagar-Haveli came into Portuguese hands in 1779 A.D. from the Peshwa of Poona. The Novas Conquistas (New Conquests), which comprise the present talukas of Pernem, Bicholim, Satari, Ponda, Quepem and Canacona, were finally annexed towards the end of the 18th century between 1782 A.D. and 1791 A.D. This shows that four-fifths of Portuguese India, that is, 1227 sq. miles out of a total of 1532 sq. miles, were occupied and acquired by them only at the end of the 18th century.

Portuguese possessions in India are under a Governor-General residing at Panjim, now known as Nova-Goa. Goa is under his direct control, while Daman and Diu are under two Lieutenant-Governors. A Governor's Council with advisory powers assists the Governor-General in his administration. Most of the members of the Council are nominated and not elected. There is a High Court, with 5 judges and one Attorney-General. The laws in force in Portugal are enforced in the Colonies even without the formality of consultation. Nova-Goa is the capital of Portuguese India. Salazar's dictatorship was established in Portugal in the year 1926. This year is notable because from then no opinion different from that of Salazar and his stooges has been permitted either in Portugal or its colonies.

A Challenge

The Portuguese were the first of European Colonial powers to occupy this country. It took about sixty years for us to drive the British out. Congress took the initiative

in this and various forms of struggle were tried under its leadership. But the technique was the same as in Goa. It took a few years more for the French to quit. It was the result of Governmental pressure as well as the people's fight. Portugal refuses to do what the other two colonial powers have done. So a struggle for the liberation of the Portuguese territories in India has become necessary to complete our freedom struggle. It is a fact that during the freedom struggle in the rest of India, Congress did not bother about Goa in the sense of conducting a parallel struggle though the subject always found a place in Congress resolutions. Of course, in those days, no one could have imagined that a situation of this kind would develop in Goa. Everybody fondly hoped that if the British were forced out, the liberation of other foreign pockets would follow in a matter of days. India has been free for some years now. Yet Goa remains under the Portuguese. Not only that, its liberation presents a challenge. It is trying the patience of the Government and the wisdom and determination of the people.

For the last 8 years, our Government has advocated and tried the policy of settling international problems by peaceful and friendly negotiation. Through a tiny colonial power, interested nations of the world are trying to put this policy to the test. From successive statements in Parliament in the last week, it seems that the Prime Minister is not only aware of it, but determined to defeat it. In reply to repeated requests from India for a peaceful and negotiated settlement of this vexed problem, Portugal has bluntly said that it does not consider its sovereignty over Goa to be a matter of dispute with India and that therefore it is not prepared to discuss its transfer with our Government. If this position is accepted, they have very magnanimously offered to give assurances and guarantees about India's territorial integrity and security!

Non-party Campaign

In the face of such presumptuous declarations from Portugal and the

Only a thin film of oil protects these huge hydro-turbines!

How Gargoyle Lubricants are helping India's river-valley projects

AT INDIA'S river-valley projects, huge hydro-turbines turn ceaselessly to convert water-power into electricity. Only a microscopic film of oil protects the turbines and alternators from destruction; without it, they would grind to a stop — valuable equipment would be ruined!

That is why correct lubrication is vitally important. In India, as in so many other countries, Gargoyle Industrial Lubricants — famous for 89 years — are chosen to protect crores' worth of equipment.

There's a right Gargoyle Lubricant for each industrial need. Backed by our experience, correct lubrication — with Gargoyle Lubricants — can help to reduce costs and protect machinery in your plant.

For details, write to Standard-Vacuum Oil Company . . . Bombay, Ahmedabad, New Delhi, Lucknow, Calcutta, Madras, Secunderabad, Cochin.

STANDARD-VACUUM OIL COMPANY

(The Liability of the Members of the Company is Limited)

oft-repeated policy of our Government, non-congress political parties have come to the conclusion that there is no likelihood of Goa being liberated now or in the near future through governmental negotiations unless some unexpected developments should supervene. And it is not wise to leave the inalienable right of freedom to chance. As Congress is the party in power, it is not in a position to express itself freely or be at variance with the policy of the Government; therefore, it cannot take the initiative and leadership for the liberation of Goa. Hence other political parties in the country, viz., the PSP, Communists, Jan Sangh, RSP etc. and a large number of Goans outside Goa, have united in the Goa Vimochan Samiti to complete the unfulfilled part of Congress work. The Satyagraha movement for the liberation of the Portuguese territories is strictly on a non-party basis. Of late, many Congressmen have joined the movement in their individual capacity. The rest of the happenings belong to recent history. These well-known facts have to be restated because of the mischievous allegations abroad about the character of the movement and the composition of its leadership.

Amirchand, Thorat, Saha and a host of others did not die as members of the various class and sectional organisations to which they belonged; they with the flag of our nation, upholding the honour and dignity of it. Giving political and partisan colour to the freedom struggle at this stage is an insult to the martyrs who came from all parts and parties of the country. We owe it to their memory that we maintain the truly national character of the struggle and refer to it as such and vehemently fight any propaganda contrary to it, from whichever quarter it may come. If even at this stage the Congress should accept leadership, which is not unlikely in view of the growing opinion in that direction, other parties are bound to work wholeheartedly under its guidance. Just imagine for a moment whether it would have made any difference at all if the Communists were kept totally out of the picture. The usual 'redscare' is slowly being brought into the picture by Portugal to sidetrack the main issue. It is also a sedulous attempt to exploit Macarthian sentiments and effectively neutralise American sympathy for the liberation movement. It would be well

if all concerned were warned about this in time.

If the Satyagraha is not called off, which is very unlikely in view of the growing tempo of the movement both inside and outside Goa, and the Portuguese authorities on their part continue their 'trigger-happy' methods, it is certain that a situation will arise sooner than later wherein Nehru will have to decide on shooting down Indians within the land in the name of law and order or effectively prevent the Portuguese from shooting our peaceful and unarmed countrymen, irrespective of the international complications that it might lead to. If he should make up his mind soon, precious lives could be saved.

Peoples Right

Knowing human nature and feeling as he does, it should have been clear to the Prime Minister by now that the people of this country would stand no more mass massacre of our brethren in Goa. As self-respecting members of a sovereign democratic republic, they demand that the Government protect the honour and lives of our fellow countrymen without further delay; and if for any reason Government fails to do that, then people will exercise their sovereign right to protect the lives of their brethren with all the means at their command. This will put an end to the completely peaceful nature of the present movement; and many innocent lives may be lost on either side in the process. Timely State intervention is any day better than unorganised violence.

As the first of the proposed administrative measures against Portuguese iniquity, the Government of India has announced the immediate suspension of money orders and value payable service to their enclaves in India. To what extent this may upset their economy can be seen from the following:

The trade balance for Portuguese India for the year 1951 was as follows:

Imports	Rs. 9,00,21,397
Exports	Rs. 2,69,02,805
Deficit	Rs. 6,31,18,592

This deficit is normally made good almost entirely by the cash remittances of Goan emigrants in India. Of course, in recent years the amount of deficit has somewhat declined owing to the increased export of mineral ores and high import duty

on goods brought for smuggling. But after the short-lived Korean War boom, the trend has come to be reversed. Besides, the best market for the greater part of their export has been the Indian Union. Shri T. B. Cunha, an eminent Goan patriot, puts it graphically thus in his book, 'The Goa Problem', "Our economy is strongly linked with India. It is the money earned by Goans living in India that serves to balance the bankrupt economy of Goa's external trade. We are fed with food coming from our neighbourhood. It is Indian capital that helps us to exploit our industries. The Portuguese never invested any capital in our land and are only taking money out of it." In the light the foregoing, it is necessary that financial measures should be accompanied by an effective trade embargo if our purpose is to be achieved.

Pakistan's Action

In this context, one cannot but condemn Pakistan's unfriendly action in providing facilities for planes and ships carrying goods and personnel to Goa. It was reported in Parliament recently that Pakistan had agreed to sell rice to Goa; shortly a regular air service between Goa and Pakistan is expected. The latter is a signatory to the Bandung declaration against colonialism. Therefore, her support to a cracking colonial power is most reprehensible. And Shurawardy's comparison of Kashmir with Goa recently was truly sinister.

It is at times glibly argued that the Goan movement is Indian inspired and conducted. This charge was answered in a most telling manner by Shri H. C. Denis, Chairman of the Goan League in England, in a letter to the "Manchester Guardian" on August 16. He said that Goan history "accounts for over 40 rebellions against Portuguese rule". In 1946, fourteen Goan leaders were deported to Portugal and Angola. "Between February, 1954 and May, 1955, about 3,000 Goans have been arrested and over a thousand Goans imprisoned, some without trial, besides some thousands who have been taken to police stations and beaten on mere suspicion such as the possession of Mahatma Gandhi's or Mr. Nehru's photos. This is no small evidence of our determination to reunite with India".

No Civil Liberties At All

Apart from daily indications in

Around Bombay Markets

IN sharp contrast to the commodity markets, the stock exchange witnessed a flare-up of speculative activity. The assurance that managing agency would not be abolished helped market sentiment; so did the thumping success of the State Government loans. The latter confirmed the market belief that there was money in plenty in the hands of institutional investors. On top of all this, Calcutta advices were continuously strong, and textile production and exports were very encouraging. All these helped to maintain a firm trend.

Tata Steel Ordinary were pushed up further from Rs. 253-8 to Rs. 262-4 on continued speculative purchases. The Tata Steel Co.'s Chairman's speech was expected to be quite in keeping with the encouraging annual report. Indian Iron, solely depended on Calcutta advices, gained further strength from reports of expansion scheme. Tata Steel closed firm at Rs. 261-8, the highest being Rs. 262-4 while Indian Iron closed at Rs. 40-7 only 4½ as. lower than the highest.

In the textile section, Bombay Dyeing and Swadeshi closed firm at the highest levels of Rs. 523-12 and Rs. 221-0 respectively. Evidently, the recently published figures of textile exports for the first seven months of the year have been a bull factor, both production and export of medium varieties having reached record levels. Century received speculative support at the hands of influential operators on reports that the company's rayon plant may soon go into production. Rates jumped from Rs. 427-8 to Rs. 440-8 to close at Rs. 439. Kohinoor closed firm five points higher than the lowest of the week at Rs. 347. Simplex closed at Rs. 171-4.

In the miscellaneous section, Bombay Burmahs and some of the small priced shares were in the lime light. Bombay Burmah added 18 points to close at Rs. 573, the highest touched during the week being Rs. 575. A C C jumped by five points to close at Rs. 195, National Rayons and Belapurs gained four points each. Scindia moved up by more than a rupee to Rs. 16-7 on reports of the Company having received a loan for about Rs. 2 crores

Firm Trend

Thursday, Morning

for development. Indian Coppers and B. B. Petrols were very much sought after, the main support coming from Calcutta. Both the companies are reported to be doing exceedingly well.

In the cash section, banks and insurance shares, with the exception of Central Bank, remained firm. Central Bank, it is feared, may be affected by the Bank Award. New India moved up to Rs. 47 on bear covering. Electric shares remained quietly steady, with hardly any business passing.

Cotton

Sustained Firmness

THE performance of the cotton futures market during the week was marked by two notable events. In the first place, there was a spectacular rise in the maturing August contract which jumped by 40 rupees on Thursday, as a result of smallness of tenders and the higher spot

rates fixed. Secondly, there was the announcement, made towards the close of the week, of an increase in export duties on Pakistan cotton. The latter development served to reaffirm the bullish fervour witnessed on Thursday which was followed by a reactionary trend on the very next day. In short, sentiment in the futures section tended to be one of sustained firmness although the closing quotations were lower than the spectacular heights reached during the week, especially in the case of the maturing contract.

Although nearly a fortnight has passed since the publication of the much discussed U S cotton policy, cotton traders in Bombay have completely ignored it. The brisk export demand for Indian cotton from all countries other than U S had temporarily pushed American cotton out of the picture.

Exports of cotton from India from the beginning of September 1954 to August 6, 1955 totalled 266,501 bales

MARKET LEADERS DURING THE WEEK

	August 24, 1955	Week's Range High	Low	August 17, 1955

Linseed Oil	13- 8	14- 0	13- 2	13-14

compared with 127,120 bales in the corresponding period last season. In view of the decision of Pakistan to raise the export duty, it is generally believed that prospects for the export of Indian cotton would be even better and it is quite on the cards that the entire quota for the season might well be exhausted before the end of October. Needless to say, speculation has been rife about an early announcement by the Government of India of a substantial new crop export quota.

Fuller details are now available about the U S cotton policy statement. From a note addressed by the Japan Cotton Spinners' Association to the U S Government, it would appear as though the U S cotton export policy had been shaped to suit Lancashire and Japanese cotton interests. The note in question reads as follows:

"Complaining, as Lancashire cotton interests have been doing, that a 'hidden' subsidy on raw cotton purchases has been giving the Indian cotton industry an unfair price advantage in export markets, the Japan Cotton Spinners' Association has asked the U S Government if it can see its way to export low-grade and middle-grade cottons among the stocks held by the Commodity Credit Corporation at 'world market prices'—prices which are competitive with non-American raw cotton".

The Association, it may be noted, has also pointed out that the high prices of American raw cotton have given man-made fibres, especially rayon staple, an opportunity to invade the domestic Japanese markets for textiles. Whether there is any 'hidden' subsidy on raw cotton purchases or not, it is now clear that the policy statement of Mr Benson concealed the real reason or reasons for the decision in respect of U S export subsidy, which had been agitating the minds of cotton men everywhere.

Reverting to the Bombay futures market, ICC August, the maturing contract which opened at Rs. 622, recorded the peak level on Thursday of Rs 655, narrowing the gap between the two contracts thereby from Rs. 37 to Rs. 13. On the same day the new crop February contract also moved up sharply to Rs. 637. The closing quotation of the two contracts for the week was identical

at Rs. 633 for August and for February.

Brighter trading conditions prevailed in the spot market on renewal of large scale export enquiries for practically all exportable styles. Vijay premium continued to be around Rs. 260 'on'. Of late mill demand has tended to broaden, resulting in fresh enquiries for popular varieties such as Laxmi, Jaydhar, and lower Jarilla.

Oils and Oilseeds

Continued Easiness

FOLLOWING the bearish reaction of overseas markets to the latest release of export quota for groundnut oil, the oilseeds market has been off colour and the closing quotations in all sections showed distinct signs of weakness. However, shippers in general are now inclined to believe that the bearish reaction overseas has gone too far and that a substantial rally in prices in the near future is not unlikely. In the first place, they argue, the quota was a small one, nearly half of it having been already utilised. Secondly crop reports of late have imparted a sober feeling to the market. Despite recent rains in Gujerat, Saurashtra and other deficit areas, the forecasts about crop put it substantially smaller than last year. Moreover summer crop arrivals from the South are also reported to have been delayed due to the monsoon. How far these factors influence the market favourably in the days to come, however, remains to be seen.

Meanwhile, following easy conditions in other centres due to slackened demand for oil, prices in all sections of the oilseeds market have declined. Groundnut August-September which opened at Rs. 23-12, lost nearly a rupee and closed at the lowest level of the week at Rs 22-15. The decline has been initiated by better crop ideas, following beneficial rains. This apart, as mentioned at the outset, the lowering of overseas quotations for groundnut oil as for instance, Singapore, Hong Kong and the Continent, also conspired to depress sentiment. Groundnut oil closed with a loss of 7 as. per quarter at Rs. 12-6.

Castor September which opened at Rs. 84-6, declined to Rs. 84 and then shot up to Rs. 92 on Saturday, on anticipations of abolition of export duty on castor oil. There was a sharp decline on the last day of the week following heavy liquidation to

Rs. 84-10, the closing being Rs. 85. Castor May, opening at Rs. 87 went up to Rs. 88-12 and again declined to Rs. 87 on Thursday last. On shippers' enquiry, it improved on Saturday to Rs. 91-12. The closing quotation was in line with the weak trend noticed elsewhere.

Linseed also ruled weak. There was hardly any enquiry from overseas while arrivals from the interior continued without a break. Linseed lost about 12 as. over the week to close at Rs. 23. Linseed oil also lost 8 as. to close at Rs. 13-8. Kardi and Niger continued weak, the closing quotations being Rs. 14 and Rs. 23-14, respectively.

Bullion

Stalemate Continues

As anticipated in these columns, there has been no improvement in the bullion market and the stalemate continues. Government sanction to the Board's amended bylaws is yet to be announced. There has therefore been a further extension of the suspension in futures trading in bullion.

Meanwhile, the spot quotations of both gold and silver have been shooting up. Floating stock being limited and the major part of stocks being in the hands of the bulls, who have been mainly responsible for the recent developments in this market, there has been a rise in spot values of both gold and silver.

A Correction

TENANCY LEGISLATION IN BOMBAY

THE author of the article "Farm Tenancy Legislation in Bombay State" which was published in the last issue of this paper has pointed out a slip on page 965, lines 4 to 5, which has completely changed the meaning of the sentence which should read as follows:—

"If the aggregate amount of land revenue, cess, etc., is less than one-sixth of yield of land, the tenant is not going to pay more to the landlord."

This means when tenant has more income, he does not pay more than the statutory rent fixed in terms of assessment. But if his income is less, he pays less rent to the landlord, subject to 1/6th maximum of rent. By inserting "the tenant does pays anything to the landlord" altogether contrary meaning is conveyed.

The slip is much regretted.

Around Calcutta Markets

No Right Issue by Indian Iron

Wednesday, evening

EVEN those who are familiar with the antics of gamblers must have been surprised at the steadiness of Indian Iron even on Wednesday. On that day, the managing agents of the company issued an official denial of rumours about issues of right shares. Even after this official denial, Indian Iron were steady on Wednesday, presumably because of settlement considerations.

As the recent steadiness in equities on the stock market here has been due mainly to the continued spurt in Indian Iron, this question of issues of right shares by the Company needs to be discussed in detail. These rumours started a couple of months ago. In the last two months, both Tata Steel and Indian Iron have been moving up on these rumours.

To begin from the beginning, the spurt in Iron and Steel started on hopes that both Tata Steel and Indian Iron would raise dividend payments. Tata Steel have not stepped up dividend for the year to March last. It is now widely realised that Indian Iron also will not raise dividend for the year to March last.

Many weeks ago, the stock markets came to the conclusion that neither Tata Steel nor Indian Iron would raise dividend payments. Even then, both these shares were moving up in anticipation of issues of right shares. It has been known for some time that Tata Steel propose to issue right shares. It became known on Wednesday of this week that Indian Iron did not contemplate any immediate issue of right shares.

From an examination of relevant facts, it should have been apparent to stock markets that, though there were prospects for issues of right shares by Tatas, there was no reason why Indian Iron should issue right shares. Tata Iron and Steel Company needs finance to implement expansion projects. There are three sources from which the Company can secure capital.

According to tentative plans, Tata Steel Company was to have secured finance from the World Bank, the Government and the new issue market. Tata Steel Company's talks with the World Bank have seem-

ingly failed. It is, therefore, only to be expected that the Company will find it necessary to raise capital from the new issue market. This expectation has recently been confirmed by the Company.

Indian Iron's Finances

Consider, now, the relevant facts about Indian Iron. This Company secured a loan from the World Bank a few years back. This Company also has expansion plans under contemplation. But shortage of funds is not preventing the Company from implementing expansion plans. As dearth of finance is not a problem for this Company, it is surprising how rumours of right issues by this Company got current.

Recently, when the Government announced an increase in retention prices for steel, it was stated by the Government that increased profits arising out of higher retention prices must be earmarked for financing expansion projects of existing steel companies. Tata Steel secured the Government's permission to raise capital by issuing right shares.

Company Notes

Active New Issue Market

AFTER remaining stagnant for months, the new issue market has become active again. Since the third quarter of 1953, many companies have raised capital through issues of bonus shares. This movement was halted by the third quarter of 1954, as stock markets developed a downward trend. In the last month and a half this movement has revived.

In retrospect, it is doubtful whether the stagnant conditions in the new issue market in the last few months is due to lack of investible funds or to New Delhi's delays in granting permission to requests for enlarging capital. It will be recalled that the Taxation Enquiry Commission had recommended that bonus issues should not be taxed. After the publication of the Commission's report, it was thought that the Controller of Capital Issues would expedite decision on pending applications for capital increases by companies.

According to the managing agents of Indian Iron and Steel Company, Ltd., the Company will not raise further capital immediately by issuing any right share. Soon, the Tariff Commission will be holding an enquiry into retention prices for steel as from April 1, 1955. It is argued by the managing agents that the question of the necessity of raising further capital cannot be dealt with until the Government's decision in the matter of a revision of retention prices has been announced.

It is clear that the Tariff Commission's enquiry cannot be concluded before the time comes for Indian Iron to announce its dividend for the year to March last. Though the information supplied by the managing agents of Indian Iron does not preclude any issue of right shares, it would seem that there is no possibility of any such issue in the immediate future. This should have a "bearish" effect on Indian Iron. A downward trend in Indian Iron may have an adverse effect on equities in general in the coming weeks.

Delay in granting permission by the Controller had fostered the impression that, in spite of the Taxation Enquiry Commission's recommendation, the Government might decide to tax bonus issues. Such apprehensions not only caused uneasiness in stock markets, but also resulted in inactivity in the new issue market. Latest developments are, however, encouraging, and have created the impression that the Government may, after all, decide not to tax bonus issues.

Asoka Cement

AMONG recent industrial borrowers from the new issue market, the pride of place goes to Asoka Cement. This company's present issue amounts to 4,50,000 equity shares of Rs 10 each at par. Of this amount, 1,50,000 equity shares of Rs 10 each have been already subscribed, and allotted accordingly. This company has now entered the new issue market for 3,00,000 ordinary shares of Rs. 10 each. These

shares are offered for subscription by the public at par.

This is one of the new issues in the last few years which is not a bonus issue. That is why the Asoka Cement's entry into the new issue market is significant. Since the commencement of the first Five-Year Plan, cement production has increased considerably. But the demand for cement is far in excess of the present supply. In the second Plan, there is emphasis on housing and construction projects. Demand for cement will certainly increase along with industrial development. As this is an instance of a new issue in the real sense of the term, it is not surprising that the Asoka Cement issue has been widely recommended by all responsible investment analysts.

ISSUES of bonus or right shares continues. Plans for raising capital by issues of rights shares by Rohtas and Indian Paper Pulp

Last Chapter in Freedom Struggle

(Continued from page 1036)

the press, some foreign correspondents who spent a week in Goa covering the Independence Day satyagraha found that a large number of the local people, whom they interviewed, were eager for merger with India. The journalists are said to have received many anonymous and a few signed letters stating that they were unhappy under the Portuguese. The letters revealed that Goans had no civil liberties, that they lacked a free press and that they would prefer to join India. About conditions in Goa, this was what Nehru said in Parliament on July 25th of this year, "The struggle of the Goans for freedom and for integration with the Union of India is not a new development. Ever since 1946, there has been a continuing agitation in Goa, and many Goan patriots have suffered because of this. Eminent citizens have been sentenced to long terms of imprisonment or deported. Even an expression of opinion in favour of integration with India or a verbal protest has led to imprisonment, loss of civil liberties and sometimes deportation. There is complete absence of civil liberties in Goa, and the normal methods of constitutional agitation are forbidden and suppressed". It is against this background that the role of Goans in the movement should be assessed.

have already been discussed in these columns. There are reports that Jessop and Company propose to raise capital by issuing new shares. This Company has been granted a licence to manufacture diesel road rollers.

Britannia Engineering have obtained permission of the Controller of Capital Issues to raise capital through issues of bonus shares. Their new issue will be on the basis of three for one held. Ordinary shares of Rs 10 each will be issued for cash at par.

Britannia Engineering have a reputation for manufacturing modern tea machinery. This company intends to extend its activities by producing jute mill machinery. Capital is being raised mainly to finance erection of a new plant to manufacture jute mill machinery. A portion of the capital will be utilised to erect a new plant for the manufacture of modern tea machinery.

If Salazar were so sure of his ground and the loyalty of Goans to Portugal, why should he not grant universal adult franchise, hold free elections in the true sense of the term and have the issue decided once for all? The main aim of the present satyagraha movement is not to bring about integration of Goa with the Indian Union but to restore freedom of expression and other civil liberties to the Goans themselves.

If the Government of India is not prepared for a show-down, it is not because the Prime Minister is indifferent to the freedom of Goa, but rather because he is afraid that any deviation from the policy of peaceful settlement may set a pattern of action tending to reverse the trend towards peaceful settlement of outstanding problems witnessed at Geneva and after. There are numerous sore spots where the situation is highly explosive. But that is only one side of the picture. There is another and a more important side.

Panch Shila Inapplicable

The whole continent of Africa and many colonies in Asia and other parts of the world are still struggling to free themselves from colonial powers. More than once, it has been acknowledged that India's

freedom movement has been a source of inspiration and encouragement to them. As the struggle of the colonial peoples is a struggle against the sovereignty and territorial rights of the occupying powers, the concept of 'Panch Shila' is meaningless to them. What is more, its acceptance will completely torpedo their basic and inalienable rights. Nor, for instance, can Free India and Salazar's Goa peacefully coexist. This aspect is examined here because there has been some confusion in certain quarters that the adherence of our Government to the principles of 'Panch Shila' and the policy of peaceful coexistence precludes any action for the liberation of Goa that is not strictly in conformity with them. It must be clear that these principles are meant for free nations with different economic systems. They are totally irrelevant and in-

applicable in a situation of this kind.

Judged by the merits of the claims and the relative strength of the disputants, Portugal has absolutely no chance of vindicating its position unless it has the secret backing of bigger colonial powers. In such a case, what is the point in appealing to international opinion and decency? What is this international opinion if not the opinion of the leading powers of the world? So long as they do not support us openly, will it be wrong to presume that just as they are said to have secretly expressed their sympathy to us at diplomatic levels, they might have also given assurances to Portugal in a similar manner that she could bank on their non-intervention, if not their active support.

We would be sadly disillusioned should we entertain foolishly hopes of big power intercession on our

behalf. It will be useful to note that the so-called civilised world, which was found to be very vocal in the past over similar incidents elsewhere, is yet to speak out against Portuguese brutality. On the contrary, many of the foreign papers, including the traditionally liberal one, the *Manchester Guardian*, which cared to comment on this subject, have very faithfully echoed the Portuguese description of the Satyagraha as an 'invasion'. Vested interest has clouded their vision. One is inclined to put to these enlightened people two simple questions. Is this the way invasion has taken place in the past—unarmed men and women silently offering themselves before machine guns without protest or resistance? If Indians really meant to invade Goa, would the Portuguese authorities be able to withstand it even for a few hours?

To refer to Britain in particular, she is a super-colonial power with the largest foreign possessions to her credit. She is fighting her own battle through smaller powers. In the book referred to earlier, Shri T B Cunha has pointed out, "The support given by Britain is due to the fact that Portugal is practically a British Protectorate. The old alliance of the two countries for the exploitation of African and Asiatic colonies is well-known. England has an absolute hold on the economy of Portugal. The export trade of main Portuguese products like port wine, cork, food preserves etc. is a British monopoly. In the city of Lisbon itself, even the telegraph, telephones, tramways and buses are owned by British firms. In Goa itself the sole existing railway and port of Marmagoa are a British concern."

(To be continued)

Company Meeting

Alembic Chemical Works Company Limited

Speech of the Chairman Mr R B Amin

FOLLOWING is the summary of the speech delivered by Mr. R. B. Amin, Chairman of the Board of Directors of the Alembic Chemical Works Company Limited, at the Forty-Eighth Annual General Meeting of the Shareholders held at Baroda on the 25th August 1955. The year under review had been an year of steady progress, the beginning of which was made last year. The progress of the two subsidiaries was even marked. The increase in the sales of the parent and subsidiaries was easily noticeable from the published accounts.

The present was the last year of the First Five-Year Plan and the Second Plan was taking shape. According to indications available, a total investment of Rs 5600 crores was envisaged during the period of the Plan. Of these, Rs 1400 crores were estimated to go in for Industries and Mining (including Small Scale Industries) and the Company's Shareholders must have been interested to know that out of these Rs 1400 crores, Rs 150 crores or over 10% were meant for Chemicals, Drugs and Fertilizers.

Mr. Amin, however, thought that there were one or two disturbing aspects of the Plan. Firstly, of the investment of Rs 1400 crores, Rs 200 crores were for small Scale and Village Industries. The organisational effort needed to put Small Scale Industries on a sound footing would have to be immense and while success in this effort would yield limited results, failure might prove quite disastrous; any new employment that they would create could only be artificial and of a temporary nature. Secondly, the plea of the Economists' Panel for a "firm legislative and administrative base" would, Mr. Amin apprehended, undermine by degrees our democratic social order. We already had a taste of such a measure in the Constitution Amendment Act.

Mr. Amin said that in the current economic situation in India, one of the main bottlenecks to further progress was the shortage of transport facilities. Complaints about non-availability of wagons were rife; tankers were scarce. There were

delays and restrictions. As regards Roads, the mileage was utterly inadequate and the progress made in the last ten years was unimpressive. Mr. Amin thought that, in these circumstances, he could hardly over-emphasize the need for construction of new Roads and Tracks, for the procurement of Rolling Stock, construction of Ports and other increased facilities for communication.

Mr. Amin was surprised at the recommendation of the Taxation Enquiry Commission that there should be restrictions on consumption; this, he thought, was unwarranted, as the existing level of living was extremely low.

The Pilot Scale Studies for the manufacture of Antibiotics at the Company's works, Mr. Amin disclosed, were progressing well. The issue of Rs 10 lacs of Ordinary Shares made for financing the proposed development of the Company was expected to be taken up by the existing shareholders alone.

Greater efficiency in cool working conditions

—with **Carrier**

self-contained air conditioners

WHEREVER a Carrier self-contained air conditioner is installed, the staff begin working better than ever before. The cool, noise-free atmosphere leads to greater efficiency; even a small increase in efficiency will pay for the cost of the Carrier in a couple of years!

You can change the action of your Carrier to suit the weather, to get extra coolness on hot days, extra dryness on damp days!

**Works silently, cuts off noise**

Your Carrier self-contained air conditioner works as quietly as a whisper. At the same time, since you shut windows and doors, it helps to cut off street noises, lets you work or relax in silence and comfort.

**Cools better at less cost**

Specially-designed coils and filters make your Carrier more efficient, help it to cool better at lower cost.

Remember—the Carrier self-contained air conditioner is remarkably compact, and takes up little floor place. The sale of these

**Circulates clean, filtered air**

Your Carrier sucks in air in a steady stream, filters it, then spreads it gently and evenly. So you get an equally-cool temperature throughout—no dust, no unpleasant draughts!

**Removes more moisture**

Your self-contained Carrier not only lowers the temperature but removes moisture from the air—gallons of it! A new 'Humitrol' regulates the rate at which moisture is removed.

units in India is backed by Voltas' unique after-sale service and their engineers' unmatched experience in the line.

Loose Ends

DRAWING up of the Second Plan could be organised a little better, not merely to enable the public to follow its development more intelligently but also perhaps to help the planners themselves to clear up difficulties and resolve their differences step by step. There is no reason to doubt, of course, that in the end everything will fall into its proper place and the Draft outline of the Second Plan will be ready in due time and maybe according to schedule, that is some time next month. But because some steps are skipped, or the participants do not have all the data before them they cannot come to a final decision, many points are left loose or hanging, and issues which should have been decided and closed are re-opened again and again.

The manner in which the Companies Bill is being handled is an example of this sort of thing. True, the Companies Bill is not an integral part of the Second Plan, but management of industry cannot be treated as a thing apart, when the main emphasis in the next Plan is on industry. This is also evident from the fact that the Finance Ministry has now set up a separate wing for company affairs. The manner in which the Bill was changed in the Select Committee stage was unusual, but it would not have been so bad, had the changes fully reflected a consensus of opinion in Parliament, so that Government could know and the country could know the role that had been given to management in the private sector in the Second Plan period. At one time it seemed that Pandit Nehru was himself opposed to changing horses in mid-stream and that the Congress had made up its mind that it could not risk a violent change in management, having decided on a mixed economy which left a large part, in fact the more important part, to the private sector. In view of the long period of gestation through which the Bill had passed, the Finance Minister's readiness to yield and accept amendments appeared to be somewhat inexplicable.

There were points on which he admitted that the drafting had been faulty and loop-holes had been left open which should have been plugged at an earlier stage. But the subsequent career of the Bill in Parliament left no room for doubt that the measure of agreement achieved was not what it was taken to be. That a crisis was averted through the personal intervention of the Prime Minister does not speak much either for the cohesion of the party or for Government's appreciation of the seriousness of the measure. The future of managing agencies not only concerns the country but also foreign capital which is already invested and the continued inflow of which has not only been accepted by Government but on which Government has been banking to a considerable extent.

The progress of the formulation of the Plan, it is not possible to follow so closely. The draft Plan-frame was accepted by the National development Council. This being the highest authoritative body in the country, its acceptance of the Plan-frame could be taken to imply that details and internal consistencies alone remained to be worked out. The Standing Committee of the National Development Council at its July-end meeting also approved the financial targets. The Committee is meeting on Monday next but it would be wrong to assume, judging from past

experience, that it would come to grips even with the basic problem of equating the financial and physical targets. For, the Planning Minister himself is reported to have submitted a note which would seem to re-open all these questions. He has now come to the conclusion, it appears, that the targets of employment and national income set out in the Draft Plan-frame cannot be achieved. The conflict between the two targets, physical and financial, cannot be resolved by raising the latter but every attempt will be made to attain at least the financial targets.

Little progress seems to have been made towards arriving at firm figures. The programme for industry approved by the Central Advisory Council does not exactly square with the provisions of the Draft Plan-frame. The competing claims of the different States are, of course, never easy to reconcile and though during the last few months the States have presented their case to the Planning Commission and have had a series of discussion, the upshot of it cannot be known until the basic frame-work, into which these claims are to be fitted, is made more

firm than what it is today. Surprisingly enough, unlike the States, the other claimants on resources, particularly the Central Ministries of Transport and Communications, have been strangely silent, while all along complaints have been flowing in from various quarters that the provisions for transport are woefully inadequate.

As the date for finalising the Draft Outline draws near, demands are being put forward by different sections. The Federation of Chambers of Commerce and Industry, the All-India Manufacturers' Organisation, the Millowners' Association and the Khadi and Village Industries Board have all published their plans during this week. The Federation wants an even more ambitious plan than the Draft Plan-frame, but naturally it wants the job to be handed over to the private sector. On the question of employment, however, the Federation has no further light to throw. In its own Draft Plan published earlier, the Federation claimed a multiple effect on employment if its pattern of investment was accepted; now it uses a different language and

talks about the snow-ball effect of employment in consumer goods industries on other sectors of the economy.

The Khadi and Village Industries Board is prepared to silence the critics that hand and household industries would neither be able to deliver the goods nor provide substantial employment. Indeed not to speak of 4 million jobs estimated under this head (including construction industries), the Board claims that it would be able to find employment to 7½ million people during the Second Plan period for the modest outlay of 300 odd crores, of which a little more than half will be given out as loans and the balance distributed roughly in equal proportions between development and administrative set-up and field organisation. All that it wants is, apart from modest finance, appropriate changes in Government policies, a common production programme and a common price policy.

The time has come now for tying up all these loose ends into a knot. Will the Standing Committee attempt it at its next meeting?

Myth of Greater France

BRITAIN quitted India immediately after the war. End of British colonialism in Asia was a direct sequel to the peoples' struggle for independence in this part of the world. It was partly due to the late President Roosevelt's insistence, on behalf of America, that colonialism must go. It was at the instance of America that a Good Offices Commission of the United Nations was appointed to facilitate transfer of power by Holland to Indonesia. Burma, India, Pakistan, Ceylon and Indonesia became independent nations. Despite the willing withdrawal of Britain and the forced retreat of Holland from Asia, other European metropolitan Powers continue to administer their colonial territories in this region. Belatedly, France withdrew from her "possessions" in India. Unlike France, Portugal has never even made a pretence of offering a theoretical alternative to colonialism. She still claims sovereignty over her "possessions" in India.

Portugal is a fascist State and an unabashed colonial Power which recognises no humane or political obligation to end the colonial status of her "possessions". But the massive massacre and blood bath

in French North Africa are poignant reminders that colonialism persists as a threat to peace. Colonialism has retreated from both East and West Asia. But it plagues Africa. Neither Britain nor France admits that it is their intention to perpetuate colonialism in the Dark Continent. But both Britain and France have advanced sophisticated political theories in support of their hold on territories in Africa. In Malaya and in the British territories in Africa, society is multi-racial. There is difference in the multi-racialism in Malaya and in the British areas in Africa. But Britain pleads that it is her intention to create multi-racial States and political entities in areas where society is multi-racial. Such a political solution poses entirely different problems for Malaya and the British territories in Africa. There have been sporadic attempts to implement this political theory in practice in both the regions. But the efforts have been half-hearted, and the progress toward self-government remains tardy and tortuous.

Under the force of compelling circumstances, France has now changed her policy to Indo-China. Recent developments are ominous. But

there is still hope that the future of the Indo-Chinese States will be shaped and influenced by the gradual implementation of the Geneva Agreement. Latest developments in French North Africa and the influences which led to the subsequent fall of M Mendes-France would seem to lend weight to the suspicion that the Geneva Agreement on Indo-China might not have been concluded had M Mendes-France not then been the French Premier. M Mendes-France was voted out of power, when he was at the height of his glory, on the issue of his policy to French North Africa by the combative Colonial Lobby in the French National Assembly. It is this powerful Colonial Lobby, fortified by the support of the French settlers, which is now prolonging the Cabinet crisis on the Moroccan issue.

Though compelling political circumstances have forced France to shift her ground, it is interesting to examine her plausible alternative solution to colonialism. To criticisms of the French policy to Indo-China and French North Africa, Paris has always replied that the

French political system and ideology are not adequately appreciated outside France. Britain has quitted Asia. But, with the exception of Burma, all the former British territories now remain members of the Commonwealth of Nations as free, independent nations. France has sought to propound a similar political concept as the foundation of her policy to her colonies. According to this concept, France is willing to offer equal partnership and privileges to her former colonies as Associated States of France. Algiers, legally a part of France, is proudly held as a model of such political, cultural, social and administrative assimilation of metropolitan France and her former territories overseas. This Greater France idea is held out to be a political concept and experiment similar to that of the Commonwealth of Nations.

Indo-Chinese States have refused to be deluded by such a political mirage. French "possessions" in India could not be seduced by this political camouflage. Inhabitants of Algiers deny that they have the same rights and privileges as the inhabitants of Paris. Neither Tunisia nor Morocco accepts the future status of an Associated State of France. Far more damaging is the disparity between France's words and deeds. There was a time when Ho Chi-minh would have accepted the substance of the French policy of transforming the Indo-Chinese States into Associated States of France. Paris refused to negotiate on these terms. France has never seriously negotiated with the Indo-Chinese leaders on this political basis. A plan of political reform is in process of implementation in Tunisia. Tunisia will have control of domestic affairs, but defence and foreign affairs will continue to be administered from and by Paris. Morocco is more unfortunate. France is not prepared to offer even an attenuated form of Home Rule to Morocco. From the comments in the world Press on the violent disturbances in Morocco a few days ago, it would seem that France has succeeded in spreading confusion. It would be foolish to pretend that the violent demonstrations in Rabat and Casablanca are sequels to tribal and religious feuds between two ambitious Sultans. As the Democratic Independence Party emphasises, the heart of the Moroccan problem "is the problem of sovereignty and independence".

Between the Commonwealth of Nations and the French concept of Greater France, there is a fundamental difference. All the members of the Commonwealth are independent, sovereign nations. All the Commonwealth members have complete and sovereign control and authority over their defence and foreign affairs. All the Asian members of the Commonwealth became independent and sovereign before they voluntarily agreed to remain as members of the Commonwealth.

These are the essential political and legal attributes of the Commonwealth of Nations which are lacking in the concept of Greater France. Post-war developments underline France's incapacity to move with the times. France has lost Indo-China. She will soon lose her colonies in North Africa. But she can even now retire from North Africa with grace. Political wisdom combines with economic necessity to dictate such a statesmanlike policy.

Weekly Notes

Who Commands Nehru?

"HE said what he was told to say. So meticulously careful was his briefing that nothing was left out. The press and the wicked citizens, who should have minded their own business, were, of course, there. The zamindars, the Communists who always fish in troubled waters, the erstwhile bus owners exploiting the situation for their own ends, the Rajput-Kayastha casteism—all these were there and many more tendentious things".

These lines are from a statement issued by Shri Jaiprakash Narayan on Pandit Nehru's Patna speech. Commenting on the same subject, it had been remarked in these columns only last week that "the Prime Minister has no other advisers except the official bloc in the Congress which is one and the same as the Government on which he naturally leans heavily." Even from this distance, this was obvious and clear. But one could hardly imagine that Pandit Nehru could be dictated to in such a fashion and made to give a "command performance".

This is not all. It was the burning of the national flag which pained and provoked Pandit Nehru beyond endurance. Even so, the following comments from Shri Jaiprakash Narayan deserve careful attention:

"When the Prime Minister shouted at the top of his voice that he did not care whether ten thousand or ten hundred thousand persons were shot dead and that he would not permit the dishonour of the national flag, he was employing accents of totalitarianism. Democracy above all is the rule of law; there is no law in this country according to which anyone can be shot for burning the national flag; and there is no such law in any civilised country. This, in spite of the fact that all citizens are agreed that the national flag must be respected and honoured."

T T K Said Nothing

T T K opposes neither nationalisation nor mutualisation of insurance companies. He said nothing at all or nothing that was intended for publication. The following correction appeared in *The Times of India* of August 11 which had escaped our attention:

"The informal talks which the Union Minister for Commerce and

Industry, Mr T T Krishnamachari, had with some pressmen in Bombay on Tuesday were not meant for publication nor did they touch the question of nationalisation of insurance companies. The U P I report published yesterday was, therefore, wrong and its publication is regretted."

Our hunch has come true. T T K could not have said that mutualisation would rob policy-holders.

Border Trade with Pakistan Resumed

THE Indo-Pakistan Trade Agreement which comes into force from the 1st of this month was negotiated before devaluation of the Pakistan rupee. That the agreement was not modified after devaluation suggests that, at least for the time being, a fairer rate of exchange cannot help much to expand trade between these two countries. The reasons are not far to seek. For one thing, judging from current prices and costs, the over-valuation of the Pakistan rupee has been reduced; it has not been removed altogether and hence parity between the two rupees is yet to be attained. For another, Pakistan's existing commitment under the American aid agreement debars resumption of trade with India on the only basis on which trade is possible viz. the exchange of Indian cotton textiles for Pakistan raw cotton, among other things.

Though the present agreement removes all impediments to foreign trade between the two countries in major commodities also—Article VIII stipulates that in respect of all commodities, import and export licences valid for the non-dollar currency area shall be valid for India and Pakistan also—its special concern is to facilitate exchange of (1) items which do not normally figure in foreign trade, such as cinema films, books and publications; (2) border trade in everyday necessities of life. The latter varies according to the border.

A quota 17 films has been fixed for the import of Hindi and Bengali films into East Bengal. The Government of India has placed import of films from Pakistan on the open general licence. But there is an ominous hint that the "exchange

earning from the export of Pakistan film to India will be utilised for the import of Indian films into West Pakistan". If this means a quid pro quo, then few Indian films can be exhibited in West Pakistan!

Besides coal, exports from India entitled to special treatment include stone boulders, hard and soft wood, mica, bauxite, betel leaves, ayurvedic medicine, biri and hookha tobacco and biri leaves, chemicals and pharmaceuticals, mill board and straw board and spices. Exports from Pakistan include raw jute, hides and skins, betel leaves, fish, poultry and egg, betel nuts, salt-petre, and rock salt. The permissible staple length of raw cotton is 15½" (7½") but with surplus American cotton in the offing and Indian mills eager for African varieties, what scope is there for importing Pakistan cotton?

Voluntary Credit Restriction in Switzerland

THE Zurich Correspondent of *The Statist* (dated June 11, 1955) gives an interesting account of the gentleman's agreement entered into by the leading Swiss commercial banks for credit restriction. The agreement, effective provisionally for a period of one year from June 15, 1955, comprehends all banks with balance sheet totals exceeding fr. 50 million, and these account for nearly 90 per cent of the corresponding aggregate for the Swiss banking system.

According to this agreement, commercial banks will deposit 3½ per cent and mortgage banks 2½ per cent of their short-term liabilities as on December 31, 1954 i.e. funds callable at sight within a month, plus 15 per cent of all savings deposits for which no notice of withdrawal has already been given, in blocked accounts at the Swiss National Bank during the currency of the agreement. It is also provided that on September 30, 1955, the proportion of funds to be impounded in blocked accounts will be recalculated on the position of short-term liabilities as on June 30, 1955, and again on March 31, 1956 on the basis of the position as on December 31, 1955. If, however, the object of the agreement ceases to exist before the due date of expiry, it is open for the concerned banks to terminate the agreement.

Switzerland in recent years has been faced with the problem of a plethora of investible funds and shortage of investment outlets. This led to excessive diversion of funds to the building industry. The shortage of building labour forced up wages; there was also speculation in real estate and in foreign securities which was largely sustained with borrowed funds. The necessary corrective has now been provided by the present agreement among the bigger banks.

Breaking the NEFA Impasse

IT was not so long ago, as time is reckoned by the calendar. But it was in the dim, distant past, almost in another age that Gandhiji admonished the Congress Government in Bombay for applying police methods on some criminal tribes in Sholapur instead of sending out trained social workers among them to bring them round to a peaceful and better way of living. This he did through the columns of the *Harijan* in an article appropriately entitled "Storm Signals". Now from criminal tribes to tribals is a far cry, for the nomenclature of the first implies the existence and acceptance of a norm, by deviating from which the recalcitrant group creates a problem of social adjustment. In the case of tribes, however, how can one talk of deviation from a norm since except the wooden type of administrator, all others agree, some from sentimental reasons, others on high scientific round, that they are better adjusted than we are and that it is undesirable in the extreme to break up the harmony of their social life. From another point of view—and this appears to be the more sensible—as argued by a correspondent in these columns in an answer to a passionate pleading for a fair deal to tribals made by an artist, we are all semi-tribals and are facing more or less the same problem of social adjustment, being uprooted from the traditional village society and not quite settled and adjusted to urban le-tribalised society, and freed from caste affiliations.

So one can readily appreciate Pandit Nehru's perplexity. Reply to questions at a Press Conference in Dibrugarh after his tour of the tribal areas of North Eastern Frontier Agency, Pandit Nehru said that he would not like too many reforms or sudden changes to be effected in the daily routine of life of the tribals of NEFA. Such cul-

tures could be changed with contacts or they may be left to themselves. "Both courses appear to me to be not quite right". There were political reasons, however, he added, why a vacuum should not be created here. Nevertheless, "sudden impact of technical civilization on primitive cultures lead to their gradual decay." The impact of technical change on culture has been a favourite subject of study for social anthropologists in recent years. But one need not be a specialist to be able to imagine that sudden impact of technical civilization can be pretty troublesome for people of primitive cultures, if by it is meant the impact of Assam Rifles or of units of the Indian Army.

The most hopeful solution suggested by Pandit Nehru was through the development of community projects. In Garo Hills, some project officers have done wonders. The people are co-operative, happy and gay. Nature is not unkind. There is plenty of land to be reclaimed and brought under the plough. Instead of being meta-physically minded, being primitive, the Garos are naturally curious, inquisitive

and interested in things. Though some of the tribes resist attempts to change their methods of cultivation and would not take to a plough in place of hoe, they are quite ingenious in their own way in bringing water from long distances through improvised pipe lines made from split bamboos. They have also a flair for the art of house building and can be encouraged to utilise for the purpose wild grasses, bamboos and timber, in all of which the Assam hills abound. Many of these areas being thinly populated, the techniques that community projects have to introduce at times are very advanced, such as ploughing by tractors and jungle clearance by bull-dozers.

But was Pandit Nehru quite happy in his choice of language when he extolled community projects as the best way "to break the Naga impasse"? So deeply has the iron entered our soul that even in expressing the most non-violent of sentiments, we readily seek the analogy of force and use quite violent metaphors. They would be quite innocuous, but for the Assam Rifles and the Indian Army Regiments.

EMPIRE'S REPORT OF PROGRESS

in 1954

New Business ..	Rs. 3,84,06,774
Total Assets ..	Rs. 12,38,65,607
Total Claims Paid ..	Rs. 14,65,12,947

Highlights from the Administrator's Report:

- ★ Every prospect of an increase in the bonus to Policyholders.
- ★ Nearly 70% of total Assets invested in Government Securities.

Off the Record

Postal Burden on Books

DHAMMA PADA is not an educational book under the definition of sales-tax nor is the Digha-Nikaya. So the cost of three slender volumes—do not be misled by the name, the latter two are translations in parts—is therefore raised in this particular case from Rs 9-8 to Rs. 9-15-3; but that is not all. On a packet of books costing Rs 9-15-3, the VP and money order charges come to Rs 2-3-9. If this is not a tax on knowledge, one would like to know what is Government's idea of taxation?

True, heavy postal charges are not a tax in the sense that one cannot be compelled to use the post and pay these charges, and against the payment, a service is rendered in exchange. Now whether the service rendered is equal in value to the price charged for it raises difficult questions of costing and the pricing policy of public utility services. By and large, it is necessary and desirable that public services should not only supply services to the public, they should also bring something in addition to the exchequer, so that these services may be improved and expanded and various other services, which are now either inadequate or not being provided at all, may be undertaken by the State. So books, even the serious and unprofitable ones, have to take their place with others and bring grist to the mill.

No discrimination is made in this matter. Book posts are book posts, irrespective of the subject matter of the books or other printed literature, whether it be advertising material, a price catalogue, or a circular aimed at the noblest impulses in man and calling upon him to come to the aid of a good cause or contribute to a charity; or whether the circular appeals to the basest instincts, exhibits naked greed or exploits the foibles of mankind, ranging from the desire for riches, beauty, health, or fame, success in love or litigation, and takes mean advantage of his fear of death or misfortune. Carriers are unconcerned about what they carry, so long as the thing carried is not some dangerous substance that may explode or otherwise cause damage while in transit. It is only in the United States of America that there are

legal restrictions against objectionable matter being sent by post, the infringement of which is a penal offence. But that is a different story.

Though the postal services do not discriminate between different types of books or other printed material carried by book post, it is not to say that it is not possible to make such discrimination. But even if it is, not impossible, it would be infinitely troublesome. Why, it may be asked should the postal department take upon itself the unrewarding task of separating the grain from the chaff or tares from corn? It would not pay. There is, however, discrimination, and quite a sharp one at that, between different kinds of postal articles. The letter post is different from the book post. Then there are registered and unregistered letters and the privilege of registration is extended to books, parcels on the payment of an additional fee. Since the introduction of 'all up' air mail the discrimination between letters and books and papers is a very real one and it goes very far indeed. It is not merely a matter of carrying letters more expeditiously by air, wherever there are air services. For where air transport is the only form of transport available, as it is today in many parts of Assam, the rail link having been breached by the floods, it is a matter of carrying the mail or not carrying it at all. Letters get through to the flood-affected parts of Assam, books and papers sent by book post accumulating somewhere, awaiting the restoration of surface communication.

The 'all up' scheme is being extended and though the night air mail service is no longer what it used to be, letters still get around much quicker in those places which are connected by air services. This of course, implies a very great, and in some ways, a very unfair discrimination against those who are beyond reach of air services and in this category come most of India's small towns and villages. With all praise to late Kidwai for inaugurating the 'all up' air mail service, for letting us have the latest by way of modern conveniences in the matter of letter post, one could nevertheless make out a case. In

the grand manner one could say that India lives in villages, that, 90 per cent of her people do not have the benefit, at least not directly, of 'all up' service, and why should the village be made to pay for the expeditious carriage of letters to the few privileged dwellers of cities? The poor man's post card was a favourite cause to be espoused by the politically minded in the old days. We have even forgotten that the postal service is a service to the public on which the Government is not supposed to make any money. In fact, the Centre has been, or rather had been making a tidy sum from posts and telegraphs after Independence, in sharp contrast to the pre-war years when the department just broke even. Indeed the net contribution to general revenues of posts and Telegraphs had gone up from Rs 90 lakhs in 1938-39 (undivided India) presumably to Rs 1,36 lakhs in 1948-49 and it improved steadily to Rs 3,98 lakhs in 1950-51. It was still high at Rs 3,43 lakhs in 1951-52 but from this year onwards, it began going down until in 1953-54, the budget estimates under this head fell to Rs 40 lakhs and postal rates were raised in that year's budget to bring up the net contribution to Rs 1,90 lakhs. This was the year when book post came in for added imposition. The actual realisation of that year, however, far exceeded the budget expectations; but in the following year, 1954-55, for the first time, revised estimates at Rs 1,40 lakhs were slightly below the budgeted Rs 1,50 lakhs. In the last budget, credit taken under this head was for no more than Rs 70 lakhs.

The turning-point was 1952-53 since when earnings from Posts and Telegraphs have been steadily going down. But they have not been going down because the benefits of a cheaper service were being extended to the public in the form of lower cost of service. Far from it. But whether the benefits were being passed on in the shape of improved quality of service or not, is more than one can say off-hand. Actually what has been happening is that working expenses have been steadily going up. In the last four years, working expenses went up from 40.06 crores (accounts 1953-54) to Rs 42.56 crores (RE 1954-55)

and Rs 44.56 crores (BE 1955-56). Along with the increase in working expenses, interest on debts has also substantially gone up e.g. from Rs 1.7 crores in 1953-54 to Rs 2.36 crores in 1955-56. The latter is not unimportant, for capital expenditure of the department has been increasing with installation of telephones, addition to equipment and other improvements.

The Taxation Commission's general recommendation is that though there should be no objection in principle to using railway travel as a basis of taxation, for the postal system, service rather than revenue should be the test of success. Postal rates designed broadly to cover the cost of operation or to bring in moderate net receipts, the Commission held, were appropriate in respect of this elementary public service. By and large, this is the policy which the Government of India has followed. Though, as pointed out above, postal earnings after Independence had shown an upward trend and had been quite substantial compared to what they were before the war, this was due to accident rather than design. In many of the years, revised estimates showed a substantial increase over the budget estimates. In other words, postal earnings had shown the same buoyancy as revenues in general in those years and had benefited from the same conspicuous under-estimation of revenues in general.

Granted that postal rates should cover cost, the distribution of cost over a wide range of services—letters, newspapers and periodicals, books, commercial and publicity literature and sheer muck—leaves some room for intelligent adjustment guided by wise social policy. If this is done, books should have a fair case to plead.

In the classification of mail, the principle actually adopted is only partially that of public interest. Here also, as in other human affairs, there is exigency and concession to pressure. This is patently the cause in extending preferential treatment to newspapers and periodicals—shall we say, because of the political pressure the Press can bring on Government and its nuisance value? If dissemination of news is important, so is propagation of knowledge. Let us have a classification of books by all means. But let not the habit of reading books, without which mere schooling is largely a social waste, be handicapped, ever so little, because some one in the Ministry is

too lazy to think up something better.

Opening of post offices in villages is a very good thing in itself by which the Minister in charge also gains in popularity. The book trade, however, does not add up to much that way; it is obviously unable to exert any appreciable political pressure but its claims are not to be ignored because of that. Now we began with the heavy postal

charges on a packet of books on Buddhism. In the year of the Buddha Jayanti, a Minister with a little imagination can cash in on the idea, by offering to carry books on Buddhism at a lower rate or even by carrying them free. In drawing attention to what appears to be unjust discrimination against books, it was not the purpose to give any such tips.

NEW INDIA STORIES FROM LIFE 2

'My advice saved this boy's future!'

Years ago, I persuaded my good friend and neighbour to take out an insurance policy. He thought I was being fussy, when I brought up the question of his son's education. His son was just six months old then.

Ten years later, my friend was struck down in the prime of life by a sudden heart attack, and he died almost at once. I took over the guardianship of his son.

Today, the boy is studying to be an engineer. The New India Life Assurance Policy his father invested in has paid for his education. And imagine my feelings, for indirectly I had ensured a successful future for the son of my friend.

An insurance policy taken out now
may one day stand
between you and disaster.

THE NEW INDIA ASSURANCE CO. LTD.,
Mahatma Gandhi Road, Bombay 1.

NI. 8993

No Test Case

UNLIKE the chairmen of other insurance companies, the Government appointed Administrator of Empire of India Life Assurance Co. Ltd., could not naturally afford the luxury of surveying the political scene and commenting on economic policy and legislation at the Annual General Meeting of his company. Nevertheless, like other insurance chiefs, he also touched on nationalisation. His own humble contribution to the discussion was that the issue had to be decided by experts in an objective manner but that the experience of his own company could not be decisive either way. Far from being a test case of private versus public management in insurance business, Empire represents on the contrary a notoriously bad case of private management and one of salvage operations under a Government appointed Administrator, who has been trying, with remarkable success, in repairing the damage done by predatory private enterprise in the past. The circumstances which led the Government of India to take action under Section 52A of the Insurance Act are well known. So the point need not be laboured.

Sri R. Varadachari is, therefore, clearly on unassailable ground when he says that Empire is no example of public management. Its management differs from that of other companies only in two respects. The present management had to start with a severe handicap, the legacy of mismanagement in the past, and it insists on strict compliance with the Code of Conduct. Far from having a top heavy administration which is usually associated in the public mind with Government management, and a hierarchy of higher-ups, in Empire, according to its Administrator, there is no hierarchy of officials and no intermediaries between Branch Secretaries and the agent, beyond what is permitted by the Code.

Empire's achievements during the last four years under the new administration, to quote the Administrator, are:

"reduction in top heavy salaries, increase in the salaries of the subordinate staff, stabilising the finances, creating a big reserve of Rs. 116 lakhs to meet losses from bad and doubtful investments (very few companies in India would be able to do this), increasing the dividends to the share-

holders and the bonus to policyholders, and with all this, lowering the overall and renewal expense ratio."

The salaries and allowances of the top officers in the Head Office were brought down from a monthly average of Rs. 22,106 in 1951 to Rs. 8,111 in 1954. The overall expense ratio in 1954 was 28.4 per cent compared with 33.66 per cent before the Administrator took over. These are no mean achievements. The expense ratio would have been even lower, but for the heavy legal charges that the company had to incur on legal proceedings against its ex-directors and others.

Confining himself strictly to field insurance and its operational problems, Shri Varadachari raised an issue which, though eminently a practical one, is nevertheless of the widest interest viz., the need for tapping rural savings. If insurance is to fulfil its role of promoting thrift adequately, this has to be done. To tap rural savings, however, agents have to penetrate into rural areas. The field force is at present concentrated almost entirely in towns and cities. Worse still, the whole-time agent has become a rarity. How to make it worth his while to turn his attention to the village?

Letters to the Editor

Personal Records of late N M Joshi

YOUR obituary note on N M Joshi (June 4, 1955) has just come into my hands. At this late date let me add my word of admiration and gratitude for his kindness and personal warmth, which revealed itself to a foreign research worker. I should also like to comment on one aspect of his life which had unhappy consequences.

When I visited him in 1952 to discuss certain historical issues on which I needed his assistance, I asked whether his records, reports, and personal files were available. He waved his hand over his 12' by 12' bedroom-office, shrugged his shoulders, and commented that having neither space nor money he had been forced to destroy virtually all of the records he had accumulated over nearly half-a-century. In this fashion a portion of India's history, immeasurable and irretrievable, has been lost to us.

Is it not possible that some steps could be taken to prevent the des-

truction of important private records, to encourage their preservation in places accessible to scholars? Could not public-spirited individuals and organizations contribute to the financing of library facilities at major Indian institutions where the files of citizens and companies important to the Indian economy would be preserved? It is true that the preservation of private records is expensive. My question is not intended in a carping vein. We in the United States have not done very well in this task. Nevertheless, records of citizens such as N M Joshi and of various voluntary associations are the stuff of history. They are critical for that understanding of the past from which alone can come the proper evaluation of the problems of the present and the needs of the future.

Are Rivers a Challenge to Engineers?

IN Sri Kumud Bhushan Ray's article in your issue of the 10th, there is a reference to Fig. 5, but the figure is absent. Perhaps the photograph referred to was published in some issue last year.

The two articles that were published last year about the same subject and the present one appear to be so interesting and important that it is surprising they did not attract official or public notice, —more so because of the recurrence of floods and the failure so far of the methods. Articles continue to be published blaming the railway embankments etc., but they do not bring out the problem and its solution so clearly.

Shri Ray's articles may perhaps be commented on editorially, if you write on the recent floods. This is just a suggestion for your consideration.

Santimoy Ray

Calcutta
August 22, 1955

The omission of Fig. 5 is much regretted. It appeared in the issue of Oct. 26, 1954 in an article by the same author, Vol. VI, page 1208—Ed.

From the Calcutta End

SOME persons are popular. Some are hated. Some others are talked about. Prof. P C Mahalanobis is not yet popular. It is not easy for a statistician to be popular. But he is the person who is most talked about in Calcutta now. His achievements are impressive. Economists may be aware of the difference between physical and financial approach to planning. Industrialists may be alarmed over physical planning. But Prof. Mahalanobis has made even news correspondents and agencies aware of physical planning. This is no mean achievement.

He is a pioneer in his field in this country. Though the man in the street does not yet know what physical planning is, everybody in Calcutta seems to know that the Institute of Statistics is at Baranagore. Everybody also knows that Prof. Mahalanobis is the Institute. He is a great organiser. His Institute is already famous. It will soon become a University. When his Statistical Institute develops into a University, it will be the first University of its kind in the world. Prof. Mahalanobis has the support of New Delhi.

World Famous Institute

In Calcutta, there is a saying that Bengal starts everything only to lose the lead later. Acharya P C Ray made Bengalis conscious of science. He was not only a pioneer in industrial chemistry. But he inspired a batch of brilliant scientists. To-day, Calcutta is not the home of the chemical industry. That claim now goes to Bombay. It was not any Bengali scientist, but Sir Santi Swarup Bhatnagar who organised the National Laboratories. Not Calcutta, but Bombay is the centre of atomic research in this country.

If Acharya P C Ray inspired brilliant Bengali students to become scientists, Prof. P C Mahalanobis is making Bengalis conscious of statistics. To-day, most of the bright boys in economics or mathematics go in for statistics for their post-graduate studies. Serious, research-minded students are doing valuable work in the cloistered surroundings of the Baranagore Institute. Economists and industrialists may be

critical of Prof. Mahalanobis's physical approach to planning, but his Statistical Institute has already become the Mecca of statisticians throughout the world.

Some days ago, Prof. P C Mahalanobis gave an interview to three correspondents in Calcutta. In his reply to the lengthy questionnaire, he answered some of the criticisms made against his draft Plan-frame. He was rather unconvincing in his defence of the inflationary implications of his Plan-frame. He was evasive in his defence of his assumption that the marginal rate of savings will amount to thirty per cent of increment of output. But he made certain points which were interesting.

No Urban Bias

West Bengal's Chief Minister has been loud in his criticism that the draft Plan-frame has an urban bias. One of the questions had relation to this aspect of the Plan-frame. Prof. Mahalanobis's reply was short but

convincing: "Cottage and small-scale industries are located in both rural and urban areas, and I have not made any distinction on the basis of geographical location". It was rather difficult to appreciate Dr B C Roy's repeated criticism that the Plan-frame neglected rural areas.

In defending the inflationary aspects, Prof. Mahalanobis seemed to argue that, under his Plan-frame, earnings will always outpace prices. But he did not dispel doubts whether his hand and household industries, would solve both the problems of unemployment and supply of consumer goods. Under his Plan-frame, these are the two functions of the hand and household industries. Some doubt whether these industries can solve either of the problems. Some argue that these industries may solve one of the two problems, but not both. To be fair to Prof. Mahalanobis, it must be admitted that, in his reply to the questionnaire, he reiterated his emphasis on the

administrative aspect of the issues in question.

Foreign Capital

As was to be expected, Prof Mahalanobis is opposed to any restrictions on repatriation of profits of foreign firms. Foreign aid will be necessary to finance the Second Plan. No policy should be introduced which is likely to hamper the flow of foreign capital. This much is easily understandable. But he is intriguing in his argument that, "as a good deal of organised large-scale industries would continue to remain in the hands of Indian business men, there are some advantages in a part of large-scale industries continuing to remain under foreign management".

Prof Mahalanobis admits that the success of his Plan-frame depends on efficient management and administration. This can be ensured in the private sector, he argues, by introducing a system of incentives in which the "earners" will share in the profits accruing from increases in production. Industrialists may be unwilling to share "profits". But they may not be reluctant to introduce a system where-

by wages and salaries beyond certain minimum levels should be closely related to labour productivity.

Social Recognition

In the public sector, efficient management and administration can be ensured, he argues, in two ways. There must be decentralisation of administrative and executive powers. Secondly, there must be a system of judging public officials by results, and the award of benefits and social recognition on such results. Some such arrangement exists in Communist States. There are certain obvious difficulties in introducing such a system in a democracy. Administration is, and will remain, the biggest bottleneck to economic planning. It is easy to say that this bottleneck will have to be blasted away. But it is more difficult to suggest how it can be done.

Labour Troubles

After many months of amicable labour-management relations, West Bengal is having some labour troubles. Tea workers in the Dooars, Terai and Cooch Behar

plantations are on strike. There have been some violent disturbances, and the police have had to take strong action. Tea workers demand higher wages and bonus for 1954. Last year's fat dividend payments justify the workers' demand for bonus. Tripartite discussions are now going on in Calcutta to settle the dispute between tea workers and plantation owners.

Justified or not, the discontent among tea workers is not difficult to appreciate. But the disturbances in some of the jute mills in Howrah in the last two weeks have surprised both the Government and management. Troubles arose because of the workers' refusal to contribute their share to the State Insurance Scheme. They want to be insured against "loss of earnings on account of sickness, accidents and invalidity". But they claim that their share of the contribution should be donated by management. This is an indirect demand for higher wages. So far, the disturbances have been confined to the Jute Mills. 230,000 industrial workers are involved. If labour force as a whole echoes the jute workers' demand, labour troubles may spread.

Official Papers

Structure of Direct Taxation in Britain

Royal Commission on the Taxation of Profits and Income in the United Kingdom. Final Report, Cmd 9474, London. H M Stationery Office. pp 470, Appendices. Price 12s 6d net.

THE final report of the Royal Commission which was appointed in January, 1951, was presented to the British Parliament in June 1955. The Commission was primarily concerned with the specific problem of inquiring into the existing system of taxation of profit and income with special reference to business profits, salaries and wages, and as such its terms of reference were very much narrower than those of the Indian Taxation Enquiry Commission which attempted an assessment of the tax structure as a whole. Both the perspective and problems of taxation in the United Kingdom have changed considerably since the last Royal Commission on Income Tax reported in 1920. Apart from the increase in the absolute burden of taxation, the problem has acquired an added urgency in the context of the financial implications of a Welfare State in an economy with a vulnerable balance of payments position. This makes it all the more surprising why the allied issue of indirect taxation was kept outside the purview of the Commission.

The Commission was first presided over by Sir Lionel Cohen and on his resignation in 1952, Baron Radcliffe was appointed Chairman. Thus while the British tradition of a judicial Chairman was maintained, the membership of the Commission itself was fully representative of all types of the necessary expertise, financial, legal, trade union, and academic, the last being represented by Hicks, Kaldor, and Mrs Anstey. As such the Report is an impressive document, a wholesome combination of theoretical acumen and practical insight, ordered and organised by the mellow scholarship and liberal outlook of the Chairman, a distinguished representative of the tradition of humane learning in British public life.

According to its original terms of reference, the Commission was required to

"inquire into the present system of taxation of profits and income, including its incidence and effects, with particular reference to the taxation of business profits and the taxation of salaries and wages;

"to consider whether for purposes of the national economy the present system is the best way of raising the required revenue from the taxation of profits and income, due regard being paid to the point of view of the taxpayer and the Exchequer;

"to consider the present system of personal allowances, reliefs and rates of tax as a means of distributing the tax burden fairly among the individual members of the community; and

"to make recommendations consistent with maintaining the same total yield of the existing duties in relation to the national income".

These terms of reference were further extended in March 1952 to include

"recommendations bearing in mind that in the present financial situation it may be necessary to maintain the revenue from profits and income; and in so far as they make recommendations which would on balance entail a substantial loss of revenue, to indicate an order of priority in which such recommendations should be taken into consideration."

Thus the Commission's task was largely confined to suggesting measures designed to tidy up the present system of income and profits taxation, that is, its labours may be subsumed under the category of "useful improvements rather than major reform".

It is equally essential to note some of the vital assumptions on which the Commission has based its analysis and recommendations. First and foremost, it has taken as a general premise that there will be relative stability, i.e., absence of any marked increase or decrease, in the purchasing power of money in the United Kingdom in the future. In the absence of some such assumption, it would have been difficult for the Commission to "build either a satisfactory tax structure or a satisfactory distribution of the total burden of tax". Besides, such an assumption is valid in the context of present day

economic policies which are aimed at maintaining the economy on an even keel, albeit at a high level of performance in output and employment. Secondly, the Commission has endeavoured to avoid the slightest suggestion of discriminatory or differential taxation even in regard to matters such as providing specific tax reliefs as an aid to corporate savings, while giving its imprimatur to corresponding reliefs in regard to industrial savings such as insurance contributions and superannuation.

It would have been surprising if a Report such as the present one did not produce the inevitable Memorandum of Dissent, which in the case is provided by the two trade union representatives, Messrs Woodcock and Bullock, who, together with Mr Nicholas Kaldor, advocate taxation of capital gains. Though the Commission itself has recommended against such a tax, either as a separate impost or as part of the income-tax, the issue cannot be regarded as a closed one. In fact taxation of capital gains is the hardy perennial of public finance. The Memorandum of Dissent, which is a notable piece of analysis and exposition, is based on the concept of spending power, i.e. "net accretion of economic power between two points of time", as the most reliable index of taxable capacity, a line of thought which is being propagated of late by Mr. Kaldor.

According to the authors of the Memorandum, the tax should be levied only on net realised gains with appropriate allowance for deduction of net realised losses and for carry-forward of any net losses, and furthermore, capital gains should be subject only to income-tax and not to sur-tax, the capital gains of corporations being liable to the corporation profit tax which would be levied at a uniform rate. While the Minority view is that capital gains "provide a distinct addition to the amount of goods and services which an individual is in a position to command, irrespective of whether he chooses to spend or save the gain", the Commission assumes that, by and large, capital gains would be saved and that a

tax on capital gains would in effect function as a tax on savings. The Commission adverts to the possible disincentive on private saving of such a tax and maintains that "though it might discourage a small number of people who were enabled by the obtaining of capital gains to maintain a standard of living out of relation to their income, its general effect would be to tax a very much larger number of persons without the justification of any equitable design".

The underlying issues of this debate on the nature of capital gains in relation to spending power suggest interesting possibilities of a further reformulation of the Keynesian consumption function as refined by the Duesenberry-Modigliani hypothesis so as to introduce capital gains as one of the explicit variables in the consumption function. In the meanwhile one may pose the question, in view of the tenderness shown to 'private' saving in the recommendations of the Commission, whether the traditional role and even the quantum of private saving are not liable to be exaggerated. Private savings today, particularly in the United Kingdom, partake of the character of contractual savings; besides, the State is increasingly tending to be the largest.

The main argument of the Memorandum of Dissent is powerfully buttressed by a most illuminating discussion of the devious dodges practised by tax-payers at present to convert taxable income into tax-free capital gains. Of course, judging by this, it would appear that Gentlemen have greater opportunities and better aptitude for showing taxable income as capital gains than mere Players, an aspect of the problem peculiarly apposite to the English social scene. In regard to the likely yield of a tax on capital gains, the Commissioners of Inland Revenue estimate its average annual yield at about £50 million as against the estimate of £200-350 million put forward by the Memorandum of Dissent.

On the subject of profits tax, the Commission has recommended that the existing tax should be simplified so as to make it a flat-rate tax on total profits and thereafter, the exemption and abatement reliefs should be dropped; in the case of special classes of corporation, the Commission has recommended that nationalised undertakings and public utilities should be taxable on

the same basis as other concerns and trading entities. In order to mitigate the hardship caused by progressive taxation on irregular incomes, it is recommended that "a fall in total income from one year to the next of at least 50% should entitle the recipient to relief by averaging".

The adequacy, efficiency, and equity of any tax system will ultimately be judged by its effect in actual practice. One may express the hope that Britain, the traditional home of empiricism, philosophy as well as political, will pioneer the way in evolving a just and workable tax structure. The abundance of English law on the subject, if nothing else, encourages this hope.

mately be judged by its effect in actual practice. One may express the hope that Britain, the traditional home of empiricism, philosophy as well as political, will pioneer the way in evolving a just and workable tax structure. The abundance of English law on the subject, if nothing else, encourages this hope.

Ordeal of Eastern Uttar Pradesh by Water

Kumud Bhushan Ray

AN area of over 10,000 square miles in East U P was devastated by extraordinary floods in July 1955. The maximum fury of the devastation was concentrated in about 1700 square miles in Fyzabad District. Between July 16 and 22, the rainfall was about 24 inches, of which 9 inches fell in one day. The run-off from such heavy and concentrated rainfall, coming after 43 inches fall in the previous weeks, could not be drained by the Tons river and its tributaries—the Biswi and Majhoi (Fig. 1). No wonder, there was backing up and the water level in these streams rose, overflowing the channels, submerging riverside lands, villages and towns. Crops have been totally destroyed in 150,000 acres out of the 'kharif' area of 324,000 acres; 1988 out of Fyzabad's 3,000 villages were submerged and 200 villages completely destroyed, while Bhadarsa, Bikapur, Khajurhat, Gosaiganj, Katehri, Akbarpur and other townships were devastated. The Fyzabad-Allahabad Branch of the Northern Railway had over 30 breaches between Fyzabad and Sultanpur, while roads were breached and stretches washed away in several places. Till July 22, there was complete stoppage of all communication in about two-thirds of Fyzabad District. As the rise of

flood water was sudden, the inhabitants could save practically nothing, and the acutest possible distress prevails. There is need of drinking water, food, clothes and shelter.

Additional Bridges

The Tons rises in the alluvial plains in the vicinity of Fyzabad Town (Fig. 2). Similarly the Gumti rises in the alluvial plains a little to the east of Pilibhit town. As these rivers do not have their upper catchments in the Himalayan mountains, there is no flow through them in the dry season, except the scanty flow from seepage of subsoil water. In the monsoon months, local rainfall finds its way into these channels and drains through them.

The Fyzabad-Allahabad and the Lucknow-Banaras Branches of the Northern Railway, and the roads parallel to these, cross the Tons and the Gumti. Bridges, constructed over these rivers, thus provide drainage of rainfall from river catchment in the alluvial plains. For 8 months of the dry season, the flow through these bridges may be taken

to be practically nil.

During the continuous and heavy rainfall in July this year, the rural and urban people saw that the road and railway embankments retarded the passage of water. Naturally, they are all demanding more bridges with greater waterways.

Conditions of River Channels

The question to be considered by engineers is, supposing that the roads and railways had been carried on viaducts, or in other roads, had there been no road or railway embankments at all to retard the passage of water, would there have been no rise of water in the river channels to cause submergence of riverside lands and consequent destruction from floods, if there had been such heavy and concentrated fall, as occurred between July 16 and 22 after the exceptional rains in the previous weeks of the monsoon?

To answer this, it is necessary to study the river channels. Fig. 1 shows that the rivers have got very tortuous alignments, the percentage of meandering being:

River	Distance along River Channel	Distance along Dotted Line	Percentage of Meandering
Tons	KLMNPR — 145 miles	78 miles	86
Gumti	WXYZ — 109 "	68 miles	60

In the Tons river, in this reach, water has to travel nearly double the distance, compared to that if it travelled in a straight line, while in the Gumti, this is 60 per cent longer.

One of the main functions of a river is to drain away the water that finds its way into its channel from its catchment. If the river is able adequately to perform this function, there is then no holding up of the discharge, no backing up of water, with consequent rise in water level in its channel. The numerous bends, many of which are of the horse-shoe type, dissipate a part of the energy of the motive force of gravity, by constant changes in the direction of velocity. Erosion of the concave banks and turbulence of flow at the bends also dissipate part of this energy.

Motive Force of Gravity

A river channel is created in the process of drainage of water from the land to the river's outfall, the flow of water being due to the motive force of gravity, down the inclined plane of the land, from a higher to a lower level. The discharging capacity of a river depends on the velocity of flow and on the sectional area of its channel. The velocity depends on the "hydraulic mean depth" (H M D) of the channel and on the "slope of water surface" (S W S) in the river, as well as on certain other factors, such as the shape and condition of its channel, etc.

Other conditions remaining the same, a deep, single channel has a greater H M D than a shallower channel or a number of channels having the same sectional area. A straighter channel, between two points in a stretch of a river, has a steeper S W S than a channel with a tortuous alignment. Hence a river, having a single deep and straight channel, develops a greater velocity and has a greater discharging capacity, than a river with a wide and shallow channel or channels having a tortuous alignment, although they may have the same sectional area. Moreover, in a straighter channel, water has to travel a shorter distance to its outfall. Thus a single deep and straight channel is able to drain away quickly the water, that finds its way into its channel from its catchment, so that the water level in its channel remains low, even when the river is carrying a high flood discharge. There is, therefore, no overflow from the river channel, no submergence of river side lands and no flood damages.

A comparison may be made of flow of water along a tortuous river, with the flow of traffic along a tortuous road. Now, if the Tons channel were a road, motor transport travelling along it would not only have to travel 86 per cent longer distance than that along a straight road, but owing to the numerous sharp bends, the speed of such transport will have to be constantly checked. Thus the time taken to carry goods from K to R by motor transport along a tortuous road will be very long. As the public keeps on sending goods, the delay in

transport would cause piling up of goods at the motor transport depot at K.

Similarly, the longer distance along the tortuous Tons channel, and the greatly decreased velocity of flow of water due to dissipation of energy of the motive force of gravity at the numerous sharp bends, cause delay in the drainage of water. During continuous heavy rains for a number of days, there is piling up of water in the upper reaches of the river, with consequent channel, no submergence of river-

side lands are thus submerged, the high water level in the tributaries—the Biswi and Majhoi—joins up with that of the Tons, the water flowing down as a vast sheet, submerging and destroying everything in its way.

Many of the English country roads have been converted into arterial roads, by removing sharp bends and by better realignment. Provision of wider roadways, without realigning, would not at all have been effective. Similarly provision of additional waterways through bridges over the rivers, without improvement of river channel alignment, would not be of much help in the control of floods. In fact, it would not be far wrong to say that without channel improvement works, flood damages would still occur, even if all the road and railway embankments were removed.

It may now be studied, how river channels can be improved effectively and at the same time economically. The velocity of water in a channel varies as the square root of the S W S. Or, in other words, if the S W S could be steepened four-fold, the velocity would be doubled. The total fall in the level of the land between the points K and R in the Tons river being constant, the only way to steepen the S W S is by shortening the length of channel.

Such shortening can be effected by constructing cut-offs, as shown in dotted lines K L M N P R along

the Tons and W X Y Z along the Gumti. The increase in velocity of flow due to the steepening of S W S, and the shorter length to be traversed by the water, would effect much quicker drainage, so that piling up of water at the upstream reaches of the river will be minimised. The rise of water level in these channels will thus be less, river-side lands will be submerged to a lesser extent and for a shorter period. There will thus be little or no flood damage, even when there is heavy and continuous rainfall for a number of days.

Channel Improvement in U S

A portion of the Sangamon River in Illinois was straightened in 1924, a tortuous length of 21.8 miles with numerous sharp bends being reduced to 15.8 miles, as shown in Fig. 3. In the Mississippi River, 13 cut-offs had been made from 1937, between the mouths of the Arkansas and Red rivers, which effected a shortening of 115.8 miles. The resulting increase in velocity caused a lowering of water level in the Mississippi during high floods.

Cut-offs, to straighten the channels of the Tons and the Gumti rivers, may be constructed, as shown by the dotted lines in Fig. 1. As there is little or no flow through the two rivers in the eight months of the dry season, excavation works for the cut-off channels will not present engineering difficulty and the cost

will be moderate. The land that will have to be acquired for the cut-off channels will be more than made up by the land that will be reclaimed from the existing tortuous river channels of longer length. Silting up of the bends to be abandoned may be effected by erecting "permeable screens" across their upstream ends to proper alignment. Such works may be done by local labour under local supervision.

Watershed Management

The cause of flood damages from rivers is sometimes attributed to deforestation and other depredations of man in the upper river catchment in the Himalaya mountains. It has been urged that the Governments of Tibet, Nepal, Sikkim and Bhutan should be persuaded to take up and maintain watershed management and afforestation works, so that high flood discharges in rivers in the plains of India are minimised.

A study of Fig. 2, however, will show that the upper catchments of the Tons and the Gumti rivers are not in the Himalayas. Flood damages from the Tons and the Gumti have occurred owing to the inability of their channels to drain away water quickly. Their discharging capacity can be increased by channel improvement works, such as the construction of cut-offs. The lowering of flood water heights in their channels will minimise submergence of river-side lands and thus prevent flood damages.

Nepal-China Relations

(From our Khatmandu Correspondent)

THE diplomatic relations established between Nepal and China on August 1 set a land-mark in the foreign policy of Nepal by renewing the age-old cultural, social and economic ties between the two countries in a manner appropriate to modern conditions. It provides an occasion for reviewing the past relations between Nepal and Tibet and examining the possible repercussions of the step taken on Nepal in future. Ever since the overthrow of Rana rule, particularly during the past two years, it had been widely known that at an opportune moment, Nepal's normal diplomatic relations with China would be re-established. In this age of internationalism when science and technology have contracted the world into a more or less single unit, a small country like Nepal has to establish proper and cordial relationship with the rest of the world and more so with China, her next door neighbour.

Foreign relations, however, are conditioned by various factors like geographical and strategic conditions, political obligations, economic necessities and historical ties (of race, religion and culture). Sandwiched between Tibet and India, Nepal is situated at a distance of 500 miles from the nearest port. The Himalayas present a great physical and climatic barrier in the north despite which cultural contact and trade between Nepal and Tibet have taken place across the Himalayas through several passes. Only a small volume of purely local trade can pass through these passes; so economic relations between Nepal and Tibet cannot be said to be very intimate. However, historical bonds have been always there as the Nepal-Tibet border has been crossed in the past by Buddhist and Christian missionaries, and Chinese armies have also crossed the Himalayas to settle in the beautiful valleys enclosed in the great barrier of the Himalayas. Even today people of diverse races and castes live in Nepal, and migration from Tibet appears to have been unrestricted in the past. Indeed, Nepal has been a meeting ground of the cultural streams from the North and the South where Brahmanism and Buddhism have been happily blended, resulting in a dis-

tinct culture which finds expression in temples and chaityas, homes and palaces, social ceremonies, religious festivals and fairs, customs and manners, and dancing and singing.

Nepal has been influenced in the past, apart from India, by Chinese and Tibetan traditions. Historical changes and developments in India and China have left their mark on this country. Through her long and chequered history as an independent nation of the Himalayas, Nepal has many a time repulsed invasions from both the South and the North and has thus proved herself, in various respects, worthy of her national freedom and independent existence. True, being a small country, at times Nepal had to bow down in the past to a large and superior military force, but never has she allowed any country to plant its foot-hold permanently on her soil. Among the famous travellers who came from China to Nepal, Fahien (406 AD) and Huentasang (635 AD) highly praised Nepalese art and culture of their times. Thus in spite of temporary defeats on the battle fields, for example at the hands of China in 1792 and British in 1816, Nepal has never allowed foreigners or outsiders to interfere with her way of life and her internal affairs.

It is in the light of her past history that Nepal's relations with China should be viewed. Some maintain that from ancient times, Nepal had no relations with China, and that hostilities between the two countries dated from the 55th year of the Chienlung reign, i.e. 1790, when Nepal invaded Tibet. Though on the governmental level, relations may not have been established before this, they both were known to each other through travellers, exchanges of art and culture and social and even matrimonial relations from very ancient times.

To trace the relationship on the governmental level, one has to go back to the end of the eighteenth century (Sept. 1792) when Nepal's ambition for expansion of territories towards the North involved her in a war with China for the first time, which brought the Chinese army under Fu-Kang-Aun within the marches of the capital. Nepalis

under Damodar Pandeny put up a fierce and stubborn resistance against the marching hordes and peace was concluded with honour. The Chinese were content with a formal submission from the Gurkas. The treaty of 1792 which governed the relations between the two countries until recently, provided, among other things, for compensation of all the losses incurred by the Bhotias in Lhasa, freedom of trade and commerce for the citizens of both the countries in each other's territories, help by China to Nepal in case of foreign invasion, and exchange of valuable presents after every five years. After 1910, taking advantage of the disturbed and uncertain conditions in China, Nepal discontinued the practice of sending presents to Peking. Nepal's relations with Tibet were determined till last year by the treaty of 1856, which obliged Tibet to pay an annual tribute of Rs. 10,000 (which has now been stopped) and also to grant certain extra-territorial rights and concessions to Nepal.

History shows that conflict between Nepal and British India had cropped up from time to time over the control of trade routes to Tibet. Moreover, before the opening of the new trade route via Kalimpong in the wake of the Younghusband Mission in 1904, there used to be brisk trade between Nepal and Tibet. Kuti and Kerang were famous centres of trade where the products of Tibet were exchanged with the goods and merchandise of Nepal. Though the volume and value of trade with Nepal has dwindled in recent times, nevertheless Nepali merchants still have some hold on the Tibetan trade. The defective system of transport is a hindrance to the development of this trade.

What Led to the Present Pact?

Why is it that diplomatic relations were established only now and not years ago? Firstly, under the Rana regime, Nepal left her foreign policy, from the time of Jung Bahadur, the first Rana Prime Minister, to the British and almost all the outstanding issues were settled by a reference to the British in India. The Ranas always had this one motive viz., that the country should be kept in isolation and that all foreign influences should be kept

out. It is only after the overthrow of the Rana Rule and the growth of the democratic atmosphere in the country that Nepal could think of establishing diplomatic relations with countries other than Britain. The independence of India also helped in this process. Secondly, the increasing importance of People's China after 1950 both internally (with the development of her national economy) and externally (relations with the Asian countries) made it necessary for almost every Asian country to establish friendly relations with New China. India's role is also quite important, for, the immediate circumstances leading up to the Nepal-China diplomatic relations have got to be examined against the background of India's diplomatic relations with China. India has been the first country in Asia to establish diplomatic relations with People's China and has ever since done her utmost to secure China's good-will and friendship. The Agreement on Tibet in April 1954, besides laying down the procedure for trade and cultural exchange between Tibet and India, was the first to enunciate the famous five principles, known as the Panch Shila. India has always stood for China's admission into the UN and has also recognised China's claims on Formosa as morally valid and she did her best to secure peace in Korea and Indo-China. Finally what paved the way for the Pact may be the joint declaration by Pandit Nehru and Mr Bulganin of the basis of the Indo-Soviet ties. The Bandung Conference of 29 countries also might have expedited matters. Apart from Mr Chou En-lai's assurance at the political committee meeting of the Afro-Asian Conference at Bandung that China would never use force in settling border questions with the adjoining countries, the leader of the Nepali delegation at Bandung, had a personal interview with the Chinese premier with regard to various problems.

Terms and Conditions

The pact which is based on the Nehru-Bulganin statement envisages the promotion and strengthening of Nepal-China relations in the economic and cultural fields. The exchange of envoys will be at ambassadorial level. The Chinese Ambassador in New Delhi will be concurrently accredited to Nepal and the Nepalese Ambassador in India will similarly be accredited to China.

The text of the joint communique on the talks conducted at Kathmandu from July 27 onwards as broadcast by Peking Radio and monitored in Tokyo runs as follows:-

The Governments, desirous of establishing friendly relations between the two countries, have agreed to establish normal diplomatic relations and to exchange Ambassadors between the People's Republic of China and the Kingdom of Nepal.

The two Governments have further agreed that the following five principles, namely:

1. Mutual respect for each other's territorial integrity and sovereignty,
 2. Non-aggression,
 3. Non-interference in each other's internal affairs for any reasons—of an economic, political or ideological character,
 4. Equality and mutual benefit, and
 5. Peaceful co-existence
- should form the basic principles to guide the relations between the two governments.

The Governments believe that the establishment of diplomatic relations will also promote further development in the cultural and economic co-operation between the two countries.

Future Prospects

This agreement does not refer to relations with Tibet and the problems connected with her will be settled separately. Tibet has stopped her annual tribute of Rs. 1000 which she had been paying to Nepal by the treaty of 1856. Nor does it provide for the careful handling and amicable settlement of the border incidents with Tibet. As Nepal's boundaries on the North are ill-defined, since the Himalayas do not run straight, this is a matter of some importance. The people living on the border often run into disputes. Border incidents used to be very frequent in the past and have been the cause of wars between Nepal and Tibet. Moreover, all the good wishes of both Governments notwithstanding, trade and commerce between the two countries cannot be properly developed, unless transport facilities are improved. Any improvement appears to be difficult in the near future, but it may be possible in the years ahead.

The present agreement, however, is just a beginning and it may be

hoped that most of the issues will be carefully examined and amicably settled when separate talks are held with Tibet. Some months ago, the Chinese national Assembly had put forward the suggestion that China should have normal relations with Nepal and other small countries on the side of the Himalayas. Nepal has already seized this opportunity. It is necessary for us to develop friendship with a Power which is growing in Asia. Culturally and socially, there are very many similarities, which will be developed and encouraged by the greater contacts (which are quite possible now) of the peoples of the two countries.

Last Chapter in Freedom Struggle

Background to Goa Satyagraha

(Concluded)

S T Chary

In his Independence Day speech, the Prime Minister examined at length the implications of Portuguese firing on peaceful Satyagrahis and declared, that in a war between two armies, resort to firing was an obvious thing. But one had to remember that the context was entirely changed when unarmed peaceful people were fired at. "Let us take note, and let the world take note, as to how far it is proper for any Government or country to open fire on peaceful people who carry no arms in their hands. If anybody breaks the law, the Government concerned has a right to arrest and send him to jail. These rights are there, but does international law sanction that unarmed people who are not attacking any country should be fired upon?"

Pathetic Appeal

Such a pathetic appeal in a Free India and that too from a leader of the stature of our popular Prime Minister is not only painful, but out of keeping with the 'dignity and honour' of a free people about which he has spoken times without number. We were familiar with such appeals in pre-Independence days. It is unthinkable now. To say the least, it is degrading. Are we not competent to decide whether the act of the Portuguese authorities is not a violation of international law and take suitable measure? Have we not enough legal luminaries in the country and experts in our External Affairs Department to decide the issue? Which self-reliant free nation in the world, big or small, has at any time appealed to world conscience to protect its national honour and sovereign rights? Are we not going to learn anything from past experience?

In our quarrel with South Africa on racial discrimination and in our dispute with Pakistan over Kashmir, why did we not get justice? Was it because we were wrong? The truth of the matter is that while every nation's foreign policy is subservient to its national interests, the reverse is the case here. It may be noble idealism, but not practical politics. It is not right to question the motives

of so worthy a man as our Prime Minister. But if one reads his speeches carefully over the last few days, one will discern his criticism has shifted from the subject of Portugal to that of opposition parties in this country. If this trend persists, it will betray the cause for which so many are giving their lives.

Now let us see how the world responded to his appeal. The Daily Telegraph described the Prime Minister's declaration as 'moral hair-splitting' and said, "The events of this week have made it plain that bloodshed is the result of tactics which he chooses to regard as peaceful." The Daily Mail went a step further, "Nehru is a man of the world. He knows that one nation cannot invade another's territory however peaceably without some one getting excited and some one getting killed. Which is what happened in Goa."

While one can understand not only the partisan but perverted attitude of British Papers because of their self-interest, one is surprised at the angle certain prominent American papers have taken on this issue. None of them has examined the issue on its merits. They have severely castigated Nehru for having allegedly provoked a situation where violence and bloodshed were inevitable. Secondly they seem to have accepted Portugal's contention that Goa is part of her metropolitan territory and that India has no legal right to it. Thirdly, they see in the present disturbances the sinister hand of Communists.

Perpetuation of Possessions

The U. S. Columnist, David Lawrence, has given out some information which the Government of India might usefully take note of. He has discovered that "the controversy over Goa is inspired by Communists as they know it will tend to strain relations between the United States and India and between Britain and India. That is because the London Government has an alliance with Portugal and because the United States needs Azores for air bases and is about to nego-

tiate an agreement with Portugal. All the double-talk that has been coming from New Delhi about desiring peace in the world has been revealed to be insincere. When it suits Nehru to begin aggression of his own, he does not hesitate to do so."

In all these criticisms, one undercurrent is very clear, viz., colonialism and cold war. What America does not understand is that world-wide collective security arrangements like NATO, MEADO and SEADO, which it initiated and which it leads with a crusading zeal, are utilised by its partners like the U. K., France, Portugal etc. for the perpetuation of their colonial possessions. To maintain the unity of these organisations America during the last 10 years has been found to take a dubious stand on colonial issues. This working at cross-purposes has already cost the Americans the goodwill and respect which they had won in Asia during the Roosevelt era. The Goa problem is a challenge to their integrity. It will also expose the nature and purpose of their Collective Security Organisations.

Meanwhile, the satyagraha movement has already achieved its main purpose. Firstly, it has shown Salazar that the people of this country, including Goans, are determined to end Portuguese rule. Secondly, it has shaken the complacency of the people and the Government. Goa is on everybody's lips. That has been the greatest achievement of the movement. Finally, it has forced a wishful Government to revise its stand on the issue and brought it to the world of reality. There is a school of thought in this country which feels that if immediately after India's freedom the Government of India had enforced economic and financial sanctions, which it believes to be consistent with its policy, the Goa problem would have been settled long ago. Satyagraha and the mass killings that followed it could have been avoided.

I have it from eminent people who have lived in Goa these years that

from 1947 to 1955 the Portuguese Government has striven hard to consolidate its holding. Hence all the complications. Whatever that might be, let the Government of India realise now at least that the longer it waits the sterner will be the measures necessary for a solution and greater the complications.

The Prime Minister may be reminded of what he said on the subject of U. S. aid to Pakistan, "Even the act of asking for protection and seeking aid disables us and makes us weak and feeble, and dependent on others. If India is to survive, it will do so by her own strength, self-help and self-confidence and not by relying on others." This is exactly what his countrymen demand he should bear in mind while dealing with the Goa problem.

To the persistent demand of the people that no more killings of Satyagrahis by the Portuguese should be tolerated, Pandit Nehru has repeatedly declared that Satyagrahis should not, according to the principles of Satyagraha, expect the Army to follow them. It is not the Satyagrahis, however, who demand more effective action from Government. There are men who have shown by their deeds, that they did not wait for either the sympathy of the people or the support of the Government. With full knowledge of the consequences of their action, knowing full well what had happened to Amirchand, Saha, Thorat and many others, they were prepared to suffer the worst. And these have not terrified or deterred the rest. Many more are daily offering themselves for this 'Bali Dan'. It is we, who have not actively joined the Satyagraha movement but have complete accord and sympathy with its objectives, who feel that we owe a duty to them. Our duty does not end with showering post mortem praises about their selflessness and sacrifice in Parliament and the State Legislatures. For the dead and the dying, there is undoubtedly all honour and glory. But for those who allow such things to happen or do not take steps to prevent them, there is nothing but cowardice and shame. It is this feeling that moved millions to demand action from the Government during the last few days. Because we are a free nation, we demand that our Government should fulfil that duty on our behalf. In our attempt to be superhuman we have almost become inhuman.

If only Nehru remembered the pre-

Independent days, he would not have made so superficial an observation. When every time Gandhiji and other Leaders fasted or defied laws and courted imprisonment, or suffered British brutalities, did not the nation rise to a man and demand that the British Government should accede to the Congress demands and release the leaders? When the British replied that Congress leaders had knowingly broken laws and undertaken fasts, and therefore, as Satyagrahis, they must silently suffer the consequences of their actions, we were neither silent nor did we relish it.

It is worthwhile to examine two other important pronouncements about Goa Satyagraha by Acharya Vinoba Bhave and Acharya Kripalani. These two eminent leaders are as competent to interpret Gandhiji and Satyagraha as any others. Their opinions have weight. Bhave has said that "Firings on Satyagrahis is an attack on our Independence." What follows from this? If it is an attack on our independence, have not we got a right to repulse it? Effective Governmental intervention will therefore be nothing else than an act of pure self-defence.

Acharya Kripalani has been more explicit. When Nehru propounded his notion of Satyagraha to about a lakh of people at Delhi on Independence day, from the same platform to almost double that number and that too within 24 hours, Acharya Kripalani made a moving declaration. "Are not the people of Goa, flesh of our flesh, bone of our bones? If so why can't our Army be sent to free them from foreign rule? That will not be aggression, but self-defence." He refuted the argument that armed action against the Portuguese would mean violation of world peace and said that it would lead to no third world war. "Mahatmaji has not taught us peace but struggle. He had called the resistance of the Chinese to Japanese Aggression the nearest approach to Satyagraha. He had sanctioned use of Army in Kashmir." As if to add his voice to the countrywide demand from the Capital for the first time he declared, "I challenge the Government: you do not represent the people, not even Congressmen on the issue of Goa." Shri Kripalani was proved right in using the word 'even Congressmen'. For a few days thereafter, a resolution was passed at the concluding session of the Uttar Pradesh Committee. The resolution as drafted by the Com-

mittee's executive council, is understood to have been 'softened' at the instance of the Union Home Minister. In its original form, the resolution had 'urged' upon the All-India Congress Committee and the Union Government to take "effective steps for ending the barbaric repression and foreign rule in Goa." The resolution actually adopted, instead, 'praised' the Government of India for "its unflinching adherence to ways of peace despite grave provocations." Such hectoring neither enhances the prestige of the Government nor serves the cause of democracy or even Congress.

In human affairs there is no finality. And much less in politics, if democracy has any meaning. Yet whenever Pandit Nehru speaks, there is such an air of finality in what he says that one is led to feel there is nothing more to be said about it. Whether he accepts it or not, his stature both in Congress as well as in Government is so dominating that no Congressman dare question him and his policies. The few who dared are already out of the Congress. Unfortunately, there is no strong opposition to challenge his policy and party. This is a fundamental lacuna in the working of democratic institutions in this country. There exists no recognised means, therefore, for reflecting and giving effect to popular wishes. No wonder therefore that people who were dissatisfied with Goa policy took the initiative and expressed themselves in a spontaneous manner, though not perhaps with decorum and in a respectable fashion.

About the liberation of Goa, Pandit Nehru has quite clearly stated that the Government of India will not be coerced or stampeded into action. This need not depress or surprise any. On numerous occasions in the past, he had made such categorical declarations and afterwards silently given in under pressure. At the Hyderabad Congress session, he described the demand for linguistic provinces as a 'mediaeval demand'. Just two days before the death of Shri Potti Sriramulu, he proudly declared in Parliament that he would not submit to threats and pressures. And within a week of this martyr's death, the Government of India announced the formation of Andhra State. My final submission to the Prime Minister is that he should not let the impression take root among the people that the only way to make the Government listen to them is to paralyse it.

Agricultural Labour

II - Wages of Farm Workers

(Continued from page 976)

THOUGH the Government of India had been collecting some wage statistics as early as 1873, and since 1951 the Food Ministry has had in operation a scheme for collecting fortnightly and monthly statistics of wages, available wage data for agricultural labour are still very inadequate and unsatisfactory. True, more than a dozen States are collecting wage data in one or two villages in every district. In addition, some States e.g. U P and Punjab, conduct wage surveys every five years and Madhya Pradesh publishes a "statement of rural and urban wages". But the shortcomings of these wage statistics are so many that they are of little use. It was for the first time that a systematic study of farm wages was carried out by the Agricultural Labour Enquiry.

It should be noted, however, that though the very first report by the Agricultural Labour Enquiry was entitled, "Agricultural Wages in India", a systematic study of agricultural wages was left over for the third and last report viz. the Report on the Intensive Family Survey. Wages paid for different operations were collected separately for men, women and children every month during the year 1950-51 and average

wage rates were calculated by weighing them by the number of man-days worked.

Of the total number of man-days put in by casual agricultural labourers, men, women and children, men contribute 62 per cent, women 35 per cent and children 3 per cent. All casual labourers (who form about 85 per cent of the total agricultural workers) are employed on daily wages and the rate of wages depends on the agricultural operations on which they are employed. There are various modes of wage payment. Wages are paid in cash or kind, in some cases partly in cash and partly in kind. Sometimes, perquisites in the form of mid-day meal, tea or tobacco, varying according to local customs, are also given. Again, wages are paid either on time or piece basis. An idea of wages paid under various methods may be gained from Table I.

Of the total man-days put in by casual agricultural labourers, only 5.5 per cent are paid at piece-rate. While time wages are paid for most of the agricultural operations, piece rates paid are usually confined to a few operations like embanking, harvesting and to a small extent weeding. Piece rate may also be applied

wherever work has to be done expeditiously. The proportion of man-days paid according to piece-rate is only one per cent in West India and North-west India, about 2 per cent in North and South India and 6 per cent in Central India and it is highest in East India, 11 per cent of man-days being paid for on this base. Among the States in East India, the man-days under piece-wage form only 3 per cent in West Bengal and Orissa, but in Bihar the proportion is as high as 17 per cent. Likewise in Central India, the Zonal average is influenced by the proportion for Madhya Pradesh where 12 per cent of man-days are paid under the piece-wage system.

It is widely believed that custom largely determines farm wages in this country but the Agricultural Labour Enquiry found that among the methods of wage payment, cash payment is the most important. As regards total wage-employment in agriculture in All-India, 57.7 per cent of man-days are paid in cash and 32.2 per cent in kind, the balance of man-days being paid partly in cash and partly in kind.

In North-west India and West India, cash payment accounts for 79 and 76 per cent of man-days. In

South India too, the proportion is high (66). In Central and East India, however, cash wages are not so important, being paid only for 46 per cent and 50 per cent of man-days respectively. The mixed system accounts for a little over 10 per cent of total man-days in Central and South India. The predominance of wages in kind in East India is mainly due to the State of Bihar where wages for 55 per cent of man-days are paid in kind. In sharp contrast, in Assam and West Bengal which are also in this Zone, cash predominates overwhelmingly to the extent of 96 per cent and 82 per cent of man-days respectively. Likewise in Central India, the importance of kind payment to the extent of 43 per cent, is mainly due to Madhya Pradesh where 53 per cent of man-days is paid in kind. Among the other States, where kind wages are relatively more important, are Hyderabad (33 per cent) Orissa (37 per cent), Punjab (32 per cent) and Uttar Pradesh (35.5 per cent.).

The Enquiry shows that during and after the Second World War, there has been a noticeable shift towards cash payment of wages, and this the report attributes partly to the rise in prices of food grains as a result of shortages and partly to the system of procurement by State Governments under the rationing system. The quinquennial Enquiry of Rural wages (1944) of Uttar Pradesh also confirms that the shift towards cash payment has been more pronounced after 1939, compared, for instance, to the period be-

tween 1934 and 1939. Thus, in 1934 the proportion of U P villages paying in kind to those paying in cash was 53.5 per cent but it declined to 46.4 in 1939 and to 29 per cent in 1944.

While it is difficult to give any reason for the relative importance of different methods of wage payment in every case, broadly, cash wages appear to be the rule where commercial crops are grown. The degree of urbanisation, presence of industrial establishments and plantations are other factors accounting for cash wages.

Among the States, while in Orissa and Bihar cash payment accounts for about 42 per cent of man-days, the proportions in respect of West Bengal and Assam, as indicated already, are 82 and 96 per cent respectively. It may be noted that in the former two states, the urban population is less than 10 per cent of the total while it is about 25 per cent in West Bengal and 18 per cent in Assam. Moreover, Assam has greater sown area under commercial crops.

In West India, cash payment is important in Saurashtra (86 per cent) and Bombay (75 per cent). The fact that commercial crops encourage the cash system is illustrated by Hyderabad, which has a large percentage of sown area (30) under commercial crops; a striking example is that of the cotton-jowar zone of Madhya Pradesh where 67 per cent of man-days are paid in cash while in the cotton and wheat grow-

ing tracts in the same State, wages are still largely paid in kind. Madhyabharat, where the important commercial crops are sugarcane, cotton and oil seeds, is another example. In the Punjab, cash and kind payments are of about equal importance, and the prevalence of payment in kind may be attributed to special factors, e.g. (1) the big and medium cultivators employ mostly attached workers and casual workers get only occasional employment; (2) small cultivators employing casual labourers during rush periods normally pay in the form of mid-day meals and (3) wages for work relating to harvesting on which most of the casual labour is employed are often paid in kind.

Male, female and child labourers receive different rates of wages for different agricultural operations. There are also geographical variations as between one village and another and from State to State. An idea of the average wage of adult agricultural labourers in the different regions of the country and the proportion that women's wages bear to men's may be gained from Table II. The wages include payments in kind as also perquisites.

The average wage is highest in Northwest India (23 annas) followed by East India (20 as.) and the lowest is recorded in Central India (13 as.). The average shows considerable variations among the States in the different Zones in Central India. Thus, in East India, while the average is 27.8 annas in Assam, and 27 annas in West Bengal, it is as low as 11.5 annas in Orissa. North-west India appears to be the most prosperous Zone, in which Pepsu records the highest average wage, (incidentally the highest in the whole of India) while in Rajasthan, an agricultural worker gets only 19.7 annas. In the South Zone, the average is high in Travancore-Cochin (21.4 as.) but it is only 15 annas in Madras and Mysore.

The All-India average daily wage of a woman worker (10.8 as.) is lower than even the lowest wage of a male worker (11.5 annas in Orissa). It is highest in North India, being 17 annas, followed by North-West and East India (about a rupee) and the lowest is in Central India (8 annas). There are considerable inter-State variations in the average among the different Zones, as would be evident from Table II.

(To be continued)

Tax on Bonus Shares

Wednesday, Evening

SPITE unfavourable developments, stock markets remain buoyant. When the primary trend "bullish", market analysts believe, stock markets have a habit of ignoring all unfavourable developments. On this definition, primary market trend seems to be "bullish" now. Equities are moving up. They are being talked up further. Speculators seem optimistic though market analysts have, in recent days, issued repeated warnings about the dangers ahead.

Buoyancy in equities is not unjustified on wider economic grounds. Industrial production is mounting. Money supplies and incomes are rising. Success of the two instalments of loans by States indicates a gradual expansion in the volume of investible funds. Industrialists and economists may have some doubts about the shape of things to come during the second Plan period, but stock markets seem to have reached the conclusion that nothing can prevent a spurt in equities as long as the expenditure estimates under the second Plan are implemented according to schedule.

Immediate Outlook

This will not be denied. But the developments in the last few days indicated that the immediate outlook was rather uncertain. For one thing, it is now certain that Indian Iron will not issue right shares. Nobody expects Indian Iron dividend to be higher. And yet, Indian Iron shares are not falling. These shares may be well below the recent peak levels, but they continue to be firm.

There were some reasons for continued firmness, until Tuesday, in Indian Iron. It was argued that Indian Iron might not issue right shares, but the Company might decide to capitalise reserves by issuing bonus shares. That was why Indian Iron were moving up until Tuesday. Subsequent steadiness in Indian Iron is rather surprising. That is what is puzzling some market commentators, though speculative investors do not seem perturbed over latest events.

Last week, the Finance Minister stated in Parliament that the Gov-

ernment had no objection to bonus issues by industrial companies. This was interpreted by stock markets to mean that the Government was in favour of capitalisation of reserves; that, in the circumstances, Government would not impose any tax on bonus issues. That was why Indian Iron continued the upward journey, despite the official denial of rumours about right shares.

This issue has a history. Even while the Taxation Enquiry Commission was investigating the problems referred to it, many companies had applied to the Controller of Capital Issues for permission to raise capital by issuing bonus shares. As the time for submitting the Commission's report approached, it became evident that Government was hesitant to announce its decision on the applications pending before it.

Bonus Issues

New Delhi's hesitant attitude fostered fears that the Taxation Enquiry Commission might recommend a tax on bonus issues. This problem was examined by the Commission. It recommended that no tax should be imposed on bonus issues. New Delhi's reluctance even after the publication of the Taxation Enquiry Commission's report, to expedite decision on the pending applications revived doubts that Government might not accept the Commission's recommendation relating to bonus issues.

When, therefore, the Finance Minister announced in Lok Sabha last week, that the Government was not opposed to issues of bonus shares, the stock markets jumped to the conclusion that the Government will expedite its decision on the applications pending before it, and that Government had finally accepted the Taxation Enquiry Commission's recommendation not to impose any tax on bonus issues.

Tax Fears

While the Finance Minister issued his statement last week on capitalisation of reserves, he made it clear that the question of taxation of bonus issues was under Government's contemplation. On Tuesday last, the Finance Minister announced in Par-

liament that Government might tax bonus issues. Equities fell as stock markets came to know of the Finance Minister's statement on Tuesday evening. But some of the speculative scrips have regained most of the lost ground at the time of this writing.

The issue of taxation of bonus issues has raised a heated controversy. Last week, the Chairman of Tata Steel stated that it was the intention of the Company to capitalise reserves through bonus issues in future. He justified this policy on the argument that issues of bonus shares would go some way in compensating the equity holders for the sacrifices borne by them in the past. Sri J R D Tata's observations as Chairman of Tata Steel make it abundantly evident that he regards bonus issues as part payment of dividend. If that be so, the Government would be justified in imposing a tax on bonus issues.

Lower Raw Jute

Neither the Finance Minister's announcement that Government may tax bonus shares nor the precautionary measure adopted by the Bombay Stock Exchange authorities has had any appreciable adverse effect on equities. Even so, it is clear that the technical position in some of the speculative issues has become vulnerable. On current indications, the speculative counters may remain hesitant for some days in order to help the stock markets to consolidate the ground gained recently.

Though the recent behaviour of equities is somewhat puzzling, the falling trend in raw jute is neither surprising nor unexpected. Both India and Pakistan had bumper jute crops this season. This factor was obscured for a few weeks by the devaluation of the Pakistani rupee, the Pakistani Jute Board's decision not to lower the export minimum price for raw jute and the Pakistani Government's decision to impose an export duty on raw jute. Belatedly, the comfortable supply position of raw jute is making its influence felt on prices.

Around Bombay Markets

Dalal Street Applies Brake

OF late, speculative activity has reached such proportions as to threaten the healthy functioning of all forward markets. This has been evident in the developments in this month in the bullion and cotton futures markets. Perhaps the month of August could be anything but normal both in the political and economic sphere! The stalemate in forward trading in bullion following the declaration of an emergency, when a leading bull operator refused to square up his transactions, had been preceded by a sharp speculative rise. Another example was the frenzied trading in the August cotton contract, which jumped by over 80 points on the closing day. But for the fixing of the room rates at a reasonable level, and the maturing of the contract in question, a crisis might well have developed in the cotton futures also.

Speculative fever has now caught Dalal Street and the authorities were forced to put brakes on. There are enough bearish factors to keep fluctuation in check. Nevertheless, it was thought prudent to restrict the limit for individual members in the case of Tata Ordinary to 4,000 shares instead of 7,500 shares as hitherto, and that of Indian Iron to 10,000 shares instead of 15,000 shares. The margin for Indian Iron has also been stepped up from Rs. 1-4 to Rs. 2 per share. Simultaneously, Budla limits have been curtailed. The free limit of overall Badla done for individuals has been fixed at Rs. 20 lakhs and that of firms at Rs. 25 lakhs, while a slab system of margin has been levied to regulate transactions above these limits. Whether this would be the answer to the speculative rigging up of prices, it is too early to say. The immediate effect, however, judging from the trading yesterday, appears to have been salutary. However, towards the close of trading even yesterday, rates tended to harden on reports that a leading bull would take delivery in steels against his earlier purchases.

During the week the question of bonus shares affected market sentiment bullishly at first when Sri Deshmukh announced in Parliament that more than 100 companies had been permitted to issue bonus shares. But, the trend was reversed when,

later in the week, the Finance Minister hinted that bonus shares might be taxed. Although this has not been recommended by the Taxation Enquiry Commission, the authoritative pronouncement gave a jolt to the market and Belapurs and Srinivas, which were strongly supported on prospects of bonus issues lost all the earlier gains and closed at their lowest levels.

In the steel section, Tata Ordinary shot up to Rs. 260-12 (ex-div. from Friday 26th, the dividend being Rs 10-8). This is the highest touched by this scrip since conversion, if allowance is made for dividend. Towards the close, Tata Ordinary declined, on fears of stern measures to curb speculative trading, to Rs. 247. Indian Iron declined from the high of Rs. 41-9-6 to Rs. 39-13 but closed higher at Rs. 39-15.

In textiles also, trading followed the same pattern—early gains followed by sharp fall and eventual improvement at the close. Shrinivas was adversely affected by the possibility of taxation of bonus shares and the quotation came down from

Rs. 270 at one time to Rs. 245 on the last day of the week, to be placed finally at Rs. 250.

In the miscellaneous section also, closing rates were around the lowest levels for the week. ACC declined from the highest for the week of Rs. 195 to Rs. 190-4 and closed at Rs. 192-8. Bombay Burma Old closed at Rs. 562-8, the highest and the lowest for the week being Rs. 576-14 and Rs. 560, respectively. National Rayon moved between Rs. 226 and Rs. 218 but closed quietly steady at Rs. 220-8.

In the bank section, Bank of India ruled firm at Rs. 153-4 but New India attracted quite a number of buyers and improved from Rs 47 to Rs. 52-8, closing at Rs. 51-12.

Cotton

Sensational Spurt and Flop

The cotton futures market which opened with a bang, recording a sensational spurt in the maturing August contract, ended in a whimper, when the only operative contract visibly weakened for want of any constructive factor.

A significant event of the week was the expiry of the August contract which went off the Board on Thursday, August 25, at Rs. 700. The authorities of the E I C A, however, cut the rate at Rs 650.

This contract had passed through an eventful career, profiting from the liberalisation of export quota, off and on. Besides, this was the first contract to be regulated by the amended by-laws of the E I C A over which quite a furore was created last year, culminating in the suspension of forward trading.

Trading in August contract commenced on March 29, 1955 at Rs. 569. The lowest level it touched was Rs. 552-8 on April 15. When the Government's intention to liberalise cotton exports was advertised on the last day of June in the form of a general cut in the export duty of Rs. 50 on all varieties of cotton, the contract never looked back again. The climax came, appropriately enough, on the last day of the contract, when it registered a steep rise of Rs. 80, a rise which was mainly the result of speculation and the contract touched the highest level of Rs. 700.

Tenders issued against the August contract were small, being only 13,600 bales as compared with 1,31,000 bales tendered against this contract in the previous season. The small tender was mainly due to the shortage of tenderable quality cotton during the season.

I C C February, the only contract now current opened at Rs. 638-8 and after declining to Rs. 623-4, improved gradually and closed at Rs. 631-8.

In the spot market, both local and up-country mills showed interest in popular varieties while there was good export demand for Wagad, Kalyan and Moglais, especially from Belgium, Italy and Rotterdam. China has completed her purchases against the ad-hoc quota of 40,000 bales allotted by the Government of India.

Oils and Oilseeds

Downward Trend

LACK of export enquiry for oils, satisfactory weather conditions in all the seed belts in the country and arrivals in dribblets in the face of a none-too-encouraging demand from Vanaspati interests contributed to the persistent downward trend in the oilseeds market during the week. The quotations in all sections recorded their lowest levels at the close of the week.

Castor section was devoid of any notable feature, and the castor futures, which were the highest for the week on the opening day, tumbled at the close to Rs. 80-14 for September from Rs. 86-10. May futures came down from Rs. 88-12 to Rs. 85-12 on the last day. The relatively sharper decline in September futures has been due to long liquidation on fears that tenders against the contract would be heavier than expected. Hence operators were inclined to switch over to the May contract.

Groundnut August-September fluctuated between Rs. 23 and Rs. 22-6 and closed at Rs. 22-8 with a net loss of 7 as. over the week. Ground-

nut oil ready lost 13 as. over the week at Rs. 11-9.

Linseed and castor oils both suffered for want of fresh overseas enquiry.

Bullion

Stalemate Continues

Pending the sanction of the Government of Bombay to the amended by-laws, the stalemate in Bombay Bullion Association continues. It is believed in knowledgeable circles that forward trading might be resumed before the middle of September. Meanwhile, spot bullion prices have moved down, reflecting paucity of buying orders.

THE HINDUSTAN CONSTRUCTION COMPANY LTD.

CIVIL ENGINEERS, BUILDERS AND CONTRACTORS

FOREMOST IN THE FIELD IN

- Designing and construction of Dams for Multi-purpose Projects ;
- Railway and Road Bridges with all types of foundations (including Caisson and monolith sinking);
- Docks and Jetties ;
- Water Supply and Drainage Schemes ;
- Aerodromes and Hangars ;

And, in essence, it operates by equating men irrespective of the size of their property. Or so it should, in principle. But unless the co-operative

movement in India undergoes a sea-change, there are doubts if it will so operate in practice.

The second main plank of Shri Nanda is to re-organize that portion of the private sector where for technological or other reasons co-operation is not a practicable remedy. This re-organisation takes the form of diffusing the decision, — making function both vertically and horizontally. Vertically, it consists in giving workers a distinctive role in the making of decisions affecting the enterprise. Here Shri Nanda adopts the line that the Prime Minister has been taking, after his recent visit to Yugoslavia. In addition, planning of output etc. has to be done by industries as such through development councils and such like organisations. This is not a new idea, inasmuch as we have already set up a few councils of this sort. But how far they can be combined with workers' participation in the manage-

ment of individual units has yet to be seen.

It would seem from all this that Shri Nanda's attack on private property is not a frontal one. He shies away from it because he is afraid of a powerful centralised State. Instead, he would follow a policy of decentralising the rights in property, through co-operatives of one sort or another and through the sharing of decision-making functions. Back of all this is the Sarvodaya philosophy, that power is the evil and that in doing one's duty by society, one derives the maximum benefit.

As an ideal to be striven for, the sort of society which Nandaji envisages has a great deal to commend. But it is a society which is capable of achievement, if at all, through a gradual change in the quality of men rather than in their material environment. Modern technology, with its tendency towards creating mammoth units of

operation is not particularly favourable for the evolution of such men —so at least Nandaji believes. Hence his very definite stand in respect of small-scale and village industries. He considers it a mistake to treat support to such industries as a temporary expedient to meet the needs of employment. Such industries, he says, should be developed as part of a stable and continuing economic structure. Once again, as a general proposition, what Nandaji says is not unreasonable, since the existence of small units does not have to mean a stoppage of technical progress. But it all depends on how one seeks to integrate the small industries with the rest of the planned economy. On that vital question, Shri Nanda like everybody else, is satisfied with stating the obvious—with this difference that the programme for development of small industries should not be of a stop-gap type.

Arabs and Jews

IT is welcome news that, after many days of armed skirmishes, both Egypt and Israel have accepted an appeal by Major-General Burns, the U N Chief Truce Supervisor, for a cease-fire on the troubled Gaza border. But it would be idle to pretend that the cease-fire agreement will, or can, ease the mounting tension between Israel and Arab States. Trouble had been brewing around the Egyptian-Israeli border for some time. Under the auspices of the UN Armistice Commission, negotiations were proceeding between Israel and Egypt for easing the tense situation in the border areas. Immediate causes for the recent flare-up around the Gaza strip seem obscure. But the Israeli Cabinet crisis and the developing events in the Sudan might explain why the UN team's efforts failed, and armed border skirmishes started.

It was when the armed border clashes were going on that the American Secretary of State announced his two-fold plan for frontier guarantees and refugee settlement. There is nothing new in Mr. Dulles's plan for frontier guarantees. Under the Armistice Agreement, America, Britain and France are committed to guaranteeing the

frontiers of Israel and Arab States. Circumstances on the battle front compelled Egypt to accept the frontier of the new State of Israel. Egypt lost the battle of Palestine. But Egypt has never yet accepted that she has lost the war against Israel. She does not recognise Israel as a political, sovereign State. Though other Arab States are not as adamant against or hostile to, Israel, none of them has openly accepted Israel as a sovereign political entity.

Egypt and all other Arab States are still at war with Israel. Egypt has not yet lifted the blockade of the Suez Canal and the Gulf of Aqaba. Both the Cairo radio and the Egyptian Press have rejected the Dulles plan for frontier guarantees. In an interview in Calcutta, Wing-Commander Gamel Salem, Egypt's Deputy Prime Minister, who is now on a visit to this country as a State guest, emphatically denied Egypt's readiness to accept mediation in the Arab-Israeli dispute. There is nothing wrong with Mr. Dulles's plan for frontier guarantees. It will be conceded that some such plan will have to be implemented if Arab-Israeli dispute is to be settled by peaceful means.

But the main defect in any such plan is that it cannot be implemented unless the parties directly involved accept the frontiers which are to be guaranteed by third parties or Powers, or even by the United Nations.

Even those who may have doubts about the manner in which the State of Israel has been brought into existence will concede that Israel has come to stay. It is not difficult to appreciate why Israel is willing, but not Egypt, to accept the Dulles offer. On this major issue, Arab States will have to accept the realities of the situation sooner or later. But the Dulles offer of guaranteeing frontiers raises issues which are complicated. Any such plan for frontier guarantees will ultimately have to be sanctioned and supported by the United Nations. But the Dulles plan has this flaw that it implies guaranteeing of Arab-Israeli frontiers by America, Britain and France. In the circumstances, it is not surprising that the Dulles offer is suspect in Egypt and in the Arab world as a device to draw the Middle East into a military network. The Russian offer of arms to Egypt and other Arab States introduces further complications. In Calcutta

recently, Egypt's Deputy Premier has confirmed the Russian offer of arms to Arab States.

Wing-Commander Salem may be diplomatic in his statement in Calcutta that Egypt will have to accept the Russian offer of arms if the Western Powers do not fulfil their commitments for supply of military equipment to Cairo. But this is an ominous diplomatic game. If Cairo is trying to exploit the strategical importance of the Middle East by playing Russia and the Western Powers against each other, it would be pursuing a suicidal policy. There are obvious reasons why both Russia and America are so assiduously wooing the Middle East. In such an international political set-up, the wisest policy for Cairo is not to get entangled in the tension between the two rival power blocks, but to follow a policy of non-involvement. For reasons entirely different from those implied by Wing-Commander Salem in his recent statement at Dum Dum Airport, Egypt's reluctance to accept mediation of the Arab-Israeli dispute by foreign powers is to be welcomed. Egypt and other Arab States will be wise in negotiating a settlement of their dispute with Israel through peaceful means and without outside interference.

If Mr. Dulles's offer of frontier guarantees is neither new nor acceptable to Arab States, his plan for the settlement of Arab refugees deserves the most careful consideration. Egypt and other Arab States may be unwise in their refusal to recognise Israel, but it is widely realised that Arab refugees are a constant source of trouble and friction between Arabs and Jews. Egypt and Arab States may be wrong in insisting that the refugees must be allowed to return to their homes in Palestine. But Israel has been undiplomatic in her emphatic refusal to accept any responsibility for Arab refugees. Rehabilitation of these refugees is an essential condition for a peaceful settlement of the Arab-Israeli dispute. Mr. Dulles's plan to float an international loan, with American support and participation, to enable Israel to compensate Arab refugees will be welcomed on wider humane considerations.

Egypt and other Arab States may be unrealistic in their refusal to recognise Israel, but Israel is not

entirely without blame for the prevailing Arab-Israeli tension. Israel can ease the tension by adopting a more conciliatory attitude to Arab refugees and to the dispute relating to the Jordan waters. Israel was adamant in rejecting the recent proposal of Jordan and other Arab States to let Israel have a share in the Jordan waters to end the water dispute. She has still time to accept this compromise plan for solving the water dispute as a peaceful gesture to reconcile her dispute with Arab States.

It is to be hoped that Mr. Dulles's plan for an international loan to help Israel assume responsibilities for compensating Arab refugees is not rigidly linked to his other proposal for frontier guarantees. Steps must first be taken to solve the water dispute and the problem of Arab refugees. An agreed solution of these problems will help to create a calm atmosphere in which the fundamental issue of recognition of Israel by Arab States may be discussed and negotiated without passion or bitterness.

Weekly Notes

Fear of Complications

NEGATIVE rather than positive considerations would seem to have weighed with the Congress leadership in deciding to discourage and even prevent Indian satyagraha in Goa, both massive and individual. Of the motivating factors, fear of complications has evidently been the most dominant. For obvious reasons, the Congress as the ruling party wedded to certain methods and policies on the Governmental level, cannot easily take on itself the responsibility for leading the Satyagraha movement. And opposition parties have not been slow to take advantage of the Congress embarrassment and make political capital of the Goa issue by providing the necessary initiative and leadership. There is no problem which appeals more to the Indian mind today than the Goa problem, and whichever party sets out to tackle it is assured of considerable public sympathy and support.

With the elections coming, this situation bodes no good to Congress influence and prestige; and there is no knowing whether the mass enthusiasm released by opposition parties over the Goa issue will be content to stop at that, or may not find other outlets for expression. The engine of direct action, set in motion however non-violently, may well be hitched to other pressing issues as well. And the possibility of the States Reorganisation Commission's recommendations being made public soon can be no source of comfort to those who may be in a position to anticipate its likely repercussions. There are some, not altogether cynical folk, who have seen in the Goa demonstrations all over the country not only a preliminary skirmish in relation to the coming elections, but also a sort of dress rehearsal in anticipation of the likely recommendations for the reorganisation of States.

These factors explain, but in no way condone, the sudden reversal of policy by the Congress on the Goa issue, though on the purely international aspect of the question, the Congress is entitled to some consideration. Satyagraha in the international arena is still an untried weapon; and the Portuguese regime, brutalised by dictatorship, would seem to be the least worthy

agency to try it with. What is more, like all other weapons, Satyagraha too would appear to be a double-edged weapon. Anyway, some folk in Pakistan, out to fish in troubled waters, have shown it to be so through their flamboyant threat to launch Satyagraha in Kashmir. To draw a parallel between Goa and Kashmir is no doubt ludicrous in the extreme; but to certain schools of thought in the West, wilfully misinformed on all questions touching India, anything is good enough as an excuse for vilification.

But to say all this is not to ignore the fact that because of a number of extraneous factors, the Goa fight or at least that which is genuine in it has come to be badly let down. One may not see much good in masses of unarmed volunteers hurling themselves against Portuguese guns; but in preventing this, the rising tempo of public opinion in India over the Goa issue and the healthy repercussions that it was having within Goa too may well receive a set-back. The issue has now been left largely to Goans, which might have been quite sensible if they were really in a position to carry on the fight by themselves.

One thing is, however, certain: that by deciding to prevent the Satyagraha campaign, the Congress and with it the administration of the country have taken on themselves the entire responsibility on behalf of India for ending Portuguese domination at an early date. Pandit Nehru at least has no doubt about that. And it is a responsibility that must needs be discharged without delay; or the Congress will have to pay dearly for it. That is the only assurance of action that the country can have now.

Egypt and Israel

THE United Nations Security Council has passed a unanimous resolution sponsored by the U.S.A., France and Britain, calling upon Egypt and Israel to take all possible steps to ensure peace following the cease-fire in the Gaza area. The fact of Russian support to this resolution shows a renewed interest in this area by Russia following a long period of sullen neutrality punctuated with offers of arms assistance to the Arab States and the

staging of anti-semitic judicial trials behind the Iron Curtain. The resolution, as usual, embodies some unexceptionable platitudes which normally would have passed unnoticed except for the fact that they contain some bizarre and impracticable suggestions for restoring peace in Gaza. It is proposed to erect a barbed-wire fence on the cease fire line! General Burns, the Chief of the Supervisory Truce Staff, has made a more sensible proposal, that is to demilitarise a 55-metre zone on either side of the line. This, however, overlooks, what should now be more obvious to the General than any one else, that mere demilitarisation of frontier zones would hardly help matters when both Egypt, as also other Arab States, and Israel have para-military formations and large number of civilians trained in the use of modern weapons, who could easily worm themselves into these demilitarised zones and stage border incidents without support from regular forces. As it is, the resolution hardly comes with grace from Powers who are still supplying arms to the Arab States while withholding them from Israel. Britain, in particular, is committed by a series of odd treaties to supply arms and ammunition to a number of Arab States including Egypt and Jordan. Israeli profits against British shipments of Centurian tanks—which could crush the proposed barbed wire fence to matchwood—and jet fighters to Egypt have been considerably ignored by the British Foreign Office.

On the eastern frontier Jordan's Arab Legion—British-trained and British-financed—is reported to be carrying out battle exercises with a crack British armoured unit based on Akaba, the Jordanian port overlooking Biblical Elath in Israel. All these are gestures hard to reconcile with the spirit of the Security Council's resolution. Peace between Israel and the Arab States can be restored only on condition that the Western Powers and Russia stop wooing the Arab States, desist from supplying arms, and restrain Egypt from interfering with the normal use of the Suez Canal by Israeli ships. The prospects of peace in this area would be brighter if the Great Powers do not treat the Middle East as yet one more part of the cold war area.

Experiment in Self-reliance

THE problem of finding gainful occupation for the rural under-employed has been much talked about, though little has been done in practice. The Village Exchange Scheme which has been in operation in West Bengal for some time now appears to hold promise of assisting such people to make productive use of their "spare hours". The basic features of the Scheme are very interesting. First, it does not involve any capital outlay in terms of money and to implement the scheme, "not one pice worth of material assistance, either in cash or kind is needed". The scheme is based on the idea that each individual can mobilise his latent productive capacity during his spare hours, working with his own tools and raw materials, and producing articles of daily necessity for mutual exchange. Besides, it is being worked almost exclusively by the people themselves, guidance and assistance being provided by the Community Development staff who bring all the people together for discussion of common problems. It thus becomes an experiment in self-reliance and self help. Finally, since both unutilised capacity and time are mobilised for producing articles of daily need, on some of which at least the people would have had to spend money, the fact that they are able to get their requirements through barter, results in a saving of purchasing power, however small this may be. It is said that the Scheme has encouraged a desire on the part of its participants in West Bengal villages, to invest rather than consume the savings made possible by this scheme. Loans are being asked for, not in cash, but in the shape of standardised and semi-processed materials and better equipment. In other words, a process of capital formation is being set up resulting in a net addition to the community's wealth.

The Exchange Scheme was officially started in the Kulkurli village in Birbhum district of West Bengal in December 1954, and the whole movement had its inspiration in certain acts of production and exchange which are illustrative of the pattern implicit in the scheme.

A carpenter is said to have produced a wooden lamp stand in his spare time out of waste wood, while a blacksmith of the same village made a razor in his leisure out of a piece of rusty steel that had been thrown on the scrap heap. In each

case, they were able to exchange these products with similar products made by others. This led the way towards the expansion of the Scheme which had spread to 575 villages by the end of June 1955, covering 2,374 artisans. The value of goods and services exchanged under the scheme is estimated at Rs. 11.3 thousand.

The goods that are produced and exchanged are mainly of daily use, e.g., household requirements, furniture, tools of trade etc. The programme is operated through Village Exchange Co-operatives and accounts are maintained for each member. Exchange value is calculated on the basis of market price and as such no one is aggrieved over the price of the article he sells. There is no problem of finding a buyer, as nothing is produced unless there is an express demand for it.

Specialisation is one of the underlying principles of the arrangement. Gradually only such industries come forward and qualify for further expansion as enjoy special local advantages in raw materials, skills, commercial location etc. An equally important principle, of the Scheme is to improve efficiency of rural industries; special training of artisans is being attempted with Government aid so that village producers may become familiar with new skills and improved processes. Government loans are deliberately planned so as to effect only small improvements at a time, in a balance manner and over a variety of production lines including agriculture and allied pursuits.

Whatever is produced is directly exchanged. Each producer also maintains his own records and accounts. Differences between debits and credits are balanced by producing and exchanging more at a later date, either directly with the same person to whom the balance is due or indirectly for some other participant in the exchange scheme, the latter discharging his debt to the first producer. So far, at any rate, the scheme seems to have functioned smoothly. In the circumstances, it bears watching.

The Companies Bill

LAST week, the Companies Bill registered rapid progress. A significant feature was that the Finance Minister was able to take with him opposition parties in getting through some of the most controversial clauses of the Bill such as

those relating to managing agencies and appointment of directors, though earlier it appeared as though a crisis might develop. Another point of importance was that he was also able to persuade the Lok Sabha to consent practically to all the 'Government' amendments, the most noteworthy being the one in respect of remuneration of managing agents in companies which do not make any profit or make only inadequate profits.

The first of the controversial clauses to be hotly debated was clause 264, which gives the option to a public limited or private company to appoint not less than two-thirds of the total number of directors on the principle of proportional representation either by the single transferable vote or by a system of cumulative voting or otherwise. Both Congress and opposition members strongly pleaded, during the debate,

IT PAYS TO REPRESENT
AS IT DOES TO INSURE
WITH A

that proportional representation should be made mandatory rather than optional, and an amendment to the relevant clause was suggested by a Congress member. In this context, the practice of some American States which have made this principle compulsory in respect of banking companies was cited to drive home the fact that this offered the most effective method for checking abuses of managements by giving the minority a voice in the affairs of the company. It was also argued that left to themselves, industrialists would never choose this method of appointing directors. Shri Tulsidas Kilachand almost supported this argument, though for a different reason, when he said that the companies would not adopt the system as it was unworkable and give rise to quarrels among directors who acted as a cabinet.

The Finance Minister met the arguments squarely, though he made a partial concession to the opposition. He pointed out that he was not personally opposed to the system of proportional representation, but he was afraid that the system, instead of being a method of safeguarding minority interest, might become a means for small power groups to put two or three directors on the board of companies, which may lead to warfare among these groups. He, however, accepted the suggestion that in cases where the minority was oppressed and there was a case for action under clause 407 relating to mismanagement of companies, Government might insist on the adoption of proportional representation. The Lok Sabha finally rejected the amendment to make proportional representation compulsory by 107 votes to 16, so that the relevant clause (264) remains unchanged.

There was also pressure from some members to adopt the system of employee representation on the directorate of companies; and in support of the contention, the example of a 'progressive' Delhi cloth mill was cited. The Finance Minister passed over this demand by pointing out that the question of employee representation was being considered by the Planning Commission, and once a decision was taken by them, it would be embodied, if necessary, in the Companies Bill as also in many other Acts.

Another important Clause which was passed by the Lok Sabha after accepting a Government amendment was that relating to the num-

ber of companies to which a person could be appointed managing director (315). As it is, the Bill limits the number of companies to two. An official amendment was proposed to the effect that the Central Government might permit a person to be managing director of more than two companies if it was satisfied that the companies should, for their proper working, function as a single unit and have a common managing director. In this connection, the case of Tata Hydro-Electric Company was cited. Though there was some opposition to this proposal, it was finally accepted.

Policy Decision

THE most controversial clauses of the Bill, viz., those relating to managing agents (323 to 367), discussion on which provoked a good deal of criticism from opposition parties, were also piloted through the Lok Sabha, though not without considerable effort on the part of the Finance Minister. A notable feature of the discussion relating to managing agents was that Government was able to push through amendments to some of the clauses; and secondly, in response to a persistent demand from opposition members for a definite statement of Government's attitude towards the question of managing agencies' continuance, the Finance Minister announced a policy decision of importance.

Some of the principal amendments proposed were: clause 324—the amendment provides for the termination of the managing agency of a company which was itself acting as managing agent to another company on August 15, 1956. Another important amendment was in respect of clause 351, which provides that the payment of additional remuneration to managing agents in excess of the limit of 10 per cent laid down in clause 347, should be sanctioned by a special resolution of the company and be approved by the Central Government as being in public interest. The amendment seeks to lay down that the limit of 11 per cent of net profits, as specified in clause 197 relating to overall managerial remuneration, might also be exceeded by a similar special resolution.

Members of the opposition, especially Shri Ashoka Mehta and Shri Sadhana Gupta, voiced strong opposition to both. Shri Mehta demanded outright abolition of the

managing agency system by 1960, and asked the Finance Minister to tell the House categorically whether Government proposed to use the powers provided in the Bill (Clause 323) of notifying industries which could not have managing agents. The Finance Minister, pointed out that it was not the intention of Government to continue the system at all costs. The Government would make an inquiry, and if it was convinced that in any particular industry the system was no longer suitable, it would notify the industry concerned. He said that by 1960, the position would be clear and Government would have a lot of data for deciding the future course of action.

Sir Chintaman put the Government's case lucidly when he said that the Government had to consider the possible advantages of the system as shown by past historic evidence and at the same time it had also to satisfy itself that the advantages of the system did not exist either industrywise or in any unit of a particular industry. It was, therefore, the Government's intention to make as comprehensive and honest an examination of all the industries with the help of the available expert advice and then come to conclusion. Until such time the system has to continue. Finally, he announced the Government's mind on this vital issue when he said that it had no "definite intention" at present to abolish the managing agency "steadily and systematically".

With the passing of clauses 197 and 347 relating to remuneration of managing agents, the position stands as follows: the Lok Sabha has accepted the limit of overall managerial remuneration of a company at eleven per cent of net profits; it has also accepted the official amendment that when Government is satisfied that for the efficient conduct of the business of a company, the minimum remuneration of Rs. 50,000 per annum (in respect of companies not making adequate profits or not making any profits at all) is not sufficient, it could sanction an increase (clause 197). Clause 347 lays down 10 per cent of net profits as the limit of remuneration for managing agents, though the Finance Minister assured the opposition that he would take note of the suggestion to introduce a tapering scale of remuneration.

Indian Citizenship

THE long overdue Citizenship Bill, which will rectify the anomalous position created by the Constitution, has now been referred to a Joint Committee of the Parliament. While as many as seven Articles in the Constitution dealt with the question of citizenship, these provided for citizenship only at the commencement of the Constitution. It is true that Article 11 spoke specifically of the power of Parliament to regulate the right of citizenship by law. Presumably, it was expected that such a law would be put into force at the earliest opportunity. Nevertheless, it was unfortunate that no provision should have been made for citizenship at least by birth after the commencement of the Constitution.

The absence of such a provision has meant that those born of Indian parents after January 26, 1950 have not become citizens automatically as they should have. This anomalous position has continued for over five years already because of the delay in bringing forward the necessary legislation visualised in the Constitution. No provision existed in the Constitution also for those who came to the country during the refugee influxes after the inauguration of the Republic. This was perhaps no flaw as it could not be expected to make detailed provisions for the acquisition of citizenship even after it commenced. The power, and the duty, to do this, was vested in Parliament. The present bill attempts to regularise the status of such persons also.

The bill provides for acquisition of citizenship in five different ways—by birth, descent, registration, naturalisation and incorporation of territory. The last of these is of particular significance today because of the merger of the French territories and of the anticipated merger of the Portuguese territories also in due course. In exercise of the powers conferred by Article 11, the bill also deals with the termination, renunciation and deprivation of citizenship in certain circumstances.

While there can be little question about the need for the present bill, and its reference to the Joint Committee is unexceptionable, there is considerable scope for disagreement with particular provisions contained in it. One provision that will cause controversy relates to the acquisition of Commonwealth citizenship on a reciprocal basis in the

case of citizenship by registration. It is true that once membership of the Commonwealth is accepted for the country as a whole, there should be little reason to quibble about double citizenship. But it is not quite clear why this provision should apply in the case of acquisition of citizenship by registration only and not to all citizens.

The one provision to which strong exception may be taken provides for deprivation of citizenship for a person found to be disloyal to the Government. The distinction between the Government and the State should not be lost sight of at any time.

Notable Banker

WHEN the history of banking personalities in India comes to be written, the name of Shri H. C. Captain, former Managing Director of the Central Bank of India Ltd., will rank very high. Sir Sorabji Pochkhanavala founded the Central Bank of India in 1919, and after a quarter century of ceaseless effort, put the Bank on a sound footing. At the time of Sir Sorabji's death, many people asked with anxiety, "What will become of the Central Bank, and will there be any man to guide the destinies of the Bank as successfully as Sorabji?" Well, the answer was the unanimous election of Shri Captain as the Manager of the Bank; and he on his part more than justified his election to the high office by developing this great institution into what it is today, one of the foremost banks in India.

Shri Captain's intention as a boy had been to become a lawyer, and after graduation, he took up the study of law. His mastery of the subject was so quick and thorough that he stood first in the Solicitors' Examination, and second in LL.B. When he was with F. E. Dinshah & Co., who were legal Advisers and Solicitors to the Central Bank, he used to attend to Central Bank matters. In his capacity as a solicitor, Shri Captain gradually came into contact with Sir Sorabji Pochkhanavala. Noticing his keen interest, talent, tact, ability, devotion to duty and other outstanding qualities, Sir Sorabji invited him to take over the responsible position of Secretary of the Central Bank of India, which he accepted.

In a couple of years, the amalgamation of the Tata Bank with the Central Bank took place. This was

a landmark. In the process of amalgamation, Shri Captain played a prominent part in solving many complicated problems and putting matters right.

On the death of Sir Sorabji, Shri Captain was promoted as General Manager, a post which he highly deserved in view of his administrative capacity. His great abilities prompted the Directors to offer him the position of Managing Director. He was accordingly elected to shoulder the responsibilities of this high office. In this capacity he piloted the destinies of the Bank very successfully and brought it to the preeminent position which it occupies today.

At the time of the death of Sir Sorabji Pochkhanavala, there were only about 80 branches of the Bank all over India. Under the able administration and guidance of Shri Captain, the number of branches rose to 370, but owing to Partition, some of the branches had to be closed, and today there are 303 branches operating all over India and in many foreign countries as well.

In the last few years, Shri Captain was not in sound health, and as days passed on, the strain and responsibility of his high office started telling on his stamina. So for reasons of health, he had to relinquish the Managing Directorship of the Bank though he continued to watch its progress with sympathy and interest. In his death, Indian banking world has lost an outstanding figure.

Calcutta Insurance

THE Twentyninth Annual Report of the Calcutta Insurance Ltd., for the year ending 31st December, 1954 shows that in spite of the stress and strain of the previous years and competitive rate-cutting among insurance companies, it was able to make satisfactory progress.

In the period under report, life proposals, including those awaiting completion, valued at Rs. 117.4 lakhs resulted into policies as against Rs. 84.2 lakhs in 1953. Net premium income also increased from Rs. 24.1 lakhs to Rs. 25.5 lakhs in the same period.

Total Claims paid during the year amounted to Rs. 6.75 lakhs of which claims by death accounted for Rs. 1.15 lakhs, against Rs. 6.79 lakhs and Rs. 2.11 lakhs respectively in 1953.

The Company's expense ratio has shown a slight decline to 17.4 per cent from 17.7 per cent in the previous accounting year.

Of the three lines of general business, the Fire department has improved upon its previous year's performance. While its working in 1953 resulted in a loss of Rs 0.23 lakh, in 1954 after charging all expenses and providing for unexpired risks at 40 per cent of the premium income, it has shown a small net income of Rs 1,716. This improvement in its position may be attributed mainly to the department's better claims experience, net claims paid and outstanding having declined from Rs 0.47 lakh in 1953 to 0.03 lakh in 1954.

The Company has earned a net profit of Rs 0.42 lakh during the year, out of which the Directors have recommended the payment of dividend at the rate of 5 per cent free of Income-tax.

It would facilitate comparison if the company furnishes in its annual accounts figures relating to the previous year also.

Sen-Raleigh Industries

ORDINARY shareholders of Sen-Raleigh will welcome the Chairman's assurance that the future profits are likely to cover the balance of losses carried forward from depreciation and that a start towards the payment of ordinary dividends "may be looked forward to at an early date".

In the year to September, 1954, the Company made rapid progress which resulted in a satisfactory reduction in previous losses even after making provision for arrears and current preference dividends and writing off of all preliminary expenses.

Mr. S. K. Sen, Chairman of Sen-Raleigh, is critical of the recent liberalisation of imports. He argues that as internal production is expanding, liberalisation of licences to import bicycles is not warranted. Nor is such a policy justified, Mr. Sen argues, on grounds of maintaining standards and lowering prices.

Bicycles of the world's highest standards are now being manufactured within the country. There can, therefore, be no fear of lower standards if imports are restricted. Prices of imported bicycles have hardly any relation to those of the indigenous ones. Liberalisation of imports is, therefore, not likely to lower the prices of bicycles manufactured within the country.

MARTIN BURN LIMITED

NOTICE is hereby given that an Extraordinary General Meeting of the members of the abovenamed Company will be held at the Registered Office, 12, Mission Row, Calcutta, on Saturday the first day of October 1955 at 11 o'clock in the fore noon to consider and, if thought fit, to pass, with or without modification, the following Resolutions, namely:

1. That pursuant to Section 99 of the Indian Companies Act 1913, the Directors be and they are hereby authorised to cancel the two Managing Directors' Agreements both dated the 25th day of April 1946 and entered into with Mr. T. Leslie Martin and Sir Biren Mookerjee respectively and to enter into fresh Agreements with them.

2. (As a Special Resolution)—That the Articles of Association of the Company be altered in manner following:

(a) In Article 1, after the definition of the words "The Directors", the following new definition shall be inserted:

"The Governing Director" means the Governing Director or the Governing Directors for the time being".

(b) Article 124 shall be deleted and the following new Article substituted therefor:

"124. The Directors may from time to time appoint one or more of their body (but not exceeding two) to be the Governing Director or Governing Directors of the Company and may from time to time appoint one or more of their body (but not exceeding four) to be the Managing Director or Managing Directors of the Company, either for a fixed term or without any limitation as to the period for which he or they is or are to hold such office, and may from time to time (subject to the provisions of any contract between him or them and the Company) remove or dismiss him or them from office and appoint another or others in his or their place or places. For the purposes of Article 141, the Directors shall nominate who shall be the Senior Governing Director".

(c) In Articles 125, 126 and 127, before the words "Managing Director" wherever they appear in these Articles, the words "Governing Director or" shall be inserted.

(d) Article 128 shall be deleted and the following new Article substituted therefor:

"128. Thomas Leslie Martin and Sir Birendra Nath Mookerjee shall be the Governing Directors of the Company and Sachindra Nath Mukerjee and Frederick George Liversedge shall be the Managing Directors of the Company. Mr. T. Leslie Martin and Sir B. N. Mookerjee shall not, whilst they continue to hold office as Governing Directors, be subject to retirement by rotation and they shall not be taken into account in determining the rotation or retirement of Directors".

(e) In Article 129, the words "Managing Director" shall be deleted and the words "Governing Director" substituted therefor.

(f) In Article 141, the words "Senior Managing Director" appearing in lines 1, 3, 6, 8 and 12 shall be deleted and the words "Senior Governing Director" substituted therefor. In the same article, before the words "Managing Director" appearing in lines 4, 10, 11 and 13 the words "Governing Director or" shall be inserted. In the same Article, before the words "Managing Directors" appearing in line 10, the words "Governing Directors or" shall be inserted.

BY ORDER OF THE BOARD

T. Leslie Martin

Chairman

Calcutta,
8th September 1955.

From the Calcutta End

Planning With Tears

CONSISTENCY is a plebian virtue. West Bengal's Chief Minister is not bothered about the obsessions of little minds. He is not consistent in his policy. And the debate in the West Bengal Assembly on the tax proposals of the State discloses that he is surprised that even responsible Assembly members should quote his views and opinions against the Government's tax proposals. Both pressmen and Assembly members have accused him of contradicting himself.

Only a month ago, Dr. B. C. Roy was carrying on a crusade against the Mahalanobis Plan-frame. His main criticism was that it implied restrictions on consumption of the many poor who somehow managed to exist below the subsistence level. Any such policy militated against the avowed aim of economic planning. It would impair the already low standard of living of the masses.

Tax Effects

Dr. B. C. Roy was also opposed to the implied taxation targets of the Plan-frame. Expenditure estimates of the Plan-frame could not be attained without further increases in taxation. Direct taxation could not be pushed further. So the Plan-frame involved further increases in indirect taxation. Dr. B. C. Roy was of the opinion that any further increase in indirect taxation would press unduly on the many poor. It would further affect consumption.

These views were underlined in his memorandum on the Basic Considerations in Framing the Second Five-Year Plan. In his Plan-frame for his State, he relied on voluntary loans. He conceded that such loans were indirect forms of taxation. But his Plan-frame did not directly envisage any increase in tax on the poor. This was one of the main points emphasised by Dr. B. C. Roy in distinguishing his Plan from the Mahalanobis Plan-frame.

Those who hoped that West Bengal's Chief Minister had discovered the magic formula of planning without tears had not to wait long for disillusionment. Dr. B. C. Roy is now chastising Assembly members for their superstitious faith in financial mumbo-jumbo. He is not only the Chief Minister. He is also his Finance Minister. As West Bengal's Finance Minister, he has been piloting

two Bills which seek to impose sales tax on a number of articles of daily consumption.

An aim of one of the Bills is to stop evasion of tax by seasonal fruit dealers. But the main object of both the Bills is to raise revenue to finance the State's second Five-year Plan. So, now, Assembly members and the people of West Bengal know that planning cannot be had without tears. But the people, the Press and the Assembly members are now echoing Dr. B. C. Roy that indirect taxes would curtail consumption of the many poor who are already ill-fed and ill-nourished.

The proposed taxation involves levies on kerosene oil and mustard oil, rape oil and their mixtures. Kerosene oil lights the poor man's home. Despite vitaminised Vanaspati the Bengali still prefers to cook his food in mustard oil. It is not surprising that the proposed imposts on these articles of daily use have created a furore in the Assembly. There is, perhaps, a case for levying a sales tax on some seasonal fruits on the ground of tax evasion. But the people argue that in a State where tuberculosis is so widespread, nothing should be done to make fruits dearer. Of all the proposed imposts, that on the entry of tea into Calcutta and Howrah is the least unpopular.

One can sympathise with Dr. B. C. Roy. Little did he realise that the arguments he had advanced in decrying the Mahalanobis Plan-frame would be used with such telling effect against him. To stress the inconsistencies between the Chief Minister's precepts and practices is not to oppose his measures to raise revenue to finance the second Plan. And despite the threat of a hartal by pawn-brokers and dealers in gold ornaments, his proposal to levy a tax on the sale of gold ornaments will be widely endorsed.

Panchayats

Government through legislation is an essential attribute of democracy. In the States, there is now more legislation. And as there is more legislation, there is more acrimonious debate in State Assemblies. Even before the West Bengal State Assembly could discuss the pros and cons of new tax measures, it

had to deal with another Bill introduced by Government. After a three-hour debate on the preliminary issues involved, the Assembly referred the West Bengal Panchayat Bill, 1955, to a Joint Select Committee of both Houses.

In introducing the Bill, Shri I. D. Jalan, Minister for Local Self-Government, informed the Assembly that the Bill sought to implement one of the directives of the Constitution. Under the Bill, panchayats would be set up to replace the British-sponsored Union Boards. These Boards did not take root in Bengal for obvious reasons. But the panchayats now proposed would be full self-governing units. These panchayats will blossom forth as "Little Republics" in West Bengal's rural areas.

Village Republics

An imposing super-structure is proposed under the Bill to establish village government of the people, by the people and for the people. There will be a Gram Sabha—the general body of all adult people, male and female, of a specified area—which is to meet at least twice a year. Every Gram Sabha will have a Gram Panchayat, in which will be vested all municipal and development functions. A group of Gram Panchayats will elect an Anchal Panchayat, whose functions will include taxation, maintenance of rural police and creation of Nyaya Panchayats (village courts).

It was rather odd that the Minister for Local Self-Government did not stress the close relation between the aims and objects of the Bill and those of the National Extension Service and Community Projects. He was more interested in emphasising that the Bill sought to implement the directive of the Constitution that the village should be the basic unit of government in the Republic of India. One may be in agreement with the underlying principles behind the Panchayat Bill. One may not over-emphasise the elementary fact that even village self-governing units cannot thrive without adequate financial power. But one may be excused in reminding the sponsors of the Bill that Panchayats will not develop into "Little Republics" unless they become the basic unit not only of the State but also of Society.

Crisis in Britain's Economic Policy

THE current economic crisis is unobtrusively bringing in its train a crisis in Mr. Butler's economic policy. Government's plunge into exhortation, as was manifest in the recent series of restrictive measures to restrain home demand, was by itself an indication that a retreat from monetary orthodoxy was on. Now that the economic crisis has reached a dimension calling for urgent Government action, everyone is waiting anxiously not only to see the particular form which any new measures may take, but how far such measures will represent a departure from the policy of monetary and fiscal control which up to now has been the hallmark of Tory rule.

When Mr. Butler said that he looked "for a positive and significant reduction in Bank advances over the next few months", it was clear that the foundations of monetary orthodoxy were being shaken. Now, with the August loss of £31m. in the gold and dollar reserve, the prospect of Mr. Butler eating the humble pie to the satisfaction of Mr. Gaitskell is a real one.

It can, however, be seen that while the Conservative Government will, for reasons of prestige, maintain the largely uncontrolled character which many of the country's industrial activities have, a determined gamble on achieving solvency at the expense of the British wage earner may be attempted. The giants of industrial vested interests—the Economist, the Banker and the Financial Times—have each, with a steadfast persistence, maintained that the only way of escape from the current crisis is to reinstate the wage freeze.

The argumentation from which this recommendation arises is a familiar one. What is, however, remarkable in the new campaign is that the Chairman of the London Stock Exchange should take the unprecedented step of resorting to a somewhat elaborate press statement in which formidable statistics have been deployed to conceal how much the increase in distributed profits and the cashing of capital gains have done to promote the present inflation. And so the attack on wages has begun.

It is more than a coincidence that the attack should be indicated at a time when the Trade Union Congress

is holding its annual conference. While it is true that some of the trade union leaders may come to be influenced by the argument that recent increases in wage rates have been primarily responsible for the current balance of payments difficulties and, of course, the inflationary rise in prices, the rank and file of trade unions, who will no doubt be adequately represented on the floor of the conference, will be in no mood to succumb to the attack. Apart from the salaried staff in the transport industry, almost every other trade union is in the queue for wage increases. The issue in trade unions has clearly become one of where the leaders must either yield to rank and file pressure or resign themselves to a flood of unofficial strikes.

The choice before the leaders in the trade unions is fully understood by the Trade Union Congress; and this must be the situation since the TUC's report published earlier this week, while emphasising Mr. Butler's own warnings of the gravity of the economic situation, thrusts the blame for the deterioration not on the wage demands of member unions or strikes and strike threats, but on Government's policy or lack of policy. It says that "despite repeated trade union warnings, Government has revealed no positive plan to increase industrial investment, to keep down costs and prices and to stimulate production."

Instead, continues the TUC report, "Government has allowed increases in profits and increases in dividends to outstrip increases in wages." This bald statement is accompanied by a flat charge that Government has put above the interests of the nation the sectional interests of people "with large incomes, particularly shareholders". There appears little doubt that the attack from the industrial front on the part of the great organs of capital are being met with equally powerful attacks from the trade union front.

One of the peculiar features of the current controversy over the economic crisis is the persistent reference to the situation in Western Germany. There appears to be considerable distress among industrialists in Britain that "the German worker is working hard". The British worker is told that the country stands, in the

words of the Prime Minister, "in mortal peril" in view of the disparity in productivity between Britain and West Germany. Up to 1952, productivity comparisons invariably involved the United States. Now, everything is compared with Western Germany.

The reason for this is obvious. In the United States the considerable gains achieved by the "guaranteed annual wage" movement of the Automobile workers has so fundamentally altered the situation that the only other country where workers' living standards and earning power are depressed—West Germany—has become an example to cite. But people in Britain are not easily bluffed into accepting West German conditions as the basis for any effort towards "tightening the belt".

In West Germany, the failure, in many people's eyes, of the rebirth of militarism on the 1933 scale is being balanced by the emergence of a German national spirit to achieve economic supremacy in Europe.

This type of reasoning is attractive as a counterpoise to the need for British workers to restrain their wage demands. In fact, the German worker is involved in some fierce struggles for higher wages and better conditions. It was only at the point of police interference that workers in the Hamburg shipyards were forced to turn back to work. More than that, the drying up of cheap labour inflows in the form of refugees as well as the intake of manpower in the newly-established Wehrmacht will certainly introduce the standard economic forces making for the demand for labour in W. Germany being met at a price.

Nevertheless, the crisis in policy facing the British Government is a real one. The City of London waits with considerable anxiety for the 6 per cent Bank rate as Mr. Butler's final bid to restore what the Economist calls "confidence in the Conservative economic programme".

It is likely, however, that while such a steep rise in interest rates is not outside the realms of reality, any bid to restore balance in the British economy and to solve the balance of payments crisis which is now a fact can only be done by some measure of physical control over the more vital sectors of the British economy.

More Light on GATT

Review of the General Agreement on Tariffs & Trade—Revised Text of the General Agreement and Text of the Agreement on the Organisation for Trade Co-operation. Presented to Parliament by the Minister of Commerce and Industry, May 1955, Pp 128. Price not stated.

General Agreement on Tariffs & Trade—Analysis of Tariff Concessions Exchanged by India with the other Contracting Parties. Ministry of Commerce & Industry, July 1955. Price not stated.

WHEN the negotiations for an International Trade Organisation Charter started immediately after World War II, the British Government in India made its views known to the Indian public through the Trade Policy Committee and the Consultative Committee of Economists. During the deliberations at the Ninth Session of the GATT last year, the present Government of India, however, took into confidence only the official economists and the principal commercial organisations in regard to the line it was going to take.

The general public were not associated with its policy. They were entirely in the dark about the revision of the GATT (until the official communique was issued last April). With the publication of these two documents, people at large are in a better position to appreciate India's attitude towards the GATT and the promotion of freer trade.

The two publications bring up to date the memorandum on the GATT published by the Ministry of Commerce in 1948. Besides an analytical note on the recent review of the General Agreement, the first publication reproduces the text of the revised Agreement as well as of the original Agreement and also of the Agreement on the Organisation for Trade Co-operation (OTC). The second publication describes the exchange of tariff concessions that has taken place under the GATT and its effects on India's foreign trade. It also gives detailed statistics on the value of trade in respect of items covered by the concessions. There are also several items not specified in the usual monthly trade accounts for which statistics have been given. It is indeed creditable that the latest figures given are for the year 1953-54, especially as the latest annual Review of the Trade of India is only for the year 1948-49.

More Flexible

The revised text of the General Agreement is a much more flexible instrument of international co-operation than the original (minus

transitional agreements). India's attitude to the GATT was stated by the Leader of the Indian Delegation in the following words, "We fully accept the basic objectives of the GATT in the field of international trade. Speaking broadly, they are: firstly to reduce discrimination, secondly to lay down rules of fair trading and thirdly to promote the growth of international trade by removing impediments to it".

Important Amendments

From India's point of view, the most important amendments to the GATT are those relating to Article XVIII and Article XXVIII. Article XVIII recognises that it would be justifiable for underdeveloped countries to take protective or other measures affecting imports, in order to implement programmes and policies of economic development. It enables them to maintain sufficient flexibility in their tariff structure so as to be able to grant the tariff protection required for the establishment of a particular industry, and also to apply quantitative restrictions for balance of payments purposes in a manner which takes into account the continued high level of demand for imports likely to be generated by their programmes of development.

A line of procedure is also laid down, according to which an underdeveloped country could apply measures like quantitative restrictions on imports to promote the establishment of a protected industry even when it is not in balance of payments difficulties. In the case of underdeveloped countries, there will be consultations once in two years (and not each year) regarding restrictions applied for balance of payments reasons.

Article XXVIII provides for modification of the schedules of Tariff concessions. It is gratifying to note that although tariff bindings would be automatically renewed every three years, any Contracting party could negotiate for a modification of any binding during the three-year period or before the expiry of this period, any Contracting party could

withdraw or modify a concession already granted even when satisfactory agreement could not be reached with other interested parties, and finally "a Contracting party which does not wish to bind its schedule at all for a further period will be free to keep its entire schedule unbound."

It would appear from the foregoing that GATT has now become an innocuous Agreement. In fact, however, GATT has become more realistic and more an instrument to reduce discrimination and ensure fair trading rather than merely to reduce trade and tariff barriers. It is not necessary here to describe all the provisions of GATT. It may be pointed out, however, that the placing of GATT on a permanent footing and the establishment of a permanent organisation to be known as the Organisation for Trade Co-operation (OTC) to administer GATT and also deal with any other connected issue, would undoubtedly contribute to the stability and development of international trade.

The second document under review is an extremely valuable statistical compendium, which includes the following:

I Details of the concessions received and granted by India by direct negotiation and re-negotiation with other signatory countries;

II Details of the concessions granted by signatory countries which would be applicable to Indian products under the multilateral provisions of the Agreement;

III Summary statement showing the total value of trade in commodities on which India has received and granted concessions directly and indirectly at Geneva, Annecey and Torquay;

IV Exports from India of commodities on which India has received concessions directly and indirectly at Geneva, Annecey and Torquay;

V Imports into India of commodities on which India has granted concessions directly and indirectly at Geneva, Annecey and Torquay;

VI Statement showing preferences enjoyed by India in U K and the Colonies which are affected by GATT; and

VII Statement showing preferences enjoyed by U K and the colonies in India which are affected by GATT.

Background Note

There is a succinct background note which attempts to analyse the wealth of data given in the publication. The following conclusions are brought out:

(a) The total value of our exports of articles, covered by direct concessions received by India, to the countries which had given those concessions was Rs. 60 crores in 1953-54, Rs 74 crores in 1952-53 and Rs 67 crores in 1948-49. On the other hand, the total value of imports of articles covered by the concessions directly given by India from countries to whom those concessions were given was Rs 27 crores in 1953-54, Rs 27 crores in 1952-53 and Rs. 30 crores in 1948-49.

(b) similar figures for indirect concessions (i.e., concessions which were not directly negotiated by India, but which accrued to her as a result of the multilateral nature of GATT concessions) were Rs 75 crores for exports and Rs 62 crores for imports in 1952-53 and Rs 32 crores for exports and Rs 60 crores for imports in 1948-49.

(c) The total value of Indian exports which received the benefit of concessional rates of import duty was Rs 135 crores in 1953-54, Rs 155 crores in 1952-53 and Rs 100 crores in 1948-49. Correspondingly, the total value of imports of items on which India has given concessions, from all countries whether or not belonging to the GATT, was Rs 115 crores in 1953-54, Rs 132 crores in 1952-53 and Rs 122 crores in 1948-49.

(d) About 50 per cent of India's export trade to GATT countries (excluding U. K. and South Africa) was covered by concessions received by India. About 25 per cent of all exports to all countries benefited by the concessions which had been received. About 20 per cent of the total imports of all commodities from all sources was covered by concessions granted by India.

It is not clear what purpose is served by these figures of value of trade, unless it is implied that no trade would have taken place in the absence of exchange of tariff conces-

sions, which is incorrect. Since exchange of tariff concessions took place on the principle of mutual advantage, anyone could jump to the conclusion that India had unduly held down her imports rather than that Indian negotiations had been extremely plucky. What should have been compared is the value of additional exports which could be attributed to the tariff concessions received by India with the value of additional imports which resulted from concessions granted by India.

Futility Of It

Clearly such a comparison is impossible, especially for a period characterised by the continuance of exchange controls, quantitative restrictions, fiscal and monetary controls

etc., and by devaluations, Korean War etc. The futility of such comparison is indeed realised in the note.

Even though the two documents under review throw much light on hitherto-obscure spots, it is still difficult to reconcile India's membership of the GATT with her devotion to planning for a socialistic pattern of society and intensive programme for developing heavy industry.

Even with all the concessions to underdeveloped countries under the revised GATT, India will have to stick to rules of fair trading and any attempts at bilateralism, monopolisation of foreign trade, differential prices, and such other devices would be taboo! This, however, is entirely a different matter.

SHALIMAR PAINT, COLOUR & VARNISH COMPANY, LIMITED
CALCUTTA • BOMBAY • MADRAS • NEW DELHI • KANPUR
Write to Post Box 68, Calcutta, for the latest copy of The Shalimar Standard spw 161

THIS IS AN ANNOUNCEMENT AND NOT A PROSPECTUS. A prospectus has been filed with the Registrar of Companies, Bombay

"CONSENT of the Central Government has been obtained to this issue by an order of which a copy is open to public inspection at the Head Office of the Company. It must be distinctly understood that in giving this consent the Government of India do not take any responsibility for the financial soundness of the undertaking or for the correctness of any of the statements made or opinions expressed with regard to them."

"A LICENCE has been obtained from the Central Government for the establishment of this new undertaking of which a copy is open to public inspection at the Head Office of the Company. It must be distinctly understood that in granting this Licence the Government of India do not take any responsibility for the financial soundness of this undertaking or for the correctness of any of the statements made or opinions expressed in regard to it."

The Subscription List will open on Monday the 12th September, 1955 and will close on Thursday the 22nd September, 1955 or earlier at the discretion of the Directors.

THE WEST COAST PAPER MILLS LIMITED

(Incorporated under the Companies Act, 1913)

AUTHORISED CAPITAL :

3,75,000 Ordinary Shares of Rs. 100/- each	Rs. 3,75,00,000/-
1,25,000 Cumulative Preference Shares of Rs. 100/- each	Rs. 1,25,00,000/-
	Rs. 5,00,00,000/-

ISSUED CAPITAL :

1,00,000 Ordinary Shares of Rs. 100/- each	Rs. 1,00,00,000/-
60,000 6% (free of income-tax) Cumulative Preference Shares of Rs. 100/- each	Rs. 60,00,000/-
	Rs. 1,60,00,000/-

The Company was incorporated on 25th March 1955. On or about 2nd May, 1955, a Statement in lieu of Prospectus was filed with the Registrar of Companies, Bombay, and a certificate for commencement of business was granted on 5th May, 1955.

The Promoters, the Directors and their friends have taken up 50,000 Ordinary Shares and 10,000 Cumulative Preference Shares all of the aggregate face value of Rs. 60,00,000/- on which a sum of Rs. 50/- per share has been paid up.

The remaining 50,000 Ordinary Shares and 50,000 Cumulative Preference Shares are offered for public subscription.

The amount payable in respect of both the Ordinary and Preference Shares is as follows:

- (a) On application .. Rs. 25/- per share.
 (b) On allotment .. Rs. 25/- per share.
 (c) The balance of Rs. 50/- in respect of Ordinary Shares and Rs. 50/- in respect of Preference Shares is payable in such calls as may be determined by the Directors provided that no call shall exceed 1/4th of the nominal amount of the shares and there shall be an interval of at least two months between two calls.

The Directors reserve the right to allot in advance of the opening of the subscription list not more than 20,000 Preference Shares out of the present issue.

By an Agreement dated the 23rd day of August 1955, the Industrial Credit and Investment Corporation of India Limited, have agreed to underwrite the said 50,000 Ordinary Shares and 50,000 Preference Shares now offered for public subscription for an underwriting commission of Rs. 2 per cent. In addition to the said commission, the said Corporation is also entitled to brokerage at the rate of 1% on the nominal value of all such shares as are either taken up by and allotted to them or have been subscribed for, through them and allotted by

the Company. In the opinion of the Directors the resources of the said underwriters are sufficient to discharge the underwriting obligations.

RIGHTS OF CUMULATIVE PREFERENCE SHARES :

The said Cumulative Preference Shares shall confer on the holders thereof the right to receive in priority to Ordinary Shares in the capital of the Company out of the profits of the Company from time to time determined to be distributed, a fixed cumulative preferential dividend at the rate of 6% per annum free of income-tax on the capital paid thereon and also the right in a winding up of the Company in priority to all Ordinary Shares to re-payment of the Capital paid up thereon together with the payment of all arrears and accruals of the said cumulative preferential dividend down to the date of commencement of winding up whether earned or declared or not, but shall not confer any further rights to participate in the profits or assets.

DIRECTORS

Shri Gobindlall Bangur, (Chairman) Calcutta.
 Shri Gokulchand Bangur, Calcutta.
 Shri Pranlal Devkaran Nanjee, Bombay.
 Shri Maneklal Premchand, Bombay.
 Shri Ramnath A. Podar, Bombay.

LEGAL ADVISERS

- Messrs. Payne & Co., Solicitors & Notary Public, Esplanade House, Waudby Road, Fort, Bombay.

- Messrs. Kanga & Co., Solicitors & Notary Public, Readymoney Mansion, Nariman Road, Bombay.

AUDITORS

Messrs. Batliboi & Purohit, Chartered Accountants, 204, Hornby Road, Fort, Bombay.

REGISTERED OFFICE

Shreenivas House, Waudby Road, Fort, Bombay.

OBJECTS AND PROSPECTS :

The Company has been formed, generally for carrying on all or any of the objects and purposes set out in the Memorandum of Association of the Company, and particularly to manufacture white printing and wrapping papers from bamboo and other raw materials.

There are at present 20 Units in the country for the manufacture of paper and paper board with a total capacity of about 1,85,600 tons. Heavy imports are necessary to meet the present demand, requiring valuable foreign exchange.

On the basis of the above figures the annual per capita consumption of paper in India is hardly one lb. This is very low in comparison with that in other countries such as U.S.A. having approximately 400 lbs., Canada 175 lbs. and U. K. 154 lbs.

With the growth of literacy, the expansion of trade and industry, the general rise in the standard of living and the increase in population, consumption of paper in India is bound to increase. The Planning Commission has envisaged a steady increase in the demand and the target fixed for the Second Five Year Plan for the paper industry is 3,70,000 tons compared with the production of 1,55,000 tons in 1954.

The present installed capacity together with the expansion already sanctioned leaves a wide gap to be bridged in order to meet the minimum requirements of the country. The industry, therefore, has bright prospects for further expansion.

The present rate of import duty on paper is 39% ad valorem which provides sufficient protection against undue foreign competition. Moreover there are indications of worldwide shortage of paper as will be evident from the following observations made by the President of the Newspaper Society, London, and the Indian Tariff Board as quoted hereunder respectively :

"We face a famine, a real famine in paper not only newsprint but every form of paper. A new source of supply must be found."

"There is an overall world shortage of paper and pulp, making import of any substantial quantity of these

products into this country from abroad, a remote possibility."

SELECTION OF SITE :

The promoters have selected Dandeli in North Kanara District of Bombay State as the site for the factory after a thorough investigation of all major factors such as raw materials, water supply and effluent, availability of cheap power, technical personnel, transport facilities and natural market. Highly qualified experts have thoroughly examined the location from various aspects and have unanimously acclaimed the suitability of the project. The Chief Engineer of a leading German Machinery Supplier has observed in his report of 25th May 1955, as under:

"The Dandeli site is probably the most suitable of the comparatively few presently eligible locations in India for the establishment of a major pulp and paper making unit based on bamboo."

AGREEMENT WITH GOVERNMENT OF BOMBAY :

By an agreement dated the 13th August 1955, the Government of Bombay have granted to the Company necessary concessions for a period of 30 years, the royalty payable being Rs. 3-2 per ton on paper or pulp going out of the factory and subject to revision after five years and subsequently after every ten years; such revision at each stage shall not exceed 25% of the basic rate of Rs. 3-2 per ton. They have further agreed to grant lease or occupancy rights of 200 acres of land for the Factory and Housing Colony.

CAPITAL OUTLAY :

On the basis of the quotations received from well-known machinery manufacturers, the Directors are of opinion that the capital outlay of the factory of the rated capacity of 60 tons including factory building, township water works etc., will be about Rs. 3 crores as under :

1—Plant and Machinery	Rs. 2,40,00,000/-
2—Buildings	" 50,00,000/-
3—Miscellaneous equipment, vehicles etc.	" 6,00,000/-
4—Brokerage and underwriting commission	" 3,00,000/-
5—Preliminary Expenses	" 1,00,000/-
	Rs. 3,00,00,000/-

and the same will be provided as under :

By Share Capital :

Already subscribed	Rs. 60,00,000/-	
Present Issue	Rs. 1,00,00,000/-	Rs. 1,60,00,000/-

By Loan from The Industrial Finance Corporation of India (already sanctioned)

Rs. 1,00,00,000/-

By Way of Deferred Payment to Machinery Suppliers.

Rs. 40,00,000/-

Rs. 3,00,00,000/-

The working capital, when required, will be provided by borrowings from Banks and other organizations.

The minimum subscription in respect of the present issue on which the Directors will proceed to allotment is Rs. 1,00,00,000/-.

ESTIMATION OF PROFITS:

The Company intends to instal the latest Plant and Machinery which will effect a substantial saving as compared with older plants both in the cost of Labour as well as of chemicals. Modern Soda Recovery and Re-causticising Plants are expected to effect a substantial saving in the cost of chemicals, and the recovery of steam will be another important economic feature.

Taking into account all these factors and leaving an adequate margin for contingencies, the costs of manufacture have been carefully prepared and examined by various technical experts and cost accountants. On the basis of existing selling prices and after allowing for all selling costs, freight, depreciation, overhead charges, the Directors are satisfied that there will be an adequate margin to permit the payment of an attractive dividend on the Ordinary Shares after meeting interest on loans and on Preference Shares.

PRELIMINARY EXPENSES:

The estimated amount of the preliminary expenses (exclusive of underwriting commission and brokerage and also exclusive of the sums of Rs. 30,000/- and Rs. 15,000/- paid to Shri A. D. Chaudhari and Shri M. G.

Kotibhaskar respectively) is Rs. 1,00,000/- approximately.

BROKERAGE:

Brokerage at the rate of Rupee One per cent, will be paid to recognised Brokers, Banks or Industrial Credit and Investment Corporation of India Ltd., on allotments made in respect of application bearing their stamps.

APPLICATION:

Application for shares should be made in the units of 5 shares of either class on the form accompanying the Prospectus or which may be obtained at the Registered Office of the Company, at the Office of the said Underwriters and at any of the offices in India of the Company's Bankers.

Where no allotment is made, the deposit will be returned in full and where the number of shares allotted is less than the number applied for, the balance of the deposit will be applied towards the amount remaining to be payable on the shares allotted and any balance thereafter remaining will be returned.

The shares when issued will be subject to the Memorandum & Articles of Association and Prospectus of the Company, copies of which can be inspected at the Registered Office of the Company during office hours.

Applications will be made to the Stock Exchanges of Bombay and Calcutta in due course for quotation for the shares.

Irrigation and Socio-Economic Change in a Mysore Village

Scarlett Trent

This is one of the series of Village Studies which have been appearing from time to time in The Economic Weekly. The author has spent about ten months in the Mysore village studying the social and economic changes brought about by the introduction of irrigation and by industrialisation, under a Rockefeller Foundation fellowship. She is a research student in the Faculty of Social Studies in the University of Manchester.

CULTIVATED lands in India fall into two major categories, "dry" and "wet". Dry lands are those which depend solely upon rainfall for cultivation, whereas wet lands receive supplementary water supply from rivers, canals, tanks or wells. Irrigation is by no means a recent innovation, but has been practised for many centuries, particularly in South India. The Imperial Gazetteer of India, referring to Mysore, stated that "almost every valley contains a chain of tanks, the first overflowing into the second and so on, until the terminal tank is filled." Irrigation wherever it is possible, is still regarded as the most radical and efficient means for developing agriculture. The five-year plans devote considerable resources to irrigation schemes, ranging from well-and tank-irrigation at village level to large-scale river valley projects.

Irrigation, by making the farmer largely independent of natural rainfall, reduces the risk in agricultural production and increases the rural earning-potential. The artificial supply of water can substantially increase productivity per acre. Large areas of complete waste may be brought within the margin of cultivation once they come under irrigation. Therefore irrigation not only potentially increases the yield per acre, but also the extent of cultivable area. Furthermore, it usually enables the farmer to undertake the cultivation of certain cash crops like sugarcane.

There is little doubt that irrigation creates an important economic-potential, but even the most elaborate irrigation schemes are of little practical value unless the affected farming population exploits the new opportunities. Everyone is familiar with the usual criticism levelled against the farmer. He is called "conservative" because he is hesitant in his attitude to measures of development. Such criticism reflects a lack of knowledge of the full impact of economic change on a village community. Before the farmer is

labelled "conservative", it would be advisable to examine closely what exactly economic progress means to the social life of a rural society. If irrigation creates a new economic-potential, can the farmers exploit this potential with the resources at their disposal? Does economic development, as a result of irrigation, lead to a greater equalisation or concentration of wealth? In what way does economic change affect the organisation of agricultural production, and through agricultural production, social institutions? These questions formulate important theoretical and practical problems, which require an intensive study that utilises the knowledge and conceptual apparatus of both the economist and the sociologist.

I am at present pursuing such type of research in a Mysore village. My particular interest is the study of the interrelationship between economic and social change. I am fully aware of the fact that what has happened since irrigation in one Mysore village cannot be taken as indicative of the whole of India. Many more studies of a similar type will have to be completed before a general theory of economic development is formulated. In the meantime even one village study may help to shed a little light on the mutual determination of social and economic forces. In order to preserve the anonymity of the village I have been studying for the last eight months, I am giving it the fictitious name of "Manhalli". It is a multi-caste village, consisting of ten castes excluding the Untouchables who live a little apart. The Okkaliga, or Cultivator's caste, is dominant both in number as well as in economic and political power. Altogether there are 947 inhabitants living in 192 households. (Each separate cooking-unit represents one household.)

Manhalli is situated in the undulating territory of the Mysore 'plains', about four miles from Bella, a rapidly growing town with a sugar factory. In 1938 Manhalli's cultiva-

ble acreage was recorded as 780 acres of which 100 acres were irrigated from a village tank. The tank depended for its water supply on small contributory nullahs, which were likely to be without water when there was a serious failure of the monsoon. Therefore the tank was never a very reliable source of water supply. Paddy was the major crop grown on the tank-irrigated lands, when there was enough water in the tank. Sugarcane was rare and was grown only for making jaggery. Ragi (*elousine corocana*) and jowar (*sorghum vulgare*), the staple crops, were grown on dry lands. Before the advent of canal-irrigation Manhalli had an economy which could be described as predominantly subsistence. Sericulture provided the only major source of cash income, but was not widely practised.

The watershed in Manhalli's recent history occurred sixteen years ago when irrigation from a widespread system of canals reached the village lands. Unfortunately the local survey authorities have not yet re-surveyed the lands since the introduction of irrigation and it is therefore difficult to compile up-to-date totals of Manhalli's dry and wet lands. The data presented here have been pieced together from several records and from direct investigation to show the economic-potential irrigation has offered to Manhalli villagers. Manhalli now has 720 irrigated acres which include 180 acres of waste brought under cultivation since irrigation. Therefore irrigation has already extended Manhalli's arable land by 23% and there is further scope for the expansion of cultivation. About two thirds of the reclaimed land form part of a sugarcane farm, which employs Manhalli labour and belongs to the sugar factory in Bella, the near-by town. Thus the area of wet land now owned and/or cultivated by Manhalli ryots amounts to 590 acres, an increase of 490% over the tank-irrigated area. Only 190 acres remain dry. A section of this area could be irrigated, but has

been labelled village-reserve as part of anti-malarial measures. Canal irrigation is the rule over the area previously irrigated from the tank, and the tank has been allowed to dry up. This is another anti-malarial measure, which places the 113 acres of the tank-bed for cultivation by irrigation.

Irrigation has thus considerably increased the area of Manhalli's arable land. The impact on yield per acre is even more significant. Bella's sugar factor, which was established shortly before Manhalli came under canal-irrigation, encouraged the ryots in the vicinity to grow sugarcane as a cash crop on a large scale. A few figures will give some idea of the increased productivity-potential. The average crop of sugarcane per acre in Manhalli amounts to thirty tons which at present prices give a net yield of Rs. 500. The ryot can usually get about two crops in three years. Therefore his annual net receipt per acre of sugarcane amounts to Rs. 333. Paddy is a less remunerative wet crop, but is also widely grown since irrigation, and has replaced ragi as the staple diet of the villagers. Ragi is, however, still a basic food and the staple crop on dry lands. If the ryot grows two crops of ragi per year per acre, his annual net receipts from one acre amount to a total of Rs. 175. These figures are only approximate, but they serve to show that irrigation has practically doubled the farmer's net income per acre, provided he is able to take advantage of the new economic opportunities.

Sugarcane as a cash crop is new to most of Manhalli's peasants. The growing of this new crop was not just a matter of changing over from one crop to another, but involved a far-reaching readjustment in the organisation and practice of agricultural production. Agricultural skill is passed on from father to son. Through time and experience the peasants develop a rhythm of production throughout the agricultural cycle in which each participant has a certain task to perform, and each operation is allocated a certain date and time. Unless the production techniques of a newly-introduced crop harmonise with those of the traditional crops, the new crop is bound to upset the rhythm of cultivation. Sugarcane, the major crop in Manhalli since irrigation is a twelve-or fourteen-month crop, whereas ragi is a three-to four-month crop. The much longer period needed to grow sugarcane forced the ryot, who wanted to change from

ragi to sugarcane cultivation, to re-organise all his cultivation activities throughout the year. Such a re-organisation, which involved new methods and skill, required time for careful planning and attention. Growing a new crop is a venture into the unknown and always embodies a risk; unless there is some authority which ensures a minimum yield to the farmer. Although in the long run irrigation reduces the risk of agricultural production by making the ryot partly or wholly independent of rainfall, in the short run a new crop means a big risk, simply because it is new. What if it fails? The peasant risks most or all of his resources. This is a big stake which no industrialist would risk lightly either. Why then label the ryot "conservative", just because he hesitates and thinks carefully before embarking on a new venture which commands the best part of his resources? Even if the farmer is prepared to take a big risk, it takes time before he and his helpers can acquire the techniques and skill required to grow the new crop. For instance, in order to grow sugarcane Manhalli ryots had to learn furrow ploughing, planting of seedlings, bundling of plants, trenching and several other operations which were new to them. The new methods also required some new equipment which cost much more than the implements for growing ragi. Before the advent of irrigation wooden ploughs were the rule; an iron plough was unknown. Nowadays almost every ryot has an iron plough, the cost of which is Rs. 30 while a wooden plough costs Rs. 5. Four of Manhalli's ryots own Kuper ploughs which are important for cane cultivation and cost about Rs. 80 each. These four men hire out their ploughs to other villagers at the rate of Rs. 1/8/- per day.

Many of the Manhalli ryots who were used to live and work in a mainly subsistence economy before the coming of irrigation found it difficult or even impossible to invest money for costly equipment required for sugarcane. The new crop also required a large amount of costly fertiliser. Even where the farmer was absolutely certain that the increase in yield would be bigger than the proportionate increase in cost, he simply lacked the necessary working capital to see him through. The longer period of a cash crop like sugarcane strains the peasant's resources to the extreme. From the time of ploughing it takes about eighteen months before he can

hope to get his final cane payments. During these eighteen months he has to meet all cultivation costs as well as his household expenditure. Certain measures introduced by the sugar factory in Bella, which is the chief buyer of all sugarcane produced in Manhalli, have ameliorated the lot of the ryots. Factory fieldmen advise ryots on sugarcane cultivation. The factory gives a cultivation advance at 6% rate of interest to help the ryot buy the costly fertiliser. This advance tides the ryot over the difficult period of waiting for cash payment. But these facilities were introduced only some time after the advent of irrigation. Before they were available only few of Manhalli's farmers had sufficient working capital available to enable them to take spontaneous advantage of the new economic opportunities.

Who were these men who could realise the economic-potential? We have noted that the change-over from growing ragi to growing sugarcane requires more than just a progressive attitude; it requires new skills, and considerable funds for fixed and working capital. At present, sixteen years after irrigation, there are only five wealthy men in Manhalli. It is interesting to note that all were traders as well as landholders before the coming of irrigation. One imported ragi to Manhalli, another acted as selling agent for Manhalli's output of silk cocoons and the others were also engaged in some kind of trade. All the five men were at the time of irrigation, and still are, informal moneylenders. They were therefore used to act in a "cash economy", and besides had liquid funds at their disposal which they could employ as working capital or investment. Being experienced traders these peasants seem to have been more ready to enter risky and uncertain enterprises than the bulk of the ryots who moved mainly in a subsistence and/or barter economy. Entrepreneurship is at least as important to economic progress as the availability of capital for experimentation. Some of the peasants with larger landholdings before irrigation lost their predominant economic status simply because they lacked entrepreneurship. They sold part of their landholding in order to benefit from the inflated land values after irrigation. Partly this was due to their lack of foresight, but partly it was a means to acquire working capital so as to finance cultivation in the remaining acres. Land values have soared to great heights since

irrigation. An acre of dry land of average local fertility and in the proximity of Manhalli's village site sold at a price of about Rs. 150 in 1938. The same acre, provided it has come under irrigation, sells now for about Rs. 1500 to 2000.

The information collected on indebtedness in Manhalli shows that it has increased rather than decreased since irrigation even when allowance is made for the general inflationary tendency of the past fifteen years. The increased creditworthiness has led to an increased indebtedness, although it must be said that there is now a bigger turnover of loans than before irrigation. This implies that the local debtors require mainly temporary loans to tide them over until they receive their sugarcane payments from the factory, and indicates the improved economic conditions of the Manhalli ryots. The few men who were the first to take advantage of irrigation are now the main moneylenders in the village. The usual rate of interest of 12% represents another factor in the cumulative increase of their wealth.

Manhalli villagers have a saying that "irrigation made the rich richer and the poor poorer". The first part of this saying is certainly true and the second is true in as far as irrigation sharpened economic differentiation. Economic forces generated by and since irrigation made for a concentration of wealth in a few hands. Yet concentration of wealth has in fact not taken place to any large extent in Manhalli. There are only five ryots who own more than ten acres each and between them they hold in all no more than 66 acres. 33 or 17% of the households are landless labourers and the remaining 154 households own an average of 4.60 acres each. How then can we account for the dispersed landholding in spite of economic pressure towards concentration of wealth? I find that in Manhalli there were social forces at work which, re-directed, and to a certain degree neutralised, the economic forces. The social institution of inheritance is probably the most important single factor responsible for the dispersal of landownership. The prevailing laws and customs governing succession and inheritance give economic powers a vulnerable character. Every son has an equal right to the ancestral estate. As long as the sons continue to live as a joint family, division of property will take place only in alternate generations. But in Manhalli the joint family has

practically disappeared. The practice nowadays is for the married sons to set up separate households after the birth of their first child. The married son with child receives his due portion of the ancestral estate. If the father acquires more lands between the first partition and his death, this additional landholding is shared equally by all the sons after the father's death. This practice of inheritance is an important and dynamic factor in the village economy which leads to a periodic reshuffle in landownership. Whilst the population is stationary or declining, dispersed inheritance presents no serious economic problem. Immediately after irrigation malaria took a high toll of Manhalli inhabitants and the population declined. During the last seven years malarial control coupled with improved health measures has successfully reduced the death rate, particularly the infant mortality rate, and population trends have shown an upward surge. Population growth gives a further impetus to a more egalitarian society in Manhalli. The widespread custom of adoption constitutes another force working in the same direction. Usually if a man is without a son even after a few years of married life, he adopts one or two boys from either relatives or friends. It often happens that in later years own sons are born to the marriage, but the adopted sons retain equal rights with own sons to inheritance and succession. As long as infant mortality was unduly high many marriages were childless or without sons and adoption was then a very frequent practice.

Here we have three important social factors, adoption, inheritance and population growth, which in Manhalli's recent history affected and shaped the nature of economic progress. The actual change that occurred since irrigation is a result of both social and economic forces, which interacted upon each other. Some social institutions are sufficiently flexible to continue to function in a period of rapid economic change and progress, whilst others break down under the onslaught of newly released economic forces. According to development in Manhalli, "caste" falls into the former and "joint family" into the latter category of social institutions.

Caste has successfully weathered many economic and political storms in the past and is still very powerful. If the pursuit of an occupation was ever a rigid criterion for caste mem-

bership, it is no longer the case in Manhalli to-day. There are ten castes and an untouchable community in Manhalli and members of each of these social groups practise agriculture either as owner-cultivators, tenants or agricultural labourers. Under the impact of competition from shops and fairs in Bella, local service castes were forced to give up their traditional caste occupations. Three of the four Manhalli potter households have become whole-time agriculturists, finding it much more remunerative than pottery. The fourth household practises pottery merely as a subsidiary source of income, most of the householder's time being spent on sugarcane cultivation in his two acres of land. The cultivator caste households continue to have their traditional relations with the service castes, such as the blacksmith, barber, washerman, and still make annual paddy payments to the latter, although the economic aspect of this relationship is rapidly losing in importance. Since the demand for village services has decreased the annual paddy payments are more in the nature of a gift than a reward for services rendered. Soap or soap-powder makes it easy for the ryot's wife to wash the clothes herself. Some ryots even take their washing to be done in a shop in the nearby town. Similarly the town hairdresser is a preferred alternative to the local barber. Both washermen and barbers in Manhalli practise agriculture as a subsidiary occupation, and the trend is such that agriculture looks like becoming their main occupation. Competition from the nearby town accompanied by a changed pattern of wants has undermined the demand for the traditional village services. Manhalli is becoming more and more incorporated into the wider national economy. In spite of the fact that the economic basis of caste organisation in Manhalli is disappearing, caste as a social institution is still a strong force. It continues as an endogamous group, and not a single intercaste marriage has taken place, although all the villagers are now part-or full-time agriculturists. The five magnates in the village are members of the Cultivator caste, but some of the service caste households own more land than many Cultivator caste households. Therefore the economic stratification of the village does not coincide with its social stratification. Yet the social stratification persists and is still exemplified in the various ritual tasks performed by the various castes during vil-

lage feasts or marriage ceremonies. The intricate rules governing inter-dining between castes are still observed, more so by the women than by the men. If caste had really been merely an expression of a strict division of labour, evidence of its breakdown should have been forthcoming in Manhalli during the past sixteen years. Caste in Manhalli has shown itself to be a flexible institution which is capable of continuing in spite of changes in occupation and economic status. Perhaps the high stability of Manhalli's population of all castes is the main single factor accounting for the persistence of the caste distinctions. Whether caste differentiation will continue against the impact of industrialisation and a higher mobility of population is a problem which can only be answered after detailed study.

Joint family in Manhalli has proved to be less resistant to change than caste. Out of the 192 households only 19 are joint families and some of these joint families are only borderline cases. Records of landholdings indicate that since irrigation the incidence of partitioning of land among sons during the lifetime of the father has greatly increased. A casual relationship between economic change and the higher frequency of partitioning of landholdings is highly probable. The sugar factory's policy to spread contracts over a large number of farmers was one of the factors which induced partitioning. The joint family was at a disadvantage as compared to the smaller family unit. For instance, if four brothers jointly own 16 acres the factory contracts to buy the crop of three acres of sugarcane from them. But if the brothers divide their property and each claims four acres, each will probably get a contract for one and a half acre of sugarcane. Therefore, instead of three acres, after partition the brothers will have six acres under contract to the factory.

Economic opportunities and the change-over to a money economy after the coming of irrigation encouraged the competitive spirit among Manhalli villagers. A wider pattern of wants put strains on joint resources and led to clashes of interest among brothers, or between father and sons. Elders complain about the extravagant habits of present-day youth and hold this to be the cause for friction within the family and eventual partitioning. Joint families pool their resources and therefore have more capital at

their disposal. Provided the participants of such joint family enterprises work well together and are equally efficient, their enterprise will be more successful than that of the smaller family unit. Otherwise joint family enterprises are unwieldy production units, cumbersome in taking decisions and burdened by slacker members. This becomes particularly evident under the impact of economic development. Economic progress favours the most efficient, the most enterprising men in society. The differential ability of men and their individual acquisitiveness are the main drawbacks of joint family cultivation, when subjected to the stress of economic change and improvement. The continuance of the 'joint family' during a period of growing population would have resulted in an even more unwieldy cultivation unit in Manhalli. The ambitious members in a family would have been probably held back by the less efficient of their brothers. If there is a new economic opportunity the smaller elementary family unit appears to have a better chance for advancement than the more unwieldy joint family. This argument is borne out by the statistics of the All India Agricultural Labour enquiry which indicate that a higher level of living is associated with a lesser number of members per family. The joint family offers a type of social security to its members and naturally has to carry a levy for it. This levy probably acts as a brake to economic improvement, a brake which is discarded when the economic opportunities are sufficiently attractive. Manhalli villagers complain that the mutual aid spirit that prevailed many years ago when they were much poorer has disappeared. The village headman then used to collect ragi from the better off families and give it to the poorer households. Such redistribution does not take place any more. Many of the villagers now have "surplus" cash, but they rarely share it with anybody outside their immediate family circle. The "surplus" money is spent lavishly on marriages and or in daily consumption of country cigarettes or cigarettes, coffee and snacks in hotels, and visits to the cinema in Bella. The new individualistic spirit is exemplified in the non-observance of some of the traditional village feasts. At major festivals of the year the villagers used to have a joint dinner outside the village temple. Each household contributed to the dinner according

to its means and the food was shared equally. This custom has fallen into disuse during the last few years in Manhalli. Temples are the emblem of village unity as well as the places of worship. In the days gone by Manhalli villagers spent a lot of effort and money on the building and upkeep of the local temples. The temples are better built and even more costly than the best village homes. The duty of cleaning the temple and the space in front of it with cowdung was distributed among the various houses in the village. This is another practice fallen into disuse and the villagers these days pay little attention to the maintenance of the temples. This does not imply any disregard for religion, but simply a decline of joint effort, of social action. Instead the villager now pays more attention to his own home. This is supported by the recent tendency among villagers to have elaborate decorations on the interior and exterior walls of their houses. Competition wages among villagers to have the most fanciful decorations and naturally the richest have the most elaborate designs.

Manhalli has not been subjected to any of the intensive development schemes organised by the State. The change that occurred since irrigation can therefore be regarded as "spontaneous" and this change has been far-reaching and has affected all aspects of village life. The relative prosperity of Manhalli and surrounding villages depends directly on sufficient water supply from the canals. If irrigation fails, sugarcane cannot be cultivated and the affected villages are threatened with serious depression. Irrigation did create a substantial economic potential, and considering the risk and difficulties involved in its exploitation, the villagers were anything but conservative in their attitude towards change. Comparative data indicate that the average standard of living has risen considerably during the last sixteen years in Manhalli and per capita income has nearly doubled. There has been a change in production methods, organisation of cultivation, and even in dress, diet and daily habits of the villagers. Yet the change was an evolution rather than a revolution. Some of Manhalli's social institutions were sufficiently strong to transform the economic forces from revolutionary into evolutionary. Other social customs altered or disappeared under the impact of economic progress.

Agricultural Labour II—Wages of Farm Workers

(Continued from page 1067)

AGRICULTURAL labour is usually supplied with some perquisites in addition to cash and kind wages. Perquisites are important inasmuch as about 33 per cent of the total man-days worked by adult agricultural labourers are paid for with perquisites. There is a considerable difference among the different zones and the States in each zone in respect of perquisites. In Central India, the proportion of man-days paid for with perquisites is 2 per cent, while it is 30 per cent in South India. In North and East India, however, payment for the majority of wage-days is supplemented by some perquisites, the proportions being 62 and 51 per cent respectively.

In Jammu and Kashmir, agricultural labour receives some perquisites almost throughout the period of wage employment. West Bengal accounts for the next higher proportion of man-days paid for with perquisites, viz., 84 per cent, and the lowest percentage is found in Madhya Pradesh, viz., 0.4 per cent of man-days. Others on the low side are Hyderabad (about one per cent) Madhya Bharat (4.8 per cent) and Orissa (9 per cent) and States that occupy the mid-portion are Punjab (29) Mysore (31) Travancore-Cochin (44) and Saurashtra (44).

The nature of perquisites differs from place to place. In U P, it is a mid-day meal or gur or sharbat and in Madras it may be ragi meal with chatni and in Mysore, it is a mid-day meal and in some cases a cup of coffee. In West Bengal a mid-day meal and muri (parched rice) are quite common. While in PEPSU two meals and a light breakfast are provided, in Jammu and Kashmir a meal and tea twice a day are usual.

The importance of perquisites in the scheme of wage-payment is perhaps better understood when their cash value is taken into account and related to the regular wages that workers receive. For all-India, on an average, perquisites account for one-fourth and one-third respectively of men's and women's average daily wages (inclusive of perquisites). An idea of the differences among the States in which perquisites are important may be had from Table III.

Although the same labourer is engaged in different agricultural operations, there are inter-occupational wage differences, depending on such factors as the amount of effort involved in an operation, exigencies of work and supply of labour. Of the four important agricultural operations (which account for about 70 per cent of total man-days) viz., harvesting, preparatory, ploughing and weeding, harvesting commands the highest average daily wage, viz. 20.2 annas. The other operations which follow are preparatory (17 as.), ploughing (16.8 as.) and weeding (14.3 annas).

Non-farm Employment

Casual agricultural labourers get some wage employment in non-agricultural work also. 58 per cent of the men and 34 per cent of the women find such non-agricultural employment. The period of employment is about 56 days in a year for men and 41 days for women. Men provide mostly unskilled labour for road building or other public works, house construction, etc., and sometimes they are also employed as lumbermen, wood-choppers, porters and in biri-making and in coffee and tea plantations. Employment in the case of women is more limited and they usually work as domestic servants, and in some parts of the country, they are employed for decortoring of groundnuts and for paddy pounding.

The average all-India daily wage rate for non-agricultural employment is estimated at 17.2 annas for men, and 9.8 annas for women. It is curious to find that both these averages are only slightly lower than

the averages for agricultural employment (17.5 annas and 10.8 annas respectively). In Mysore and Madhya Pradesh, on the other hand, however, non-agricultural wages are higher than agricultural wages, though the difference is not appreciable.

Attached Labour

Although attached labourers are more or less in continuous employment, conditions of work differ from worker to worker, depending on the contract which defines the tenure and terms of employment taking the workers' skill etc., into account. There are, broadly, two types of attached labourers, viz. skilled and experienced labourers, who are employed usually by large farms, and generally well paid, and the less skilled, indigent workers who get attached in order to repay debts and other forms of obligation.

The wage of an attached worker is not strictly comparable with that of a casual worker, as it is fixed for a definite period and is not subject to seasonal variations. Continuous and secure employment may also induce the attached labourer to accept a lower wage than that of his casual counter-part. Subject to these, Table IV on next page gives an idea of the rate of wages of these two categories of labourers.

Trend of Wages: 1939-51

Since 1938-39, wage rates in agriculture and the prices of food articles, which agricultural workers consume, have both increased in all parts of the country. An idea of the relation that price increase bears to the increase in wages may be gained from Table V, on next page which gives the indices of weighted wage

rates and retail prices in 1950-51 (1938-39=100). The wage index relates to ploughing, transplanting, weeding and harvesting operations and wages are weighted according to man-days put in these operations. The prices of food articles are those of rice, wheat gram and other cereals, and are weighed according to the intake of these articles.

It will be seen that in 1950-51 as compared to 1938-39, wages either lagged behind or just kept pace with the increase in food prices in most of the States. The only exceptions to this general tendency were U P, Madhya Pradesh and PEPSU. It is only in PEPSU, where the number of agricultural labourers is relatively small, that the benefits of a rise in the value of agricultural output ap-

pear to have been passed on to agricultural workers. However, before jumping to conclusions, it is better to bear in mind that the wage and price data for 1938-39 are not as reliable as those for 1950-51.

SUBSIDIARY INCOME

The most important source of income for agricultural labour is, of course, to be found in wages earned from work in both agricultural and non-agricultural operations. Some income accrues from the cultivation of small plots of land owned or held on lease by the agricultural labour families. However, they also often derive driplets of income from several subsidiary occupations such as non-agricultural labour and occupations other than farming, especially during the lean months. Owing to a general lack of resources, they cannot take to occupations involving capital outlay. The only non-farm occupations, therefore, which are easily procurable are: selling vegetables and firewood, house repairing and road construction.

In estimating the income level of agricultural labourers and the total wage bill in agriculture, it would be necessary to take note of these diverse sources of earnings, however small in volume. It is also important to include the cash value of wages

paid in kind and perquisites, if any. This, the Agriculture Labour Enquiry, has done by evaluating kind wages and perquisites in terms of the ruling retail prices and the amount has been included on both sides of the family budget. Though the contribution of helpers in each family was reckoned, their share of income was not separately estimated.

For computing the income level of agricultural labour, the Agriculture Labour Enquiry takes the family as the economic unit. For estimating the 'total' for each 'family', data on the income of each individual earner in the family for the year 1950-51 were collected.

The overall income of an agricultural labour family thus includes wage income, cash value of home-grown products and perquisites as also income from other subsidiary occupations. An idea of the average annual income of an agricultural labour family may be gained from Table VI.

It is seen that the total family income is very high in North-West India (Rs 651) followed by North India (Rs 551) and East India (Rs 506). The high level of income in these regions may be explained by a number of factors. In the first place, relatively a small number of

agricultural labour families in North-West India work on fairly large and fertile holdings. Secondly, the availability of good irrigation facilities and better land utilisation in the Punjab and Pepsu have contributed to a generally higher level of wages; and as indicated earlier, the highest average daily wage of male casual labour (viz. as. 45) obtains in Pepsu, and the average in Punjab is also quite high (as. 28).

Again, as hired employment is low, families in this region are relatively free to follow other pursuits. And this is borne out by the fact that the income derived from sources other than agricultural labour in this region, viz. Rs 281, is the highest for all India. These very factors explain the high level of income in North and East India.

The level of income was relatively low in Central, West and South Zones, and particularly so in the last named zone. The low level (Rs 417) in Central India may be explained mainly by the fact that wage rates here are among the lowest in India, viz. as. 12.8, against the all-India average of 17.5 annas. In West India, hired employment of an adult male is very low at 196 days in a year. Secondly, the proportion of landless families is quite high in this zone, and consequently the income from cultivation of land is also very small. Lastly, it is essentially a millet zone, with some rain shadow districts. The lowest level of income in South India appears to be due to such factors as the small size of the holdings, abundance of agricultural labour and consequently less employment per worker, the high proportion of women labourers and last but not least, the prevalence of low wages.

Inter-State Differences

As regards inter-State disparity in the level of income, it is found that income per family is extremely low in Orissa (Rs 340) and rather high in West Bengal (Rs 622). This appears to be due to the fact that while in the case of Orissa the extremely low rates of wage (viz. 11.5 annas, the lowest for all-India) depress incomes, in West Bengal both wage rates and employment in agriculture are high, with the result that incomes also tend to be high. In addition, the refugee rehabilitation activities in the State further contributed to the high share of non-farm income, viz., Rs. 102 as against the all-India average of Rs 53.

In North-West India, PEPSU records the highest income per family, viz., Rs 913 against the all-India average of Rs 447. In addition to factors such as the fertility of land and better irrigation, the main reason is the predominance of attached labour families (66 per cent of the agricultural labour families in the State) whose average income is generally high owing to longer duration of employment. The total annual wage income in Pepsu at Rs 658 is the highest for all-India.

In South India, the level of income is noticeably higher in Travancore-Cochin (Rs 541) than in the two other States of the region. This is due mainly to the relatively high rate of wages, viz., 21 annas (against the zonal average of 16.2 annas) and the consequent higher earnings from both agricultural and non-agricultural operations.

Disparity in the level of income is noticeable not only as between different zones and States, but as between different categories of families, viz., (a) attached and casual labour families or (b) landless families and families with small plots of land.

The average income of an attached labour family (Rs 489) is higher than that of a casual labour family (Rs 442). This is due to the fact that attached labourers derive higher income from relatively higher average and continuous employment. But in their case, as they are tied by an employment contract, they are generally unable to take up other pursuits, in the result that income from sources other than agricultural labour is lower than that for casual labourers.

The income of a family with land is much higher than that of a family without land, as may be seen from the figures below:

Average Annual Income Per Family (In Rupees)

Casual Families	Total Income	Income from Land
With land	495	128
Without land	393	—
All	442	62
Attached Families		
With land	524	122
Without land	472	—
All	489	38

On the basis of an annual average income of Rs 447 per family, the total income of all the agricultural labour families in the Indian Union (viz. 17.6 million) for the year 1950-

51 is estimated at Rs 790 crores, which accounts roughly for 8 per cent of the National Revenue for that year, viz., Rs 9,530 crores. For the same year, the national per capita income was placed at Rs 265. The per capita income of an agricultural labourer, on the other hand, works out at Rs 104.

The per capita average is generally high in the North and low in the South. It is highest in Pepsu (Rs 176) and the States that follow are Assam (Rs 162) and West Bengal (Rs 159). The lowest average is found in Orissa (Rs 79); and other States on the low side are Madhya Pradesh (Rs 87) Madras (Rs 87), Bombay (Rs 88) and Madhya Bharat (Rs 83).

A comparison between the per capita income of an agricultural labourer and that of an industrial worker would be interesting indeed; but this is rendered difficult owing to the non-availability of data relating to family budgets of industrial labour for the year for which data for agricultural labour is available. The Agriculture Labour Enquiry has, however, attempted a broad comparison on the basis of the available statistics regarding earnings of industrial workers, size and earning strength of their family etc. for the year 1950, an idea of which may be obtained from the figures below:

Per Capita Income of Agricultural and Industrial Labour

	(In Rupees)	
	Agricultural Labour	Industrial Labour
West Bengal	160	268
Bihar	119	332
Madhya Pradesh	87	262
Orissa	79	145
Punjab	121	216
Bombay	88	368

Wage Bill

On the basis of the total income of all agricultural labour families in the Indian Union, it is possible to estimate the total wage bill in agriculture. It was mentioned earlier that the total income in 1950-51 for the 17.6 million families amounted to Rs. 790 crores, and that earnings from agricultural labour accounted for about Rs 500 crores. This gives an approximate idea of the Agricultural Wage Bill, which incidentally forms about 11.8 per cent of the net domestic product of India in 1950-51 attributable to Agriculture, viz., Rs. 4890 crores.

Around Calcutta Markets

Irregularly Lower Trend

EASINESS in equities in the last few days was not unexpected. What was surprising was the absence of a technical improvement in equity prices by the time of the settlement on Wednesday. This is causing anxiety to market operators. It is now being argued that equities may not again touch the recent peak levels in the immediate future.

Technical considerations apart, the general market outlook is not unpromising. Indicative of the surplus resources available to the money market is the success of the series of State loans. Though institutional investors were the main subscribers to the loans of States, informed opinion is inclined to the view that many small savers came forward to subscribe to the State loans.

Basic Factors

In recent months, several companies have issued bonus shares. Expectations are that many more companies will be issuing bonus shares in the immediate future. Though these issues of bonus share do not represent a new issue activity in the proper sense of the term, most of these bonus issues involve some fresh investment of funds. In this respect, issues of right shares are germane to the problem under discussion.

More relevant is the acceptance by the National Development Council of the Mahalanobis Plan-frame as the basis of the second Plan. In the latter half of last week, there were rumours that the Minister for Planning was of the opinion that the Mahalanobis Plan-frame was too ambitious, and that the investment targets would have to be lowered. Subsequent reports showed that the AICC was in favour of a more ambitious plan. Despite inspired and contradictory reports, it is now clear that the second Plan will involve expenditures which are likely to have a healthy effect on stock markets.

ICIC

Recent developments make it clear that the private sector will find no difficulty in securing finance for implementing expansion projects. In ICIC, private industry has a source for supply of finance. This institution is also likely to help the private sector in its functions as a

sponsor of new industries and as an issuing house. ICIC's association with the West Coast Paper Mills is an interesting instance in point.

There are welcome developments. To stress the favourable long-term outlook is not to justify the recent peak levels touched by equities. Some of the assumptions behind the recent spurt in equities were not valid. It is now known that Indian Iron will not issue right shares. It is also evident that bonus shares will be taxed. These factors explain the easiness in equities in the last few days. From fluctuations in equities in the last few days it seems that the immediate trend may remain uncertain.

Tea Prices

Tea shares did not flare up when equities were pushed up to inordinate heights recently. Equities are now lower. But Tea shares are relatively steady. There are reasons for the comparative steadiness in Tea shares. There are, of course, fears that the wages of plantation labourers may have to be raised. The tea workers' claim for bonus for 1954 is widely conceded. These factors will necessarily raise production costs. But the developing events are not discouraging.

A reputed firm of tea brokers are inclined to the view that the world crop position to the end of August last may be ten million pounds down on that of the 1954 season. When the current season started, it was widely believed that this season's supply will far exceed the prospective world demand. As the current season has progressed, the earlier pessimism has gradually been replaced by moderate optimism.

Throughout August, Calcutta auction prices were higher than those in July last. According to the firm of tea brokers mentioned above, auction prices hereafter may exceed those witnessed so far this season. Soon, it is argued, London will have to be in the Calcutta market to buy tea under the new auction arrangements. This may further aggravate the expected increase in Calcutta tea auction prices. These are the reasons which justify expectations of steadiness in Tea shares.

Neglected Jutes

In respect of Jute shares, Clive

Street is wiser by events. Immediately after devaluation of the Pakistani rupee, jute shares moved up. There was a further spurt in jute shares as New Delhi abolished export duties on Indian jute manufactures. Jute shares continued to remain steady as it became known that the Pakistani Jute Board had decided not to lower the export minimum price for raw jute. Pakistan's subsequent decision to impose an export duty on raw jute was evidence that she was interested in enjoying the benefits of currency devaluation at the cost of the other interests and countries involved.

Much has been discussed in the last few days about the action and reaction of raw jute, gunny and Jute shares. In recent days, both raw jute and jute goods have fallen heavily. These are developments which are not necessarily unfavourable to Jute shares. Even so, Jute shares remain depressed because of growing fears of competition from Pakistan. This is the basic factor so far as the future of Jute shares is concerned.

Set-back in raw jute is mainly due to steady arrivals of raw jute in the mofussil markets. In the last few days, mills have been able to buy Pakistani raw jute at prices well below the fixed minimum export price. This has fostered the belief that Pakistan may soon lower the fixed minimum export prices for raw jute. Fall in jute goods is partly a reflection of the decline in raw jute. But it is mainly due to the fact that Pakistan is consistently under-quoting hessian in oversea markets. This is the most ominous development which explains why both jute goods and jute shares are falling.

Around Bombay Markets

Semblance of a Recession

Thursday Morning

TRADING in the stock exchange during the week under review, such as it was, bore semblances of a recession in the offing. With only two full days' session, namely on Monday and Tuesday, activity in the market was necessarily constricted. It is true that a retreat from the high levels recorded in the past few weeks, off and on, was warranted on technical grounds alone. This apart, high level pronouncements relating to taxation on bonus issues and abolition of the managing agency system had been potent enough bearish factors.

As though these in themselves were not sufficient to provide the desired corrective, the measures adopted by the Stock Exchange authorities to curb speculative activity, towards the end of last week, served to cry a halt to the top-heavy bent of the market. In the event, there was a precipitous fall in values all round with most of the leading counters closing the week (on Tuesday) at around the lowest levels for the period under review.

On the opening day of the week, Thursday, when there was only half an hour's trading, equities tended to rule steady. Coming close on the heels of the announcement of curb measures to set at naught excessive speculation, this appeared to indicate as though the market was out to take up the challenge of the authorities. However, it proved to be but a flash in the pan and sentiment was woefully depressed on Monday when the market opened after three days' closure.

Conditions in the market on that and the following day were verily in the nature of those associated with the proverbial bull in a China shop! The market was rampant with nervous bulls eager to unload their holdings. This was initiated by consistent offerings by a leading bull operator who was credited with having sold about 10,000 Tata Ordinaries while, at the same time, effecting delivery to the tune of 20,000 shares. This brought about a thoroughly unsettling effect on the market and everything pointed to a marked recession in values.

In the steel section, Tata Ordi-

naries which were at one time, on the opening, quoting Rs 251-8 steadily declined during the week to be placed weak at Rs 242-4 on Tuesday. On week advices from Calcutta, Indian Irons too were depressed at the close at Rs 39-0.

As in the case of steel shares which persisted in seeking lower levels, despite a bright outlook for the steel industry, textile share values bore no relation to the bright prospects before the cotton textile industry. It is true that the move to boost up handloom cloth production has apparently had a bearish effect on market sentiment. But in the long run, it may be argued, the restriction of mill production in preference to handlooms, will only result in higher prices being obtained for mill made cloth. Anyway, textile shares in the market meekly followed the declining trend of steels and closed the week with a distinctly bearish undertone. Bombay Dyeing and Kohinoor registered sizable losses to close at Rs 501-4 and Rs 328-8 respectively.

In the miscellaneous section, Bombay Burma suffered a sharp reversal on long liquidation as also on bear pressure and came down from Rs 536-14 to Rs 542-8, to close better at Rs 546-4. Premier Construction, Scindia, Tata Chemical and National Rayon shares also suffered similarly to close the week at Rs 161, Rs 15-5-6, Rs 15-11 and Rs 17-4, respectively.

Cotton

Dull Trading

TRADING in the cotton fabrics market was confined to the first four days and was characterised by dull trading throughout, culminating in a depression of values to the lowest levels in more than a month. As in the case of oil seeds, weather reports acted as a depressant in this market too. There was also persistent selling from Akola and Calcutta operators, and no amount of scattered short covering could keep in check the declining trend. Besides, the single factor, from which the market drew sustenance, namely, the possibility of an early export quota announcement, being no longer there—inasmuch as it was

apprehended that there would be further delay in the announcement—it was clear that the market would not move up.

I.C.C. February which opened the week at Rs 630 declined on the opening day itself to Rs 627-4 for want of any fresh development. On Saturday it opened further lower at Rs 624 and moved up to Rs 627-4 on resurgence of bull support. However, it was patent that the market was inherently weak as witness the precipitous fall on the last day of the week when the February contract touched a new low level to close at Rs 621.

An event of significance to cotton trade during the week was the announcement by the Egyptian Government of a reduction in its cotton tax from 15 to 8 tallaris per canter in the case of Karnak-Menonfi and from 10 to 2 tallaris in respect of Ashmonni-Giza 30. Simultaneously it was also announced that the entitlement system has been abolished for sterling.

Oils and Oilseeds

Considerable Ground Lost

RECORDING a further extension of the bearish trend noticed last week, the oilseeds market lost considerable ground during this week, a feature of the market being sustained speculative pressure from Saurashtra and other centres. This was intiated by reports of favourable weather conditions in all the seed tracts and a consequent upward revision of crop estimates. The prospects of larger crop in the face of growing deterioration in oversea demand for Indian oils and oilseeds naturally curbed the enthusiasm of the market, if there was any.

Owing to recent rains in the groundnut producing areas, traders estimate that the season's crop will be about 1,900,000 tons, out of which Bombay State alone is expected to contribute more than half. On top of this, the world groundnut crop is also expected to be on the high side. While America is expected to maintain her satisfactory level of production, Nigeria promises to report higher crop output.

INDIA'S NEWEST Penicillin Plant!

Designed to produce 20 million mega units of Penicillin every year, the Rs. 2-crore Hindustan Antibiotics Limited, is Asia's newest Penicillin factory. Spread over an area of 200 acres, near Pimpri, 9 miles from Poona, Hindustan Antibiotics is the result of close co-operation, and financial and technical assistance which the Government of India received from the United Nations International Children's Emergency Fund and the World Health Organisation.

Hindustan Antibiotics use highly specialised production methods in processing Penicillin. The preparation of the seed, culture of the mould, fermentation, evaporation of liquid and refrigeration form the most important stages for the production of this wonder drug. Precision electric drive is of utmost importance at each stage.

G. E. has supplied over 100 Electric Motors, ranging from 5 H.P. to 350 H.P., and electric controls for the supply of compressed air, chilled water, mixing of pumping, refrigeration and other processes vital to the production of Penicillin.

G. E. Research and experience have produced precision electrical equipment for installations like the one at Pimpri, which are extremely important to the progress of the nation's health.

Convertibility and Development

THE Annual Reports of the International Monetary Fund and the International Bank for Reconstruction and Development for the fiscal years ended April 30, 1955 and June 30, 1955 respectively, which have been just released contain as usual a factual review of the activities of these two institutions and an appraisal of the international trade and payments situation as well as of development problems. From the point of view of the Fund, the past two years can be best described as representing a further extension of *de facto* convertibility "even apart from formal moves in the direction of *de jure* convertibility". Thus, while there has been no extension in the formal sense during the past year or two of the convertibility into dollars of privately-held balances of non-dollar currencies, the area of *de facto* convertibility has been steadily extended. For instance, the United Kingdom has extended 'commodity convertibility' to raw sugar, copra, coffee, cocoa, and the non-ferrous metals. Under this type of convertibility "a country with an inconvertible currency permits its traders to buy certain 'commodities' from countries with convertible currencies against payment in convertible currency, for resale to other countries against payment in its own or other inconvertible currencies, with no obligation to receive the convertible currency through a reverse transaction".

A second type of unofficial convertibility which largely operates in some free markets, particularly Zurich and New York, takes the form of sale of officially inconvertible currencies—mostly sterling—at a discount against dollars. Of course, this type of convertibility depends upon the willingness of countries to permit dollar imports on a larger scale if they are financed by the 'inconvertible currency' rather than in dollars. General developments have aided the growth of effective convertibility such as the extension of sterling transferability in March 1954 to practically all non-dollar countries, the preference of some countries to buy sterling in the free market "rather than purchase it with gold or dollars at the official rate" when sterling is required for purposes of meeting deficits in sterling or for reducing "bilateral positions in advance of monthly EPU settlements".

Commodity switch operations have had the effect of maintaining the free exchange market though they have at the same time exerted pressure on the official rate of exchange. Since February 1955, the United Kingdom has officially intervened in transferable sterling deals in foreign markets. The cumulative effect of all these factors has been to ensure a high degree of *de facto* convertibility of principally two types of currency, viz. sterling and the deutsche mark, into dollars at discounts at about one per cent below the official rates of exchange.

In a lesser degree, this form of convertibility has also operated in the case of other currencies. But in spite of all this, the Fund is still far from its goal of full convertibility. Its Report makes the observation that "despite the extension of nondiscrimination and multilateralism in trade and payments, there is still a great network of bilateral trade and payments agreements which links the inconvertible currencies of the world". Even more significant is the awareness of the Fund that balance of payments difficulties are not the only or even the principal obstacle to the

further removal or relaxation of quantitative restrictions, particularly in Europe where social and strategic considerations have led to special treatment of individual industries and also agriculture. On the other hand, the obsession of the Fund with the narrower 'dollar shortage' problem appears to have clouded its thinking; the really basic problem is the balance of payments problem and not its manifestation in shortages of specific currencies. The pressing need is to restore the international economic viability of trading countries. Convertibility is not an end in itself; rather it is the reflection of improvement in the capacity to export and willingness to import of different countries. In any case, the restoration of convertibility should take into account the maintenance of full employment and stability in the so-called developed economies and the need for accelerated development in the under-developed areas.

Development strictly appertains to the sphere of operations of the International Bank of Reconstruction and Development. The Bank has recorded impressive progress during the year under review. Its loans amounted to 410 million dollars, which was more than in any earlier fiscal year; and the total volume of lending since the Bank commenced operations amounts to 2,324 million dollars (2,274 million dollars net of cancellations and refundings) spread over 37 countries. The Bank's net earnings have reached the peak figure of 24.7 million dollars, whereas reserves have risen to 184 million dollars. It is noteworthy that apart from the fact that all borrowers met the repayments due, a number of them even made pre-payments i.e., in advance of maturity, amounting to 116 million dollars. This is hardly surprising in view of the rather exacting standards of creditworthiness laid by the bank. Moreover since loans are made only to Governments or private borrowers for whom Governments act as guarantors, the risk of default and failure are negligible and 'bad and doubtful debts' which are the normal incidents of ordinary commercial banking are virtually non-existent. Consequently, it would be misleading to evaluate the performance of the Bank only in terms of its profit and loss account.

Even if it is not entirely realistic to expect the Bank to show that sense of adventure which Lord Keynes had held forth as one of its guiding principles, it would not be

unfair to say that the Bank appears to have a bias in favour of the orthodox type of projects. Of course, it is notoriously difficult to lay down any criteria for investment which would be wholly acceptable to all the parties concerned. Even accepting the criteria of creditworthiness laid down by the Bank, there would appear to be a case for reducing the cost of credit extended by the Bank. This would be one way of narrowing the fringe of unsatisfied borrowers, the other would be to relax the insistence on a Government guarantee in the case of at least a small proportion of private borrowers. A Government guarantee is in a sense an unsatisfactory half-way house. On the one hand it would be invidious for Government to sponsor one of several—perhaps equally credit-worthy—private borrowers, and on the other, the mere fact of a government guarantee might invest otherwise undeserving projects with an unnaturally high credit rating and even prejudice fair appraisal of a proposition by the Bank. All these difficulties have resulted in the creation of what may not inaptly be regarded as an international "Macmillan Gap".

The Bank is undoubtedly alive to the need for filling the gap and has already presented for the consideration of member governments the Articles of Agreement for the proposed International Finance Corporation, which will function as an affiliate of the Bank. This Corporation, whose membership will be open to Governments which are members of the Bank, will have an authorised capital, payable in U S dollars or gold, of 100 million dollars; the subscriptions will be in amounts proportionate to the subscriptions to the capital of the Bank. "The corporation will have authority to invest in any kind of productive private enterprise, including agricultural, financial and commercial undertakings; but its main emphasis is likely to be on industry". The basic difference between the Bank and the proposed Corporation will be firstly, that, unlike the Bank, the Corporation would lend to private borrowers without a governmental guarantee, and, secondly, it will be authorised to make both fixed-interest loans—which is at present the only form of credit extended by the Bank—as well as investments of other types such as purchase of securities participating in the profits of an enterprise. But the corporation will "invest in an enterprise only if it is satisfied

that the private interests concerned are contributing their full share of the funds required, and that the remaining requirements cannot be met from other sources on reasonable terms. It will supplement, and not take the place of private investment". Thus it would appear that the main purpose of the Corporation would be to meet the marginal requirements of venture capital of private enterprise and more particularly of industrial enterprise in the less developed areas. The actual formation of the Corporation will materialise only when at least 30 member governments have subscribed at least 75 million dollars to the capital. Of course, its early operation is a moral certainty but its full effectiveness can be judged only if it is able to extend developmental credit and cheapen its cost.

The Bank to date has been successful in helping to break some strategic bottlenecks in different economies, e.g. shipping in Holland and port modernisation in Belgium, quite apart from the reconstruction loans made to European countries before Marshall Aid. Whether it will be equally successful in initiating, in co-operation with the new International Finance Corporation, a self-reinforcing process of development in the backward areas remains to be seen. But as the Report of the Bank rightly remarks "economic development requires more than machines, more than money. It does not only require the building of great power plants and ports and roads. It has to be an awakening in the minds of millions of people in all walks and conditions of life—an awakening that will move people to work more effectively for tomorrow's rewards".

Russia and Germany

IF it was the intention of the Western Powers to fight a diplomatic battle with Russia by proxy, Moscow has successfully foiled any such attempt. Some months ago, even before the start of the "summit" talks at Geneva among the four Powers, Russia issued an invitation to the West German Chancellor to visit Moscow for talks on certain issues. Russia let it be known that the discussions would be confined to recognition of West Germany by Russia and promotion of trade relations between the two countries. Dr Adenauer accepted the invitation. But, during his talks in Moscow, he wanted to extend the scope of the talks by including the problems of re-unification of Germany and of return of German war prisoners. Moscow was diplomatically correct in refusing to extend the scope of the talks. When Dr Adenauer found that Moscow was not willing to oblige him by falling into a diplomatic trap, he abandoned his demand to enlarge the scope of the talks.

As a result of the talks, it has been agreed that diplomatic relations are to be established between Russia and West Germany. This was the main aim of the talks. Resumption of trade relations is expected to follow recognition of West Germany by Russia. Both West Germany and Russia are anxious to establish normal trade relations. With the establishment of diplomatic relations, it should be possible for both countries to ensure trade and economic co-operation. West German industrialists will welcome opportunities to resume trade relations with Russia and the Communist States of Eastern Europe. Economic relations between Communist States and Western Powers are in process of being normalised. Without the preliminary step of diplomatic recognition, West Germany's industry would have lost a valuable market to its rivals in Britain and America. There are reasons why Russia is interested in resuming trade relations with West Germany. Through lavish American Aid, West Germany's industry has been rapidly developed since the war. With Russian help, East Germany's industry has also grown. But East Germany, Russia and other Communist Eastern European States were hitherto deprived of the rich coal and iron resources located in

West Germany and Ruhr basin.

It is not difficult to appreciate Russia's intentions in recognising West Germany as a prelude to normalisation of trade relations. West Germany is not uninterested in resuming trade relations with Russia and Eastern Europe. In securing diplomatic recognition from Russia, West Germany has gained advantages which are not without political implications. Russia is committed to unification of Germany. In the circumstances, Russia's recognition of West Germany implies acceptance on her part of the status quo in Germany. There are certain circumstances in which Russia would prefer perpetuating the status quo to unification of Germany. Dr Adenauer was unwise in ignoring this aspect of the problem. In his demand to include the question of German war prisoners in the Moscow talks, the West German Chancellor was making a futile attempt to equate West Germany with the whole of Germany. Moscow was right in retorting that the problem of German war prisoners could not be discussed in the absence of representatives from East Germany. If Dr Adenauer was briefed by some interested Powers to extend the scope of the Moscow talks so as to have a dress rehearsal for next month's Geneva talks among the four Foreign Ministers, Moscow made arrangements to ensure the presence of Herr Grotewohl in Moscow to find out whether Dr Adenauer was willing to allow the East German leader to participate in the Moscow talks.

There were motives behind Dr Adenauer's demand to include the question of re-unification of Germany in the Moscow talks. To allay Russian apprehensions, Dr Adenauer is reported to have assured Moscow that "in the event of re-unification, it is exclusively the business of an all-German Government and an all German Parliament to decide whether to join a system of alliances and, if so, which one". This is in conformity with Sir Anthony Eden's plan for a future, unified Germany. Moscow can reply that Bonn has already forced the issue by ratifying the Paris Agreements. Both Russia and the Western Powers have been forced by circumstances to change their policies to Germany. Russia's present stand is that she has no

objection to holding free elections to unify Germany as long as West Germany does not align herself with the Western Powers as a NATO member. Russia has always insisted that the problem of a future, united Germany is an issue which must be settled primarily through discussions among the leaders of the two Germanys. This is a legitimate stand. But Dr Adenauer and the Western Powers are not willing to accept this arrangement. Bonn refuses to have any relation with the East German Government. Herr Grotewohl and his East German administration are not recognised by the Western Powers.

Dr Adenauer may not yet have realised, but the Western Powers must be aware of the changed circumstances since Geneva. During the "Summit" talks at Geneva, Russia and the Western Powers agreed to settle disputes through negotiation, and without the use of force. Under normal circumstances, and in the absence of any violent provocation by any of the Powers, a third world war is thus ruled out of consideration. This means and implies that Dr Adenauer has lost his bargaining position considerably. Incorporation of the twelve German divisions into NATO is no longer so threatening a menace. Dr Adenauer is therefore deprived of his bargaining argument that either Russia must accept the terms dictated by Bonn or West Germany will permanently align herself with the Western Powers. To emphasise this changed situation relating to Germany, is not to suggest that Germany has ceased to be a European or a world problem. Unification of Germany remains a condition of European as well as of world peace. But, since Bonn's ratification of the Paris Agreements, and particularly since the "Summit" talks at Geneva, Russia has shifted her stand on the German problem. She now emphasises that the problem of a future, united Germany is essentially an issue for discussion among the representatives of the two Germanys. Russia will not abandon East Germany without certain firm assurances. Bonn and the Western Powers are not willing to offer the requisite assurances. This is the main problem which will monopolise the discussions among the four Foreign Ministers at Geneva next month.

Weekly Notes

Cotton Prospects

IT never rains but pours—or so it seems in respect of our raw cotton supplies. Time was when there was not enough cotton to go round, and we were compelled to plug the 'leakage' through exports of the raw material. But now, unless we step up our export quotas every other month, we shall find too much stocks on hand when the new crop starts coming into the market. That would not be a headache if the new crop threatened to be smaller than in the past year. But expectations are that it will be, if anything, 2 to 5 lakh bales more than in 1954-55. This is, in a sense, disturbing since last year's crop was itself a heavy one—of the order of 50 lakh bales. With large carry-over stocks, and the inevitable imports of long-staple varieties, we shall have in the coming year either to produce and consume more cloth, or export more cotton and textiles, or support raw cotton prices at the 'floor' through Government off-takes.

As if this was not enough, we have agreed to take about 85,000 bales of American cotton under the 'aid' programme. When exactly these will be on the Indian market is not clear; but it may be sooner than is generally expected, since the USA would only be too glad to get rid of some of her surplus cotton at the earliest possible moment. Even if the arrival of these stocks does not depress domestic prices, Government will in all probability have to subsidize the 'aid' cotton to attract buyers, and stop comparable varieties of East African cotton from coming into India. Reportedly, Indian Mills have already bought up their normal requirements, and Government may have to wait before the 'aid' cotton is absorbed in sizeable quantities, even at subsidized prices.

It is curious that a commodity which is in plentiful supply should have been chosen for import under the 'aid' programme. Raw cotton has to be sold, for the Government to benefit from the aid. And if sales have to be held over and subsidized, the counterpart funds will be much less than the American value of the imported bales. What really made the Government take on this unprofitable line? Either the Government was not aware of

the domestic supply position, or they were forced to accept cotton in a package deal. Whatever the reason, it is not a particularly sagacious move. If in order to dispose of the 'aid' cotton, we are forced to reduce imports from East African countries, we shall probably be doing harm to them immediately and to ourselves in the long-run. A little less of exports would impinge more heavily on the African exporters than on the USA. And India would, in the process, take on the aspect of an unreliable customer; so that later, when we have to fall back on East African supplies, we may not get the special terms which a steady buyer would.

Turkey and Greece

THE recent anti-Greek disturbances in Turkey touched off by the dynamite outrage in the Turkish Consulate in Salonika are strikingly reminiscent of the Armenian atrocities so distressingly familiar to students of Turkish history. Turkey has yet to live down these atrocities, a fact to which even outside observers like Lord Kinross have referred to not so long ago. Whatever the initial provocation, it can hardly justify the orgiastic display of mob violence under the very nose of the Turkish authorities, who have displayed a strange pusillanimity in the face of civil commotion. Surely a state professedly in the camp of the Western democracies can insist on better standards of conduct on the part of its citizens towards minorities. The Middle East is a hotbed of mob politics and Governments seem to be swayed by the collective frenzy emanating from the bazaar quarters, whether it be the Suq of Istanbul, the Bulak of Cairo, or the riverine slums of Baghdad. The Turkish brand of mass recidivism seems to have been actuated as much by political considerations as by economic rivalry. The Greek in Turkey—in fact anywhere outside his native Greece—is an eminently successful businessman and commercial success of a minority group is hardly likely to endear it to the majority which at least in the Middle East is not particularly known for its business acumen. This is what makes the Greek, the Copt, the Armenian and the Jew a tempting target for mobs in the Middle East. Greece has shown admirable restraint and dignity in the face of grave provocation.

In the meanwhile, the present discord between two states linked by mutual defence arrangements will raise many anxious eye-brows in the Pentagon and NATO headquarters and perhaps more than a snigger across the Black Sea.

Bowing to Logic

THE dissolution of the Fourth Party, successor to the old Muslim League in Bombay State, marks a new trend in Muslim thought, which, under high-pressure communal propaganda, had tended to be largely sectarian, exclusive and obstructionist for more than four decades. League leaders in Bombay were mainly responsible for giving a vicious and even violent twist to Muslim opinion; and it is therefore in the fitness of things that the new orientation should originate from here. And what Bombay decides today, the rest of the country is apt to accept tomorrow, the more so as in the case of Muslims at least, this City represents not only economic and intellectual primacy, but also political leadership. It was some nine years ago at Kesar Baug Hall that Jinnah got his followers to vote for 'indirect action' which led to much disturbance and suffering in the country and in a way paved the way for Pakistan; and now in that very hall, a significant new decision has been taken which may influence the destinies of Muslims for decades to come.

The choice before ex-Leaguers has been fairly clear ever since the advent of Independence, though the long period of isolation and contrariness earlier, initiated and encouraged by themselves, might have made it a little difficult for them to switch over to a new line of thought in a hurry. The little window-dressing that was attempted in Bombay by converting the old Muslim League into the Fourth Party, with supposedly a non-communal approach, did not achieve any good. In the changed circumstances in the country, with secularism accepted both in principle and practice, the ex-Leaguers could not any longer appeal to the narrow communal instincts of their followers and even if they tried to do so, there was little to gain. At the same time, because of the old heritage of the League, the Fourth Party could not win much sympathy from the wider non-communal public or from parties run largely on economic and political lines.

Two Courses Open

THE alternatives before the Fourth Party were: complete stultification in course of time or a voluntary change-over to secular politics. In the latter line of approach, there were two courses open: either to widen the scope of the Fourth Party and make it absolutely non-communal or seek absorption in one of the well-established political parties in the country. The former held little promise, as there was no possibility of the Fourth Party turning out to be the nucleus of a new non-communal party, with a clear-cut economic and political programme, or of its winning any wide support. It would have been clearly superfluous, deepening rather than lessening the confusion that already exists in the political field through a multiplicity of parties with no striking features of differentiation between them. As for the other course, there were quite a few existing parties to seek absorption in; and if the Fourth Party preferred the Congress to other parties, there is nothing surprising about it.

Considerations of stability, strength, assurance of power and evidence of concrete action and of policies being proven in practice must have naturally weighed with the Fourth Party in its decision; and that is not to speak of the negative fact that Leftist ideals have not had much impact on the Muslim mass mind. But what is of significance is not that the ex-Leaguers have plumped for this particular party or that, but they have broken away from their past communal moorings and fallen in line with the present trend of party evolution in the country. The few remaining, but fast disintegrating, communal groups in the land may well take a lesson from this and wind up their rival shows in grace and through deliberate action rather than sink into oblivion from the sheer compulsion of events. Meanwhile, the ex-Leaguers of Bombay, and particularly their go-getting young leader, Shri A. K. Hafizka, deserve to be complimented on the sense of realism they have shown and the initiative they have taken, albeit somewhat belatedly.

Shape of Things to Come

THE country has already had some indication of what is in store for it when the recommendations of the States Reorganisation Commission come to be published. Significantly, the lead in creating misunderstanding and providing an impetus to agitation has been taken

by the Chief Ministers of two States, Andhra and Travancore-Cochin. When the country was being told that the Commission was yet to meet in Delhi to finalise its recommendations, these dignitaries were found giving out seemingly authoritative details about the shape of things to come particularly in relation to their States. This rightly led the public to think that the recommendations had already reached a stage of finality and also that they had been communicated to a few select folk so as to prepare the relevant sections of the people for the announcement to come. Since then, however, these Chief Ministers have received a rap on the knuckles from the Congress High Command which does not signify much.

The moot point is whether these responsible stewards of States had been favoured with a peep into the likely recommendations of the Commission or they were trying on their own to work up public opinion on lines acceptable to themselves and their States so as to force the hands of the Commission in the last and most decisive stage of its deliberation. If the latter assumption proves correct, it will only show how far the linguistic mischief has already gone and how, when it comes to a test, there are few who can retain their balance under its impact.

Linguistic Fury

THAT all this should have followed immediately after the earnest appeals of Pandit Nehru, Shri Govind Vallabh Pant and other top Congress leaders for calmness and sobriety in reacting to the recommendations of the Commission,

strikingly indicates how neither considerations of party discipline nor of Governmental responsibility can be expected to keep linguistic rivalry and fury under check. It may be pointed here that the Chief Ministers who thought it fit to open their mouths and stir a controversy in advance have been and are Congressmen of considerable standing and record of service. But what is so apparent is only a part of what seems to be going on behind the scenes. Not only agitators and other vocal citizens, but also those in authority are fast breaking up into hostile camps, watching one another for likely manoeuvres and preparing frantically for a bitter fight.

As things are, it would seem as though the announcement of the recommendations will be the signal for this cold war to flare up into something neither so cold nor comforting. In this situation, where State Governments are parties directly involved and sadly riven by rivalry, it is only the Union Government that can possibly stand apart and exercise a controlling influence. The Union Government is obviously not unaware of it; but when it is the hard-won unity of the country, the very pivot of our freedom, that is in peril, a little extra caution, a little extra erring on the side of prudence and deliberation should not appear inadvisable. Meanwhile, it is good to learn that the Prime Minister has moved from his earlier stand of investing the likely recommendations of the Commission with an inexorable finality to that of tending to treat them merely as recommendations meriting further consideration.

Progress on the Food Front

THE general impression that the food situation in the country has shown—considerable improvement since the critical days of the war and post-war years is borne out by recent reports issued by the Ministry of Food and Agriculture. A review of the food position since 1939 in respect of both production and availability, highlights three important factors. First, from the position of a net importer of food grains in the pre-war days, the country has been able to reach a state of self-sufficiency, if not one of substantial surpluses. Second, the increase in production has, for the first time, in the agricultural year 1954-55, assured every Indian a per capita cereal supply amounting to 14.4 ozs, which is 0.4 ozs higher than that required to make a balanced diet as laid down by the Nutrition Advisory Committee, and exceeds the target of 13.71 ozs, for 1955-56, laid down in the First Five Year Plan. Lastly, it is claimed that the improvement in food production is due, in a large measure, to permanent improvements in farming, such as better irrigation, improved methods etc.

The agricultural year 1954-55 witnessed an increase both in the production and acreage of cereals in comparison with 1949-50, the base year (for food production) for the First Five Year Plan. The total production of cereals during the year under reference, at 55.3 million tons represents an increase of 9.3 million tons over that of 1949-50. The area under cereals also increased from 193.6 million acres to 209 million acres in the same period. Against an increase of about 7 per cent in acreage, production rose by about 20 per cent, indicating an improvement in the average yield per acre.

There has been some difference of opinion on the question as to the extent to which the improvement in food production achieved in recent years is due to fortuitous circumstances and to progress in farming. The Planning Commission's Progress Report for 1953-54, while analysing the probable influence that various factors had on the improvement in food production, expressed the view that though favourable weather was an important contributory factor, at least fifty per cent of the increased production must have been due to permanent improvement in farming,

which would be retained in any average year. The Report of the ECFAE for 1954 has also lent support to this view. While it is difficult to be dogmatic on this question, it may not be far out of the mark to say that improved farming is as important as, if not more important than, better weather, in brightening the food situation in India. In fact, in view of the increased average yield, recorded in the period 1949-50 to 1954-55 and in the context of abnormal conditions—floods in UP and West Bengal and drought in Bihar—in 1954-55, considerable credit for the improvement can be given to factors such as better irrigation, liberal use of fertilisers and quality seeds, and better farming methods.

Land Reclamation

ANOTHER sphere in which considerable progress has been achieved in recent years is in respect of land reclamation. Under the reclamation programme of the Community Development Projects, over half a million acres have been reclaimed since 1952. The programme provides also for the supply of improved agricultural aids, like quality seeds, manure and water for irrigation. Over five lakh demonstration plots have been laid all over the country with a view to driving home to the farmers, the advantages of improved seeds, use of fertiliser and compost etc. The minor irrigation programme under the Community Development Scheme to reduce the farmers' dependence on the monsoon, has also made good progress, and an additional one million acres of land are served under this programme.

The reclamation programme under the Community Development and Extension Service Schemes, has been carried out in four stages, viz., in

- Community projects or blocks started in October 1952, (1952-53),
- Community Development Blocks begun working in October 1953 (1953-54),
- National Extension Service Blocks started in October 1953 (1953-54) and
- National Extension Service blocks started in October 1954.

In the first stage i.e. in 1952 about 2½ lakh acres of land were reclaimed; in the next year, 40 thousand acres were reclaimed; under the Extension Service plan started in

1953, 2 lakh acres were brought under the plough; and in the last phase of the programme 48 thousand acres were reclaimed.

First Urban Health Unit

WEST BENGAL enjoys the distinction of trying novel experiments. It is there that the Village Exchange Scheme, which was described in these columns last week, has been put into operation with the help of the Community Development Agency. It is again in Calcutta, that the first urban health unit is expected to commence working in November 1955.

The health unit has been sponsored jointly by the Government of India, the UNICEF, WHO, the Government of West Bengal and the Corporation of Calcutta. The capital cost of the scheme is estimated at Rs 15 lakhs, with a recurring expenditure of Rs 8 lakhs per annum. The scheme will be based on a joint agreement between the Calcutta Corporation, the West Bengal State and the Union Ministry of Health. The buildings for housing the clinics, laboratories etc. are said to be practically ready.

The scheme will cover about 68,000 residents (or 13,000 families) of Ward No 24 in Calcutta. Health and welfare services for these people will be provided and arrangements are to be made for the care of industrial workers, expectant mothers, children, and those suffering from tuberculosis, venereal disease and leprosy. A maternity home with a 30-bed capacity and a nursery will also be provided in the locality.

The health unit is also intended to serve as a demonstration centre for students under training in the All India Institute of Hygiene and Public Health, and the work of the unit is to be carried out jointly by the Institute and the Corporation. The latter will provide the routine health services in the area and the Institute will meet the cost of such additional services as may be necessary for teaching purposes.

There will be a local health council consisting of representatives of business, the medical profession, welfare organisations and residents of the area for enlisting the co-operation of the people in running the unit. The unit is expected to provide a medium through which official and non-official agencies can co-operate in the effort to reach a common goal.

Off the Record**'On a Matter of Facts'**

THE framers of the First Five Year Plan must be today amongst the most embarrassed of men. They are embarrassed not because they urged the country way back in 1951-52 to aim too high but because the targets they then set have been in many cases over-achieved. One might argue that this is no reason for them to feel ill at ease. As citizens, they must be pleased by the turn of events for more than one reason. But as experts, they find to their chagrin that the economy has done much better than they thought, without doing all the things they enjoined or running all the risks they feared. In retrospect, they take on the aspect of a pessimistic lot, fearing the worst because they knew so little about the ways of the economy they were planning with such assiduousness. The very fact that today everybody is asking for a 'bold' plan is a commentary on the lack of boldness in the first plan.

The experts probably feel cheated because real output has increased greatly despite the fact that the public sector's investment—which was the king-pin in the first five year programme—has been less than what was set out in the Plan. It is known that the Planning Commission had to prune drastically the plan submitted by State Governments and Central Ministries so as to keep deficit-financing to an absolute minimum. Having done that, the Commission expected Governments to spend all that they were expected to spend under the Plan. But things have turned out otherwise. Instead of having to curb a spending spree by the executive agencies, the planners have had to urge them to get on with it, and not bother about inflation and runaway prices and what not. True, the perspective for Government spending changed radically in the interval, as a result of international as well as domestic factors, and monetary policy in 1951 helped men to worry less about too much money chasing too few goods. But the real miracle was that many goods ceased to be 'few', and a little more of money in the hands of the spenders was no serious disadvantage.

Here, the planners probably feel that they have been cheated by nature. Two remarkable harvests

have practically eliminated the food problem, which so dominated their minds at the time of framing the First Plan. This is a surprise, it is true, not only for the planners but for everybody. It would be extremely uncharitable to blame the Commission for not anticipating such a sea-change. Even so, one sometimes wonders if that august body does not sometimes feel cheated by those who gave them the basic data to work on.

To say this is not to cast aspersions on those who produced the factual material for the planners to build on. With the best of intentions, they could not have provided all the information necessary to prognosticate the effects of a change in the weather on the supply of wheat or rice. They could not have done so because such information does not, and probably cannot in full, exist. If there was one thing that was known way back in 1951-52, it was that data relating to agricultural supply and demand were scanty and not very reliable. This was known to those who passed on whatever material was available, as well as to those who used it for planning the future. And small wonder that the planners tended to discount future increases, since the figures they had to start with may easily have over-estimated rather than underestimated the actual position. It is easy to be wise after the event, and one can probably now say that the official estimates started by erring on the safe side and this process was carried a step further subsequently.

And yet, one feels like nagging a bit because one sees little indication of anybody concerned with policy being wiser even after the event. In all the confabulations that are going on preparatory to the formation of the Second Plan, lack of adequate data is time and again the argument for deferring judgment. Whenever anything is quantified, it is vitiated to a greater or less extent by hunches about the actual state of supply or demand. Such hunches are, of course, inevitable in looking ahead and that is not what is meant here. It is about the past that we have to guess, and therefore all prognostications become guesses based on other guesses. This, it will be generally agreed is a situation that must be remedied if planning is to

be rational. We ought to know where we are before we decide to step out in one direction or another, expecting this development or that. And there can be no excuse for not going all out to find out where we in fact are.

That in formulating the Second Plan we are hindered by much the same lacunae in data as five years back is, indeed, a sad thing. True, not all the gaps could have been filled in five years. But even those which could and ought to have been, remain and hinder intelligent appreciation of the present state and the future prospect. In respect of some of these, setting up a proper machinery for collection of primary statistics right at the start of the first plan could have taken us a long way towards better planning for the future. And in respect of others, there already was some machinery for gathering the data, and all that was needed was adjustment in methods with a view to reducing the errors of estimation. The tragedy of it is that little has in fact been done even in respect of these tractable cases. And the Planning Commission should, above all, have known that there would be a second and a third plan; and that they could not do any better than in 1951-52 unless they initiated a drive for collection of all sorts of statistics. Obviously, unlike ordinary men, who are incapable of learning from another's experience, the Commission is unable to learn even from its own experience.

All this is not idle reflection, generated by a propensity to find fault. For, there is today a serious problem which could perhaps have been avoided had steps been taken to make official estimates more reliable than in the past. It is common knowledge now that there is more raw cotton in the country today than we expected or arranged to dispose of in one way or another. In the cotton year 1954-55, we have actually produced around 50 lakh bales of raw cotton in the country today than basis of official estimates, to utilise for various purposes only about 45 lakh bales. So when last month the cotton year ended, we suddenly found ourselves with more stocks than was healthy; and inevitably, we are now working out ad hoc arrangements to get rid of them before

the new crop—which very probably will be even larger—comes on the market. The Commerce Minister has now seen the stocks, so to speak, and allowed 2.5 lakhs bales to be exported expeditiously. This does blot his copy book somewhat, but how else could he have remedied when he was officially told that our output was around 42 lakh bales?

Surely this could have been avoided if Government had taken a little more trouble to make its estimates trustworthy. More so because it is not only in 1954-55 that official figures of raw cotton production have been gross underestimates. One has only to compare official estimates for the past seven or eight years with known consumption of Indian cotton to see the extreme unreliability of the official figures. And yet, nothing has been done to correct the estimates and each year, there is a mad effort to keep down the carry-

over stocks to manageable levels somehow. Perhaps the Commerce Minister feels annoyed at having to change his export quotas at the eleventh hour. If so, what prevents him from compelling the Ministry of Food and Agriculture to give him a better estimate of output?

There is a further point. It is believed by the traders that the raw cotton crop in 1955-56 will be of the order of 55 lakh bales, or nearly 30 per cent more than the target set in the First Plan. What is more relevant is that at 55 lakh bales, it would equal the target set for the Second Plan in the Draft Plan-frame. Maybe the traders are pitching it a little high with a view to keeping down the producers' prices. Even so, it cannot, unless something very unusual happens in the next few weeks, be less than 50-52 lakh bales. What happens then to the targets for the Second Plan? Do we keep on to 55 lakh bales and

curb increases in raw cotton output? Or do we step up the cotton target? If we do so, what will happen to the targets for cotton textiles production and the sharing of that by the mills and handlooms? One can go on endlessly relating the likely repercussions of an adjustment in the raw cotton target. But the point is that a decision has to be taken now, and we cannot take the right decision unless we know better the actual size of the crop. And we cannot know it unless we try to find out. Maybe there is some political advantage in setting a target at a certain level and exceeding it in fact when the time comes. But there is little sense in setting targets unintelligently. And as long as we do not make proper arrangements for collecting facts, we will be planning on the basis of wrong estimates and hunches. And we will continue to feel cheated by nature or somebody and probably enjoy it.

The Week of the Old Horse

THE portrayal of the leadership of the Trade Union Congress as an ageing horse in saddle by Mr. David, now Manchester Guardian's cartoonist, was never more apt. At last week's conference of the Congress, the old leaders—over 90 per cent of whom have been on the General Council of the TUC for over 10 years and have earned the title of "Right-wing"—were able as in all previous years to maintain just that degree of restraint and moderation which would in Tory eyes make the TUC an institution worthy of continued praise. But this by no means suggests that the Conference was of little significance.

There was to be perceived at times an almost perceptible movement away from the "sense of responsibility to the broader needs of the country" argument which the platform has invariably used to the satisfaction of the authorities. More than this, the schism between the representatives of skilled workers and the more right-wing leaders of the less organised, unskilled sections was more marked. Another notable feature was the considerably greater attention given by the Conference to national economic policy than to matters of international significance.

For weeks the TUC Conference was heralded by a spate of inspired publicity on the part of the semi-official press about the "dangers" to the economy resulting from the current round of wage claims. It was, therefore, not unexpected that the centre of controversy in the Conference should have been the motion (sponsored by the Electricians), calling for full TUC support to all the wage demands of affiliated trade unions. In the climate of the "card vote"—that hideous practice of Labour democracy—it was inevitable that this motion should succumb to a resolution somewhat milder and less obnoxious to the authorities. And yet the trend of discussion was particularly illuminating and instructive.

The Electricians' resolution had necessarily called for a free discussion of Government's economic policy. That there was a crisis in the economy nobody doubted, and it was expected that the T.U.C. General Council, who before the Conference had had an interview with the Prime Minister, would outline Government's

plans to meet domestic inflation. In its report, the General Council found the policy of Government "obscure and difficult to understand". This was not surprising. What was surprising was the counter suggestion included in the Presidential address and reiterated in the Council's report that (a) the time had come for a "concerted" study to be made of the "national economy" and its attendant problems and (b) that the Conference should not do anything which would anticipate Government's policy. It was clear to all concerned that these proposals were suggestive of nothing more than a lack of policy on the part of the TUC General Council itself.

The crisis in Government policy is a real one. The "credit squeeze" through monetary policy has taken too long to have any effect on inflation, which has already begun to gnaw at the vitals of the price mechanism. Government would wish to add wage restraint to its armoury of economic weapons, but can only do this by limiting dividends and levying higher taxes on profits, and this, of course, is outside the Chancellor's powers. Apart from proving how utterly wrong Government had been in its revolutionary abandonment of controls over the economy, such a step would meet with widespread opposition from the Federation of British Industries and suchlike august institutions of capital.

Taken by itself, the credit squeeze appears to be having greater impact on the living standards of the working man than on profits. The sharp rise in interest rates has pushed up household rents while the current profits boom is able to take the higher cost of borrowing money in its stride.

These immediate effects of the credit squeeze were not beyond the comprehension of the Conference. Indeed, many of the delegates, sensing the negative policy of the General Council, were able to argue, and cogently too, that a large proportion of the blame for the current gap in the demand and supply for resources lay at the door of the rearmament programme. And it must remain one of the more remarkable turnabouts of our decade that official thinking has come to argue on these lines as well.

The Times, that ever loyal interpreter of Government's point of view, in an editorial comment, put the now-publicly-recognised truth thus:

"Naturally, if international tension were to be permanently relaxed, the problem of the double burden would fade away. Without that the prospect is forbidding—those who can see the end of the cold war, can see the escape from the dilemma. For the rest the dilemma remains."

The Financial Times, too, quickly faced up to the reality. It described the rearmament programme as the "storm-centre" of the current inflation. It was, therefore, not easy for the General Council to oppose the resolution for a cut in "call-up",

WORLD CONSUMPTION

India meets over 50% of the world demand for tea which is estimated at over 1,200 million pounds a year, excluding China, Japan and the U.S.S.R.

No other drink refreshes you so much, yet costs so little as **TEA**

i.e., a cut in the period of military conscription.

The impossibility of reinstating the wage-freeze, in view of the difficulty the Authorities would experience in placing controls on dividends and profits and the recognition now that a cut in rearmament spending would bring balance to the economy, is possibly the most important lesson that came out of the Trades Union Conference. Another lesson was the exposure of the "inflationary wage-price spiral" argument which has now been peddled for years. By discerning the causes of inflation in the existing economic structure and policy and especially in the rearmament and cold war programme, it could be realised that wage demands were not the starting point of inflation but its reflection. "Prices are not panting after wages", as one dele-

gate put it, "wages are panting after prices".

The failure of the Electricians' resolution by a vote of 5 to 3 and the adoption of a milder resolution moved from the platform did not fully reflect the temper of the debate. What is, however, clear and definite is that the authorities will now not be able to solve the present crisis by means of a wage-freeze.

The split between representatives of the skilled and unskilled workers at the conference was illuminating because had the controversies taken place a few years earlier, the split would have been described as being between the Left and the Right in the British labour movement. The controversy on this occasion was on the question of the granting of powers to the General Council to

intervene in industrial disputes in order to avoid strikes. In the past, the Left always supported proposals for increasing the powers of the TUC. On this occasion the reverse situation was reflected.

The Right-wing now finds that it is the Left-controlled Unions which are more and more resorting to direct industrial action, and it was with a view to circumscribing the individual union's powers in this field that they were prepared to grant greater "sovereign" powers to the TUC which they controlled. The voting was close: 5 to 3.5 in favour of increased TUC powers. It showed that the common ground necessary in trade union policy was sadly lacking: suspicion and mutual distrust were all-pervading. A common front with a common policy was thus not the outcome of this year's Trade Union Congress conference.

From the Calcutta End

Jute Target Under Second Plan

BOMBAY'S prosperity is based on the cotton textile industry. Calcutta is the home of the jute textile industry. There are some other States where there are cotton mills. Statistics indicate a relative expansion in the cloth industry in States other than Bombay. Even so, Bombay remains the major cloth-producing State in this country. West Bengal is the only State which manufactures jute goods. Bengal may have lost its near-monopoly in the world jute industry. But West Bengal retains its monopoly status within the country as the producer of jute goods.

India was formerly a considerable exporter of raw cotton. She is still a minor exporter of short-staple cotton, in which she has a monopoly. India's transformation from an exporter of raw cotton to an exporter of cloth is a partial reflection of her growing industrial status. India was never a large-scale exporter of jute. But partitioned India is an importer of raw jute from Pakistan. India's cotton textile industry is expanding. Her jute industry is threatened with the emergence of Pakistan as a serious rival. After eight years of independence, this seems to be the major economic consequence of partition.

At the time of partition, both the textile industries were faced

with the problem of an internal shortage of raw materials. For the cotton textile industry, the main problem was the shortage in quality cotton. For the jute textile industry, the raw material shortage was both quantitative and qualitative. This was another immediate economic impact of partition. This problem has been solved in respect of the cotton textile industry. For the jute industry, too, there is no longer any quantitative shortage in raw material. This is one of the main agricultural achievements since partition.

Welcome Developments

But quality raw jute is still in short supply. India has to import quality jute from Pakistan. Opinions differ whether India can ever become self-sufficient in quality raw jute. Official efforts have led to an improvement in the quality of raw jute produced in this country. Modernisation of jute mills has, one gathers, minimised the industry's requirements in quality jute. These are welcome developments. But, for some years to come, India will have to rely on Pakistan for supplies of quality jute. This is where Pakistan will continue to have an advantage.

This is also where the Indian Central Jute Committee enters the picture. ICJC does, for raw jute what the Indian Central Cotton

Committee does for raw cotton. Both these organisations undertake agricultural and technological researches to improve the quality of the raw materials concerned. These bodies exist for the benefit and welfare of the growers. Interests of the industries concerned are looked after by separate organisations. IJMA is to the jute industry what the Bombay Mill-owners' Association is to that city's cotton textile industry.

ICJC

Last week, the Indian Central Jute Committee held its annual meeting in Calcutta. A committee was formed to study ICJC's agricultural and technological research on jute. This committee will investigate ICJC's actual achievements of practical utility to the jute-growers and the jute mills. ICJC has also recommended to New Delhi a scheme for undertaking extensive trials all over the jute-growing States to study the performance of the improved varieties of jute and different manurial treatments under varying soil and climatic conditions.

Expansion in jute cultivation since partition has been astonishingly rapid. There has also been some improvement in the quality of raw jute produced within the country. Even then, production of adequate quantities of quality jute remains the main problem before the jute-

grower and the industry. It is welcome news that the industry is modernising so as to lessen the need for imports of quality jute from Pakistan. But recent developments underline the urgent necessity for modernising so as to lessen the need quality jute so as to overcome growing Pakistani competition. ICJC's main task is to improve the quality of raw jute grown within the country. It has a grave responsibility. Well-wishers of the jute industry will wish success to ICJC.

Five Million Bales

Relative self-sufficiency in raw jute is the aim. This was disclosed by Shri K. R. Damle, Additional Secretary, Union Ministry of Food and Agriculture, in his presidential address to the annual meeting of ICJC held in Calcutta last week. Most of the jute-growing States had submitted ambitious production targets for the second Plan period. These targets had to be reduced to suit the available resources. Accordingly, the jute production target for the second Plan has been revised downward to five million bales.

Shri Damle was evasive in his discussion of the problem of minimum price for raw jute. Prices of raw jute depend on the prices of jute goods. Prices of jute goods

are dictated by conditions in international markets. This explains the difficulties in fixing a minimum price for raw jute. But, without the assurance of a minimum price, there may be wide variations in the annual output. There is also a possibility that, without a fixed minimum price, the production target for the second Plan may not be reached. This was the dilemma posed by Shri Damle, but he did not solve the dilemma.

Shri Damle seems inclined to the view that the gradual improvement in the quality of jute produced within the country will help the producer and tend to reduce the margin of variation in prices during the Plan period. He implies that this would help to ensure adequate cultivation of raw jute so that the planned target will be reached. He may not be in favour of fixing minimum prices for raw jute. But he is in favour of enlarging credit, warehouse and marketing facilities to the primary producer, including the jute grower, so that the agricultural output targets in general and the jute production target in particular, are implemented according to schedule.

Producers' co-operatives are being encouraged under the second Plan. These co-operatives will be

assisted by the Reserve Bank with liberal loans. New Delhi will grant short-term loans for the purchase of fertilisers to farmers willing to accept the advice of technical experts in the use of fertilisers. These are some of the measures advocated by Shri Damle to ensure adequate prices for the crops that the farmers cultivate. Even those who are not as optimistic as Shri Damle will concede that farmers need cheaper credit and better manure.

Every National Extension Service Block will have a warehouse and a seed store in the near future. Arrangements are being made to establish regulated markets in order to eliminate malpractices in the marketing of primary produce. These are measures which should help the agriculturist to secure better prices for his produce. There is much to be said in favour of these measures to protect the interests of the cultivators. There is, in theory, much to be said against any policy of fixing minimum prices for farm products, including raw jute. Means for achieving the end are likely to differ. But the end of achieving planned targets must be attained. And the end cannot be achieved without assuring fair, economic prices to the farmer for his produce.

National Income Studies

A System of National Accounts and Supporting Tables, F/2 Pages 46, Price 3sh. 9d.

Methods of National Income Estimation, (Provisional Issue) F/8 Pages 58, Price 3sh. 9d.

Statistics of National Income and Expenditure H/6 Pages 94, Price 6sh. H/7 Pages 98, Price 6sh.

RECOGNISING the difficulties — conceptual, methodological and statistical—involved in the compilation of national income estimates, the United Nations has taken considerable interest in the subject. It has been assumed, of course, that these measures possess some international as well as inter-temporal comparability, and it is from the viewpoint of comparing the incomes of different countries or of examining the progress made by a single country over a period of time that the United Nations has been interested in the subject.

Whatever the reasons for its interest in the subject, the fact is that this interest has resulted in a substantial contribution to the subject from committees of experts set up by the United Nations or from the staff of the Statistical office. The report on Measurement of National Income and the Construction of Social Accounts, published in 1947, contained a classic appendix by Richard Stone, which has formed the foundation of work on the subject in most countries in subsequent years. The report entitled A System of National Accounts and Supporting Tables is a sequel to this classic report. It aims mainly at bringing together the large amount of experience obtained in subsequent years in the field and, therefore, it does not contain any radical departure in principle from the earlier report.

The main purpose of the report is to set out a system of national accounts, with particular emphasis on the development of international standards for concepts and classification. It does not, therefore, give any attention to the statistical problems of compiling and measuring the items entered in the accounts.

The principal chapter of interest is that which deals with concepts. In discussing the problems that arise in the definition of the value of production, the problems covered include the delimitation of the boundary of production, the distinction between intermediate and final products, the separation of gross and net concepts, the difference be-

tween national and domestic concepts, the question of market valuation, and the advantages of the distinction between market prices and factor cost. Other questions raised cover the uses of total product, the finance of products and the characteristic of a system of national accounts. The systematic presentation of material on the subject will be found highly useful by those who are approaching the subject for the first time or wish to have an authoritative exposition of accepted views on this subject.

In chapter III, the construction of the standard accounting structure is explained. This is descriptive rather than analytical and here again there is no attempt to examine alternative views. It would have been appreciated, for instance, if the authors had cared to discuss the relative merits of the official United Nations approach and of the system followed in Sweden and other Scandinavian countries. The proposals for a four-account system made by O. Aukrust in *The Review of Economic Studies* needs to be carefully examined at the official level. A useful chapter on the definition of various flows, together with appendices on the industrial classification of domestic product and the classification of private consumption expenditure, rounds up the report.

The *Methods of National Income Estimation*, as its title suggests, shifts the emphasis to methods of measurement from the region of concepts and definitions. As the report points out, "even in countries with a highly developed statistical service, much ingenuity is required in order to measure the various sets of transactions entering into national income and product aggregates". In view of the numerous adjustments that have to be made to existing data and devious ways that have to be followed in filling the gaps in available statistics, the description of actual methods used by various countries should be found very useful by those engaged in carrying out such investigations. As a basis for the exposition of

methods the theoretical foundations and frame-work proposed in the *System of National Accounts and Supporting Tables* reviewed above and in *Concepts and Definitions of Capital Formation* have been accepted. The study is limited to a consideration of the flows explicitly entering into the income and expenditure accounts in the national income.

Since much depends upon available data, the study proceeds in terms of actual country practice rather than in terms of abstract principles. At the same time, since all methods can hardly be described in a work of this length, nor might it be desirable to do so, a process of selection has become necessary. The hope of the authors that "the methods selected for description here will be found suggestive and helpful" seems to be justified.

The two publications *Statistics of National Income and Expenditure* form the sixth and the seventh in a series being published bi-annually by the United Nations. The information brought together in this way for a large number of countries enables the reader to get a quick glance at the state of affairs in different countries. While it was not to be expected that such a publication would discuss the various concepts and methods used or even explain them at length, the reports do carry notes on these at the beginning of each chapter. It is apparent from the fact that new series are added in almost every issue that an attempt is being made to extend the coverage of these reports.

Can Mahalanobis Do It?

R J Chelliah and C T Kurian

THE main purpose of this article is to make clear and examine the theoretical implications of the Mahalanobis Plan Frame and the Tentative Framework prepared by the Economic Division of the Planning Commission in consultation with the Finance Ministry and the Indian Statistical Institute. It must be clear even to the casual reader that these documents make a marked departure in some ways from currently held economic ideas. Thus, the Outline of the First Five Year Plan had said, "India has considerable resources of water, power and minerals still to be harnessed and exploited; there is land which can be reclaimed, and industries which can be developed. But to do this it will be necessary to divert to these capital works resources which would otherwise be utilised by the community for current consumption Hence some restraint on current consumption is necessary if the country is to find resources to build up the capital-equipment required for sustained increase of production." (p. 12, First Five Year Plan, People's Edition). But the framework of the Second Plan prepared by the Planning Commission says, "in a poor country where consumption standards are already too low, higher investment and the development of basic industries cannot be made to depend on a curtailment of consumption even in the initial stages."

A Tentative Framework

Again, as a corollary to the statement quoted earlier, it had been said categorically, "First, however, let it be made clear that we are confronted with a definite problem of choice—a choice between, on the one hand, a small or moderate increase in the standard of living in the near future but with only relatively small additions to capital equipment and hence no marked and sustained upward trend; and, on the other, a substantially higher standard of living for the next generation at the cost of continued austerity and privation to the present generation in the interests of rapid capital formation," (P 13, First Five Year Plan, People's Edition) and also, "A large and early increase in consumption and a high rate of capital formation cannot go together." (P. 18, The First Five Year

Plan, A Draft Outline). But now it is said, "An attempt must be made, therefore, to increase both consumption and investment simultaneously by harnessing such resources as are unemployed or unutilised at present." (Tentative Framework, p. 1. bold ours). And again, Prof. Mahalanobis in his Draft Plan Frame says, "Unemployed man power and unexploited resources can be brought together to increase both consumption and investment simultaneously", (p. 4. bold ours). Indeed, in a speech delivered in Madras recently Prof. Mahalanobis seems to have gone further than this and is reported to have said, "I venture to claim that in India the right way is to increase consumption and investment at the same time. I not only claim this can be done. I also claim that this is the only way," and, surprisingly, "But this is not the way of more highly developed economies." (!) (The Hindu, Aug. 3, 1955).

It is interesting in this connection to note what the U N experts' report on Measures For the Economic Development of Underdeveloped Countries has to say on this question of the comparative possibilities of increasing consumption and investment simultaneously in the developed and in the under-developed countries. It says, "In modern industrial communities, the existence of unemployment or of this sort of under-employment, would make it possible to increase capital formation rapidly, without cutting consumption and without inflation Thus, the existence of unemployment would make possible a rapid simultaneous expansion of both consumption and investment." (p. 41) It goes on to say, "Unfortunately, in underdeveloped countries, the process is not so simple". The reasons for this, according to the report, are the high tendency to import on the part of some of these countries and the inelasticity of supply in response to increase in demand. Thus their conclusion is that it is relatively easy to increase investment and consumption simultaneously in developed economies in a situation of unemployment whereas, it is difficult, if not impossible, to do this in underdeveloped economies in spite of the admitted fact of unemployment and under-employment. Needless to say this is

quite the opposite of what Prof. Mahalanobis is reported to have said in his Madras speech on August 2.

We submit that the change in the theory underlying planning of economic development which we have indicated above is a major change with significant theoretical implications. It is surprising that the Planning Commission has nowhere in the Tentative Framework taken the trouble to explain clearly in what sense they claim to be able to increase consumption and investment simultaneously and how they came to change their point of view, except for the cryptic reference to 'unutilised resources,' which term is by no means unambiguous. It is, therefore, necessary to examine this question carefully. It is possible that apparently contradictory statements really mean the same thing or can be reconciled because some of the terms are used in different senses. (cf the controversy about the equality between Saving and Investment.)

Principal Sectors of Economic Activity

Let us divide the economy into four sectors or kinds of economic activity: 1. Industries directly producing consumption goods. 2. Industries producing capital goods or machines which, when completed, can be directly and immediately used to produce consumption goods. 3. Industries producing capital goods or machines or materials which cannot be directly used to produce consumption goods but can be used to produce other machines or capital goods which can be used to produce consumption goods. In other words, Sector No. 3 produces goods or material which can be used in Sector No. 2. 4. Social services like Public Health Services and Education. This is only a rough and ready classification. We realize that it is somewhat artificial to split up investment industries into two sectors. However, we find this a useful classification for our purposes.

In Sector No 1 consumption goods are produced by using part of the existing factors of production at any given time. At any one time, more could be produced only by purchasing and using more of the existing resources. Over a period of time, however, more could be produced either by using more factors of pro-

duction (whose supplies might have increased meanwhile), or by increasing the productivity of the factors used. Increase in consumption or consumption output means increase in the output of Sector No 1.

Sector No 2 produces goods (and services) which directly make possible the maintenance and increase of factors available for use in Sector No 1 and also increase the productivity of the factors used in that Sector. Some of the goods and products in this sector will not take much time to produce, others may take a longer time; e.g. a minor irrigation work will take only a few months at the most to be completed; a huge irrigation project or a factory for producing cloth may take a few years. In an underdeveloped economy, there is bound to be scope for the production of a large number of goods, services or projects which do not cost much and which do not take much time to produce or mature. If we take a period, say, of five years, and plan, among other things, for investment in such products or projects as take less than five years to mature, we would naturally find that consumption output is higher at the end of the five-year period than at the beginning. Indeed as some of the projects need only a few months for completion, consumption output would start increasing soon after the beginning of the plan.

Sector No 3 consists mainly of heavy industries, like steel including manufacture of machines to manufacture steel, machines to make other machines, power etc. The difference between the industries in the second sector, and those in the third lies in the fact that the former produce goods which directly help to increase consumption in a sense in which the output in this sector does not. It might be said that the difference is ultimately only a difference in time-lag. But then this difference is crucial.

Social services are like consumption goods in that they directly satisfy consumers' needs or wants. But many of them, in a poor country, would increase productivity of labour and therefore represent investment in human capital.

Production in the second and third sectors together makes up the total investment in an economy in any given period. It is in this sense that the term investment is used in economic literature. Now in any programme of economic development over a period of time investible funds could and would be divided between

the second and third sectors with the result that at the end of the period total consumption output would necessarily be higher than at the beginning of the period. This is because investment projects in the second sector, as and when they are completed, increase the supply of factors available for Sector No 1 and/or increase their productivity. The less time-consuming these projects, the sooner will it be possible to increase consumption output. Even during the plan period, therefore, consumption output will start increasing. Further by not taking full advantage of the increasing possibilities of increasing consumption output and by diverting continually more factors to the investment sector, it would also be possible to step up the rate of investment. Thus it could be shown that in the plan period both consumption and investment are increasing. In a poor country where consumption standards are low, it follows that total investment must be judiciously divided between the second and third sectors. When Prof. Mahalanobis and the Tentative Framework speak of increasing both consumption and investment, is this what they are saying? Presumably not; it is hard to think it can be so. Undoubtedly the Plan (as a matter of fact any plan) would lead to an increase in consumption in this way and so it is true they have this also in their minds when drawing up their schemes. But if this is all that they mean, there would have been no need to make special mention of it, since this is the essence of economic development as ordinarily understood and therefore obvious.

Let it be noted that in the process we have outlined above, the increase in consumption comes about at every stage as the result of previous investment. That is to say an increase in output in Sector No 1 follows, and is made possible by, an increase in output in the second and third sectors. But the Tentative Framework as well as the Draft Plan Frame of Prof Mahalanobis speak of increasing both consumption and investment simultaneously. Secondly, in these passages reference is made to unutilised resources; it is the harnessing of unutilised, underutilised or unexploited resources that is supposed to make possible a simultaneous increase in consumption and investment. Prof Mahalanobis says, "Unemployed man-power and unexploited resources can be brought together to increase both consumption

and investment simultaneously." (bold ours). Again, "In an underdeveloped economy, where there are idle resources, increased investment need not imply a reduction in current consumption." (Tentative Framework p. 30, para 6.) Therefore it is fair to conclude that it is held by Prof Mahalanobis, and approved by the Economic Division of the Planning Commission, that consumption could be made to increase simultaneously with investment in other ways than by investment at the previous stage. In other words, there can be a simultaneous increase in Investment output (Sectors No 2 & 3) and in the output in Sector No. 1.

Strategy of the Plan-Frame

Admitting that Prof. Mahalanobis holds that investment and consumption can be made to increase simultaneously, through utilisation of resources at present remaining idle, what importance has been given to this factor in his Plan Frame? The basic strategy of the Plan seems in fact to turn on the utilisation of unutilised and underutilised resources. In the words of Prof Mahalanobis: "The basic strategy would be to increase purchasing power through investments in heavy industries in the public Sector and through expenditure on health, education, and social services; and to meet the increasing demand for consumer goods by a planned supply of such goods so that there would be no undesirable inflationary pressures." (bold ours)

This is indeed a novel strategy in planning for economic development. Ordinarily, it would be argued by most economists that in any plan for economic development, the rate of investment must be stepped up at first with as little addition to purchasing power, and, therefore, as little increase in consumers' demand as possible in order to avoid inflationary pressures and that when investment projects have matured consumption output will increase. But such an argument, of course, is based on the assumption of the absence of unutilised resources that could be readily utilised in order to increase consumer goods to meet the increased demand for them. If there are such resources, this argument breaks down. The strategy then could be one of increasing purchasing power. Similarly, the Mahalanobian strategy would break down in the absence of unutilised resources and could be justified, and could succeed, only if there are substantial under-

utilisable resources in the economy which could be drawn into use to increase consumption output (in Sector No 1) at the same time as investment is undertaken. We have already seen that an increase in the output of Sector No. 1 at any given time can take place only by purchasing and using more resources.

Prof. Mahalanobis was asked to draw up a scheme which would lead to the creation of 9 to 10 million jobs to cure unemployment. At the same time it was necessary to step up investment in heavy industries in the long-range interests of the economy. The strategy he has conceived would, if it succeeded, achieve not only the two objectives mentioned above, but also a third one, namely, a substantial increase in consumption output which would raise living standards. It is his preoccupation with the question of unemployment that leads him to put the accent on increase in purchasing power. In one of his recent speeches in Madras, he is reported to have said, "The objective of the plan in India should be to create a demand for consumer goods and also to arrange for the supply of consumer goods." (The Hindu dated, Aug. 9, 1955). A truly unorthodox statement; but Prof. Mahalanobis has set before himself the task of creating a large volume of new employment and that could be done, if at all, mainly by expanding the household and hand goods sector for producing consumption goods.

It is not difficult to see that the strategy advocated by Prof. Mahalanobis is substantially the same as that advocated by Keynes for a developed economy in a situation of (involuntary) unemployment and underemployment. Both wish to cure unemployment to the maximum extent possible in the short-run; both desire to increase demand, and therefore, purchasing power; and for this both rely on public investment. We do not refer to Keynesian theory as such, because there is no overt macro-economic theory behind the Mahalanobian strategy. Keynes, it is well known, advocated deficit financing in order to increase effective demand and thus to draw into production unemployed or idle resources. Created or borrowed money could be spent on public works or public investment and the resulting increase in money income or purchasing power would, via the operation of the principle of the multiplier, continually increase, up to a point, money incomes, and since there are idle resources in most sectors of the economy in a depression, real income

too (i.e. consumption output too). It is necessary that there be increase in investment in this process, as otherwise the increase in National Income cannot be sustained, the marginal propensity to consume being considerably less than unity.

What would we have, if this strategy were adapted to the needs of an underdeveloped economy? Unutilised resources are to be used to increase investment and consumption. Public Investment could, therefore, be undertaken in such a way as to lead to an increase in purchasing power. But since the marginal propensity to consume is very high, the increased incomes, unlike in the Keynesian system, are not likely to generate the required savings to match the original investment. Hence suitable policy measures, like additional taxation, are necessary to supplement increased voluntary savings. This is, in substance, the main argument of the Tentative Framework adduced in support of deficit financing in the

Second Five Year Plan. "For initiating a process of higher investment and higher incomes by fuller utilisation of unemployed and underutilised services, it is not necessary that savings come first and only these are invested later. Credit has to be taken in advance for the additional savings that are likely to arise as incomes and investment increase. Some initial credit creation, therefore, is an essential part of development programme. Nonetheless, if planned investments are to be realised without generating serious inflationary pressures, the initial credit creation must be limited with reference to what savings are likely to be available or can be created by suitable policy measures." (Tentative Framework page 29, para 2.) This, of course, corresponds to the "basic strategy" mentioned by Prof. Mahalanobis, and is clearly seen to be nothing but an adaptation of the Keynesian technique.

Farm Surplus as Source of Development Finance

THERE was a time when countries suffering from a shortage of foodstuffs, especially those in the ECAFE Region, had to look to countries with surpluses to spare for getting allotments. But, with a change for the better in the agricultural picture of such countries, the position has so altered that countries with large surpluses are now trying to seek the aid of the FAO for the disposal of their farm surpluses. Although the prosperity of agriculture in the ECAFE region is partly due to favourable weather, it is equally the result of sustained efforts at improving agricultural practices. In the result, many of the countries in the region have themselves surpluses to spare, and as the latest report of the ECAFE has revealed, countries such as Burma and Thailand are faced with the problem of marketing their farm products. In such a situation it is only natural that there should be frequent international discussions regarding the disposal of farm surpluses and the FAO should strive to suggest a constructive approach.

The FAO Committee on Commodity Problems, entrusted with the task of laying down the principles for surplus disposal, has placed emphasis on three methods of using surplus, viz., (1) to aid additional effort on economic development in under-developed countries; (2) to improve the nutritive standards through direct feeding programmes for special underprivileged or vulnerable groups and (3) to help relieve famine conditions caused by crop failure or other disasters. With a view to assessing the possibilities of using surpluses for aiding economic development, a pilot study was conducted by the FAO staff in India last year. The report of this specialist group*—which was considered by the Committee on Commodity Problems at its last session in May, 1955—examines the problem in certain terms. The Report has illustrative projects. For this purpose, it has selected projects which have not been included in India's First Five Year Plan.

The idea behind the use of sur-

*Uses of Agricultural Surpluses to Finance Economic Development in Underdeveloped Countries—Commodity Policy Studies No. 6, FAO, June 1955. Price \$1 or 5s.

pluses for development purposes, is very simple: the under-developed countries abound in underemployed and unemployed resources. These could be put to profitable use, provided a number of additional development projects are undertaken. Increased outlays on such projects would, however, increase the demand for food, clothing, etc. from the people newly employed. Unless sufficient supplies of food are available, inflationary pressures are bound to appear. It is here that surpluses come in and help in catering for a large part of the increased demand, until domestic production increases. They will also be useful in providing a part of the finance for the project by saving current expenditure on the part of the Government, provided they could be obtained either as grants or as long-term loan on concessional terms.

However, two main conditions must pre-exist in the recipient country for using the surpluses in this manner. First, the limiting factors for a more rapid economic development in the country concerned must be the scarcity of resources including finance. In such a case, surplus farm products would provide a part of the resources either through providing finance obtained by their disposal, or through their direct use in training programmes for labour or in paying for labour in kind. Secondly, the use of surpluses should bring about a net increase in consumption, and not act as substitute for domestic supplies. The increase in consumption should be as large as the sale or distribution of surpluses. Otherwise, the latter will be added to domestic supply and would either bring down the prices of such products on the internal market or effect their international prices by encouraging exports.

According to the pilot study, both these conditions exist in India. An assessment of the progress made in the first three years of the Five Year Plan indicates that finance and skilled manpower are limiting factors in accelerating the pace of development, and there is need for quickening the tempo of activity through larger investments. However, the issue whether foreign farm surpluses could be used in speeding up development, and if so, how much of resources this would provide, is not equally clear. In view of the fact that currently, supply of farm products in India is

plentiful, leading to a fall in prices, and the Government is considering the question of price support, it is feared that the utilisation of surpluses might affect prices of domestic farm products—a result which the FAO is keen on avoiding. Nevertheless, it is suggested that the surpluses, if used for additional projects, might not make the situation worse; thus, if the projects selected put some of the poorest people to work, they and their families would eat better and consumption would rise. While the problem of price would still be there, the country would be better off through higher levels of employment and consumption and through additional real capital having been created by the new projects. It is also possible that the surpluses may help the country to build up reserves for future contingencies.

The Report describes three different types of individual development projects wherein surpluses could be utilised. There are, first of all, projects where wages to labour are to be paid in kind, i.e., the food is moved directly into consumption where the recipients—the labourers employed on the project—add all of it to their own consumption. It should be ensured that the surpluses are not resold by the labourers. It is also necessary, if there is to be a net increase in consumption, that the surpluses distributed should not substitute the food formerly bought by the labourers. If these are taken care of, then the amount of surplus that could be utilised depends on the income elasticity of demand for food; but in any case it cannot be larger than what would be bought by labourers as a result of the increase in their income. Illustrative projects of this kind described by the study include village community and other development projects, milk marketing schemes etc. It must, however, be noted that the direct use of surpluses in this manner involves sizable administrative costs and the use of scarce administrative personnel for implementing the scheme of distribution of wages in kind.

Secondly, there are projects where additional workers are put to work and a part of their consumption is covered by surplus food, such as road construction, irrigation projects etc. A portion of the surplus allotted for any particular project would be used for paying wages in kind and

the balance would be sold and the proceeds used for financing the rest of the outlay on the project. In this event, the extent of increase in consumption of food as also the amount of finance that the sale of surpluses could provide depends on a number of considerations. If there do not already exist pockets of unsatisfied demand for the surplus farm products, the increase in consumption and the finance that could be obtained through sales, will be related to the direct and indirect effects on the demand for food of (a) the expenditure on the project other than on labour, (b) the expenditure of employees on items other than food and (c) the expenditure on transport and marketing of surpluses. This would mean that each expenditure item will have to be traced at least some two or three 'rounds' ahead—and the derived demand for food-grains estimated. If this could be done, it may be possible to know the amount of increase in food consumption brought about by the use of surpluses in financing the project. Clearly the extent to which the outlay on the project can be covered by the surplus, depends on the proportion of labour cost to total, and the proportion of the additional income spent in that particular commodity. In most cases, only a part of the outlay can be so met. For the balance, reliance will have to be placed on other external sources such as the International Bank for Reconstruction and Development. Alternatively, the projects should be such that they are productive in an unusually short time, and help cover part of investments from their own earnings, e.g., where some additional marginal equipment or construction is needed which can be quickly procured and installed.

According to the Report, the utilisation of surpluses would, perhaps, be more effective in financing an increase in the development programme as a whole, than when it is concentrated on a particular project or set of projects. In such a case, it would be easier to take note of the difference that surpluses make to total investments and the rate of capital formation, the consequent increase in incomes etc., if the surplus is made available over a period of years. It is also possible to administer the sale or distribution of surpluses through a central organisation. Above all, in a unified programme approach, it will be possible to balance carefully the various projects to be included and their phasing. The requirements of external

finance may also be more easily assessed—how much of it in surplus foods and how much in complementary foreign exchange, etc., and a careful examination of all these factors will provide the basis for "package deals" of foreign exchange and surplus foods.

After examining the current economic situation in the country, the Report suggests that there are numerous projects potentially suitable for financing in whole or in part, with the help of surplus foods, e.g. educational food scholarships, village community and other local development projects, milk marketing schemes, construction of district roads, hydel projects, forest roads etc. It cites more than half a dozen schemes of this type involving about 536 million over a four-year period, of which \$292 million could be provided by food surpluses.

While no doubt the idea behind the utilisation of farm surplus for financing development projects is simple and the objectives with which the surpluses are offered are laudable, there are certain obstacles in the way of effective implementation of such a policy. Perhaps the most important of these is the price factor. Any commercial disposal of surplus farm products is bound to affect the price of these products on the international markets, and also depress the price of domestic supply of such products in the recipient country. It is well known that surplus countries such as Australia and New Zealand have always been apprehensive of the US policy of disposing of its farm products. The fear has been so grave that at the Gatt, the United States has had to give positive assurances to these countries that its export of agriculture products would be as orderly as possible. In its reply to the FAO regarding the "principles" governing the disposal of surpluses, Australia has drawn attention to the 'principle' that governments undertaking or proposing to undertake large scale releases should, wherever practicable, consult with other countries interested in the possible effects of such transactions. Disposals of surpluses at concessional terms would not cause much worry provided they formed a small part of the normal exports. Australia considers that the placing of large additional quantities of a commodity on the world market even at ruling world prices will depress the markets.

It is perhaps because of such opposition which the U. S. expects from these surplus countries that

she is trying to offer her surpluses through the FAO as a recipe for the problems of the under-developed countries for financing their development plans. But these latter have their own points of view. In the first place, the possibility of implementing the scheme would be limited if an under-developed country itself has a surplus in any commodity. Any international arrangement for surplus disposal would make it obligatory on its part to part with its surplus; but in fact the country concerned may find it difficult to do so unless it receives some form of compensatory assistance from outside. Secondly, the under-developed countries which have had bitter experience of obtaining food from the surplus countries during emergencies such as famine, are trying to become self-sufficient in food and even build up reserves. In such a situation they may not view with favour a scheme which might encourage dependence on foreign imports of food.

As regards the use of surpluses for financing development projects, there are a number of difficulties. Using such surpluses for paying wages in kind involves heavy administrative costs. The effect of these surpluses on the domestic supplies, and the possibility of obtaining finance for the balance of the costs of the project have also to be carefully assessed. It is estimated that even in the most labour intensive projects, labour costs form not more than sixty per cent of total costs of development projects. And of the amount of outlay accruing to labour as wage income, about 35 per cent would be spent on foodgrains. To take an illustration, in a development programme involving, say, Rs. 500 crores, labour costs would account for Rs. 300 crores. Of the latter, about Rs 100 crores or so, would be the expenditure on food, i.e., about 20 per cent of the total costs of the project concerned. On this basis, surpluses could provide about 20 per cent of the total costs of a project. Therefore, unless it is possible to secure the balance of the finance from abroad, it will be difficult to consider additional projects based on such surpluses. It would be more useful, perhaps, if these surpluses are available as free grants for utilisation in programmes such as provision of school lunches, providing better nutrition to voluntary labourers in Community and other local development projects, free scholarships to indigent students, training programmes for labourers etc.

From the Chair

The Jupiter General Insurance Company Ltd

Report of the Administrator Shri R Varadachari

THE Revenue Accounts and the Balance Sheet of the Company with the Auditors' Report appended hereto relate to the year ended 31st December 1954.

The total premium during the year 1954 from all departments including the Life Department, amounted to Rs. 75,30,075/- as against Rs. 73,50,402/- in the previous year and it is a testimony to the inherent soundness of the Company's position and its organisation as a whole that in spite of the great handicaps under which it has been working since July 1951 it has shown such a good performance without any tied business or help from any source in the prevailing atmosphere of cut-throat competition. The financial position of the Company is quite sound and the assets have increased to a total of Rs. 3,64,97,657/- as against Rs. 2,88,36,324/- in 1950.

As there is some misapprehension in the minds of the public about the "Government management" of this Company, I should state that the Government is not placing directly with the "Jupiter" any of its business. The Company's share of premium on account of Government business received through the Indian Insurance Companies' Association Pool, like many other companies, was—Rs. 25,025/- under Fire, Rs. 22,724/- under Marine and Rs. 15,332/- under Miscellaneous Departments—that is, Rs. 63,081/- in all. The day to day running of the affairs of the Company such as the procurement of business, settlement of claims etc., is almost entirely in the hands of the Managers who have been working with the Company for a number of years. In particular, the reputation of the Company for prompt and fair settlement of claims continues to be high both in Indian and foreign markets.

Fire Department

The net premium in the Fire Department amounted to Rs. 15,10,540/- as against Rs. 15,41,959/- in the previous year. Though the premium has been more or less kept up during the last two years, it is about 50% of what it used to be some years back. The fall is due to the

fact that the Company is unable to enter into the cut-throat competition and the terrible rebating prevailing in the field at the moment. The year has, however, been an unfortunate one for the Fire Department. It had to meet a number of claims arising out of a Fire in Burma; the risks in that area were on the books of the Company even during private management for a number of years. Apart from this, certain foreign inward treaties showed rather unusually heavy losses with the result that the Department closed at the end of the year with a loss of Rs. 2,63,992/-, after providing 51% of premium under Reserves for unexpired risks. As the Chairman of a well-known in-

4,80,303/- as against Rs. 4,80,141/- in the year 1953. The profit of this Department was Rs. 1,51,114/- after keeping 141% of premium under Reserves for unexpired risks.

Miscellaneous Department

The net premium amounted to Rs. 18,08,048/- as against Rs. 15,85,798/- in 1953, the increase being due to the fact that premiums due for the two years 1953 and 1954 from a treaty company amounting to Rs. 3,26,640/- were accounted for in this year. This Department has been running at a big loss during the previous two years but this year the loss has been reduced to practically a nominal figure of Rs. 18,159/-, after providing 50% of premium under Reserves for unexpired risks. This is not unsatisfactory as the loss was really due to our having to increase the reserves by over a lakh of rupees on account of the increase in premium. The loss due to the Chief Agency at Trinidad opened by the late management and which worked for about a year was over Rs. 3 lakhs and this is a pointer to the clamour for opening out Branches in far off places without adequate supervision.

Life Department

The New Business completed during the year amounted to Rs. 99,19,000/- covering 3,265 policies as against Rs. 1,06,60,000/- covering 3,332 policies in the previous year. The renewal expense ratio for the year works out to 17.0% as against 18.3% in 1953. The Life Fund increased during the year by Rs. 22,51,392/-. The gross interest earned on the mean Life Fund during the year was 3.8% while the net yield was 3.1%.

In spite of various economies, such as the closing of unprofitable Branches and retrenchment of a number of executive officers, the expense ratio in the Fire Department still continues to be high, but this is largely due to the fact that the premium receipts in the Department have fallen down by about 50%. I should add that the expense ratio in 1950 under private management was not very much below that of 1954 notwithstanding the fact that the premium income in that year was nearly twice of this year.

Shri R Varadachari

insurance company in London remarked: "A company has nothing to be ashamed of in showing poor results in a year in which catastrophe has been experienced. On the contrary, it can be proud that it has been able to fulfil its purpose; namely, to meet at all times whatever calls may be made upon it. It is some consolation to know that although we have had such heavy losses to meet as a result of these catastrophes, we have been able to alleviate the lot of those unfortunate policyholders who sustained such widespread damage to their homes and personal belongings."

Marine Department

The net premium in the Marine Department amounted to Rs.

**Steel & Cement
for Building
Construction**

*A part of the
Martin Burn Enterprise
to make
India industrially
self-sufficient*

MARTIN BURN LTD

12 MISSION ROW, CALCUTTA 1

Branches at: NEW DELHI BOMBAY KANPUR

The expenses in the Marine and the Miscellaneous Departments are within reasonable limits, while the renewal expense ratio in the Life Department has actually been brought down to 17.0% from 24.4% in 1950 under private management.

Profit & Loss Account

The Accounts of the year have been closed with a small profit of Rs. 38,951/- and adding this to the

balance brought forward from the Accounts of the last year, the total available profit is Rs. 5,72,881/-. After making a further provision for Bad and Doubtful Debts and reserve for taxation amounting in all to Rs. 1,07,565/- the balance of profit is Rs. 4,65,316/- and I propose to carry forward this amount.

The Scheme for the reconstruction of the Capital Structure of the Company in accordance with Section

6B of the Insurance Act, 1938, is pending in the High Court.

Investments

From 11th July 1951 up to date, the investments of the Company in Government securities and first-class debentures etc. amounted to Rs. 74,98,870/-, after meeting all the outgo during the period. The total assets of the Company as on 31st December 1954 amounted to Rs. 3,64,97,657/-.

Supreme Court and Sales Tax

Hannan Ezekiel

BY reversing last week its decision on the question of sales tax on inter-state trade delivered in the United Motors Case in March 1953, the Supreme Court has taken a step whose significance extends far beyond the immediate question which it has now decided. The constitutional provision that "the law declared by the Supreme Court shall be binding on all courts within the territory of India" (Article 141) had been taken so far to mean that it would be binding also on the Supreme Court itself. This view was refuted, however, by the Acting Chief Justice C. R. Das. "There is nothing in our Constitution" he said, "which prevents us from departing from a previous decision if we are convinced of its error and its baneful effect on the general interest of the public."

However welcome the present decision about sales tax on inter-state trade may be, the implications of this statement need to be examined carefully. For one thing, the finality that has so far been the most important attribute of the decisions of the Supreme Court has been destroyed. Yet, the importance of this element of finality can hardly be over-estimated. Until now, once a decision of the Supreme Court had been delivered one could take it for granted that it represented an authoritative exposition of the provision concerned. If the decision of the court was found politically unacceptable, i.e., if it was felt that the decision operated to the detriment of the people, the only solution was to amend the Constitution, however difficult that might be. In this way, the political decision rested with the Constitution amending authority and ultimately with the people. Even if the judges of the Supreme Court felt that the decision was not correct, they could

do nothing but bow to it, though they might as individuals press for the necessary amendment of the Constitution.

Examining this question the Acting Chief Justice argued that in countries governed by a federal constitution it was by no means easy to amend the Constitution if an erroneous interpretation was put upon it by the Supreme Court. In the circumstances, he felt that an erroneous interpretation of the Constitution might quite conceivably be perpetuated or might at any rate remain unrectified for a considerable time to the great detriment of public well-being. I submit that the question of the public well-being is irrelevant to the issue and the Supreme Court has little to do with it except in those cases when the Constitution itself makes the effect of any legislation on public well-being a matter to be determined by the Court. It might for instance very well happen that an "erroneous" decision might be in the interest of the people and the correction of it might operate to the detriment of the people. That would not prevent the erroneous interpretation from being erroneous. The assertion that the judges should be convinced both of the error of a decision and "of its baneful effect on the general interest of the public" seems therefore entirely unacceptable.

Besides, the baneful effects of a particular decision could hardly be considered greater than those of one which removed the finality from decisions of the Supreme Court, which has hitherto been their greatest advantage. Once the Supreme Court has made an interpretation of the constitution, it should be final. Otherwise, the volume of litigation that is taken up to the Supreme Court will show an enor-

mous increase. Cases will be filed with the deliberate object of persuading the Supreme Court to reverse its decision relating to the interpretation of any provisions of the Constitution if that Court has already given an unfavourable verdict in a similar case. The Court will not be able to rely on its own previous decisions but will have to listen to lengthy arguments aimed at persuading it to reverse previous decisions.

Last week's decision was given in an appeal from a decision of the Bihar High Court preferred by the Bengal Immunity Company of Calcutta. This company, having its registered office, laboratory and factory in West Bengal, was called upon to register itself under the Bihar Sales Tax Act as it was selling its medicines for consumption in Bihar. In 1953, in the United Motors Case relating to the Bombay Sales Tax Act the Supreme Court had decided that a State was entitled to levy "any non-discriminatory tax on goods imported from sister States". In its judgment at that time, the Supreme Court had argued that Clause (2) of Article 286 which prohibited the States from levying the Sales Tax on inter-State trade unless permitted to do so by Parliament by law should be read in the light of the explanation to Clause (1) of the same Article. This explanation provided that for the purposes of clause (1) A of Article 286 which prohibited taxation of sales outside a State "a sale or purchase shall be deemed to have taken place in the State in which the goods have actually been delivered as a direct result of such sale or purchase for the purpose of consumption in that State."

In the present case, the Court has decided after a re-examination of

the whole question that "the explanation to Clause 1(A) could not be legitimately extended to Clause (2), either as an exception or as a proviso thereto or read as curtailing or limiting the ambit of Clause (2)." The effect of this decision is that prohibition on the levy of sales tax on inter-State trade unless Parliament permits it by law now stands absolute. It will no longer be permissible for States to levy such taxes and presumably all States will have to amend their Sales Tax Acts appropriately. They have already suspended the collection of such taxes pending further decision. It is now reported that Parliament will pass legislation to legalise the collection of such tax by the States from the commencement of the Constitution till Sept. 6, 1955, the date of the present decision. This would be necessary as the legal

Around Bombay Markets

ALTHOUGH the equities market witnessed sizable losses owing to an over-bought position, culminating in the last settlement, there has been an attempt at recovery with the closing quotations in all counters displaying a perceptibly steady trend. But since the floating stocks in Tata Ordinaries and Indian Irons have been steadily increasing, the uptrend noticed towards the close of the week may not continue for long. No doubt, industries are doing well, and the Second Five-Year Plan is expected to increase the purchasing power of the people and create a healthy economic climate. But Government's emphasis latterly on heavy taxation, and the prospects of a better deal for labour, have had a bearish influence. Unless these bearish factors disappear, there is hardly any prospect of any undue rise in prices of equities.

In the steel section, Tata Ordinaries after moving up to Rs. 247 reacted sharply to Rs. 241-8 to quote finally around Rs. 245 at the close of the week. In the case of Indian Irons, the rise to Rs. 41-6 was occasioned by rumours that the Company might be able to pay a dividend of Rs 1-8. When doubts were expressed as to whether Government would allow the Company to declare such a high dividend, there was a natural decline in values. However, it is strongly suggested in market circles that the dividend might be Rs. 1-4,

position is that the Supreme Court merely interprets the Constitution and by the present decision the levy of such a tax is declared to be illegal from the very commencement of the Constitution. It would also be desirable since the States should not have to repay the amounts collected by them in the past.

What will be done in the future is a matter of speculation. It is unlikely that Parliament will pass legislation authorising the levy of such a tax in terms of the Constitutional provision as currently interpreted. It has been suggested that sales tax on inter-State trade might now be levied by the Central Government. This is what the Taxation Enquiry Commission had recommended. But an amendment of the Constitution will be necessary

for that purpose and the revenue might have to be distributed amongst the States. While this might have some advantages over the existing arrangements, it would mean that there would be one more authority in the country collecting sales tax and considerable duplication of administration, both of which would be undesirable.

Since in any case an amendment of the Constitution will be necessary, why not take advantage of this to cut the Gordian knot of sales tax problems by centralising the entire sales tax? This would be desirable from so many points of view. If only the States could be persuaded to accept centralisation with distribution of the revenue to them, that would indeed be the best possible arrangement.

Bearish Influence

Thursday, Morning

i.e., 4 as. higher than in the previous year. At the close, it was placed around Rs. 39-1 after being down to Rs. 38-13.

In the textile section also, the pattern of trading was more or less the same, earlier weakness being followed by a semblance of steadiness at the close. Bombay Dyeing, Kohlnoor and Swadeshi closed around Rs. 503-8, Rs. 328-12 and Rs. 215/-, respectively.

In the miscellaneous section, ACC were in the limelight. After having been at Rs. 188 at one time they improved to Rs. 196-12 on rumours of a fresh issue on bonus terms. Killick also ruled better, having improved from Rs. 160 to Rs 164-4. Bombay Burma enjoyed considerable investment support and were taken up to Rs. 569-6 on reports that the Company had undertaken an expansion programme in East Africa—an improvement of nearly 30 points over the week.

Cotton

Setback in Prices

THE cotton futures market, which opened the week with a distinctly improved undertone on prospects of an export quota, witnessed a setback towards the close of the week when the actual announcement came. Early in the week it was thought that an export quota was imminent, following the

visit of the Union Commerce and Industry Minister to the City and the discussion that he had had with trade representatives. When it turned out that nothing much could be expected of his visit, the market tended to rule quiet. It was, therefore, not surprising that there was a setback in prices when Government announced on Tuesday an export quota of 2,50,000 bales of Indian cotton with immediate effect. In fact, the slight recession in prices was true to form as it is not uncommon for the market initially to react in the way it did to an announcement of this nature. This does not, however, belittle the importance of the announcement.

With the release of the 2,50,000 bales of Indian cotton for export, the aggregate quota released during the 1954-55 season amounts to a record figure of 7,81,000 bales, clearly underlining the liberal export policy pursued by the authorities. But the increased quantum of export quota has failed to enthuse traders inasmuch as there has been an increase in the production of cotton, the final estimate of which is put around 51 lakh bales for the 1954-55 season. Moreover, as the market had been hoping for some such action on the part of Government, ever since the phenomenal increase in the price of the August contract, traders were inclined to discount the announcement when it was actually made known.

Hence, the market lost as many as five points on the day the quota was released.

Two questions arise from the announcement. In the first place, it is not clear whether the quota released is in respect of the old crop or the new one. However, as the validity period for shipment is only up to the end of December, by which time it may not be possible to have any new crop on hand, it may be presumed that the announcement refers to the current crop (that is, 1954-55). Secondly, while free licensing has been allowed to the export of Zoda cotton, there is no mention of any possible reduction in its export duty. Unless there is a reduction in the export duty of 30 per cent ad valorem, in this variety, traders may not be able fully to capitalise on the relief given by way of free licensing.

ICC February, which opened the week at Rs. 623, improved on the opening day itself to Rs. 627 on expectation of an immediate export quota. On the following day although it improved to Rs. 628, the contract lost about seven points to be placed at Rs. 621-4 on fears that there might not be any export quota after all. On Saturday again, fanned by favourable reports of an export quota, the market improved once again to quote Rs. 624. An extension of this firm sentiment was seen on Monday also when the contract reached the highest for the week at Rs. 630. But thereafter values topped and even the actual announcement of the quota could not cry a halt to the declining trend. At the close on Wednesday, I.C.C. February ruled weak at Rs. 624-8. However, the contract, after moving up to Rs. 630-8 on quota announcement, again declined to close the week at Rs. 621-8.

Oils and Oilseeds

Further Decline

THE declining trend in oilseeds market, noticed last week, was further accentuated during the week under review. In fact, the price of groundnuts has gone down so low as to be even below the fair price suggested by the Union Commerce & Industry Minister, namely, Rs. 1000 per ton. The main reason for the recession in values all round has been the satisfactory weather reports from all the producing areas. Crop reports from overseas also indicated an increase in the groundnut crop in Africa, France and Belgium while America is reported to have maintained her usual standard

in the production of groundnut. Nearer home, Saurashtra, which entertained fears of a shrinkage in groundnut crop only a few days back, has also come out with prospects of improved output following the recent timely rains. In the event, the Bombay market, which is a natural outlet for Saurashtra's surplus, must needs be cautious, and even the buying pressure from Hyderabad traders failed to check the declining trend.

Castor futures, however, tended to rule firm on the whole. In view of the comfortable crop position, longs in the maturing September contract were left with two options, either to liquidate their holdings or to switch over to the distant May delivery. In the September contract, which is approaching its maturity, most of the outstanding business has been squared up. Castor oil prices, however, could not maintain an equally steady trend in view of the decline in prices of castor oil in the oversea markets, particularly in the U. K. and on the Continent.

In the case of linseeds, higher overseas advices helped maintain a steady trend, particularly towards the close of the week.

THE ECONOMIC WEEKLY

Bullion

Steadier Tendency

THERE is as yet no sign of the resumption of forward trading in bullion. A deputation of the concerned interests who waited on the State Finance Minister is believed to have been asked to consult the general body in regard to the proposed changes in by-laws. In order to ascertain the views of its members on this point, the Bombay Bullion Association decided to meet, and the meeting is scheduled to be held on September 21, 1955. The changes in the by-laws, if approved by the general body, are expected to be placed before Government for its sanction, which means an extension, by another month, of the suspension in futures trading in bullion.

Meanwhile, thanks to higher up-country advices, a steadier tendency was imparted to the spot section. Ready silver started the week at Rs. 165 against the previous closing of Rs. 165-8 and improved to Rs. 166-8 on sustained buying support from upcountry centres. Later on in the week, however, there was heavy selling by a leading bull operator which brought down the price to Rs. 165-8.

THE ECONOMIC WEEKLY

Around Calcutta Markets

Hesitant Trend

Wednesday, Evening

WHEN the stock market trend is "bullish", even unfavourable developments fail to have the expected adverse effect on equities. When, again, the market trend is "bearish", even minor adverse developments tend to have a major "bearish" effect on equities. Fluctuations in equities in the last fortnight reflect this market phenomenon faithfully, although it is as yet early to say whether the primary market trend has turned "bearish".

Some days ago, the managing agents of Indian Iron let it be known that the question of issuing right shares was not under their contemplation. Even then, Indian Iron did not start falling, although the earlier upward movement was mainly due to expectations of an issue of right shares by the company. Subsequently, Indian Iron fell. But these shares failed to move up at the time of the settlement last week. These two unexpected movements in Indian Iron explain the principle mentioned in the preceding paragraph.

In the second half of last week, equities remained steady as it became known that the National Development Council had decided to accept the Mahalanobis Plan-frame as the basis for the second Plan, thereby rejecting the Planning Minister's argument that the Plan-frame was too ambitious for a poor country like India. Decision of NDC not to lower the targets of the Plan-frame was interpreted by the market to mean that investment will be maintained at a high level during the next Plan period.

For the first three days of this week, equities gradually drifted downward as selling pressure persisted. An irregularly lower trend in equities was partly due to the passage of the Companies Bill in Lok Sabha. This could only have a psychological effect on the market, as the consent of Lok Sabha to this Bill was anticipated. It would seem that the main reason for the hesitant trend in equities in the last few days lies elsewhere. There are growing fears that State interference with company management and stock market activities may grow in future.

On the day Lok Sabha passed

the Companies Bill, the Finance Minister disclosed that a Bill to regulate stock market trading will be introduced in Parliament soon. Such a Bill has been in the offing for some time now. It is not difficult to understand why stock markets have reacted unfavourably to the Finance Minister's disclosure in Parliament that the Government will soon introduce a Bill to regulate stock market trading. It will be the aim of such a Bill to check undue speculative activity. But investors should have nothing to fear from such a Bill.

This week's weakness in equities is partly due to technical reasons. From the Budla rates in the last settlement, it is clear that there is an active "bull" position in Indian Iron. Some of the tired "bulls" have since liquidated their holdings. Though healthier, the technical position in some of the clearing shares is still vulnerable. It is, therefore, only to be expected that the market will take some time to complete the process of digestion.

Despite this week's fall in equities, Engineering Shares remain comparatively steady. This is partly due to the fact that there is still interested buying in some Engineering shares in order to acquire control in some companies. It is partly due to the fact that some engineering companies will soon be issuing bonus shares. What of taxation of bonus shares? Operators are now arguing that, despite the Finance Minister's recent statement, bonus shares may not be taxed. That, of course, remains to be seen.

Fall in Tea shares has also not been as steep as in some other shares. For one thing, it is now realised that auction prices may continue to be satisfactory. In the circumstances, it is argued that this year's profits of tea companies may not be as bad as apprehended some months ago. These factors explain why Tea shares are not falling. Even so, buyers are reluctant to lend support to these shares because of fears that the tea industry's production costs may increase owing to higher wage disbursements.

There are reasons why Jute shares remain inactive. Apprehensions are growing that Pakistan will soon emerge as a very powerful rival to

India as an exporter of jute goods. Recently, India lost a valuable American order for hessian to Pakistan. There are reports that Pakistan is still under-quoting hessian in overseas markets. This was the main reason for the recent heavy fall in the prices of jute goods. There has since been a recovery in both raw jute and jute goods. But the situation remains fluid.

Raw jute was falling because of regular and heavy arrivals of the raw material to moffussil markets in both Pakistan and India. A few days ago, rumours were current that this season's Pakistani crop will not be as heavy as estimated in private trade circles. There was a spurt in raw jute prices. But the spurt was not sustained. As raw jute resumed the downward trend, jute goods continued to drift down. Both raw jute and jute goods remain irregularly lower. That is why, jute shares remain hesitant and inactive.

THE CENTRAL BANK OF INDIA LIMITED

(Established December, 1911)

Head Office: Mahatma Gandhi Road, Fort, Bombay 1.

Can Mahalanobis Do It?

(Continued from page 1117)

The "basic strategy" calls for further examination. Let us first deal with the proposed technique of increasing purchasing power "through investments in the heavy industries in the public sector and through expenditure on health, education and social services." It is worthy of notice that in laying down this basic strategy, Prof. Mahalanobis makes no reference to the specific method of financing the investment outlay which is supposed to lead to an increase in purchasing power. It is, of course, clear that an increased investment outlay will lead to an increased demand for consumption goods from those who are newly employed. But will increased investment as such regardless of the method of financing it lead to a net increase in demand for consumption goods in the economy as a whole? If the new investment is financed by taxation or by voluntary savings there need be no net increase in purchasing power. In so far as additional taxation is paid by cutting down consumption or by cutting down savings this is obviously the case; for even if savings and not consumption are cut down, there will be a reduction in the volume of private investment. If, however, the taxes are levied on the richer section of the community, and if they pay them by reducing the consumption of luxury goods, there may be a net increase in the demand for wage-goods.

When, however, we come to the financing of investment from voluntary savings through public loans, it is difficult to see how there could be a net increase in purchasing power. In his article in the *Indian Economic Review* of February 1953, Dr V K R V Rao asks "whether investment outlay need necessarily result in deficit financing in the sense of creating a net addition to National outlay or aggregate expenditure", and goes on to say, "this need not be so if the investment outlay undertaken is equivalent to the expected and realised reduction in the outlay on consumption, i.e. if planned investment is equal to planned savings." (page 57). We are, however, not overlooking the fact that if idle hoards are utilised to pay taxes or to contribute to public loans, there will be an increase in purchasing power. But this increase is negligible and so it appears safe to conclude that increased investment financed by additional taxes or

voluntary savings will not lead to a net increase in demand.

It is, therefore, rather strange that Prof. Mahalanobis should speak as though investment per se will lead to an increase in purchasing power. However, it may be argued, that the Second Plan contemplates deficit financing of the order of about Rs. 1000-1200 crores for investment purposes and that this will generate new demand. This is true. But according to Prof. Mahalanobis, increase in purchasing power is to be brought about through expenditure on social services also. He is reported to have said in his Madras speech, "If they appointed a teacher, his salary would give him new purchasing power, and create a new demand for consumer goods. This latter would have to be satisfied either through factory production or hand-production." (*The Hindu*, Aug. 3, 1955). In this connection we wish to recall the Finance Minister's declaration at his Press Conference in Madras on May 26, 1955, that expenditure on social services, (as distinguished from investment) should and would be financed only through tax revenue. (*Indian Express* May 28, 1955).

If this be so, it is difficult to see how the new teacher's salary, coming as it does, through a diminution in other people's salaries, will lead to additional demand which has to be met by increasing consumption output. This part of the basic strategy would not work at least as far as the social services are concerned.

Let us now consider the second part of the strategy, i.e., increasing the supply of consumption goods. It may readily be granted that an increased output of consumer goods (leading to a marketable surplus) if this were possible without slowing down the rate of investment, would facilitate a higher rate of investment, for more labour could then be supported in the investment sector without affecting the consumption of others. But for a simultaneous increase in consumption output to be possible, there must be enough of idle but utilisable resources in the economy to make possible not only increased consumption output, but also higher investment. In other words, it is not just a problem of increasing the marketable surplus of consumption goods, "but of doing

it in spite of the increase in investment.

The term 'unutilised resources' might be used to mean the following different kinds of resources: (a) Excess capacity in organised industries represented by under-utilised equipment and under-employed skilled personnel; (b) unemployed, unskilled labour; (c) unexploited resources like deposits of various ores, unreclaimed land and water for hydro-electric projects; (d) under-employed craftsmen and under-utilised equipment in the household industries; (e) under-utilised land. All these resources facilitate economic development; but not all of them are in a readily utilisable form nor can make possible increase in output without prior investment. Thus, unexploited resources are not utilisable until after the capital goods necessary to exploit them are ready. Unemployed labour may have to be trained for many purposes. Even apart from this, when unexploited resources and unemployed labour alone are brought together, not much can come of it. Unutilised resources coming under categories a, d, and e, would be helpful in increasing consumption output at the same time as investment. But the presence of any one resource alone is of no great use. Thus, the existence of under-utilised equipment by itself cannot ensure a quick increase in consumption. Increased quantities of raw materials etc. must be available. In an economy based on division of labour, the production of a commodity is a long process. In order that increase in output may be possible, excess capacity must be present at every stage. For instance, there must be the possibility of increasing transport services to distribute the products or to transport the raw materials. If there is no excess capacity in such services, the necessary performance of the same services in the investment sector will be impeded.

It has been assumed by many economists including Dr V K R V Rao, that in an under-developed country like India, there is not enough excess capacity in the economy to make possible a quick rise in consumption output. That is why they have argued that as a result of a rise in investment, the multiplier will work in money terms, but not in real terms. To quote Dr Rao, "Thus the primary increase in investment and therefore increase in income and employment leads to a secondary and tertiary increase in income, but not to any noticeable

increase in either output or employment, in either the agricultural or non-agricultural sector. The multiplier principle, therefore, works with reference to money income but not with reference either to real income or employment." (*Indian Economic Review* page 60 No. 1. Vol. I)

The Multiplier Ignored

The operation of the multiplier principle seems to have been ignored by Prof. Mahalanobis. He has made no mention of it and the idea or aim as seen from the Draft Plan-frame, seems to be to attempt to increase consumption output to just the extent necessary to meet the demands from those who are newly employed in (Public) investment sector, social services and Public works. But whether or not Prof. Mahalanobis has taken into account the operation of the multiplier, we have to reckon with it in any scheme designed to increase purchasing power. When new purchasing power is injected into the system there is a primary increase in the demand for consumption goods. In the Plan-frame this is supposed to be met by arranging for increase in the supply of consumer goods. But when this is done, the workers in the consumption goods sector will have new or higher money incomes and these will generate (a secondary) increase in the demand for consumption goods. This increase in demand will be more or less equal to the new incomes created because the propensity to consume is high in India. This process would continue, but only upto a point and not indefinitely, because part of the increased incomes will be saved and another part will be taken away in taxation. However, the ultimate increase in the demand for consumption goods will be much greater than that arising from the primary rise in incomes in the Investment industries. It follows that the increase in consumption output necessary to prevent an inflationary rise in prices will have to be larger than what is necessary to absorb the purchasing power created in the investment sector. If the strategy is one of "increasing purchasing power", then the amount of unutilised resources has to be considerable.

It might be argued that the increase in consumption output is certainly not going to be brought about merely by the utilisation of idle resources and that the investment that has been, is being, and will be undertaken (in Sector No. 2), will increase the resources necessary to

produce consumption goods. The Tentative Framework does hint at some such thing (p. 6, para 22.) But the crucial question is, on what is the main reliance placed in the 2nd Plan to increase consumption—on the utilisation of idle resources or on investment itself? If it is the latter, the basic strategy could not be one of increasing purchasing power in the initial stages. We would have to start with the resources for investment made available through voluntary savings and taxation and then, if necessary, increase purchasing power as and when consumption output increases. This latter would enable the absorption of increased output and thus prevent a fall in prices which might distort the relative price structure and bring distress to many sectors of the economy. This would be the part that credit creation would play in a development programme. But according to Prof. Mahalanobis the main or basic strategy is to be one of 'increasing purchasing power' and 'creating a demand' for consumer goods. And this could succeed, as we have shown, only if there are considerable amounts of idle resources.

The extent of the idle or unutilised resources present in our economy is not exactly known. The Tentative Framework refers to the existence

of considerable excess capacity in some of the organised industries. There may also be some excess capacity in the house-hold sector. But these by themselves will not be sufficient to support a large investment programme based on the technique of 'increasing purchasing power'. There must be general slack in the economy such as to be found in an advanced economy in a time of depression.

When the U N Report we have referred to earlier, argues that Investment and Consumption cannot be easily made to increase at the same time in an under-developed economy, it is arguing on the basis of lack of effective excess capacity. When Dr V K R V Rao argues that the multiplier works only in terms of money incomes, he also bases his argument on the lack of effective excess capacity. Thus the Mahalanobian strategy runs counter to the theory developed in recent times. Not that thereby he is proved wrong. It is too early to make a judgment on that. But if his basic strategy of increasing purchasing power is adopted and is successful, it would lead to a revision of some currently held ideas. The presence of a large volume of unutilised resources will call for an explanation on other than Keynesian lines.

Get most miles per gallon

WITH

DOUBLE POWERED

Mobilgas

WHICH of today's gasolines gives the best mileage? Obviously, the one that keeps your engine running best. And this means *Double-Powered* MOBILGAS — because it corrects more engine troubles than any other gasoline you can buy.

So your engine gives more power, runs more economically. You get the

smooth, powerful performance your car or truck *was built to give*.

Change now to *Double-Powered* MOBILGAS, the only gasoline with MOBIL Power Compound — most powerful combination of additives ever put into gasoline. It's worth changing, because MOBILGAS gives you more for your money.

AT THE SIGN OF
THE FLYING RED HORSE
—NOWHERE ELSE!

Truck - drivers everywhere praise *Double-Powered* MOBILGAS — they find it gives full power, top economy!

The Industrial Disputes Bill

CONSIDERING the issues of principle and practice involved, it will be a miracle if the Industrial Disputes (Amendments and Miscellaneous Provisions) Bill, 1955, introduced in the Lok Sabha this week by the Union Minister for Labour, has a smooth passage. The Bill aims at setting right, in consonance with the ruling Government's views, the balance of power between the employer and the employee. And as in all cases of this sort, endowing one of the parties with certain privileges—howsoever reasonable they may be—will make the other fight ferociously before yielding. The House is not wanting in members with pronounced leanings towards one or the other of the parties involved in industrial disputes. Such of those who are not so openly attached to Labour or Capital might find it difficult to take a firm judgment on the various clauses of the Bill. They will either succumb to the better organised lobby or try conscientiously to hedge the privileges so as to prevent their being misused. All this will result not only in delay, but probably also in significant changes in the provisions of the Bill. For better or for worse, a democracy has to make allowance for these.

It is, therefore, too early to visualise the shape that the Bill will take when it is finally passed by Parliament. But it is not too early to discuss whether or not the direction in which the Bill wants to take us, and the speed with which it desires us to move are the right ones. Such discussion is of supreme importance because no earthly being, however sapient he might be, can decide what the right course is for society as a whole. Indeed, all judgments as to whether a particular step is the right one in the right direction has to be ex post facto. Ex ante, one can only surmise on the possible advantages or disadvantages of altering the balance of power between Labour and Capital through a particular legislative measure.

The proposed Bill aims at two things. Firstly, it seeks to amend the Industrial Employment (Standing Orders) Act of 1946, with a view to conferring certain rights on the workman which he so far did not have. It seeks, in the second place, to repeal the Industrial Disputes (Appellate Tribunal) Act, 1950 and provide an alternative machinery for settlement of industrial disputes. Of the two, it will probably be the former that will arouse heated debate. For, the suggestions regarding the machinery for settling disputes are linked to the question of solving the disputes, once they have come up. But the amendments to the standing orders are concerned with narrowing down the area of dispute, by clarifying the procedure to be adopted in changing the conditions of work.

It is, of course, possible that the suggested changes in procedure might in practice prove ineffective. That apart, the objective is based on the philosophy that by hedging meticulously the scope for unilateral action, open conflict might be avoided. And it is on this that people will disagree—depending on whether they consider workers as having at present too much or too little power to decide the conditions under which they will work.

September 24, 1955

THE ECONOMIC WEEKLY

The main extensions of the workman's privileges consist in the provisions (a) that the employer shall not introduce any change in respect of certain specified matters without giving to the workman twenty-one days' notice of his intention to do so; and (b) that workmen might henceforward take steps to modify the existing standing orders. The first of these obviously limits the power of the employer to introduce changes suddenly, while the latter extends to the workmen a power which only the employer so far had. Ideally, these provisions could help resolve differences of opinion between the worker and employer regarding the suitability of any change in working conditions through discussion and negotiation—since notice of the change has to be given, and the workers have an equal chance of initiating amendments to the standing orders. But in actual fact, it may cause conflict if either of the parties approaches the issues without due sense of responsibility.

It will doubtless be argued that where good relations exist between the employer and the workmen, these alterations in legal status are unnecessary. The wise and sagacious employer will, whether law requires it or not, try to get his employees to agree to a change in conditions of work before introducing it. Equally, workmen with a sense of responsibility for the well-being of the concern in which they are employed will not suggest modifications that are impracticable or injurious to the other party or parties concerned. But not all employers or employees will be cast in this mould. And in an acquisitive society, energy will be devoted to enlarging personal gain, even if it be at the expense of someone else. Where the employer-employee relationship is such that each tries to utilise every opportunity to mulct the other of his share, these modifications will probably increase rather than diminish conflict. In other words, neither the very good nor the very bad will be affected by the modifications suggested. It is the in-betweens that might find some comfort.

Judged from the point of view of equity, it is right that the workman should have a clear say in the matter of how and under what conditions they will work. It is enough for a modern society

to say that if a worker does not like the conditions of work, he is free to quit the job. It is a freedom which few workers can in real life exercise without suffering for it. Even more important is the fact that for the economic well-being of a community, conditions of work should be such that the worker is eager to put forth his best effort; and this he will not do if he has no voice in deciding the environment for his activity. Despite all this, the Bill will provoke many to cry havoc. There is amongst the vocal elements in the industrial field already the complaint that the Government is trying to pamper labour; and that as a result of this, it is impossible to get labour to work efficiently. Probably, there is some truth in the argument that a feeling of security of tenure is conducive to laxity and laziness. But there is little doubt that the remedy lies not in making the worker feel powerless and completely at the mercy of his employer, but in giving him discretion and a stake in the well-being of the concern, as well as the community. It would, therefore, appear to be neutral that the Bill is oriented in the right direction, at least in so far as the amendments to the Industrial Employment (Standing Orders) Act are concerned.

On the other side, the Bill proposes the abolition of the Labour Appellate Tribunal and the setting up of three types of original tribunals, viz., Labour Courts, Industrial Tribunals and National Tribunals. The last of these are intended to cover disputes which involve questions of national importance, or which are such that establishments in more than one State are likely to be affected by the dispute. Reference of disputes to the National Tribunals will have to be by the Government of India. In regard to the other two, the jurisdiction would be limited to disputes in specific areas and references may be made to them by the parties concerned or the State Governments.

Whether this three-tier machinery will prove more efficacious than the existing system in resolving industrial disputes speedily and satisfactorily has to be seen. But one cannot help feeling that a new area of dispute is opened up by this hierarchy viz., deciding which disputes are of national importance and which are not. To the extent that any dispute leads to a strike or

lock-out and results in reduced output, the economy as a whole suffers. In that sense, national considerations creep in every time there is an industrial conflict. Some of these are palpably more injurious to the economy than others—such as a railway or dock strike or a bank strike. But there will be many border cases, in respect of which the propriety of leaving the matter for settlement to a Labour Court or Industrial Tribunal might be questioned.

Presumably, some arbitrariness in these matters is inevitable. That apart, there is probably some advantage in dispersing responsibility for the settlement of disputes. Proliferation of these bodies will mean that more men will have to look into cases of industrial conflict, and this in itself might help a careful appreciation of the position taken by the contesting parties. In any event, Government cannot avoid resorting to an alternative method when the feeling is general that the existing machinery is inadequate to ensure industrial peace. Whether the three-tier system will yield better results than the industrial Courts and the Labour Appellate Tribunal is, as we said earlier, yet to be seen.

Measures like the one that is before the Lok Sabha are, at best, palliatives. They cannot and should not be expected to usher in an era of industrial peace and concord. It is in the very nature of modern society that such disputes should arise, since men will not always agree, with the best of intentions, on the share of the national product that should go to the workers on the one hand and the entrepreneurs on the other. But there are things on which everybody could agree—and these are that the status of the workman in society should be raised, and that no dispute can be solved to the complete satisfaction of one of the disputants. Given such general agreement, the Labour Minister's Bill should find favour with the country. Otherwise, even the minor advance towards industrial welfare envisaged in the Bill will become impossible of achievement.

Spirit of Geneva

WHEN Moscow frowned, the Western Powers argued that there could be no understanding with a potential aggressor. Now, when Moscow has assumed a smiling 'new look', they are intrigued by Moscow's overtures. Ever since the start of the 'cold war', Russia has demonstrated that diplomacy is a game at which two can play. Moscow has always had the diplomatic initiative. Throughout the 'cold war', Russia has claimed that peaceful co-existence is possible. For a long time, the Western Powers refused to accept this claim. Only the grim realisation of the fearful consequences of an atomic war forced the Western Powers to accept co-existence as a basis of understanding with Russia. At Geneva, during the 'summit' talks, the Western Powers were impressed by Russia's peaceful intentions. Dr. Konrad Adenauer, Chancellor of West Germany, has expressed his belief that Russia is sincere in her desire for peace.

Russia's peaceful intentions are now conceded. But it is insinuated that she has ulterior motives in desiring peace. Moscow has never been insincere in her reasons for ensuring world peace. M. Khrushchev is honest to a fault. He is blunt, but not dishonest, in his warning that Moscow's smiles should not be interpreted to mean that Russia has any intention to abandon Communism.

Not only will Russia not reject Communism, but, in urging the Western Powers to reach an agreement to maintain world peace on the basis of co-existence, she has made it abundantly evident that she will not abandon her policy of converting other countries to Communism. She hopes to establish the superiority of Communism through competitive co-existence. This is a legitimate aspiration as long as it is pursued through peaceful means. Like Russia, the Western Powers are equally entitled to demonstrate the superiority of Capitalism. Any lasting agreement between Russia and the Western Powers can only be reached on the clear understanding that each side will work for the spread of respective ideologies.

This is the wider canvas against which Russia's post-Geneva moves have to be assessed. Russia's peaceful deeds multiply. At her initiative, diplomatic relations have been estab-

lished between Bonn and Moscow. Russia has signed a treaty to restore East Germany's sovereignty. She has offered amnesty to Russian collaborators with Germany during the last war. This is a generous gesture. Other Communist States in Eastern Europe have already made similar offers of amnesty. There are reasons why Moscow is more lenient in her attitude to Eastern Germany than in her policy to Western Germany. But it is welcome news that Russia has agreed to discuss the question of return of German war prisoners with Eastern Germany.

Equally significant, is Russia's gesture to Finland. Even those who may be inclined to stress the diplomatic motives behind Russia's recent policy towards the two Germanies will concede that her gesture to Finland is generous. Russia's renunciation of her naval base at Porkkala in Finland is as dramatic as it is magnanimous. There has been a tendency to belittle this Russian gesture on the argument that Russia has lost no strategic advantage in withdrawing from the Finnish naval base. Admittedly, Russia now has alternative naval bases in the Eastern Baltic.

But it should not be ignored that Porkkala is a naval base which can be readily fortified to bring Leningrad within easy striking distance of the fleet air-arm. Nor should it be forgotten that Finland joined Germany in invading the Russian mainland. Russia was under no political compulsion to show mercy to her former enemy. Finland is an independent-minded, non-Communist State to which Communist Russia might be expected to be rigid, if not hostile. By reaching an agreement with Finland, with whom Russia can feel no social or political affinity, Russia has demonstrated her desire to come to an understanding with Western Powers on the basis of peaceful co-existence.

Though peaceful, Russia's recent overtures to the two Germanies need to be appreciated in the context of the forthcoming Geneva Conference of the four Foreign Ministers. Even as Moscow has recognised Bonn so as to facilitate economic intercourse later, there are reasons why Eastern Germany's sovereignty has been restored. With sovereignty restored, East Germany is now free to discuss her relations with West Germany.

Admittedly, there are motives behind Russia's diplomatic moves to foster direct talks between the two Germanies to reach an agreed plan for a future, sovereign, united Germany. Russia has made it abundantly evident that she will not agree to a plan for Germany which involves West Germany's integration with NATO.

It may be assumed that an agreement between Russia and the Western Powers on Germany must imply a comprehensive arrangement for the security of Europe. But, while the Western Powers approach the German problem on the assumption that they and Russia will have to devise a solution, Russia is more diplomatic in implying that the problem of Germany is the prime concern of the people of Germany. Russia's recent moves are aimed at encouraging the two Germanies to reach an agreement through mutual negotiation. This is a diplomatic triumph which Russia has scored on the eve of the Geneva talks among the four Foreign Ministers next month.

Weekly Notes

Principles, Parties and Persons

THERE is not much cause for surprise in the decision of Mr. Ghulam Mohammed, Governor-General of Pakistan, to relinquish his office a little more than a month after his going on leave. The nature and course of his illness made it almost certain that he would have to quit power sooner or later. What is surprising, however, is the manner in which a section of the public and the press seemed to hush the ailing Governor-General out of office. There appeared to be little grace in the controversy that had been worked up over his illness, his leave and the treatment that was being given to him at State expense. It is true that Mr. Ghulam Mohammed was not given to much ceremony in disposing of political opponents or those who did not meet with his approval. Whether there should have been any return of compliment, now that he is unable to hit back, is a question that is bound to assail those who still set store by certain decencies of public life.

Democracy may be no respecter of persons; but there has been evident in Pakistan a trend which would make of public men no more than handy instruments to be used for a particular purpose and then thrown on the scrap-heap. Were there well-organised, well-disciplined parties in Pakistan, this would not have mattered much to the progress of the country. But with a few able individuals bulking larger than parties there, one feels that there might well be a little more care in expending leadership material. Political stability can come only when there is faith in basic principles, parties or a few dependable individuals; but when there is abiding faith in none, the outlook cannot be very encouraging.

The argument that the lack of too much faith in leaders is a healthy antidote against dictatorship carries little conviction in the case of Pakistan at least; for while Jinnah or Liaquat Ali Khan were alive and in power or Ghulam Mohammed was in good health and in a position to assert himself, their rule had all the elements of a personal dictatorship. The political forces in Pakistan may have no respect for fundamental human values

which are of an enduring type; but they certainly appear to have a healthy regard for bravado and obvious strength, which are apt to pass away and which provide no lasting foundation for political evolution or national growth.

Mr. Ghulam Mohammed came to power at a time when, with the passing of Jinnah and Liaquat Ali Khan, there seemed to be none in view to take control of the troubled affairs of Pakistan and when power-seeking politicians were at one another's throat and political groups were disintegrating as fast as they had sprung to life. Within a short time of his coming to power, he showed that he was not going to be a mere figure-head; and in three years, through bold decisions and drastic actions, he came to be the only man that mattered in the whole of Pakistan. Politicians were reduced to playthings, the legislature was reduced to a convenience, and triumphing over them all was the executive personality of the Governor-General operating through a puppet-show of Ministers.

A Man of Crisis

IT was the triumph of what may be called the one-track 'service' or bureaucratic mind over the squabbles, hesitations and bargainings of politics; and though in the process, democratic processes were set at naught, the country was saved again and again from serious trouble, albeit temporarily. For that, credit is certainly due to Ghulam Mohammed, and also perhaps a certain measure of gratitude from his people; but thoughtful people, seeing the host of problems that he has left unsolved behind him, may well ask whether in purchasing stability at such great cost to democracy, Pakistan acted wisely at all. It may be that if Ghulam Mohammed could guide the destinies of his country for a few years more, he would have tidied up things in his masterly way; but as things are, this must remain a piece of idle speculation. And Ghulam Mohammed is less likely to be known to history as an outstanding administrator, a far-seeing statesman or a leader who put Pakistan on her feet than as a plucky ruler or rather as a man of crisis.

Succeeding him is Major-General

Iskander Mirza who also answers to the strong man type, though perhaps without the vast administrative experience, the power of handling men and mental agility which distinguished the retiring Governor-General. In a sense, Mirza faces a situation in Pakistan not far better than what his predecessor had to face, though one may not go so far as to describe it as definitely worse, what with the damage that has been done to democratic growth in the preceding years. Anyway, the posture of affairs would seem to be not unfavourable to the conversion of the one-man rule of the previous regime with the trappings of democracy into a full-fledged dictatorship without the trappings—frank and unabashed. And Major-General Mirza is an Army man. Whether the power that has passed out of politicians' hands into those of servicemen will see yet another transfer is a question that cannot but agitate those in Pakistan who are still trying to keep their faith in democracy alive, however disillusioning the experience of the past might have been.

It is a question that is bound to cause concern to democratic-minded people outside Pakistan too. And the first few actions of the new regime, particularly the arrest of Khan Abdul Gaffar Khan, have not been such as to obviate this concern. One may not deny that Pakistan has been facing an extraordinary situation for some time now; but in resorting to extraordinary measures to deal with an extraordinary situation, irreparable harm may be done to ordinary values—the values that constitute the very springs of human rectitude and righteousness. The immediate past has been too redolent of this to escape notice.

Cambodia

OF the three States in Indo-China, in Cambodia alone have general elections yet been held under the Geneva Agreement. Laos will hold the elections later this year. In Viet Nam, the situation has been complicated by the refusal of South Viet Nam to discuss arrangements with North Viet Nam to hold the elections. M. Diem, South Viet Nam's Premier, has let it be known that

he owes no obligation to accept the Geneva Agreement as it was concluded by France, and not by his Government.

In the Cambodian elections, Prince Norodom and his Popular Socialist Community Party have swept the elections held recently. After the Geneva Agreement, Prince Norodom abdicated the thrown in favour of his father to fight the elections. His victory was not unexpected, though only a few could have anticipated that he and his party would capture all the seats. Prince Norodom is a colourful political personality. He, it has been remarked, has the make-up of General de Gaulle. His party has been compared with the General's "People's Assembly". It is not without significance that Prince Norodom and his Popular Socialist Community are opposed to the parliamentary system of government. Abolition of direct elections and the introduction of indirect voting by village assemblies are the major issues on which the Prince and his party fought and won the elections.

Some of the statements issued by Prince Norodom since his party swept the elections would seem to indicate that his political rivals were wrong in labelling him as a dictator. He may dislike the Cabinet system of government. But he is in favour of limited monarchy. Prince Norodom would, perhaps, not mind being described as a benevolent despot. His constitutional plans may not vest sovereignty in the people. But his plans seem to be aimed at establishing the village as the basis of Society and of the State. Cambodia is the only Hindu State in Buddhist Indo-China. Prince Norodom's political ideologies are not entirely unfamiliar to Hinduism.

While there may be speculation as to whether Prince Norodom is an aspiring Ataturk, his enunciation of his foreign policy discloses that he is familiar with world affairs. He rejects the status of an Associate State of France for Cambodia unless the French offer means and implies a status similar to the status of a member of the Commonwealth of Nations. His foreign policy is based on non-involvement in power blocs. He will recognise both Communist and non-Communist States. He will try to be independent of American financial and military aid. He will seek membership of the United Nations. His attitude to the neighbouring States is not undiplomatic. He will

not recognise Viet Nam until elections are held, nor China as long as the two Chinas continue to exist. Prince Norodom is, admittedly, a Cambodian patriot. There will be hope that the former King will not exploit the circumstances to assume dictatorial powers.

Andaman and Nicobar

RECENT reports suggest that the Government of India are paying more attention than hitherto to the Andaman and Nicobar islands. The main aim of the plans currently being implemented is to augment the supply of labour and other productive resources available in the islands by encouraging the immigration of people from the mainland and providing them, as well as the original inhabitants, with the finances necessary for exploiting the rich natural resources. It is intended to clear 20,000 acres of land for paddy cultivation and allot it equitably to 4000 agricultural families by 1958. About 1257 families (or 5000 persons) from West Bengal, Travancore-Cochin, Madras and Bombay have already been settled since 1949; and during the current year (1955-56) out of 500 agricultural families expected to settle in the islands, 431 families have already moved in. Each family in the islands is to be allotted 10 acres of land, 5 acres of

which would be from the cleared area, for purposes of cultivation. A loan of Rs. 1730 towards house-building, purchase of live-stock and agricultural implements and a grant of Rs. 1050 for maintenance purposes are also given.

There are other schemes of development for the welfare of the community: a sum of Rs. 3.23 lakhs has been provided in the current year's (1955-56) budget for dispensaries, hospitals, etc. The possibilities of tapping oil deposits in Port Blair will also be explored. It is further proposed to develop several extractive and processing industries in the islands. By the end of the present Plan period it is expected that timber valued at Rs. 2.5 crores would be available for use and export. There are plans to develop the production of coir, mats, shells etc. and to encourage fisheries.

The main obstacle to development of these islands is the lack of adequate transport and communication—both within the islands, and between them and the mainland. It is of interest to note, that in the FAO Memorandum on the use of surpluses published recently, transport development in the Andamans is cited as a project eminently suitable for financing through food surpluses, because of the immediate results it will yield in the form of timber and other saleable forest

IT-9467

products. Apparently, the planners have seen the point and schemes are in hand for increasing the number of ships plying between Port Blair and the mainland ports, and for building a network of roads inside.

Natural Gas in Andhra

SCARCELY two years after the discovery of natural gas at Sui in Baluchistan had revolutionised the economic situation in West Pakistan, another discovery of natural gas has been made in the sub-continent—this time in the Amalapuram area in the East Godavari District of Andhra State. If, as has been claimed, immense reserves of natural gas exist in the area, the discovery will bring about a sea-change in the economic prospects for South India. It would go a long way towards solving the problem of energy supply in the South. South India has no coal reserves worth the name. Though extensive deposits of lignite exist in the region, their utilisation is still limited by certain technical factors. The tremendous burden thrown on the economy by the need to transport coal over long distances from the coalfields of Bihar and Bengal, has made industrial development in the region difficult in the past. Hydroelectric power is not plentiful and must be supplemented by thermal power, which implies once again dependence on coal. Natural gas can be used for generation of electricity or directly as a source of power.

Uneasy Argentina

TROUBLE has been simmering in Argentina for some time now. Though the June revolt proved abortive, it was evident that President Peron was fast losing his popularity. Many complex factors explain Peron's fall. In Argentina, as in all Latin American countries, the Army is the most powerful influence. It has been evident that President Peron has been losing the support of the Army, and especially of the Navy. Basically, President Peron's fall is due to his quarrel with the Catholic Church. Since the abortive June revolt, the "descamisados" were encouraged to indulge in wholesale burning of churches. Peronist purges in the armed forces must have fanned the flame of revolt in the Navy. It is clear that the rebels had the support of the large landowners who have always been hostile to the

Peron regime. Even the military leaders in the capital did not support Peron this time. But the events indicate that the rebels are too strong to ignore the military junta which tried to form a provisional government after the fall of Peron.

Argentina has been under the Peron dictatorship for many years. Though a dictator, Peron was not without popular support. His policy to the landowners had popular support. He encouraged trade unions, though he exploited the movement for his personal aggrandisement. His policy of separation of Church and State had the support of all progressive elements in Argentina. Though the revolt has been successful, the rebels have yet to declare their policy. It is not yet clear whether they will retire from politics after they have helped the establishment of a regime. It will be a bad day for Argentina if President Peron is replaced by a reactionary army dictatorship.

Bombay's State Transport

EIGHT years ago the Bombay State Road Transport Corporation commenced operations with only 35 vehicles covering a few small routes in the State. Today, with a fleet of over 3,000 buses and a route mileage of 48,000 miles, the organisation can claim to have expanded sufficiently to cover the whole of the State. Impressive figures can be advanced about the daily mileage of State Transport buses and passengers carried by them which average 2 lakh miles and 5 lakh passengers respectively.

It is more important, of course, to know how the Corporation has gone about its job. There has been some severe criticism of the Corporation in the Bombay Legislature—not necessarily well-informed—and since this has been directed at its financial position, it is good to know that the Corporation has been able to pay the prescribed dividend of 4½ per cent on its capital after meeting its expenditure and contributing to the necessary funds for depreciation, insurance etc. It has been argued that this is not enough; that apart from the payment of interest on the capital invested in it, the Corporation should be able to show a substantial profit. This argument is, not necessarily valid, and criteria other than profitability must be applied to nationalised industries, provided

lack of profits is not due to inefficiency and waste.

While all may not be well as yet with the Corporation from this point of view, the fact that breakdowns have declined from 3.56 per 10,000 miles in 1950-51 to 1.53 and that the regularity has improved from 74 to 92 per cent is encouraging. The Corporation also seems to have gone about its task of providing amenities to the public in the shape of bus stations, waiting rooms, canteens etc. with alacrity, and even though the entire State has not yet been fully provided with such amenities, much has been done.

In spite of the provision of these amenities and 'an overall rise of about 50 per cent in the operation costs,' the Corporation has been successful in maintaining the original fare rate of 9 pies per head per mile. It is claimed that this has been possible because of rationalisation of the staff structure and operational schedules, improvement in stores purchase policy, conversion of petrol into diesel operated vehicles, undertaking of body building and retreading of tyres and better preventive maintenance of vehicles. The assurance that the drive towards reduction in operation costs still continues has been given by the Chairman of the Corporation, Shri R G Saraiya.

Whatever may have been the merits or demerits of the Bombay Government's policy of nationalisation of road transport, the way in which State Transport has functioned leaves little room for doubt about the successful implementation of that policy. We would like to know more, however, about the experiment in freight transport on which the Corporation embarked some time ago.

Tata Locomotive

THE Tenth Annual Report of the Tata Locomotive and Engineering Company Ltd. for the year ended 31st March 1955 records all-round progress in its working, and the company appears to have been able to make an impression on the locomotive needs of the country.

The manufacture of locomotives continues to rise, and the output during 1954, at 47, compares favourably with the average of Chittaranjan at approximately 55 per annum (275 between 1950 and 1954). The company has plans to increase the capacity of the locomotive division to 100 complete locomotives per annum by 1958. Again, despite diffi-

culties due to a temporary shortage of indigenous plate supplies early in the accounting year and labour troubles about the end of 1954, the output of boilers reached 92 units—which marks an increase of about 50 per cent over the previous year's output. Progress has also been recorded in the manufacture of underframes—both broad and metre gauges—as also in the work of the automobile division; the work in the division is actually ahead of schedule, and during the year under report, the company assembled as many as 443 Tata Mercedes Benz trucks, which are said to have been well received in all quarters; and it is heartening to learn that demand for the vehicles far exceeds the capacity of the company's automobile division to supply. However, with a view to meeting the growing demand, the company proposed a doubling of the capacity of the automobile division. An interesting feature of the automobile line of business of the company is the arrangement made for aftersale service.

As a result of operations in the year under review, the company has been able to show only a nominal profit of Rs. 3,303, after meeting expenses, providing for managing agent's remuneration and depreciation. Provision for depreciation has also declined from Rs. 96.8 lakhs in 1953-54 to Rs. 35 lakhs in 1954-55. Again no allocation has been made during the year to the Company's Reserve Fund. There are a number of reasons which explain this apparently gloomy financial picture. In the first place, since the prices for locomotives and boilers supplied during the year under review have not been agreed upon between the Railway Board and the Company, the profits under this head have not been taken into account. Secondly, though there is an increase in the total profits earned during the year to Rs. 4.65 crores from Rs. 3.32 crores in the previous year, the net profit is only nominal; and this is partly due to the fact that there has been a noticeable increase in the Company's expenses, mainly under sales, publicity, commission (Rs. 3.2 lakhs) and interest charges (Rs. 16 lakhs)—these and other items accounting in all for Rs. 21.49 lakhs against Rs. 8.1 lakhs in 1953-54.

With a view to financing the expansion of the automobile division of the Company, 200,000 additional shares of the value of Rs. 100 each were issued during the year, and of this 120,000 shares have been allotted

to the existing shareholders and the balance to the Company's Associates, M/s Daimler-Benz A. G.

Jupiter General Insurance

THE Annual Report and other accounts of the Jupiter General Insurance Company Ltd. for the year ending 31 December, 1954 show that despite keen competition, the Company has been able to show satisfactory results. Total premium income during the year from all lines of business, including Life Assurance, amounted to Rs. 75.30 lakhs as against Rs. 73.5 lakhs in 1953, and it is good to know that the Company, which is under a Government-appointed Administrator, has been doing well, without any tied business or help from any source. The Report points out that though the Company is in the hands of an Administrator, day-to-day affairs, such as the procurement of business etc. are almost entirely in the hands of Managers of the Company.

There has been a slight fall in the new Life business written in 1954 to Rs. 99.19 lakhs from Rs. 106.6 lakhs in the previous year. The renewal expense ratio has, however, shown improvement, having decreased from 18.3 per cent in 1953 to 17 per cent in the year under review.

Net premium income in the Fire business has shown a decline from Rs. 15.41 lakhs in 1953 to Rs. 15.10 lakhs in 1954. The year under review has been particularly bad for this branch of business inasmuch as the Company had to meet a number of claims owing to a fire in Burma. In addition, certain foreign inward treaties showed unusually heavy losses, with the result that Fire business had to close with a loss of Rs. 2.53 lakhs in 1954. Despite efforts at economy, the expense ratio has been high, but this is said to be due to a drop in the premium income of this branch of business, by as much as 50 per cent, from what it used to be a few years ago.

The Miscellaneous Department has been running at a big loss for the last two years; during the year under report, however, its loss has been reduced to a nominal amount of Rs. 18.1 thousand only.

On balance, the Company has been able to make a profit of Rs. 38.9 thousand. If this is added to the Profit brought forward from last year, the total profit available

amounts to Rs. 5.72 lakhs. Out of this, the Administrator of the Company, has proposed to provide Rs. 1.07 lakhs for bad and doubtful debts and taxation reserve, and carry forward the balance of Rs. 4.65 lakhs.

Oriental Life Assurance

THE Directors, at their meeting held on September 14, decided to recommend to the Extra-ordinary General Meeting to be held shortly to consider the Actuary's Report on the Valuation as at 31st December 1954 Bonuses to With Profits Policyholders at the increased rate of Rs. 18/- on Endowment Assurances and Rs. 22-8-0 on Whole Life Assurances per Rs. 1000/- Sum Assured per annum. This represents an increase of 50% over the bonuses declared at the last Valuation, viz., for the triennium ended 31st December 1951.

Letters to the Editor

Land Redistribution

I HAVE read with deep interest the comments offered by you in the Weekly Notes column of your Issue dated August 27, 1955 on the Bhoodan Movement. You have raised some important questions regarding redistribution, which are of wide public interest. I, as a person actively participating in the Movement, would like to clarify the position.

Land received as gift, but not yet distributed to the deserving, lies with the donor himself. Vinobaji has time and again urged all the donors, whose lands have not yet been distributed, to cultivate them and pay the taxes till such time as they come to be distributed by Bhoodan Samitis. The donors have been requested, if they so desire, to give the produce of the donated land, after deducting expenses, to the Bhoodan Samiti concerned for proper disposal. It will be clear from this that the responsibility for idle lands does not rest with the Bhoodan Samiti, nor does any land lie idle with it.

As regards the attitude of State Governments towards organising cultivation, it has been one of help and co-operation in almost all the States of India. Bihar Government has offered to give Rs. 60 per acre of barren land brought under rice cultivation. Bhoodan Samitis do not reject Government help either in principle or in practice. The Village Reconstruction Programme—which is but a naturally corollary to the Bhoodan Movement—encompasses such a wide field and is of such immense magnitude that no organisation can hope to cope with it single-handed. Government, social organisations and the public themselves, all must co-operate in this gigantic work of Village Uplift.

It is, unfortunately, true that the pace of land redistribution has been alarmingly slow. Vinobaji has recently drawn the attention of all the workers concerned to the vital role of the redistribution of land in the Bhoodan Movement. Apart from the paucity of capable and efficient workers for distributing land, the nature of the work itself is such as to require a lot of time. It has been our experience that it takes nearly a week's preparation on the part of two or three workers to organise distribution in a single village. Another practical difficulty, which greatly delays the redistribution programme, is that particulars such as

plot numbers, demarcation details etc. in the case of nearly 50 per cent of the donated lands have not been filled in by the donors. In the heat and haste of the Movement, the workers too were not so particular about these things. This deficiency is keenly felt to-day.

The needy have, however, definitely become aware of their want. The landless are eager to receive and cultivate lands. The question is of providing necessary facilities to them in implements and funds before they can stand on their own legs.

In Bihar, where the second year of Land Redistribution is running, one can see lands being cultivated by former landless labourers now working for themselves and by themselves. But, even now, it would be premature to arrive at any opinion on an all-India scale. But the experience so far gained is neither gloomy nor disheartening. The claims of social justice, as you have stated in your article, will be found, we hope, to square with the requirements of productivity and economic utilisation.

Govindrao

All-India Sarva Seva Sangh,

Seven Eminent Bengalis

YOUR Calcutta end, I am afraid, is slipping up. The piece in the issue of August 27, for instance, is shot through with errors. There are mistakes, grammatical and typographical. Some of the other comments require further explanation, and here it is. But before that, why must your correspondent use the word 'eminent' a dozen times in a couple of paragraphs?

Your Calcutta correspondent's explanation of the lack of J.P.'s in Calcutta is just the sort of conclusion a stranger would jump to; and, I am afraid, your correspondent must be a stranger in Calcutta. The Economic Weekly, if none else, must know that a province's life is determined more by economic factors than by any other; and here is the obvious explanation why there are J.P.'s in Bombay and there aren't in Calcutta. Trade and industry have always been dominated by the British in this State. Quite the contrary was, and is, the case in Bombay. Forget this basic differ-

ence, and you will soon get everything wrong about Bengal and Bengalis. Bengalis are not important in business; they haven't got the dough; and they haven't had a say. The British are gone, and the Marwaris have taken their place, whence it comes about that there is a Marwari in the West Bengal Cabinet, and in recent years there has been at least one Marwari mayor.

It may be that it is the Bengalis' fault they don't know how to make quick and big money; but once you have accepted that, and there is nothing else to do, I do not see any point in telling Bengalis that this is bad and that is worse. Which, I fear, is what your correspondent seems to be doing week after week with his superior intelligence. He makes no secret of his dislike of Bengal and everything Bengali. It may be no bad thing to understand Bengal slightly better, and to that understanding critical judgment has no more to contribute than sympathy.

Who told your correspondent that Sunil Chatterjee is not a Sanskrit scholar?

Wasn't Radhika Goswami a great singer? Tarapada Chakravarti?

Off the Record

On Spending and Scrutiny

CONSIDERABLE excitement was caused by the Public Accounts Committee's report on the Defence Services Appropriation Accounts for 1951-52 and 1952-53, on account of what is commonly known as the Jeep Scandal. There were a host of irregularities, and not a few personalities, connected with that affair and naturally the press and the public lapped it up. Interest was particularly great because last December, the Finance Minister had requested Parliament to treat the matter as closed—on the plea that, while there were errors of judgment and procedural irregularities, there was no evidence of negligence or mala fides on the part of those connected with the deal. The Committee had, a few days prior to the Finance Minister's appeal to the House, been given a note by Government on the matter, with the request that the Committee reconsider its views regarding fixing individual responsibility for the misuse of Government money. But before the Committee could convey its decision, Government had put the matter before the House. Not unnaturally, the Committee felt piqued by this irregularity. That apart, after studying Government's note, the Committee still felt that the extent of individual responsibility in the jeep and allied affairs should be assessed by a high-level committee, consisting of one or two High Court Judges.

All this is ammunition for the trouble-makers, since Government's eagerness to see the matter closed can easily be equated with a desire to protect the reputation of some highly-placed persons. It was perhaps unwise of Government to have tried to force the pace. With so much waiting to be done in so many fields of Government activity, they probably wanted to spend less time and energy on apportioning blame for past mistakes. But a Parliamentary Committee should not be bypassed, whatever the intentions—or the whole fabric of parliamentary control will be weakened. Even if one is not interested in personalities, one might still support the Public Accounts Committee's recommendation that the matter should be judicially appraised.

It is nonetheless a little unfortunate that public attention should have been focussed on the Jeep Scan-

dal, to the neglect of several other important issues raised in the Committee's Report. For the jeep business is a case in point of the sort of contretemps that arise in spending Government money by its nominees. In principle, public money should be most carefully spent—especially when the aggregate of Government spending forms such a large chunk of total expenditure by the community. Those entrusted with the task have a special responsibility since the mistakes they commit inflict not a personal but a social loss. To safeguard that money is not ill-spent, detailed rules of procedure are laid down, both for authorising the expenditure and for actual spending. It is the business of the auditors and the Public Accounts Committee to see that these rules are observed. When they are not observed, they have to insist on Government taking such steps as will help prevent repetition of the same irregularities in future.

There is little dispute about the need for such vigilance. But the point is that extreme absorption with questions of procedural irregularities is apt to cloud one's appreciation of the other aspects of public spending. Indeed, the fear of spending without proper authorisation is responsible for the tendency to 'err on the safe side', on which the Committee has commented strongly. It is observed that since 1949-50, actual expenditure on the Defence Services has fallen appreciably short of the amounts for which Parliamentary approval was obtained either in the Budget or subsequently. Such 'savings' might cause satisfaction in certain quarters, and might be considered a sign of good husbanding of resources. Equally, it might indicate an incapacity to estimate properly the likely expenditure, or to put through with speed the projects for which financial sanction has been obtained.

When Government is enlarging its activities in order to further economic development, these are serious short-comings in the management of public spending. These findings are not special to the Defence Ministry; they afflict all the executive departments of Government. Otherwise, we should not have had to bother so much about the shortfall in development outlay. The Public Accounts

Committee has rightly emphasized that closer estimating is very essential, so as to ensure that the greatest possible value is obtained for the money available; without this, the demands for grants will always be in excess of the actual spending; and because of this overestimation of the annual expenditure, Government will develop a tendency to budget for more revenues than it need have.

To say this is not to cavil at the taxation or loan policy of Government at the moment. That is a

separate issue. What is suggested is that with closer estimation, it is possible that instead of ending the year with some unintended saving, the programme of expenditure could be widened in scope. What is more important, the capacity to estimate the outlay more correctly implies a capacity to judge the speed at which different branches of Government can spend, once the projects are voted. Much of the 'saving' emanates from the delay in taking in hand and making arrangements for the execution of the jobs proposed. Part of this delay, it is true, arises from the procedure to be observed in drawing Government money; and unless steps are taken to ensure that this sort of delay is avoided, actual programmes will fall behind schedule. But part of the delay is also due to the fact that the spending departments do not start the year with carefully worked out plans, on the basis of which appropriations could be demanded of Parliament. Admittedly, it is in many cases impossible to foresee the lines along which a particular project will develop, and therefore estimate the costs involved. A certain flexibility about the demands for grants is conceivable. Even so, there is little doubt that with proper planning, the difference between estimates and actuals can, save for extraordinary cases, be narrowed down. Not to pay attention to the desiderata in this respect is a trait worthy of criticism, and the Public Accounts Committee has done a service in pointing it out—albeit it does so with reference to defence expenditure. This is in present-day context a more significant observation than the one relating to procedural laxity in the jeep deal.

Akin to the above is another pregnant comment viz., that relating to stores accounts. The Committee is not satisfied with the state of these accounts, and suggests proper and periodic reconciliation of ledgers, after conducting a physical verification of the ground balances. Further, military stores, like railway stores, apparently suffer from over-indenting and over-provisioning of stores. What the book-value of military stores is as of today one does not know. But considering the variety of items involved, and the size of the defence budget, it must be a very large figure. And even a small percentage change in the size of stocks could well mean a sizable saving of Government funds for other purposes.

One will readily agree with the Committee that building up idle stock, especially when the stock is liable to become obsolescent or to suffer from lack of proper storage facilities is a luxury that we can ill-afford. At the same time, we can think of extenuating circumstances, especially in respect of military stores. For a country like ours, the stores have to be distributed among a large number of depots—for reasons both of safety and logistics. Information regarding the type and size of stocks has to be limited to a very close circle. In such conditions, it is possible for one depot to be not fully informed about the size of stocks in another, and therefore it may buy up goods which are already in stock elsewhere. True, much of this can be and should be remedied. But they cannot for technical or other reasons be always avoided. And perhaps, for a country like India which depends largely on imports for her military equipment, it may not even be wise to cut down on stores. All this notwithstanding, failure to maintain satisfactory stores accounts must needs attract adverse comment.

Some of these observations of the Public Accounts Committee deserve a better appreciation than Parliament or the country seems to have accorded them. Indeed, the objective of having a committee of this sort is to enable Parliament not only to decide action in respect of individuals who have carelessly or otherwise misused public money, but also to suggest ways and means of avoiding procedures that prevent Government from getting the best out of its spending activities. When we are embarking on huge development outlays, it is of the essence to make such adjustments in financial procedure as will encourage more effective spending without increasing the scope for misappropriation or corruption. It is on these that our eyes have to be focussed. Of course, punishing past offenders has a role to play in all this, inasmuch as it puts the fear of penalty in those entrusted with public funds. But unless other steps are taken simultaneously, a drive to fix individual responsibility will lead to so much hesitation in spending that all plans will come to nought.

Refugee Rehabilitation

IF employment is the main aim of the second Plan, refugee rehabilitation is the main problem of West Bengal. Next month, members of Parliament of the Eastern States will meet at Calcutta to discuss the problem of displaced persons from East Bengal. This will be followed by a Conference of Rehabilitation Ministers of the States concerned. Plans, thus formulated, will be examined jointly by the Union Ministry of Rehabilitation, the Planning Commission and the Government of West Bengal.

Plans for rehabilitation of East Bengal refugees have been under preparation for some time now. A statistical survey of displaced persons has been proposed. Its aim is to find out the number of displaced persons, how many have already been settled and what steps need to be taken to place displaced persons from East Bengal. Such a survey has already started in West Bengal. It will soon begin in Assam, Bihar and Orissa will start such surveys later.

Outlines

Outlines of the Plan for refugee rehabilitation are already clear. It is now conceded by New Delhi that the solution of the problem of East Bengal refugees is beyond the resources of West Bengal. It is equally clear that there is not enough land in West Bengal to settle all the East Bengal refugees. Nor is West Bengal's current and potential industrial capacity such as to enable this partitioned State to accept the responsibility of providing employment to East Bengal refugees. West Bengal will be responsible for those refugees who will be staying within the State. Those who have to be settled outside the State will be New Delhi's responsibility.

West Bengal's second Plan has been framed on the assumption that the rehabilitation of refugees and some other development projects will be undertaken and financed by New Delhi. Refugee rehabilitation, it is estimated, will cost Rs 114 crores to New Delhi. Four major projects like reclamation of southern and northern salt lakes, disposal of sewage and production of sewage gas and the Durgapur projects will

be undertaken through separate, independent development corporations.

Attempts have been made to settle East Bengal refugees outside West Bengal. These efforts have not been very successful. There are two reasons why these efforts have not succeeded. There are refugee colonies outside West Bengal. But no attempt has yet been made to establish refugee townships outside this State. That seems to be the main reason why efforts to settle East Bengal refugees outside West Bengal have not been successful.

Complications

Most of the refugee colonies are in the neighbouring States of West Bengal. Experience suggests that these refugee pockets have intensified tension between West Bengal and the neighbouring States. In West Bengal, the demand for linguistic States is inevitably linked with enlargement of the boundaries of this State at the cost of Bihar, Orissa and Assam. This has further complicated the problem of settling East Bengal refugees. Tentative plans are to settle Bengali refugees in States far away from West Bengal, and in areas which have some social and climatic affinity to former, undivided Bengal.

It is already known that an irrigable area in Hyderabad has been selected to settle a number of Bengali refugees. An area in Orissa is likely to be made available for settling these refugees. Andhra, Mysore, Vindhya Pradesh, Rajasthan and Madhya Pradesh are some of the other States which will be explored by the Union Ministry of Rehabilitation, the Planning Commission and the West Bengal Government for similar sites to settle Bengali displaced persons. It would be idle to pretend that these efforts to settle the displaced persons are bound to succeed. Bengali refugees seem unable to reconcile themselves to new and strange surroundings.

Townships

But the way in which refugee townships are now being planned encourages the hope that these townships will fare better than refugee colonies. In the proposed townships, attempts will be made to settle groups of Bengali refugee families. Social and language difficulties are not, thus, likely to hamper their

settlement. There will be an organisation in each of the proposed refugee townships in the various States to look after the grievances of the refugees, and help them get acclimatised to new environments. The question of setting up such organisations is as important as that of considering the suitability of the areas selected for refugee townships.

Bengali refugees' incapacity to adapt themselves to new surroundings is one of the main reasons why refugee colonies have failed to solve the problem. But this is not the only reason why the problem of settlement of Bengali refugees persists. Even at the risk of repetition, one must emphasise that attempts at settling Bengali refugees outside West Bengal are doomed to failure unless the proposed townships offer adequate opportunities to absorb the refugees in gainful employment. It simply means that the townships must be industrial townships. It augurs well for the plans now under preparation that the projects visualised include the establishment of medium and cottage industries to provide employment to refugees. Simultaneously, efforts will be made to absorb the displaced persons in Government undertakings like Sindri, Chittaranjan and Kharagpur and in new projects like Rourkela and Durgapur.

Jadavpur

Jadavpur is a suburb of Calcutta. One part of Jadavpur, the Tollygunge approach to this suburb, is becoming a thickly populated refugee colony. There is another part of Jadavpur in which are located famous research and educational institutions. Jadavpur's College of Engineering and Technology is symbolic of Bengal's patriotic spirit as well as of the munificence of eminent Bengali landlords and lawyers. This College is a byproduct of the Bengal partition of 1905. It started as a University, though it is now better known as the College of Engineering and Technology. Under a Bill, now before the West Bengal Assembly, Jadavpur will be raised to the status of a University.

With Jadavpur are intimately associated some of the illustrious sons of Bengal. It was built up on generous donations from Brojendra Kishore Roy Chowdhury, Subodh

Chandra Mallik, Surya Kanta Acharya, Sir Rash Behari Ghosh and Hirendranath Datta. Sri Aurobindo was once a teacher at Jadavpur. It had two chairs for Indian history and Philosophy. Jadavpur has always shown interest in the humanities. It is built on the model of the Massachusetts Institute of Technology. It is wider in scope and conception than the Engineering institutions in Britain.

Jadavpur was a successful challenge to the British Raj. When it was started, a National Council of Education was established. Many private schools were affiliated to this Council. Only later, it developed as a Technological Institute. For long, the engineering graduates of this College were not officially recognised. But even before independence, the graduates of Jadavpur had come to be recognised as be-

ing as efficient as the graduates of other colleges and universities. With the achievement of University status, the Jadavpur College of Engineering and Technology will gain more prestige. Technology will remain the main course of studies in the Jadavpur University. It is widely welcomed as a Government gesture to a private institution. It richly deserves such recognition.

From the London End

Whither Germany?

THE outcome of the Russo-West German talks has provoked a debate of considerable significance for the future of European politics. Stripped of trimmings, the debate boils down to the question of whether the outcome of the negotiations was a victory for Moscow or for Bonn.

It is significant for the European political scene because it poses the all-important question: which way—East or West—will Western Germany veer in the search for all-German unity? Put in a more cynical form, as done by the *Times*, the apparent ending of Russo-German enmity can promote "a thorough-going deal or alignment between them" which would "play havoc with the balance of power in Europe".

Historically, the rest of Europe has always been sensitive to the size and power of both Russia and Germany. It is this historical estimation that now conjures up in the minds of every Western foreign office possibilities of considerable consequence for Europe. The "stakes in Germany" in the words of the *New York Times*, "are huge".

Essential Calculations

Its 70 million people are among the more industrious and skilled in the Western world. More than that, the great industrial complex of the Ruhr has twice in one generation armed German aggression. These facts provide the essential calculations in current diplomatic thinking, and this is the approach to arguments in regard to the side to which German foreign policy can be drawn. It is the foundation of the historical European "political balance".

That such calculations have instead led European politics into a cycle of war and disaster is often forgotten. The approach of international relations in terms of alliances, combinations and political "equilibrium" has been ipso facto the starting-point of military preparedness (lest the very combinations so delicately poised be upset), and hence war. This alternate possibility which twice in a generation became a reality, is once again sadly ignored under the myopic assumptions of the present debate.

One would have expected that with the lessons of the last 50 years, coupled with the new circumstances of the H-bomb, the aim of having a

disarmed, neutral and thus peaceful, but united Germany would meet the requirements of tranquillity on the European continent and indeed in the world. In a word, the idea of peaceful co-existence in Europe is synonymous with the idea of a disarmed and unified Germany. And yet the unfortunate trend of Western policy has been "unification before disarmament", a "strong" Germany and as the *Economist* described it "alignment with the West."

Material Change

The Moscow negotiations have resulted in one material change in the complexion of Europe—the establishment of diplomatic relations between the Soviet Union and the Federal German Republic. It is this which poses the superficially important question which prompted the *Times* to phrase as follows: "who, in fact, stands to gain most . . ." from the opening up of diplomatic relations?

To answer this correctly, it is more than necessary always to keep before us the foreign policy objective of the Adenauer regime in Western Germany. West German pretensions, which were in fact publicly banded around long before the London and Paris Agreements were concluded and which, somewhat earlier, led to the stalemate of the Berlin Conference of the Big Four Foreign Ministers (1954), were shaken by the Moscow negotiations to the point of Dr. Adenauer suffering some loss of diplomatic prestige.

These cherished pretensions: that West Germany is not West Germany but the German Reich in the frontiers of 1937; that the East German State did not exist; that the Potsdam-agreed frontier on the Oder-Neisse was not conclusive; and in fact that World War II did not take place—were all abandoned in one way or another. Considered in this light the short answer to the poser of the *Times* is that Dr. Adenauer did not gain much, if any at all.

If he has gained anything, it is the return of German war criminals and prisoners-of-war in Russia. But even this return will involve the appointment of a mixed Commission on which both West and East German representatives will serve. And this entails some recognition by the Bonn Government of the existence of a viable authority in Eastern Germany.

The estimation of the worth of the Moscow negotiations on the foregoing lines and more so in terms of "who gains" can, however, never be fundamental or significant for European politics. In essence, the exchange of diplomatic relations between Bonn and Moscow gives permanence to the status quo in Europe. So long as the London and Paris Agreements provide the framework for a rearmed Germany or more basically, as long as there is disagreement between the Big Four on all-European security, Germany will remain divided. Contrariwise, German unification is dependent on agreement to obtain European security on the basis of a "non-aligned" Germany. And according to the Russians, the basis of peaceful co-existence in Europe is a disarmed Germany — the "vacuum" which the Americans have found to such considerable distaste.

Diplomatic recognition of the Federal German Republic by Russia is thus the clearest possible indication that a unified Germany, with other things remaining unchanged, is now outside the realms of reality in Europe. And it is the recognition of this fundamental fact that prompted the *Economist* to write:

"...it is better to have no 'agreement'...that is why the re-union of Germany as a free democracy is necessary before a state of real security can be achieved." And typical of the double-talk and curious logic which we have come to expect in the argumentations of European politics, the *Economist* goes on to insist that "the more Germany becomes integrated in the Western system, the greater the security for the Russians."

Basic Weakness

The Western powers in the German policy of "Western integration" are beset by a basic and ever-present weakness. They stand the risk—an extremely real risk—that some time or other influential West German politicians, schooled in the traditions of the Real-politik, would throw overboard the Western link, take on the garb of neutrality and so obtain a single German State. This, indeed, is the policy of the German Social Democrats—the largest and most powerful minority in West Germany.

The Russians, on their part, can wait—and wait without labour—until this turn in the tide of German policy occurs. Dr. Adenauer, it is true, is pledged to the Western military alliance, but as we have been reminded recently, he is “an old man”. In the diplomatic auction for

the soul of Germany, and not that of Dr. Adenauer, the Russians have a bigger, better and more inducement—their zone in the East.

In October next, the Four Foreign Ministers will meet in accordance with the Geneva directive of the Big

Four conference. And when the German unification question is once again raised there, Russia can, with little qualms, suggest that this matter be left to the two German Ambassadors in Moscow. And so the European status quo will have been given permanence.

What is the measure of an Industry's importance ?

If a bicycle, a sewing machine, or even a hurricane lantern were shown along with a steel ingot to the man-in-the-street, he would not take a second look at the ingot. Yet, in machines, factories and buildings...in the making of the hundred things we use every day...Steel is indispensable.

Started less than fifty years ago, India's Steel Industry is to-day a vital factor in the nation's economy. It produces nearly 1.75 million ingot tons of steel at a

cost that no country can equal, of which Tata steel accounts for over one million tons. Tatas plan to produce 2 million ingot tons early in the second Five-Year Plan period.

Book-Review

Out of the Ashes of the Past...

China Phoenix By Peter Townsend. 1955, Jonathan Cape, London, pp. 406, 25s net.

Reviewed by B N Ganguli

THIS is a fascinating story of New China written by a member of the Friends Ambulance Unit who stayed on to work with the Chinese co-operatives and observed the unfolding of the revolution which has convulsed China and has been shaping the pattern of what is now called New China. What makes this book fascinating is the literary form chosen—that of vivid narrative and reportage, full of verve and colour and yet devoid of sentimentality.

The author has made use of the 'case history method' of analysing the complex situation that is New China today. The reader is left to draw his own inferences from each individual case, and yet the picture takes form and shape only after he has covered the wide field of the narrative broken up into fragments enclosed in the many chapters. New China today presents a vast canvas. The author paints on it with bold strokes and daubs of paint here and there. I would not say that in a picture of this kind one would expect to see delicate light and shade or adequate balancing of numerous details which should make up a full picture. This is not the author's limitation, but one that is imposed by the subject matter itself. For, the picture is still unfolding itself and the main ingredients of it have been changing.

Nevertheless, to all but the discerning readers Mr Townsend's narrative may appear as of shifting of scenes in a phantasmagoria. It cannot be otherwise if one is writing about a revolution which is still running its course. But even the casual reader will feel all the time that the author knows what he is talking about, that his vision is not clouded by ideology in one way or another and that as a real humanist he sees in the Chinese revolution "a triumphant affirmation of life by the ragged, hungry, brutalized, illiterate, not of one generation alone but back through countless silent, unchampioned generations".

One does not expect a thesis to be established in a book of this kind. But if one were to locate one, it is, to quote his own words, that "conditions in China were such that

revolution was preferable to no revolution". The most revealing parts of the book are those which relate to the utter bankruptcy of the Chiang Kai-Shek regime. The author has pieced together the dramatic facts of the situation which were fast approaching a climax in 1949 according to the pattern of a Greek tragedy.

The contradictions of this regime were characterised by so much of cruelty, corruption and bloodshed that the outcome was never in doubt. As an estimable Christian missionary told me in Shanghai in 1952, the situation needed a "surgical operation" and a certain amount of bleeding was inevitable. But Mr. Townsend's narrative as well as the testimony of others has shown that the leaders of the revolution understood the importance of a "surgical operation" and have minimised useless bloodletting through crude use of surgical instruments.

Metabolic disturbance always follows a major surgical operation. How the Chinese Society has reacted to metabolic disturbance and how a new adjustment is sought to be achieved is part of the story which Mr. Townsend tells quite skilfully. But it is sometimes sketchy and inadequate. An economist looking for facts and trends will perhaps be disappointed, for example, when he reads what the author has to say on land reform, agricultural transformation and industrial development. Chapters dealing with these are not meaty to an economist's taste.

I, for one, looked for more facts about China's industrial co-operatives in a book written by a person who worked with these co-operatives. A more adequate description of the kind of metabolic disturbance which appeared in the Chinese economy for overcoming which, in my opinion, bold and effective measures were taken by the Chinese, would have pleased the economist more and the layman would also have gained much useful knowledge. I say this, because I have noted that where the author chooses to deal with economic facts he is extremely knowledgeable and objective.

Mr. Townsend's strong point is his sociological analysis which has become very effective as the result of the interesting case histories that he has presented. They are, of course, not case histories of the type in which modern sociologists revel; but they are quite impressive, as they are. For example, his sketches entitled "A Peasants' Life", "Turning Over", "Moving the Peasants" and "Three R's" are more eloquent than the dry economic or sociological analysis of the changing peasant life in China. In fact what is most rewarding in Mr. Townsend's book is these cameos of real life which help us to recapture the spirit of creative energy which is moving New China's teeming millions.

Mr. Townsend talks about politics too. The reader will find in his book a number of arresting details of which the author had inside knowledge. These facts may very well be set against those which came to us via Hong Kong in the absence of other normal channels of communication. His chapter entitled "Trojan Horses and Fifth Columns", is one of the most revealing chapters in the whole book. A study of it would help the reader to understand the significance of some of the news which has recently appeared in the newspapers regarding Chinese Secret Societies and also the character of international espionage which has been a terribly sore point with the Chinese people.

On the whole Mr. Townsend's view of New China is contained in the title of his book. In Egyptian mythology, Phoenix was a fabulous bird which was said to exist single, to be consumed by fire, and to rise again from its own ashes, with renewed youth and beauty. Mr. Townsend thinks that out of the ashes of old China New China is rising again with renewed youth and beauty.

Some may think that this is a bird with borrowed plumage. Others may concede renewed youth, but not beauty. Mr. Townsend thinks otherwise. Phoenix is China's dream bird, a kind of dream symbol, and emblem of immortality. Humanity can trample on the dreams of a people at its own peril.

Change in a Malwa Village

Adrian C Mayer

The author, a Research Fellow of the Australian National University, Canberra, recently spent a year in the village about which he writes. He has previously done field-work in Kerala, and among the Indians in Fiji. He is the author of Land and Society in Malabar, Oxford University Press, 1952. This article is yet another in the series of Village Studies appearing in this Journal.

NO study of an Indian village can omit a discussion of changes taking place there. Some of these are not the result of any conscious policy for the village, but are the concomitants of population growth, natural calamities or general economic and cultural trends. Others stem from recent Government policies of reorganisation or development. The former can be called informal changes, made sometimes by the decisions of the villagers themselves, and sometimes by circumstances over which they have little control. The latter are sanctioned changes, since they are usually in the form of laws or directives which must be obeyed. In general, more attention is paid by townsfolk to sanctioned changes, since these are more easily known, being discussed and initiated by Government. But the influence of informal changes on these policies is also important, as I shall try to show. Both kinds of change can be seen in a Malwa village some 30 miles from Indore, and in describing them, this article will add material to what has already been published on the subject in this journal.

Informal Change

In our village the main informal change has been a transformation of the caste population. There are now 25 castes in a Hindu population of 806. These are, in order of size: Khati (181), Rajput (118), Balai (85), Chamar (69), Bhilala (64), Gosain (45), Teli (29), Brahmin (28), Ahir (26), Sutar (25), Nath (14), Nai (14), Kumawat (14), Mali (13), Gari (10), Darzi (9), Kumhar (9), Balai Babaji (9), Lohar (8), Doli (8), Bhangi (8), Mina (8), Beragi (5), Bargunda (5) and Bar-bujya (2). In addition there are 102 Pinjarra and 4 Fakir Muslims.

It was not always like this, however. Sixty years ago there were only 5 Khati houses in the village, with hardly more than a dozen people. At that time the two main castes were Rajputs and Balais. The turning point was the famine of 1899-1900, the baseline for most village memories. Both Rajputs and Balais were decimated by this catas-

trophe—and some castes, like the Bhambi and the Nayak, were either completely wiped out, or fled the village in search of food and never returned.

Because the fields were empty and untilled, the landlord (jagirdar), wishing to maintain his land revenue, started to invite outsiders to settle, giving them bullocks and other inducements. Most prominent among those who came were Khatis, brought by the few already in the village. In the next 40 years 14 Khati men with their families settled in the village. By contrast, only 4 Rajputs came, and more Rajputs than Khatis left the village in the years which followed. The Khatis are now firmly established—44 of the 53 adult males are village born (compared with 30 of the 34 Rajputs). Immigration has more or less stopped, only 1 family coming in the last 15 years, for there is no longer any vacant land. But Khatis have increased naturally at a more rapid rate than the Rajputs, and so the numerical gap between the two castes has been further widened. (Khatis and Rajputs form one third of the village population, and are the most influential of the large castes in the village. Thus we shall, for simplicity's sake, consider only their positions in the village, though there are also changes in the population of other smaller castes).

The 43 Khati males who are not bachelors and who have had their wives living with them for more than a year or two have each produced an average of 2.28 children alive at the time of enumeration (of whom 1.1 are male). The 27 corresponding Rajputs have had 2.18 such children, including 1.0 male. From another angle, the 29 Khatis of over 30 years have produced an average of 2.73 such children each, 1.38 being male; the figures for the corresponding 23 Rajputs are 2.22 and .89 respectively. The data for childhood mortality (up to 6 years or so) again show a castewise difference. Such figures can only be treated tentatively—for some people may not mention all the deaths—but the difference appears too great to be entirely explained by

such discrepancies. Khatis reported 1.28 dead children each, Rajputs 2.70. For men of over 30, again, the figures are 2.01 and 2.90 respectively.

It is true that tests show no statistical significance in these figures of castewise differences, possibly because of the small numbers involved. But the fact remains that these differences exist, whether as an historically unique fact, or as a general trend of difference between these castes; and the villagers undoubtedly see them as trends when they seek an explanation by saying that the Rajput blood is now 'weak'. Some lay it to the consumption of meat and liquor by Rajputs, whereas the Khatis are vegetarians and said to eat more green vegetables. Others say that the Rajputs are expiating some previous sin. The acceptance of this trend reflects the general weakening of the Rajput position in the village, which we note below, and it makes the figures socially, if not statistically, important.

Same Trend

Moreover, say the villagers, in two nearby villages the same trend is seen. In one, some newly-arrived Khatis are said to have been increasing more rapidly than the original majority group of Ahirs—this is now marked by the transfer of one of the two Ahir headmen's powers to a Khati. In another village, it is said, there has been no history of immigration or emigration. Both dominant castes, the Dhakars and the Rajputs have been in the village for many generations. But now there are 45 houses of Rajputs and only 7 of Dhakars. The latter caste, again, is said to have 'grown weak'. Dhakars died in the 1900 famine, they died in the 1919 influenza epidemic, they died in an outbreak of cholera some 10 years ago. Differential survival and mortality rates appear to be more than exceptional factors in village change, combining with famines and epidemics to change radically a village's caste composition and so form a basis for other informal changes, as well as for influencing sanctioned change.

Sanctioned Change

The main sanctioned changes have

Branches at: NEW DELHI BOMBAY KANPUR

taken place in the field of village authority. Historically, Rajputs have been the village's dominant caste since their immigration some 500 years ago owing to their possession of the village headmanship (pateli). The patel had considerable authority in previous times. He was the collector of the land revenue, which he remitted to the jagirdar or the Maharajah.* He was responsible for the peace of the village, having under him village watchmen; and if major breaches of the law occurred, he had the duty of sending a report to the Police. He had the power to settle small disputes, when the jagirdar did not act as arbitrator. Through the patel the Maharajah recruited labour for any work he might have in the neighbourhood; and the patel acted as his general agent, arranging for the reception of State officials. The relationship of patel to Maharajah was symbolised in the annual homage paid at the Dassera Darbar, where the village patels assembled with the nobles of the State, and in the Patels' annual Dassera sacrifice of a goat before the State flag. In the course of these duties, the patels had direct control over a number of people. The village watchmen were Bhilalas: there were two Balais under the patel's orders to fetch and carry for any public purpose or for touring officials; these and the Nai, Kumhar, Bhanghi, Brahmin and Doli all had duties in case of a visit from the Maharajah or other notable, and all received rent-free land as payment. Ultimately the patel supervised their activities, having general responsibility for such work.

*The village was under a jagirdar until 1934. But he had no power to fix or collect rents; his agent, therefore, merely had the duty of taking these rents from the patel, and of managing the jagirdar's personal land, about 100 acres. Before 1915 the jagirdar had far more land under personal cultivation, and the agent's powers were correspondingly greater. But in the last 40 years only the Patel has had any considerable officially-backed power, and we need not consider the position of the agents or their caste. The patwari, or village accountant, has power, but is invariably a man of a different village; unless he has kinsmen in the village (which is not the case here) his influence is an individual one, liable to immediate termination on his transfer.

The patel's powers have recently diminished with the inauguration of machinery for village action which bypasses him. In 1946 a village council (panchayat) was constituted, with 6 (later reduced to 4) elected members. Its duties originally included the arbitration of minor disputes, but this has now been transferred to the Nyaya Panchayat in the town, where a representative from our village sits with men from other nearby panchayats. But the village panchayat is still responsible for all public and development work in the village—building of roads and public wells, clearing and lighting of streets, for example—and has the power to levy labour for 5 days each year to carry out these projects. Administration of this growing development programme, and the considerable sums involved, gives quite a lot of power to the panchayat members.

The patels retain the duties of collecting rent, reporting disturbances, and of entertaining visiting revenue and police officials—the two most frequent categories of outside visitors, after the development officials. This, it is true, still represents considerable power. But it is only the transition stage between the old hereditary order and the new democracy. The rent-free family lands of patels and village servants are to be abolished, payment for service being in cash. And it is said that plans are afoot to abolish all but one patelship, and have this patel elected, first from among the present Rajput patels, and later from amongst all castes in the village. The personal contact of the patel with the Government has stopped, too. Since the State was merged, along with 24 other Princely States, in the Indian Union State of Madhya Bharat in 1948, the patel's direct fealty to the Maharajah stopped. No longer does he make sacrifice to the flag, and the prestige and influence he gained from direct contact with the ruler has gone. The centre of Government is now hundreds of miles away in Gwalior, or in Indore, wielded by unknown men from whom no favours can be sought on a traditional and personalised basis of service and loyalty.

Position of Rajputs

The general Rajput position in the village has been considerably changed by this Government policy on village administration. For the authority of the patels overflowed to their caste as a whole, especially as the majority were their close rela-

tives. There are two main groups of Rajputs in the village—one Chauhan, the other Solanki. In each there are two main lineages stemming, it is said, from brothers who first came to the village and who split into separate households. At present 21 of the 34 Rajputs belong to these lineages, and a further 5 are linked through marriage. Each of the lineages had a patelship; recently, however, one of the Solanki patelships fell vacant, being without a direct heir, and the other agnates were not allowed to take it up—so three patels remain. The lessening of their powers has meant a diminution of the caste's influence as a whole.

Further, the non-official position of the patels and their kin is changing—due in part, as we shall see, to the growing Khati population. Patels had important ritual duties in the village. On the ninth day of the Dassera festival, for example, they sacrificed goats at the shrines of the goddess. That evening they went to each of the village shrines and worshipped, sending materials for rituals at shrines of the tutelary deities of all lineages in the village. By doing this they assured divine protection for the coming year. At other major festivals, too, the patels were the initiators and general guardians of the rites. Thus, on the day after Diwali, when a calf-skin is tied to a pole, and cows are teased and fought with it, the patels went early in the morning to the Chamars' quarters, saw that the skin was ready and made fast to a stout stick, and then gave a token payment to the Chamars on behalf of the village.

In addition, the patels and their kinsmen had a secular influence on people. Being among the largest landholders and some of the wealthiest men in the village, they were expected to give more in alms to the begging castes (Nath, Babaji etc.), and to pay more for the services of other castes (Nai, Kumhar etc.) at such times as weddings and funerary feasts. Again, on journeying to other villages they had their carts driven by Balais, whereas members of other castes drove themselves. Thus, through their wealth and the authority of their traditional responsibilities, Rajputs held a position of eminence in the village.

This non-official influence continues, of course. Patels still perform the rituals mentioned above, and the Rajputs' status as major landholders still gives them the position which comes from a good

economic standing. Nevertheless, the shift in the village's caste composition has spelt some informal change. As we note below, KhatIs do not take much part in public events. The proportion of the village which attends them, therefore, grows less as Khati numbers increase—and it is the Rajputs who are the major maintainers of such events.

This change can be seen in specific cultural factors. Take, for example, that of diet. In former times all major castes in the village ate meat—the Rajputs, Balais, Chamars, Bhilalas and the Pinjarras. Only Brahmins, Sutars, Lohars and a few others abstained. Now KhatIs do not eat meat, and with the other vegetarian groups they form about one-third of the village population. They disapprove of the sacrifice of goats at the Dassera festival, and few attend the proceedings. Again, there is a periodic worship of Sitala Mata, performed by the entire village. On previous occasions goats were sacrificed by the meat-eating castes; but at the most recent worship this was forbidden, over Rajput and other protests. The reasons were that it might be hard for vegetarians to worship at a shrine where blood sacrifices had taken place (though no difficulties had apparently occurred on previous occasions) and also that Government disapproved, and that blood sacrifice was not in the spirit of the times. This was an informal change, not brought about by any specific policy. It was the result of the growth of the vegetarian population in the village, and a corollary of the wider cultural change-over from the ways of the martial Maharajah and his nobles (Mahrattas and Rajputs) to the Gandhian precepts of the present era. In both cases the Rajput values become less widely held in the village and their lead less followed.

Position of KhatIs

What of the Khati position? KhatIs, of course, have held no official powers and responsibilities like the patelship. They have simply formed a growing group of peasant farmers, a few of whom have become quite wealthy, but in the main have stayed fairly small owners due to inheritance by large families. They have had no traditional responsibility in village affairs, not being either village craftsmen or servants.

And it seems that, in general, too, KhatIs are more caste- and family-conscious than village-conscious,

fewer than of other castes attending affairs which demand a general village participation. Thus, in the playing of gulli-danda at the San-krant festival only 5 KhatIs came, as against 8 Rajputs and 6 Balais; and the KhatIs were young boys, whereas there were senior Rajputs present. Again, in the worship of Ram Devji Maharaj at two shrines in the village, 12 Rajputs were seen to make offerings and only 2 KhatIs—many KhatIs maintaining that they observed the day of fast, but made worship in their own homes, not in public. Mention has already been made of the Rajput responsibilities at Dassera, and the Khati attitude towards the sacrifices. In general, too, more Rajputs are found to come and listen at the visit of any outsider, the KhatIs saying that they have no time to leave their work, unlike their more easy-going fellow inhabitants.

The obverse of this is that KhatIs tend to emphasise more closely the caste and kin-group in their activities. Different branches of Rajputs worship their lineage goddess on different days of the Dassera festival; but all KhatIs worship on the same day. Again, there is a custom of making brothers and sisters of those who together "hear Ram's name" from a guru, and these can be of different castes. Of 148 men and women hearing Ram's name together where KhatIs figured, 67 were KhatIs and 81 from 17 other castes. Of the 156 in which Rajputs were included, only 50 were Rajputs and 106 were from 21 other castes. Since a negligible number were outsiders, the figures indicate a greater linkage of Rajputs with other castes in the village, and a rather more exclusive pattern for KhatIs, promoted perhaps by their greater numbers which allow it.

Finally, KhatIs are more exclusive than Rajputs in their eating. They will only eat food cooked in salt or water from a caste-mate or a Brahmin, and sit apart from others to do so. But Rajputs will eat such food from the hands of more than a dozen other castes—Brahmin, Nai, Kumhar, Gosain, Kumawat and so forth. This means that KhatIs do their own cooking at most large feasts, and eat separately, whereas Rajputs usually eat with other castes, and thereby participate more fully in the activities of other castes in the village.

These present characteristics of the KhatIs in our village do not mean that they never take part in village

affairs as a caste. In many places KhatIs are patels and members of the panchayat. Neither can it be solely because of their recent arrival in the village. For the KhatIs in a nearby village also came there at the time of the 1900 famine, and have since acquired one of the patelships; and in another village, KhatIs have lived for generations but have the same lack of interest in village affairs. It is probably because of present divisions within the caste, and an apparent absence of men with the temperament and desire to lead in public life. The fact that many positions of importance in the village are now to be gained by elections would give KhatIs considerable influence if they were to enter public affairs more fully. There are qualifying factors—whether KhatIs would vote together as a caste, to what extent a Khati leader could obtain other votes—but numbers, not descent, will determine power in the village, and so opportunities will be thrown open to all castes, particularly the larger ones.

Conclusion

To sum up, then, informal changes in the caste composition of the village population (through immigration and a differential survival rate) and in the general values held (in such matters as participation in public rites and vegetarianism) have here combined with sanctioned changes (as regards the patelship and the general system of hereditary positions) to make for a lessened influence of the hitherto dominant caste of Rajputs; and it is possible that the influence of KhatIs will grow. These two types of change need not have interacted thus. If, for example, the change in the powers of the patel and the institution of the village panchayat had taken place in a village where the population of the patel's caste was growing, or even steady, the possibility of a change in authority through introduction of an elective system would not have the same weight as here described. The effects of the same specifically induced changes may therefore differ considerably from village to village, and cannot be described or predicted without a knowledge of the history of the village, its caste composition and the attitudes of those castes—in brief, some knowledge of what informal changes may be taking place there. And it is the same with the impact of any general trend of change. There can be no easy way to knowledge of 'the Indian village'.

Story of Co-operation : 1953-54

RECENT developments in rural credit have placed greater emphasis on the co-operative movement than ever before. While there are many who feel that this confidence in the movement is entirely justified, others have serious doubts about the ability of the movement to deliver the goods. In the context of this controversy, the state of the movement during the last few years acquires a special significance, and trends in it must be watched with special care. The year 1953-54 has particular interest from this point of view because efforts under the First Five-Year Plan probably had time to get under way during the year. The recent publication of Statistical Statements* relating to the co-operative movement provides an opportunity to review its progress in these circumstances.

The considerable expansion of the co-operative movement during that year will undoubtedly be welcomed by all. By the end of the year, there were 1,98,598 co-operative societies of all types in the country having a membership of 15.2 million and an aggregate working capital of nearly Rs 352 crores. This compares favourably with 189,436 societies having a membership of 14.3 million and a working capital of nearly Rs 327 crores at the end of the previous year. The expansion during the year was much greater than that achieved in the previous years. Whereas the increase in the number of primary societies has been running at the annual rate of 4,000, this year it has been more than twice as much. This probably reflects the rising tempo of official effort.

If this is correct, the next few years should see even greater expansion; and the hope that co-operation will cover the entire population may appear to be near realization. Assuming that the average Indian family has five members, it has been roughly estimated that 75.9 million or 20.2 per cent of the total population have been brought into the fold of the co-operative movement in one form or another by the end of 1953-54. This does not

*Statistical Statements relating to the Co-operative Movement in India, for the year 1953-54—Published by the Agricultural Credit Department, Reserve Bank of India, Bombay, August 1955, Price Rs. 3.

allow for the possibility that some persons might be members of more than one society or that two or more members of co-operative societies might belong to the same family. It is interesting to note that of various types of societies, agricultural credit societies showed a larger increase than others. The credit side of the movement continued to be predominant, credit societies constituting 73.5 per cent of the total number of all types of primary societies and 81.5 per cent of all types of agricultural societies.

While the co-operative movement as a whole was registering expansion, the downward trend in agri-

cultural non-credit societies, seen in 1952-53, continued during the year under review with a decline from 35,568 societies having 27,32,047 members to 30,306 societies having 25,11,386 members. It is explained, however, that "this fall is mainly attributable to the transfer of 6,027 multi-purpose societies" to the list of credit societies in the case of Bihar. This transfer may have been occasioned by the increasing predominance of credit activities with the ending of rationing and controls throughout the country; but it is good to note that the societies have managed to survive and carry on credit activities at least. It is

TABLE I

THE ECONOMIC WEEKLY

interesting to note also that the number of such societies actually registered an increase in the States of Himachal Pradesh and Uttar Pradesh. The total working capital also showed an increase, but as one might expect, total sales dwindled sharply from Rs 41.22 crores to Rs 33.74 crores during the year. The fact that they did not fall further indicates a resiliency, which would be a very happy feature of the movement, if it should be kept up in subsequent years.

That the year was not without its other side is indicated by the statistics relating to societies under liquidation. As many as 3,496 societies were brought under liquidation during the year against a slightly larger number, 3,696, during the previous year. This larger number of liquidation should occasion considerable thought. Particular attention should be devoted to a study of the survival rates among societies brought into existence in the course of special campaigns for expanding the movement. If this is low, the futility of such organised campaigns tending to pay more attention to quantity than quality should be realised. The profits position of the different types of societies put together also worsened as compared with the previous year. The non-credit societies registered net losses. The figures of profits and losses for 1953-54, compared with the previous two years, are highly disturbing. Obviously, an enquiry into the reasons for this state of affairs is called for in the context of an increasing measure of State assistance.

Revealing Study

A study of the membership and working capital of agricultural credit societies is revealing. Membership increased from 51,26,002 to 58,49,380. Working capital also increased from Rs 49.18 crores to Rs 54.41 crores. The average membership per society is, however, still small at 46, making the majority of societies uneconomic. The average working capital per society worked out at only Rs 4,286. The weakness of the movement is illustrated by the figures in Table IV.

An analysis of the working capital of primary agricultural credit societies reveals that owned funds constituted 39.6 per cent of the total working capital. "The major part of the working capital was derived from the central financing

agencies and Government (Rs 28.25 crores) which together lent 51.9 per cent of the total working funds. There continued to be an inadequate emphasis on thrift, and the relative importance of deposits (Rs 4.61 crores) in the working capital of these societies continued to decline." The share of deposits in working capital fell to 8.5 per cent in 1953-54 from 14.4 per cent in 1946-47. This might possibly have been due to a larger increase in sources of working capital other than deposits without any proportionate fall in the latter, but deposits per member have also shown a tendency to fall.

Regional Disparity

Five new State Co-operative Banks have been set up during the year. Two new Central Land Mortgage Banks were also established. In spite of this, the Central Land Mortgage Banks were functioning in only 9 out of 30 States in the

Indian Union. The long-term movement continued to predominate in Madras and Andhra. The regional disparity in the development of the movement is in fact found in all its activities, and this is one of the most important problems that will have to be tackled in future.

Delay in publication of annual data robs them of considerable significance. Realisation of this fact seems to have induced the Reserve Bank of India to take special steps to expedite the publication of the present report. In fact, it is only a little over a year since the 1951-52 report was published and six months since the 1952-53 report was brought out. The time-lag between the period covered and the publication of the report has now been reduced from over two years to a little over a year. A further reduction in it is not impossible and would really facilitate a study of current economic developments.

Falling Trend

Wednesday, Morning.

SOME weeks ago, equities were rigged up to unduly high levels. A reactionary set-back was expected. Starting a few days ago, the fall in equities continues. Price fluctuations indicate that equities may decline further before investors feel inclined to lend support to the market. It is clear that the market will take some time to complete the process of digestion. There are indications that the adjustment may not be possible without a further fall in equities.

Set-back in equity prices is not entirely technical. It is partly due to the implications of the passage of the Companies Bill by Lok Sabha. It is, to some extent, a reflection of Government's desire to curb speculation. Last week's disclosure by the Finance Minister that a Bill to regulate stock market trading will be introduced soon had an adverse effect on equity prices. Measures taken by the authorities of the Bombay Stock Exchange to check over-activity are, belatedly, having their effects.

Market Fears

There are, however, rumours that the Government may take drastic steps to curb speculation in stock markets. The recent cancellation of ad hocs by the Reserve Bank has been cited as proof that Government is determined to contract currency in order to check speculation. Such fears arise from lack of knowledge of seasonal money market operations. Retirement of treasury bills or cancellation of ad hocs as the busy season approaches is not unusual. Although Government is committed to pass legislation to regulate stock market trading, there is no possibility of the Government taking steps yet for curtailing the volume of money supplies to curb speculation in equities.

Although the possibility of a further fall in equities cannot be ruled out, long-term prospects for equities do not seem to be discouraging. Industrial production is mounting. It is likely to move up further in the second Plan period. Money supplies and money incomes will increase. There is the Finance Minister's assurance that there will be no fresh taxation in the next year or two. In the circumstances,

it is a reasonable assumption that equities will move up along with the implementation of the second Plan.

Teas Steady

Even as Tea shares did not move up as much as other shares, these shares remain comparatively steady while equities are falling. There is more than one reason for the comparative steadiness in Tea shares. For one thing, it is now widely realised that this season's tea prices will not be as much lower as formerly apprehended. This means that the industry's profits will not be so adversely affected as feared earlier.

But the recent steadiness in Tea shares seems to be partly due to continued cornering activity. In recent weeks, there has been selective support for some Tea shares. This may seem surprising in view of the proposed legislation relating to managing agents. But it cannot be denied that some interests are still active in acquiring controlling rights in some tea companies. To some extent, the relative steadiness in Tea shares is due to the fact that some tea companies contemplate issuing bonus shares.

Jutes Hesitant

It is symbolic of the present mood of the market that Jute shares remain depressed, despite the decision of the National Industrial Development Corporation to finance modernisation of the jute industry. Sufficient time has elapsed since devaluation of the Pakistani rupee to make it evident that Pakistan is fast emerging as a serious rival to India as a manufacturer and exporter of jute goods. Since devaluation, India has already lost a valuable American order for hessian to Pakistan. There are reports that Pakistan has secured another order from Burma at the cost of India.

Repeated emphasis by Cabinet Ministers of Eastern Pakistan that the export minimum price will be maintained is having the desired effect. Raw jute prices are steady, up, despite reports of satisfactory arrivals in mofussil markets both in India and Pakistan. Since the recent statement of the Chief Minister of Eastern Pakistan that flood damage to the jute crop has

been heavy, offerings of raw jute have been curtailed. This explains why raw jute prices are firming up.

This week's fall in gunnies is mainly due to political troubles in Argentina. There are apprehensions that political developments in Argentina may delay shipments of hessian to that country. Reports that India has lost a Burmese order to Pakistan have accentuated the fall in hessian. Lower sacking prices are partly due to the fact that fall in stocks of sackings in August was well below expectations. Weakness in sackings is mainly a reflection of the downward trend in hessian.

Indian Iron

Recent fluctuations in Indian Iron indicate that the market has lost faith in bonus issues or higher dividend payments by the company. Some days ago, there were rumours that the Company might not raise the basic dividend, but that it might decide to pay four to eight annas extra as bonus dividend. It is now better appreciated that higher disbursements to shareholders are not likely. This is the main reason for this week's fall in Indian Iron, though the set-back has been accentuated by technical factors.

As in Tea shares, in some Engineering shares also, there is interested buying. It is now known that British holdings in BIC will be taken over by a group of Indian capitalists. It will be recalled that Jessops and Richardson and Crudas have recently changed hands. Developments relating to BIC are not new. Recent activity in Engineering shares indicates, however, that there is no new attempt at cornering of Engineering shares.

While equities are falling, it is of interest to note the changing make-up of the Calcutta Stock Exchange. Jute shares can never regain their former popularity. Tea shares may remain steady. But this group is not likely to lead the market on to higher levels as it did last year. Recent price movements indicate that engineering shares may not immediately exercise a sustaining influence on the market. From the technical point of view, this is a discouraging development.

"Bombay Mutual" In Socialistic Pattern Of Society

Mutual's Business Amounts to Rs. 6,83,71,288: Record Increase by Over 55 Per cent.

BOMBAY, Sept. 15: "There should be no nationalisation merely for the sake of nationalisation," observed Mr. Umakant S. Desai, Chairman of the Bombay Mutual, addressing the Annual General Meeting of the Bombay Mutual Life Assurance Society held today.

"In recent months", he said, "the topic of nationalisation has been discussed in the insurance circle in India. The various statements made show that the subject of nationalisation is not quite a simple one and must be proceeded with after full discussion of its consequences in various directions".

Referring to the progress made by the Bombay Mutual the Chairman remarked, "During the year the new business completed amounted to Rs. 6,83,71,288 as against Rs. 4,40,67,250 last year. This shows an increase of about 55% over last year's figures. The premium income during the year amounted to Rs. 2,21,11,724 as against Rs. 2,04,34,886 in the previous year. The total expense for the year amounted to Rs. 57,38,776 against Rs. 49,88,440 in 1954. At the close of the year under review, the Life Assurance Fund of the Society amounted to Rs. 15,32,41,382 as Rs. 13,94,42,129 in the previous year".

Pointing out that the renewal expense ratio was lower than in the

previous year, he said "that the trend observed last year towards decrease in the expense ratio continued this year also. The total investments at their book value in Government Securities are Rs. 5,10,73,932 as against Rs. 4,99,23,125 in the previous year."

Mr Umakant S Desai

In reviewing the work of the Society in 1954 the first important event which comes to the mind is the reduction in the premium rates, which was effected in the wake of similar action by some sister insti-

tutions, informed the Chairman.

"The long-term effects of this reduction," he said, "are yet to be realised. Its immediate consequence, however, has been a very large increase in the new business transacted by most offices".

Dilating on the success made by the Bombay Mutual, Mr. Desai said "part of our success in the spectacular increase in the new business of 1954 can safely be ascribed to our improved organisation during the year. Steps are being taken for training the salaried and other field workers to improve efficiency".

Concluding, he said, "Life insurance business is in a sense a business for mutual help and in the fitness of things they should be ultimately managed by companies organized on the principle of 'mutuality'. Mutual companies should, therefore, be completely acceptable in a socialistic pattern of society".

The Chairman placed on record the appreciation of the services rendered by the Manager, Officers and the staff of the Society both at the Head Office and its Branches. The late Mr. N. J. Shah, it was recalled, was a Director elected on behalf of the policy-holders and in the vacancy caused by his death, the Company got Mr. R. K. Dalal to join the Board after having been duly elected by the policyholders.

Around Bombay Markets

Equities Down Again

Thursday, Morning

AS was witnessed in respect of reports of taxation on bonus shares, a single factor played fast and loose with equity values, during the week of three days' trading under review. Early in the week equity values appreciated on reports that there would be no further taxation for another two years. In fact, the Finance Minister was credited with having said as much in Delhi. When the Secretary of the Congress Parliamentary Committee came out with a statement to the effect that the reported "no-taxation for another two years" story was baseless, a natural brake was applied to the rising trend in equity values. Thus, what gave a fillip to the shares initially also provided a bearish slant towards the close. Besides, expectation of heavy delivery against the settlement just ended (Friday) also contributed to the fall in prices all round. In fact, the closing rates on Wednesday in almost all sections of the market were the lowest for the week.

Among steel shares, Tata Ordinary declined to close at the lowest level of Rs 242-12 from the peak of Rs 249-8. Indian Iron lost more than a rupee to Rs 38-8-6 from the highest level of Rs 39-10.

Textile shares were also very weak. Bombay Dyeing lost more than ten points to close at Rs 505. Century lost about as many points to finish at Rs 420. Kohinoor lost seven rupees lower at Rs. 326. In the Miscellaneous shares also, Associated cement, Burma old, National Rayon, Scindia, Tata Chemical and others lost considerable ground. Tata Electric shares closed firm on proximity or dividend. Banks were better. Insurance were dull.

Cotton

More Exports of Zoda Cotton

WITH only four days' trading during the week, activity in the cotton futures market was necessarily limited. An event of importance during the week has been the reduction in the export duty on Zoda cotton. Earlier in the previous week, when the export quota for 2,50,000 bales of Indian raw cotton was announced, relief was granted in respect of Zoda cotton by way of free licensing.

However, it was then felt that unless free licensing is followed up by a cut in export duty, there could be no material benefit to the trade. In fact, representations to this effect were believed to have been made to the Union Commerce and Industry Minister when he was in the city a fortnight back. It may be presumed, therefore, that the present duty relief on Zoda cotton has been the result of these representations. The actual announcement in this regard states that the export duty on Zoda cotton will be assessed either at Rs 50 per bale or at 30 per cent ad valorem whichever is lower. Zoda cotton, which is hardly consumed on a sizeable scale within the country, is bound to show distinct improvement on the export front now that it is doubly blessed with a duty cut and free licensing.

Although there was a perceptible undercurrent of steadiness in the market, the price of the February

contract could manage only a rise of Rs 1-4 during the week. After opening at Rs 622-8 it improved on the same day to Rs 625-4 and steadied up to Rs 626-8 on Saturday. Again on Wednesday, the contract dropped on option dealers' liquidation to close the week at the lowest at Rs 623.

The spot market at Sewri remained lively thanks to continued export enquiries from overseas for all exportable styles, especially Kalyan, Vijay, Dhollera, Wagad and some deshi varieties.

The scheme for the import of American aid cotton is yet to be finalised. Pending a decision in this respect, it has been officially announced that no applications for import of sterling area cotton would be entertained. As a result of the suspension of imports from the sterling area, the comparable varieties of East African cotton have seen an upward movement in prices.

Oils and Oilseeds

Cheerful Tone

IN sharp contrast to the pattern of trading witnessed for over three weeks now, the oilseeds market presented cheerful conditions all round during the week under review. In the event, prices of almost all seeds and oil recorded appreciable gains. Sentiment has been favourably influenced mainly because of strong suggestions in the market that an export quota for at least about 3,000 tons of groundnut oil would be granted shortly to crushers. This apart, prices tend to rule firm on reports of unfavourable weather in groundnut producing tracts particularly in and around Hyderabad. As though these were not enough, there were also rumours that it is quite possible that the Government might announce an export quota of the order of 10,000 tons of groundnut oil before the end of next month.

On the export front too there was more activity. Rangoon reported business to the tune of 500 tons of oil, in drum, at around Rs. 1450 per ton. It was also reported that Hong Kong did some stray business while there were enquiries from the U K and the Continent. It was even reported that Japan was keen on buying Indian oil and if no business took place, it was for want of import licences.

In the castor section, both ready and futures, remained firm throughout the week. Overseas support was provided by the U K and the U S A; the latter was reported to have bought 1500 tons of castor oil (first pressure) at between 11 and 11.50 cents. Britain's interest was in castor oil commercial at around £82 per ton.

Castor September futures started the week at Rs 88. After declining to Rs 86-12 on the same day, looked up on heavy speculative buying and bear covering to Rs 90-4 on the last day of the week. May contract shot up by five rupees from the lowest level of the week to finish the week at the highest level. Thus, the contract started the week at Rs. 86-4, declined the same day to Rs. 86-0 and, then steadily went up to Rs. 91-2 on the last day and closed at Rs. 91.

Castor ready and oil also remained very steady throughout the week.

Groundnut ready and delivery and its oil displayed steady condition throughout. Seeds moved within a range of four annas while oil moved between Rs 11-4 and Rs 11-8.

Linseed improved, from Rs 23-8 to Rs 24-4, but finished the week steady at Rs 23-14. Oil remained almost stationary at Rs 13-8.

Kardiseed and Nigerseed also remained steady without much business passing during the week.

Bombay Mutual

THE accounts of the Bombay Mutual Life Assurance Society Ltd. for the year ending December 31, 1954, indicate a trend of consistent progress. During the year under review, new proposals valued at about Rs. 6.83 crores resulted into policies as against Rs. 4.4 crores in the previous year. The total business in force, inclusive of bonuses, increased to Rs. 45.01 crores at the end of 1954 from Rs. 43.51 crores in 1953.

Claims under policies, less reinsurances, during the year amounted to Rs. 77.8 lakhs of which claims by death accounted for Rs. 17.11 lakhs, and the corresponding figures for the previous year were Rs. 68.3 lakhs and Rs. 20.59 lakhs respectively.

"He who is firmly seated in authority soon learns to think security."

J. R. Lowell.

★
INDIAN TRADE & GENERAL INSURANCE COMPANY LTD.

Jehangir Building,
Mahatma Gandhi Road.
BOMBAY.

Telephone: 36881-3

General Manager: T. M. STURGESS.

Income of the company in 1954 totalled Rs. 2.72 crores of which premium income accounted for Rs. 2.21 crores, as against Rs. 2.52 crores and Rs. 2.04 crores respectively in 1953. Although there has been some increase in the total expenses from Rs. 49.88 lakhs in the previous year to Rs. 57.38 lakhs in the year under review, renewal expense ratio has shown a decline from 16.79 per cent to 15.90 per cent.

Investments of the company at the end of 1954, at book value, amounted to Rs. 12.54 crores and the average rate of interest earned on investments was 3.55 per cent, after deduction of income-tax at source.

The Directors have maintained the bonus to staff at the rate of a month's salary to those who have put in a year's service and half a month's salary to those who have served for six months and more.

Tea Industry

1954 was a good year for the tea industry. Tea auction prices were appreciably higher. World demand for tea was satisfactory. As a result, the Indian tea industry earned highly satisfactory profits. Some months ago, the industry's prospects for this season were not considered bright. This season's auction prices are not as high as those of last year. But an examination of the current world demand and supply position in tea suggests that prospects are not as bad as apprehended at the beginning of this session.

Dividend payments for 1954 are not yet over. Some tea companies are still announcing their final dividend payments for 1954. Recently, Hantapara and Birpara announced their final dividend disbursements for 1954.

Some time ago, Hantapara Tea Company applied to the Controller of Capital Issues for permission to issue bonus shares on the basis of one for four ordinary shares held by shareholders. In the absence of any decision from New Delhi, the Company now proposes to make a fresh application to the Controller seeking permission to issue one ordinary share for two ordinary shares held. As this proposal involves an increase in the Company's authorised capital, the Company will be holding an extraordinary general meeting on September 28, 1955, to enable it to obtain the necessary sanction to raise its authorised capital.

Where oil does two vital jobs

Gargoyle Industrial Lubricants — first choice for hydraulic systems

IN a hydraulic system, power is transmitted through oil; and the flow of oil is regulated through precision valves. If the oil oxidises, or rust is formed, the valves may be blocked — holding up production in an entire plant!

The oil has a double function; in addition to transmitting power, it also lubricates. Choosing the right oil is thus of vital importance. In India, as in so many other countries, Gargoyle Industrial Lubricants — famous for 89 years — are chosen to keep hydraulic systems working efficiently.

There's a right Gargoyle Lubricant for each industrial need. Backed by our correct lubrication — with Gargocants — can help to reduce costs — maintain output in your plant.

For details, write to Standard-Vacuum Oil Company

Next Stage

AT Geneva, four Heads of State reached an understanding to settle world issues in dispute through negotiation, and without use of force. This was no mean achievement. But subsequent developments lend weight to suspicions that some of the Western Powers have accepted the principle of peaceful co-existence with certain mental reservations. Since the "summit" talks, both Russia and the Western Powers have eulogised the spirit of Geneva. Recent speeches before the General Assembly of the United Nations have been cordial. America's Secretary of State has expressed the hope that the second decade of the United Nations will be more harmonious than the first. M. Molotov has waxed eloquent on the spirit of Geneva. Though the common man throughout the world welcomes the assurance by major Powers that they will refrain from settling disputes through use of force, he feels disappointed to find that the world issues in dispute do not seem to be any nearer solution.

Mr. Dulles assured the General Assembly that Russia and the Western Powers were entering the "agreed second stage". At Geneva, the plans for the second stage were decided. In accordance with that decision, disarmament problems are now under discussion by a sub-committee of the United Nations. Soon, the four Foreign Ministers will meet at Geneva to discuss Germany, the question of European security and other related European issues. But suspicions deepen that the "cold war" may be replaced by intense diplomatic activity by both the rival power blocs to maintain the status quo in Europe. There is a dangerous possibility that the "cold war" may be followed by a prolonged period of uneasy co-existence. With the rejection of atomic warfare as an instrument of policy, it becomes clear that the possibility of a stalemate in world affairs cannot be eliminated unless both sides are sincere in their intentions to reach a lasting solution of the issues in dispute.

There are ominous indications that some of the Western Powers interpret peaceful co-existence to mean the re-emergence of the principle of balance of power. Their attitude to disarmament is an instance in point. From M. Bulganin's message to President Eisenhower, it is clear that Russia is sincere about disarmament. At Geneva, President Eisenhower announced a plan for aerial inspection, exchange of military information and an inspection system at strategic points. In his message to the American President, M. Bulganin observes that the Eisenhower plan of an early warning system can have some significance only if there is any agreed arrangement for reduction of armaments and prohibition of atomic weapons. Evidence accumulates that America is unwilling to go beyond any agreed plan in regard to the early warning system. "We believe," Mr. D. A. Quarles, the U. S. Secretary of Air Force, observed recently, "that so long as we retain the capability to react to aggression with crushing force—regardless of how the aggressor could initiate war—we will have a convincing deterrent to war".

Washington's disarmament policy has been annotated recently by an expert American commentator on foreign affairs. According to this interpretation, America's disarmament policy is based on the assumption that both sides will retain atomic weapons and that this will compel peace. If

Fort, Bombay. Phone: 23046
Annual Subscription Rs. 24.

this interpretation is correct, it means that America relies on the alarm system and on the traditional system of balance of power to maintain world peace. Any such policy has ominous implications. Throughout the nineteenth century, international relations were based on the theory of balance of power. This principle failed to avert wars. Any such principle can only lead to continuous and constant diplomatic manoeuvres by both sides to create spheres of influence in order to attain and to maintain a balance of power. Even at present, some such system of balance of power exists in Europe. There are suspicions that the Western Powers may not be uninterested in maintaining the status quo in Europe in order to perpetuate a delicate system of balance of power.

If any such policy has ominous implications for Europe, its repercussions on Asia are no less disquieting. In his recent speech before the General Assembly, M. Molotov endorsed India's suggestion for a "summit" conference for Asia. Mr. Dulles was diplomatic in his discreet silence on

Asian problems. But, in his speech before the General Assembly, he supported SEADO, and reiterated America's determination to defend Formosa. These are precisely the issues which are in dispute in Asia. It may not be incorrect to interpret America's policy to Asia as that of maintaining a system of balance of power in this region. Rhee, Chiang and Diem can be relied on to maintain the system of balance of power which America wants to establish in this part of the world. Asia rejects such a solution of the issues in dispute in this region. No such policy can ensure peace in Asia and the Far East. It can only perpetuate the sources of conflict.

At this crucial stage in world affairs, President Eisenhower's indisposition is to be deeply deplored. Recently, the President let it be known that whether he would seek re-election next year would depend on his state of health. There will be hope for President Eisenhower's prompt and total recovery. But the political consequences of the American President's illness may even so

be significant. Any possible development which creates political instability in America, the recognised leader of the Western Powers, must necessarily lead to uncertainties in world affairs. At this juncture, when Western Powers have to reach firm decisions on plans to solve the major issues in dispute, it will be a calamity if President Eisenhower's ill-health deprives the Western Powers of his mature leadership. In the Republican Party, there is no politician of sufficient prestige and stature to replace Mr. Eisenhower. Developments in the United States since the "summit" talks at Geneva indicate how influential political interests in that country are reluctant to accept the spirit of Geneva. In the interests of world peace, it is to be hoped that the Western Powers will have the statesmanship to accept peaceful co-existence without mental reservations when the four Foreign Ministers meet at Geneva a few days hence to implement the decisions reached during the "summit" talks between the Heads of State.

For Good or Ill...

DESPITE all the flutter caused by the indiscretions of the Chief Ministers of Andhra and Travancore-Cochin, all that is definite about the report of the States Reorganisation Commission is that it is to be submitted to Government in a day or two. This at least the Prime Minister has made clear, not only by saying that he and his colleagues at the Centre have as yet no idea of the nature of the Commission's recommendations, but by suggesting that the loquacious Chief Ministers did not really say all that was attributed to them. It is the privilege of public men to wriggle out of inconvenient corners by blaming the press for adding overtones to what they actually say. In much the same way, the Prime Minister has elucidated Shri Gobind Ballabh Pant's statement about Government's acceptance of the Commission's recommendations before knowing what these recommendations were.

All this is at once comforting and disturbing. It is comforting to know that the Commission at least has been most scrupulously guarding its secrets. It has not taken even Shri Nehru into confidence—either in deciding the principles to be followed in realigning States'

boundaries or in marking out the specific areas. It is also comforting to know that Shri Nehru, at any rate, does not consider the Commission to be bound by the AICC's resolutions on linguistic States. On the other hand, one feels concerned at the tensions already being built up around the report. For the Prime Minister to convene a press conference specially to explain Government's attitude to a report that is yet to be submitted is so unusual that it deserves sober consideration. It is a measure of Government's concern at the possible repercussions.

Considering the explosive character of the Commission's subject, it is right that Government should take certain precautions. Shri Nehru has stated that the State Governments will be consulted before the Union Government decides to publish the report or notify its acceptance of the recommendations. Which means that the first tussle will be at what may be called the inter-cabinet level. It is an open secret that the Chief Ministers of several States are trying to create opinion for or against linguistic States, according to the likely effect of such reorganisations on their positions, both in the Congress Party

and in Government. One therefore doubts if they will be able to agree to a reshaping of their territories without a fight. This would be especially true wherever the Chief Ministers and Provincial Congress Presidents do not see eye to eye with each other. Add to it the conflicts that will arise between State Governments and opposition parties, between linguistic groups etc., and you have as many opportunities for stirring up trouble as you wish.

Unfortunately, it is a position which seems unavoidable in the context of things. It is a matter of principle that no section of India can be denied the right of self-determination; and the Union Government is most loth to impose its will on the States. If the States amongst themselves agree to a readjustment of their territories, the Union Government cannot, and will not want to, say no. But the trouble is precisely at this point. If the States do not agree, what then? It is perhaps better to take the position that one need not bother about crossing a bridge until one comes to it. But then, one often does not know how many in the country will be content to wait till then.

If past events are any guide, the repercussions will be most wide-

spread and possibly violent in Southern and Western India, in the Punjab and in the NE Frontier regions. Bombay, Hyderabad, Andhra, Mysore, Madras and Travancore-Cochin—all these States are apprehensive of the major readjustments they will have to undergo if the Commission's recommendations are based strictly on linguistic considerations. And they will have most disturbance if the basis is otherwise, considering the agitations that have been going on for the establishment of Vishala Andhra, Samyukta Karnataka, Aikya Kerala and Maharashtra.

Whether or not the transition to a new order of States will be smooth and peaceful will depend largely on the attitudes that people and Governments and parties in these States take. They have, therefore, a special responsibility in preparing themselves and others for acceptance or orderly modification of the Commission's recommendations. For good or ill, we have decided that the present State boundaries are not what they should be; we have accepted the case for internal homogeneity, in matters cultural and social, in the units we want to call States. But we have, at the same time, agreed that we are all part of India; and that for one to seek profit at the expense of another—in whatever sense—is harmful to both. It is of supreme importance to remember this, and one hopes that those who are in positions of power and influence will remember it.

In the nature of things, the States Reorganisation Commission cannot suggest a realignment that will be completely satisfactory to everybody. That is manifestly impossible. It will, therefore, be essential to consider their recommendations as a whole and make up one's mind. Maybe, this will mean that the aspirations of some groups or States will be fulfilled partly or not at all. But having appointed a Commission—which is obviously capable of taking an objective view and making its recommendations for the benefit of India rather than this State or that linguistic entity—it would be a tragedy if its recommendations were used to turn a cold war into a hot one. That would be not only negation of democracy which we profess so ardently, but crass indifference to national well-being. The Prime Minister has been fair enough to let the States and the people decide in a way that does credit to them-

selves. It is to be hoped that for their own sake, they will live up to the expectations of Shri Nehru as well as of those who believe that chauvinism is neither civilised nor healthy.

Weekly Notes

Management of State Enterprises

THE Estimates Committee of the Lok Sabha could not have timed its recommendation on the organisation and administration of nationalised industrial undertakings better. For, the next few years will witness a great proliferation of industrial undertakings in the public sector, and the problems they will throw up will not be only those of finance or commodity balances. They have to be made to work, and work efficiently; and this depends basically on how they are organised and administered.

The Committee does not approve of the system of entrusting the management of State undertakings to boards of directors, and of treating a state joint stock company as a department subject to the control of the Secretariat. And the Committee's opinion on these matters should carry great weight, since, more than anybody else, it is aware of how these modes of administration have worked in the past. Instead, it is suggested that the responsibility for running the enterprise should be entrusted to one or more managing directors, according to the size of the undertaking. And what is more important, these managers should have direct relationship with the Minister concerned.

Admittedly, both these measures would obviate to a greater or less degree that bane of public administration, namely, delay born of diffused responsibility. But they also create a major problem of finding the men. The future public undertakings will certainly be giant units; and they are coming up in fields which are hitherto relatively unexplored. The problems of planning and management that they throw up will be such that the Indian Civil Service, with its convinced air of omniscience will be unable to cope with. Nor is there in the private sector a large reserve of managerial and technical ability of the right sort that can be drawn upon. The Committee is well aware of all this. It is quite categorical about the unsuitability of the administrative services as a source of recruitment for these managerial posts. It also knows that as long as the present high salaries in the private sector continue, it will be extremely difficult to attract the best

men to the State undertakings. Consequently, it recommends the setting up of an Indian Commercial and Industrial Service, recruits to which should be given specialised training in industrial management. And it argues in favour of fixing a ceiling for salaries in the private sector! The latter is more easily said than done. But unless the country undertakes a vast scheme of technical training, or gives Government power to conscript managers, it may be impossible to avoid such a step.

This will inevitably raise vociferous protests from various quarters. Similarly will the other recommendation of the Committee, viz. that 25 per cent of the share capital of joint stock companies running state enterprises should be available for public subscription. Maybe this will encourage some additional investment in industries by the savers. But private entrepreneurs are certain to hold forth that any investment in the public enterprises will be at the expense of private investment in industries.

Industrial Finance Corporation

PARTING with the Sodepur Glass Works, details of which are given in the Chairman's speech, must have been for the Corporation one of sweet sorrow. The pleasure would arise from the fact that a problem had been solved, an industrial enterprise had been put on the path to revival and a part of the funds almost given up for lost had been recovered. The sorrow would be occasioned by the crystallisation of the loss that the Corporation had suffered from this single transaction.

The Sodepur Glass Works has been sold to Messrs. Asahi Glass Company Ltd., of Japan for Rs. 62 lakhs. It was obvious that only a foreign concern would have the necessary technical knowledge and experience to take over the management of the concern. The Chairman, Shri K R K Menon, pointed out that the Asahi Glass Company "has the reputation of being one of the largest and most efficient glass manufacturing companies in the world". All in this country will join the Chairman in hoping that they will be able to make a success

of the venture and thus justify, in this way at least, the loss suffered by the Industrial Finance Corporation. The Corporation's interests are still bound up with the concern—for the price is to be paid in instalments spread over seventeen years together with interest on unpaid balances at 3½ per cent per annum.

The loss of the Corporation which has now crystallised out of the transaction amounts to over fifty lakhs of rupees. Considering the revenues of the Corporation, it will be quite some time before the Corporation is provided fully against this. This is obvious from the fact that the Reserve for Doubtful Debts which was started with Rs. 5 lakhs last year will amount to only Rs. 20 lakhs after the current year's transfer of Rs. 15 lakhs to it. Even so, this transfer has meant that the Corporation had to call upon the Government for a subvention of Rs. 11.25 lakhs to meet the entire guaranteed dividend this year, as compared with a subvention of a little over Rs. 4 lakhs last year. The hope that the Corporation would soon be able to start repaying subventions received in the past has therefore proved false.

There is little to note on other accounts since the Corporation has not yet had much time to settle down under the new set-up. The gross profit was somewhat higher than in the previous year at Rs. 24.70 lakhs, though a sum of Rs. 1.49 lakhs has had to be written off on account of loss on the Corporation's building project which has now been given up and the slightly larger amount taken to the Interest Suspense Account.

On the issue of the Auditor's Report on the working of the Corporation, little light could be made available as the Public Accounts Committee's report based on it has not yet been discussed by Parliament. In any case, it is to be hoped that the matter is treated in the right way and the Corporation follows a vigorous but cautious policy for the future. If the Corporation emerges from the troubles it has undergone during the last few years with renewed vigour, it will be all to the good.

Three Chemicals off the List

ON the recommendation of the Tariff Commission, Government has withdrawn the element of protection from duties on sodium thio-sulphate, sodium bisulphite and sodium sulphite, effective from January 1, 1956. These chemicals are produced domestically in sufficient quantities to cover the demand, and the industries have presumably benefited from the protection enjoyed by them since 1946. The number of units manufacturing these chemicals has now increased to six, with a rated annual capacity much in excess of normal domestic requirements. Though the Commission has not stated it specifically, it would seem that such unused capacity as still exists in these units is due more to limited demand than to serious competition from abroad. Imports of these chemicals in the past few years have been of a very minor order. And though consumers have sometimes complained about the quality of the domestic product, they have in general been willing to buy the stuff, which leads the Commission to conclude that the quality of the indigenous material is satisfactory; and, as usual, an admonition to the industry to remove such deficiencies in quality as still

exist is added to the recommendations.

With the removal of protection, these chemicals will, from next year, be subject to the normal revenue duties of 36 per cent standard and 26 per cent preferential to British manufacturers, applicable to all unspecified chemicals. In the Tariff Commission's view, these ad valorem duties will meet the needs of the industry.

Record Output of Sugar

THE sugar industry has apparently made up its mind to put its best foot forward. With a total estimated production of 15.86 lakh tons for the current season ending October 31, not only has it achieved a 35 per cent increase over the 1953-54 output, but has also exceeded the record output of 1951-52 by 87,000 tons. Owing to delayed deliveries in respect of commitments in 1953-54, imports in the current year at about 6 lakh tons have also been on the high side. This conjunction of high production and high imports will, despite the increased consumption of white sugar, leave a carry-over stock of around 5 lakh tons at the end of the season.

This is, indeed, a very satisfactory position. Unless something very unusual happens to the sugar cane

crop next year, we should be able to do with much less imports of sugar in the future. It is true that consumption of sugar is on the increase, and with the expected growth of incomes in coming years, this trend will be maintained. There are two comforting factors in this respect. One is that sugar cane is largely an irrigation crop, and, therefore, could be made relatively free from violent fluctuations in output. Secondly, Government has already granted licences for establishing 35 new sugar factories and for substantial expansion of the 38 existing units. These projects will add altogether 5.5 lakh tons to production capacity, of which a capacity of nearly a lakh tons is likely to be available in the 1955-56 season.

With the target for sugar production in the Second Five-Year Plan put at 22.5 lakh tons per year, it will be necessary to add another 5 lakh tons to installed capacity, and raise sugarcane output to 770 lakh tons (as against 555 lakh tons in the current season). To step up cane output, a provision of Rs. 5 crores is being made for assistance to States from the Centre. This money is expected to be utilised on schemes for the supply of better seeds, irrigation, communications and so on.

Neither Here Nor There

ONE of the most maladjusted of communities in India is that of Anglo-Indians; but this maladjustment is largely due to themselves. They have not tried to belong decisively anywhere; nor was it perhaps wholly possible for them at least in the old days. When the British were still dominant in this country, they loved to flutter about them; but they could not escape an inner feeling that were not highly acceptable to that society, though the latter might tolerate them as a sort of an outer ring of self-protection. But being rather proud of that role, and proud too of modelling themselves on their masters, they would not associate with Indians. Nor perhaps they felt the need for it, as quite a few must have hugged the hope that the British would never clear out of the country.

Freedom came all too soon for their way of thinking at least; and in the ensuing panic, some of them hurried out of India and a few attempted a last-minute adjustment, while the remaining found themselves at sea. Without the means or the influence necessary to find a berth in Britain or other congenial climes, and knowing too that those who had hastily sought shelter there were either uncomfortable or already on their way back, they knew that they had no escape from the land which had given birth to them, but which had hardly met with their approval. To decide to belong here finally, they thought, was an act of condescension they could not permit themselves; but to belong elsewhere seemed to be a feat that was beyond their immediate power of decision. Thus impaled neatly on the horns of a dilemma, and making of their motherland merely a place of sojourn, they have been living from day to day, hope of the impossible alternating with despair over the real.

Split Psychology

THESE facts have been cited here not so much as points for a charge-sheet against any section of the community, but as background material for a better understanding of its psychology—or rather the ‘canker of split psychology’ which, according to the outspoken President of the Anglo-Indian Association, Shri Frank Anthony, ‘bedevils’ a section of his community. And he was quite unequivocal in his advice, “If an Anglo-Indian feels that India is not his country, the sooner he

leaves it the better.” That is sound advice so far as those whose eyes are glued on other lands is concerned; but what about those who are to stay on or who have decided to do so? Shri Anthony had not much guidance to give them, and what little he gave was not exactly helpful. He seemed to make out that the salvation of the community lay in the hands of the Association, and that it was through it, that the ‘past and present security’ of Anglo-Indians had been ensured.

One may not belittle the service rendered by the Association to the community so far; but one wonders whether in secular India, with parties evolving on broad economic lines, with no racial, sectarian or linguistic bias, a small sectional group, largely concerned with the security of a single community, its language and way of life, can continue to pull its weight in the larger political field. It may have a role to play now; but that role, one feels, ought to be more in the direction of associating itself closely with the community stream of national life than of preserving itself as a unit apart. No one will ever deny them the right to live as a separate ‘cultural and social entity’; but if that means that they are to remain isolated from the general current of national progress, the ‘split psychology’, of which Shri Anthony has so eloquently spoken, will continue to ‘bedevil’ the community in one shape or another.

And real security for the community can come only from a voluntary act of association and harmonisation with national trends and not from complex-ridden isolation, whether in the matter of language, acceptance of tradition or ordering of social life. In other words, when the country proceeds on certain agreed lines in these matters—and it is certainly proceeding fast—the Anglo-Indian community would feel left out, insecure and perhaps unwanted too, should it wilfully continue to stick to its old habits of thought and demeanour. It is perhaps time that the community decided to belong somewhere, no matter where, and strove to make a whole-hearted job of it in confidence and faith. It cannot afford to be ever in a state of suspense.

Wait and See

WHATEVER may be the circumstances that impelled the All-Party Goa Vimochan Sahayak Samiti to decide on continuing its campaign of Satyagrahic marches

into Goa, albeit in an altered form, and however much one may admire the firmness of the Samiti's resolve to free the Portuguese pockets by such action, one cannot help doubting the advisability of the move at this juncture. The Samiti may no doubt derive solace from the fact that it is doing its best to redeem its pledge to the Goan people; but whether the pledge of freedom will ever come to be redeemed in the process is more than can be visualised at this moment. With our Government bent on preventing the entry of satyagrahis into Goa, the campaign is bound to take the shape of a protest against our Government rather than the Portuguese regime which may watch the resulting imbroglio with considerable satisfaction. And far from such a spectacle having a morale-boosting effect on the people inside Goa, it may well present our Government in a strange light, which the Portuguese may be depended on to capitalise to the maximum extent.

The only saving feature of the new plan of the Samiti is that the campaign of satyagraha will not be continuous. The new marches will be attempted at fairly large intervals; and in between, whatever little public enthusiasm over the issue might have survived Government's recent damper is bound to wane. The grim fact is that satyagraha as a means of liberating Goa from the clutches of the Portuguese holds little hope. It is practically ruled out. And even if Government had not decided to ban it, it is doubtful whether it would have prevailed against Portuguese brutality. That is the one extenuating consideration that Government can find for its present attitude. The other is that other and more promising measures are being tried. From the state of high hope and excitement which prevailed on last Independence Day, the nation has been reduced to the plight of “wait and see”.

India and GATT

TO the question whether India would be doing the right thing by ratifying the revised GATT, the Union Minister for Commerce and Industry, Shri Krishnamachari, provided a conclusive answer in his prefatory speech on the White Paper on GATT placed before Parliament last week. India's stand on this issue was further elucidated in his reply to the debate on the subject. He outlined the part that India had played right since the inception of

GATT to the revision of the same last winter, and analysed the Union Government's attitude towards such points as: (a) the position of under-developed countries (b) the question of export subsidies (c) quota restrictions and the country's development plans; (d) flexibility of GATT provisions; and finally (e) India's attitude to Japan's admission to the GATT Club.

Shri Krishnamachari countered Communist criticism about India's association with GATT, and said, in effect, that the country had everything to lose and little to gain by not joining the organisation. The primary aim of GATT is tariff reduction and no individual country can obviously get concessions from others, without a corresponding sacrifice on its part. Though the benefits that a particular country derives may not be direct, on balance it always makes up for the sacrifice it may have to

make. Putting it briefly, we have the freedom to withdraw all the tariff concessions which we have given, provided we do not mind losing all the concessions we get. We have received tariff concessions, directly or indirectly, on most of our important exports, e.g., on jute yarn and manufactures from the U.S., Canada, New Zealand and Australia; on cotton textiles from Australia, New Zealand, Canada etc.; on coir yarn and manufactures from the U. S., Australia, Benelux countries etc.; on tea from the U. S., Canada, Australia, New Zealand and so on. On the eve of the revision of GATT last winter, the Union Government carefully considered the pros and cons of the proposals for amending the existing provisions, and it was convinced that by and large they were in accord with the country's thinking and interests, though it recognised the need for modifications in certain aspects.

Speaking broadly, the three main objectives of GATT are: (1) elimination of discrimination, (2) abolition of unfair trade practices of all kinds and (3) removal of barriers to the smooth flow of international trade. Basically, Shri Krishnamachari averred, Government is in agreement with the first two objectives. India believes neither in discrimination nor in questionable practices like export subsidies and dumping. In this respect, GATT deserves our support, and its provisions need to be strengthened. On the question of reduction of trade barriers, however, India has had to press for an amendment, but not because she does not subscribe to the principle that obstacles to trade must be reduced to the minimum. The reason is that as an under-developed country, we may have, in the course of our economic development, to discourage particular lines of imports in order that corresponding domestic industries

PC-3472(A)

How banking serves the RUBBER INDUSTRY

RUBBER was first planted commercially in India in 1902. Today Indian rubber plantations, concentrated in Travancore-Cochin and Malabar, produce 20,000 tons of rubber every year, valued at four and a half crores of rupees. More than 250 Indian factories depend on this output for their production of finished goods.

Without banking, this growth could never have taken place. The facilities and guidance offered by a good bank, such as the availability of ready funds when needed and the collection of dues in any part of the country, have become part of the structure of the rubber industry.

We at Palai are proud that so many important rubber producers, and indeed leading firms in every field of business and industry in South India, employ the complete banking service we offer.

Current Accounts—Demand Drafts—Telegraphic Transfers—Bill Collection Letters of Credit—Deposits—Investments—Loans & Overdrafts—Confidential Credit Reports, etc.

If you have business interests in the South, it will pay you to open an account with us. Our 25 branches are strategically located, 23 in important South Indian business centres and two in Delhi and New Delhi; and we have correspondents in all important Indian cities. We offer a fully comprehensive banking service at each office.

Our clients can make deposits at any of our correspondent banks, situated in all important Indian towns and have the amounts credited to their accounts at any of our branches.

PALAI CENTRAL BANK LTD.

Head Office: PALAI, TRAVANCORE
Branches at: Madras, Cochin, Quilon, Trivandrum, Alleppey, Mangalore, Bangalore, etc. Also at: Delhi & New Delhi.

A LEADING BANK IN SOUTH INDIA

might grow and expand. In fact, such restrictions which countries in the early stages of development may have to place, will in the long run lead to a larger volume of world trade as a result of heightened economic activity in the developing countries.

The Indian Amendments

INDIA pressed for two specific amendments, which obtained the support of all under-developed countries and some of the advanced countries as well, viz., (a) under-developed countries like India should be enabled to use quantitative restrictions on imports in order to fulfil their programmes of economic development by assisting particular industries and (b) sufficient flexibility regarding the bound rates of tariffs should be secured to enable under-developed countries to make changes as and when new industries develop.

As a result of India's efforts, Articles 18 and 28 have been wholly revised. The practical outcome of the amendments that have been made is: Section (a) of Article 18, provides for a more flexible use of tariffs as an instrument of industrial development. There are facilities for under-developed countries to raise tariffs on bound items to provide for the establishment of particular industries. Tariff charges can be made not merely when there is agreement; even if there is no agreement among the concerned parties, the GATT organisation can, if it finds that the applicant country has offered adequate compensation, authorise the withdrawal of the concessions.

Section (b) of this article provides for quantitative restrictions to be imposed for safeguarding the external financial position and maintaining an adequate level of reserves for implementing development programmes and controlling the level of imports by restricting the quantity or value of such imports. And Section (c) authorises quantitative restrictions and similar measures for ensuring the establishment of a particular industry. In imposing such measures, the country concerned will be expected to reach agreement with the countries interested in that particular trade, but in the last analysis, it would be free to act unilaterally unless it is an item on which the tariff is bound.

As regards the question of tariff flexibility, Article 28 has been revised. The tariff bindings under this article will be valid for periods of three years at a time. And at the end of the period, it will be open to

a country entering into these bindings to withdraw any concessions, which freedom is, of course, allowed to the other concerned parties to the agreement as well. Therefore, before a country acts under this provision, it must satisfy itself that it is likely to gain rather than lose under a freedom which cannot be exclusive. Thus, the flexible manner in which the relevant articles have been framed show that India's commitments under GATT do not tie her hands too rigidly and regardless of consequences.

As regards India's attitude to Japan, although we have supported the latter's admission to GATT, and have given the most favoured nation treatment under the Peace Treaty, since it is feared that many of our industries are vulnerable to cheap Japanese exports, the Union Government has reluctantly invoked Article 35, thereby freeing itself from the obligations of GATT so far as Japan goes.

Security Council

PANDIT Nehru's reply to questions in Lok Sabha quashes rumours that America has offered India a permanent seat in the Security Council. Such an offer could

not be made without a simultaneous proposal to amend the Charter of the United Nations. Pandit Nehru's observation that the time is not opportune for amending the Charter will be endorsed on wider grounds. India has always been in favour of admitting the People's Republic of China, to the United Nations. In the circumstances, New Delhi is not likely to accept any suggestion that India should replace China in the Security Council even if such an offer were made by America or any other Power.

To stress this aspect of the issue is not to suggest that India and other Asian nations are satisfied with the present make-up of the Security Council. New Delhi's view that Asian representation on the Security Council is not adequate will be endorsed by all Asian nations. There are many Asian nations that are qualified to become, but are not members of the United Nations. India has always advocated the admission of such Asian nations to the United Nations. Even so, Japan, Ceylon and Nepal will welcome Pandit Nehru's re-affirmation of India's support to their demands for admission to the United Nations.

Industrial

announces SUBSTANTIAL increase in

BONUS

WHOLE LIFE Rs. 18 per 1,000 per year

ENDOWMENT Rs. 15 per 1,000 per year

for the

Triennium ending 31st December, 1954

Observations of the Valuing Actuary

"The valuation results are Excellent (Surplus Rs. 66,48,698/-). It is a matter of great satisfaction that it has become possible to declare Higher Rates of Bonus after maintaining a Strong Reserve Position of the Company and the carry forward (Rs. 10,77,872/-) to the policyholders' account which I have recommended will enable you to maintain your Bonuses at HIGHER LEVELS in future years."

THE INDUSTRIAL & PRUDENTIAL ASSURANCE COMPANY, LIMITED

Industrial Assurance Building, Opp. Churchgate Station,
Fort, Bombay 1

From the Delhi End

HE laughs best who laughs last, and it looks as though the Railway Ministry will have the last laugh on the Plan-frame. For some time it has been known that the Railway Board has been preparing a plan involving an outlay of Rs. 1500 crores—nearly double the provision in the Plan-frame (which had provided Rs. 950 crores in all for transport and communications). The details of this huge total have now been released informally. The Railways were not previously asked for the probable investment in the context of the targets in coal, steel, cement; and their case now is that these three alone require about Rs. 515 crores by way of complementary railway investment to meet additional transport demands. It is expected that separate provision will be necessary for meeting additional passenger traffic which will rise at the rate of 3 per cent a year, while another three per cent increase will be necessary to prevent overcrowding. The general goods traffic is expected to increase by about 5 per cent a year. For meeting these other demands a further sum of Rs. 520 crores has been found to be necessary.

The problem of fitting a plan of these dimensions within a total outlay of Rs. 2050 crores in the public sector at the Centre is quite formidable. It is not easy to reduce the Railway demands in the abrupt way in which the Education Ministry's proposals were cut. The cuts, wherever applied in the railways, will be reflected elsewhere. But cuts may become inevitable because, as in the State Plans, the sum of the parts of the planned investment cannot be larger than the estimated total outlay. The Railways hope to find only about Rs. 283 crores through their own efforts, unless they can raise fares and freights further—which will not be practicable at least in the next two years, though it may become inevitable later to get more money. It is also assumed that in the Plan as now prepared, about 40 to 45 per cent will be the foreign exchange requirements—a serious enough problem. There are other difficulties too involved; the rough estimate of steel needs for railways alone on the present calculations is a million tons a year which may not be possible to obtain in addition to the steel need-

The Railway Plan

ed in the other sectors of the economy during the next five years.

It is difficult, however, to take exception to the main heads of allocation and the priorities now assumed. The estimate of investment needed on rolling stock is assumed as Rs. 460 crores—for about 2900 locomotives, 150,000 wagons and 16,000 coaches. One third in each category will be for replacement. Of this net addition of one lakh wagons, only a fourth is shown against the demands for coal transport of the additional 23 million tons to be raised—a rather low estimate, if the new production should fully materialise. Under the first Five-Year Plan, a total of Rs. 250 crores would have been spent on all the items of rolling stock. This expenditure has gone towards the acquisition of about 2000 locomotives, 5800 coaches and about 60,000 wagons. There has already been an improvement of about 8 per cent in the goods traffic handled this year, over 1954. But the demand for goods space has been going up; outstanding registrations have increased and pithead stocks of coal are mounting. It is claimed that but for the transport difficulty today, 40 million tons could be produced and sold causing a corresponding rise in industrial production. The rolling stock now planned for will be absolutely necessary if the total volume of goods traffic increases from about 115 million tons this year to about 180 million tons in 1960-61. If each ton moves a longer distance on the average, the capacity needed will be more than proportionate; but the Railways have acted on the conservative assumption that the demand will just be proportionate in terms of ton-miles also.

An equally irreducible demand is Rs. 200 crores estimated for works for improving line capacity. This includes provision for the doubling of track over 2500 miles and conversions of gauge besides new stations, sidings, bridge repairs and so on. Among the normal revenue items, one can also find a provision of about Rs. 125 crores for renewal of track. The hope for increasing operational efficiency by about 10 per cent, as now assumed, will depend on these works which may relieve the bottlenecks at important junctions and transshipment points. Other essential items are Rs. 65

crores provided for workshop extensions; and Rs. 100 crores in suspense for stockpiling of materials.

These considerations would leave only the proposals for new lines and for electrification and passenger amenities, within which to explore the scope for economies. There is provision of Rs. 200 crores for the construction of 3,000 miles of new lines in industrial areas as well as backward ones. The axe may fall on the second category of new lines. In the first Plan, all items other than rolling stock had been neglected, the total expenditure amounting only to about Rs. 165 crores in five years on these items. This has to be remedied at least in the next Plan but the outlook is rather unpleasant. The Railways have, however, powerfully brought home the truth that means are scarce and that choices have to be made in the end. These railway demands need priority, despite the fact that the permanent additional employment to be created will be only about 2 lakhs, with subsidiary short-term employment of about 2.5 lakhs. There is no promise of amenities to passengers to sugarcoat this somewhat bitter pill. Larger goods traffic will not capture the popular imagination to sell the Plan! But it has to be sold nonetheless; there is no alternative.

Andhra State's Progress

TWO years after its birth, Andhra, the first linguistic State in India, can legitimately claim to have overcome its teething troubles and to have entered a period of healthy childhood. Both on the political and economic fronts, the State has reached a point of stability which inspires the hope that its further progress will be free from violent upsets and uncertainties.

The feeling of optimism here expressed stems from the developments subsequent to the general election to the Andhra State Assembly in January-February this year, which settled a number of things about the State's future. Most important of all, it freed the State from the apprehension that it was a stronghold of the Communist party in India. The election resulted in the return of the Congress United Front candidates in overwhelming numbers, while the Communist strength shrank from 45 in the dissolved 140-strong Assembly to a bare 15 in the new 197-member Assembly. The collapse of the Communist party represented a significant turn in the tide in favour of the Congress, which has maintained its changed course since, as revealed by the subsequent by-elections in which Congress candidates have won almost hands down.

The election not only revealed the sandy foundations on which the myth of Communist influence in Andhra was built but it disclosed also the thin support that the Praja Socialist Party could command among Andhra's electorate. The opposition in the legislature has thereby been reduced to almost nothing. While this is to be welcomed from one point of view, from another point of view it imposes a special responsibility on the Congress party, which has been called upon to demonstrate that the confidence reposed in it by the electorate is well-deserved and justified.

This test the Congress has fortunately been able to pass so far. It could successfully overcome a split in its ranks which the election of the leader of the Congress Legislature Party threatened. Through the intervention of the Congress High Command, Shri B. Gopala Reddi's unanimous election as leader was ensured. Another split was threatened in connection with the election to the Andhra Pradesh Congress Presidentship; but though a

contest could not be avoided in respect of that office (resulting in the defeat of Prof. N. G. Ranga, the candidate sponsored by the former K L P group which had prior to the general election merged with the Congress) no unsavoury repercussions followed that event. On the whole, the Congress, on both the organisational and the legislature fronts, is preserving its facade of unity.

This is a hopeful factor and one of its striking consequences has been a strengthening of the tone of public life in the State. Another has been a steady improvement in the morale of the administration. As evidence of the former may be mentioned the sobering down of agitations and controversies over the issue of the capital of the State, an almost complete absence of the once vigorously pursued controversy over the issue of prohibition, the calm noticeable in respect of Rayalaseema-Circars' disputes over irrigation projects and so on. The Circars' Andhras no doubt still entertain a longing, lingering hope and desire that the headquarters of the State would be shifted to Vijayawada; but they do not any longer make it an issue with the Rayalaseema people. Kurnool's continuance as capital is now taken as a fait accompli, though what reactions would ensue if, as prognosticated, the disintegration of Hyderabad state is not going to be followed by the establishment of a Greater Andhra or Visal Andhra State, with Hyderabad as the permanent capital, cannot be envisaged at present. The report of the States Reorganisation Commission is awaited with keen interest and anticipation by Andhras as by other concerned linguistic groups.

Two relatively minor disputes regarding boundaries remain to be settled between Andhra and Madras on the one side and Andhra and Mysore on the other. The former pertains to the thin strip of bilingual territory comprising a few villages in the Chingleput and Chittoor districts while the latter relates to the town of Bellary and three taluks in Bellary district, which under the Misra award have been incorporated in Mysore State. A somewhat unfortunate and needlessly vociferous agitation has been raised by some sections in Tamil Nadu over the

Andhra-Madras boundary in the two districts referred to and a boundary commission is being demanded to settle the dispute. If a boundary commission, though provided for in the Andhra State Act, is appointed, it would only lead to a recrudescence of linguistic acrimonies, which have been progressively disappearing during the last few months. It is hoped that the Government of India will not capitulate to the demand but permit the Andhra and Madras Governments to settle the dispute at Ministerial level and put their seal of approval on any agreement that may be thus arrived at. Regarding Bellary, the States Reorganisation Commission has been seized of the issue and its recommendation will have to be regarded as the last word on the matter.

What is the prospect regarding the economic future of Andhra? Along with the plans of other States, Andhra's second Five Year Plan has also recently been scrutinised by the Planning Commission, which ultimately provided for an expenditure of Rs 125 crores as the State's target. The figure was arrived at on a consideration of the combined criteria of population, needs and the amount which the State could spend on development schemes during the first Plan period. The financial deficit of the State on the one hand and the prospective spending capacity of the State Government on the other were probably other criteria that entered into the fixation of this allocation. As is well-known, the current year's budget deficit for Andhra amounted to the somewhat staggering figure of Rs. 3½ crores, representing a gap between revenue and expenditure in the revenue account which could be made good only by additional taxation. It is heartening to realise that the Andhra Government did not fight shy of this proposition despite vigorous opposition attacks and has introduced legislation for the imposition of a betterment levy on lands which have benefited from extension of irrigation facilities and a surcharge on water rates in delta areas. In Andhra, as in other states, the agriculturist is shouldering a heavy burden of taxation compared to the return he gets from his vocation; but in the districts under wet cultivation and served by irrigation sources, land can

certainly bear a heavier burden, if land reforms which afford cultivators security of tenure and reduction in rents, are introduced. Two other sources of revenue which the Andhra Government can appropriately explore are an income-tax on agricultural incomes and a surcharge on land revenue in respect of areas where commercial crops like tobacco, sugarcane and groundnut are grown.

The second Five Year Plan for Andhra provides for industrial development related to local availabilities of raw materials and labour and for the development of a number of small-scale industries. With the prospective early completion of the Machkund and Tungabhadra hydro-electric schemes, the smaller industries in the State should get a fillip, as power would then be available for running them. The agriculturists will also greatly benefit, as power would be available to them for operating pumps and for undertaking lift-irrigation schemes.

Among the schemes of major significance for Andhra's future prosperity, mention must be made of the Rs. 129 crore Nandikonda project on the Krishna river, work on which is expected to commence in the very near future. The project will be one of the biggest of its kind in the country and it is proposed to be executed, as far as possible, through indigenous engineering talent. A medium-sized irrigation project, the Vamsadhara project, which would benefit the Srikakulam and Visakhapatnam districts in north Andhra, has also been sanctioned for execution during the next Plan period, besides a number of local irrigation works for the benefit of scarcity areas.

It is altogether satisfactory that the fervid controversies on prohibition that marked the first year's life of Andhra and which ultimately led to the fall of the Prakasam Ministry, have more or less subsided in recent months. The prohibition scheme indeed continues in operation in the State and its implementation has recently been made over completely to the Police Department. What the future of the scheme would be would depend very largely on the recommendations of the Prohibition Enquiry Committee, but Andhra is now in the happy position of being one of the few States which have already experimented with total prohibition and know its advantages and disadvantages and the problems that arise

out of it. This experience should be helpful in enabling the State Government to implement any recommendation made by the Committee without finding itself floundering in the process.

This brief review of the developments in Andhra justifies the con-

clusion that the State is now no longer the problem State it was at one time considered to be or rather threatened to be. With stable political conditions and with conditions favourable for steady economic progress, Andhra can look forward to a period of increasing prosperity.

NEW INDIA STORIES FROM LIFE

'My good turn helped me most'

MY FRIEND'S son came to sell me insurance. My business was doing well, and I thought I did not need any. But the boy was so young and enthusiastic, that just to encourage him and please his father, I agreed to take out a policy.

Some years later, business slackened and everything I touched seemed to fail. My business took some hard knocks; and my partner got too ill to share my problems. I had to reorganise, but where was the necessary capital to come from? The only solution was to sell our house—and it was my wife's pride and joy.

Then my young friend dropped in to remind me that my New India Endowment Assurance policy would mature shortly. What a wonderful relief! I would get the money I sorely needed at exactly the right time.

I thought I had obliged a friend—actually he had helped me!

An insurance policy, taken out now, may one day stand between you and disaster. For full information write to

Eradicating Corruption in Railways

Report of the Railway Corruption Enquiry Committee 1953-55. Published by the Manager of Publications, Delhi, pp. 220. Price not stated.

THE inquiry into Railway corruption has made us sad. We knew that there was a good deal of corruption in Government departments including the Railways, but the wide extent of corruption prevalent and the ingenious methods adopted by the Railway staff to extract illegal gratification have shocked us. This, however, does not mean that all Railway men are corrupt. Many are honest and conscientious. Yet unfortunately a good many of them are not so. The misfortune is that those who are honest have little influence over those who are not and on the administration as a whole. Even when high officials are themselves scrupulously honest, they feel, and some of them have admitted, that they are helpless in the matter of eradicating corruption from among the rank and file. This is the conclusion of the Railway Corruption Enquiry Committee of which Acharya Kripalani was the Chairman. Corruption in the Railways is not new. Corruption has been there all along; only the magnitude or volume varied according to circumstances. What we expected of the Kripalani Committee was an answer to the question how to root out corruption from our Railway administration. Railways are not only our largest nationalised undertaking, but also the biggest public utility concern.

After having realised the gravity and importance of the problem it is unfortunate that the Committee has nothing new or original to suggest to root out corruption from the largest nationalised sector in our economy. It has pleaded for a new outlook and has tried to put together the various suggestions which the Railway Board and various Railways must have been considering from time to time. By getting entangled in administrative details, the Committee appears to have lost sight of the main issues. To understand the problem in its proper perspective, the Committee should have examined as many case histories as possible. It would have, then, immediately revealed that as long as responsibilities for decisions remain diffused, it would be impos-

sible to root out corruption completely. Many cases of corruption are not proceeded with because of difficulties in fixing the responsibilities. An equally large number falls for the same reason at the final stages of investigation and trial. In executive jobs, chances to shift responsibilities for action should be reduced to the minimum.

Another source of corruption is all-round inefficiency. Intelligent but unscrupulous people thrive in an atmosphere of inefficiency. Corrupt as well as incompetent officials commit similar errors of judgment; the only difference is that in one case it is wilful and in the other it is unintentional. It will be very often difficult to distinguish between wilful and unintentional errors of judgement. It, therefore, follows that in the process of rooting out corruption, the incompetent will also have to suffer the same fate as the corrupt. Any attempt to hide the incompetent is to encourage corruption. But in the present political climate, weeding out the incompetent and toning up efficiency are not so easy as it would appear at first. The greatest evil in the administration to-day is casteism and regionalism. Every officer is looked upon as a representative of the caste to which he belongs and of the region in which he is born. And most officers behave also as if it were so. This is an evil which is eating into the vitals of the nation. One may not believe anything in this world; but from the high-ups to the lowest, all are prepared to believe stories of victimisation because of caste, region etc. to which one belongs and to intervene on behalf of incompetent, undisciplined and even corrupt officials.

The question that is looming large is: will it be possible to restore the honest and efficient i.e. the good administrator, as CR would like to call him, to his rightful place and allow him to function effectively. The Committee, however, has the politician's suspicion of the bureaucrat. The Committee observes: "with democratic progress of the country and the change in social temper, these bureaucratic powers

have been circumscribed with a view to safeguard the interests of the public and the workers. Many gazetted officials have now asked for increase of their powers to enable them to take disciplinary action against the subordinate staff. We are sorry we cannot agree to such increase of power. It would in our opinion be a retrograde step. The officials will now have to cease to be the arbitrary rulers of the destiny of those who are placed under them and will have to discharge the new role of leaders of the men working under them. This leadership cannot be gained merely through fear but by good understanding and by setting an example of efficient and honest handling of the task allotted to them and by absolute fairness and impartiality in their dealings with their subordinates". It goes well as a political harangue. But it shows little appreciation of the problems of the administrator. When undesirable forces are working to undermine the discipline of the staff, to what extent the Committee's advice will be practicable has to be seen. In normal times, what the Committee has stated should be the norm. But is the Committee prepared to admit that we are passing through normal times in regard to corruption and efficiency?

If the Railway Ministry is keen on eradicating corruption, wider powers will have to be given to honest and efficient people and they will have to be supported to the full in their drive against corruption and inefficiency. A wise administrator seldom uses his extraordinary powers. The bureaucrat, whatever his other defects may be, is a cautious being. And if he is not vested with sufficient powers, he tends to become ineffective. With its limited resources of honest and efficient officers, it is also for consideration whether it would not be better to start a concerted effort to eradicate corruption in one division or district of each railway and to extend it to other divisions as and when experience is gained. It is not likely to yield satisfactory results if one tries to deal with the entire railway system. It will only end in red-tape and delay.

Prospects for Steel Tubes

The European Steel Pipes and Tube Industry. Prepared by the Industry Division, Economic Commission for Europe, United Nations, Geneva. June 1955. Pages 103. Price 4sh 6d.

THE steel pipe and tube industry, which has been absorbing an increasing proportion of total steel production in recent years, has been facing a number of problems. While in the immediate post-war years, supply tended to be particularly short of demand, there has been for some time considerable danger of over-production. Since tubes find their way mainly into industries, the expansion of which is of basic importance for economic development and which directly reflect a rising standard of living, a study of the structure and problems of these industries has been carried out by the Economic Commission for Europe. Detailed studies of the wide-strip mill producing flat products have already been published.

The report notices the very significant fact that "the industry has tended to be concentrated into relatively few hands, inevitably suggesting that there may be artificial barriers to the growth of production and demand on the one hand and reduction of costs and prices on the other." The tendency towards concentration appears to arise out of the heavy capital investment made necessary by the development of new techniques of production and particularly of the seamless tube. As a result, the industry has been concentrated in a few hands in each country, and at least until recently a comparatively small number of countries have been substantial tube producers. There are, in fact, only 13 substantial producers in the world with an output of more than 100,000 tons per annum. Of these only four are outside Europe. The United States leads the world with an output of more than 9.3 million tons, thrice that of the second largest producer, the U.S.S.R. and eight times the third; the U. K. The biggest producer in the USA produces 43 per cent of total output, but the concentration is still higher in other countries. Most units are vertically integrated, producing their own steel. In the United States, more than elsewhere, the tube manufacturers produce other products as well.

Tubes are classified, according to end-use, into those used for transport or circulation of fluids and gases, and those required for structural uses drawing upon the mechanical

properties of tubes. Since the Commission is interested in assessing the demand and supply position of the industry, an analysis of the pattern of consumption is made. The oil and gas industries together form the largest single user. In the four West European countries, roughly a quarter of total tube production is for the oil and gas industries; most of this is exported to extra-European markets. Exports of tubes of oil-producing countries constitute more than half of the total steel exports from these countries. Exports, in fact, constitute 35 per cent of the total production of the four West European countries. United States exports are large in volume, though they constitute only 8 per cent of its output.

The rate of growth of apparent consumption of tubes in itself and in relation to apparent consumption of steel, varies considerably between countries. While consumption is low and yet unchanging in the less-developed countries of the world, it is high and at approximately the same level in the United Kingdom and Western Germany. The report believes that "this experience may be in some measure a pointer to what can be expected in other developing countries in the coming years."

Tube production has expanded considerably in Western Europe relatively to pre-war times. In spite of this, however, Western Europe now accounts for a smaller share of world output than before the war. In addition to the high rate of expansion of tube production in the United States, all other non-European areas show rapid expansion, and tubes are also being produced in areas where there was no production before. Latin America is expanding output at a rapid rate; Africa, Asia and Oceania are producing twice as many tubes as before the war. Besides, plans are in hand for expansion of capacity in all these areas. Established producers in the advanced countries frequently participate in the development of tube production overseas with the provision of capital, equipment and technical aid. The factor that determines the capacity laid down in these new producing countries is the existing or potential size of the market.

The report makes a detailed study of the trends of costs and prices of

tubes. The gaps in statistical data necessary for such a study are wide. The problem is made even more difficult by the existence of wide divergences between export and domestic prices and the absence of a uniform pattern among the different producing countries; but the report has made a commendable job of it. To make a complete analysis of the situation affecting costs and prices of tubes, study has been made of (a) The behaviour of producers; (b) Steel prices and qualities, (c) Competition from new producers, particularly overseas; (d) The size of the market and standardisation; and finally from the side of demand of (e) The elasticity of demand for steel tubes; and (f) The growth of total demand.

In the light of the discussion of these general considerations—the elasticity of demand is discussed in very great detail—the trend of actual and potential demand for tubes in four fields of activity is examined. To assist in this process of analysis, the actual pattern of exports of tubes is also studied in a separate chapter. The four fields covered are oil, gas, the supply of water and housing and general construction. The large remaining sector of miscellaneous uses has not been discussed in view of the lack of data, though this must necessarily imply a weakness in the analysis.

As regards oil, the report concludes that there "seems to be no reason to suppose that a continuing annual increase in oil production of 5 per cent cannot be expected." It anticipates a continuing high and growing demand for tubes. Further analysis shows, on the basis of experience, that tube consumption in oil production follows a fairly definite pattern. When a new oil-field is discovered, initial demand for tubes is likely to be high, falling off as oil production rises. The next stage is likely to be an increase in tube consumption per unit of oil output as drilling goes deeper and strikes become rarer.

That is why the report finds that the future prospects for tube consumption in oil-producing areas would appear to depend on the result of two conflicting factors. First, as the share of the Middle East and the Far East in total world oil production increases, tube consumption

per unit of output is likely to fall. Against this, it is likely to rise in other oil-producing areas of the world as production is extended to less economic districts.

Tubes are used, however, also for the transport of oil. In the United States and Middle East extensive pipe-line systems already exist. Probably, therefore, demand from here will be largely for maintenance. In Western Europe, the long coast line and comprehensive system of inland waterways make distribution by tanker and barge cheapest. Therefore, on the whole, no substantial increase in demand from this sector can be expected outside the USSR. Increasing refinery capacity will, however, mean some new demand.

The Gas industry has a large demand for tubes and pipes. Future expansion of the manufactured-gas industry depends more on the total demand for gas than on competition from other sources of energy, in view of the probable overall shortage of energy. Movement of natural gas also requires tubes, but the demand is highly localised, being determined by the location of sources. The farther away the source of natural gas from industrial and commercial centres, the longer the pipe-line required for transport. Demand, apart from that of replacement, depends, therefore, on the discovery of new sources and their exact location.

Manufactured gas is not usually transported long distances, but it nevertheless makes considerable demands for tubing even for distribution in small urban areas. The report finds that "the trend of gas production and distribution and particularly of the development of natural gas is such that the consumption of steel tubes by the gas industry will grow steadily, not only to meet new demand, but also for replacement purposes."

Water transport also requires steel pipes although here they have serious competitors. Water requirements have been continually expanding with increased demand for conveniences in the household and with the development of a more complex industrial structure. The industrialization of underdeveloped areas is, therefore, likely to be a potent factor in the demand for steel tubes for this purpose.

Tube consumption by the construction and related industries depends partly on the level of construction, partly on the scale of amenities provided, particularly in houses, and partly on the degree to which tubular forms of construction

are used in substitution for others. Modernization of old buildings may also be important, as also the provision of additional amenities in new dwellings, the former being more important than the latter.

A fairly detailed presentation of the report has been given above, particularly of its very thorough discussion of the possible demand for steel tubes in different types of use because the main purpose of the report is in fact to study the prospects of the industry. The conclusions finally drawn from the study are interesting and are presented below. The hope of the industry, if experience is any guide, lies in the development of underdeveloped countries. The tube industry "could benefit substantially from progressive policies of economic development in the less industrialized countries of the world. As the report notes, the industry may be contrasted with the flat sector, "where a real upsurge of demand depends essentially on a certain level

of economic development having been already attained, so that expanding incomes are available for expenditure on motor vehicles, durable consumer goods and other articles associated with a high standard of living."

The acute shortage of tubes during the immediate post-war period has stimulated expansion of tube production in parts of the world where there was little or no tube production before the war. The report characterises this as "a natural and inevitable movement" which "need not cause the tube-exporting countries undue concern, since the main factor affecting the prospects of the tube industry is the state of total demand and, as has been seen, the long-term outlook would appear to be favourable." That is a conclusion which should be welcome to the steel industry in this country, which is also going for the production of pipes and tubes according to the latest methods.

An Experimental Village Industry Project In a Delhi Village

Philip Zealey

The author of this article, which is a further addition to the series of Village Studies appearing in this Journal, is the Liaison Representative of the American Friends Service Committee. He has been in India for three and a half years—at first helping to establish a multi-purpose rural project in Orissa and now co-ordinating the rural work of the AFSC in India. He is especially interested in the problems of village-based decentralised small industry.

CHANDRAPET is a small, somewhat isolated village, about 20 miles north of Delhi. It lies one mile from a metalled road; the connecting link being a rough track which is hazardous even for a jeep in wet weather. An all-weather road is projected for construction during the coming winter season. The dominating features of the population are the existence of a small group of comparatively prosperous farmers and a large group of "Harijans", mostly leatherworkers and low-caste weavers. The village has been strongly influenced by Congress doctrine and "untouchability" has gone, though caste interdining and intermarriage is still taboo. The leatherworkers are good craftsmen but poor tanning techniques result in bad quality leather and this tends to nullify their technical skill. The weavers use very poor looms and only produce a low grade and coarse type of material.

This village has already undertaken some community work on a self-help basis with some Government assistance. A new well has been dug, the village tank has been enlarged and deepened, and some of the village streets have been paved with brick. Two co-operative societies have been registered.

Resulting from the visit of some foreign technicians, a small sum of money has been raised in the U. S. for the benefit of this village. Initially the villagers wished to apply this fund towards the building of a community centre. In the light of the serious un- and under-employment, it was suggested that the fund might be better used for some productive purpose which could provide both employment and profit. The idea was that the profits would be used for welfare purposes in the village. The idea was accepted and the question arose as to what might be a good productive purpose. At the time there did not seem to be an immediate opportunity for providing assistance in the development of leatherwork and the fund was not

sufficient for the establishment of a tannery. The weavers' position looked pretty hopeless.

It was known that the Ingraham Institute near Ghaziabad had successfully sponsored a small metal-pressing industry in the eastern part of Delhi State. One of their technical experts was willing to assist in a further extension of this kind of work, and had full confidence in its potentialities. With his encouragement and promise of technical aid, the village was willing to co-operate in a village industry experiment. The expert had already drawn plans, designs and costing for the manufacture of a folding coathanger for a refugee colony near Delhi, but co-operation had not been forthcoming and he was willing to transfer this idea to Chandrapet.

Capital & Organisation

Basic equipment, consisting of a No. 3 hand-operated fly-press of Indian manufacture, plus bench vices and tools, were purchased at a total cost of Rs. 300. The technical department of the Ingraham Institute undertook to manufacture the dies and jigs at a cost of Rs. 160. Rs. 100 were given for the initial purchase of metal, wire, plastic tubing etc. Subsequently an advance of Rs. 400 has been made to meet running expenses until money from sales comes in regularly. This industry has been "floated" on a total capital of Rs. 960 or about \$200. It is foreseen that additional capital will be needed to provide for adequate expansion to a sound economic and business unit.

At present, the project is "informal". The equipment and capital has been provided on a loan basis and held in trust. It is supervised by a young village leader who is at present studying law at Delhi University. When development has reached a point where a group of at least six are employed and feel committed, as well as having full confidence in the work, the organisational structure must be formalised. It is

planned that this working group shall decide, in consultation with the village, what structure the industry should take. E. G. co-operative, profit-sharing company, village self-government corporation etc. When this has been done, and with the approval of the donors, the fund and equipment will be formally and legally transferred.

The industry is only providing full time employment for two persons and part-time employment for two more, just now. To be efficient and viable as an industrial unit, full employment must be provided for 6 to 10 persons with supplementary part-time assistance. Observations would indicate that a larger working unit might lead to a factory environment which it seems desirable to avoid. If this unit develops successfully, a second stage would be the establishment of another unit directly associated with the leatherworkers to produce metal parts for leather products. Subsequent contacts now indicate that some technical assistance can be provided to improve leather and adapt leatherworking techniques.

It should be pointed out that it has taken well over nine months to reach the present stage of development.

First Products

It has to be admitted that the choice of a folding coathanger has not been good from the point of view of the orthodox conception of village industry. It is not a product for village consumption and depends on a town market. Products of this kind are only suitable for villages within a reasonable distance of large towns. This is also true in relation to the acquisition of raw materials. All tools and equipment, as well as the raw material, are of Indian manufacture. Subsequent products must certainly include those which can be of benefit to the village areas. One obvious reason for starting on this particular product was that designs, costing and manufacturing procedures had already been

worked out. Another was that this would be the first article of its kind to be manufactured in India.

The economic success of the project in East Delhi had been in the fact that the industry was bringing into the village about Rs. 1,000 of extra-village-sourced money and the whole village was definitely feeling the benefit of the increased circulation of money and purchasing power. This project had also shown that small metal products could be manufactured on an economically competitive basis in a village under conditions far preferable to the crowded "sweat-shop" environment of similar industries in dirty and congested back streets in the bazars of Old Delhi.

The second product is a hacksaw frame and is now being manufactured at a cost very much lower than its imported counterpart. The present market is limited but it is such a useful "multi-purpose" tool that one can envisage a broader market including village use, when the price has been brought to such a tempting consumer level. Other products are in various stages of development.

Technical Aspects

A weakness was shown in the fact that the commencement of operations depended vitally on the outside production of dies and jigs. The preparation of the dies was delayed and this resulted in a loss of enthusiasm and of confidence in the project. This, of course, was only temporary but it also resulted in a theoretical loss of productive potential. It would be sounder if the project can expand to a point where it would be economic to employ a good tool-maker and provide him with needed equipment to make dies and jigs on the spot. He would also be available to undertake repairs to damaged material without delay.

A welcome surprise was the speed and ease with which the villagers came to understand the meaning of "precision tools". The top and bottom parts of the dies have a clearance of only 5% of the thickness of the material used. In one die this represents a clearance of 1/500th of an inch. Faulty setting means damage or destruction to the die concerned. After one afternoon's demonstration and instruction, the villagers have operated the presses for over three months now without a single breakage. The quality of the product has steadily improved in finish. A new set of dies of an im-

proved design is now being made. These will call for even greater precision operation, and should result in a first class product, better able to withstand competition from rival "copy" production, which may well occur as it is a feature in the small industry picture in India today.

Attention has also been given to attractiveness in presentation. Hangers are packed by dozens in cardboard boxes made on the spot and wrapped in cellophane paper. Printed labels and tags have been prepared. These embellishments form but a fraction of the total cost, but make all the difference to marketability. It is less easy to convince the villagers of the importance of "finish" and attractive presentation to the market.

Marketing

This is certainly the "critical" area in the development of village industry. In its broader aspects markets cannot be increased until there is increased production and a sounder distribution of wealth resulting from production. Exploiting a town market where purchasing power is greater, is of advantage to the villager from this point of view.

Fly-press production is potentially high and efficient. For example, the present set-up at "Chandrapet" is capable of turning out 10,000 coathangers per month. Under existing marketing procedures, this output cannot be absorbed by those selling agencies specially organised to assist village and basically non-commercial production. One is left with a choice of countrywide or regional "sole agents" or direct sale. This type of agency is largely in the hands of people who have been traditionally exploiting the small producer in a number of ways. Several months of negotiation with a few selected agents has not led to satisfactory or acceptable results. The alternative left has been to use village production selling emporia and develop additional markets through direct contact with retailers. This is not the most efficient method of marketing for a small unit but seems the only workable system at present. The cost of employing one man almost full time on selling costs more than the 15% commission which seems reasonable for an agent. Agents seem to have a tendency, by playing one producer off against another, to direct production into shoddy products at a lower price. Recent market studies show that even poor buy-

ers are willing to pay a slightly higher price for a better product. This should be encouraged and not for the least reason that it is in the best interests of Indian craftsmanship to produce on a good level of manufacturing quality. This unit, not being financed by, or indebted to, any agent, is free to experiment in a more direct form of marketing, which, though difficult and more costly initially, may show results to the benefit of both producer and consumer.

Tentative Conclusions

1. Unskilled village people are capable of quickly learning skills of a mechanical nature and of undertaking small industrial production outside the field of traditional village industries.

2. Some types of new village industry can be established for a surprisingly small amount of capital, but sound technical guidance is essential. Such guidance must cover all aspects of the project tackled. It must be followed through continuously until it is no longer required. It needs to cover not only the purely mechanical and industrial aspects, but also organisation, business methodology and marketing.

3. In certain spheres of production, village manufacture can be as economically efficient as town manufacture.

4. It is easier to develop such new industries near large centres of population and for a town market. There is a need for surveys to be made of actual and potential village needs for articles which could be both produced and consumed in rural areas.

5. Marketing is the "critical" area and a great deal of study is required in this field prior to any large-scale development or encouragement of new-type village phased industry.

6. New village industries need a good "mother" from whom the "child" can be weaned at the appropriate time.

7. Financial aid from outside is essential but should be of such a nature that it is regarded as a capital investment for sound productive purposes and not merely as a kind of charitable gift to relieve a state of poverty.

8. Some measure of productive control against unfair competition may be provided when necessary. There should be limits on this in respect of basic consumer interests.

From the Chair

Industrial Finance Corporation of India

Speech of the Chairman Shri K R K Menon

THE following is the full text of the speech delivered by the Chairman, Shri K. R. K. Menon, at the Seventh Annual General Meeting of the Shareholders of the Corporation held on September 17, 1955:—

Gentlemen,

I have pleasure in placing before you the Accounts of the Corporation and the Report of the Board of Directors for the year ended the 30th June 1955. This task should have fallen on Shri P. C. Bhattacharyya, whom you all know, as he presented the Annual Accounts and the Report for the year 1953-54, and was also Chairman of the Corporation during the entire period of the year under review. This was a difficult period for the Corporation, and I am sure, I am voicing the feelings of all of us who are assembled here today when I say that the Corporation has laid itself under a deep debt of obligation to Shri Bhattacharyya for the most efficient and effective manner in which he discharged his onerous duties as Chairman, in spite of the fact that his main official burden as Financial Commissioner of Railways must have left him with very little time to devote to the affairs of the Corporation. It is my first pleasant duty, therefore, to convey to Shri Bhattacharyya the grateful thanks of the Shareholders and of the Board of Directors of the Corporation for his valuable services.

Late Shri H C Captain

Before I proceed to the other items on the Agenda, I have to refer to the sad demise of our esteemed colleague Shri H. C. Captain who was a director of the Corporation from its early stage. His wise counsels were of immense value in the deliberations of the Board and I am sure you will join me in expressing our deep sense of sorrow at his unfortunate demise and conveying our sympathies to the bereaved family. I would also mention some of the more important changes that have taken place in the Board of Directors of the Corporation. I was nominated Chairman, in succession to Shri Bhattacharyya on the 6th August 1955. Shri Sonalker, the Managing Director, retired on the 7th June 1955 and was succeeded by Shri H. V. Venkatasubbiah. To Shri Sonalker I express the thanks and good wishes of the Corporation.

The first item on the agenda is the consideration of the Annual Accounts and the Report of the Board of Directors on the working of the Corporation for the year ended the 30th June 1955. Printed copies of the Accounts and the Report are before you. These have also been circulated to all the shareholders. I shall, if you agree, take them as read. I would, however, make some observations on a few points.

Working of the Corporation

The working of the Corporation for the year ended the 30th June 1955, was, on the whole, satisfactory, judging from the number of applications for loans received as well as the amount of loans sanctioned by the Corporation, particulars of which are furnished in the Report. Our gross profit for the year, subject to provision for taxation, was Rs. 24.70 lakhs, and is higher than that for the previous year by Rs. 2.51 lakhs. In fact, it is the highest earned by the Corporation since its inception. I should add in this connection that this year also no interest has been charged on the advances made to the Sodepore Glass Works Ltd., and interest on certain accounts which are considered doubtful of recovery has been taken to the Interest Suspense Account. You will observe from the Profit & Loss Account that the interest so taken to the Interest Suspense Account amounts during the year to Rs. 2.45 lakhs as compared with Rs. 1.37 lakhs during the previous year. The increase of Rs. 1.08 lakhs is due to a careful review of the present position of our loan accounts as a result of which the Directors considered that it would be prudent to take the interest on a few more accounts to the Interest Suspense Account in addition to those interest on which was so taken during the last year. I must, however, point out that though the position regarding our gross profit is satisfactory, we have had to call upon the Government this year to pay us a subvention to meet the entire guaranteed dividend, amounting to Rs. 11,25,000/-, on the share capital of the Corporation, as against a sum of Rs. 4,06,363/14/- which was the corresponding figure for the previous year. The main reason for this is that this year we have considered it necessary on a review of our loan

accounts in consultation with our Auditors, to transfer a sum of Rs. 15 lakhs to the Reserve for Doubtful Debts, as against a sum of Rs. 5 lakhs which was all that we transferred to this head last year. This brings the total provision under this head of Reserve Account to Rs. 20 lakhs and this does not include any provision for possible loss in the account of the Sodepore Glass Works Ltd. You will observe from the Balance Sheet that the estimated loss in this account will be in the neighbourhood of Rs. 50 lakhs for which provision has to be made from our future profits.

Defaults in Payment

A reference was made in my predecessor's speech last year to the defaults made in the payment of principal and interest. I am glad to mention that the position regarding defaults during the current year shows some improvement. The percentage of the companies defaulting as well as the amount defaulted shows marked reduction. It is only in the case of a very small number of companies that defaults have been due to their unsatisfactory financial position; in the majority of cases, the defaults were of a casual nature and the Corporation, after careful consideration of the circumstances of default in each case, has dealt with the parties sympathetically, and granted postponements for payments of principal and/or interest wherever this was found possible.

You will observe from Appendix "E" to the report now presented to you that we have attempted, for the first time, a brief review of the development of industries in this country, particularly in the fields in which the Corporation has advanced loans. It is hoped that this review, which has been done in implementation of a directive issued by the Central Government, will be found useful and instructive, and an improvement on the purely statistical statement we furnished in Appendix "E" to our last Annual Report.

Sodepore Glass Works

A reference was made by my predecessor, in his speech at the last Annual General Meeting, to the negotiations that had been taken in hand regarding the Sodepore Glass Works Ltd. After consideration of all the

aspects of the case, the Board of Directors came to the conclusion that this factory should be sold as early as possible. A Negotiating Committee was appointed by the Board, with Shri Bhattacharyya as Chairman, for exploring the most satisfactory terms for this purpose, and, on the recommendation of this Committee, the Board have decided to sell the factory to Messrs. Asahi Glass Company Ltd. of Tokyo. The main terms and conditions of the sale are that the vendee will pay Rs. 62 lakhs as price of the assets of the Glass Works, in instalments spread over a period of 17 years together with interest on the unpaid balances at 3½% per year. Further, the vendee company will form an Indian Company immediately to take over the assets and work the plant so as to be able to bring the factory into production early next year. The Asahi Glass Company has the reputation of being one of the largest and most efficient glass manufacturing concerns of the world today, and we confidently expect that they will be able to make a success of this venture.

A reference has been made in the Annual Report to certain companies whose assets the Corporation had to take possession of. The specialised nature of the work done by the Corporation and the need for sympathetic treatment of borrower concerns was dealt with by my predecessor in the speech made by him at the last Annual General Meeting. I need only add that the cases referred to above are receiving the careful consideration of the Board of Directors, and it is hoped that a satisfactory solution regarding them will be found before long.

Profit and Loss Account

I must now invite your attention to one or two items in the Profit and Loss Account for the year. You will find therein that a sum of Rs. 1.49 lakhs is shown as having been written off on account of loss on the Corporation's building project. At an early stage after the inception of the Corporation, it was felt that a suitable building should be constructed to house the office of the Corporation at Delhi. Accordingly, a site was purchased from the Government, plans, estimates etc., were prepared, and tenders were invited for the construction of the building. However, it was felt on a subsequent reconsideration of all aspects of the matter that the scheme should be dropped, and that other arrangements should be made for suitable office accommodation for the Corporation. The amount spent on architects' fees

etc., has therefore had to be written off. Luckily, we were able to re-sell our plot to Government at the same price at which we bought it.

Income-tax Act

You are aware that Section 23-A of the Income-tax Act has been substituted by a new Section 23-A under the Finance Act, 1955. As a result of the substituted Section, the Companies in which the public are not substantially interested have to pay super-tax unless they distribute dividends to the extent of 60 per cent of the total income as reduced by the amount of income-tax and super-tax payable by them in respect of their total income as also any other tax levied under any law for the time being in force. Discretion has, however, been vested in the Commissioner of Income-tax to reduce the minimum amount of dividend required to be distributed under this Section under certain circumstances. If companies which are engaged in the manufacture or processing of goods, shipping, mining or generation or distribution of electricity or any other form of power, are dissatisfied with the decision of the Commissioner of Income-tax, provision has been made for reference to a Board of Referees to give the Companies opportunity of being heard. Some of the Industrial concerns to whom the Corporation has given financial assistance are likely to come under the purview of the above Section and the Corporation has addressed a circular letter to all the borrower companies to ascertain from them how far this new Section will adversely affect their capacity to repay the instalments of loans advanced by the Corporation. On receipt of their replies, it is proposed to consider in what manner the Corporation can assist the borrower companies in the matter of obtaining exemption from the operation of the new provision in the Income-tax Act.

It has been mentioned in our Report that the Bill further to amend the Industrial Finance Corporation Act, 1948, was introduced in the Lok Sabha on the 12th April, 1955. The Bill has since been passed by both the Houses of Parliament and has received the assent of the President. The Central Government have notified that the Act will come into force with effect from the 18th September, 1955. The amended Act has brought about certain alterations in the structure of the Corporation mainly in regard to the Chairman and the Executive Committee.

A reference has been made in our Report to the audit of the accounts of the Corporation for the first time by the Comptroller & Auditor General of India under the provisions of Section 34 of the I. F. C. Act. You may have observed from the Audit Report that it has raised a number of vital issues regarding the working of the Corporation. The Board of Directors gave their earnest consideration to all the matters arising out of the report and submitted to Government their views on the various issues and also gave detailed replies to the points brought out in the Report. In view of the interest and public criticism that the Audit Report has evoked it would normally have been in the fitness of things if we had placed before you our observations on the various items included in the Report, but we have been unable to do so as we have been advised that, as the Public Accounts Committee's report on the Audit Report has not yet been considered by Parliament, it would not be in order for us to place before our shareholders our comments and observations on the Audit Report. I would like, however, to assure them that no efforts will be spared by the Corporation to remove whatever shortcomings there may be in its working.

Before resuming my seat, I would like to convey my thanks to my colleagues on the Board of Directors for their co-operation and guidance in all our deliberations. I would also like to convey on behalf of the Board and on my own behalf, our thanks to the Managing Director and the staff of the Corporation, both here and in the branches, for their loyal and devoted work during an exceptionally difficult year.

Agricultural Labour

III—Cost and Level of Living

SO far the findings of the Agricultural Labour Enquiry relating to the rural occupational pattern and employment and wages of farm workers have been analysed. In the following paragraphs, the results of the Enquiry regarding the cost and level of living of agricultural labour families are discussed.

With a view to examining the cost and level of living of agricultural labourers, the Enquiry collected data on expenditure every month (From March, 1950 to February 1951) for several items of consumption, such as food, clothing and footwear, bedding, household requisites, fuel and lighting, house-

rent and repairs, services and miscellaneous items and ceremonies and functions. For computing the total consumption expenditure per family, the value of articles obtained as wages in kind or perquisites was taken into consideration. Though expenses on ceremonies and functions were separately recorded, they were not included under consumption expenditure. Expenditure of a capital nature and interest on loans were also excluded.

Both from the standpoint of earnings per family and per capita, the income of agricultural labourers is very meagre (Rs. 447 per family or Rs. 104 per capita), and an analysis of their expenditure shows that it

is generally the necessity to subsist that determines expenditure, and there is hardly any choice regarding the items on which money is to be spent. In the result, as much as 91.6 per cent of income is utilised for buying food and clothing, the very bare necessities of life. In fact, the earnings of labourers are hardly adequate to buy even the bare necessities and they have, in consequence, to resort to borrowing.

Thus, while the annual average income per family amounts to Rs. 447, expenditure is higher at Rs. 461, exclusive of the expenditure of Rs. 7 on ceremonies. There is, thus, a deficit of Rs. 14 on consumption

TABLE I

Consumption Expenditure of Agricultural Labour Families

Zones and States	Number of consumption units per family	Average annual consumption expenditure (Rs.) per family on						Income per Family Rs.
		Food	Clothing and Footwear	Fuel and Lighting	House Rent and Repairs	Service & Miscellaneous	Total	
North India	3.4	464 (84.7)	43 (7.8)	6 (1.1)	4 (0.7)	31 (5.7)	548 (100.0)	551
U.P.	3.4	464 (84.7)	43 (7.8)	6 (1.1)	4 (0.7)	31 (5.7)	548 (100.0)	551
East India	3.5	464 (87.9)	26 (4.9)	6 (1.1)	5 (1.0)	27 (5.1)	528 (100.0)	506
1. Bihar	3.6	516 (89.9)	26 (4.5)	5 (0.9)	5 (0.9)	22 (3.8)	574 (100.0)	534
2. Orissa	3.5	281 (84.9)	21 (6.3)	5 (1.5)	4 (1.2)	20 (6.1)	331 (100.0)	340
3. West Bengal	3.2	543 (85.4)	30 (4.7)	8 (1.3)	6 (0.9)	49 (7.7)	636 (100.0)	622
4. Assam	3.0	501 (85.0)	27 (4.5)	7 (1.3)	8 (1.3)	46 (7.9)	589 (100.0)	601
South India	3.4	323 (81.3)	27 (6.8)	5 (1.3)	5 (1.3)	37 (9.3)	397 (100.0)	382
1. Madras	3.4	312 (82.3)	27 (7.1)	4 (1.0)	4 (1.0)	32 (8.6)	379 (100.0)	365
2. Mysore	3.4	325 (75.9)	37 (8.7)	8 (1.8)	14 (3.2)	45 (10.4)	429 (100.0)	396
3. Travancore-Cochin	3.9	431 (79.9)	21 (3.9)	7 (1.3)	12 (2.2)	69 (12.7)	540 (100.0)	541
West India	3.4	327 (83.4)	34 (8.7)	7 (1.8)	2 (0.5)	22 (5.6)	392 (100.0)	391
Bombay	3.4	309 (84.2)	30 (8.3)	6 (1.6)	1 (0.2)	21 (5.7)	367 (100.0)	368

1. Madhya Pradesh	3.6	366 (89.3)	22 (5.4)	3 (0.7)	1 (0.2)	18 (4.4)	410 (100.0)	390
2. Hyderabad	3.9	404 (87.1)	27 (5.8)	5 (1.1)	1 (0.2)	27 (5.8)	464 (100.0)	455
3. Madhya Bharat	3.6	304 (81.8)	33 (8.8)	5 (1.4)	1 (0.2)	29 (7.8)	372 (100.0)	399
North-West India	3.7	571 (84.7)	52 (7.7)	6 (0.9)	3 (0.5)	42 (6.2)	674 (100.0)	651
1. Rajasthan	3.4	491 (85.0)	54 (9.3)	4 (0.7)	1 (0.2)	28 (4.8)	578 (100.0)	604
2. Punjab	4.0	611 (85.1)	55 (7.7)	6 (0.8)	3 (0.4)	43 (6.0)	718 (100.0)	607
3. PEPSU	4.2	687 (82.9)	50 (6.0)	8 (1.0)	2 (0.2)	82 (9.9)	829 (100.0)	913
All India	3.5	393 (85.3)	29 (6.3)	5 (1.1)	4 (0.8)	30 (6.5)	461 (100.0)	447

Figures in brackets are percentages to total expenditure in each Zone, State and All-India.

expenditure alone. While this gives an indication of the cost of living, the low level of living would be apparent from the fact that the annual expenditure of Rs. 461 on consumption, ensures food consisting mainly of cereals and provides just a loin-cloth for the man and a sari for the woman and semi-nakedness for the children. An idea of the average annual income per family and the distribution of total expenditure over different items may be gained from Table I.

The study of average expenditure in the various parts of the country discloses a similarity in pattern not only in regard to total expenditure, but in respect of distribution over different consumption items, although the levels of absolute income and expenditure may be different. Generally, the average annual expenditure hovers round the level of income, though in most cases the former exceeds income.

In Travancore-Cochin in the South Zone, both income and expenditure are highest. But as between Madras and Mysore, the level of expenditure in the latter is much higher, indicating a relatively high deficit budget for a labour family in Mysore. In North-West Zone, expenditure like income, is highest in Pepsu; and this is the only State where the excess of income over consumption expenditure is appreciable. As indicated earlier, the pattern of expenditure is similar in all States excepting Mysore and Travancore-Cochin, where the percentage expenditure on food is comparatively low and that on services and miscellaneous items relatively high. This does not necessarily mean a higher standard of living, but reflects the consumption of low-priced foods like ragi in Mysore and tapioca in Travancore-Cochin.

Inasmuch as the size and composition of the family vary, total consumption expenditure may not truly reflect the level of living. For this reason, the family could be reduced to a common measure, and the usual method is to work out the size in terms of consumption units, on the basis of available consumption scales. According to Lusk's Coefficients, a male above 14 years of age is reckoned as one consumption unit, and females and children below 14 years are taken as less than one unit, depending on age. Consumption expenditure per unit is then obtained by dividing the family consumption expenditure by the size of the family in terms of the number

of consumption units. An idea of the pattern of expenditure in these terms may be gained from Table II.

It is seen that the average annual expenditure per adult male consumption unit for the country as a whole works out at Rs. 134.9. Among the States, the highest expenditure per unit is found in Pepsu, followed by West Bengal, the amounts being Rs. 212 and Rs. 200 respectively. The high level in West Bengal is due almost entirely to the consumption of rice, a relatively costly cereal.

The pattern of expenditure as between casual and attached labour families does not show any noticeable difference, since in both the cases the average size of the family in terms of consumption units is almost equal and expenditure invariably follows the income pattern, higher expenditure in respect of attached labourers generally being associated with higher average income. As regards families with land and those without land, the same trend is noticeable, viz., the higher expenditure in respect of the former type of families being the result of higher income, but with one difference; that is, the size of the family with land is found to be generally larger, and any difference in the level of expenditure consequent on higher earnings is, therefore, considerably evened out.

An agricultural labour family spends on food annually as much as Rs. 393 or about 85 per cent of

its total expenditure. When it is remembered that the expenditure on clothing, the other basic necessity of life, brings this percentage to about 92, leaving only 8 per cent for all the other items of consumption including housing and fuel and lighting, the staggeringly low level of living becomes evident. The expenditure on food per capita amounts to Rs. 91.4 and to Rs. 112.3 per consumption unit (all India); the relative position in the different parts of the country in this respect may be seen from Table III.

TABLE III

Zones and States	Average Annual Expenditure on Food (In Rupees)	
	Per Capita	Per Consumption Unit
North India	110.5	136.5
U.P.	110.5	136.5
East India	107.9	132.6

3. PEPSU	160	5.2	4.2	211.8
All-India	11,004	4.3	3.5	134.9

The diet of agricultural labourers consists mainly of either boiled rice or chapattis made out of wheat or millet or other cereals locally grown, and it is supplemented by a little of pulses and vegetables. While some quantity of fish is included in the riverine areas, milk and milk products are negligible except in some States of North and North-West India. Of the food items, cereals are most important throughout the country, and if the cereal content of perquisites is also reckoned, about 79.2 per cent of the food budget is on cereals alone. The highest expenditure on cereals is incurred in North-West India (Rs. 412), followed by East India (Rs. 386) and North India (Rs. 369). As regards the composition of cereals, it appears to be associated with the crop pattern in different zones; thus, rice is predominant in the rice-growing zones of East and South India, while wheat is important in North-West India, where wheat is the staple crop.

As indicated earlier, the cereal content of the diet of agricultural workers is generally high, and the cereal intake follows the pattern of income and expenditure in different parts of the country. But what is very surprising is that the consumption of cereals should be higher in areas where incomes are high. Contrary to the belief that an increase in income would encourage the consumption of more nutritive foods and discourage that of cereals, the tendency to augment the intake of cereals is noticeable throughout the country and this is indicative of the unsatisfied demand that exists even for the basic food item, viz., cereals. Increases in incomes, instead of being associated with a larger consumption of protective foods and other items, are used up in larger outlays on cereals, as may be seen from Table IV.

Among the other items of the diet, any considerable consumption of milk and milk products is to be found only in the Punjab and Pepsu, where the expenditure on these items formed about 13 per cent of the food budget. Vegetables appear to be luxuries, and most of what is consumed is grown in the back-yard of the labourers' house or obtained gratis from their employers.

A decent level of living should contain within it—apart, of course, from provision for nutritive food—adequate provision for clothing, footwear, housing etc. But the so-called level of living of an agricultural

labourer woefully lacks any such provision worth the name. The average annual expenditure on clothing and footwear amounts to Rs. 29 or 6.3 per cent of total expenditure. This ensures just one dhoti or a pair of pyjamas and kurta for an adult male and a sari for a woman. Children are found mostly in a semi-naked condition, specially in summer. Housing facilities leave much to be desired, and labourers live mostly in small houses with mud walls and thatched roofs.

With a view to studying in greater detail the existing standard of living among agricultural labourers, the Agricultural Labour Enquiry has attempted a classification of families into a number of income groups, described as "Economic levels of living". The economic level of living of a family is determined by the consumer expenditure per consumption unit in the family, where, as referred to earlier, the consumption units are calculated by taking the adult male members as full units and other members in terms of their relative caloric requirements. The percentage distribution of agricultural labour families among the various levels of living is given in Table V.

TABLE IV
Cereal Intake at Different Income Levels
(In ounces per consumption unit per day)

	Rs. 51-100	Rs. 101-150	Rs. 151-200	Rs. 201-250	All Levels
North India	14.2	19.0	23.4	29.6	23.3
East India	15.7	19.0	20.5	23.0	20.0
South India	11.8	16.3	21.7	23.0	15.5
West India	13.2	17.8	21.3	19.3	16.2
Central India	16.1	18.9	23.6	25.7	18.8
North-West India	15.2	21.1	23.7	26.4	24.1
All-India	13.7	18.0	21.9	24.6	18.4

TABLE V
Percentage Distribution of Families in Important Economic Levels of Living By Zones

Levels of living (per consumption unit)	North India	East India	South India	West India	Central India	North West India	All India
Rs. 50 and below	0.1	2.0	2.8	3.1	1.3	..	2.0
Rs. 51 — 100	7.5	16.5	31.3	36.0	31.0	3.1	24.4
Rs. 101 — 150	28.8	30.3	39.0	36.2	44.6	21.4	36.0
Rs. 150 — 200	27.4	22.5	17.0	14.5	15.4	33.6	19.5
Rs. 201 — 250	16.1	12.8	5.9	5.6	5.8	17.7	9.0
Above Rs. 250	20.1	15.9	4.0	4.6	1.9	24.2	9.1
	100.0	100.0	100.0	100.0	100.0	100.0	100.0

It is seen that in the North-Western Zone, the proportion of families living with consumer expenditure per consumption unit of less than Rs. 100 is very small. It is also extremely low in the Western State of Saurashtra. In the Northern Zone, the proportion is less than 10 per cent. The proportion of families living under Rs. 100 per consumption unit is also small in Assam and West Bengal (less than 5 per cent). It is generally very high in the South, Western and Central India, and particularly high in Madras (36 per cent) Bombay (43.6 per cent), Madhya Pradesh (36.3) and Madhya Bharat (51.7). What makes the picture more gloomy is that it is particularly in these parts, that the proportion of agricultural labour families to total rural families is very high. If we take the Indian Union as a whole, it is found that more than 80 per cent of the agricultural labour families live under Rs. 200 per annum per consumption unit. In the result, a large number of agricultural labourers live on quantitatively inadequate diets, for want of income and thus remain underfed even in respect of staple foodgrains.

Market Outlook

Wednesday, Evening

PRICE movements in equities in the last fortnight have deepened doubts about the outlook for Stock markets. Some are inclined to the view that the present phase of the market will soon be over, and that equities will gradually resume the upward trend. Some others express apprehensions that the "bear" market may have started. Current price movements in equities indicate that Stock markets have not yet succeeded in reaching a decision about the outlook.

It is clear that the present fall in equities is partly technical. In the recent past, some of the speculative scrips were bid up to unduly high levels. These high levels could not be maintained for ever. A corrective set-back was only to be expected. With the recession in prices, the technical position of the market is now healthier. Even so, it is clear that there is still a considerable "bull" position in some of the speculative scrips.

Causes

Before a discussion of recent developments in stock markets, it is necessary to analyse the causes behind equity movements in the last few months. For some months since October last, stock markets were depressed. Equities were being talked down. It was being confidently predicted that the boom was over. Many reasons were furnished for predicting the end of the long boom. Some of the arguments were valid.

Though equities started falling, it soon became evident that investors were not unduly pessimistic about the market outlook. Boom in equities for some months prior to October, 1954, was partly due to cornering activities. These activities were discouraged as it became known that Government would soon be introducing legislation relating to companies. In the absence of interested buying, economic forces began to make their influences felt.

It was at this stage that another buying movement started. Many companies announced issues of bonus or right shares. In anticipation of such issues, the shares concerned were being bought by speculators. Improvement in some of the shares

in the last three months was due to such speculative buying. This influence is no longer in active operation. This partly explains the recent hesitant trend in equities. All those familiar with stock markets are aware that, after bonus or right issues, the shares concerned develop a sagging tendency.

Indian Iron

Indian Iron were moving up, in anticipation of a higher dividend. To some extent, the spurt was due to expectations of an issue of right shares by the Company. It is now realised that a higher dividend disbursement is not likely. There are growing doubts whether Indian Iron will issue right shares. That is why Indian Iron are falling. As is only to be expected, the falling trend in Indian Iron is having a depressing effect on the whole market.

Why are Indian Iron not falling further? Some are inclined to the view that, despite official denial of rumours, Indian Iron will issue bonus or right shares. It is argued that the Company will have to capitalise reserves in order to ensure a reasonable relationship between its capital and working funds. This is an argument for an issue of bonus shares. Some such argument has been advanced by the Chairman of Tata Steel in support of the Company's contemplated policy to issue bonus shares in the future.

Money Supply

Besides technical factors, there are other reasons why equities are hesitant or falling. There are indications that New Delhi is determined to introduce measures to check undue speculation in stock markets. As discussed in these columns before, New Delhi has issued directives to the authorities of the stock exchanges to adopt measures to curb speculation. These precautionary moves are having their desired effects. Simultaneously, there are other developments which are having a "bearish" effect on equities.

There has been considerable withdrawal of funds from the money market. Both the Centre and the States have floated loans. In the last few weeks, there has been considerable contraction of currency.

These events are being interpreted to mean that the Government is interested in contracting money supplies available to the market in order to discourage speculative activities. There may be something in this argument. But it should not be forgotten that contraction of currency is not unusual at this time of the year.

Many factors have combined to check speculative activity in stock markets. It may be that the fall in equities is not yet over. Even so, it would be rash to jump to the conclusion that the outlook for equities is bleak. There will be considerable deficit financing in the current financial year. As the second Plan gets going, the tempo of economic activity will be higher. In the circumstances, it is a reasonable assumption that the prospects for sound equities are bright.

Jute Shares

While the prospects for equities in general do not seem unpromising, the future outlook for some industries would seem to be uncertain. It is, to take an instance, not without significance that Jute shares remain neglected, despite the abolition of export duties on jute manufactures. This is partly due to the current depression in jute goods. Political developments in Argentina are having a "bearish" effect on hessian because of fears that shipments to Argentina may be delayed. But there are deeper reasons why Jute shares remain inactive.

There are growing fears of competition from Pakistan. Recent developments are ominous. Pakistan secured an American order for hessian at the cost of India. Recently, India lost a portion of the Burmese order for jute goods to Pakistan. Hopes that Pakistan will be forced to reduce the export minimum price for raw jute are receding. Authorities in East Pakistan have repeatedly stressed their determination to maintain the export minimum price at the current high level. This gives Pakistan a decided advantage over its rivals. Growing fears of Pakistani competition are mainly responsible for the current hesitant trend in Jute shares.

Around Bombay Markets

Firm Trend

Thursday, Morning

IN the absence of any fresh factors, the stock exchange in Bombay hovered around the lowest levels during the greater part of the week. The only exception was National Rayon which went up from Rs. 226-12 to 229 on Tuesday. This improved sentiment was inspired by encouraging reports about the Corporation's forward sales for the first quarter of 1956. It is true that technically, these sales have not been finalised as yet, but there are indications to show that sales for three months in 1956 will be around Rs. 3-10 for 150 deniers and Rs. 4 for 120 deniers as against the rates of Rs 3-6 and Rs 3-13 respectively in the last quarter of 1955. Indian Irons too saw some renewed activity, taking up the shares from Rs 38-4 to Rs 39. At buldge, however, the bulls began to liquidate when earlier reports that the Company would announce their dividend on Monday (26th September) proved incorrect. In the event, the quotation naturally reacted and was fluctuating around Rs 38-4. On balance, however, on the last day, on Wednesday there was heavy bull support in all counters depicting a firm trend of the market in general.

Tata Steel ordinary opened the week at Rs 241-8 and after fluctuating between Rs 244 and Rs 240-8 jumped on the last day to Rs 245 to close the week at Rs 244. Indian Iron closed the week at 38-3-6 with a bearish undertone.

Textile shares looked up near the close on heavy influential buying. On suggestion that working of the Bombay Dyeing mills has been better than earlier expectations, the shares were taken up more than thirty points from Rs 503-12 to 535. Under the leadership of Bombay Dyeing other textile equities also went ahead to close the week at or around the best levels. Improvement in Century, Swadeshi, Simplex and Tata Mills were particularly impressive.

In the electric group of shares, Ahmedabad Electric, Tata Power and Tata Hydro stole a thunder. There was heavy investment buying in Ahmedabad electric shares which went up to Rs 113-12 from Rs 109-8. Tata Power also moved up by nearly 20 points to Rs 1535 on proximity of dividend. On the same

ground Tata Hydro also were strong at Rs 156-8.

Bank shares were better but Insurance were weak. Bank of India and Central Bank received investment support. The money that is being received from the Imperial Bank (now the State Bank of India) by way of compensation is now being partially invested either in Electric shares or bank shares like the India or the Central.

On continuous fears of nationalisation, New India Assurance were sold at every rise. They lost two points over the week to Rs 46-4.

In the miscellaneous section, Bombay Burma, Belapur, Killick and Shivrajpur and Scindia fared well.

Cotton

Bearish Movement

THE cotton futures marked continued to display a distinctly

bearish trend mainly on account of prospects of better crop during the 1955-56 season. In the event, the ruling February contract which opened the week at Rs 623 lost more than ten points in the course of the week to touch the lowest for the week on the last day, Wednesday, namely, Rs 610.

Two significant decisions affecting cotton were taken during the period under review. Early in the week, America's decision to sell her surplus cotton to the tune of one million bales in the world market from January 1956 onwards was interpreted bearishly in all the major cotton producing countries despite the US Secretary of Agriculture, Mr Benson's repeated assertion that his country has no intention of disrupting world cotton prices by resorting to 'dumping'. Nearer home, towards the close of the week, the longstanding uncertainty in respect

of import of American aid cotton was cleared when at a meeting (in Bombay) between the trade representatives, the Textile Commissioner and officials of the Finance Ministry steps were taken to ensure import of American aid cotton into India. Some of the salient features of these measures may be mentioned here. The Government of India will nominate agents numbering 15 to 17 and enter into agreement with them with a view to importing American cotton into this country. The total quantity of this cotton will be 84,000 bales of which 50,000 bales are to be imported before the end of October. Although individual ceiling has been fixed at 5,000 bales per week, the aggregate of 50,000 bales could be purchased at the rate of 15,000 per week.

It is noteworthy that only cotton stapling 1-3/32" and above will be allowed for import. In order to ensure good quality cotton imports, it has also been stipulated that if a lot is granted 75 points allowance, the entire lot would get the benefit of double allowance.

Both the above decisions deal with American cotton and while America's decision to sell her surplus cotton overseas has certainly a bearish slant, the Government of India's decision to import US aid cotton is not expected to have any material effect on the market either way. It is true that there has been a considerable decline in import of foreign cotton into India during the season 1954-55 and on that account the import of US gift-cotton may be

welcomed. But this is offset by a general decline in the export of fine and superfine cotton textiles for the production of which alone foreign cotton is at all required.

Oils and Oilseeds

Steady Tone

THE firmness in the oilseeds market witnessed last week has been extended during the week under review also thanks mainly to the entry of Japan into the world markets for castor oil. This imparted strength to the overseas market which naturally resulted in Indian prices being lifted up. There have also been reports that some exporters have put through fresh business in castor oil with the US buyers on the basis of delivery by a chartered steamer. This has naturally given rise to hopes in trading circles that shortly the UK also might become an active buyer of Indian castor oil. On the whole, the oilseeds market presented a firm front unlike other commodities market like cotton which, of late, have been ruling indifferent.

On the reported entry of Japan into the international market for her castor oil requirements, bulls in the local market in Bombay who have accumulated futures became enthusiastic and there was heavy bull buying. When this was followed as usual with bear covering on a sizeable scale the uptrend was confirmed and castor futures, particularly the May delivery, recorded a jump of nearly Rs 5 over the

week to Rs 96. At the close on Wednesday castor May were quoted at Rs. 94-12 while the maturing February contract was placed at Rs 91 (nominal).

In view of the unsatisfactory reports about the crop position, especially in Saurashtra and Hyderabad, groundnut ready and delivery prices displayed a steady to firm trend. This apart, expectation of an export quota announcement some time during October was also responsible for the bullish inclination of the market. Already during the week, stray business in groundnut oil for export to the tune of 500 tons was reported to have been done with Burma. Business with Britain and some Continental countries continues although on a moderate scale.

Thanks to some export business, linseed prices also have improved. Britain is reported to have bought about 2,000 tons of oil at around £93-8 c.i.f. October-November delivery. Business with Italy has not as yet materialised due to the profit margin for the shippers here being not sufficient. Yet another bullish factor to lift up prices in this section has been the report that linseed crop in Argentina has been affected by drought.

At the close of the week, groundnut and oil prices ruled weak on adverse reports from Saurashtra and Southern India. Tempo of arrivals of seeds is said to have increased.

INDIA'S NEWEST

Penicillin Plant!

Designed to produce 20 million mega units of Penicillin every year, the Rs. 2-crore Hindustan Antibiotics Limited, is Asia's newest Penicillin factory. Spread over an area of 200 acres, near Pimpri, 9 miles from Poona, Hindustan Antibiotics is the result of close co-operation, and financial and technical assistance which the Government of India received from the United Nations International Children's Emergency Fund and the World Health Organisation.

Hindustan Antibiotics use highly specialised production methods in processing Penicillin. The preparation of the seed, culture of the mould, fermentation, evaporation of liquid and refrigeration form the most important stages for the production of this wonder drug. Precision electric drive is of utmost importance at each stage.

G. E. has supplied over 100 Electric Motors, ranging from 5 H.P. to 350 H.P., and electric controls for the supply of compressed air, chilled water, mixing of pumping, refrigeration and other processes vital to the production of Penicillin.

G. E. Research and experience have produced precision electrical equipment for installations like the one at Pimpri, which are extremely important to the progress of the nation's health.

Fair Prices of Rubber Tyres

THE question of determining the fair price of rubber tyres and tubes is tied up with the broader question of the operation of foreign companies and the inflow of foreign capital, as all the tyre companies happen to be foreign. The complaint that tyre manufacturers were making too much profit was voiced loudest by raw rubber interests in the country, particularly during the Korean boom; others had also made similar complaints and the Ministry of Commerce and Industry had referred the question to the Tariff Commission as early as 1952. It is one of the most complex enquiries that the Tariff Commission has handled so far, involving as it does the question of costing in an industry with a wide range of products. In view of the world-wide operations of the tyre companies, the apportioning of the large costs of research and development of new techniques and new products is not easy. Add to this, high-pressure competitive selling along with integration of manufacturing which may appear phoney, thought it may not lack justification as this kind of arrangement has enabled many countries to develop and sustain domestic manufacture of tyres where the internal market is not large enough to support competitive production.

In addition to all these, the emotional ambivalence in the attitude towards foreign capital not only in this country but in all countries which have newly won their freedom from foreign domination and which are under-developed, adds a sharp edge to the controversy. All these countries need foreign capital and foreign assistance on a scale never contemplated before, if they are to push through their ambitious development programmes. Their determination to catch up with the West is only matched by their determination not to countenance foreign domination in any shape or form. They are now at the crossroads. Whether they should lean more on the West or on the Soviet bloc to achieve their end has begun to tantalise them. If foreign capital continues to be impelled by the same desire and the same motives which impelled it in the past, the choice will be obvious.

On the other hand, if foreign capital realises that its present prosperity is built, to a large extent, upon the sweat and toll of the people of the underdeveloped countries and that it is as much its concern to raise the standard of living of these people as that of the people of the underdeveloped countries themselves, then only can it play its proper part under the new set-up. That this has not been adequately realised by the Tyre Companies operating in India appears to be the main purport of the Tariff Commission's long-awaited Report on Fair Prices of Rubber Tyres and Tubes.

The Commission does not think that it needs much argument to convince anyone that a profit of 47 to 77 per cent on employed capital is excessive. But it is not so easy to decide what fair profit is. In this case, the Tariff Commission's job was made more difficult because, though all the four companies in the country sell tyres and tubes, they differ widely in their organisational structures. Dunlop's is a public limited company. Goodyear and India Tyre are private companies and get their tyres and tubes manufactured by Dunlop's on a cost plan basis. Firestones have their own factory in the country, but

they operate more or less as a branch of the present company in the USA. In these circumstances, the Commission had no other choice but to take Dunlop's as the representative unit for the determination of fair profits and fair prices.

The Commission has come to the conclusion that 10 per cent on employed capital is a fair profit and though it generally allows depreciation on a two shift basis, in this case, it has allowed special depreciation to the extent of the difference between the depreciation actually provided by the company and that included by the Commission in the computation of costs. In other words, the Commission has allowed the company the full depreciation that it has been providing for. It has not, however, allowed the annual bonus on the ground that bonus should come out of profits. On this basis, the Commission has come to the conclusion that the prices of tyres and tubes were higher than the fair prices by 21.79 per cent in 1946, 18.90 per cent in 1947, 15.26 per cent in 1948, 9.28 per cent in 1949, 7.70 per cent in 1950, 6.88 per cent in 1951, 11.24 per cent in 1952 and 8.52 per cent in 1953. One need not be concerned too much about the past. There appears little doubt, however, that the tyre industry has made excessive profits in the past; whether it was 20 per cent or 5 per cent is now only of academic interest. What need to be examined closely are the Commission's recommendations for the future.

The Commission has come to the conclusion that for the future a judicious system of price control based on uniform selling prices will adequately safeguard the interests of the consumer, without interfering with the continued expansion of the industry, and it has recommended a uniform reduction of 11 per cent in the consumer net dealer prices and list prices.

The Commission has also recommended that Government should explore the possibility of securing imports of tyres and tubes with a view to providing some measure of competition to the Indian companies. Another recommendation made by the Commission is that a pilot project should be started for the manufacture of tyres and tubes and special assistance should be offered to Indian enterprises wishing to enter this field, either independently or in collaboration on reasonable terms with foreign enterprises. The Commission has also suggested that Gov-

ernment should examine the desirability of securing a larger participation of Indian capital in the tyre companies operating in India, in order that the benefit accruing to the national economy from the manufacture of tyres and tubes may be enhanced through the retention in the country of a larger proportion of the profits earned in the business.

Any reduction in price is welcome from the consumers' point of view. The only point to be considered is whether the new prices will be economic for the manufacturer. Government had the benefit of the companies' view before taking action on the Commission's recommendations. The companies' claims that depreciation should be allowed on three shift basis and bonuses should be treated as an item of cost, however, do not seem to have received the attention which they deserve. The Tariff Commission had conceded that the normal practice of allowing depreciation on two shift basis was not adequate in this case and it did not, therefore, object to the additional depreciation. In the circumstances, Government's homily that while depreciation due wholly to the wear and tear of machinery is doubled with two shift working and trebled with three shift working, other elements do not increase in the same proportion, and therefore by allowing depreciation on two shifts while the factory works three shifts, no real injustice is being done to the tyre companies, appears a little out of place.

Nor is Government's explanation for excluding bonus from cost convincing. True enough, on the face of it, it seems to be unexceptionable. After all, bonus is paid out of profits and how can it be made into a cost item? This is, however, too naive a view when Industrial Tribunals consider bonus to be deferred wage and treat it as such. It would be unrealistic, in view of the present attitude of labour, to disregard all this.

As the Commission views it, and Government concurs, the crux of the problem is administrative, selling and distribution expenses. The Commission has come to the conclusion that Dunlop's are not exerting sufficient control over administrative, selling and distribution expenses, and these should be frozen at the 1953 level. This conclusion has been arrived at (a) from observing the steady increase year by year and (b) by comparing Dunlop's expenditure in this regard with Firestone's. To take

1946 as the base year, when Government was taking the bulk of the supply and the administrative set-up was still on a war-time basis, and to conclude, as in the case of Dunlop's, that expenditure on administration etc. in 1953 had increased by 229 per cent, is not very fair. Nor is it proper to compare Firestone's expenditure with that of Dunlop's, when the former works only as a branch office and confines its activities to the production of a narrow range of tyres and tubes alone. Since the Commission accepted Dunlop's as the representative unit, it would have been more logical to confine its examination to Dunlop's expenditure alone and give more concrete suggestions for reduction in expenditure, i.e. whether and to what extent salaries and emoluments should be reduced, how far retrenchment could be effected etc. That would have strengthened the hands of the management to bring about the economies desired by the Commission.

In a situation like that prevailing in the tyre industry, where all over the world economies of large-scale production have reduced the number of producers to a few, to look to competition to secure fair price for the consumer would be futile, though Government apparently has made up its mind to try both price control and competition as the ultimate remedy. Tyre producers, if they are far-sighted, should not object either to the emergence of Indian enterprise in this field or to wide Indian participation in their share capital. In fact, they welcome it. It is only about costs and over-heads that they may have a legitimate grouse, assuming that the measure of control suggested interferes with their operations—of ploughing back profits and initiating continuous new developments within the country in the shape of new products and improvement of existing products. Government wants to invite competition so that control on profits may not weaken the incentive to development. Price freeze may under certain circumstances also freeze the quality of the product. Government may also look to wide Indian participation in the capital of tyre companies for supplying the needed pressure on the companies not to slacken their efforts. A major reorganisation of the industry, particularly of those units which have not yet developed into semi-self-contained Indian units, nor aspire to do so at the moment, will be necessary before all these can be hoped for.

Hauteur

FRANCE is angry over the decision of the United Nations to discuss the situation in Algeria. No UN action on Algeria was envisaged by the sponsors of the resolution in the General Assembly. Their only intention in including Algeria on the agenda was to elicit information about the situation there. This has provoked a show of diplomatic arrogance by France. M. Pinay walked out of the General Assembly; the entire French delegation to the United Nations has been withdrawn. M. Pinay has threatened diplomatic repercussions on nations which voted for the resolution. Because of Russia's support to the resolution, the forthcoming visit of M. M. Pinay and Faure to Moscow has been cancelled.

France is a civilised nation. She is a great power. Her people are intelligent. But M. Pinay's diplomatic affront to the United Nations will prompt civilised and intelligent persons both within and outside France to echo the sad comment of *Le Monde* on the French policy to North Africa:

"France has lost a little more of her prestige as a liberal nation, a little more of her reputation as an intelligent people, and a little more of her standing as a great Power".

France insists that Algeria is part of Metropolitan France. M. Pinay's main argument against the Algerian resolution before the General Assembly was that, under Article 2(7) of the Charter, the United Nations had no authority to discuss issues or questions which were domestic problems of nations. That Algeria is a Department of France, is a legalistic myth. France's claim has no moral basis. As Paul Johnson described the problem some time ago, "the French occupied Algeria by force, they colonised it by force and they still hold it by force". There are two nations in Algeria: 1,000,000 Frenchmen who control the administration and 80 per cent of the economy and 8,000,000 politically and economically underprivileged Arabs".

Apart from legalistic myths, there is the fundamental question of human rights. "It is very evident", M. Pinay made the observation on his return to Paris, "that the events of these days will show it is necessary to modify the functioning of that institution (United Nations)". This

has been "very evident" long ago. If France can quote the Charter in defence of her plea, fortunately unsuccessful, that the situation in Algeria cannot be discussed by the United Nations as Algeria is part of France, it is evident that the Charter needs modification to fulfil its primary aims and objectives.

There will be disappointment over the reaction of the Western Powers to the General Assembly's decision to discuss the situation in Algeria. M. Spaak, the Belgian Socialist, is combative in his support of M. Pinay's haughty conduct before the

United Nations. He has not yet reached a decision about whether the matter should be referred to NATO. But he has expressed his opinion that NATO Powers must have a common policy on issues voted upon by the United Nations. It is not without interest that the *New York Times* has expressed surprise that Greece and Iceland, two NATO Powers, have voted for the Algerian resolution. Bandung has emerged as a major influence in the United Nations. But Bandung is not a counter-NATO. M. Spaak and the leaders of the Western Powers can only perpetuate world conflicts by instigating NATO Powers against Bandung countries.

FAMOUS *throughout* INDIA

Gateway of India,
Bombay.

The name 'West End Watch Co.' famous many years before the Gateway of India was built, is still the symbol of superlative value in watches.

Styles range from sturdy work-a-day models to elegant dress watches (and prices vary accordingly,) but all are built—with Indian conditions in mind—to give lasting and accurate service. See the words 'West End Watch Co.' on the dial before you buy.

Prices in Agriculture and Industry

THE problem of agriculture is its reorganisation which in its turn means changing the existing system of land ownership and cultivation. And since agriculture does not stand in isolation, the problem has to be viewed in relation to the rural economy as a whole on the one hand, and the industrial sector on the other, which brings in the question of price policy. Neither on the question of price policy nor on that of land policy was Shri Ajit Prasad very illuminating when he initiated the economic policy debate in the Lok Sabha. For the latter, he has an excuse. Land comes under the State list. The Centre can only plead or try to persuade; it cannot direct the States. About agricultural prices, however, Ajit Prasad did not feel diffident at all. Price support had worked, and it had cost very little. He almost seemed to imply that reorganisation of rural credit under the aegis of the State Bank and the warehousing scheme would do the rest. Strengthening the agriculturist's holding power may protect him from the middleman, but it does not do away with the problem of relative prices or appropriate techniques and organisation needed for securing the objectives of the Second Plan.

While the Minister for Food and Agriculture is busy supporting prices in this sector of the economy, it is good to see at least one of the industrialists advocating price reduction. Lala Sri Ram is still toying with the idea of letting every middle class home have a table-fan for Rs. 60/- and a ceiling fan for Rs. 100/-. The price reduction that Jay Engineering has been able to offer in respect of sewing machines, naturally figures in his speech at the annual general meeting of the company. So, to say "toying" is not to question his intentions, but merely to draw attention pointedly to the current disparity in the movements of industrial and agricultural prices and the drift towards a high cost economy. Lala Shri Ram is prepared to plunge for price reduction, if labour would co-operate by accepting a ceiling, not on wages but on bonus, or rather forgoing a part of bonus, while managing agents make a similar cut on their commission. But even if this is done, it will hardly go very far in the enterprises which Lala Shri Ram controls. Shri Ram's ventures are mechanized to a sur-

prising extent and wage bills account for only a modest part of their total cost. Taxes come in the way of substantial price reduction and taxes can hardly be touched these days, judging from the way things are going. That does not mean that Shri Ram believes in low wages. He does not. He claims that Jay Engineering workers are the most highly paid and challenges the claim of Bombay industrialists that the wages they pay are the highest, though he admits that the industrial worker in Bombay is the most highly paid in India but whether it is due to his better ability or harder work or otherwise he does not know.

Laos

NON-INTERFERENCE in the internal affairs of nations is one of the principles of Panch Shila. Both India and Laos accept Panch Shila as the basis of relations among sovereign nations. India wishes well of Laos, whose Crown Prince and Prime Minister were on a visit to this country. Laos is one of the States in Indo-China which is expected to hold general elections under the Geneva Agreement by the end of this year. Owing to political differences between Laos and Pathot Lao, the elections, which were to have been held in August, had to be postponed. As the leader of the International Supervisory Truce Commission, India has a responsibility to ensure that the Laotian elections will be free and fair. But the people of this country will echo Pandit Nehru's wish that the people of Laos will succeed in solving their problem without outside interference.

Under the Geneva Agreement, the elections are to be held in the areas under the Royal Laotian Government and also in those under the control of Pathot Lao as a preliminary to the union of these two parts of the country. Pathot Lao represents a resistance movement which is influential in the two northern provinces of Laos. Its representation in the transitional Government, pending the elections, is provided under the Geneva Agreement. Pathot Lao demands representation in the administration which is to arrange the elections. There is deadlock between Pathot Lao and the Royal Laotian Government on this issue.

That was why the elections were postponed from August last to De-

cember next. There are suspicions that the Royal Laotian Government speaks with two voices. Laos participated in the Bandung Conference of Asian and African nations. In New Delhi recently, the Crown Prince of Laos reiterated that country's adherence to Panch Shila. But, some time ago, when the American Secretary of State visited Laos, the Laotian Government issued a communique expressing satisfaction that Laos was covered by the geographical guarantee of the Manila Treaty. Pathot Lao may not claim the same status as that enjoyed by Viet Minh under the Geneva Agreement. But impartial observers will endorse the views expressed by the International Supervisory Truce Commission that the Royal Laotian Government should reach an agreement with Pathot Lao so that the elections can be held for unifying the country.

Calcutta Tramways

MR D E WEBB, Chairman of the Calcutta Tramways Company, Ltd., is provocative in his address to the shareholders of the Company. He is proud of Calcutta Tramways' achievement. This "unsubsidised public transport undertaking in the year 1955 can carry its passengers for 2½ miles for a fare of 1d. and make a profit". The story has a moral. "I think", Mr Webb concludes, "this says a great deal for free enterprise".

With the proposed final dividend of 4½ per cent. free of tax, the total ordinary dividend for the year to December last will be higher at 7½ per cent. free of tax.

CTC carries passengers 2½ miles for a penny. Even then, CTC earns enough to step up dividend payments. So far, so good. But this is not the end of Mr Webb's story. Mr. Webb laments that sums provided during the year for modernisation "are insufficient to cover the necessary expenditure on improved rolling stock, revised track layouts and the latest equipment for the workshops and sub-stations of this great undertaking." He apologises that, in the absence of an increase in fares, allocations for modernisation cannot be raised. He explains that the Company does not propose to raise fares as any such action may provide opportunities to Calcutta's "political extremists" to create trouble and civil disturbances.

American Subsidiaries in U K

THOUGH the late Sir Alexander Fleming, the discoverer of penicillin, and the father of anti-biotics, was a Briton, the commercial production of anti-biotics until recently was an American monopoly and the new £2½ million anti-biotic factory opened last week in Kent, is a joint Anglo-American enterprise. While the project is essentially a British project, the parent company which founded the firm, Charles Pfizer and Co., Inc., is American. This is going to be the most modern plant in Europe and according to the hand-out issued by the British Information Services, it is expected to save Britain between 7 to 8 million dollars a year in foreign exchange. This sort of Anglo-American co-operation is, of course, not new. Indeed, it has been one of the most remarkable of post-war phenomena, the economics of which has not perhaps received the attention it deserves.

As a result of enormous post-war expansion of American corporate investment in Britain, many of the goods previously imported from the U S are now being produced in Britain not only on a large enough scale to eliminate imports, they are playing an increasingly important role in Britain's exports. In the latest issue of the District Banks Review, Mr. John H. Dunning points out that before the war U K imported some 70 per cent of the products of such newer industries as agricultural tractors, industrial instruments, anti-biotic drugs and sulphonamides, whereas now she is well nigh self-supporting and has actually sent overseas about 30 per cent. of last year's output. Indeed the U K is today the second largest world exporter of office machinery and agricultural tractors and the value of the refined petroleum exported is in excess of the "traditional" coal exports. Moreover, despite the pre-war American monopoly, Britain is exporting substantially the same quantities of washing machines, refrigerators, agricultural tractors and excavating equipment as the States.

The immediate explanation of the high export achievements of American branch subsidiaries is that in its post-war screening of would-be foreign investors, the British Government has been biased towards those which offered a high export potential, whilst the Americans have been influenced by the world dollar shortage and tariff restrictions. Moreover there has recently been a tendency, especially where the British

subsidiary can produce and sell at a lower cost than its parent concern owing to the different wage levels in the two countries, for the parent concerns to route all foreign orders via their subsidiaries.

From this the author concludes that American manufacturing firms in Britain are helping to further Britain's newer exports. There is, of course, a reverse to the picture and that is the outflow of dividends. Although this flow will no doubt grow, the net gain of foreign exchange should continue to increase, provided the export (or import replacement) achievements of the American subsidiaries expand in like proportion. American corporate investment is strengthening the economic and strategic ties and should be mutually satisfactory since the U. K. would benefit from American research and the U. S. from the differential in manufacturing costs and the inherent skill of British labour.

Different Story in India

SAVING in foreign exchange in general and savings in dollars in particular have also been a prime consideration which paves the way for the operation of American subsidiaries in this country also. But primarily because of the agreements regarding their fields of operation, few of the subsidiaries, American or British, have so far played any appreciable role in our exports. There is one peculiarity, however, in the operation of some of these subsidiaries, particularly the American, to which attention has been drawn in this paper from time to time but on which not much light has been thrown by the Reserve Bank or the Government. It is the capital part of their operations. Many of these subsidiaries seem to operate without making any significant direct contribution to the country's foreign exchange reserves in so far as they are financed very largely, if not wholly, from bank advances. The Tariff Commission on Fair Prices of Rubber Tyres and Tubes has shown that one of the tyre companies, American, has a paid-up capital of only Rs. 20,000 though its total turnover runs naturally into crores. Since this subsidiary, like others, has the full sanction of exchange control, it would be interesting to know how its operations square with exchange regulations and in what way, beyond saving of foreign exchange on tyre imports which are rendered superfluous, it contributes to the foreign exchange reserve of the country.

'Divine Right'

FEW will envy Shri B G Kher in his new responsibility as Chairman of the Hindi Commission. The questionnaire issued by the Commission has itself caused considerable uneasiness in the non-Hindi-speaking States, particularly in the South. In the Madras Assembly, powerful voices were raised for extension of the time-limit of 15 years set by the Constitution to replace English by Hindi as the official language. And on behalf of the State Government, it was conveyed that efforts would be made to get the constitutional provisions regarding the issue re-opened and reconsidered in concert with other non-Hindi speaking States in the country. The only hopeful feature is that the Madras Government is prepared to be guided by the views of other non-Hindi speaking States. It is important that whatever attitude comes to be adopted has the support of as many non-Hindi States as possible; for the issue is truly a national one, and individual dissent would only complicate matters not only for the country as a whole, but also for the State concerned.

Meanwhile, there has been no lack of assurance on the part of the Union Government that there is no intention to impose Hindi on the country; but the insistent advocacy for the language, and the steps that are already being taken for installing it as the official language, make the distinction between persuasion and compulsion seem very thin.

To speak of 'Hindi imperialism' may be more than hyperbolic; but the air that some of the Hindi zealous of the north assume of being almost divinely ordained to lay down the law on language and culture to the rest of the country smacks of frank domination. It is the tone and aspect of these shoddy autocrats, more than any other factor, that has queered the pitch for the easy progress of Hindi. But the question is whether the non-Hindi-speaking majority, however annoyed they may be by the insolence of these few, should, because of the few, jeopardise in any manner the interests of the many. Indeed, it is a matter for grave consideration whether the present trend towards unity, cohesion and social and cultural synthesis should be retarded through lack of a common, unifying medium of communication native to the soil. English may, and must indeed, continue as a language of importance; but can we whole-heartedly hug it, as our *lingua franca*?

Pandit Nehru in the South

THE separatist undercurrent in South India, concern over Hindi, the threat to the honour of the National Flag and the re-emergence of communalism or rather of casteism in less repellent, though not for that reason less mischievous, garbs lend special significance to Pandit Nehru's extended tour in the State of Madras, regardless of what the immediate purpose of his visit might have been. Apart from that, District Board elections are drawing near; and though the Congress might have done well in the civic elections in Madras, it provides no clue to the possible turn of events particularly in the districts which were included in Pandit Nehru's itinerary. In two of them, the Congress has an embarrassing alliance with a party owing its origin to communalism; in two others, Shri E V Ramaswami Naicker's Dravidian forces roam; and in the remaining district, the position of the Congress is frankly weak.

If the crowds that lined the streets to welcome Pandit Nehru, the warmth of their ovation or the eagerness with which they listened to him are any indication, his tour has been a great success. But the fact that is often apt to be overlooked in Nehru's case is that the masses are likely to have one type of feeling towards him and quite another to the organisation that he represents, though the two may seem to get mixed up. However closely Pandit Nehru may identify himself with the Congress and however emphatically he may proclaim it, most people are prone to make that fine distinction between the man and his organisation which sometimes leads to unexpected results, as in the case of some campaigns he conducted at the time of the last elections.

In the course of his present tour, Pandit Nehru has been persuasive on the issue of language, silent on the Dravidasthan movement and as heartily critical of sectarianism as ever. This was perhaps to be expected; and though there cannot be much surprise either in his vehement declamations against those who might have been, or tend to be, disrespectful to the National Flag, one wonders whether the full fury of the language he employed on the subject was called for. It seemed as though he was attaching too much importance to the dolings of a group of charlatans in the South who have been entertaining the public to antics far crazier than the one which

provoked Pandit Nehru's ire.

Apart from that, it is a moot point whether respect for a symbol as freely and happily accepted, as lofty and as deserving of universal acclaim as the National Flag is to be promoted by indignant outbursts and threats of punishment on the part of leaders and State dignitaries every now and then—or rather by the robust play of enlightened public opinion. Reverence that is enforced bears no comparison with reverence that is freely and thoughtfully given or is fostered by popular will.

Letter to the Editor

Mal-adjusted But Not Ethnic Anglo-Indian

YOUR indictment of the Anglo-Indians (in the Weekly notes in the last issue), to my mind, savours more of Beverley Nichols and Bhowani Junction. Your advice to this community is that of a candid friend but has it occurred to you that your exhortations to the Anglo-Indians might very usefully be directed to other Indians? Is it your contention that Anglo-Indians are more mal-adjusted and less patriotic than, say, the Indian Muslims, who even to this day owe their spiritual allegiance to Pakistan, or the Parsis, who, even to this day, dearly love to pass off for Greeks and Spaniards

From the London End

Assimilation Or Independence — Turmoil in Algeria

ON August 23, 1946 there took place a remarkable and highly suggestive episode in the first post-war French Constituent Assembly. The war in Europe had ended a year earlier and constitution-making in France had begun; in the extremely complex and politics-ridden discussion the question of the future of the Colonies turned out to be the least important. If there were any Colonial problems they were solved, at least to all Frenchmen, by the enthusiastic verbiage of M Herriot: "There are a hundred million Frenchmen" and "our younger brothers not yet of age". It was in the midst of protestations like these that the young Algerian Deputy, Hadj A Saadane dropped the first brick of realism into French overseas politics. With a modesty that should have been a lesson to his European colleagues,

while on continental tours financed by 'Tata Deferreds' and the savings effected by staying in Parsi ghettos at rock-bottom rents? Perhaps, sir, it may not be very tactful on your part to alienate the riotous Muslim or the prosperous Parsi. Hence your partiality for the Anglo-Indian.

As for the Anglo-Indian demand for English medium schools, surely you are not unaware that these institutions are largely patronised by 'superior' non-Anglo-Indians who would resent their children sharing tuition with the common herd in vernacular schools. The real Anglo-Indians who badly need your advice are the spiritual and mental Anglo-Indians amongst us, the type of denatured Indian who is illiterate in his own mother tongue, who disdains Indian ways and manners, who is a trifle ashamed of being known as a Hindu, and who is remarkably immune to any nationalising influences, like the Mysorean intellectual who after two decades of service in Bombay cannot tell Marathi from Gujarati and who has to forego a proper hair-cut due to sheer inability to communicate with the barber. In the meanwhile, we had better leave the ethnic Anglo-Indian to himself and try to reform the 'brown' and the 'ebony' sahibs in the country.

"A mal-adjusted but not an ethnic Anglo-Indian"
Bombay October 5, 1955

he commenced his maiden speech:

"I feel somewhat embarrassed in addressing this assembly, which consists chiefly of Frenchmen (violent interruptions, right and centre) because I fear I may not be able to make myself understood."

The President rose to "correct" M Saadane. He reminded him that he was "a Frenchman" and that he was "speaking from the rostrum of the French Parliament". The modest M Saadane persisted. In a brief retort to a Radical deputy's interruption that if he did not understand the President's "correction" he "must go", M Saadane said:

"If France does not give us the rights which she ought to give us in accordance with her philosophic traditions and her history, we shall go!"

Only the extreme left benches ap-

plauded. But as a whole the French deputies still could not understand why the Algerians refused the offer of being called Frenchmen. And it was here that M Saadane let loose the brick:

"Many people say to us: why do you not accept the policy of assimilation? We are making Frenchmen of you. Why do you reject the honour done to you? In a community like ours the national stage is an inevitable and natural stage of development and I do not understand how any members of this Assembly could possibly condemn national feeling. You brought us your civilisation—that above all I honour in the record of France—the ferment which would make possible the enfranchisement of man. You showed us the way, you gave us, the taste of liberty, and now, when we say that we do not want the colonial spirit or the spirit of colonisation and that we wish to be free, to be men, no more and no less, you deny us to take over your own formulas, and are surprised, you Frenchmen, that a few spirits among us aim at independence."

The abjectly insensible President then called upon M Saadane to "address us as a Frenchman".

Now, some nine years later, the French Government announces that nothing will deter it from its policy of "forcible assimilation" in Algeria. And in a way which M Saadane had so cogently argued nine years ago, the Second College of the Algerian Assembly has now decided by a large majority to reject French integration—forcible or otherwise. The period of boycott and inevitability of bloodshed between Algeria and France on the scale of Morocco is now in the offing.

The policy of "assimilation" was first contained in the infamous Algerian Statute of 1947. And it was in that statute that the tone and deeper meaning of "assimilation" came to be learned by the Algerian people. The statute recognized the territorial unity of the three Algerian departments and it gave them certain administrative autonomies with an apology of a parliament of their own. The powers of the parliaments (the colleges) were so restricted as to reduce them to talking shops. The feature of the statute which most clearly showed French colonial aims in Algeria was the provision which perpetuated the

pre-war demarcation between the colons (the French settlers) and the Algerian people. The statute placed the Algerians in the "old" category and the Europeans in the "new" category. These two types of "citizens" vote in separate colleges and while the first "old citizens" college (the Second College of the Algerian Assembly) outnumbers the "new" college by eight to one, both send the same number of representatives to the Algerian and the French assemblies.

In spite of the restricted powers of the Colleges and of the Algerian Assembly, the French administrator has continued to act as a dictator in the interest of the colons rather than as an "adviser" as he was supposed to do under the Statute. In fact, therefore, the 1947 Algerian Statute had the effect if not the purpose of perpetuating those power relationships which existed in the pre-war years rather than promoting what was termed "assimilation".

In a thousand other ways, irrespective of what guarantees remain in the 1947 Statute, the policy of assimilation has been and is being flouted. The police in Algeria act arbitrarily where such actions concern the "old citizens". Only in January last a group of Algerian deputies made a protest to the Paris authorities at the lack of "fair judicial" facilities for Algerians subject to arbitrary police action. The protest went unheeded and the Algerian deputies responded by stating that they had seen "through" the policy of integration and would accordingly subscribe to the demands of Algerian nationalists. Racial discrimination and segregation (the very opposite of "integration") is practised in the occupation of land in particular areas, in the grant of trading facilities, the right to enter particular occupations and trades. The social and economic hegemony of the colons governs French policy in countless forms and after nine years of warning, the change which the Statute of 1947 was supposed to introduce remains as dead as all French promises of "reforms".

Like the policy of all the Colonial powers, French policy in Algeria is steeped in hypocrisy. The more naive of French administrators, when they are frank and honest, say that universal suffrage in Algeria will create havoc for French democracy, that the Algerian people are ignorant and that there is no limit

to their capacity to be led astray. It is for these reasons, such administrators explain, the Algerian people should be told how to fill their voting forms, and if they choose wrong in spite of that, "we must be able to correct the results". (It was because of doubt on this understanding that the results of the last Algerian elections were rigged by the French authorities). The more subtle exponents of French policy in their franker mood, however, refer to the investments of the French capitalists and of the French banks, of the phosphate and potash mines and to the cheap labour which is so abundant in the country. They may also justify the maintenance of French power in Algeria to satisfy France's prestige in the Mediterranean and in Africa. And all this placed alongside the protestations of a "hundred million Frenchmen" and "assimilation", fouls the political atmosphere in Algeria.

The statements of the modest M Saadane in 1946 have always reflected the mood of the Algerian people faithfully. In the first elections after the 1947 Statute, the Algerian Peoples' Party demanding the right to self-determination swept the polls and gained almost all the seats in the Second College. The reaction of the colons was shown by their voting to power in the First College the reactionary colonial Gaullist Rally. The completely opposing stand which the one college took to the other created for the French Ministry of the Interior an impossible situation. Being past-masters in the art of political humbug, the Authorities both in 1948 and 1951 so shamelessly rigged the election results that the representatives sent to the Second Algerian College were nearly all official candidates—"yes" men, as they are called locally. It is these "yes" men who have now withdrawn support to integration and gone over to the Algerian Peoples' Party. It is these "yes" men who last week refused to come to Algiers to listen to the "reforms" which were promised in the 1947 Statute and which now was again to be promised by M Soustelle, the Resident-Governor. And thus with the postponement (by M Soustelle) of the Algerian Assembly following the "yes" men's refusal to co-operate any longer, the whole facade of democracy in Algeria has vanished. Integration, or the French understanding of it, has been seen through and the era of bloodshed in Algeria has begun.

From the Calcutta End

Plan and Big Business

WEST Bengal's Big Business does not like the look of the Plan-frame. It does not seem to be bothered about whether a physical or a financial approach to planning is more appropriate. It does not endorse the Plan-frame's emphasis on cottage industries. But its main quarrel with the Plan-frame is that the draft's bias to the public sector will impede economic progress. It is opposed to the proposed Company Law.

Last week, presidents of the Bharat Chamber of Commerce and of the Indian Chamber of Commerce had occasion to analyse the Plan-frame. Shri Rangnath Bangur, President of the Bharat Chamber, was combative in his criticism of the investment pattern of the Plan-frame. Shri N. L. Kanoria, President of the Indian Chamber, stressed the need for blasting the transport bottleneck. Both were critical of the Company Law.

Plan's Investment

Neither Shri Bangur nor Shri Kanoria discusses the problem of availability of resources for the second Plan. But Shri Bangur questions the investment pattern of the Plan-frame. Under the Plan-frame, the outlay on the public sector will be Rs. 4,300 crores, and that on the private sector will be Rs. 2,200 crores. Shri Bangur's contention is that such an investment pattern will have wholly differential income-effects on the various economic groups. And, also, it will unduly widen the public industrial sector without producing proportionate beneficial results either on employment or on the distribution of income.

One of the main aims of the Plan-frame is to provide ten to twelve million new jobs. Detailed breakdown figures of new employment and annual real output per worker in the various sectors of the economy are included in the Plan-frame. From these figures, it would seem that the income of industrial workers will increase by Rs. 407, while the increase in the income of agricultural and allied workers will be about Rs. 89. This is what he means by his criticism that the income-effect of the Plan-frame on the various groups will be of a wholly divergent character.

Shri Bangur endorses the Plan-frame's emphasis on industry. But,

of the Rs. 1,400 crores allocated to the industrial sector, only Rs. 400 crores will be spent in the private sector. By the end of the second Plan, the industrial segment of the economy will represent an investment of Rs. 1,300 crores in the private sector and an investment of Rs. 1,200 crores in the public sector. By the end of the second Plan, therefore, Shri Bangur complains, the private sector will, in investment terms, play a relatively subordinate role to the public sector in the industrial economy of the country.

Employment

Shri Bangur is not without sophistication in his arguments against the Plan-frame's emphasis on industrial investment in the public sector. He applies the test of employment to damnify the Plan-frame's investment pattern. New investment of Rs. 1,000 crores in the public industrial sector will not provide employment to more than one lakh persons. But, Shri Bangur calculates, Rs. 400 crores of investment in the private industrial sector will increase employment by five times as much.

Shri Bangur concedes that the estimated investment in the public industrial sector will broaden the capital base of the economy. But he argues that it is the economic base rather than the industrial base which should be strengthened at this stage of planned economy. "I hold, therefore", Shri Bangur concludes, "that the investment volume in the public sector has been over-allocated". He has a constructive suggestion. It should not be difficult for those familiar with the pattern of industry in India to anticipate it.

Medium Units

He is in favour of a shift in investment from heavy industries to medium-sized industries. There is scope for expansion of medium-scale industries. These industries can absorb a considerable portion of the working force now employed in agriculture and allied industries. Such an occupational shift is desirable. In support of his plea for expansion of medium-sized industries, Shri Bangur argues that, at the present phase of the national economy, the problem is more of balancing than of keying-up aggregate income.

Shri N. L. Kanoria discusses some of the points raised by Shri Bangur.

But he is convincing in his plea for blasting the transport bottlenecks. Expansion of the railway system lags behind the rate of economic development. So, mobility of goods suffers. There is a plan by the Railway Board to increase mileage by 3,000 miles. Shri Kanoria estimates that an increase of 10,000 miles in railway mileage would have been more appropriate. He is also in favour of a more rapid development of road transport. Expansion of railway and road transport could, Shri Kanoria suggests, provide considerable new employment.

Shri Kanoria is equally constructive in his discussion on the railway freight structure. He concedes that the railways, India's biggest national asset, must be a paying proposition. But his point is that railway freights should be so arranged as to assist rapid expansion of industry. As industries develop, the volume of goods traffic will expand. He argues the case for a more rational freights structure which will help railway revenues by encouraging the volume of goods traffic.

Company Law

Both Shri Bangur and Shri Kanoria refer to the changes in Company Law. Shri Bangur complains that the procedural details are so complex that it may be difficult for small companies to maintain their corporate existence. He is not as much worried about the actual provisions of the law as about the views expressed during the debate in Parliament on the Companies Bill. Shri Bangur is candid in his confession that he is apprehensive of attempts to "treat Company Law as an opportunity for pattern-setting of a social system"

Shri Kanoria is more diplomatic in his criticism. There is a clause which empowers the Government to exempt from all or any of the provisions of the law those concerns in which the Government holds 51 per cent or more of the share capital. Shri Kanoria takes objection to this attempt to introduce casteism in company finance and management. State undertakings are expanding with the extension of the public sector. Their affairs should be subject to periodical examination through increasing public participation. This demand will be widely endorsed.

Official Papers

Farming as Industry in Denmark

Danish Agriculture—Denmark as a Food Producer. The Danish Agricultural Organisation, Copenhagen. Pp. 94. Price not stated.

THE question is sometimes raised whether India cannot achieve prosperity through development of agriculture, apart from, and in addition to, industrialization. But the question is raised only to be immediately dismissed without even a cursory examination. The examples of Denmark and New Zealand are usually considered to be exceptions which prove the rule that prosperity cannot be achieved through agriculture, however well developed. The fact that both the countries named are small in size is taken as conclusive evidence of the absurdity of the belief that India can ever tread the path followed by them.

Without suggesting that India can in fact follow this path, it is open to argue that considerable development of Indian agriculture is still quite possible and that in bringing this about, the experience of these two countries might prove invaluable. This is particularly so because in future the development of Indian agriculture must be much more varied than it has been so far. The need "to increase the supply of food of higher nutritive and protective value such as fruits and vegetables, milk and milk products, eggs, fish, meat etc" has been recognised in the Draft Plan-frame. It is time now that we turned our attention to how this can be done. The story of Denmark's progress is very interesting from that point of view.

"The soil", this little book points out, "is virtually Denmark's only raw material. There is not much of it and it is not in itself particularly fertile." Yet, although only a fifth of the total population is dependent on agriculture, "Denmark's prosperity depends upon selling her agricultural products abroad." Agricultural products average about two-thirds of the value of all Danish exports. The explanation of this can be found in the production of large quantities of top quality foodstuffs at competitive world prices. The story of how Denmark maintains its watchwords of efficiency and quality is one of untiring effort to improve strains of livestock and techniques of production, with strict enforcement of high quality standards for every product and the operation of

the whole system at every stage through co-operation.

Co-operation is in fact the kingpin of the whole system. A single Danish farmer may belong to the co-operative dairy, bacon factory, cattle export society, egg export association, feeding stuff society, the fertiliser society, tractor station, poultry dressing station, seed association, cattle breeding society, cattle insurance and other insurance societies, laundry, cold-storage lockers, machinery purchase societies and, last but not least, credit society. This formidable list justifies the conclusion that producers' co-operation is a dominant factor in Danish agriculture.

The reason why a single Danish farmer may belong to such a large number of co-operatives is that Danish agriculture is largely mixed farming, dairying, pig-keeping and poultry farming being the major occupations that are combined with cereal production. These different activities are carried on so as to sustain one another, thus contributing to the prosperity of the farmer.

In each field of activity, a tireless search for quality in the product and for efficiency—to reduce costs—characterises the common effort. To ensure an improvement in the quality of the product, careful breeding and elimination of low quality stock are resorted to. The elimination of

tuberculosis in cattle and the raising of the production of milk as well as of its butter-fat content have helped dairying. The deliberate development of a breed of pigs with long sides, light shoulders, good hams and little back-fat, which grow rapidly under careful feeding, has helped this sector.

Finally, the development of qualities of high egg production and good flesh have made poultry farming an important contributor to the average agriculturist's income. It is clear that no effort is spared to ensure in every sector those qualities that will pay the Danish farmer for the effort put in by him. Farming is not treated merely as a way of life—an excuse for slipshod production technique and inadequate effort. Farming is an industry whose object is a high standard of life for the Danish citizen, and it is clearly realized that this can never be achieved without meticulous care and long-term effort.

This little report has chapters on horses, potatoes, fruits, herbage and grain seeds also. Though the information is presented in a popular style and few quantitative data have been given, except incidentally, it impresses the reader considerably by its repeated emphasis on the basic principles followed in all sectors of Danish agriculture—quality and efficiency through co-operation.

Book Review

Unemployment: Cause and Cure

Problems of Unemployment in India by Moti Lal Gupta, University of Rajputana, Jaipur, Rs. 10. Pp. 184.

THIS is the author's doctoral dissertation at The Netherlands School of Economics. It is divided into three parts. In part one the magnitude of the unemployment problem is estimated, in part two an attempt is made to analyse this problem and in part three, measures are suggested to solve it.

Under unemployment, the author includes seasonal, disguised and visible unemployment and estimates that about 30 per cent of the population of working age is unemployed in India. Inevitably this estimate is

based on certain arbitrary assumptions. However, it accords well with the general impression about the magnitude of this problem.

In the part dealing with factors responsible for unemployment, the author lists growth of population, shortage of capital, British trade, tariff, transport and fiscal policies, the system of education etc. This is rather a commonplace presentation of the problem and the author has not tried analytically to link the different factors so as to establish

the casual relations in this dynamic process.

One of the major solutions, suggested by the author, of this problem is to develop industries with low capital coefficients. The author seems to be confused at this point, and is not able to distinguish two separate problems: the problem of choosing the industries to be deve-

loped and the problem regarding the choice of the methods of production for these industries. The right criterion for the choice of industries to be developed is social benefit—social cost criterion, however nebulous it be, and not the capital intensity criterion. The capital intensity criterion is relevant only when trying to solve the second problem.

In trying to deal with far too many topics, the treatment of the subject has become rather superficial. Moreover, there are a lot of tables and computations, which are irrelevant to the main purpose and could have been safely omitted from the book. It could perhaps be regarded as a competent piece of compilation rather than a good piece of research.

Flood Damages of 1955, Orissa Delta

Kumud Bhushan Ray

A LOOK at the map will show that the waters of the three principal rivers flow through one or another of the many channels in the Orissa Delta. Thus the water of:

The Baitarani flows through the Lower Baitarani and Dhamra, or the Kharasua and Maipura Rivers into the sea, while the Dhamra and Maipura Rivers are connected with each other.

The Brahmini flows through the Kharasua or the Bara Brahmini, which are joined together lower down, and then through the Dhamra and Maipura Rivers into the sea.

The Mahanadi flows through the Birupa, Lower Mahanadi, and Katjuri Rivers. The Birupa flows through the Bara Brahmini and finds its way into the sea through the Dhamra and Maipura Rivers. The Lower Mahanadi splits up into the Nuna, Chitartola, Sukpaika and Paika Rivers, which join a little upstream of the outfall into the sea, near False Point Light House. The Katjuri splits into the Lower Katjuri and Kuakhai. The Lower Katjuri has a loop known as the Sarua, and the lower reach is the Debi River flowing into the sea. The Kuakhai splits into the Kushabhadra flowing into the sea, and the Bhargavi and Daya flowing into the Chilka Lake.

It is thus very uncertain how much of the flood waters of each of these three principal rivers will flow through the several channels in the Orissa Delta.

Erosion of River Banks

The flow of water on the surface of the land is down an inclined plane, from a higher to a lower level, and is due to the motive force of gravity. The acceleration caused by the motive force of gravity is balanced by the frictional resistance to flow, so that running water in a channel develops a mean uniform velocity. In order that the velocity may remain high, no part of the motive force of gravity should be allowed to be dissipated. Such dissipation of energy occurs in the creation of eddies, in flowing round bends, in erosion of river bed and banks, and in transportation of the additional silt load formed in the process of erosion.

The primary function of a river is to drain the water from its catch-

ment to the sea, and to replenish the water that evaporates from the sea, thereby maintaining nature's balance. For a river to perform adequately this function, it must have:

- A channel of adequate sectional area;
- A high velocity of flow;
- The shortest length from the source to its outfall; and
- A stable alignment.

The great force which a river commands—its current of water—enables a river to create and maintain a channel of adequate section, by its power of erosion and of transportation of silt load. As these powers increase in geometrical progression with an increase in the velocity of the current of water, the velocity in a channel must remain high. With a high velocity, a river has been observed to develop a straighter alignment, so that it has the shortest length from its source to its outfall. Such a river is able to maintain a straight alignment without eroding its banks.

Rise in Bed Level

Erosion of river banks goes on increasing the channel width. With an increasing sectional area, the velocity of flow goes on decreasing, reducing thereby the power of transportation of silt load of a current of water. Part of the silt load, therefore, goes on depositing on the channel bed, raising the bed level of the river. Thus with erosion of river banks, the river goes on becoming wider and shallower. When silt deposits to a greater extent in certain parts of a channel bed, islands are formed. Erosion of river banks also causes development of bends, lengthening the channel.

Thus with the erosion of its banks, the channel of a river becomes wider and shallower, while its alignment becomes tortuous and the course of the river lengthens. The hydraulic mean depth goes on decreasing in a widening and shallowing channel, while the slope of water surface goes on flattening in a lengthening channel. As a result, the velocity of flow goes on decreasing, so that the discharging capacity of the river goes on diminishing. With a decreasing velocity, the river is not able to transport the whole of its silt load to its outfall into the sea. A part of the silt load thus goes on being de-

posited on the channel bed, raising its level. With a rise in the channel bed level, the dry season as well as the flood season water level goes on rising, until flood water level becomes higher than that of river banks. There is then overflow of water away from the channel, submergence of river side lands and flood damages.

With a gradual lengthening of river channel, as a result of development of bends, water in a river has to travel increasingly longer distances to its outfall into the sea, with a decreasing velocity. Drainage of water from a river's catchment into the sea is thus delayed, there is consequent heaving up of water level, further rise in flood water heights, greater overflow away from its channel, greater submergence of river side lands, and greater flood damages.

Natural Levees and Swamps

When water flows away from a river channel, there is a sudden decrease in the depth of water flowing over the river bank, as compared to that in the river channel. This sudden decrease in depth causes a sudden decrease in the velocity, and this decrease in velocity continues as the water flows away from the river's edge, on account of the decreasing depth of water. A considerable part of the large silt load, transported by a current of water with a high velocity in a river channel, is thus deposited on a small width of the river banks. Marginal embankments, or as they are called, levees, of small width, are thus formed naturally along both banks of the river, where water overflows the banks. Further away from the river banks, the velocity of flow over the land becomes negligible, so that little or no silt is carried so far, and with little or no deposit, there is little or no rise in the level of the land, which remains practically at its original level.

As this process of overflow continues, the level of the natural levees goes on rising, while the level of the channel bed and consequently the dry season and the flood season water level also goes on rising. When the dry season water level in the river channel becomes a little higher than that of river side land, water collected on the land cannot drain naturally into the river channel. River side lands are thus converted into swamps.

Marginal Embankments

To protect homes and lands from flood damages, the height of natural levees has been raised by man. Marginal embankments or levees are thus the oldest type of river engineering in the alluvial and deltaic plains of the world. The earliest levees were constructed along the Yellow River in China in 603 B.C. From old records, it appears that serious difficulties were experienced in the Yellow River levees, and in many instances they proved uneconomical and sometimes positively harmful. A breach in the Yellow River banks in 1897 appeared to have caused the death of a million people, owing to sudden submergence of the river side lands.

Levees do not prevent erosion of banks. With uncontrolled erosion, the channel goes on becoming wider and shallower, and its length keeps on increasing. As a result, the velocity of flow goes on decreasing, causing deposit of silt, rise in level of channel bed and of dry and flood season water levels, necessitating raising of levee heights.

This happened in the Mississippi river. The first levees were constructed in 1777. Between 1833 and 1927, the height of the levees had been raised as much as 17 feet in places. But in spite of such raising of levee height, levees were overtopped and breached. In 1882, there were 284 breaches. The largest number of breaches occurred in the great floods of 1927. The sudden flow of water through the breached levees submerged 20,000 square miles of land in six States, caused 350 deaths, left 60,000 people homeless and resulted in property damages estimated at 270 million dollars.

River Conditions in Orissa Delta

A study of the Orissa Delta shows that the outfall channels of the Mahanadi—the Daya, Bhargavi and Kushabhadra—have deteriorated considerably. The Debi and the Lower Mahanadi have developed wide and shallow channels, having many islands and loop channels. Through the Birupa, Mahanadi water finds its way into the sea through a tortuous and longer channel.

Under such condition, velocity of flow in these river channels is low, so that a part of the silt load is deposited on the channel bed. The consequent rise in level of channel bed has caused the dry season and flood season water levels to go on rising. The construction of marginal embankments along the banks

of these rivers has led to considerable rise in channel bed and water levels. All this has been brought about by erosion of river banks. The question in everybody's mind is: Since river channels in the Orissa

Delta are in this condition for years, what is the cause of the abnormal flood damages this year?

Ordinarily, at the beginning of the rainy season, discharge in a river goes on increasing gradually. The

THE ECONOMIC WEEKLY

resulting gradual increase in velocity enables a current of water gradually to scour the channel bed, thereby increasing the depth of flow. With increasing depth, velocity of flow as well as the sectional area of the channel increases, so that the discharging capacity goes on increasing. Thus when in the latter part of the rainy season, a high flood discharge comes down the river, it is accommodated and drained away quickly. There is no abnormal rise in flood water heights, no overflow, no submergence of river side lands and no flood.

This year, however, there had been drought in the early part of the rainy season in Orissa. As ordinary flood discharge did not flow in increasing volume down the river from the beginning of the rainy season, the channel bed had no opportunity of being gradually scoured and deepened; so the discharging capacity of Orissa rivers could not be gradually increased. Hence when in the latter part of the rainy season, a sudden high flood discharge came down, there was abnormal rise of flood water levels in the shallow channels of the rivers, and marginal embankments were overtopped and breached. Water rushing through these breaches, suddenly submerged lands and villages in the Orissa Delta to great depths. The inhabitants had no time to remove any of their belongings. The flood damages were thus colossal.

Prolonged Submergence

As explained above, due to uncontrolled erosion of river banks, the level of channel beds in the Orissa Delta Rivers has risen, and is now higher than that of the river side lands. Thus even when flood water levels in the river channels have gone down, the water on the land is not able to drain naturally into river channels. This explains the prolonged submergence of river side lands and villages in the Orissa Delta. The level of the water can go down only very slowly, by evaporation and slow drainage into the sea, mostly by seepage.

Need of Deeper Channels in Rivers

Deeper channels would lower the dry season and flood season water levels in rivers. The author has advocated the deepening of rivers, by narrowing their wide and shallow channels. A deeper river develops a higher velocity and consequently has a higher discharging capacity, so that high flood discharges can be accommodated and drained away

quickly. Flood water level in the rivers will then remain low, so that there will be no overtopping of river banks, no overflow away from its channel. A deeper river has also a lower dry season water level, so that water collected on river side lands is able to drain naturally into the river channel.

Deepening a wide and shallow river channel in the dry season had been and is being done by the Steamer Companies in India, by utilising the great force of a current of water in a river, by the use of "bandals". These are temporary expedients, as the bamboos driven into the river bed for the "bandals" are undermined, with the rise of water level and consequent increased velocity of a current of water in the river in the flood season.

The author has developed these "bandals", and the "permeable screens" used by him maintain themselves in a river channel even in the flood season.* These "permeable screens" assist a river to utilise the great force of its current of water to deposit silt and form new parallel river banks, by reclamation of a part of the wide and shallow river bed, and by the development of a narrow and deep channel between the newly formed parallel river banks.

An Adequate and Stable River

A current of water with a high velocity is able to develop and maintain a deep channel of adequate sectional area. It has been observed that a current of water with a high velocity of flow may flow alongside and parallel to an erodible bank, without causing it to cave appreciably. Erosion of banks being thus prevented, a river channel alignment becomes stable. Dry season and flood season water levels in a deep channel will remain low, so that there will be no overtopping of river banks, no overflow and no submergence of river side lands and no flood damages. In a narrow and deep river, a nucleus channel is always maintained, which is easily utilised by the flood waters. Such a nucleus does not exist in a wide and shallow river.

The cost of "permeable screens" is a fraction of the cost of marginal embankments, or of any other type of river control work that has been attempted, such as dams and reservoirs, etc.

Investment Trends and Financial Policy

K N Raj

A MASS of financial data, covering the year 1954-55, has become available in the last few months. The public are interested in these data in so far as they throw some light on the larger economic trends and policies in the country. But most people who try to understand the meaning and significance of the data from this point of view are likely to find them somewhat confusing. The reason is that, for all their impressive coverage, variety and detail, they come from different sources, represent estimates made at different points of time, and have often different reference periods. Some of the information which is required for linking them up and reconciling the discrepancies is also not accessible to the public. What one is confronted with, therefore, is a rather impossible jig-saw puzzle, and anyone who attempts to put the different pieces together, and tell a story out of the picture that emerges, has to take several risks in the reconciliation and interpretation of the data.

It is this which makes it particularly unfortunate that the Reserve Bank of India, which brings together and presents these data in its annual Report on Currency and Finance, has not offered a coherent economic analysis and interpretation. The Report for 1954-55 published two months back by the Bank, does not contain even a synoptic analysis of the financial operations of the Central and State Governments taken together, not to speak of a reconciliation of the estimated budget deficits with the other data presented in the Report. There are estimates of the changes in money supply, and also descriptive accounts of the foreign exchange transactions of the Reserve Bank, the operations of the scheduled banks, the estimated receipts and payments of the Government, and the trends in prices. But the broad order of magnitude of the increase in public investment during the year, the extent to which this increase was matched by public saving, the contribution of the gap between public investment and public saving to the increase in money supply, the significance of the shift in the asset preferences of the public in favour of time deposits and government securities, and the implications of all these for not only financial but for economic policy in general, are largely left to be inferred

from the statistical data presented in the Report.

The few exercises in the analysis of the data that the Report has permitted itself are loose and confusing in the extreme. What, for instance, is one to make of the statement that "a better balance between aggregate demand and aggregate supply seems to have been achieved", when it is followed by a reference to "the sharp fall in agricultural prices and the continued seriousness of unemployment"? Another example is the reasoning about the change in money supply: "Money supply expanded sharply during the year, accompanied by a substantial increase in bank credit. Despite this increase, prices have declined; it would thus appear that the increase in money supply took place in response to the growth in economic activity". If prices declined along with the growth in economic activity, why was it and how, in any case, could it have been "in response" to it? Is it more pertinent that prices have declined despite the increase in money supply, or that money supply has increased despite the decline in prices?

Let us take as our starting point the trends in public investment. One thing that is obvious is that the rate of public investment in India has been increasing in the last few years, and particularly since 1953-54. The question is, by how much? If one were to go by the estimates of the Central and State Governments, the increase in the last two years would seem indeed phenomenal. According to the latest available estimates, their expenditure on the Plan was around Rs. 260 crores in 1951-52 and Rs. 270 crores in 1952-53, but rose to about Rs. 340 crores in 1953-54* and over Rs. 540 crores in 1954-55. Thus the rate of public investment would appear to have doubled in the course of the two years,** the increase in 1954-55 alone being equivalent to about 2 per cent of the national income. If these estimates are correct, and this rate of progress can be maintained, it seems also reason-

*This estimate is based on the data from preliminary accounts, published by the Planning Commission in its last Progress Report on the Plan.

**We shall ignore, for the moment, that the increase in the outlay on the Plan has been partly on some items of recurring expenditure.

ably certain that the expenditure targets of the First Five-Year Plan will be fulfilled.

A closer scrutiny of the estimates, however, throws some doubt on the magnitude of the increases in the rate of public investment so far realised. The consequent revision which is necessary in the estimates helps also to explain a little more easily the trends in employment, prices and money supply that have been recently in evidence, and brings out indirectly the significance of the particular way in which it has been possible to finance the expanding public investment in this period.

The method open to us for verifying the estimates of the increase in public investment expenditure is necessarily an indirect one. Both in 1953-54 and in 1954-55, the 'revised' estimates of the Central and State Governments visualised substantial reduction in their cash balances and increase in their issue of treasury bills; the two items together were expected to amount to about Rs. 142 crores in 1953-54 and over Rs. 245 crores in 1954-55. But the actual decline in cash balances and the increase in treasury bills issued have proved to be considerably smaller, being only about Rs. 47 crores in 1953-54 and Rs. 146 crores in 1954-55. Moreover, of the increased treasury bill issue of Rs. 137 crores by the Central Government in 1954-55, it would appear that about Rs. 30 crores have been absorbed by the State Governments. There are of course reasons other than shortfalls in the estimated development expenditure which could account for the difference between the 'revised' estimates and the actuals, such as unexpected increases in current revenue or moderate decreases in the non-Plan expenditure, and in fact, there is reason to believe that, in 1953-54, these latter were more prominent. It would seem, however, on a close examination of the estimates, that the shortfall in development expenditure compared to the 'revised' estimates, was not less than Rs. 25 crores even in 1953-54 and was perhaps larger than Rs. 100 crores in 1954-55. If this assessment is correct, the expenditure of the Central and State Governments on the Plan could not have been more than about Rs. 330 crores in 1953-54 and Rs. 440 crores in 1954-55.

One can look at these shortfalls from different angles. From one point of view, it is disconcerting that the gaps between planned and realised investment expenditure have been widening and not narrowing with every successive year of the Plan. This will be obvious from the table:

	Expenditure on the Plan (In Rs crores)		
	Budget Estimate	'Revised' Estimate	Accounts
1951-52	N.A.	286	260
1952-53	345	322	270
1953-54	413	356	(330)
1954-55	571	542	(440)

Large and persistent gaps of this kind, if they are not anticipated, can have serious repercussions on economic and financial policies. But let us assume that these gaps do enter into the calculations of the policy makers, even if they do not explicitly say so. What is then impressive is that, though the shortfalls have been

growing larger, the levels of realised investment expenditure have also been rising fairly rapidly. How has this rising public investment expenditure been financed?

It is clear that the current revenues of the Central and State Governments have gone up very little in the last few years and that their non-Plan expenditures have not only not declined but have gone up. 'Public Saving' (i.e., the saving of public authorities) has therefore not increased, and was probably not more than about Rs. 100 crores in 1954-55. The bulk of the rising public investment expenditure has obviously had to be financed, in consequence, through borrowing and by creation of money. But, as can be guessed from Table I below, the actual increase in money supply in the last two years directly attributable to fiscal operations has been relatively small.

This was on account of the very considerable increase in the rate of absorption of government securities

by the public in this period, and it is the circumstances in which this happened that we need to look into more closely.

An idea of the extent of the increase in the absorption of government securities (including treasury bills) by the public can be had from Table II.

It is known that, in 1951-52 and 1952-53, the Central and State Governments reduced their holdings of rupee securities and treasury bills, but in 1953-54, there was a small increase and, in 1954-55, an increase of probably over Rs. 40 crores. It will be evident from this that the absorption of government securities and treasury bills by the public, which was at one stage negligible, and perhaps around Rs. 40 crores in 1953-54, was likely to have risen to more than Rs. 120 crores in 1954-55. This is exclusive of the larger subscription to 'small savings'.

If rising investment expenditure by the Government can be expected in the future to be matched in this way by larger absorption of government securities by the public, the fears about the possibility of financing an expanding volume of public investment, that are expressed so often in the discussions about the Second Five Year Plan, would appear to be misconceived. As investment expenditure goes up, the amount financed by borrowing will also go up, and so even if there are no corresponding increases in the income of the Government, from taxation or through State enterprises, the bulk of the expenditure could be covered. It requires only one further step in reasoning to conclude that, if the bulk of the expenditure of the Government could be covered by borrowing, even if not by its current income, a large investment programme could be financed without creating inflationary pressures, in much the same way as in 1954-55.

But before one jumps to a conclusion of this kind (and several members of the A I C C seem to have already arrived there), one must be clear what exactly the increased absorption of government securities signifies. One of the facts that might be noticed in this connection is that it is not merely the rate of absorption of government securities that has been growing. The holdings of time deposits with the scheduled banks have also been increasing. In 1951-52, these holdings of time deposits had fallen by Rs. 8 crores, but they went up by Rs. 27 crores in

Table I Money Supply

	(in Rs Crores)	
	1953-54	1954-55
Increase in money supply	+ 29.3	+ 126.6
Increase in the time deposits of banks	+ 16.2	+ 48.3
	+ 45.5	+ 174.9
Increase attributable to surplus on current account in the balance of payments	+ 44.9	+ 13.1
Increase attributable to increased loans, advances, and discounts by banks	+ 22.0	+ 32.8

Table II Absorption of Government Securities by the Public

	(In Rs crores)			
	1951-52	1952-53	1953-54	1954-55
Increase in outstanding Rupee Loans of the Central Government	-36.4	+1.5	-37.5	+108.9
Increase in outstanding Rupee Loans of State Governments	+11.0	+11.3	+24.9	+ 13.2
Increase in Treasury Bills outstanding	-43.7	+1.0	+19.7	+136.9
	-69.0	+13.8	+ 7.1	+259.0
Increase in holdings of rupee securities and treasury bills by the Reserve Bank and the scheduled banks.	-39.2	-13.6	-42.9	+ 91.1
Increase in holdings by the public, as well as by the Central and State Governments in their Cash Balance Investment Accounts	-29.8	+27.4	+50.0	+167.1

1952-53, Rs. 16 crores in 1953-54, and by no less than Rs. 48 crores in 1954-55.

The larger absorption of government securities and this increase in the holdings of time deposits by the public suggest that the bulk of the increased saving in this period has been among classes which are in touch with the commercial banking system and familiar with the mysteries of the organised capital market. An analysis of the sources of 'small savings' will probably show that the increased subscriptions to these also have come largely from certain classes in the urban sector. It is therefore not unreasonable to infer that the larger absorption of government securities, taken along with these other developments, reflects an improvement in the relative position of the middle and upper income groups in the urban sector.

This, in itself, is not surprising or difficult to explain. For we know that the fall in prices in this period has affected mainly the agricultural incomes, and has improved the terms of trade for the urban sector, helping to increase, in the process, real incomes and profits in this sector. Apart from the fixed income groups that have been able to save more, the relative stability of the prices of manufactured goods and the expansion of their output by the utilisation of excess capacity have helped the urban producers of these goods to reap larger profits.

The fall in prices itself, however, we must remember, was occasioned by a large increase in the output of consumption goods (particularly of foodgrains) unaccompanied by a corresponding increase in the demand for them. The inadequate increase in demand must, in turn, be attributed to insufficient expansion of the rate of investment. Thus, in the ultimate analysis, the larger absorption of government securities in this period, which made it possible to finance a growing volume of public investment without corresponding increase in money supply, is to be explained, not by a simple formula about "improved flow of savings", but with reference to a rate of investment which was inadequate relatively to the increased output of consumption goods and caused, in consequence, a shift in the distribution of incomes that helped the savings to accrue to the middle and upper income groups in the urban sector.

This analysis, if correct, implies several things, some of which it may

perhaps be useful to spell out. It will be obvious, for instance, that the improvement in the response to government borrowing against the background of a growing rate of public investment does not in itself prove anything about the possibilities of sustaining a rapidly expanding public investment in the future. The crucial relationship to study and watch is that between increases in investment and the accompanying increases in demand and output. In the period, 1953-55, it so happened that the increase in demand did not keep pace with the increase in output partly because the Government was not in a position to expand its rate of investment rapidly enough and partly because the magnitude of the increase in output was unexpected; but there is no reason why, in the future, the increases in demand should not out-strip the increases in output, in which case not only are the terms of trade likely to be turned against the urban sector, with adverse consequences perhaps on the savings of those who are most inclined to subscribe to government loans, but the increased saving, irrespective of the form in which it tends to be held, will necessarily have to emerge through price rises.

It follows that those who try to prove the feasibility of the rapid expansions in public investment visualised in the Second Plan, on the basis of what they believe to be the potentialities of government borrowing, are as much the victims of the financial approach as those who oppose these expansions on the basis of what they consider to be their knowledge of conditions in the capital market. It will probably contribute to clarity of thinking if less attention is given to government borrowing, as the factor that must ultimately set the limits to public investment,

and more attention paid to the steps that have to be taken to ensure that the increased output of consumption goods becomes available to the extent assumed or, in the alternative, to regulate the increases in demand according to the increases in supply.

It is one of the significant features of the period we have been analysing that the increase in output was not only of consumption goods but also of materials and equipment required directly for investment. This was possible because there has been new investment in industries like cement, steel and locomotives in the period of the First Plan and also because of the previously-existing excess capacity in engineering industries which has now been almost completely absorbed. The increases in supply seem to have been in the aggregate just about adequate for the increases in demand from the growing investment programme, with the result that there has been no additional pressure on foreign exchange for the import of capital goods. As will be evident from Table III, the value of the imports of producer goods has actually declined in this period, and this despite the fact that, along with the expansion in public investment, there has been also in all probability an increase in the volume of private investment in the country.

It is this simultaneous expansion of consumer and of producer goods that provided the increased investment potential in this period and made possible the expansions in investment without untoward consequences. (Indeed, considering the trends in prices and in balance of payments, it is clear that investment could have been increased even more.) The fact that savings increased in the economy in this period, without having to be forced through rise in prices, and the circumstances

Table III Imports of Producer Goods

	(In Rs crores)		
	1952-53	1953-54	1954-55
Electrical machinery	17.7	19.1	15.8
Textile machinery	16.4	12.4	14.1
Prime movers, other than electrical	10.2	6.3	6.8
Other Machinery:	17.9	18.1	16.3
Metals:			
Iron and Steel and manufactures thereof	16.3	18.4	21.9
Others	16.0	10.3	18.6
Vehicles (carriages, wagons, chassis, and parts thereof)	11.6	8.1	8.2
	106.1	92.7	101.7

that a large part of the increased savings went into government securities, must be considered the effect of these real developments which increased the investment potential, rather than as active factors in the situation responsible for the non-inflationary financing of an increased volume of investment. In the Draft Plan-frame for the Second Plan, the expansion of producer goods has been visualised on a large scale, and for the good reason that it will help to increase the capacity for sustaining a growing volume of investment in the future without adding to the pressure on foreign exchange. But what is not certain is that the methods visualised for expanding the supply of consumer goods are adequate to sustain the growing investment in the interim period. It is on this that attention needs to be concentrated, and not on the potentialities of borrowing as a source of finance.

In the technical jargon of the economist, we might say that our concern should be with the 'flows' in the economy consequent on larger investments rather than with the 'stocks'. If the increased output of consumer and producer goods is adequate to meet the direct and indirect increases in demand generated by the additional investment, the additional saving corresponding to this investment is bound to emerge somewhere in the economy without being forced through price rises. Whether these savings are held in the form of cash or as government securities, or as time deposits, is a matter of secondary importance affecting primarily the composition of stocks; for, in so far as they represent potential purchasing power, time deposits and government securities can be converted into cash and the proceeds used for purchases at any time almost as easily as cash itself. The basic problem is to maintain conditions in which there will be no tendency to run down cash, deposit or security holdings, and this will depend largely on the price trends which, in turn, will be related to the 'flows' in the economy.

In fact, if the required increase in the supply of consumer goods can be ensured, even the proposed increases in taxation are not strictly essential as a means of financing the additional investment. If the current income of the Government does not expand—as it did not to any significant extent over the period 1953-55—but the expansions in the output of

consumer and producer goods prove adequate to prevent a serious rise in prices or deterioration in the balance of payments, it will only mean that the Government will not have used the tax weapon to appropriate to itself any part of the increased income of the community and thus to bring about an equitable distribution of this income.

This income distribution aspect is certainly not unimportant in the context of development, as, with expanding investment, profits in the economy will also tend to expand, and it is only by skimming the profits and capital gains accruing that the State can provide the social services with which the conditions of living for the mass of the people can be improved. If there is no significant increase in the current income of the government, and additional expenditures have to be financed through borrowing or creation of money, there will be inevitably a bias against expansion of social services, since it is the kind of investment the additions to output from which are not so obvious and the increased product will not be forthcoming in a concrete form in the market for absorbing the demand created in the process of investment. Our reasoning is, therefore, not that additional taxation is unnecessary but that this taxation should be in the main of a progressive character designed to absorb profits and capital gains, and moreover that, if the real balances set out in the Plan-frame can be secured by appropriate technical and organisational arrangements, additional taxation should be viewed in this way as a device for equitably distributing the increases in income rather than as one required for the financing of the additional investment.

In setting out the estimates about the planned increases in investment and the planned increases in output, as well as the real commodity balances, and in expressing the confidence that no comprehensive system of physical controls would be necessary, what the Plan-frame has said, in effect, is that the high propensity to consume of the community will be matched by a skilfully arranged investment pattern which ensures a correspondingly favourable capital-output ratio. This, as we know, is not a matter for theoretical argument, but something which will depend on the practical feasibility of the technical and organisational arrangements visualised.

If, however, the technical and organisational arrangements are not adequate for this task, the role of taxation as a means of financing the investment programme will have to be much more severe than visualised anywhere in the Draft Plan-frame. For, additional taxation will then be necessary as a means of reducing the demand for the goods in short supply, and if these happen to be among the basic necessities of life the amount that would have to be absorbed as tax revenue before a significant impression is made on the demand for these goods will have to be a multiple of the actual discrepancies between demand and supply. This is why it is disconcerting to find a tendency to shift the emphasis from the real balances set out earlier in the Plan-frame and the organisational problems involved, to the problem of financing the investment programme, and particularly to the possibilities of borrowing and increased indirect taxation. For this is to evade the basic issues involved in a planned programme of rapid development, and it will not be long before the consequences are evident.

THE CENTRAL BANK OF INDIA LIMITED

(Established December, 1911)

Head Office: Mahatma Gandhi Road, Fort, Bombay 1.

Authorised Capital	6,30,00,000
Issued Capital	5,77,50,000
Subscribed Capital	5,76,66,125
Paid-up Capital	3,14,54,250
Reserve Fund and other Reserves	4,01,00,837
Deposits as at 31-12-54	1,24,21,26,680

Directors:

Sir Homi Mody, K.B.E. (Chairman)
Cooverji Hormusji Bhabha, Esq. (Vice Chairman)
Dinshaw D. Romer, Esq.

Manmohandas Madhavdas Amersey, Esq.
C. P. Wadia, Esq.
Chimanlal Bapalal Parikh, Esq.
Framroze J. Gazdar, Esq.

Branches and Pay Offices in all important cities and towns of India, Pakistan, Burma and in London:

London Branch:

159, Fenchurch Street, London, E.C.3.

New York Agents:

The Guaranty Trust Co. of New York.
The Chase Manhattan Bank.

Banking business of every description transacted on terms which may be ascertained on application.

N. K. Karanjia,
General Manager

From the Chair

Jay Engineering Works Limited

Speech of the Chairman Sir Shri Ram, Kt.

THE following is the text of the speech delivered by Sir Shri Ram, Kt., Chairman of the Jay Engineering Works Limited at the Annual General Meeting of the Shareholders of the Company held at Calcutta on 21st September 1955:-

Gentlemen,
We are meeting almost after a year and I am glad to say that the past year has been of continued greater success and greater service, which is evident from the figures given in the Table below:

The Balance Sheet, Profit and Loss Account and the Directors' Report have been in your hands for some time and with your permission I will take them as read.

I will now mention a few special features of the year. The most important and in consonance with our past policy was a further reduction in the price of our sewing machines from Rs. 200/- to Rs. 175/- on the 1st of December, 1954. You will no doubt remember that it was only on the 1st of July 1953 that we had reduced the price from Rs. 220/- to Rs. 200/-.

Our prices are about 60% less as compared to the well-known makes available in India.

Needle Plant

The Tariff Board, while recommending the removal of protective duty, also suggested that we should put up a Needle Plant, and the Industries Ministry, when conveying this to us, suggested that we should put up a Needle Plant. We are glad to say that we have received a licence for putting up a Needle Making Plant. The orders for machines have been placed with a reliable firm, and I hope I will be in a position to tell you next year, that we are now making and supplying our own needles; in fact, the only part of sewing machines which up to now was not made by us.

Protective Duty

We are glad to say, and perhaps, with some pride, that the protective duty from Sewing Machines was removed during the course of this year, but we are grateful to the Ministry of Commerce and Industry that to protect the indigenous industry from imports of cheaper

varieties they have restricted the imports.

Excise Duty

Not only was the protective duty removed but actually when announcing the Budget proposals for the year 1955-56 the Hon'ble Minister for Finance had proposed an Excise Duty of 10% on sewing machines. This was a great shock to the infant industry of sewing machines. I am, however, glad to say that on the representation of sewing machine manufacturers, both on big scale, and on small scale basis, the Finance Minister appreciated that the sewing machine was not either an article of luxury or of consumption, but an instrument of earning their livelihood by tailors and poor class women. He also appreciated that this industry was providing means of livelihood to thousands of people working either on their own on cottage industry basis, or working for the big scale industry in their homes. We are also very grateful to Hon'ble Dr. B. C. Roy, who appreciated our difficulty, and helped us in our difficulty. I am glad to say that the Excise Duty from the sewing machines was removed.

I am also glad that the Hon'ble Finance Minister finally levied instead of 10% on sale value, a fixed duty of Rs. 5/- per table and Rs. 10/- per ceiling fan, which has avoided a lot of difficulties and misunderstandings, and we are grateful to the Finance Minister for this.

Exports

While our production has gone up and the sales have also increased for all our products, but due to increased demand in the country, so far as sewing machines are concerned, much to our regret, we had

to restrict the export to foreign countries. We, however, hope with our steadily increasing production now, to again increase our exports.

As I said last year, the Industries Ministry have created an Export Promotion Council for studying the foreign markets and advising exporters. I have no doubt that in course of time they will prove very useful, and we on our part will do everything to make it successful and take full advantage of their services.

Increased Production

I have said above that our production is steadily increasing, and while the average production of sewing machines last year was 6,476, in the month of August last, in spite of fewer working days, we produced 9241 machines.

Due to our steady expansion we need much bigger area of land, than is available in the present site. We have visited a number of sites to which place we could remove a part of our factory and relieve congestion here. Nothing in this connection has yet been finalised.

Factory At Chindwara

Partly on account of difficulty of space and mainly to reduce cost, we are putting up a factory for making Bhilawa Enamel, instead of in the factory itself, at Chindwara, a Bhilawa collecting centre in C.P.

Our requirements of timber for various purposes, either for our sewing machines, tables, covers, bases etc. or for packing purposes having greatly increased, we are putting up a small saw mill at Chindwara, which is a very big timber centre. We hope this will result in a good deal of reduction of costs.

Particulars:	Year ending 31-3-54:	Year ending 31-3-55:
Sales (In spite of reduction in prices in 1954-55)	Rs. 1,87,37,729/-	Rs. 2,23,95,049/-
Profits	" 16,31,020/-	" 18,78,517/-
Payment to Labour	" 46,84,106/-	" 54,27,552/-
Number of Workers	2,403	2,639
No. of Schools & Students in Embroidery & Tailoring Schools ..	Students 4,000	Students—8,000
	Schools 72	Schools — 120
Centres for Sales and Service ..	712	781

We are also grateful to the Development Wing of the Industries Ministry for time to time helping us by lending the services of foreign experts got under T. C. M. Scheme. In many cases their advice has been of great help.

Helpful Conference

Since we last met, we invited the Managers of all our Branches, as well as all our agents and sub-agents in the month of March. About 700 people came in this conference. We made very satisfactory arrangements for their board and lodging. We had free and frank discussions with them about their problems and our problems and we invited their free and frank criticism about our ways of working, about the quality and the defects of our products, and what sort of improvements etc. they would like us to make.

They were taken round the Factory and every process and every part and its function was explained to them. It was only after they had spent a lot of time in the Factory that they realised the enormity of the problems, the amount of work that has to be put in, in making a sewing machine of quality and they also realised the difference between a cheap and a good machine, and they made extremely useful suggestions and we are grateful to them.

It was our first experiment on these lines and it certainly was a very great success.

Higher Dividend

You will have no doubt noticed with pleasure that with the permission of the Industrial Finance Corporation of India, we have increased the dividend this year to 12%.

Section 23 A

While on this subject, I might tell you that in the new Budget, as finally approved by the Parliament, the definition of Section 23A has been so considerably modified which may create serious difficulties in the way of our paying back our debts to the banks or even to the Industrial Finance Corporation, or building up Reserves for future expansions. The changes were: that if 60% of the share capital was held by 5 or fewer persons, the Company had to pay 60% of the profits as dividend and in certain circumstances even 100%. I am glad to say that on the representations made to the Finance Minister, he has agreed to give exemptions under certain circumstances, and we have

also applied for the exemption from the new Section 23A.

Electric Fans

You will be glad to know that our production of Electric Fans also has considerably increased. Not only in sewing machines and Hurricane Lanterns are we the biggest manufacturers in the country, but I believe, during the last few months we have been the biggest manufacturers of electric fans also.

Like many other articles, Electricity is no longer a luxury and it is our intention to produce a cheap table and a cheap ceiling fan which we may be able to produce on mass production basis, and we will try to sell a table fan for, say, about Rs. 60 and a ceiling fan for about Rs. 100 so that even a worker in a factory or the lower middle class people, and clerks may also be able to buy the same.

Like all our other departments, the expansion of our Tool Room could not keep pace with the demand on the same, either from our own manufacturing sections or from our friends outside for the supply of tools and jigs and gauges. We are trying to expand it as fast as circumstances permit.

Good Advices

As I said last year, our suggestions scheme is going on very satisfactorily and sometimes extremely good suggestions are received, which are of very great value.

Our Statistical Quality Control Department is also going on, and with the help of the unit formed by the Indian Statistical Institute we are expanding our work in this direction, and are trying to get the greatest benefit from the advice of this unit.

Capital-Labour Relation

I am glad to say that the Planning Commission have very rightly realised the importance of good capital-labour relations which are absolutely necessary for the satisfactory carrying out of the Plans of the country. Meetings were recently held in the Planning Commission between the representatives of Government, Labour and Capital, and it was realised on all hands that steps should be taken to remove all causes of friction and steps should be taken to improve the relations. I hope and pray that much goodwill will come out of the deliberations of this tripartite conference, and its Committees.

During the last many years various Tribunals, High Courts, and Appellate Tribunals have given decisions on various matters, and surely by now it should be possible for the authorities, in consultation with the parties concerned to lay down some sort of norms, and some system of easy solution, and arbitration so that both Labour and Capital may be able to give their undivided attention to their work, and have peace of mind.

While on this subject, I am again happy to say that our relations with all our colleagues, from the highest officers to the smallest worker, have been very friendly and good, and I hope and pray that they will go on improving with the time.

We are glad the 2nd Five-Year Plan is of much higher dimensions—we in our humble way will do all we can to make it a success.

Comparative Wages

Some Industrialists in Bombay compare their wages with wages paid elsewhere. They forget that the Industrial Worker in Bombay is the most highly paid in India whether it is due to his better ability or harder work or otherwise I do not know.

But comparing wages paid in Bombay with other places will be as unfair as comparing wages paid, say in USA, with those paid in India and we still claim that our worker is the most highly paid.

Appreciations

I cannot close my remarks without conveying my gratitude to all my colleagues, right from Bishan Swarup Agarwal and T. R. Gupta to everyone concerned, for the loyal and devoted service they have put in, and I hope and pray that when we meet next year we will be able to give better account of our working.

Thank you.

Around Bombay Markets

Firm Undertone

Thursday, Morning

EQUITIES have once again come into their own. In sharp contrast to the halting movement witnessed for some time past, the stock market made strident advance during the week under review, helped by speculative buying all round. The absence of any bearish pronouncement, governmental or otherwise, could itself be construed as a favourable factor. Besides, the crop of bonus share issues, some already announced and others in the offing, also helped to sustain a firm undertone.

In the textiles section, the recent observation by the Union Commerce and Industry Minister that India was well on the way to become a net exporter of cotton before the end of this year on the one hand and the increasing off-take in the cotton piecegoods market, in view of the approach of Dussera, on the other, invigorated the market. As a result, all the leading textile counters recorded sizeable gains.

In the steel section, there was considerable speculative support. Tata Steel Ordinary opened at Rs 243-8 and touched the highest for the week on Wednesday at Rs 255 to close at the same level. Indian Irons almost followed Tata Steels and closed on a distinctly better note at Rs 39-2-6, the lowest for the week being Rs 38-1.

On better working reports of some of the leading mills, textile shares registered sizeable gains with Bombay Dyeings in the lead. The introduction of three shifts in some units and reports of introducing rationalised methods of production soon were particular points in favour of Bombay Dyeings. The increase of Khatau dividends from Rs 8 to Rs 10 per share, the proposal to issue two shares for one held (subject to Government sanction) in the case of Shivrajpur Mining and the declaration of dividend at the rate of one bonus share for three held in respect of Shri Niwas Cotton, strengthened sentiment all round. The rise in the value of Indore Malwa was also attributable to the announcement of an interim dividend.

In the miscellaneous section, ACC, Bombay Burma, Belapur, Phalton, Tata Chemicals and Scindias were in the limelight. In the case of ACC,

the prospects of a better future thanks to the country's several development plans, have helped sustain the strong sentiment. Bombay Burma improved on capital reorganisation reports, while sugar shares took courage from bonus expectation and higher dividend prospects. The announcement of preference dividend enabled Tata Chemicals to move from Rs 15-11 to Rs 18-2 at the close. Small priced shares also benefited from the general firm trend and closed better.

Cotton

Bearish Trend

THE cotton futures market displayed a distinctly bearish tendency during the week and the ruling contract closed quiet at Rs 622.

In the main, sentiment was adversely affected by expectations of a bumper crop in the 1955-56 season.

There was no sign of improvement in the spot section which continued to suffer from a perceptible slackness in demand. Even the reports of floods in the Punjab resulting in some damage to the crop failed to enthuse the market and profit-taking towards the close of the week accentuated the downward trend.

The problem of US surplus cotton has been causing serious concern in all the leading cotton producing countries. The recent increase in acreage under cotton in Mexico, Egypt, Turkey and Syria has served only to aggravate the problem. On this question, the International Cotton Advisory Committee expressed the view that there appeared to be little reason to expect any immediate acceleration of the upward trend in cotton consumption to offset increased cotton production. In view of this, the problem

MARKET LEADERS DURING THE WEEK

	Oct. 5, 1955	Week's Range		Sept. 28, 1955
		High	Low	
Steel Shares :

OILS AND OILSEEDS

	Oct. 5, 1955	Week's Range		Sept. 28, 1955
		High	Low	
Seeds :				
Castor May 1955 (per candy)	93- 4	96- 8	92- 0	94-12
Groundnut Dec-Jan (per cwt.)	22- 2	22- 6	21- 7	20- 0
Linseed Feb-Mar	23- 1	23- 1	22-15	23-14
Kardi Ready	13- 4	13- 8	13- 4	13- 8
Nigerseed	23- 4	23- 8	22- 8	22- 8
Oils :				
Castor Oil Com. (per quarter)	10- 6	10- 8	10- 6	9-14
Groundnut Oil R.R. (")	11- 7	11- 7	11- 2	11- 3
Linseed Oil (")	14- 4	14- 4	13- 8	13-10

of surplus may very nearly prove intractable.

It is not surprising, therefore, that the declining trend in the cotton futures market in both New York and Liverpool had its immediate repercussion in Bombay, the February contract having come down from Rs 621-8 to Rs 618-8 on Tuesday. Again, when these markets showed a 'technical' improvement, there was moderate upward movement in the February contract. At the close of the week, however, sentiment was weak.

Oils and Oilseeds

Steadier Trend

EXCEPT for groundnut and groundnut oil, the oilseeds market ruled steady, compared to last week. Thanks to large-scale buying, prices of both castor seeds and oil improved. Business to the tune of 800 tons is reported to have been done on American account in castor oil at prices ranging between 10.50 cents and 11.50 cents. This was reflected in the rise in price of castor oil by nearly 12 annas to Rs 10-6. Castor ready followed suit, and recorded moderate increases.

Apart from the effect of business on behalf of the USA, the firmness in castor oil prices was also brought about by a shrinkage in arrivals and the keenness shown by crushers for purchase of seeds to meet their immediate requirements. Besides, tenders against the September contract were reported to be less than anticipated earlier, though they are likely to be higher than the tenders issued against the same contract in the previous year.

Trading in the September contract commenced in the third week of April this year at Rs 76.6. It declined to Rs 72-10 in June, only to shoot up by nearly Rs 35 to touch the highest level at Rs 105 in the first week of July. Thereafter it saw a steady decline and moved between Rs 80 and Rs 90 during September, to wind up finally on Thursday, September 29, at Rs 94-8.

Castor May opened around Rs 94 and shot up on speculative buying to Rs 96-8 but closed at Rs 93-4 on Wednesday.

Groundnuts and oil were depressed during the week with Khandesh closing at Rs 22-2 and oil R/R at Rs 11-7.

Linseeds remained firm on support from local traders.

Around Calcutta Markets

Hesitant Trend

Wednesday, Evening

EQUITIES may not be falling. But recent price movements on the stock market here underline the absence of investment support. Price fluctuations remain narrow. There has been a considerable fall in the volume of business. Neither buyers nor sellers are active. This is what happens to stock markets when the outlook becomes uncertain. There is no doubt that investors are hesitant. There are, however, differences of opinion about whether they have any reason to be hesitant.

In the main, the narrow range of fluctuations in recent days is due to technical factors. Some days ago, the massive sales in Indian Iron of an influential "bear" operator had to be squared-up. This process was effected through a mutual understanding among the "bulls". At the moment, therefore, the technical position in Indian Iron is vulnerable. There is no active "short" interest. But the extensive "bull" position remains. These "bulls" will have to liquidate their holdings some time, some day. But, on current indications, the market will then be deprived of the "bear" cushion.

On technical considerations, therefore, Indian Iron should have been falling. These shares are not slumping because the holders cannot afford to let a landslide occur. That is why "bulls" are determined to exploit all "bullish" developments. Relative steadiness in Indian Iron in the last few days is due to these tactics. Recently, steel selling prices were raised. "Bulls" were prompt in exploiting this event. They lost no opportunity in warning "bears" that steel retention prices will be announced soon, and that these prices will be fixed at higher levels.

It is a safe assumption that steel retention prices will be stepped-up. But neither higher steel selling prices nor higher steel retention prices are likely to lead to higher dividend disbursements by iron and steel companies. New Delhi is firm in its decision that increased profits arising out of higher retention prices must be ploughed back to strengthen reserves, and should not be frittered away in higher dividend payments. This quashes all hopes of higher dividend disbursements by Indian Iron.

But there is another argument which has some "bullish" implications. In his last speech as Chairman of Tata Steel, Shri J. R. D.

Tata hinted that, apart from the contemplated new issue, in future the Company's policy would be to capitalise reserves by issuing bonus shares. Arguments advanced by Shri Tata for future issues of bonus shares by Tata Steel are not inapplicable to Indian Iron. There is a case for re-adjustments in the capital structure of both the companies. This is a potential "bull" factor.

Meanwhile, the market hopes against hope that the forthcoming dividend of Indian Iron will be higher. Last year's production, earnings and profits were better. But it is widely felt that New Delhi is opposed to raising dividend payments. Incidentally, output data for Burnpur Works indicate a fall in current production. It will be recalled that New Delhi warned shareholders some time ago that this year's steel output of both the existing companies might be lower because of technical adjustments incidental to implementation of expansion projects.

In the first half of this week, Clive Street was influenced mainly by developments in Dalal Street. There are both technical and basic reasons for a spurt of about ten points in Tata Steel since the beginning of this week. According to reliable reports, there is an active "short" interest in Tata Steel. "Bulls" are in a position to rig prices up in the sure knowledge that the Company would be issuing right shares soon. There has been a sympathetic rise in Indian Iron. It is partly due to end-account buying operations. But it should not be ignored that the management of Indian Iron has not yet reached a decision on the question of issuing right or bonus shares.

Despite the improvement in Indian Iron in the first half of this week, leading cash scrips remain quietly steady. There are reasons why Jute shares remain idle. Although the abolition of export duties on jute manufactures will be of help to the Indian industry in holding its position in export markets, it is more than evident that Pakistan is determined to deprive her rivals of any possible advantage arising out of devaluation of her currency. Karachi has reiterated Pakistan's determination to maintain the export minimum price of raw jute at the pre-devalued sterling level. Pakistan's rivals are, therefore, not likely to acquire supplies of raw jute at cheaper prices.

The Hard Test

EVEN the harshest critic of the Fazl Ali Commission Report will agree that the Commission had an extremely tough assignment. They had to ascertain the desires of people in different areas, weigh conflicting claims, apply what they, as impartial judges, considered to be the basic criteria for deciding the issues, and work out a pattern which satisfied to the maximum the people's aspirations as well as their own conscience. All this had to be done with due regard to the Constitution that we have given unto ourselves, and the cultural and economic heritage that India has. It was a task that would have awed the greatest of us; and it was a task that no body of men could have performed to everybody's satisfaction.

It is, therefore, no matter for surprise that so many, including the Prime Minister, are surprised by the recommendations, though they may not all be surprised by the same thing or for the same reason. What has surprised the Prime Minister and why, are secrets which he has so far not disclosed. But in most other cases, it is just because the recommendations have not given them what they considered or proclaimed to be their pound of flesh. There will also be some who feel that the Commission, after an academic discussion of the factors that count in carving out a State, has thrown it all to the winds in fixing the boundaries of different States. And yet others will perhaps raise metaphorical eyebrows at the administrative arrangements suggested for a smooth transition to the new pattern of units. Whatever the reason, it is obvious that the Report has not fully satisfied everybody; and if that is the test of objectivity, the Commission has certainly been objective to a degree.

The trouble is that having given ourselves this Commission we cannot just shelve its Report and call it a day. The Government might, of its own accord, or under pressure, modify some recommendations in the process of implementation. But such modifications cannot be so many as to make nonsense of the pattern set out by Shri Fazl Ali and his fellow commissioners. Which means that whatever alterations are now suggested will have to be demonstrably in accordance with some principle or principles that the Commission has enunciated but not followed; and it will need to be based on a specific elucidation of the 'national' interests that are to be promoted thereby. Otherwise, ad hoc adjustments that smack of appeasement of particular sections will only mean strengthening the case for pressure groups.

The Government's position at the moment is very unenviable. Despite its professions to the contrary, the Commission has arranged the boundaries in such a way that, with the exception of Bombay and Punjab, all others are linguistic States. Why then, the Maharastrians and the Punjabis ask, should they be denied the right to form their own States? Again, though U P, Bihar and Madhya Pradesh are all peopled by those who speak Hindi, they are different States. Why then, the Mysoreans ask, should there be only one State and not two for the Kannada-speaking people? If breaking up Karnataka or Madhya Pradesh into smaller units is sought to be countered by arguments of administrative viability, how could the formation of Vidarbha and Kerala and Hyderabad be

justified? Many such 'contraries' will have to be solved and in the process those that are now pleased with the reorganisation will probably turn bitter.

No wonder, therefore, that the Prime Minister said that the Report had set a hard test to all of us. The test really is whether, placing India above the particular State to which we belong, or want to belong, we are prepared to evolve, through trial and error, the best set of internal units that we possibly can have. And in evolving that pattern, whether we believe in the good faith of the other man who speaks a different language as much as we want him to believe in ours. It is by all accounts a difficult test, since it involves crying halt to a tendency that has for various reasons been brought out in its worst form. And that is that unless a person lives in a State in which his language is the principal language, his status in the country is inferior to that of others, and his 'culture' will suffer. It is, on rational grounds, a viewpoint most inimical to the working of a Federal constitution in a country like India. For, nothing can so bank up prejudices and suspicions as the feeling that one's social and cultural development depends on having, as it were, a closed group of like-speaking persons.

Either we believe in secular democracy or we do not. If we believe in it, it implies mutual respect amongst citizens, irrespective of the way they live, the faith they conform to, the language they speak or the diet they eat. From which it follows that none of us, by having a language-State of our own, should imagine that thereby a special privilege is conferred on us. The protagonists of particular linguistic States are always eager to emphasize that the minority languages in their area would not suffer any disadvantage. Why then should they feel that if they are not in a majority, their language and culture will suffer? Surely, this amounts to believing that they are made of nobler stuff than the others. It is a particularly insidious form of the 'Herrenvolk' principle, and however much we may protest, it is a principle most harmful to the development of a feeling of oneness in the country.

All this is to say that individual or regional characteristics should be mercilessly weeded out in order to evolve a mythical set of Indians, each indistinguishable from the rest in matters of cultural equipment,

dress or habits. The point is that one has to learn to live with such differences, and learn to like them. It should be a matter of pride that these differences do not affect political, social or economic relationships between man and man in India. Only then will it become true that by developing one's language or culture, one enriches others as well as oneself. There will be many who say that all this is understood, and that it has nothing to do with the reorganisation of States. But the pity of it is that the establishment of good relationships is made conditional upon linguistic integration. Give us our States, they say, and we will be most friendly to the others. But why cannot one be friends with others otherwise? Why does not one think of the national needs that are crying to be met, needs that are no less insistent in the remote villages of Maharashtra than in those of Gujarat or Bihar or Orissa or Andhra?

The material well-being of the country will not automatically improve by redrawing the State boundaries. All of us, whatever language we speak, have, as a nation, access to a given volume of resources, physical and human. And it is by improving the volume and quality of these resources that we can, in the future, hope to be better off as a nation. That basic fact is being ignored in the fight for territories and majorities. The scramble that we are engaged in may or may not contribute to an augmentation of the products that we all want to share. But who pauses to weigh these matters when the slogan for so many is 'cry the beloved language'?

Unfortunately, the States Reorganisation Commission's Report is likely to add to such vociferous cries. It will also be criticised on the ground that the suggested rearrangement is biased in favour of the Congress Party. And it is more than likely that the positive recommendations for furthering a feeling of oneness in the country through administrative adjustments will be ignored or resented. The fact that the Commission went into such details regarding recruitment, educational administration etc. is in itself an indication of the sort of separatist tendency likely to be encouraged in the new States. Had the Commission been unaware of this, or had it discounted its potentialities, it would not have carefully laid down the procedure for staffing essential services and the judiciary in different States. Some of these, such as

the institution of various technical services on an all-India basis, and appointment of at least one-third of the high court judges in each State from outside the State are measures which could, and should, be taken irrespective of the basis adopted for redrawing State boundaries. But part of the cry for linguistic States derives from a desire to ensure more of such jobs in each area to local recruits. To the language-patriot, therefore, the Commission's suggestions will seem to be a Machiavellian move to take away by one hand what is offered by the other. And for that reason, they might either reject the administrative recommendations in principle or get round them in practice. Either way, it would be a sad reflection on the extent of trust which we repose in one another.

We have before us an issue the solution of which will make or mar the future of this country. The Commission has given its verdict according to its best judgment, and there is no point in imputing motives or ostentatiously burning the Report. That is not a civilized way of reacting to something which we collectively asked the Commission to do for us. It is everybody's task now to contribute to the setting of a pattern that will work to the advantage of all of us. We can, with a realisation of that great responsibility, achieve miracles. Or we can use the States Reorganisation Commission's Report to break up the country into warring camps and take the road to national ruination. The choice is with us now, and let us decide in a manner that will make possible our looking back on this as our finest hour.

A National Institute of Social Sciences

ONE of the important recommendations which emerged from the deliberations of the Seminar on Casteism and Removal of Untouchability which met in Delhi between 26th September and 2nd October was the idea of starting a National Institute of Social Sciences. The suggestion was long overdue. And it is a matter for surprise that it was not made earlier by a responsible body though it is well-known that some of the leading social scientists were informally discussing the idea for some time. The cat has only been belled; that is all, but even that is important.

The Government of India cannot escape the charge of neglecting the social sciences. Otherwise a National Institute of Social Sciences would have been one of the links in the splendid chain of national laboratories which an enlightened and far-sighted government built in the first few years of Independence. This blindness is all the more surprising in a country which is ruled today at least as much by caste, kindred, linguism and sectarianism as by the progressive ideas of Pandit Nehru and the party which he leads. The importance of social research is only gradually being brought home as the Plan is getting under way. Even here it was left to the Americans to lead the way—the Community Project Administration started its Evaluation Programme with funds from the Ford Foundation. It is true that in the last two or three years the Research Programmes Committee of the Planning Commission has made grants of sums of money for various research projects. It is interesting to recall in this connection that the first grants were all made to economists to conduct socio-economic surveys of towns and cities. Some sociologists protested that economists were only competent to undertake strictly economic surveys and this resulted in the recruitment of a few non-economists to the R P C and in the creation of the Technical Welfare Sub-Committee to advise the R P C on schemes of research into projects directly bearing on social welfare. Such projects have to be closely related to the development schemes of the Plan in order to be financed by the R P C.

In short, economists in this country have, like economists elsewhere, the gift of collaring all the money that is available for social research.

This is to some extent due to the fact that economics is the most developed of the social sciences, and even more important, economists occupy positions of power in the Government of India. To put the thing in a nutshell, economics is different from the other social sciences in that money has always been available for research, and jobs have always been available for economists. This has been responsible for the greater mobility of economists as compared not only with other social scientists but with other academicians as well. The universities have been drained of good economists and the drainage has been towards the International Monetary Fund, ECAFE, Reserve Bank of India and Government of India. The ones who have stayed behind look up occasionally from their huge and cluttered-up tables to heave a sigh at the absence of their more gifted and nimbler colleagues. The universities are, to some extent, to blame—the low salaries, the utter confusion regarding language policy, the lack of incentives to research, and the pervasive stink of academic politics have driven the more sensitive minds to places where they need not pretend to a life of plain living and high thinking.

The long and the short of it is that research in the social sciences has been woefully neglected in our country. Even in the relatively affluent subject of economics, a number of factors have been responsible for killing research. One of them is certainly the extremely unattractive conditions which prevail in our universities today—and very little is being done to remedy this situation—and secondly, the attractions of service outside. Economists are after all human, and a good many of those who are outside universities would only be too glad to return to the latter if conditions improve. It is up to the Government to see that suitable conditions are created in our universities to attract and to retain their good men. In brief, in no social science are we producing research work of a high quality. There are a few able men, it is true, but they are swamped by the others.

The Seminar has definitely stated that the proposed Institute should concern itself with pure or fundamental research. It should not at all surprise anyone if this idea does not find favour with powers that be. Of

find favour with the powers that be. Of all people, politicians are the least equipped to be able to see the utility of 'useless' things. This is especially so when the country is preoccupied with planning and productivity. The national mood is in favour of doing useful things, and by and large, this is as it ought to be. But there is a danger that this may defeat itself when pursued in all matters and to an extreme.

In the last three or four years, the Research Programmes Committee has been making some grants for applied research. (The American Foundations financing research in India also make grants only for 'useful' projects.) Pure research is left to the slender resources of the universities which have already started telling their unfortunate scholars, "Why don't you approach the Government of India?" The award of a R P C grant goes to strengthen the department's and university's status, and also satisfies the demands of local patriotism. But R P C grants are made only for strictly utilitarian research.

All in all, the 'Brahmins' are having a bad time. This is deplorable because in the long run pure research is the goose that lays the golden eggs of utilitarian research. There must always be a core of people thinking about fundamental problems if applied work has to be more and more fruitful. And as things stand today, fundamental research is neglected in every branch of human knowledge, and especially in the social sciences. If the objection to creating an Institute for pursuing only pure research is very strong, then the Institute could have two wings, one Pure and the other Applied. The danger here is that the Applied wing will soon drain away all the funds. People engaged in Applied research are usually better showmen than the 'Pure' men, and when a 'Pure' man has showmanship 'Pure' research suffers.

The Institute should be so conceived that its administrative side will not develop to the detriment of the research side. This has happened in all Government of India research institutions and it is high time that a committee was appointed to rationalize the administrative side of these institutions in such a way that the institutions performed better, if not start performing, the job they were primarily designed to do, viz.,

research. As things are at present, the Directors who were appointed for their scientific eminence are becoming increasingly busy with things which are far removed from research, and they are occasionally heard consoling themselves that they are enabling others to do research. If the Institute of Social Sciences is to avoid this major pitfall, its administrative procedure needs to be greatly simplified, and second, there ought to be one able man whose whole-time business it should be to look after the administrative side. But such a man should not be the Director. The Director should be engaged actively in research work of his own, otherwise the Institute will go on the wrong track.

There are some who fear that the creation of such an Institute will affect adversely research work in the universities. There is no reason why this should happen if it is made clear from the very beginning that the

Institute is not the sole body to pursue social research in the country. Centralisation in the realm of knowledge is always attended with danger, and especially in the humanities and social sciences. That is why there must be more than one active centre of research in the country. And surely India is big enough and its problems are important enough for the Government to incur the extra cost.

Actually the setting up of the Institute might have a healthy effect on research done in the universities. Junior fellows of the Institute may be attached to particular universities while working for their doctorates, and vice versa. And if the senior fellows turn out first-rate work it will not be without effect on the young men and teachers in the universities.

The Seminar has recommended that the task of carrying out a sociographic survey of the major castes

and other groups in the country should be entrusted to the Institute. Such a survey would have lasting scientific and historical value, and would also be helpful in tackling the problems of particular groups. Besides, the universities and Institute could come together in undertaking this gigantic task. We mention it here only to show that the Institute might actually benefit the universities, instead of coming in the way of their development.

All in all the Seminar is to be congratulated on suggesting the need for a National Institute of Social Sciences. We hope this suggestion will be debated in the circles that matter and a decision taken in the near future. We must stress here, however, that every care must be taken to ensure that the Institute, if and when created, does actually do research work of the highest order. Otherwise it ought not to be created.

Weekly Notes

TELCO Prices

GOVERNMENT have requested the Tariff Commission to conduct an enquiry into and make recommendations on the 'fair prices' that should be paid for locomotives and boilers manufactured by the Tata Locomotive and Engineering Co. Ltd. (TELCO) since February 1, 1954. The Commission has also been asked to indicate the period for which these prices should hold and the basis for further revisions in them.

Under the agreement between the Railway Board and TELCO signed in 1947, the railways have agreed to buy 50 locomotives and 50 boilers per year when the factory is in full production. Further, should the factory achieve a higher rate of production, it was agreed that the Railway Board should buy such surplus production in preference to imports. Trouble has now arisen because the prices quoted by TELCO are higher than those quoted by foreign firms and are considered by the Railway Board as excessive. Since TELCO consider the higher costs to be a result largely of the terms and conditions imposed by the Railway, they plead inability to lower the prices. Hence the need for a thorough enquiry.

The Railway Board's view is that TELCO's quotations could be reduced if costs of production are calculated exclusive of charges admissible only

during the initial stages of development, and if existing capacity is utilised properly. TELCO, on the other hand, argue that the prices are based on actual costs of production. They are higher because the Railway insists on 75% of the components being produced indigenously and because the boiler orders placed are for those of an uneconomic size.

Considering that the Railways would be the major if not the sole purchaser of TELCO's products, it is obvious that the extent to which capacity can be utilised depends on the railways' offtake. It is also evident that in the present state of things, TELCO's costs should be higher than those of foreign producers, who have been in the field for long and have a much larger operational size. It would, in this connection, be interesting to see how TELCO's costs compare with those of Chittaranjan and why the differences, if any, arise. The Tariff Commission's decision in this regard would be of more than usual interest—since there would be many more cases of this sort in the future, with Government appearing on the one side as a monopolistic buyer and private units appearing on the other as more or less monopolistic sellers.

Indonesia

FOUR major political parties have emerged out of free Indonesia's first general elections. There will be no immediate change in the Gov-

ernment. Dr. Harahap's Masjumi Party will continue to function as an undertaker Government until the completion of the work of the Constituent Assembly. Any change in the Government is, thus, not likely before April next. More disquieting is the uncertain verdict of the general elections. It is clear that Indonesia will have a coalition Government. But it is not yet clear whether the Nationalists or the Masjumi Party will dominate the next coalition Cabinet.

Dr. Soekarno's popularity is reflected in the narrow lead of the Nationalists in the elections. His Party fought the elections on two main issues. It told the people that Indonesia was politically free, but economically dominated by the Dutch. It is well-known that the Nationalists accept the Bandung attitude to foreign affairs. The Communists endorsed the Nationalist viewpoint that Indonesia was under Dutch economic domination. They were diplomatic in assuring voters that they would work for a "popular front" and would not try to establish a Red regime. Dr. Harahap's Masjumi Party stressed the dangers of the growing popularity of the Communists. It warned the voters that Nationalists were fellow-travellers. Though Dr. Sjahrir has still some influence, the Socialists are fast losing political hold on the country.

Western Powers would prefer a coalition Cabinet of the Masjumi Party and the Socialists. Both these parties have pro-West leanings. Dr. Soekarno's Nationalist Party is intimately associated with Bandung and all it stands for. That is why the Nationalists are not popular in Washington or in Amsterdam. From the election results, it would seem that the voters accept Bandung, and are opposed to attempts to cajole Indonesia into SEADO. It has been apparent for some time that the Army plays an important role in Indonesian politics. It remains to be seen whether the Army will help Dr. Soekarno to form a coalition Government, or will tilt the political scale in favour of the Masjumi Party. But Dr. Soekarno is in a position to exploit the United Islam Party in its opposition to the Masjumi Party. It is, however, not yet clear whether he can count on United Islam to dictate terms to the Army.

Steel Imports

IN July, steel prices were increased by Rs 20/- per ton on an average. They have been again increased by another Rs 80/- per ton now. Government communique states that this steep increase is to subsidise larger quantities of imports of steel. T T K is reported to have stated that the present shortage of pig iron and steel in the country had taken Government quite unawares and he has tried to pass on the blame, to some extent, to the private sector. This is rather unfortunate. Till lately, Government did not give any encouragement to the private sector to expand steel production. On the other hand, the price policy adopted since 1948 has been hampering the development of steel industry in the private sector. That apart, it does not reflect any credit on Government to admit now that the present shortage of pig iron and steel developed unexpectedly. It only shows that the Ministry responsible for the development of steel industry was not aware of the development projects sponsored by other Ministries. Anyway, Government have now decided to make all-out efforts to get as much steel as possible from abroad and the target for the next year is about 1 million tons. It appears that the agency to be used to procure steel is the Government trade representatives abroad. It should be admitted that Government Officers have not shown much competence in any large-scale purchases of this nature

abroad. As large-scale transactions are expected, it is better to have the assistance of those who are closely associated with the steel trade in any negotiation that the Government might undertake for the procurement of steel from abroad. This is a point that Government will have to bear in mind if they have not already taken steps in this direction.

Industrial Relations

PROPOSALS for ensuring better industrial relations and for accord a fairer deal to labour are, of late, being widely discussed, and during the last session of Parliament the Industrial Disputes Bill, directed to this end, has been introduced in the Lok Sabha. There has been a striking awareness, especially on the part of Government, of the need for smooth employer-employee relations in implementing the several programmes of development, and in this context, the observations made by the Union Deputy Labour Minister, Shri Abid Ali, at the seminar on industrial relations at Visakhapatnam last week, are significant inasmuch as they give, in a nutshell, Government's policy towards labour-employer relations. Shri Ali's prescription for avoiding disputes is this: managements in industry should accept and respect the trade union movement, and they must regard the problems of workers as their own and deal with them "at the highest level with sympathy and personal touch". On the other side, labourers should play their role with a sense of discipline, responsibility and realism, and identify themselves with the country's efforts at achieving economic development. And if a socialistic pattern of society is to be attained quickly, these two conditions are essential. The Government, on its part, would encourage the development of trade union movement on sound lines and will also help settle disputes when they arise, with its conciliation and adjudication machinery.

Shri Abid Ali has rightly emphasised that without a genuine and strong trade union movement for the industry or the unit, industrial relations will be weak, and therefore workers should not only organise themselves effectively but be well informed about their unions. In this connection two points need special emphasis. For the trade union to be really genuine i.e. for it to be an entirely workers' move-

ment, it would be necessary to rid it of external influences. It is well known that outsiders who become labour "leaders" or hold office in the unions, often misguide labourers into disputes with managements and make political capital out of the situation. Again, the labour movement in India is divided between divergent political ideologies. It is, therefore, necessary to eliminate the external influences that have brought about a division in the rank of labourers. This is, no doubt, a process needing time. But no efforts should be spared to make the labour movement self-reliant.

The multiplicity of trade Unions and the rivalries that they often give rise to should be enough to understand the need for consolidation. As Shri V V Giri, former Union Labour Minister, suggested some time back, efforts should be made to have one union for one industry, and this industry-wise organisation would greatly facilitate effective collective bargaining.

Shri Abid Ali has neatly summed up some of the recent 'progressive' proposals such as labour representation on management, profit sharing etc. when he says that "association with management wherever possible, sharing of gains, prosperity and provision for the future would be still another effective way of building up healthy labour-management relations". These proposals are, however, still under examination by the Planning Commission and while it is difficult to be dogmatic on the merits of such proposals, it must be pointed out that they cast a responsibility on employers, which they must recognise and live up to, if they want labour to honour its responsibility and obligations. And in the context of the officially accepted policy of a socialistic society, unless employers are prepared to be progressive and share the gains of industry with labourers, happy industrial relations would, for ever, remain an ideal.

New Major Ports

IT was evident from Shri Lal Bahadur Shastri's broadcast last week that although considerable expansion of port facilities is proposed during the Second Plan, no decision has yet been taken regarding the development of a new major port. On the West Coast, south of Bombay, the choice between Mangalore and Malpe has not yet been made and the Minister indicated that technical in-

vestigations with regard to the feasibility of developing Mangalore into an all-weather port are still being carried out. On the east coast south of Calcutta, Paradip at the mouth of the Mahanadi in Orissa is being considered for development and preliminary investigations have provided favourable results.

Since further investigations will be necessary before these projects can be taken up, only Rs 5 crores have been provided during the Second Plan to cover them as well as other minor port development. The development of a major part is a long-term programme even after a final decision has been made, considering the progress of Kandla so far. Even though the decision to develop Kandla was taken urgently as far back as 1948, only Rs 6 crores of a total of Rs 14 crores have been spent so far. The bunder for discharging cargo from sailing vessels and from ships anchored at moorings, and the staff colony have been completed, while the oil jetty is nearly ready. The four cargo berths and one passenger berth are, however, still under construction. From the Kandla experience it is obvious, therefore, that even after final decisions are taken with regard to the two new major ports, it will be many years before they are available for use, and the leisurely way in which the question is being treated is hardly justified.

The Transport Ministry is probably influenced in this connection by the fact that programmes for the extension of the facilities at the existing major ports are under active implementation. That these will improve port facilities considerably is undoubted. But the question of the new major ports is really independent of them, being linked to the development of new major industrial areas—Orissa and the surrounding areas in the East and the new Karnataka State in the South.

If the pace of industrial development really goes up at the rate anticipated during the next decade, the need for these ports will become very urgent and then the time needed to develop these ports might prove to be a major obstacle to further industrial progress. The development of ports must precede and stimulate industrial development, or at the very least proceed concomitantly with it. It cannot be left to follow industrial development, hampering rapid progress in the interval.

Other Port Developments

SHRI LAL BAHADUR SHASTRI revealed in the course of his talk that only Rs 37 crores of the planned expenditure of Rs. 62 crores had been incurred on ports, during the First Five Year Plan. This slow progress was attributed to the complicated nature of the works which involved long preliminary investigations and preparation. Only after momentum had been gathered could the work be expected to proceed rapidly. The unexpended sums from the first Plan together with new schemes which have been drawn up for the new Plan period make a total of Rs. 60 crores for investment during the Second Plan.

The schemes included in the Plan are intended to render the existing capacity more effective through modernisation and replacement of old and obsolete equipment. Additional berthing capacity is to be provided at Calcutta, Madras and Cochin, while river training measures in the Hooghly, provision of mechanical handling appliances at Calcutta, channel dredging, modernisation of the Princess and Victoria Docks and improvement of ship repair facilities at Bombay are among the measures included in the Plan. A new dry dock has also been planned at Visakhapatnam as part of the development programme of The Hindustan Shipyard. The improvement of facilities at 18 minor ports, which have now been designed as intermediate ports, has also been planned. Inadequacy of shore facilities and situation of approaches are their major problem and a solution of these will help them to play a larger part in the development of India's transport system.

Private Foreign Capital

THE flow of foreign capital on an organised basis has been mainly through official channels since the end of the War. The International Bank for Reconstruction and Development and the Commonwealth Development Finance Corporation have been the major sources and though they have provided substantial amounts of capital for reconstruction and development projects, the need for organised private institutions for the provision of foreign capital has been deeply felt. The newly-formed Transoceanic Development Corporation is expected to satisfy this need.

The new Corporation, which has been formed by Kuhn Lach and Company of New York, the First Boston Corporation of New York and S G

Warburg and Company of London, has the support of a large number of banks, issuing and investment houses in the United States, Canada and many Western European countries. Registered in Canada, the Corporation has a share capital of \$10 million divided into shares of \$100 each, all issued and subscribed. Only half the capital is called up at present. The Corporation will undertake equity investment in existing and new companies. It will also assist the promotion of new enterprises. This new entrant to the field of international finance is highly welcome. It is to be hoped that some of India's projects will find support from the new Corporation.

Imperial Tobacco

SHAREHOLDERS of the Imperial Tobacco Company of India, Ltd., will welcome the disclosure by Mr E H Hare, the Chairman, in his address before the first annual general meeting since the conversion of the Company into a public company that the directors propose to declare interim dividends in future, provided the profits so justify. For the year to March last, a final dividend of 4 per cent free of income-tax, is proposed.

There has been a satisfactory increase in the volume of sales for the first five months of the current financial year over the same period of last year. This is the reason advanced for declaring an interim dividend of 2 per cent, free of income-tax, out of the profits of the current year.

Mr E H Hare is a progressive industrialist. He is aware that the progress of his Company's business is intimately associated with the continuing economic prosperity of the country. He, therefore, welcomes the steps that have already been initiated to frame the second Plan, and measures that are being introduced to ensure prosperity to the remotest villages.

Mr Hare is aware that taxation of tobacco products is a fruitful source of revenue. But, Mr Hare observes "in fairness to the consumer and with a view to ensuring the maintenance of a sound revenue-producing source to Government, the latter should consult with the Tobacco industry as to the best method of applying the incidence of such taxation . . ." Mr Hare expresses disappointment that the Taxation Enquiry Commission has recommended no material change in the structure of tobacco taxation.

Beaten, heated to 3,500° F —this oil won't give up!

How Gargoyle Lubricants protect diesel engines

TEMPERATURES in a diesel engine often exceed 3,000 degrees Fahrenheit. The flame generated in the engine cylinders, every time the fuel is injected, attacks the thin film of lubricating oil. This oil film is all that protects the cylinder walls from destruction.

That is why choice of the correct lubricant is vitally important. In India, as in so many other countries, Gargoyle Industrial Lubricants — famous for 89 years — are chosen to protect crores' worth of equipment.

Different diesel engines have different lubrication needs, and there's a right Gargoyle Lubricant for each. Backed by our experience, correct lubrication — with Gargoyle Lubricants — can help to reduce costs and protect machinery in your plant. For details, write to Standard-Vacuum Oil Company . . . Bombay, Ahmedabad, New Delhi, Lucknow, Calcutta, Madras, Secunderabad, Cochin.

STANDARD-VACUUM OIL COMPANY

(The Liability of the Members of the Company is Limited)

A More Positive Approach

PROFESSOR MAHALANOBIS gave an exposition of the Plan-frame on Gandhiji's birthday at a meeting organised by the London Majlis. In course of this exposition, he made, inter alia, the following points:

(i) The Plan-frame gives high priority to heavy industry because the economic progress of any country depends on the development of its heavy industry;

(ii) The Plan-frame rests on a "feed-back process" the rate of increase in the supply of consumer goods determining the rate at which it would be possible to make investment in heavy industry;

(iii) In a socialist economy there is no conflict between the objectives of raising labour productivity and creating new employment; but in India it is necessary for the present to depend on handicraft and cottage-industry for the creation of additional employment.

Professor Mahalanobis' argument, which he presented persuasively enough, seems to be wrong at several points. This does not necessarily mean that the Plan-frame is unsound; though it does mean that where the Plan-frame is right, it is often for reasons other than those which its author has in mind.

(i) The degree of industrial development essential for the utilisation of the available labour force is higher in over-populated countries than in those that are under-populated. But where a country is not only over-populated but has rich iron deposits, as in the case of India, there is a case for special attention being paid to the development of iron and steel industry, and certain other allied fields of manufacture. It is, however, wrong to generalise. No absolute case can be made out for heavy industry, unless it be on nationalist grounds. In an under-developed country, which is also deficient in iron and coal, the path to economic progress does not lie through a special attempt to develop heavy industry. Even in India, it is good to remember that the fact that a certain product is "key" to the development of other industries, or products, is not necessarily an argument for producing it domestically.

(ii) and (iii) Under dictatorship, investment in heavy industry can be

pushed up even when the supply of consumer goods fails to keep pace. In this connection, the closing years of the First Five Year Plan and the opening years of the Second Plan in the USSR make interesting study. Increased investment in heavy industry was undertaken in spite of the consumer goods industry falling much behind the postulated targets. To make this possible, on the one hand, a rigorous system of rationing and control was applied; on the other hand, the increased purchasing power resulting from heavy investment was drawn away by the State through a turnover tax, which affects the consumer much in the same way as a purchase tax. The rate of the turnover tax on many ordinary commodities was well over 50 per cent. A sales tax to the tune of 2 annas in the rupee (12½ p.c.) imposed in India, even with the clearly declared policy of investing the proceeds in chosen industries, would almost certainly provoke riots.

In other words, a democratic government has to observe certain strict limits in the forced restriction of present consumption that it can feel free to impose. These limits being given, it is not open to a democratic government—even if it be socialist—to create any amount of additional employment with methods of production of any degree of capital intensity. Even a dictatorial government is not all powerful. The Chinese have realised this quite early, and have employed labour-intensive methods in their river valley projects in order to raise the volume of employment. The available volume of capital and the number of additional jobs to be created being given, the ratio between the two indicates for the moment the average capital intensity of the techniques to be adopted.

There is, of course, a more dynamic aspect of the problem. Professor Mahalanobis pointed out that in a socialist economy the government can reinvest the surplus accruing to any enterprise. Such surpluses are normally reinvested by the representatives of the State, under the one system, and by the representatives of shareholders, under the other system. The instrumentality through which the reinvestment is made may, and does, make a difference, but not of the nature that Professor Maha-

lanobis seems to imagine. A dictatorial government can, indeed, make the surplus to be reinvested larger than it would be otherwise, by forcing down wages, by concentrating chiefly on heavy industry, by imposing a high turnover tax, or by other similar measures. But such courses are equally open to dictatorial governments of the non-socialist variety, as represented in the past by Japan, for instance.

The following are few additional observations:—

The rate of economic development in India will depend considerably on the extent to which the government succeeds in mobilising savings in the countryside. This is one of the clearest lessons of economic development in a number of countries. The problem is to forge democratic methods of mobilising and investing rural savings. The answer to this problem lies, at least partly, in linking up rural savings with investment in rural areas. Only in this way can the villager be made investment-conscious. Herein lies the importance of community development projects.

Nonetheless, it is necessary to re-think whether it is desirable to impose discriminatory taxes against medium sized consumer goods industry to afford protection to cottage industry. It might be better to adopt a less negative approach.

In the increased supply of manufactured consumer goods that we would require in future, there should be room for simultaneous expansion of cottage and medium scale industries. There is a very good case for organising more scientific research for helping handicrafts to improve their methods of production. There is need for improving credit facilities for cottage and small industries, and for greatly strengthening the marketing organisation for their products. But it is on this positive approach that the stress should lie. Cottage industries should be encouraged—to struggle, and not to stagnate.

Shadow Boxing

FROM a perusal of the Report of the States Reorganisation Commission, suspicion arises whether it has properly interpreted the terms of reference. Suspicion grows as one reads some of the passages in the report whether SRC has been unduly influenced by political considerations. Suspicion deepens as one analyses its major proposals that it lacks the courage of its convictions.

Of the three members of the Commission, one is an eminent jurist, another is widely respected as one of India's elder statesmen and the third is a reputed historian and a distinguished diplomat. It was appointed to examine the question of reorganisation of "the States of the Indian Union" objectively and dispassionately "so that the welfare of the people of each constituent unit as well as of the nation as a whole is promoted". Over and over again, the Commission emphasises the supremacy of the nation. It quotes the Constitution to stress that "there is only one citizenship, a common citizenship, for the entire Indian people with equal rights and opportunities throughout the Union".

And yet, it discusses the time factor in introducing changes in the present set-up to conclude that "the task of redrawing the political map of India must be undertaken now and accomplished without delay...". It will not be denied that the Commission's proposals, if accepted, should be promptly implemented. Immediate implementation of the recommendations will be necessary to avoid any delay in holding the general elections as well as in executing the second Plan according to schedule. It augurs well, as latest reports from New Delhi indicate, that Government is aware of these overriding considerations in relation to readjustments in the administrative boundaries of the units of the Union.

Opinions will, and must, differ on SRC's proposals. But there must be no doubt or ambiguity about the tasks set before the Commission, or about the implications of its recommendations. It was not the function of the Commission to redraw the 'political map' of India. But more than once the Commission uses this expression to suggest readjustment of boundaries for administrative convenience. It would be uncharitable, however, to accuse

the Commission of fostering irredentist tendencies. It is emphatic in its rejection of the "homeland" concept or of the theory of "one language, one State". But it would be idle to pretend that there are not combative groups which want to redraw "the political map" of India, or that such movements are without sinister implications.

Those who claim familiarity with the deeper political cross-currents in this country must feel surprised at, if not impressed by, some of the political arguments seriously advanced by many thinking persons in this country. History is cited in support of the theory that India has never been administered, except under British Rule, as an integrated political entity since Asoka. It is symbolic that "Asoka Stambha" is the national emblem of free India. International developments since the first World War are relied on to support the case for small, national, sovereign States. Experiments in Communist Russia are loudly acclaimed to buttress the concept of small, independent, sovereign States within the Republic of India. If Laos or Cambodia can aspire to exist as sovereign States, there is no reason why, it is hinted, West Bengal or Kerala or even Manipur, to take a few examples, could not exist as autonomous, linguistic, sovereign States.

These are dangerous doctrines. These theories are widely advocated. It is a major flaw of the States Reorganisation Commission that these underlying political cross-currents have not been adequately considered by it. To-day, Congress is in power at the Centre as well as in the States. But a time may, and certainly will, come when the administrative control of the Union and of the units may not be under a single party. It is, therefore, necessary to re-examine the provisions of the Constitution relating to relations between the federated Union and the units. It is to be deplored that this aspect of the problem has never been properly treated.

Prospects of gloom are not rare. But the countrywide reaction to SRC's recommendations encourages the hope that implementation of its proposals may satisfy the most predominant urge for reorganisation of the boundaries of States. SRC rejects the theory of linguistic States. But its proposals, if accepted, will lead

to the formation of linguistic States. SRC has not recommended the formation of Samyukta Maharashtra. But Vidarbha will be a Maharashtra State; Marathi-speaking districts of Hyderabad will be merged in Bombay. In the SRC set-up, only Gujaratis will be without a linguistic State. Gurumukhi is a script. Therefore, SRC's rejection of a separate Sikh State does not mean its total rejection of linguistic States.

SRC's acceptance in practice of the theory of linguistic States, despite its theoretical objection to linguistic States, will be welcomed on wider grounds. But it will be criticised for its inadequate appreciation of wider economic factors. Linguism has been a potent influence mainly in southern and western India. SRC has not been unsuccessful in satisfying South India's aspirations. In western India, Gujaratis, though deprived of a State, will have nothing to complain about SRC's proposals. Maharashtrians alone will nurse a sense of grievance. But those who do not rely exclusively on linguism in rearranging the boundaries of the units will wonder whether SRC has duly considered the relation between population and area of the proposed units. SRC's proposals relating to reorganisation of States in central India will evoke criticism from this angle. It could have escaped any such criticism by accepting Sardar Panikkar's suggestions in his minute of dissent.

SRC can claim that its proposals are as good as any other that could be framed. To the criticism that it has ignored basic economic factors, it can reply that it has recommended an industrial location plan and a permanent organisation to consider the claims of economically backward units. Economic implications and consequences of reorganisation of States cannot be avoided altogether. Suggestions are made by SRC to ensure a minimum standard of economic development in the States through planned distribution of expenditure by the Union Government. It is where SRC leaves that the problem of reorganisation of States becomes more complex. Economic implications of planning in a federal State and the federal organisations necessary to ensure uniform progress in the federated units need to be explored further.

From the London End

Labour in Crisis

THE Annual Conference of the Conservative Party has now taken place and that of the Labour Party is about to open. For the Tories, this year's conference, like all the previous ones, has been concerned with how best the acquisitive society which they preach can be brought quickly into existence or, alternatively, how best the dismantling of all those welfare facilities which the Labour age of 1945 to 1950 bestowed, can be introduced without civil unrest and uncertainty. The Conservative Party Conference was made to face some of the more unhappy features of the current economic situation, but Mr Butler's smile was sufficient as an assurance that in no way would the final aims of Toryism be jeopardised by quick remedies of the more easily applicable collectivist type (physical controls over wages and dividends, imports and consumption). The easy streamlined political machinery which the Conservative Party has become was, of course, the hall-mark of the Conference discussions. Considerable confidence in the party and in the accomplishment of their aims was the outcome of the otherwise tedious discussions at Bournemouth.

In contrast, the conference at Margate faces a situation of crisis for the entire British labour movement. The famous Wilson report on the organisational weakness of the party will be before the delegates and they will have to come to realize that unless something very fundamental is done to overcome the present organisational weaknesses and the apathetic policy of the Labour leaders, the Labour Party will have had its day. Mr R T McKenzie, in his outstanding recent study on *British Political Parties*, drew the conclusion that Lowell's characterization of the Liberal Party as being a "sham organisation" can in a certain sense be made appropriate to refer to the Labour Party. A characterisation in this form is serious enough for British labour, but when Mr Wilson's Committee on the organisation of the Labour Party states unequivocally that labour organisation is still in the stage of the "penny farthing" while that of Labour's opponents has moved into the jet age, the crisis is certainly real and overwhelming.

Historically and otherwise the Times has never been a friend of the Labour Party, for it has been

many years now that the Times has warned against the potential menace of Labour if its leadership and policy should shift from the present channels. Now, however, the Times has struck a new note and it warns against the dangers that are developing in view of what it calls the 'decline' of Labour. The last general election outcome is conceived by this august organ as "shocking". It is well to quote from an editorial comment of this paper:

"The shocking fact about the election was the steep fall in the Labour vote for the first time in a quarter of a century The historic question is whether the Labour Party is going into decline or whether the pendulum has simply swung temporarily against it."

In another editorial comment, the Times conceives the current situation in the Labour Party as representing "a picture of an aged party divided within itself, lacking vigour at the top and zeal at the bottom; inadequately organised and inadequately financed, unable to attract the young men and women who might rejuvenate it." This view is completely correct. Anyone who has studied the agenda of the coming Margate conference can, without any reason, doubt the awareness of many members of the Party that the time for revival is now or never. What is alarming about the situation in the Labour Party is that very few of its members know how a revival can be brought about.

The Wilson report virtually confines its recommendations to organisational matters, but it is clear that no matter how streamlined and modern the organisation of the Labour Party is made, Labour's revival in terms of strength and influence will still remain a distant prospect. The revival can only come from a drastic review of policy—from a change in attitude and understanding of Labour's mission so that the minds of Britain's youth can be captured in much the same way as the sickness of Toryism in the 1930's and Labour's alternative policy then were able to attract the youth of that period.

This fundamental requirement for revival is forgotten and one fears that it will be forgotten at the Margate conference. A glance at some of the statments and pronouncements of leading Party theoreticians—MP's and the like—reveals that the

ways of overcoming the crisis have hardly dawned on them. Even the Bevanites, that group of dissidents, who, in the period of their origin, had exercised an enthusiasm and an influence which appeared to delay the coming on of the crisis, are now so overwhelmed by apathy and lack of policy that the more informed of British political commentators have come to speak of "the missing Bevanites", in somewhat the same strain as they speak of the "missing diplomats".

The Bevanites' position in the present situation is clearly brought out by a recent article by its leading thinker, Mr Richard Crossman. In his column in the *Sunday Pictorial*, he writes as follows:

"Five weeks since the election and still no real challenge to the Government. What is the opposition playing at?" I can understand why Labour supporters are impatiently asking this question. They want to see Socialist enthusiasm in the constituencies revived by a resounding clash at Westminster. But at present there is scarcely a tinkle of conflict there. The trouble is that in British politics it takes two to make a quarrel. And the Eden Government refuses to oblige."

The implication of this remarkable piece of logic is that at present the Labour Party has nothing to quarrel with in the policy of the Conservatives. On this basis it can, with reason, be asked, "Why is there a Labour Party?"

The situation dictates the call for a new policy on the part of the organised Left—the Labour Party. It is time that they "obliged" the nation with a quarrel based on the firm understanding that by history Labour has a mission to fulfil.

Instead of this the Labour leadership have from recent pronouncements little to offer in the nature of "a policy of revival". For international peace and tranquility, the Labour leadership have substituted arguments favouring the hydrogen bomb, power blocs, German rearmament and colonial wars. For retrenchment, they have substituted a programme of rearmament. In this situation it is impossible to believe that revival can emerge in its basic form from the coming Margate conference.

West Bengal is Disappointed

BENGALIS are individualists. They are supposed to be incapable of team work. This is, perhaps, as good an explanation as any other of the misfortunes of Bengal and Bengalis. There is remarkable individual achievement by Bengalis. But they are not good at co-operative, organisational effort. There are as many views on any subject as there are Bengalis. West Bengal is a party-ridden State. Individualism also explains why the joint-stock form of enterprise is not popular among Bengalis. That is why they are not in industry.

Bengalis may lack unity. But on one issue, they are united to the last man and woman. All are agreed that West Bengal, partitioned Bengal, must have more space to live in. West Bengal claimed 12,000 square miles of territories from adjoining States before the States Reorganisation Commission. It got 3,812 square miles. Every Bengali, every political party, is disappointed at this niggardly territorial concession. Communists, Revolutionary Socialists, Praja Socialists, all Left and Right parties, have agreed with the State Congress that injustice has been done to West Bengal.

West Bengal's claims to territories in Assam and in Orissa have been rejected. Most of its claims to areas in Bihar have been refused. But SRC proposes to create a corridor by carving out a portion of the district in Purnea now in Bihar. Since partition, northern West Bengal has been cut out from the rest of the truncated State. This has caused communication troubles. It has fostered a feeling of remoteness in the northern parts of the State. This concession was widely anticipated. It was a foregone conclusion that SRC will concede this claim of West Bengal.

This claim is conceded by SRC on grounds of territorial integrity. "We attach great importance to the geographical compactness of administrative units because we are of the view that the physical integration of such units is vital to their real political and administrative integration". This concession has a rider. Kishanganj sub-division is a predominantly Muslim area. SRC recommends transfer of a portion of this sub-division to West Bengal in the hope that the West Bengal

Government will do nothing to prejudice the interests of the Muslim population of this region.

West Bengal Government's treatment of the Muslim population in this State is unexceptionable. There has, therefore, been some irritation over SRC's rejoinder that the West Bengal Government should make "a clear announcement" that no rehabilitation of displaced persons would be attempted in this region. SRC's concern over this Muslim pocket is commendable. So is the West Bengal Government's policy to Muslims in this State. It is the influx of displaced persons which is the urge, and part justification, behind some of West Bengal's territorial claims. That is why SRC's advice gratis has caused some irritation in West Bengal.

A portion of the Kishanganj sub-division is proposed to be joined to West Bengal on grounds of physical integration. SRC is not in favour of linguistic States. But it has recommended transfer of Purulia sub-district, excluding the Chas revenue thana, to West Bengal on linguistic grounds. On the same logic, West Bengal's claims to some other areas in Bihar and to Goalpara in Assam are not unjustified. But SRC has expressed the opinion that West Bengal's claim to Goalpara is untenable. Tripura has more cultural and linguistic affinity with West Bengal. And yet, SRC proposes to merge Tripura in Assam, and not in West Bengal.

West Bengal, SRC is aware, "has steadily lost territory". Inflow of displaced persons has complicated this land-starved State's problems. There are many aspects of rehabilitation of East Bengal refugees. One is their inability to settle in areas outside West Bengal. But the Andamans is one of the few areas outside West Bengal where many East Bengal refugees have been settled successfully. SRC rejects West Bengal's claims to the Andamans. This and the Nicobar Islands are to be Centrally-administered territories. West Bengal's claim is not conceded, though SRC recommends inclusion of Laccadives and Aminadives in the proposed Kerala State.

That Bengalis will feel aggrieved over the proposals of SRC, is not unnatural. Nor is it surprising that some of the arguments advanced

against SRC are rather partisan and parochial. With the exception of Assam, none of the States in Eastern India is happy over SRC's recommendations. West Bengal is angry. Bihar is in a quarrelsome mood. Orissa is disappointed that it stays as it is. Only Assam is pleased with SRC.

In all parts of the country, reaction to SRC's proposals is unpleasant, if not hostile. SRC may regard this as an indirect tribute to it. In a way, it is. Its basic approach to the problem is sound. It is not unwise in playing down linguism. Its emphasis on the supremacy of the nation will be widely endorsed. It has done well in stressing the need for more cohesion and integrity in the units of the Union of India.

Judged by this basic criterion, SRC's concessions to West Bengal's territorial claims do not seem adequate. As proposed by SRC, West Bengal will be the thirteenth State in area, but will be the fifth State in respect of population. West Bengal will have 34,590 sq. miles with a population of 26.5 million. Bihar will have a population of 38.5 million, but its area will be 66,520 sq. miles. Assam's population will be only 9.7 million, but its area will be as large as 89,040 sq. miles. Orissa's population will remain at 14.6 million, and the area will be the same as now at 80,140 sq. miles.

One should have thought that SRC would consider the problem of population in relation to area. This is not the only or the major factor in redrawing the map of India. But this is an issue which cannot be ignored altogether in making an attempt to draw rational boundaries for the units of the Union. Boundary readjustments are not unfamiliar to Bengal. But partition has crippled Bengal. And West Bengal, divided Bengal, has to bear the main responsibility of settling the East Bengal refugees.

One feels that SRC has not considered fully this problem of displaced persons. West Bengal's main grievance against SRC's recommendations is that the problem of displaced persons has not been taken into consideration.

Reorganisation of States The Approach and Arrangements

THE Historic Report of the States Reorganisation Commission which was released early this week will obviously be the subject of considerable discussion throughout the country. The principal recommendations of the Commission, which consisted of Shri Saiyid Fazl Ali (Chairman), Shri Hriday Nath Kunzru and Shri K M Pannikar, are summarised below. The Commission has recommended the establishment of 16 states without any distinction instead of the 27 existing Part A, Part B and Part C States. In addition, there will be three centrally administered areas to be called territories.

The Commission has insisted that no change should be made unless the advantages which result from it in terms of "the welfare of the people of each constituent unit, as well as the nation as a whole" are such as to compensate for the heavy burden on the administrative and financial resources of the country, which reorganisation must entail.

In view of the controversy over linguistic States, the Commission has affirmed that "it is neither possible nor desirable to reorganise States on the basis of a single test of either language or culture". They have postulated a balanced approach, which would:

(i) recognise linguistic homogeneity as an important factor conducive to administrative convenience and efficiency, but not to consider it as an exclusive and binding principle, over-riding all other considerations, administrative, financial or political;

(ii) ensure that communicational, educational and cultural needs of the different language groups, whether resident in predominantly unilingual or composite administrative units, are adequately met;

(iii) where satisfactory conditions exist, and the balance of economic, political and administrative considerations favour composite States, continue them with the necessary safeguards to ensure that all sections enjoy equal rights and opportunities;

(iv) repudiate the "home-land"

justified on grounds of linguistic homogeneity, because there can be more than one state speaking the same language without offending the linguistic principle, nor practicable, since different language groups, including the vast Hindi-speaking population of the Indian Union, cannot always be consolidated to form distinct linguistic units; and

(vi) finally, to the extent that the realisation of unilinguism at state level would tend to breed a particularist feeling, counter-balance that feeling by positive measures calculated to give a deeper content to Indian nationalism.

Financial viability has an important bearing on reorganisation proposals, but it has to be considered along with other relevant factors. The units should, as far as possible, be self-supporting. They should be so constituted that they have an incentive to raise and are able to raise, on their own initiative, at least a part of the resources needed for their development. The States cannot be so reorganised as to conform to economic regions. Nor can the principle of economic self-sufficiency within an administrative unit be regarded as a clear criterion. Consistently with these principles, however, it would be desirable to avoid as far as possible wide disparities in resources between the various States. The units should be large enough to ensure administrative efficiency and the co-ordination of economic development and welfare activities.

The wishes of the people should be regarded as an important factor bearing on reorganisation, but they have to be considered along with other relevant factors. The facts of the existing situation are more important than the previous historical associations of different areas. Undue importance cannot be attached, therefore, to historical arguments. Geographical contiguity of the units is important from the point of view of administrative convenience. Other geographical factors have to be regarded as secondary.

be transferred to the State of Madras, and

(ii) the districts of Malabar and South Kanara and the Kollegal taluk of the Coimbatore district should be detached from Madras.

The addition to Madras of the five taluks which have been mentioned will be justified by reason of geographical contiguity and linguistic and cultural affinity. It will also meet a clearly-expressed local demand.

Kerala:—The State of Kerala should be formed, which should consist of the following areas:

(a) the State of Travancore-Cochin minus the five taluks proposed to be transferred to Madras;

(b) the Malabar district (including Fort Cochin and the Laccadive Islands), the Kasaragod taluk of the South Kanara district and the Aminadive Islands.

Karnataka:—The State of Karnataka should be created consisting of the following areas:—

(a) the present State of Mysore, excluding the following portions of the Bellary district, namely, the Siruguppa taluk, the Bellary taluk, the Hospet taluk and a small area of the Mallapuram sub-taluk in which the dam and headworks of the Tungbhadra project are situated;

(b) the four Kannada-speaking districts of Bombay, namely, Dharwar, Bijapur, North Kanara and Belgaum, (except the Chandgad taluk of Belgaum district);

(c) the districts of Raichur and Gulbarga from Hyderabad;

(d) the South Kanara district of Madras minus the Kasaragod taluk;

(e) the Kollegal taluk of the Coimbatore district of Madras; and

(f) Coorg.

Hyderabad:—Hyderabad should be reconstituted on the following lines:

Apart from the districts of Raichur and Gulbarga, the Marathwada districts should also be detached from the Hyderabad State. The residuary State which should continue to be known as Hyderabad should consist

1224

30,971

& Nicobars 3,215
Andamans

Jammu and Kashmir—No recommendations are made in regard to Jammu and Kashmir.

Rajasthan—After the proposed merger of Sironj in the new Madhya Pradesh district of Rajasthan.

1225

The residuary State of Hyderabad might unite with Andhra after the general elections likely to be held in or about 1961, if by a two-thirds majority the legislature of the Hyderabad State expresses itself in favour of such unification.

Andhra:—The Andhra State should for the time being continue as it is, subject to certain minor adjustments which are mentioned below.

The taluks of Siruguppa, Bellary and Hospet and a portion of the Mallapuram sub-taluk of the Bellary district should be transferred to Andhra.

The Munagala enclave of the Krishna district, as has already been stated, should be transferred to Hyderabad.

There should be no change in the present position regarding Madras City and its future should be regarded as finally settled.

Bombay:—Bombay should continue to be treated as a composite rather than a unilingual unit. This arrangement will also provide the right solution of the problem of the future of the City of Bombay.

The State of Bombay should be reconstituted so as to include the existing Bombay State minus the Abu Road taluk of the Banaskantha district and the Kannada-speaking districts of Dharwar, Bijapur, North Kanara and Belgaum (excluding the Chandgad taluk), plus the following areas:

(a) the Marathi-speaking districts of Hyderabad, namely, Osmanabad, Bhil, Aurangabad, Parbhani and Nanded;

(b) Saurashtra; and

(c) Kutch.

Vidarbha:—A new State to be known as Vidarbha should be created, consisting of the following Marathi-speaking districts of Madhya Pradesh, namely, Buldana, Akola, Amravati, Yeotmal, Wardha, Nagpur, Bhandara and Chanda.

Madhya Pradesh:—After the separation of Vidarbha, a new State, which may be known as Madhya Pradesh, should be created consisting of:

(i) the 14 districts of the residuary Madhya Pradesh;

(ii) the whole of Bhopal and the whole of Vindhya Pradesh;

(iii) Madhya Bharat except the Sunel enclave of the Mandsaur district; and

(iv) the Sironj sub-division of the

Pradesh State, Rajasthan should continue in its present form subject to the addition of territories mentioned below:

(i) Ajmer, and

(ii) the Abu Road taluk of the Banaskantha district of Bombay, the Sunel enclave of the Mandsaur district and the Lohara sub-tehsil of the Hissar district of the Punjab.

The Punjab:—P E P S U and the Himachal Pradesh are too small to continue by themselves and as there already are economic and administrative links between them and the present Punjab State, the merger of these two States in the Punjab will be justified.

Uttar Pradesh:—There is no case for dividing the Uttar Pradesh, and this State should continue in its existing form.

Bihar:—It does not seem to be either necessary or desirable to create a Jharkhand State in South Bihar; the special needs of this area should, however, be recognised. Seraikella and Kharsawan should continue to be part of Bihar. Some adjustments in two eastern districts belonging to Bihar are indicated under West Bengal.

West Bengal:—Geographical contiguity between the disconnected northern portion of West Bengal and the rest of the State is necessary, and this will have to be provided for. A portion of the Purnea district east of the river Mahananda, being the minimum area necessary for this purpose, will, therefore, have to be transferred from Bihar to West Bengal. The Purulia sub-district of the Manbhum district in the south minus Char Thana should also be transferred from Bihar to West Bengal.

Assam:—Assam has been and must of necessity continue to be a composite State, having regard to its geographical position and ethnological and cultural history.

The demand for the creation of a hill State in Assam is impracticable and there is also no reason, having regard to the peculiar features and circumstances of Assam, why a separate hill State should be created. Tripura should be merged in Assam. The present arrangements with regard to the North East Frontier Agency should continue.

Orissa:—No changes are called for in the boundaries of Orissa which were fixed in 1936 after prolonged and detailed examination.

some of the arguments advanced

TERRITORIES

The units or areas which have not been dealt with so far will be directly administered by the Centre and will be known as territories.

Delhi:—If Delhi is to continue to be the seat of the Central Government, it must adopt a model which is sound in principle and administratively workable in practice. The people belonging to centrally-administered territories in India are more advantageously placed than those of centrally-administered areas in other important federal countries, in that full representation in the Union Parliament has been provided for under the Indian Constitution.

Delhi should be constituted into such a centrally-administered territory; the question of creating a municipal corporation with substantial powers should be considered.

Manipur:—Manipur should be a centrally-administered territory for the time being. The ultimate merger of this State in Assam should be kept in view.

Andaman and Nicobar Islands

The status quo in the Andaman and Nicobar Islands should continue.

The arrangements in regard to areas which have been or may be brought under Central administration in future, either before or after becoming de jure part of the territory of India, must be flexible, until the position is finally clarified.

The Indian Middle Class

—Its Future

B. N. Ganguli

THE middle class in India, as elsewhere in the world, is a much-maligned group of people. Members of this class are abused and slandered by political extremists, both of the right and of the left. The reason is that the middle class refuses to toe the line. Members of this class are self-centred: they are unwilling to sacrifice their deeply ingrained sense of personal integrity and self-sufficiency. They would perhaps subscribe to a diluted kind of social solidarity or even anarchism provided their own basic scheme of values was left untouched. Not infrequently they have an innate suspicion of idealistic experiments. They are inclined to roam backward and forward. But they would never go out of their tether which is their own particular view of life. And at the end of their going forward and backward in moments of stress, they only succeed in sticking to the status quo. This is a mentality which exasperates extremists. Thus, the middle class is described as a reactionary class. And people talk about the decay of this class and indulge in a lot of wishful thinking.

Heterogeneous

The middle class is always a mixture of heterogeneous elements. That is why the impact of social and political change may undermine the stability of certain elements but actually strengthen the position of others. Rot may set in within a certain sector of the middle class. But the class as a whole does not decay, because other and more vital elements grow and redress the balance. It is usual to include in the middle class the middling size entrepreneur in industry and trade, the simple producer of goods, such as the artisan and the farmer, the small shopkeeper and tradesman, and the official and the salaried employee. If we take these broad groups it is quite easy to see how heterogeneous the middle class is. And since the economic interests and incentives of these groups are not identical, their power of adaptation and resistance to a given change will not be the same. Let us see how during the last few decades these classes have maintained or lost their position relatively to one another and whether only certain

elements of the middle class, rather than the middle class as a whole, have been showing signs of degeneration and decay.

In Europe, A Spearhead

In India the modern middle class has shown the conditioned reflexes of an abnormal growth induced by foreign rule. In the West, the Burghers in the towns who formed the solid core of the middle class, were the spearhead of the economic revolution which destroyed feudalism. They were a militant class with the sturdy independence of a new class which fashioned a new society. It played off the other social classes, the nobility, the peasantry, the rising capitalists and the working class against one another to strengthen its position and aligned itself against the one or the other according to circumstances to maintain what it understood as the social balance. This has involved this class in a long struggle the issue of which even now is not clear. But this struggle has sharpened its reactions and moulded its peculiar attitude and sense of values.

In India, An Abnormal Growth

In India the order of events has been different. The British rule created a new feudal class in place of the old, authentic feudal class which had struggled against the rising British power. This new class again was composed of new elements that had enriched themselves as agents or employees of British merchants and traders who found in India a vast field for profitable enterprise, particularly because there was no sharp distinction between governing and trading in those early days. Thus a new class which spilled over from the port towns and other centres of British power to the countryside came into existence to serve as the intermediary between foreign merchants and traders, on the one hand, and the masses of people, on the other, in the joint venture of economic exploitation. This upper class created by the British gradually found itself related to the new middle classes in the descending order of wealth and influence.

These new middle classes, no doubt, consolidated their position in the

urban and rural society as stable elements. But their role was not that of Burghers in the West. They were essentially feudal elements with feudal traditions and attitudes. It was by accident that some were in the countryside and others in towns. All were linked in the feudal chain which the rising British power was interested in preserving. But it must be said that the British system of law created contractual relations and a field for individual enterprise, although economic enterprise was based largely on predatory exploitation of the masses of the population. Thus, that vital element of the middle class which is concerned with simple production of goods, i.e., the artisan and the farmer, steadily lost ground. The small shopkeeper and tradesman gained ground in the atmosphere of a commercial civilisation. The official and salaried class gained considerably in power and influence, because it was allied to British commerce or British administration. The middle sized entrepreneur in industry and trade also had a chance so long as he fitted himself into the new hierarchical economic order which rested on the supremacy of the foreign ruler and the foreign trader.

Lacks Vital Elements

The middle class in India thus grew as a parasitic class devoid of the vital elements like the independent farmer and the self-respecting artisan. A time was bound to come when the inherent economic instability of the Indian middle class could not but create a crisis. The most numerous elements of this class were people with inadequate intermediary interests in land as rent receivers, who had to supplement their income by urban occupations either in the professions or as salaried employees. Owing to the poverty of the country and lack of industrial development, the chances of employment were not expanding as fast as the number of men seeking employment. Owing to the growing depression in agriculture the income of this class as rentiers was also dwindling fast. With the recent disappearance of landlordism this element of the middle class has now become exclusively dependent upon urban occupations. Inflation

during the two wars seriously undermined its economic strength. The Great Depression between the two wars sapped its economic vitality. This element of the middle class actually found the ground slipping from under its feet. To crown all, the Partition destroyed whatever economic strength and resiliency it possessed in spite of the vicissitudes of the last few decades.

Led National Movement

This section of the middle class has joined hands since the beginning of this century with other classes in the community in the nationalist movement. In fact the lead came from the urban middle class which had felt most the cramping influence of British rule. Within this class the hard core of nationalist resistance developed amongst people who had become partially uprooted from the soil and yet regarded shopkeeping, trading and manual work as degrading occupations out of a sense of feudal contempt for these occupations. They naturally assigned a higher value to literature and art and revivalism in general which inspired our nationalist movement.

If one were to trace the history farther one would be tempted to point out that during the period of the second world war and the years following the Partition this section of the middle class has become more unstable. While the class of small merchants and traders and independent producers like the skilled artisan and the farmer have gained in relative economic prosperity, the lot of the salaried employees, with the exception of those in the higher ranks of government service, has now become desperate, particularly in view of the additional burden of maintaining unemployed and unemployable relations who have joined them as refugees.

Present Crisis

The economic and moral crisis through which the middle class has now been passing in India has raised serious doubts and misgivings about the future of this class. All predictions about the future of a class are not only difficult to make but are apt to go very seriously wrong. A class in a class-ridden society has very tenacious roots. It has a knack of absorbing plenty of shocks and is not seriously shaken by the ordinary pressure of circumstances. But it does change its character and adapt itself to the basic changes in the social environment. Hence the future of the middle class has to be fore-

cast in terms of how it is expected to fit into the changing society in India.

The middle-class has not been properly understood either in this, or in any other, country. There are persons who think that the members of the middle class are just 'lackeys' of the propertied classes or feudal elements. It is said that they are under the economic grip of the richer classes in society. Therefore, they have a stake in the existence and stability of these classes. But, so runs the argument, with the increasing concentration of wealth and economic power, the middle class is economically pauperized and is gradually reduced to the level of the working class. So long as it is able to maintain its snobbish respectability it tries its best not to align itself with the working class. But when pauperization reaches an extreme limit this class just disintegrates and cannot but be merged with the working class in the final struggle for a classless society.

Holding the Balance

Things just do not happen in this way. Those who forecast the future of the middle class in this way do not care to see whether what really happens to the middle class fits into their theory. Life being a series of compromises, social life does not follow the pattern of polar opposites which appears so neat and attractive in theory. The fact remains that while class conflicts go on, the middle class stands always in the middle to hold the balance.

Now, a class holding the balance is intensely disliked by extremists. The bourgeois is the worst enemy of the communist, for the communist knows that the bourgeois works for stability, and so long as he is allowed to function he contradicts in himself the polarization of social forces and the formation of only two opposite classes ready to fight each other to a finish. But while the middle class refuses to join the working class as a militant group, it is not a class members of which can be correctly described as lackeys of capitalists. In fact this class sees a good deal to resent in the present economic order, and, if things are squarely put to it, would go very far indeed in trying to check the excesses of a materialistic and capitalistic civilisation. Unfortunately those who speculate about the future of the middle class fail to see that this class is vital enough not to lose its balance in the conflict of social forces.

Is the middle class, then, a class of people who, consciously or unconsciously, are just opportunists? Has this class a positive character of its own? There are extremists who say that the middle class combines in itself the worst of both the worlds. The members of this class do not have the grit, the realism and the capacity for manual work which one associates with workers and peasants. They also lack the initiative and enterprise of the capitalist class.

We are told that the middle class represents decadence of life and culture in modern communities. It may be stolid, but has too much of 'small town' spirit in its attitude to life. On the other hand, those whom the middle class is supposed to serve as their 'lackeys' think that the worm after all cannot really turn, and, therefore, they need not bother about the future of this class. Thus, the middle class is slandered and underrated by extremists in both the camps who want the middle class to be merely a camp follower if it is more sensible and is able to make a choice of its lifetime. But I would submit that these extremists ignore history and have failed to grasp the positive role of the middle class.

Curbed Feudalism

As I have already said, the middle class in the course of its history has fought feudalism. In India it has not fought feudalism in the way it has done in Europe; but it has curbed the excesses of feudalism through its influence on administration and the making of laws very largely because it has been the repository of religious learning and moral enlightenment. In the West the middle class has fought capitalism as well and has aligned itself with the feudal class or the working class according to circumstances. At the same time it has fought the working class in alliance with its opponents. But this kind of behaviour may not be described as mere opportunism. The middle class in the West has wanted to survive in a social order which should ensure opportunity for self-employment for independent ownership of property for the sake of self-employment. Naturally the modern capitalistic society which squeezes out the small man who wants to be his own employer is the enemy of the middle class. Similarly a socialist society which also destroys the independence and initiative of the small man seeking self-employment cannot also be a kind of society

which the middle class will welcome. If we bear in mind these basic attitudes of the middle class, it will be quite clear that this is not just a reactionary and decadent class. It has positive ideals and attitudes which distinguish it from other classes and which unconsciously influence the members of this class all the world over.

In India the absence of industrial revolution and the exigencies of British rule created a middle class which has forgotten its historic role and has lacked the initiative and enterprise of a virile class. British rule created a middle class the members of which fitted into the feudal set-up as subordinate rent-receivers and functionless owners. It also created an urban middle class consisting of clerks, bureaucrats, professional people and petty middlemen in business. Fortunately, this class received modern education which eventually proved a revolutionary force. The contribution of this class to our cultural renaissance and political freedom has been very impressive indeed. It has suffered and struggled for the sake of social and political ideals. But the time has now come when it must develop the basic attitudes of the middle class in other parts of the world if it is to survive economically as a socially significant class. I have always felt that Mahatma Gandhi's programme of economic reconstruction held the key to the realization by the Indian middle class of its effective role of holding the balance between the conflicting economic forces in modern industrial societies. Gandhiji raised self-employment of the small man to the level of a spiritual ideal. He laid emphasis on the development of individual initiative and enterprise, on manual labour and on constructive and creative work. He very clearly saw that the Indian middle class must save itself by ceasing to be either a parasitic class engaged in what he called unproductive work, or a class which is compelled by economic necessity to lose its soul and be used as an instrument of exploitation by others.

Economic Privation

The urban middle class is now passing through a crisis of economic squeeze and privation. We must also remember that it is a vocal class and can influence public opinion. Its economic distress has created a psychological and moral crisis. The danger now is that the economically unstable urban middle class may seek compensation primarily by featuring moral, religious, racial, patriotic and

'social' issues. Feeling economically inferior, the middle class asserts itself on a non-economic plane. Being individually unimportant, the middle elements seek collectively to rise to a state of significance by basking in the reflected greatness of institutions, organizations and personalities. Hence we see the ugly manifestations of psychological malaise like chauvinism, jingoism, provincialism, fraternalism, hero worship, faddism and styles. There is clear evidence that the urban middle class in India is treading a dangerous road. What can really rescue it is robustness of its own outlook and increasing awareness, on the part of the government, of the danger inherent in the slow disintegration of this class. Let us remember that German fascism was born out of post-war inflation which had squeezed and demoralized the German middle class.

Urban and Rural

When one thinks of the future of the middle class, however, one must not ignore the emergence of a fairly strong rural middle class in India in recent years. This class is politically conscious and forms the backbone of rural society. It has become so powerful that no political party in the country dare impose economic burdens or disabilities on this class. This is a class which has been developing on the lines of the Western middle class with its ideal of self-employment for the small man. Its weakness, however, is its tendency to exploit the still smaller man. The future of this class is, in my opinion, very bright. Indeed the disintegration of the small urban middle class will not perhaps merit so much attention in a democracy as the welfare of the rural middle class.

Hence it stands to reason that the future of the urban middle class can be assured if it can align itself with the rural middle class to which it once belonged in the past. If the urban middle class can get rid of its preference for sedentary occupations and soft jobs and ceases to be merely a class of automatic brain workers, if it can outgrow its class prejudices and its attachment to tradition, if it can learn to respect the dignity of labour it can still meet the challenge of the times and perform its proper function in society. Otherwise its economic instability will spell its ruin. Its attachment to tradition and to the so-called cultural values of which this class is so proud will merely lead to frustration and moral chaos if its economic foundation resting on self-employment is undermined by the pressure of economic forces. At the same time I must say that it is the moral tone which this element has imparted to the changing social life in India which can sustain the middle class as a whole and, with it, the very basis of civilized existence in this country. The middle class will fall to pieces if it is to depend only on the interplay of economic interests. The farmer desires high commodity prices. The artisan desires low commodity prices. The public official favours high salaries. The small shopkeeper and tradesman favour low taxes. As regards wages and social policies the salaried employees have the interests of those who are given work. But the small capitalists have the equally definite interests of those who give work. The economic interests of the different sections of the middle class are not only different but also opposed to one another.

Gandhiji's Advice

It is, therefore, on the plane of higher values that the middle class can have real cohesion and avert disintegration although the economic and cultural base of its operations has to be different. Gandhiji understood this complex problem, and he also showed the way. Broaden the base of the middle class by joining the ranks of the simple producer of goods, the artisan and the farmer, the vital elements of the middle class which, in an economically backward country, are also the really stable elements. Otherwise you cannot stop the rot. This was his advice to the middle class that fought for freedom under his banner. Nobody has, to my knowledge, given better advice based on solid historical and sociological sense.

Castes: Can They Exist in India of Tomorrow?

M N Srinivas

THIS talk* is going to be both dogmatic and provocative: dogmatic because there is no time to develop an argument, but only to state certain conclusions, and provocative because its explicit aim is to initiate a discussion. The mode of presentation would have been different had the talk been intended for a purely professional audience.

The question which I have been asked to answer is worded vaguely, but the vagueness is deliberate—it is designed to permit discussion on two questions: one, should castes exist in the India of tomorrow, and two, are they likely to exist? The first question belongs to the realm of ideals while the second, to the realm of facts. I will consider the former question first.

Hindu Opposition

It must be clear to everyone that in this country only a small minority which is numerically insignificant but which may be—and probably is—powerful, really desires that the caste system ought to go. The vast majority of the population, especially Hindus, not only do not want caste to disappear, but they would probably find it impossible to envisage a social system without caste. As Dr Karve has pointed out, to the bulk of the people living in the rural areas, caste is nothing more than a collection of kin groups—agnates and affines—living in a few neighbouring villages. Joint family and caste provide for an individual in our society some of the benefits which the welfare state provides for him in the industrially advanced countries of the West. A man's earliest friends are frequently drawn from his caste, his kin belong to his caste, and his kin are often an important part of his kith. A caste also stands for a certain amount of cultural homogeneity if not autonomy.

The point which I wish to stress here is that only a small minority sees caste as a menace to our national life. I willingly concede that their number is increasing every day, and that nowadays even in the rural areas one comes across urbanised young men who say that

* Paper read before the Seminar on Casteism and Removal of Untouchability on Saturday, 1st October '55, at Delhi.

caste has begun to poison relations between people. But it is still true to say that the vast majority of the people do not consider caste an evil. It is essential to remember this fact for nothing effective can be done unless the people themselves are made to realize that caste necessarily means casteism, and that the benefits it offers are bought at a heavy price for the country as a whole. It is not at all an easy task to put across this point to the people, and so far neither the politicians nor the social workers have displayed any awareness of the existence of this difficult problem of communication. The first thing to realize here is that good intentions are not only not enough, but may even produce the exact opposite of what is intended.

Talk and Practice

I am not trying to be cynical but I cannot help wondering how many of those who have of late started publicly speaking in favour of a casteless and classless society really mean what they say. Now that this ideal is incorporated in our Constitution, and Pandit Nehru is a very powerful and universally respected man, Congressmen, legislators and other leaders find it more convenient to agree with him than to disagree. Most of us—not only our politicians but our intellectuals as well—are bamboozled into agreeing with something merely because we are afraid to be mistaken for being 'reactionary'. Even discussion of the subject is taboo. In the case of caste this disease has proceeded so far that there is great danger that our talk and policy will leave reality far behind. Secondly, coupled with the widespread fear of being dubbed a reactionary, there is also a shrewd if somewhat cynical appreciation of facts. I know that what I say may seem a contradiction but it really is not so. Agreeing to progressive resolutions satisfies our consciences and assures us of our worldly prospects, while at the same our sense of facts tells us that nothing serious is going to be done by anyone, and that caste will continue to remain what it is. The best of both the worlds are secured by taking such a course.

In April 1954, I was in a village in Mandya District in Mysore State.

A few days previous to my visit to this village a huge fight had occurred between Holeyas (harijans) and Okkaligas (Peasants) in a neighbouring village, and a few had been seriously injured in the fight. One Okkaliga leader complained to me, "These Holeyas, they are getting above themselves. They are now demanding that our girls be given in marriage to them". I tried to explain to him the aims and ideals of explicit Congress and the Republic, and the Caste by voting for the Congress he had tacitly agreed with its policy. He replied, "Then let them (the MLAs) invite Holeyas to their homes for a dinner, and give them their daughters in marriage, and we will follow". He had hit the peasant shrewdness. Many MLAs nail on the head. How his daughters are willing to eat food, piece answer is to Harijan youths? The answer will be obvious. But the same MLAs all vote for a casteless and classless State when they meet in Delhi or Bangalore or Avadi.

Communal Representation

The principle of caste is so firmly entrenched in our political and social life that everyone including all the leaders have accepted tacitly the principle that, in the provincial councils at any rate, each major caste should have a minister. (And this principle has travelled from our provincial capitals back to our village panchayats—nowadays the latter give representation on the panchayat to each caste including Harijans). In the first popular cabinet in Mysore State, headed by Shri K. C. Reddy, not only were the ministers chosen on a caste basis, but each had a secretary from his own sub-caste. And today in Mysore State this principle is followed not only in every appointment, but also in the allotment of seats in schools and colleges. Mysore is no longer ruled by the Mythical demon Mahishasura, but by the very real demon Varnasura. One Okkaliga in Ramapura told me indignantly, "Shri Hanumanthayya wants to rule strictly and impartially, but he must realize that the electors don't want him. They want him to confer favours on the people who have elected him. We want returns for what we have done." I am afraid the Okkaliga

was right—voting is on a caste basis and voters do not understand that it is immoral to demand that the elected minister help his caste-folk and villagefolk. It is at the same time a tribute to Shri Hanumanthayya that he does not think on caste lines. But his party does, and the people do, and this fact cannot be forgotten. Incidentally, no explanation of provincial politics in any part of India is possible without reference to caste.

Mere resolutions and laws are worse than useless as they lead us to believe that we are really doing something. And I must bluntly tell you that if you are thinking that you can get rid of caste easily you are very badly mistaken. Caste is an institution of prodigious strength and it will take a lot of beating before it will die. The first lesson to be learnt here is not to underestimate the strength of your 'enemy'. It is so powerful and pervasive, and its appeals are so strong that the first step in the struggle is to have a precise measure of its strength.

Caste Hindus and Harijans

I must mention here, however, that the Anti-Untouchability Law is having some effect chiefly because some educated and better-off Harijans are trying to get the law enforced. Believe me, this is not an easy matter for them. Naturally their efforts have led to an increase in the tension existing between Caste Hindus and Harijans, but without such an increase and the probable occurrence of fighting and shedding of blood, the rights which the Constitution gives to Harijans will not be translated into reality. I will not be surprised if such fights increase in the near future, especially in the villages. As Harijans get more and more educated, and as their economic condition improves, they are bound to resent increasingly the disabilities which the flat of brute Hindu majority imposes on them. The latter are not likely to yield gracefully to the former's demands and the general public will only awaken to the issues when fighting and bloodshed occur. It is only then that issues which are being discussed at this Seminar will be discussed everywhere, in streets, tea shops and verandahs.

The giving of the vote to the Harijan is also a crucial measure. In the legislative assemblies, Caste Hindus will be increasingly on the defensive, as they will not have the

courage to come out openly against measures to improve the conditions of Harijans. Overt agreement and covert sabotage will probably be the path they will choose. And in this they will probably have the bulk of their co-religionists with them.

I will now deal with the second question. "Are castes likely to disappear in the India of tomorrow?" In trying to answer this question a reference to what has happened in the recent past is unavoidable.

Past Experience

What may be very loosely called a 'feudal' type of society prevailed when the British overran India. Only a tiny section of the people lived in the few cities scattered over the sub-continent while the vast majority lived in villages. The cities were, however, different from the modern industrialized ones. The old cities did not require a radical departure from the traditional way of life. In the village a subsistence economy prevailed. Relationships between individuals and groups were governed not by contract but by status i.e. birth in a particular family and caste largely determined one's rights and duties. Relationships were also 'multiplex'—the same people were involved with each other in several kinds of relationship. Barter was widespread and important while money played a minimal part. The political system consisted of local chieftains who were feudatory either to a distant king, or to the Viceroy of an even more distant emperor. Relations between chieftains, and between them and the king or viceroy were always unstable, and frequently characterized by war. The political system erected very nearly impassable barriers between one chieftain and another. This had many important effects one of which was that it prevented the horizontal spread of caste solidarity beyond the chieftain, and forced the many castes of a region to be interdependent.

Caste-Interdependence and Social Ties

At the village level castes were not only interdependent but acutely aware of the fact, and the annual grain-payments made to the Smith, Potter, Barber, Washerman and Priest dramatised the interdependence. While each caste had its own solidarity, it was also aware of its solidarity with other castes—each Smith, for instance, competed with all other Smiths for the custom of

the agriculturists. Besides this competition, other kinds of ties such as those between master and servant, landlord and tenant, creditor and debtor, and patron and client cut across the divisions of caste. Again, loyalty to one's village was universal, and this was common to all the castes from the Brahmin to the Harijan. It is necessary to point out here that the Harijan occasionally exercised authority over members of the upper castes and this was specially true of south India. Historical evidence going back to a few centuries testifies to his taking an active part in the deliberations of the village assembly. Even as recently as fifty years ago the Holey cheluvadi (hereditary servant of the assembly of village elders) of Kere village beat a rich Smith from Mysore because the latter had the audacity to wear red slippers (chadavu), a privilege expressly forbidden to them in that area. The Smith was a powerful man and he had lent money to the tune of several thousand rupees to the village.

At a higher level, several neighbouring villages were bound together by ties of kinship, economics and ritual. The warring chieftains prevented the extension of ties beyond the region though here and there we find that the Brahmins were considered superior to these political cleavages because of their position as priests. The 'bottling up' of caste ties within the region, and the derivative emphasis on interdependence of all castes living therein, is a most important feature of the pre-British system. With, however, the establishment of Pax Britannica over the entire sub-continent, and the rapid improvement in communications which both strategic and administrative considerations required, castes found it possible to range over wide areas.

Horizontal Caste-solidarity

The horizontal solidarity of a caste gained at the expense of the vertical solidarity of the castes of a region. The coming in of printing, of a regular postal service, of vernacular newspapers and books, of the telegraph, railway and bus, enabled the representatives of a caste living in different areas to meet and discuss their common problems and interests. Western education gave new political values like liberty and equality. The educated leaders started caste journals and held caste conferences. Funds were collected to organise the caste, and to help

the poorer members. Caste hostels, hospitals, co-operative societies etc. became a common feature of urban social life. In general, it may be confidently said that the last hundred years have seen a great increase in caste solidarity, and the concomitant decrease of a sense of interdependence between different castes living in a region.

Certain additional factors have helped to increase horizontal solidarity as well as the tensions existing between different castes. The virtual monopoly which the upper castes if not the Brahmins exercised over the new jobs induced the British to start favouring the low castes. In the South this resulted in the gradual forging of an anti-Brahmin policy by the different states. The barrier which already existed between Caste Hindus and Harijans was carried over to the political sphere as well. Educated members from different castes competed for the same jobs, and there were more men than jobs. The tensions generated between individuals in the struggle for jobs spread to their respective castes as it was the elite of each caste which was competing.

One of the short-term effects of universal adult franchise is to strengthen caste. It is easily understandable that the villager, other things being equal, prefers to vote for his casteman. This is so widely accepted that during the recent elections in Andhra State even the Communists were at pains to select candidates who had the proper 'social base', which, when translated into simple English, means that they belonged to the locally dominant caste. I learn there was only one exception to this, and he, a front-rank leader, was duly elected.

Education of Harijans

The things I have said so far may appear to be extremely pessimistic. I will now therefore point out the existence of certain other and opposing tendencies. As education spreads among the Harijans, it will be increasingly difficult for the Caste Hindus to keep them in the condition in which they are today. There are also signs that the Harijans are organizing themselves to assert the rights which the Constitution gives them. As I said before, this will probably mean the occurrence of fighting between them and Caste Hindus, and an immediate increase of tension, but the latter are bound to give way, in the end. Let no one expect, however, that the pro-

cess will be smooth, quick and non-violent. It would be against the nature of things to expect Untouchability to disappear overnight.

Industrialization and an expanding economy will mean jobs to educated people and this should minimise the bitter inter-caste hatred which is now poisoning relations between individuals and groups. This is especially true of the South where, in the towns especially, one hears of nothing except caste. I believe that the establishment of a single factory will do more to ease inter-caste relations in that locality than an equivalent sum of money spent on propaganda in favour of inter-caste dining or marriage. The mechanization of labour and the provision of underground drainage everywhere will make unnecessary the personal handling of material which is considered not only very dirty but defiling. A new type of education in which the fingers are used for other things besides driving a quill should inculcate not only a respect for, but a love of, manual labour. Widespread industrialization—and not the crazy concentration of industries in and around Bombay, Calcutta and a few other cities as at present—will usher in towns in every part of India, and the heterogeneity and habits of urban life should help somewhat in reducing inter-caste tensions. Co-

education is bound to make inter-caste marriages more common in the future, but I would urge reformers to go slow on this. Marriage is a 'hard point' and too much propaganda at this stage about the desirability of inter-caste marriages may frighten the upper castes into taking a stand against all reforms.

In short, on a short-term basis the country is likely to have more trouble with caste, while on a long-term basis, adult franchise, the industrial revolution which our Five-Year Plans are helping to bring about, the spread of literacy and higher education among the lower castes, the legal rights given to Harijans, the privileges given to backward castes, and the greater Sanskritization of the way of life of the latter, should remove the more obnoxious features of the caste system gradually. In the meanwhile, reformers would do well to study caste more, and realize that quiet hard work, patience and a sense of humour are indispensable in fighting an institution as powerful as caste.

There is one question which, though extremely important, I have refused to consider, and that is, "What will happen to Hinduism when caste disappears?" It raises such far-reaching issues that I cannot hope to deal with it satisfactorily here.

Irregular Trend

IT was inevitable that the recommendations of the States Reorganisation Commission would have repercussions on stock markets this week. Dalal Street steadied-up as it became known that SRC had not recommended the formation of Samyukta Maharashtra. Dalal Street is dominated by Gujaratis. They are happy over SRC's recommendations. Many others share their joy that Bombay City remains intact. Dalal Street looked up after the release of SRC's report. Clive Street steadied-up in sympathy.

As Tata Steel improved, Indian Iron steadied-up. There were other reasons for the recent steadiness in Indian Iron. There were rumours that the dividend might be announced on Tuesday last. These rumours did not prove true. But Indian Iron started moving up in anticipation of the dividend. It continued to move up, even though the expected dividend announcement was not made on Tuesday last, for different reasons.

This is where technical factors come in. Owing to the intervening Puja holidays, this settlement extends to a month instead of the usual fortnight. It is now believed that the Indian Iron dividend may not be declared before the Puja holidays. Thus, speculators have enough scope and time to indulge in their tactics. It is now being argued that Indian Iron dividend will be stepped-up by eight annas. That remains to be seen.

While opinions differ about the forthcoming Indian Iron development, it is clear that the steadiness in Indian Iron is having a sustaining influence on equities in general, and on Engineering shares in particular. Relative steadiness in Miscellaneous and Engineering shares has been a feature of trading on the Calcutta Stock Exchange in recent days.

There are reasons why Braithwaite are steady-up. There are reports that this Company may undertake capital reorganisation in the near future. Improvement in Braithwaite on such expectations is only natural. A developing trend in these groups may be noted. Recent price movements indicate that recent favourites in this group invariably meet with support whenever these shares tend to slide back below cer-

tain levels. This is not surprising. Those who have recently cornered these shares will, naturally, like to see that the prices of the shares concerned are maintained at reasonable levels.

Tea auction results continue to confirm the expectations of moderate optimists. Tea prices are being maintained at reasonably high levels. Export demand continues to be satisfactory. It is clear that this year's profits will enable the industry to distribute reasonable dividends, although this year's dividend disbursements cannot be as high as those of last year. These are reasons which explain why Tea shares are not falling.

Why are Tea shares not rising? For one thing, investors are worried about the growing burdens on the industry. Recently, the West Bengal Government has imposed an import levy on tea imported into Calcutta and Howrah for use or sale. Besides, at present, investors have no incentive to enter the market. Final dividend payments for 1954 are over. Interim dividend payments for 1955 have not yet started. Investors can, therefore, afford to wait and watch developments.

By far the most disquieting feature of recent trading on the Calcutta Stock Exchange is the inactivity in Jute shares. These shares have been inactive for a sufficiently long time to cause anxiety to genuine investors. Reasons for dull conditions in Jute shares are not far to seek. Jute shares are listless because investors are apprehensive of the outlook for the Indian jute industry.

Some days ago, data relating to stocks of jute goods with the mills were released. Statistics indicated a welcome decrease in the mills' stocks of both hessian and sackings over September. And yet, neither jute shares nor jute goods moved up, though the falling trend in jute goods was halted. Price movements in raw jute and in jute goods have been irregular in recent weeks. This irregular trend is mainly a reflection of the Pakistani Government's determination to maintain the export minimum price for raw jute at the pre-devalued sterling level.

This aspect of the problem has

been discussed in these columns more than once. Primarily, jute shares are friendless because investors are apprehensive of growing competition from Pakistan. Recently, the Industrial Tribunal has awarded higher wages for workers in jute mills. Such an award was not unexpected. But investors are now arguing that the Indian industry, burdened with higher wage costs, will find it more difficult to overcome Pakistani competition. It is of interest to note that the demands of jute mill workers in Pakistan for higher wages have been rejected by the Pakistan Government. Implications of these developments cannot be ignored. But it would be equally unwise to minimise the Indian industry's efforts to modernise itself in order to lower production costs.

Around Bombay Markets

Bullish Fervour

Thursday, Morning

CONDITIONS on the Stock market during the week under review, were extremely bright, all the leading counters registering considerable appreciation in values. Textile shares generally and Bombay Dyeing in particular drew speculative support. Various factors have been at work to boost up the value of Bombay Dyeing. On the one hand, it is said that the Company's spinning capacity in the spring mill has been considerably augmented, thereby enabling immediate implementation of the multiple shift; on the other, reports are current that the Company would soon announce its bonus issue. This apart, there were also rumours, though unconfirmed, that the Company has already obtained Government's sanction to instal automatic looms. Shrewd market observers, however, dismissed these as wishful thinking. They argued that inasmuch as the Company's level of reserves was below 20 per cent of the increased capital, it failed to satisfy the criterion laid down by the authorities for the installation of automatic looms and hence there was no likelihood of introducing the new device, at any rate, in the immediate future. This did not, however, deter the shares from moving up. In fact, all the textile shares drew considerable support from encouraging Company reports, the crop of bonus issues and declaration of higher dividends. In the event, thanks to sustained short-covering and speculative support, the Stock market closed on a distinctly firm note.

Steel shares moved within narrow limits and did not fully share the general bullish fervour of the textile and miscellaneous sections. Conflicting reports about the high dividend prospects of Indian Iron were, to some extent, responsible for this and there was sizeable selling pressure in respect of Indian Iron and Tata Steels, both these closing at Rs 39-0-6 and Rs 253-4 respectively as against the previous closing rates of Rs 39-2-6 and Rs 255.

Bombay Dyeing led the rest in the textile section. It opened at Rs 546-4, then shot up to the highest level of the week at Rs 569-6 to close firm at Rs 557-8. Kohinoor,

Swadeshi, Century and Simplex also rose to new high levels at Rs 352, Rs 234, Rs 451 and Rs 206-12 respectively. The improvement in Simplex was attributed to reports that the Company had acquired another mill and this attracted sustained investment support from a leading Insurance Company.

In the miscellaneous section also, there was widespread speculative support. ACC attracted good investment and shot up to a new high at Rs 208-12. Shivrajpur rose further and was quoted at Rs 111, the highest for the week. On continued bull support Bombay Burma jumped

from Rs 616-4 to Rs 658-12. Sugar shares also ruled firm at higher levels on bonus and higher dividend expectations. Belapur jumped from Rs 347 to Rs 357, while Phalton registered a gain of Rs 2 to close on reports of fair weather in some of the cotton belts, prices reacted once again. Nevertheless closing quotations higher than those for the Among Banks and Insurance, New India advanced to Rs 52-12 from Rs 48-12, while Bank of India, Central and UCO Bank also appreciated on continuous investment buying. There was good business in Union Bank also.

Cotton

Steadier Tone

THE cotton futures market which was listless on the opening day, saw some hectic rise in prices following continued reports of damage caused by heavy rains to cotton crops in the Punjab, Khandesh and Berar. Towards the close, however, on reports of fair weather in some of the cotton belts, prices reacted once again. Nevertheless closing quotations were higher than those for the previous week.

ICC February opened at Rs 622 and after rising to Rs 640-8, it closed at Rs 634-12 as against the previous week's close of Rs 622.

The Fourth Crop Report for the 1955-56 season, published by the US Department of Agriculture, has caused serious concern to all the cotton producing countries as it forecasts the perpetuation of the problem of cotton surplus. The US cotton crop for the month of October at 13,926,000 bales is a new record in cotton production. This has been possible mainly due to a significant improvement in the yield of cotton, at 405 pounds per acre, as against the ten-year average (1943-1952) of 272.1 pounds. Again, the long-term programme of expansion of cotton production in countries like India and Pakistan, has only served to aggravate the cotton surplus problem by ensuring in-

creased, production of cotton. Unless there is a phenomenal increase in the rate of cotton consumption, the problem of surplus will continue to dog cotton producers.

Oils and Oilseeds

Firm Trend

OILSEEDS as a whole displayed a firm trend during the week under review unlike as in the previous week when only castor and linseed ruled steady. Thanks to the release of millers' export quota and increased business with overseas markets at slightly higher rates, groundnuts were marked up. Sentiment in the castor section was favourably influenced by attractive deals with overseas buyers. America was reported to have bought BSS oil at 11.75 cents and Commercial oil at 10.75 cents. Continent was also believed to have done business at around £98 while enquires from the UK were not wanting, although business with the latter was negligible. Besides, crop reports from Brazil indicated a smaller output to the extent of 30 per cent. Output in Brazil averages about 200,000 tons annually. Brazil was reported to have offered oil at 22 cents but no business was possible in view of foreign exchange difficulties. And countries such as US which kept aloof from Brazil, naturally turned to India. Business to the tune of 1000 tons was re-

ported to have been done on export account. With the week's exports of oil, Bombay has accounted for nearly 30,000 tons of castor oil for the year up to September.

Castor May futures opened at Rs 92-12 and forged ahead on sustained buying and reached the highest level at Rs 97-14 to close a point lower on profit-realising at Rs. 96-12.

Following a downward revision of the crop estimate of groundnut at 24 lakh tons, groundnuts ruled fairly firm throughout the week. The Maharashtra crop is estimated to be about 1.25 lakh tons, while Karnataka's is placed at 1.25 lakh tons showing a decline of 25,000 tons over the previous estimate. Saurashtra's crop at 2 lakh tons also means a decline of about 30,000 tons, Khandesh is also estimated to bring a smaller outturn at 1.25 lakh tons. In the circumstances, groundnut Khandesh which opened at Rs 22-1 improved steadily to reach the highest for the week at Rs 23-4 and closed slightly less at Rs 22-12.

In sympathy with the firm trend in both castor and groundnut, linseed, niger and kardi seeds showed a perceptible change for the better with the closing quotations showing distinct improvement over the week. Thus, linseed improved from Rs 22-12 to Rs 23-4 for delivery, but niger came down from Rs 23 to Rs 22 for ready, while Kardi moved from Rs 13-12 to Rs 13-4.

Source : Ministry of Irrigation & Power

The Planning Commission's task is exceedingly difficult even if new problems do not come in the wake of States' reorganisation. For, despite all the discussions both in government and outside, it seems as if the basic issues have not been, and cannot be, formulated in a manner acceptable all round. Shri Nanda, for instance, is not convinced that the outlays envisaged in the Draft Plan-Frame will be adequate to ensure the achievement of the employment targets. The Railways are convinced that with the investment allocated to them, the physical targets that have been set cannot be achieved; nor would these targets be, in terms of actual transport service rendered, consonant with the production targets in industry and agriculture. And the differences of opinion in regard to consumer goods industries, both large-scale and small-scale, the order of deficit-financing that would be 'safe' etc. continue undiminished.

The great importance given to large-scale capital goods industries in the Draft Plan-frame has had the effect of focussing attention on certain of the balances that need to be assured. Much has been said about the necessity of ensuring that all the outputs of capital goods industries will in fact be absorbed; and that all demands for consumer goods will in fact be satisfied by the small-scale and hand industries. On a more fundamental plane, it has been argued that by giving undue weight to the household and hand industries, technical progress would be impeded, and the problem of unemployment would, in the long run, not be solved. Not all of this is convincing, since small industries may well produce what is expected of them if they are properly organised and financed; and technical improvements do not all have to be associated with large-scale units of production. That apart, it is notable that compared to the controversy centring around the industries plan, the discussion of balances between the industries plan and the others, as well as between 'physical' and 'social' capital has been very little.

There are probably reasons for this. With agricultural products in such plentiful supply, and with the reduction in their prices, there is a general feeling that on the agricultural side we are very well off, and will continue to be well off. Indeed, it is this which has prompted so many to keep harping on our being in a position to think of a 'bold'

plan. There is, of course, little doubt that the improvement in food supply and cotton and sugar has in the past two years been very real and beyond expectations. And one does not these days like to be called a pessimist for suggesting that the next five years may not all be so good. But keeping that on the one side, and assuming agricultural output to be as good as one wants, one can still ask the question: what about policy regarding agricultural prices? Maybe it is good for us that the terms of trade have moved against agriculture. But it is not so good for agricultural incomes unless agricultural costs are reduced *pari passu*. Moreover, it is not so good from the point of view of reduction of income inequalities, which is a major component of the socialistic pattern of society which we want to establish. There is no easy way out of this, through simple price support policies; nor can one depend on deficit-financing and government outlay in the rural areas to even out the income differences. The Plan has of necessity to work out a set of policies that will ensure progressively larger incomes to agriculturists without turning the terms of trade against the rest of the economy in the process.

This part of the Plan needs very careful consideration because, in the interests of industrial development, we have to limit agricultural investment. And what is more, the agricultural plan is to be implemented

Ominous Shadows

AT Geneva, the four Heads of State agreed to settle disputes though negotiation. Rejection of the use of force as an instrument of policy was the essence of the Geneva agreement. It would have been a logical assumption that the Geneva talks would be followed by a series of negotiations among the parties or Powers concerned to settle disputes in all parts of the world. In accordance with the Geneva decision, Moscow entered into negotiation with Bonn; as a sequel, diplomatic relations were established between Communist Russia and Western Germany. Immediately after the conclusion of the talks between Russia and Western Germany, Russia started discussions with Eastern Germany. As a result of these talks, Eastern Germany was granted sovereignty; Russia, the occupying Power, made certain military con-

mainly by the State governments under the present arrangement. Considering the unsettled position in regard to States, there is room for apprehension that while the industrial side of the Plan, which is largely in the Central and private sector plans, might get a good start, the agricultural plan might not. Should that happen, we might in a couple of years be thinking of shortages again.

Like agriculture, social services like health and education as well as road transport are mainly State subjects. Plans for the development of these may also suffer from delays in implementation. This is a factor that has emerged now, and is in addition to the question whether the provision for these activities in the Draft Plan is in keeping with national needs and objectives. From the point of view of both the quantity and quality of employment, we should provide for a much larger outlay in respect of these.

One presumes that all these questions have occupied the mind of the Planning Commission in the past many months. Whether or not they have tentative answers to these by now is not clear. If they have, they should make them known early—not least because such a move on their part may help the public to turn from the States Reorganisation Commission's Report to the more basic problems of national development.

cessions. These negotiations with the two Germans were followed by talks between Russia and Finland. Russia made a significant gesture by evacuating the naval base of Porkkala.

These conciliatory gestures by Soviet Russia should have been welcomed by the Western Powers as evidences of Moscow's readiness to settle disputes through mediation. Russia's actions should have prompted reciprocal policies by the Western Powers. At the instance of India, Washington did start negotiations with Peking. It was widely hoped that the Geneva talks at the ambassadorial level would ease the tension between America and Communist China. But the slow progress of the Geneva talks has caused doubts about America's intentions in the Far East. More surprising has been the reaction of

the Western Powers to the series of negotiations between Russia and her European neighbours. Russia's diplomatic initiative is resented as a device to extend her spheres of influence in Europe. Recent developments at the United Nations indicate that America, if not her NATO allies, suspects the assertion of the Bandung feeling by Asian and African nations as an extension of Russia's diplomatic influence in the East.

Since the Geneva "summit" talks, there have been suspicions that there may be a shift in international diplomacy to the East. Recent events would seem to confirm these suspicions. Once the major Powers came to an understanding not to wage an atomic war, the disagreement between Russia and the Western Powers on Germany, the major issue in dispute in Europe, lost its former sinister significance. In Europe, a status quo could be maintained for a period of time to explore prospects of an agreement on Germany and on European security. But there were many issues in dispute in more than one part of Asia and Africa on each and all of which neither side could afford to lose the diplomatic initiative. This explains some of the recent developments in the three Indo-Chinese States and in the Middle East as also the unexpectedly hostile attitude of America to the stand taken by Bandung nations in the United Nations on Algeria.

New Delhi has always expressed apprehension that SEADO may impede implementation of the Geneva Agreement on Indo-China. Subsequent developments indicate that New Delhi's fears are not baseless. In Indo-China, M Diem refuses to hold the general election on the plea that South Viet Nam was not a party to the Geneva Agreement. In Cambodia, the Crown Prince has swept the elections under circumstances which are mysterious as well as complicated. In Laos, there is deadlock in the negotiations between the Royal Government and Pathet Lao on the conditions of a general election. Guarantees included in the Manila Treaty about protection of the geographical frontiers of Laos and Cambodia introduce additional complications in this region.

At the moment, attention is focussed on the Middle East. Iran's entry into the Baghdad military alliance fortifies a region which extends from Turkey to Pakistan,

Iran's participation in the Baghdad pact was not unexpected. Two events may have hastened Iran's decision. There are abundant indications that America resents the Bandung policy of enlarging the number of uncommitted nations in Asia and Africa. America's Secretary of State can take pride in scoring a diplomatic triumph immediately after the Asian-African nations' stand on Algeria before the United Nations. There is a more immediate reason behind the timing of Iran's decision. Iran's Shah was to have gone to Moscow for talks. Recent experience of Dr Adenauer's visit to Moscow must have prompted Mr Dulles to goad Iran into the Baghdad pact on the eve of the Shah's visit to Moscow.

Iran's entry into the Baghdad military alliance raises wider issues. Iran's strategic significance is beyond dispute. Fortification of Iran and Turkey will be a constant threat to Baku and Trans-Caspian Russia. By cajoling Iran into the Baghdad alliance, America and the Western Powers have gained a decisive strategic advantage. Time alone can reveal whether Iran has been wise in abandoning her traditional role of a neutral, strategic frontier area. Iran's participation in the Baghdad military pact means a dual diplomatic victory for Mr Dulles. With Iraq and Iran as members of the Baghdad pact, Arab States remain disunited in their stand against non-

involvement in military alliance of the rival power blocs. Mr Dulles is not unaware of the traditional hostility between Turkey and Egypt in their aspirations to be the undisputed leader of the Middle East. Through Iran's entry into the Baghdad military alliance, America has retaliated against Egypt for her decision to accept supplies of arms and ammunition from Communist Russia. Opinions will differ whether Mr Dulles has scored a victory over M Molotov, or whether M Molotov induced Egypt to purchase arms and ammunition from Russia in anticipation of Iran's entry into the Baghdad alliance.

But these developments will be deplored by those who have been welcoming the spread of the 'Geneva spirit'. There can be no lasting peace, nor can there be any agreed arrangement about disarmament, as long as one of the rival power blocs pursues a policy of extending military alliances. With NATO, SEADO and the Baghdad alliance, prospects for disarmament seem unencouraging. World peace cannot be attained or maintained merely by an understanding to refrain from an atomic war. History is conclusive that wars cannot be prevented by a policy of maintaining an even balance of world power. Recent international developments do not augur well for the forthcoming talks at Geneva among the four Foreign Ministers.

Weekly Notes

Colombo Plan Meeting

WHAT precisely happens at the annual meetings of the Colombo Plan Consultative Committee? Surely, Ministers of so many countries do not merely gather to approve the drafts of the reports published some time after the Committee's meeting. These reports are, as a rule, so jejune that hardly anybody outside a small circle of professional 'report consumers' will find them interesting. If that was all that was to be done, it seems unnecessary that Ministers should leave important work behind and journey forth to different countries in different years.

The fact that they have gone in all seriousness to Singapore this year means, however, that there is something more done in these sessions. In terms of intangibles, it probably helps countries in the 'Colombo Plan' region to know what others are doing by way of planning and development, and feel, as it were, that they are members of a team. The exchanges amongst those present would, of course, be in the nature of clarification of what has been already made known to the world in some form. But perhaps the more tangible part of the affair is the arrangement regarding aids to be given and aids to be received. Actually, financial and other aid received under the Colombo Plan is very little compared with the aid provided by America to several of these countries, or with the loans obtained from IBRD. But be it ever so little, it helps in the great task of accelerating development in this part of the world.

Much of the assistance under the Colombo Plan is in the form of technical personnel or equipment for particular projects, and by way of training facilities in the more advanced of the countries. India is in the special position of being a donor as well as a recipient country. And she has perhaps the most developed organisation of all countries in this region for formulating as well as executing development plans. Consequently, her spokesmen have a special responsibility for setting the problems that arise at such international meets in the proper perspective.

It was therefore proper that Shri Nanda should have made two things clear at Singapore. One is that the countries which want to give should think in terms of sizable measures rather

than in token quantities. And secondly, that linking aid with particular projects was not always a suitable thing to do. It took the IBRD many years to appreciate this; maybe the personal contacts at the Colombo Plan Conferences will make it easier for the various Governments to see more easily the point that Shri Nanda has made.

Technical Co-operation

AMONG the notable features of the Annual Report of the Council for Technical Co-operation of South-East Asian Countries for the year 1954-55, are the steady expansion of technical co-operation and the increase in the number of trained personnel. The quantum of technical assistance provided up to the end of June 1955, through the Council for Technical Co-operation, "amounted to 392 experts and training facilities to 2,676 students from South and South-East Asian countries". The number of experts supplied by the different countries was as follows, United Kingdom (157), Australia (115), Canada (59), New Zealand (44), India (14), and Japan (3). It is also stated that the heaviest demand for experts has been in medicine and health, followed by communications, engineering, food, agriculture, forestry, education and industry.

The total cost of equipment supplied or offered under the various schemes is placed at approximately £1,500,000 of which equipment for training purposes costs about £927,000. The value of equipment received by India amounted to £147,318, of which the largest shares were provided by the United Kingdom (£77,983) and Australia (£55,154).

In addition to the assistance given under the technical co-operation programme of the Colombo Plan, the specialised agencies of the United Nations as also the United States have contributed through provision of experts and training facilities.

Thus, the Report would appear to make impressive, but dull reading. The statistical quantum of technical assistance means little unless it makes an appreciable impact on the economies of the countries concerned. As is well known, the problems of 'technique' are distinct from those of 'economy'—a proposition which cannot be laboured often enough in these days of machine technology. One may refer in this connection to the shrewd observation of Arthur

Koestler about the Jews in Palestine, who, according to him, after living for nearly three or four decades in the country could not yet build houses as cool to live in as those of the Arabs nor turn out Kababs as succulent!

Technology is not nearly enough nor can it afford to be contemptuous of environment. All these are fascinating aspects of the problem of technical assistance, but the Colombo Plan reports tell us precious little about them. Perhaps, economists like Raul Prebisch, whose Economic Surveys of Latin America are among the more outstanding of their kind, could be commissioned to probe into these problems.

US and Far East

NO exception will be taken to Mr Cooper's enunciation of America's attitude to colonialism in his address before the Council of Public Affairs in Madras. America, the US Ambassador rightly emphasises, is one of the few major powers without any colonies. America's efforts to end colonialism in South-east Asia in the immediate postwar years are duly recognised. And yet, America to-day has few friends in Asia and the Far East. Uneasy relations between the United States and some newly-independent nations in Asia and the Far East stem from America's foreign policy.

Mr Cooper was diplomatic in his defence of America's policy to Asia and the Far East. To the criticism that American interference and intervention in Asian affairs reflect her ulterior designs, Mr Cooper replies that the United States would be glad to disengage herself from Asian problems provided she can do so "with honour and security". Mr Cooper defends SEADO on grounds of honour and security. Except Pakistan and Thailand, no Asian nation will accept this argument. They, on the contrary, are united in their opinion that SEADO is a menace to peace in Asia and the Far East.

Even as Asian Nations resent SEADO, they are opposed to America's policy to Formosa. It is widely believed that Far Eastern problems cannot be solved as long as America does not withdraw from the Formosa area. There is tension between the People's Republic of China and the United States. Mr Cooper argues that America's refusal to recognise Red China and her opposi-

tion to Communist China's admission to the United Nations stem from her belief that Communist China "has aggressed against the UN and has not yet abandoned the use of force with respect to Formosa". Any such argument ignores developments during and since the Geneva Agreement on Indo-China. Over and over again, Peking has expressed its willingness to reach a negotiated settlement of issues in dispute between America and Communist China. Peking's claim that Formosa is an internal affair of Communist China and that Formosa is not an issue in dispute between Red China and America is widely endorsed.

Language Problems

SHRI B G KHER may be said to have facilitated to some extent his ticklish new task as Chairman of the Official Language Commission by giving expression to views on the language problem that cannot but meet with wide approval. Though he would not be drawn directly into any discussion on the work before the Commission, he gave some indication of the Commission's approach to the problem. He said that the approach had to be pragmatic in assigning positions to the official and other languages, so that the country's business might be carried on with the greatest facility, so that there would be a suitable means of communication at all appropriate levels of inter-State contact and so that the standards of teaching in universities would not be impaired while India moved from the present unsatisfactory position to one in which the official and other languages had attained their appropriate status in their respective fields in the life of the country. And he added significantly that the language problem should be tackled from a secular, national and pragmatic angle as distinguished from a revivalist, provincial or ideological standpoint. The last statement was indeed the keynote of the thoughtful, balanced speech he made on the subject while inaugurating the Autumn School of Linguistics at the Deccan College, Poona, last week.

The language problem like so many other problems in the country is being bedevilled by extraneous considerations—considerations that have not much relevance to the basic function of language as a means of simple, clear communication, easily learnt, easily used and easily adapted to the changing needs of the times. Language can no doubt be something more than this. It can get sophisti-

cated to a degree. But just now, with literacy at a low ebb, it is the basic aspect of language rather than its finer points that should call for attention. To refine or purify a language and try to restore it to its pristine glory is not only to make it less easily communicable, but also to put it out of touch with the trends of the times. And to import religious or narrow traditional considerations into it is to render the issue more complicated. Not less unhelpful is the attitude of mind that would seek to associate regional or narrow historical or dynastic considerations with a language and strive for its supremacy at the cost of national cohesion, unity and cultural synthesis—an attitude of mind which may well receive further stimulus from the proposed reorganisation of States, creating further complications all round.

The imperative needs of the country at present are three: a language or set of languages in which the masses can express themselves freely and naturally for workaday purposes at the State level; a common national language for inter-State communication, cultural exchange and synthesis and promotion of oneness; and a medium of communication at the international level. Answering these needs respectively are regional languages, Hindi and English. Each of the three has a place of its own, obvious and almost inevitable, the only question remaining to be decided being in what form each must be developed or adapted to the needs of the present times and the degree of importance to be attached to each or the sphere of operation to be demarcated. Then there is the time factor: how soon the changes visualised should come into force. But should there be no undue haste, no attempt, open or insidious, at compulsion, no prejudiced or clouded assessment of the relative needs of region, country and the world at large and no play of extraneous considerations, then it is not too much to expect that the problem will solve itself in the fulness of time. A factor of considerable importance in this matter will be the attitude adopted by the Official Language Commission. In this respect, there is no little cause for satisfaction in the views expressed by Shri B G Kher in favour of a broad, detached and utilitarian approach.

Nation Above States

BY the fortuitous circumstance of the National Executive being in session at the right time, the Praja-

Socialist Party has had the privilege of being the first to express itself officially on the recommendations of the States Reorganisation Commission. While accepting the recommendations with 'reservations', the National Executive has rightly laid stress on the overriding consideration that weighed with the Commission in its approach to the problem: national unity and due concern for the future of linguistic minorities and backward areas. The Executive has directed its provincial branches to examine details of the recommendations in the light of Party policy and make specific suggestions for modifying them wherever needed. The Executive is not prepared to countenance any agitation on boundary issues, though it has left the door open for such action on the part of party branches on other issues, either on their own initiative or in association with other organisations, subject, however, to the condition that the agitation must proceed on peaceful and democratic lines, and that the approval of the Executive or Chairman of the Party should be sought in advance.

Whether the Executive has acted wisely in leaving the initiative for agitation to party branches remains to be seen. Perhaps the Executive had no alternative but to yield to the pressure of the branches in this matter which, however, does not reflect much credit on the influence and power of the top leadership or its capacity for decision. Though border issues, over which party branches of rival States might well come to clash, have been ruled out of the sphere of agitation, there might still be questions over which such clashes become unavoidable. And then in giving the necessary permission for agitation, the Party Executive might conceivably find itself in an embarrassing position. By deferring a clear-cut comprehensive decision on the recommendations, the Executive has only gained time; but the time so gained may complicate the issues rather than simplify them.

Judging at least from the utterances of Shri J B Kripalani, it would seem that the top leadership is on the whole in agreement with the recommendations of the Commission, though branch leaders, in certain States would appear to be disinclined to fall in line. It would have been creditable on the part of the National Executive if it had boldly tackled these differences and given an agreed lead to the branches and through them to the country too.

Such a lead from the Praja-Socialist Party, standing between the ruling power and extremists, would have been invaluable.

Nationalisation of Insurance

THE Union Minister for Revenue and Civil Expenditure, Shri M C Shah, is reported as having stated at Ahmedabad recently that the nationalisation of Insurance is under the active consideration of Government. It is difficult to say what weight should be attached to this latest statement on the subject as indicating Government policy in the near future. But there is no denying the fact that the question of nationalisation of insurance is a live issue and not a few Chairmen's speeches this year have been devoted to presenting the case against such nationalisation.

Unfortunately, the case for nationalisation of this important industry has hardly been considered, if at all, on economic grounds. Intelligent policy-making, particularly in the economic sphere, cannot be based merely on obiter dicta which broadly flow from the acceptance of "the socialistic pattern of society". The public is entitled to know on what lines Government is thinking on vital issues of policy such as the proposed nationalisation of insurance, and its suspicions are hardly likely to be allayed by the numerous inconsistencies of Government policy vis-a-vis insurance companies. To give only one instance, one may refer to the Government ban on 'Staff Insurance Schemes' which were sponsored by some leading Indian Insurance Companies with the avowed purpose of cheapening life and endowment insurance and making it available to a larger number of people. Whatever the ethics of the companies' method of cheapening insurance by by-passing the agents, it cannot be denied that these schemes had cheapened insurance for the small man. It is difficult to appreciate the logic of Government's stand, particularly when it was presumably not unaware of the proposal to initiate these schemes. Surely, Government would not like to be accused of allowing the vested interests of the smaller insurance companies and of insurance middlemen to come in the way of so laudable an objective as reducing insurance premia and extending insurance facilities. Yet this is precisely the effect of the Government ban on staff insurance schemes. Is the common man to be deprived of cheaper insurance while he is asked to wait for the millennium of nationalised insurance? Would not one of the ma-

for objectives of nationalised insurance be the cheapening and popularising of insurance?

To date, Government's excursions into the field of insurance, e.g. Postal insurance, have not been an unqualified success. This is of course no argument against nationalisation of insurance as such for which there might be substantial economic reasons. But is Government aware of these? Or is it oblivious to all other economic aspects of the problem except the possibilities of exploiting state insurance profits to supplement the resources of the public sector during the Plan period? One wonders.

Industries in Refugee Townships

THAT the problem of unemployment in the refugee townships should continue to exist even today is certainly a grave reflection on those responsible for their establishment. After the initial enthusiasm had waned and the marketing and other difficulties of those industries that were established there proved insuperable, a number of units had to close down and employment actually fell considerably. In his studies of these refugee townships, Dr V K R V Rao called for vigorous action by Government to solve this problem. He pointed out also that "if private enterprise is to provide an important source for new employment and if it involves import of capital from outside the township significant concessions, possibly limited to a period but conspicuous in nature, should be given in the form of land, water, power and taxes".

This recommendation seems to have found acceptance in Government circles and the Central Minis-

try of Rehabilitation has announced this week its decision to give a number of facilities to industrialists for setting up industries in such townships. It is proposed to sell factory sites on easy instalments or to allot them on rental basis for a period of seven to ten years. In the latter case, Government will also be prepared to construct factory buildings according to the specifications of the industrialist and allot them on rent for the same period. An option will be given to the industrialist to buy the land and building at any time—land at its market value and building at its depreciated cost.

Other facilities include the supply of water and electricity at rates comparable to those prevailing in neighbouring industrial areas and the provision of loans up to 50 per cent of the value of the machinery installed by the industrialist and if he purchases the land and puts up his own buildings further loans up to 50 per cent of the value of land and buildings.

These facilities are to be granted on condition that the unskilled workers and as many skilled and semi-skilled workers as possible should be employed from among the displaced persons of the colony. These facilities have been extended at present to fourteen townships in various parts of the country, but it is proposed to bring other townships within the scheme after further examination. It is now up to the progressive industrialists in the country to respond to this gesture and establish industries in these townships so that they may develop as flourishing centres providing adequate employment to their residents.

Burn and Company Ltd.

NOTICE is hereby given that the Sixty-first Ordinary General Meeting of the Shareholders of Burn & Company Ltd. will be held on Friday, the 11th November, 1955, at 11 a.m. at the Registered Office, 12, Mission Row, Calcutta, to transact the following business:

- (1) To receive and adopt the Directors' Report and Audited Accounts for the year ended 30th April, 1955.
- (2) To declare a dividend.
- (3) To elect Directors.
- (4) To appoint Auditors for the current year and to fix their remuneration.

The Ordinary Share Register of the Company will be closed from the 4th November, 1955 to the 11th November, 1955, both days inclusive.

Calcutta, 22nd October, 1955.

By Order of the Board,
Martin Burn Ltd.,
Managing Agents.

NOTE: If the dividend as recommended by the Directors is passed at the Meeting, it will be paid on or after 16th November, 1955, to those Shareholders whose names are on the Company's Register on the 11th November, 1955.

Off the Record

The Ten-Year Old

FOR all its usefulness, the Food and Agriculture Organisation of the United Nations lacks the glamour so necessary these days to hit the headlines. It does not enjoy the privilege of Mr Molotov's or Mr Dulles's attention. Even Shri Krishna Menon does not pack his brief case and set out to straighten a hitch in the FAO parlours. Politicians give the organisation a wide berth and so do, for that matter, the men of finance. The IMF is often in the news because balance of payments difficulties make good 'copy'—since there are always crises and international confabulations about them. The IBRD figures prominently now and again because it gives a loan to a country, as also because it does not. UNESCO is saved from oblivion because it offers such interesting problems for nations to fight about, on ideological grounds. But the FAO just goes along, finding more about the state of the world's food supply, suggesting means of improving yields or arresting soil deterioration etc. These activities may mean more to mankind in a few decades than adjustments in the rates of exchange; but then they are not exciting news.

Hence the general lack of notice in the press of the coming of age this October of the FAO. The sixteenth of October this year marked the tenth anniversary of the birth of that organisation; and in these ten years, the FAO has, without much fanfare, made solid contributions in the special fields that occupy its attention. It has helped greatly the collection and exchange of useful information on all aspects of agriculture. Special committees to deal with problems of individual crops like rice have been formed, and facilities for training agriculturists have been provided. The FAO has also taken on hand the question of agricultural surpluses and their disposal. One can add many more such items on the credit side of that institution. But in the very nature of things, its activities do not produce spectacular results in the short-run. Consequently, few 'big' men pay attention to it.

This is perhaps not entirely a pity. For in the cold war atmosphere that still persists, Geneva notwithstanding, much harm could have been done had the FAO received the close

attention of politicians and statesmen. It is and has been the meeting ground of technicians who, so to say, speak the same language and whose fight is largely against natural impediments to larger production. Very aptly, the FAO has as its motto fiat panis; and man everywhere needs bread and more bread, whatever the colour of his skin or of his State. And with a growing population, the task of keeping the people properly fed becomes an ever-present problem.

It is a task the performance of which demands international understanding and co-operation on a continuing basis. In agriculture, as in many other fields, nations have progressed at different rates; and we have now a situation in which there is too much food in some and too little in other regions of the world. And what is worse, this may, with the progressive application of atomic knowledge to the problems of agriculture, become more pronounced. For, the richer nations of the world have the benefit of the technical knowledge as well as the material resources to go ahead in this direction, while the hungry nations plod along very much in the rear.

In living up to its motto, the FAO has to strive for joint international action in two related directions. In the first and obvious place is the arrangement of a rational distribution of the existing supplies amongst the surplus and deficit nations. This could well be a lever for the second, viz. an augmentation of the world's agricultural supply. By facilitating a smooth disposal of surpluses, the agriculturally advanced countries will be saved from following a paradoxical policy of cutting down their output when people elsewhere starve or go without enough clothes. By diverting the surpluses to the underdeveloped and needy countries, they will be enabled to concentrate their efforts more on accelerating development than on keeping the mass of people barely alive. And in the changed conjuncture, both of them would be willing and able to produce more.

That the FAO has not achieved such a happy solution in the past ten years is not its fault. For it was not expected to function as a clearing house for surpluses. And what is more, in this strange world

of ours, nations have difficulties in both giving away what they do not need, and receiving what they do need. Political and financial complexities bedevil the transfer of excess supplies across national frontiers. And any arrangement will need to be approved by the powers that be in the political and economic spheres of each country. All that the FAO can do, and has in part done, is to work slowly for the triumph of common sense and goodwill over vested interests and international suspicions, by working out the several ways in which the available supply could be distributed in a more equitable manner, without endangering the economy or independence of the different nations. Whether or not the suggestions put forward by the FAO for intelligent use of surpluses find favour with the governments concerned, the FAO has made a signal contribution by making these suggestions. Further progress rests with the men who formulate and execute the foreign economic policy of each country; and, possibly, with the special organs of the United Nations entrusted with international harmony and development on a broader basis.

From the viewpoint of the underdeveloped countries, it would be a great mistake to lose interest in the other activities of the FAO, should nothing come out of its efforts to ease the distributive situation. It would, indeed, be less than fair because not all the underdeveloped countries are, as mentioned above, willing to depend on other countries for a length of time for their supplies of food and agricultural raw materials. Almost without exception, they want for one reason or another to develop their own sources of supply, and thus make their political independence more real. Whether or not this is a rational attitude is beside the point. It is a fact that is with us now, and will be with us for as long as one likes to peer into the future. In that context, the activities undertaken by the FAO to disseminate information about the methods that could be adopted for exploiting the natural resources of each country to better advantage are of supreme importance. These activities cover not only agricultural production but also dairy farming, livestock, poultry and such related primary industries.

The crux of the problem in respect of these activities in underdeveloped countries is the increasing of productivity per man-hour or per acre of land utilised; and this involves adoption of better methods of production, with all its corollaries of better financing, marketing etc. There are probably directions in which progress merely depends on men in one country coming to know how men in other countries organise these things. Or, maybe, the mass of statistics collected and published by the FAO regularly has information that may be of use in formulating policies for increasing land yields. One might indeed go further without being facetious or condescending. The statistical material collected by the FAO could have a direct bearing on similar work in the underdeveloped countries, which woefully lack such essential data. What data are to be collected and how, are points of great importance to these countries, especially when they are engaged in planned development. In deciding these, the help that would be derived from the FAO is of no little significance.

It might be worthwhile adding a little body to these observations, by reflecting on some of the items published in the production volumes of the FAO Year Book of Food and Agricultural Statistics. The latest of these, for the year 1954, contains information from land use through crops, livestock, production and consumption of fertilizers, tractors and pesticides to prices and index numbers of prices received and prices paid by farmers. With this mass of information for almost all the countries in the world, one can work out all sorts of correlations, and at the worst, derive some amusement. But even a casual juxtaposition of some of these data may set one thinking about the real problems that arise in the agricultural sector.

Here is an example. Both Belgium and the United States grow wheat and oats. They are important crops in these countries, and in both countries fertilizers and tractors are used on a large scale. But the average yield in Belgium in 1953 was 3,260 kilogrammes per hectare in respect of wheat, and 2,870 kilogrammes per hectare in respect of oats. The yields in other years were also around this level. Compared with this, the yields in the USA in 1953 were as follows: Wheat, 1,160 kilogrammes per hectare and oats, 1,110 kilogrammes per hectare. Yields in other years were of a similar magni-

tude. Why are yields so much higher in Belgium than in the USA? Arable land and land under tree crops amounted to about 1.05 million hectares in Belgium and about 193.37 million hectares in USA during that year. Corresponding to this, Belgium had 17,345 tractors in operation and consumed about 317,500 metric tons of fertilizers (nitrogenous, phosphoric acid and potash varieties). On an area 193 times larger, USA employed 4,200,000 tractors and consumed 5,480,000 metric tons of similar fertilizers. That is to say, USA used relatively more tractors than Belgium, while Belgium consumed relatively more fertilizers per hectare.

Now, one can straightaway infer from this that yields are a function more of fertilizers than of tractor cultivation. This is probably nothing new to those in the field; also, an inference of this sort may be objected to on technical grounds.

But the point is this: the result obtained above could provoke thought in several directions. Apart from these two, was there anything else that contributed to higher yields in Belgium than in USA? If fertilizers and not tractors determine yields, why should one bother about the size of farms? One can spin out many such questions, and in an honest effort to find answers to them, pitch upon points of great importance.

All this is by the way. It only emphasizes the usefulness of the statistical work being done by the FAO. But this is not the only function that it performs; the organisation's scientific divisions are very much in the van of the fight against pests and natural damages to soil. It is a fight undertaken by the FAO on behalf of humanity, not this country or that alone. And for that reason, the FAO deserves a big hand, on this, its tenth birthday.

The Small External Surplus

IN his Mansion House speech earlier this month, the Chancellor of the Exchequer claimed that in spite of the sharp falls in the gold and dollar reserves over the past year, a "small surplus" in the balance of payments for the first half of 1955 was in fact achieved. This claim was then generally received with some surprise. Some explained the "small surplus" in terms of a sharp rise in invisible earnings while others found it "just too difficult to believe". This latter view was based on the course of imports and exports over the past year and of the rising trade gap. Now the "surplus" is explained. The Balance of payments White Paper issued this week shows that on current account, excluding extraneous items, a deficit of £16 million occurred in the first half of this year compared to the surplus of £141 million and the deficit of £5 million in the first and second halves of 1954 respectively. It was the extraneous item "Defence Aid" that has covered the deficits since July 1954.

The White Paper, though purely statistical, gives the clearest possible picture of the course of the domestic inflation since May 1954. In Table I the swing into deficit over the past 18 months is seen with remarkable clarity. The distortions resulting from the dock workers' strike of November last have, of course, inflated the level of exports in the first half of 1955. It has been estimated that these strikes resulted in a £150 million carryover of export shipments into the new year. Taking this into account, exports over the past 18 months have remained relatively unchanged at an average six-monthly level of about £1,450 million. Imports, however, do not appear to have been distorted so much by the dockers' strike. There was a steady increase over the period.

The fundamental importance of the overseas sterling area and in particular, of the colonial area in maintaining the traditional triangular balance in Britain's external economic relations is equally shown by the White Paper statistics. Even after taking into account the "Defence Aid" item, Britain ran a large deficit (£102 million) in its account with the non-sterling world. The deficit with the dollar area was alone in the region of £56 million in the

first half of 1955. And yet, the gold and dollar reserves declined by only £29 million, while Britain's sterling liabilities to the non-sterling world fell by only £51 million.

The explanation for this difference between the financing of the non-sterling deficit of Britain and the deficit itself is, of course, found in the earnings of the colonial territories. The dollar surplus of the colonies in the first half of 1955 amounted to £60 million. Apart from this, the colonies sold about £5 million worth of gold to the Bank of England. The Commonwealth countries, on the other hand, just about struck even in the payments with the dollar area: their trade deficit was covered by gold sales to Britain.

As a result of this situation, there has been some redistribution in Britain's short-term liabilities to all countries. The sterling assets of the

dollar and the transferable account countries fell by £25 million in the six months January to June 1955. There was also some drawing on the sterling balances of the non-colonial countries of the sterling area (by about £88 million). These drawings possibly covered the trade deficit with the rest of the sterling area since their dollar accounts were, in the main, financed by gold sales to the United Kingdom. For the Colonies, however, their relatively immobile sterling balances rose to the peak level of £1294 million—an increase of £71 million in six months. The Economist describes this remarkable position with irritating self-satisfaction:

"The good work done by the colonies mitigated the external strain on Britain".

Nothing is said of the forgone purchasing power of imports which this piling up of sterling balances repre-

sents, nor of the reduction of the claims on the British economy which results from the British control over the disposal of these balances.

The statistics in the White Paper do not give any precise indication of the inflow and outflow of short-term capital over the past six months. There is a "balancing item" amounting to £22 million, this being described as "net borrowings". On the other hand, there has been a fall in the

sterling balances (the liquid sterling assets) of the non-sterling world to the extent of £25 million. If it can be assumed that the current account of the U K Balance of Payments was financed by gold and the foreign exchange earnings of the colonies, it would then appear that in six months £3 million flowed out in spite of the favourable rates of interest in London. While this figure is by no means accurate, it has all the ap-

pearance of being true, if account is taken of the various pressures on sterling arising out of rumours of a change in the gold parity. These rumours had gained most widespread currency in June and it is possible that in that month alone such a large outflow of short-terms took place as to wipe out any inflows that may have occurred after February 23rd when the Bank rate was raised to 4½ per cent.

Displaced Persons

THERE are many angles to a problem. Consider, for instance, the problem of displaced persons from East Bengal. This influx of refugees started many years ago. It still continues. Some days ago, Shri Meher Chand Khanna, Union Rehabilitation Minister, appealed to Pakistan to stop this exodus. His Secretary has echoed his appeal. East Bengal's Chief Minister has issued an appeal to his countrymen to solve the minority problem. Eight years after partition, both New Delhi and Karachi prefer to pretend that the problem can be solved this way.

Realism is a political virtue. Experience is conclusive that the problem cannot be solved this way. Refugees continue to pour in. In the first eight months of this year, the influx has continued to increase. It was, and is, due to a combination of political and economic factors. Both these influences persist. Economic conditions in Eastern Pakistan remain unstable. This breeds political and economic discrimination against East Bengal Hindus. This state of affairs will continue even if Mr. Fazlul Huq's dream of full regional autonomy for Eastern Pakistan comes true.

State Boundaries

Once it is assumed that the refugee influx will continue, the problem of rehabilitation becomes urgent. Realism again dictates that a pronounced characteristic of Bengalis be appreciated. Experience shows that attempts at settling the refugees outside West Bengal have not been very successful. East Bengal Hindus can be blamed for their incapacity to adapt themselves to new environments. But their problems cannot be solved by blaming them. Here, the problem of reorganisation of State boundaries becomes relevant.

West Bengal's case seems to have gone by default. To put it in another way, West Bengal's claims have suffered through wrong emphasis. West Bengal's Government, the Pradesh Congress Committee and all other political parties supported the claims to some areas of adjoining States on grounds of language and culture. Some of these claims were well documented. SRC implies that the census figures of

the claimed areas in Bihar are intriguing. Its recommendations about domicile rules confirm some of West Bengal's allegations against discrimination of Bengalis in Assam.

Linguistic and cultural affinity of the areas claimed was stressed in all the representations made to SRC. But the close relation between refugee rehabilitation and West Bengal's claims to some parts of adjoining States was not duly emphasised. Nor did SRC consider this co-relation in all its aspects. A comparative examination of population and area of West Bengal, Bihar and Assam justifies West Bengal's claims to some parts of Bihar and Assam. Some such rearrangement of boundaries of these three States could have partially eased the problem or rehabilitation of refugees.

Plan Outlines

Rehabilitation Secretaries of Eastern States have now assembled at Darjeeling to discuss plans for refugee rehabilitation. Some days ago, Shri Khanna had talks on this problem with some MPs of the States concerned. Plans for refugee rehabilitation have yet to be finalised. But the outlines have been framed. Hindu refugees from East Bengal are to be settled in the various parts of the country. Congenial sites and surroundings are being selected. Among the Eastern States, Bihar and Assam will have refugee pockets where townships will be established to rehabilitate the refugees. It is strange that this aspect of the problem was not adequately examined by SRC in recommending readjustment of State boundaries.

Certain facts emerge out of the tentative plans for rehabilitating East Bengal refugees. New Delhi accepts responsibility for settling these refugees. It admits that West Bengal alone cannot solve this problem. There is recognition that refugee rehabilitation must be a major aspect of the second Five-Year plan. This problem is now being jointly considered by the Union Rehabilitation Ministry and the Planning Commission. These are welcome developments. These arrangements have been under discussion for about a year. SRC, therefore, could not be unaware of these plans. Yet, nowhere in its report is there any indication that it has considered

West Bengal's claims to territories from the adjoining States from this angle.

Shri Mehr Chand Khanna's approach to the problem of refugee rehabilitation is honest and humane. Plans for establishing industrial townships in and around refugee colonies in the various States are sound. Every year, New Delhi will loan out Rs 3 crores to industrialists to help them start small and medium-sized industries in these townships. Industrialists will have to provide Rs 3 crores more each year. In the next five years, Rs 30 crores will, thus, be available to develop industrial townships to absorb refugees. This is a good start. But these plans will have to be expanded further.

Income Issues

Dr John Matthai was in Calcutta a few weeks ago. He delivered an address before the Indian Council for Economic Affairs. It was an illuminating address in which he discussed topical issues like deficit financing, nationalisation and ceiling on incomes. His remarks on the problem of a ceiling on incomes have evoked considerable criticism. Dr Matthai did justify the Taxation Enquiry Commission's recommendation on this issue. But the critics do not seem to realise that neither Dr Matthai nor TEC is in favour of a ceiling on incomes immediately. It has to be enforced over a period of years.

Dr Matthai emphasised the political and ethical aspects of the problem of a ceiling on incomes. In his presidential address before the half-yearly meeting of the Bharat Chamber of Commerce, Shri Ranganath Bangur discusses the issue from the economic angle. Balancing of incomes poses a problem. Shri Bangur's contention is that the problem should be solved by levelling up, and not by levelling down, incomes. He suggests that the Government is already trying to divert incomes by its tax and wage policies. But TEC's proposal that the after-tax higher income over Rs 25,000 should be immobilised by certain devices is opposed by him.

Shri Bangur furnishes interesting statistics. Assessors with incomes of Rs 25,000 and over now contribute 62.9 per cent. of income-tax re-

ceipts. Thus the tax policy leads to diversion of incomes. Even with a 87.4 per cent tax, there is some incentive left to private enterprise. Dr Matthai's proposal, Shri Bangur warns, will eliminate even this small incentive. If incomes are frozen at Rs 25,000, there will be no incentive left for private enterprise to assume

risks. Unemployment will grow.

Shri Bangur complains that the Government's tax and wage policy is creating unemployment. There is nothing new in this argument. But Shri Bangur is amusing in his criticism that any policy for fixing a ceiling on incomes is undemocratic. In a free democracy, disproportion-

ate disparities in incomes are frowned upon. But Shri Bangur concludes that any policy of immobilising income beyond a ceiling "is an attempt at applying an economic tool which is alien to the assumption of basic freedom in a democratic society". So, now one knows how definitions can differ.

Monetisation and Development

Scope and Structure of Money Economies in Tropical Africa; United Nations, Department of Economic and Social Affairs, New York 1955.

Reviewed by **Hannan Ezekiel**

THE need for information about the nature and volume of subsistence production in underdeveloped countries has been repeatedly stressed in recent years. Recent national income studies of such territories have in fact provided considerable information on this sector and it is now possible in most cases to obtain a balanced picture of their economies. Since, however, these economies are being subjected to substantial changes and in fact the information now available is intended to be utilised for formulating policy for facilitating such changes, a more dynamic picture is essential—a picture of the changing relations between the subsistence and exchange sectors of the economy. A study of the process of monetisation and of the factors determining it was published recently by the United Nations under the title 'Enlargement of the Exchange Economy in Tropical Africa.' The information available about the monetised sector, however, itself needs to be subjected to careful analysis. This has been done by the United Nations Department of Economic Affairs for the same region in the present report. The geographical rather than the national product is taken for the purpose of analysis.

The report distinguishes three major sectors, which directly or indirectly account for the total product of the money economies of tropical Africa. These are the export sector, the public sector and the autonomous exchange sector arising independently of the other two. The first two are held to be strategic "in the sense that they largely account for both the short-run fluctuations in the level of activities and the growth of the money economy in the long run".

Three features of these economies are highlighted for the purpose of short-run analysis. (1) The money economies in tropical Africa are open economies, that is to say, the impetus to the rise of activities derives largely from external sources, (2) the secondary effects of this impetus in creating further activities within the economies are limited in scope; and (3) the supply of domestically produced goods is relatively

inelastic, not only in the short-run but possibly in some other territories also over a considerable period. The study concludes that this combination of factors sets limits to the effective rate of development expenditure, though these vary from territory to territory and within each territory from time to time.

The activities of the public sector are considered important because they enlarge the scope of the monetary economy and powerfully influence its structure. The fact that Governments are likely to spend proportionally larger amounts on domestic goods and services than the private sector, from which they obtain their funds through taxation, means that the generation of secondary income within the economy is encouraged through the enlargement of the public sector.

Presumably, the report would like a large development programme to be undertaken on the basis of this analysis. But the limitations to such a programme have been already indicated. These limitations, according to the report, may become more severe in the event of a large rise in export income in the private sector, "which would then come into sharper competition with the public sector for goods and services, the supply of which is, in the short-run, inelastic". In these circumstances, the report concludes, "if development is not to be jeopardised by inflation, Governments may face the necessity of neutralizing the immediate effects of such an increase". The type of situation that has developed in some British colonies, where marketing boards have built up large reserves, thus in fact neutralising the rise in export incomes, is evidently welcome to the authors of the report on these grounds.

This is the basic analysis of the short-run problems of the economies of tropical Africa and the remaining chapters are devoted to detailed analyses of different aspects of the monetary economies of these countries, which are intended to support the conclusions contained in the basic analysis outlined above. The report does admit that this analysis

is fundamentally short-run and applicable only to the situation as it prevails at present. It emphasises that the problems of long-term growth are considerably more complex.

The complexity of the long-run factors arises from three factors. In the first place, economic development implies monetisation and therefore a shift of resources from subsistence production to specialised production for markets. Scope for this is considerable. Secondly, the increase in money incomes that will result from monetisation will induce changes in habits of spending and saving and in elasticities of supply. Thirdly, changes in techniques of production, especially in agriculture, are a necessary condition for economic development, and such changes cannot be expected to come about automatically. All this has to be appreciated in the context of ignorance about the significance of money incentives in a backward social system. Changing population provides another semi-independent factor to be taken into consideration.

It will be noticed that the short-run analysis differs considerably from the long-run and one could perhaps argue that the former fails to take note of the significance of the latter. Involved in the long-run analysis is the influence of sociological factors, which seem to have been entirely disregarded in the former. The tendency, at any rate in the short run, to regard the social factors as obstacles to be overcome and in fact to be blasted out of the path marked out by apparently desirable economic objectives through the instrumentality of economic change, is quite apparent in this analysis—which is not surprising as most economists appear to think along these lines on problems facing the underdeveloped countries.

The report argues that in "inducing and assisting economic and technical changes, social resistances will have to be overcome. At the same time, part of the resources of Government will, of necessity, have to be devoted to mitigating some of the social consequences of economic de-

velopment". Not a thought appears to have been given to the need for inducing autonomous social changes and integrating the process of social change with that of economic change. The latter is conceived of as the instrument for blasting the foundations of those social forces that may appear to be antagonistic to economic development.

The significant place given to the public sector in bringing about economic development, which is identified in this study for all practical purposes with monetisation, is itself an evidence of this approach. At the same time, the present insignificant place of the autonomous exchange sector, is taken as conclusive proof of its unimportance in the process of development. A more careful analysis, not carried away by existing economic situations nor forgetful of the importance of social factors, might well have led the authors of this report to place a greater emphasis on this sector. The widening of the area of choice offered by the use of money and the greater scope for improving methods of satisfying one's wants offered by rising money in-

come might well be considered the instruments for bringing about the change in social attitudes necessary for the growth of the autonomous sector—which, in turn, by its impact on secondary income-formation on the one hand, and on elasticities of supply on the other, would open up the path towards rapid economic development.

The study of the relations of indigenous and non-indigenous peoples to the monetised sector provides further material for expanding the type of analysis indicated above. The need to change a situation in which "indigenous inhabitants become involved in the money economy largely as wage-earners" would also stimulate further thought in this direction. It is because of the importance of non-indigenous enterprise that the indigenous people get related to the money economy only in this way. Extension of public enterprise would not directly remedy the situation, but would worsen it. Only a study of social factors can indicate why indigenous enterprise is engaged primarily in agriculture and apart from that only in distribution. Yet as the

report points out, in "the Gold Coast a relatively important diamond mining industry has been developed in recent years by indigenous small-scale producers". In what circumstances could this happen? If it is the small-scale character of the enterprise which made this possible in the Gold Coast, would that not suggest that it would be desirable to change traditional economic ideas and thus facilitate the growth of indigenous enterprise instead of trying to fill in the existing lacunae through the entry of the State?

The conclusions of the report, as I have indicated above, raise a whole set of questions. It is to the credit of the rest of the report that it provides the material on the basis of which an independent analysis can be made. The differences between the territories show that in each case some differences in approach and technique may be permissible and even desirable. Provided the conclusions of the report are subjected to critical examination, the report should prove very useful in studying the problems of economic development in underdeveloped areas.

Views on States Reorganisation - I

Karnataka and Mysore

K N Subrahmanya

THE recommendation of the States Reorganisation Commission to form a Karnataka State bringing together predominantly Kannada-speaking areas presently scattered over five States has been generally welcomed by a large section of Kannadigas who had a genuine, long-standing complaint that their economic and cultural progress was hampered owing to their numerical inferiority in the States dominated by other linguistic groups. There is a feeling of satisfaction among the Kannadigas over the Commission's approach to the question of the formation of a Karnataka State, although there is room for differences of opinion on questions of minor detail. Barring these minor differences, it must be said to the credit of the Commission that it was moved by a genuine desire to help the creation of a homogeneous, viable State having vast potentialities for expansion.

Nevertheless, to an outsider unfamiliar with the currents and cross-currents of opinion inside the Kannada-speaking areas, the discordant voices now being heard in responsible quarters give the impression that there is no unanimity of opinion among Kannadigas even on the major issue of a United Karnataka. Puerile and inconsequential as these hallucinations are, an appreciation of the motives behind these vain outbursts is worthwhile. In the course of this article, an attempt is made to interpret the under-currents of opinion in Karnataka against the background of the Commission's recommendations.

The Commission has recommended the formation of a Karnataka State consisting of the following areas:

1 The present Mysore State excluding the following portions of Bellary district as now constituted, namely, the Siraguppa taluk, the Bellary taluk, the Hospet taluk and a small area of the Mallapuram sub-taluk in which the dam and headworks of the Tungabhadra Project are situated.

2 the four Kannada-speaking districts of the southern division of Bombay, namely, Belgaum except Chandgad taluk, Bijapur, Dharwar and North Kanara;

3 the districts of Raichur and Gulbarga;

4 the South Kanara district except Kasaragod taluk;

5 the Kollegal taluk of the Coimbatore district of Madras;

6 Coorg.

The State thus formed will have a population of 19 million and an area of 72,730 square miles.

Criticism of the recommendations of the Commission, so far as it relates to Karnataka State, falls into two categories. Firstly, there are those who welcome the suggestion to form a Karnataka State but complain that the Commission has excluded certain areas, which on a purely linguistic basis, should be included in the proposed Karnataka State. And secondly there are those who, for some inexplicable reason, oppose the formation of a single State comprising all the major Kannada-speaking areas. They put forth the plea that the merger of a progressive area like Mysore with the rest of the Kannada-speaking areas, which, they argue, is backward, would place an unnecessary strain on the resources of Mysore. Loyalty to their Rajpramukh is also put forward as an argument against effacing Mysore State from the future map of India. For sentimental reasons, some of them, at any rate, do not view with favour the suggestion to abolish the institution of Rajpramukh.

The Commission's recommendation on the Bellary district and Kasaragod taluk has caused disappointment among Kannadigas. So far as Bellary is concerned, it was already a closed issue, having been joined to Mysore State on the basis of Shri Justice Misra's award. Indeed, the process of integration with the neighbouring Kannada-speaking area of Mysore was so smooth that the recommendation of the States Reorganisation Commission to transfer the entire area back again to Andhra came as a rude shock to Kannadigas there. The interests of Kannadigas in Bellary would be gravely affected if it was appended to Andhra State and it would be a prolific source of perpetual conflict between Karnataka and Andhra. That the Commission is keenly aware of it will be evident from its advice to the Andhras: "We trust that the Andhra Government and the leaders of the Andhra State

will show vision and broadmindedness in dealing with the Kannada population of the area in question and will provide for adequate educational facilities for them and also ensure that they are not discriminated against in the matter of recruitment to services." How far this paternal advice will be heeded remains to be seen. In this connection, one fails to appreciate the attempt of the Commission to link up the Kolar question with that of Bellary. In treating Kolar as a bargaining counter, the Commission has thrown to winds the principles that they had set before them. The Commission easily dismisses the question by saying: "The retention of Kolar district in the Karnataka State and the addition of the major part of Belgaum district to it will, in our opinion, be more advantageous to the new State than the continuance in it of the eastern portion of the Bellary district." There is a growing feeling among Kannadigas in Bellary that the Commission has succumbed to the pressure tactics of a handful of business tycoons of Andhra who have stakes in the town. In view of the fact that even some of the outstanding recommendations of the Commission are going to be changed, in all likelihood, to satisfy the interests affected, one hopes even now that suitable readjustments along the Andhra-Karnataka border will be made before the reorganisation of the States finally takes place.

Another recommendation which has aroused Kannadigas' protest is the inclusion of Kasaragod taluk in the proposed Kerala State. Kannadigas concede the claim of Kerala up to the Chandragiri river, but oppose the proposal to exclude the entire taluk from the proposed Karnataka State.

Two Karnatakas

Since the publication of the report of the Commission, a section of the people in Mysore State have voiced their opinion against the formation of a single State of Karnataka. Fissiparous tendencies have become apparent even inside the Mysore Cabinet, which so far, had maintained a sphinx-like silence behind a facade of unity. The facade has now been pulled down and three ministers have come out with a categorical state-

ment opposing the formation of a single State of Karnataka by joining the Mysore State with the other areas. Curiously enough, the Chief Minister, who had consistently taken a favourable stand on the formation of a United Karnataka, now seems to be vacillating on the brink of a cabinet crisis. The dissident ministers, in their statement, said:

"The States Reorganisation Commission's proposals for Mysore deny to Mysore what has been conceded by them to Hyderabad and Vidarbha. These two new States with lesser population than Mysore have emerged and taken shape in the picture of future India. But Mysore, which has been assiduously built by its great rulers for decades, has been effaced from the all-India map... The people of Mysore are demanding that the Kannada area should be divided into two States: 1. Mysore with Kannada areas lying in the east and west of it; and 2. the Kannada areas lying to the north of Mysore."

It is difficult to establish a direct casual connection between this new movement in favour of two Karnatakas and the fear of some of the major communities in Mysore State that in the future set-up, they would be reduced to pitiful minorities. Nevertheless, the motive force behind this reactionary movement seems to be the communal groups who have now a major voice in the political affairs of the Mysore State but are likely to lose their importance in the future Karnataka State. The Commission has referred to this problem in its report. It states that "there has grown up in the last two or three years opposition to the unification of Mysore with other Karnataka areas." Quite apart from the fear that the inclusion of relatively under-developed areas in the financially stable Mysore would lead to huge budget deficits, there is the fear among the Vokkaliga community that they would lose their importance in the Karnataka State. Considering that the movement is of very recent origin, it does not seem to have any sizable following in the countryside. It is argued, however, on their behalf, that the Vokkaligas who now constitute about 29 per cent in Mysore State, would be reduced to about 14 per cent in the proposed Karnataka State. On the other hand, the Lingayats, who form a predominant section of the Bombay Karnataka, will, in the future set-up, constitute about 20 per cent of the total population, thus tilting the

scales against the Vokkaligas. Over and above this is the fear of the political leaders of Mysore that they would suffer a political eclipse in the new State. The Commission has dismissed these arguments by stating that in the perspective of the political and economic development of the Karnataka State, the importance of narrow communal jealousies should not be exaggerated.

As public opinion in favour of a United Karnataka is overwhelmingly strong and persistent, it seems likely that the reactionary pseudo-royalist movement will fizzle out in course of time. As for the economic prospects of the Karnataka State, the Commission has estimated that in the initial stages, it will have to run a deficit of over one and a half crores of rupees. This is accounted for by the heavy burden of servicing the public debt the new Government has to bear on account of the Tungabhadra and other projects. When the projects are completed and when the initial period of transition is gone through, this deficit is expected to decrease to manageable proportions. The Commission has rightly dismiss-

ed this as an argument against the formation of a Karnataka State. Further, the creation of a Karnataka State will enable the speedy development of the Malnad area now distributed over many States. When the entire Malnad area, so rich in natural resources, comes under one administration, it is reasonable to expect that there would be greater scope for development through proper, comprehensive planning. Far from being a drag on the resources of the area now comprising Mysore State northern Karnataka will contribute in a large measure, to the balanced growth of the Karnataka State. With the completion of the Tungabhadra, Upper Krishna, Bhima, Ghataprabha and Malaprabha projects, the Karnataka State will have increased irrigational facilities and the recurrent food deficits in the area now constituting Mysore State will be eliminated.

Of course, the new State will have to bear the additional burden of levelling up the pay scales but this will indirectly foster contentment and a better standard of administration in the long run.

Views on States Reorganisation - II

A Karnataka Viewpoint

KARNATAKA has no special reason to exult over the recommendations of the States Reorganisation Commission—particularly in relation to itself. The 30-year old demand for a separate Karnataka State, arising out of a desire much older in origin, was too well-grounded to be brushed aside. Scattered over five States with no particular reason or motivating factor, the territory of Karnataka has been suffering from neglect and near-oblivion with the exception of Mysore and, to some extent, Coorg. When the new State of Andhra was carved out, it was inevitable that the establishment of Karnataka should follow; and if there has been delay, it must be put down to the indecision of Authority rather than to any want of earnestness and effort on the part of the people concerned. Minor differences there were, and there are bound to be in any move for territorial redistribution. But such differences in the case of Andhra were not allowed to hold up the formation of a new State. Even if language were not to be the supreme consideration, Karnataka had a case all its own. There has been and is a certain natural unity, geographical, economic and cultural, about the territory which none but the purblind could ignore. And that unity could survive the strains inevitable in a scattered existence for decades, as the States Reorganisation Commission has had to admit.

That this fact has been recognised at last may be a source of gratification to some; but even in their case the feeling cannot be one of unmixed joy. Karnataka's temperament is not aggressive; and its struggle throughout has been to protect itself against aggressive designs all round. Encroachment, infiltration and insidious replacement of Kannada by other languages have been the methods employed through the years by enterprising neighbours to secure more elbow-room; and backward as Karnataka was, it was only lately that anything like a defensive movement started. But by then much mischief had been done; and thanks to it, what Karnataka has got today from the Commission is a nibbled territory. A number of Kannada-speaking areas that had come under the domination of others in the north, south and east have been withheld without so much as an explanation; and even some that were a

part of Karnataka or had been granted to it like the Kannada-speaking localities in the Kasargod taluk of South Kanara and significant portions of the Bellary district, have been taken away. While Kasargod's fate would seem to have been taken for granted, an elaborate explanation has been attempted in the case of Bellary, which to cynics might sound like an argument for Andhra rather than a plain assessment of the issues involved. In any case, Karnataka's close cultural links with Bellary areas and the fact of their containing several places of more than ordinary historical and sentimental significance would seem to have received no attention at all. What is more, Bellary has been made an issue of barter with the Kolar district in Mysore, which, though never a source of much controversy, has come to assume sudden significance. Much has been made of the allocation of Belgaum to Karnataka; but one wishes there were some mention of the gifts made of several Karnataka areas to the Bombay State, Hyderabad, Andhra and Tamilnad.

Karnataka has no designs on neighbouring States; and if any Kannadigas have, they are then clearly false to the spirit of harmony, amity and tolerance that has characterised the growth of Karnataka. But in a comprehensive reorganisation of the pattern of States, a reorganisation that is meant to be final and lasting, Kannadigas are perfectly justified in saying that areas which rightly belong to them should not be allocated to others. It would be unwise to leave pockets of frustration and discontent all round the border. The argument that they will after all be within India, no matter to which State they are handed over, knocks the very bottom out of the scheme of reorganisation. If so, what is the need for reorganisation at all? But if there is to be reorganisation, why should it not be made on a sound and comprehensive basis?

But to say so is not to condemn the Commission. They were surely faced with a ticklish and thankless task; and having to deal with conflicting claims, they evolved certain general principles to proceed upon. But general principles, while convenient in such a situation, may not always lead to satisfactory results, particularly in respect of details, which though seemingly small, may

have a significance not comprehended in the general principles. Making allowance for this, it must be said that the Commission has made a good job of its assignment. In the broader aspects of the issue, Kannadigas have little to cavil at that august body. Particularly creditable has been its decision to commend a single, united Karnataka State instead of two, as had been proposed in certain quarters. And the Commission's robust view of the future of the proposed new State is bound to come true. It may start with a deficit; but the potentialities of the State in agriculture, industry and trade, with vast undeveloped resources in soil, forest, water and manpower, are such that it may well prove to be one of the more prosperous States in free India in course of time. And that is not to speak of the special role that this State may come to play as a bridge between the north and the south—a harmonising factor, a medium for linguistic and cultural synthesis.

Meanwhile, what about the immediate present? What about the little border issues that demand attention? The Commission has done its task, and quite ably too; and now it is for the people concerned to tackle the rest of the problem. They will have enough opportunity to do so through the various State legislatures and Parliament—more perhaps through Parliament than the State legislatures where the position of Kannadigas is anything but strong. There is no point in getting excited over imagined wrongs and having recourse to measures which may further complicate matters. If the new State of Karnataka is to play the role which it is best fitted to play in India of the future, then it must make a start right from now on.

Respect for justice and fair play, understanding, tolerance and sportsmanship, and not envy, anger and pettiness should mark its efforts to settle the few issues that demand attention. Indeed, Karnataka leaders would set a welcome example and deserve well of the country if they made a direct approach to the neighbouring States concerned and took up the task of mutual adjustment in a spirit of goodwill and friendship in advance of Authority. India badly needs such an example at this troubled moment.

Bombay's Transport Problem

(Contributed)

ONE of the most important effects of the rapid growth of population in Bombay City in recent years has been the emergence of an acute transport problem. This problem presents some of the most characteristic features of the problem of urban transport, made even more difficult of solution by certain peculiar geographical and historical factors.

Bombay City is situated on an island which runs from north to south in an elongated oval and is connected with the mainland at the north end by two causeways at Mahim and Sion. Greater Bombay includes what were previously described as the suburbs, situated on the main land along two railway lines. These suburbs are connected with the City by the causeways on each of which there is a road and railway line.

Commercial Centre

The commercial centre of the City is what is described as the Fort area situated in the southern part of the island. Only Colaba, a shopping-cum-residential area, is to the south of the Fort area, while the rest of the City and the whole of Greater Bombay is to the north of this commercial centre in which are situated the offices of the Government of India, the Bombay Government and the Municipality, together with the offices of the principal commercial and industrial firms which give Bombay its predominant position. Somewhat to the north of the Fort area is another large shopping and commercial area known as the Crawford Market and Kalbadevi. In this region, however, residential housing is intimately mixed with business sectors.

The industrial areas of the City are Lalbaug and Parel in the centre of the island and the Sewri and Worli areas situated respectively to the east and west of the Lalbaug-Parel area. This industrial region is no doubt somewhat to the north of the commercial centre, but a considerable portion of the residential areas of the City constituted by the Dadar-Matunga-Mahim areas and the entire suburban territory also lie to the north of this industrial area. Between these commercial and industrial centres of the City is situated another large residential area stret-

ching from Dongri in the east to Girgaum in the west.

It is this basic factor, the geographical distribution of the commercial and industrial areas of the City vis-a-vis the residential areas, which gives rise to the transport problem of urbs Prima in India. The movement of the population to and from work or to and from the shopping and entertainment centres is respectively southwards and northwards. As a result, during the earlier part of the day there is a steady and heavy movement of people in the southward direction; and during the latter part of the day the movement is sharply in the opposite direction.

The problem arises from the need to transport this tremendous stream of humanity moving continuously in one direction during a given period of time and a similar stream which is homeward and northward bound for a roughly similar period of time later in the day.

To perform this function is the task of the two suburban railway services running more or less parallel to each other in the north-south direction, and also of the cars, buses and trams which run on the few main roads in the north-south direction.

Western Railway

Of the two suburban services, one run by the Western Railway, serves the western part of the City and the western suburbs which are relatively modern, having been encouraged to develop particularly in the post-1918 period. This terminates at Churchgate somewhat more to the north than Victoria Terminus, which is the terminating point of the Central Railway serving the eastern part of the City and the eastern suburbs. This latter has also a harbour branch which for a portion of its run goes even more to the east, hugging the docks which line the eastern part of the island overlooking the fine land-locked harbour between the island and the mainland. This harbour branch as it moves north turns to the west and crosses over the main Western Railway line to link with the Western Railway at Mahim, while the two main lines themselves touch (i.e. have stations side by side) a little more to the south at Dadar before diverging from one another once again. This connecting link at

two points facilitates any movement from the Western to the Eastern part of the City or vice-versa that may be found necessary.

The main problem before the railways is the tremendous volume of traffic that has to be moved in one direction during the peak hours. The fact that both the Western and Central Railways are electrified and that both utilise multiple-unit rolling stock operated by electric motors incorporated within each complete train has, of course, enabled the railways to carry a considerable number of passengers; but overcrowding is still the fundamental feature of the situation.

Packed to Capacity

Throughout the busy hours, trains run packed to capacity with passengers standing in gangways and doorways with hangers-on precariously perched. The problem here arises from the fact that at most points there are only two lines making overtaking impossible. Trains stopping at particular stations must wait for the minimum period necessary for passengers to alight and entrain, and the only possibility of speeding up the schedule is to have faster units that accelerate and slow down rapidly to reduce the intervals between the movement of trains.

New units have been introduced on both the railways do satisfy the first condition, but unless all the units possess this capacity, it is not possible to arrange time-tables in such a manner as to take advantage of their capacity. Considerable progress has already been made in reducing the intervals at which trains follow each other and further progress in this direction can be very limited unless shorter signal sections are introduced and other changes involving substantial capital works are carried out.

If increasing the number of lines can be carried out at particular points or additional platforms introduced, e.g., at Churchgate, some improvement in this direction may be possible. Already, fast trains of different speed limits, and the varying of the destination or starting point, e.g., Bandra, Andheri, Borivli or Virar on the Western Railways, help to carry the maximum number of passengers in the minimum time,

Mysore

DURING the festival of Dusserah, the enchanting 'Garden City' of Mysore becomes the centre of celebrations. In the flower-strewn streets, richly caparisoned elephants, silver and gilt coaches and colourful standard-bearers enact a pageant of unforgettable splendour.

Though they love pomp and pageantry, Mysore motorists have a lively respect for progress. That's why they appreciate the virtues of Double-Protection MOBILOIL, and make it a point to look for the Flying Red Horse—honouring a tradition among progressive motorists throughout the world.

Mobiloil

Twice the **CLEANING** action
Twice the **PROTECTION**
against wear

STANDARD-VACUUM OIL COMPANY (The Liability of the Members of the Company is Limited)

and it may be possible to improve this arrangement if the additional facilities noted above are made available.

The railways, it is apparent, cannot do much more than they are doing at present unless drastic changes are introduced; and in many cases, these are made impossible because of the built-up nature of the area through which they pass. The building of an underground may be a solution, but it is ruled out by its prohibitive cost. Even the technical difficulties would by no means be easy to overcome.

Road Transport

The problems faced by road transport are similar. The existing links in the north-south direction are too few to permit a smooth flow of the large volume of traffic that is necessary. Many of these roads are too narrow for heavy traffic and pass through dense residential-cum-shopping areas, Girgaum and Kalbadevi. On top of all these, Bombay's north-south tramway system passes through these very roads.

The total effect is to clog the traffic passing through these roads and thus reduce the pace at which each vehicle can move. This in turn holds up traffic, which actually reduces the volume of traffic that can pass through these channels during peak hours. The bad habits of motorists and pedestrians contribute in a vicious circle to the worsening of each other's habits and of the problem.

Remedial measures are undoubtedly being taken. Parking at certain points during certain hours is prohibited. Animal-drawn vehicles are not permitted on certain roads. One-way roads to smoothen the flow of traffic have been introduced. Turns in particular directions are prohibited at certain points and also U-turns on the main roads at peak-hours. Traffic control points have been strengthened and mechanical traffic control at an important crossing has been introduced as an experimental measure.

The system of pedestrian crossings has been enforced in important areas and an underground crossing constructed at the Churchgate end of Queen's Road, where the heavy flow of pedestrians crossing to the railway station has been hampering the flow of vehicular traffic. This is the first of its kind, and others at important centres are being planned. Widening of traffic channels at particular points and enforcing of the

traffic lane system on main roads have resulted in some improvement. But in spite of all these, the problem remains.

Abolition of Trams

A step that would give considerable relief is the abolition of tramways. The disadvantages of the slow-moving, unwieldy trams, held to fixed tracks, need hardly be stated in considering problems of urban transport. If, as often happens, a tram falls or does not move for whatever reason, an immediate hold-up of the entire traffic takes place which may mean valuable minutes lost for each vehicle on that road. But even otherwise the hold-up of traffic is considerable.

It has often been argued that this cheap means of transport to the poor man should not be taken away. This point needs to be examined. First, the tramways in Bombay are running at a loss today, and are able to carry on only because the bus services are making a profit. But that is relatively a minor point. More important is the immense social cost of running these services, the cost to motorists and bus services in the shape of extra petrol and oil, and additional wear and tear of brakes and tyres of thousands of cars, apart from the waste of time and the heart-breaking and nerve-wracking experience which drivers have to undergo. For the bus service, and taxis, the abolition of trams would mean a substantial increase in the number of passenger-miles carried during peak hours and thus a gain in revenue which might permit a reduction in fares or result in an increase in profits.

Other Possibilities

Buses running on petrol or diesel oil are not the only alternatives to trams. Trolley buses may provide a solution. In so far as they use electric power produced internally rather than imported petrol or diesel oil it may be considered an advantage that justifies their introduction. The economics of trolley bus operation would, of course, have to be calculated carefully; but the heavy initial capital expenditure in overhead wiring system would be the greatest disadvantage in view of the current scarcity of capital.

The best alternative would, of course, be the new type of electrically operated buses that require no continuous overhead system but would have to be charged at intervals at charging stations which

could be easily set up at various points. From the point of view of solving the Bombayman's transport problem, all these—ordinary trolley and electrically charged buses—would offer the same advantage of eliminating an important clog in the stream of traffic.

It should be apparent that the solution does not lie merely in introducing a larger number of vehicles on the road, but of speeding up the flow of traffic along the main arteries. The elimination of the tramway system will contribute considerably to that end. All the other measures that are being taken do help to a considerable extent, and require to be extended. The difficulty lies partly in the expenditure involved, and also partly in organisation.

Redistribution of Industries

The various measures that I have examined above for the solution of the transport problem in the city do not really attack the rest of the problem. It is the peculiar distribution of the residential and business-cum-industrial centres that is the source of the problem; and the narrow width of the island has worsened the situation. The solution lies obviously in bringing about a redistribution of these industries so that the flow of traffic is two-way at every stage.

Apart from the fact that it will be easier to transport the large mass of humanity to and from work this way, it will also improve the financial position of the transport operators since a larger number of passengers could be carried per vehicle per day with vehicles running full in both directions. This is easier said than done; at any rate, steps must be taken to ensure that both offices and industrial units are established to a larger degree in the 'Greater Bombay' area, than in the City itself. Even the existing establishments in the City could transfer their less essential sections to the suburbs, as has been done by an insurance company recently.

At the same time, an expansion of residential housing in the Colaba area will also help. Something has already been done in this direction, and that is why the problem is not much worse than it is. But with population and the city's importance growing as rapidly as they are, much more thought must be devoted to the achievement of such a redistribution than has been done till now.

Around Bombay Markets

Firm Sentiment

Thursday, Morning

THERE was an extension of the boom conditions noticed last week with prospects of a further rise in prices all round in the stock exchange. In general, the budla rates on October 14 were normal and underlined the healthy technical position of the market. While the budla rates for Bombay Dyeing and National Rayon remained almost unchanged, those for Tata Steel declined from 11 to 9 annas on reports that a prominent bull operator was taking delivery from an old bull who was an active participant in the recent selling spree. The budla rate for Indian Iron was higher by half to one anna and for Bombay Burma it was higher still at Rs 1-8-0. Due to closure of books, the budla rates for cements were higher at Rs 3-4 against the normal rate of 8 annas.

A notable feature of this week's trading has been the phenomenal increase in the price of Premier Construction which recorded a new high level of Rs 190 on Wednesday. This scrip has not seen such a remarkable appreciation in value for the last seven years. The main factor responsible for the boosting of these shares was the reported move of the company's management to abolish the promoters' scheme which would prove advantageous to holders of ordinary shares. The abolition of this system means brighter prospects of the management simultaneously increasing the capital of the company. Reports that the Company's order books have already been well filled following, no doubt, the development schemes envisaged by the Second Five-Year Plan, also served to stimulate these shares.

While the volume of business was restricted due to anxiety regarding the future of Bombay State, sentiment in the market continued to remain firm. Tata Steel opened at Rs 253-12 and were taken up to Rs 257-8 on Monday to close at Rs 256-12. Indian Iron, the dividend prospects of which were a subject of speculation in the market, remained subdued as compared to the firm undertone in steel shares. After opening at Rs 39-1, these shares suffered a reaction revealing an overbought position and were down to

Rs 38-8 but again looked up and closed at Rs 38-13-6. On the last day of the week, the Company announced the dividend of Re 1, per share—the same as last year.

Thanks to encouraging reports from the cloth market, the textile section continued to lead with Bombay Dyeing moving up on rumours of a change in agency, from Rs 555 to Rs 575 though later they declined to close at Rs 560. There was active buying in Kohinoor, while Standard were well supported in view of the firmness of New Shorrock in Ahmedabad. Simplex which recorded a new peak at Rs 210 reacted a little to close at Rs 206-4. Gokak, Finlay and Swan were also sympathetically firm at Rs 304 and Rs 400, respectively.

Cotton

Weather Influences Futures Market

AN important factor, which influenced the cotton futures market both ways during this week

was the weather. In view of the reported damage to the standing crop in the cotton growing districts of Punjab, Khandesh and Berar, there was considerable speculation in the market as a result of which the new crop February contract which opened the week at Rs 640-8 improved to as high as Rs 644-8, a new peak level. On days when there were reports of favourable weather, however, there was an easy trend in the market, the lowest level for the whole week being Rs 633-8. It is now estimated that about two to three lakh bales have been affected by the recent untimely rains.

The Sewri spot market continued to be featureless for the greater part of the week. Several mills have already bought their requirements upto December and in a market subject to considerable fluctuation owing to conflicting reports of the extent of damage to cotton, it was natural for the mills to fight shy of entering into fresh com-

mitments. As a result, the market was lethargic but for stray lots being bought by some mills for their immediate requirements.

As no fresh export quotas were announced prices of old crop Vijay have, as anticipated, moved down to Rs 233 On. However, new crop Vijay continues to rule firm at Rs 162 On. Any possibility of a new crop export quota being announced immediately must be ruled out since the export quota of 2,50,000 bales released last month has not resulted in any sizeable export of cotton from this country.

Oils and Oilseeds

Quietly Steady

FOR the greater part of the week the oilseeds market ruled steady with groundnut and castor ruling fairly firm and kardi and nigerseeds quietly steady. As in the case of cotton, apprehensions about the damage to groundnut crop due to the recent excessive rains coupled with small arrivals from the interior and dwindling stocks of old crop locally had the cumulative effect of keeping prices firm. An additional contributory factor was the encouraging export enquiries for groundnut oil. Business for about 2,000 tons in groundnut oil is reported to have been done with the UK and the Continent at between £103 and £105 per ton. Burma was also reported to be in the market and is believed to have bought a small quantity of groundnut oil at around Rs 1,470 per ton.

Groundnut delivery moved up on buying support from Punjab traders as well as from shippers and speculators. Groundnut quality ready improved to a high level of Rs 23-4. It closed the week at Rs 22-5. December-January delivery opened at Rs 22-12 and closed at Rs 22-13.

In the case of castor seeds and oil, there was consistent support at the hands of US purchasers of oil at higher levels. Moreover, the firmness in groundnut and other forward markets as also the grip of speculators on castor futures made for a generally encouraging trend in prices in this section. For the first time in several weeks castor May futures touched a new high level of Rs 96-14. America was reported to have bought about 400 tons of Indian oil during the week at higher rates at 12.00 cents per lb. of BSS quality and at 11.00 cents per lb. commercial oil.

Thanks to favourable overseas advices linseed Feb.-March and Kardi and Niger seeds improved and ruled firm at the close of the week at Rs 23-4, Rs 13-8 and Rs 22-12, respectively.

Bullion

NOW that the Government of Bombay have sanctioned the amendments to the by-laws of the Bombay Bullion Board, subject to certain conditions, forward trading in bullion will be resumed from next Monday. It is well-known that following the cornering of silver on a

large scale by a leading bull operator, the Bombay Bullion Board declared an emergency as early as on July 11. Since then the market has been in a state of suspended animation. Now that the prolonged inactivity of the futures market is to come to an end, traders have become enthusiastic and there has been a sharp improvement in the spot quotations of silver and gold, particularly in the former. It may be added here that this sharp improvement in prices of these metals has also been assisted by the generally rising trend in prices of world silver and gold noticed for some time now.

Around Calcutta Markets

Indian Iron Dividend Maintained

Wednesday, Evening

ON Wednesday, all speculation about the Indian Iron dividend ended as it became known that the directors had decided to maintain the dividend for the year to March last at rupee one per share. That the dividend was merely maintained was not as surprising as the fluctuations in Indian Iron on that day. Immediately after the declaration of the dividend, Indian Iron fell by eight annas only to move up by more than a rupee later in the day.

Essential data, released along with the dividend announcement, are highly encouraging. For the year to March last, production and sales improved considerably. Provisions for depreciation and reserves were larger. Allocations to depreciation were Rs 40 lakhs higher at Rs 120 lakhs; those to reserves were Rs 86 lakhs higher at Rs 203 lakhs. Net profits were Rs 2.88 lakhs higher at Rs 66.99 lakhs.

These figures are highly encouraging. Even a cursory glance at these figures discloses the formidable financial strength of the Company. This was probably the reason why Indian Iron, after an immediate fall to Rs 38, spurted to Rs. 39-4 on Wednesday, although the expectation of a higher dividend did not materialise. Even so, there are certain factors which must be taken into consideration in assessing the outlook for Indian Iron.

From the financial data available, it is clear that the dividend could be raised. But those who claim familiarity with the basic issue in question have always been aware that the dividend would not be stepped up. From the market reaction to the

dividend announcement, it is clear that there are not a few who expect an issue of right or bonus shares by the Company. For an appreciation of the outlook for Indian Iron, this question needs to be considered.

It will be conceded that there is a case for issuing bonus shares by the Company so as to establish a more reasonable relation between working funds and the capital structure. This was one of the arguments advanced by Shri J R D Tata for issuing bonus shares by Tata Steel. This is a possibility which cannot be ignored altogether.

Sometime ago, the managing agents of Indian Iron let it be known that the question of capital reorganisation could not be decided before the Government announced steel retention prices. There is some causal relation between these two factors. But it should not be ignored that there are other considerations also.

New Delhi's decision on steel retention prices will be announced soon. It is widely expected that steel retention prices will be raised. But it is equally widely assumed that the Government will issue a firm directive that higher earnings and profits arising out of higher steel retention prices must be ploughed back to finance expansion projects. This is one of the most relevant aspects of the problem under reference.

Two other aspects may now be considered. On the assumption that Indian Iron decide to issue bonus shares, the question arises whether the Company will be able to maintain the dividend on the enlarged capital. This year's production is running at a lower level. Output by

Company Notes

Oriental's Valuation Report

Fifty Per Cent Increase in Bonus Rates

PROFITS, sumptuous enough to enable the Actuary to recommend a fifty per cent increase in bonuses highlight the triennial valuation of the Company as at 31st December 1954. The report discloses a profit of Rs. 7.10 Crores, as against Rs. 4.65 Crores for the previous triennium. The Actuary has recommended bonus to with profit policyholders at the rates of

(1) Rs. 22½ per thousand per annum on Whole Life Assurances, and

(2) Rs. 18 per thousand per annum on Endowment Assurances.

These represent an increase of 50 per cent over the rates for the previous triennium. The bonus rates now declared are believed to be the highest declared by an Indian Company in the current year.

Record New Business

New business for the Triennial Valuation period at Rs. 92 Crores broke all previous records, and shows an increase of 59,470 in the number of policies and over Rs. 30 crores in the sum assured as compared with the preceding triennium. There was a progressive increase both in premiums and interest in each year of the triennium. Premiums increased by 12.82 per cent, interest less income-tax by 29.92 per cent, and the total income from both by 15.58 per cent.

both the iron and steel companies will be lower this year because of technical hitches arising out of implementation of expansion projects.

More relevant is the need for adequate provisions to depreciation and reserves. Indian Iron have commitments which are prior charges on the Company's assets. This Company will have to provide Rs. 7½ crores out of its own resources to repay loans. Recent statistics indicate that the Company has already accumulated about Rs 4 crores. Thus, Rs 3½ crores have yet to be provided before dividend payments can be raised.

An interesting feature of recent price movements in equities on the Calcutta Stock Exchange is the strength in Engineering Shares. Burn and Company moved up on higher dividend payment. National Rolling looked up on reports of capital reorganisation.

Expenses

The expense ratio for the triennium was 24.0 per cent., as against 22.2 per cent., for the preceding triennium. The increase, it is stated in the Actuary's report, is mainly due to the increased outlay on first year's agency commission and other initial expenses on the large volume of new business completed during the triennium.

Lower Mortality

A progressive improvement in the mortality experience is another feather in the cap of the Company. The percentage of actual deaths among the lives assured with the Company to those expected according to the Mortality Table adopted in the Valuation, viz., the Company's own ultimate mortality experience during the period 1925-35, was 42.9, 41.7 and 37.0 for the years 1952, 1953 and 1954 respectively, giving an average of 40.4 for the Triennium, as against 50.6 for the preceding Triennium.

Growth of Funds

The average net rate of interest earned for the triennium as a whole at 3.92 per cent., shows a substantial increase of over one per cent., over the corresponding rate for the preceding triennium which was 2.85 per cent. The Company's Funds have risen during the triennium from Rs. 63 crores to Rs. 78 crores. The increase of Rs. 15 crores, the Actuary observes, is largest in the history of the Company.

Valuation Bases

The valuation was made on the basis of interest at 2 11/16 per cent., as against 2 5/8 per cent., on the previous occasion. The mortality basis is the Oriental 1925-35 Ultimate Table and the provision for future expenses of management and future profits is equivalent to 21.9 per cent of the premiums. Regarding the increase in the rate of interest for the valuation and the prospects of future profits, the Actuary reports—"Notwithstanding the increase in the Valuation rate, the excess of the net rate earned over the Valuation rate is much larger on this occasion and, in consequence, leaves an increased margin for future profits from the source of interest. The continued improvement in the mortality experience of the Company during the Trien-

nium and the further improvement that can reasonably be expected to occur hereafter again provides an increased margin for future profits."

Results of the Valuation

The profit of Rs. 7.10 crores disclosed by the Valuation has, the Actuary further observes, made it possible to recommend 50% increase of bonus to policyholders. It also enables allocation to shareholders of a sum of Rs. 3,37,600 together with dividend at the higher rate of Rs. 200 per share per annum.

The satisfactory results of the Valuation are attributed by the Actuary to several favourable factors: "The comparatively lower level of premium in force subsequent to the premium revision in 1954, the obligation for payment of Estate Duty created by the Estate Duty Act, 1953, etc., served as a substantial impetus to the flow of new business and enabled the Company to write a large volume of business. The increase in the portion of the surplus exempted from tax from 50 per cent., of the bonus distributed to policyholders to 80 per cent., as a result of the passing of the Income-tax Amendment Act, 1953 has gone to reduce the income-tax liability of the Company and thereby has made a sizable contribution to the surplus".

Future Prospects

On the question of future prospects of the business, the Actuary says "Recently, the Finance Act, 1955, has increased the maximum amount of life insurance premia plus contributions to provident funds in respect of which abatement of tax is admissible from 1/6th of an individual assessee's total income or Rs. 6,000 whichever is lower, to 1/5th of the total income or Rs. 8,000 whichever is lower. This should serve as a stimulus for individuals to augment their life insurance cover. With the accelerated tempo of development envisaged by the Second Five-Year Plan, both the national income and the per capita income can be confidently expected to increase rapidly, and a part at any rate of the enhanced margin for saving which would be available would find its way into life insurance."

to say. But the sort of things he has done is very similar to what the late Sir Stafford Cripps did in the late forties.

To strengthen these measures, the Chancellor has made telephones more costly, raised postal rates and stepped up the purchase tax from 25, 50 and 75 per cent on the three main categories of goods to 30, 60 and 90 per cent. The combination of these measures—viz cuts in Government spending and tax changes—should give Mr Butler a larger surplus 'above the line' than he had anticipated in April. But the Chancellor has to keep his fingers crossed in regard to the effect on prices and wages. If measures of indirect taxation, leading to a mark-up of prices, prompt another round of wage claims, he—rather, the economy—will have lost in the swings more than is gained in the roundabout. None will gainsay the fact that wage increases reflecting increases in labour productivity need not be viewed with any alarm. But repercussions on wages of the tax increases would not fall in that category.

Mr. Butler has in the ultimate

analysis to depend on the good sense of the trade unions and investors to get what he wants—which is a reduction in spending, with a consequential reduction in imports. It is a temptation to compare this with the policy of the Labour Governments. They also relied heavily on trade unions exercising restraint in their demand; and they hoped that despite a low Bank Rate, investors would also watch their outlays. But they had no inhibitions about imposing direct checks on spending or on the use of resources. Mr Butler on the other hand has his monetary weapons in operation. The difference therefore boils down only to the attitude adopted in regard to private investment expenditure. On the wages side, Mr. Butler's line is little different from Mr. Gaitskell's.

It would be hard at the moment to say whether in six months' time Mr Butler will go further in the direction that he has now taken, or be able to retreat to the position he took six months back. Much will depend on the trend in U K's balance of payments. The facts that Germany and Japan are emerging as major competitors in Britain's export mar-

kets, and that the U S A has thought it fit to move towards dearer money might make U K's position increasingly difficult. In that event, the induced effects of the present policy on British imports will be of supreme importance.

Should they turn out to be large enough to avoid adverse effects on sterling, especially transferable sterling, Mr. Butler may yet be able to stop where he is now, or even retrace some steps. Or again, he may find his stand vindicated if innovations forced by overfull employment cause U K's output to take a spurt. But it is all a matter of surmise and hope, depending as much—if not more—on international developments as on trends in the domestic economy. Behind it all, however, one stark fact remains: Transport House is no less important today than it was five years back. It alone can give body to Mr Butler's hope that there will not be a cumulative wage-rise. And Transport House in its turn will have its task cut out, viz, convincing the British worker that the time is not yet for consuming as much of the national cake as he wants.

The Acid Test

FOUR Foreign Ministers are now assembled at Geneva to explore prospects for an agreed arrangement to settle issues which are the source of international tension. Because the four Heads of State succeeded in reaching an agreement to resolve issues in dispute through negotiation, it would be idle to pretend that it should not be difficult for the four Foreign Ministers to come to an understanding on the implications of the decision reached at the 'Summit' conference earlier this year. Developments after the Geneva conference of the four Heads of State have falsified hopes entertained immediately after the conclusion of the 'summit' talks that the 'cold war' is going to be replaced by a prolonged period of peaceful co-existence. Hope still lingers that both sides will reaffirm their faith in reconciling disputes through mediation. But there are growing doubts whether Russia and the Western Powers can come to an understanding on the specific issues in dispute.

Disarmament, German unity and

European security are the three major issues under discussion by the four Foreign Ministers. On each and all of these issues, there is scope for bargaining by either side. All these three issues are co-related. But there is a danger that the Foreign Ministers may reach deadlock through any undue insistence on this co-relation. There are indications that both Washington and Bonn are inclined to lay emphasis on the co-relation of the issues involved. Certainly, both America and Western Germany would like to insist that German unification must be the pre-condition of any security pact for Europe. A simultaneous or parallel solution of these two problems is to be desired. But neither Russia nor, it seems, Britain or France insists that these two are so inter-dependent that none of the issues can be reconciled without a solution of both.

On disarmament, too, there are substantial differences between the two sides. It is true that Russia, Britain and America have recently reduced their ground forces. But

it is equally evident that these measures have been undertaken on wider strategic reasons. On the basic problem of controlled disarmament, hardly any progress has been made. President Eisenhower's plan for aerial inspection of national armies and armaments is not accepted without reservations either by Pentagon or by America's NATO partners. Plans for ground patrol are widely suspect as encroachments on national sovereignty. Since the 'summit' conference, there have been encouraging developments relating to peaceful uses of nuclear energy. But the race for nuclear armament continues. There are disturbing indications that Pentagon is inclined to the view that world peace can be better ensured by both the rival power blocs continuing to pile up nuclear armaments as deterrents to aggression. This is a dangerous delusion.

As on disarmament, so on German re-unification and on European Security there are differences between Russia and the Western Powers. In

Paris recently, the three Western Foreign Ministers and their experts met to put finishing touches to plans formulated earlier in Washington. Russia is likely to prepare a security pact open to all European States, and to which the two Germanies will each adhere at least provisionally. There are indications that Britain has partially succeeded in convincing America of the unwisdom of any rigid approach to the two problems of Germany and of European security. It is possible that the Western Powers may no longer insist that no security pact can be concluded without prior unification of Germany. They may not also insist that a future united Germany must be allowed to rearm and must have freedom to join NATO. But there are indications that the Western Powers may insist that both these problems must be solved in simultaneous stages. This means that, on Russia's acceptance of the principle of "security through unification", they may formulate their instalment plans for the solution of both these problems. This is one of the tactical issues on which there is likely to be prolonged bargaining and counter-bargaining at the Foreign Ministers' conference. Meanwhile, an intriguing develop-

ment relating to Germany may be noted. Here, Russia has shown diplomatic initiative since the 'summit' conference at Geneva. Russia's overtures to Western Germany have not been entirely unsuccessful. Russia has given abundant indications that she would prefer a solution of German problem through negotiations between the two Germanies. An influential group in Western Germany has recently initiated a move to open negotiations with Eastern Germany on all-German elections. An electoral law is being framed by the KOENIGSTEIN CIRCLE, an organisation of eminent lawyers in Western Germany. A tentative arrangement is reported to be well under way for formulating an electoral law which could be applied to all Germany. Sponsors of this move favour the plan that the German problem should be solved through negotiations between the two Germanies. They hope that the Foreign Ministers will issue a joint statement that East and West Germany should start talks on holding all-German elections. So far, the Western Powers have insisted that all-German elections are their concern. Though Dr Adenauer is committed to this claim by the Western Powers, there are indications that Russia has

partially succeeded in encouraging the principle that the elections are a purely German affair.

There are, admittedly, substantial differences between Russia and the Western Powers on each and all of the issues which will come up for discussion during the conference of the four Foreign Ministers. To stress the existing differences is not to suggest that these cannot be eliminated or minimised. Peaceful co-existence does not mean that no dispute will occur, though the acceptance of this principle involves readiness by both sides to resolve disputed issues through negotiation. At Geneva now, the four Foreign Ministers are making sincere efforts to work out the implications of the accord reached by the Heads of State. This will not be an easy task. There are many who doubt whether Russia and the Western Powers can come to any agreed arrangement on the specific issues now under consideration by the four Foreign Ministers. But there can be no harm in making an honest effort to reach an agreement on the issues in dispute. Throughout the world, there will be hope that the four Foreign Ministers will succeed in minimising, if not eliminating, the sources and causes of world tension.

NAS 852

Give this a thought..

These children growing up so happily today will, in due time, occupy their rightful places in the pattern of the nation.

Will they, by their learning and training, be leaders in their own fields, standing head and shoulder above others....

Or will they be like dumb, driven cattle without any aim and without any ambition?

You, their parent, can decide it now. Ensure their future greatness by careful planning with the Bombay Mutual.

Weekly Notes

Once for All...

THE Conference of Chief Ministers of States called at Delhi to consider the report of the States Reorganisation Commission has generally approved the broad basis of the Commission's recommendations. Elimination of the present distinctions between States, abolition of the institution of Rajpramukh and some of the proposals made by the Commission to promote inter-State harmony and national oneness have received the support of the Chief Ministers, though one might wish that in respect of the last item they had gone a little further than they were inclined to go. Divergence of opinion at the conference mainly related to border adjustments, and that is an issue on which there can perhaps be as many opinions as there are States abutting on one another. But the significance of the Conference does not lie so much in the broad approval it has given to the SRC recommendations as in the earnestness shown by it to stick to the time-table for reorganisation tentatively drawn up by the Union Government. According to this time-table, the Bill on the subject is to be passed by Parliament before the conclusion of its budget session in May next and the provisions are to be given effect to 'not later than October 2, 1956,' so that the general elections take place as scheduled in the early part of 1957. To prevent any delay on the part of States, Article 3 of the Constitution is to be amended shortly so as to fix a time-limit for them to communicate their views to the President on reorganisation.

This sense of urgency is fully called for. The longer the issue of reorganisation is kept open, the more will be the complications besetting it, not to speak of the resentments that will pile up in the process and the incalculable damage that will be done to constructive endeavour through continual distraction. The main issue and the many side issues involved must be settled one way or other without delay, and a touch of finality given to the solution of a problem that has been causing frequent irritation for the last two or three decades. It is impossible to expect all-round agreement or satisfaction on an issue affecting different States in different ways,

and it would be imprudent to put off a final decision in the hope that Time may provide a solution. For various reasons, the next elections can only follow and not precede the reorganisation of States; and it would be a confession of political weakness to have to postpone the former because the latter does not lend itself to an early settlement. And it would be a bad precedent too, open to misuse by parties out to capitalise internal dissensions. From whatever angle one may approach the question, it seems imperative that a time-table should not only be drawn up, but also rigorously adhered to in the matter of reorganising the States, however forbidding the attendant difficulties may appear to be.

It is also necessary that the decision on reorganisation must have finality. The proposal made by the Commission itself on one disputed point and those being canvassed in other quarters on other contested points for leaving certain controversial issues open for a period of five years or so and providing for a reversal of any decision that may be taken now is, to say the least, unfortunate. We have had so much of linguistic uproar in this country in recent years that it is time we called a halt to it in the larger interests of national cohesion and united endeavour for reconstruction; and the present juncture is perhaps the best for the purpose. What is decided on and implemented by October next must stand unalterably for the succeeding two or three decades at least, and by then, one hopes, some of our basic problems will have been solved and a more realistic attitude fostered in respect of diversions such as of language and linguistic divisions which we have been pursuing in crass indifference to the common people's cry for work, food and shelter. As for boundary disputes which are involved in the proposed scheme of reorganisation, they may be left to the good sense of the States immediately concerned to settle among themselves, or there may be a boundary commission or commissions to go into the matter and give a final verdict.

'Symbol of an Age'

EITHER the Portuguese rulers are prone to speak with their tongues in their cheeks, or they have reach-

ed a stage of inebriation where their pathetic delusions seem real. The Foreign Minister of that benighted country, Dr Paulo Cunha, repeating parrot-like the cry that Portugal had no intention of quitting her territories in India, is reported to have tried to explain why. It seems it is not the 'material value' of these possessions that make them dear to Portugal, but their value as the 'symbol of an age'—presumably the age of Portuguese rapacity, loot and bigotry when tyranny was the rule and persecution the order of the day. Any other nation would fain have striven to forget that age and rehabilitate itself in the eyes of the modern world by forswearing the methods and policies that made that period one of the darkest in human history. But no, Portugal, with its political and social evolution proceeding in reverse gear, wants to hug that age, and, what is more, preserve relics of it, no matter how repugnant it may all be to those who are condemned to be living exhibits in the museum of Portuguese colonialism. In any case, if it is the museum idea that actuates Portugal, she had better try to give effect to it within her own land inasmuch as the process would be not only less inconvenient, but also less disastrous.

Continuing in the same state of near-hallucination, the Portuguese Foreign Minister said that the task accomplished by his countrymen in the past 'gives them the right to continue their Christian and civilising mission' in India. Only recently was the world given a further sample of this 'civilising mission' when unarmed men and women volunteers were shot down or brutally treated by the 'civilising' hordes of Portugal. Indeed, if the head-hunters of Borneo or others equally free from the inhibitions of culture were to confess to a civilising intention with regard to their immediate neighbours or the rest of humanity, the proposition would not raise a bigger laugh in this part of the world. Nor would it seem unreasonable to sane minds if the people threatened with such civilising intentions were to deny themselves the amenity in exercise of the basic right of sticking to their own modest ways. That is just what freedom-loving Goans have been trying to put across to the Portuguese all these years.

meanwhile, it is noteworthy that attempt made by the Portuguese to commemorate the initiation of their tyranny in that other museum, Portuguese imperialism, Macao, joining the Chinese mainland, has been checked by Peking, which has made it clear that 'Macao is Chinese territory and the Chinese people

have a right to demand the return of their territory from the hands of the Portuguese colonialists.' Nor has there been much comfort for Portugal from the NATO quarter lately. Anyway, Lord Home, the British Secretary of State for Commonwealth Relations, was reported saying while in Delhi last week, "It

will be stretching the North Atlantic Treaty Organisation too far to apply it to Goa", and adding that NATO only provided for consultations. Nevertheless, in their present self-deluded state, the Portuguese can be expected to continue flying merrily in the face of stark facts.

THE RUMANIAN PAVILION
AT THE INDIAN INDUSTRIES FAIR, NEW DELHI.

OCTOBER 29 - DECEMBER 15, 1955.

The Milk of Co-operation

THE Prime Minister of India is to perform this week the official opening ceremony of the dairy buildings of the Kaira District Co-operative Milk Producers' Union Limited at Anand in Gujarat. Last year, the President had laid the foundation-stone of these buildings. The decision to organise the dairy industry in the district along co-operative lines was taken on the advice of the late Sardar Patel at a meeting presided over by Bombay's Chief Minister, Shri Morarji Desai, who was then President of the Gujarat Provincial Congress Committee. This high-level association with the Co-operative Milk Producers' Union and its new dairy at Anand is symbolic of its importance for the country.

The origin of the Co-operative Milk Producers' Union is to be traced to the inauguration in 1945 of the Bombay Government's scheme for the supply of milk to Bombay City, of which the Aarey Colony near Bombay is one expression. Purchase of surplus milk from the Kaira district, which is famous for its production of good milk, was started by Government under this scheme. During the initial stages, the collection and pasteurisation of the milk was left to private milk contractors and dairies. As a result the benefit of the higher price offered by Government, as compared with the existing local price, did not percolate down to the milk producers, who felt aggrieved and decided to boycott the scheme. When they approached Sardar Patel in this connection, he advised them to organise the dairy industry of this area along co-operative lines, and that is how co-operation came to be established in this district. At a meeting of milk producers presided over by Shri Morarji Desai, it was decided to organise in every village a Milk Producers' Co-operative Society, and to form a Union of these Societies with the object of establishing a pasteurising plant at Anand and carrying out other activities for the benefit of the member Societies.

The Union started processing milk in June 1948 in the buildings of the Government of India Research Creamery, which were then lying unused and which were leased to them through the good offices of Dr Rajendra Prasad, who was then the Minister for Food and Agriculture. The quantity of milk handled by the Union has increased since then from 500 lbs per day to 1,00,000 lbs; the

number of farmer members has increased from 900 to over 18,000 and the assets of the Union have risen from Rs 40,000 to nearly Rs 22 lakhs.

The new dairy being set up at Anand has a pasteurising capacity of 3,00,000 lbs per day. In addition, it can make 10,000 lbs of butter and ghee per day, 12,500 lbs of milk powder and 1,200 lbs of casein. One of the objects of the new dairy is to utilise the surplus quantities of milk available to the Union during the flush season for the manufacture of subsidiary products, since a fixed quantity has to be supplied throughout the year under the Bombay Government's milk scheme. Condensed milk, milk powder and baby foods will be manufactured in India for the first time.

The capital requirements of the new project have naturally been heavy—estimated at Rs 40 lakhs. Of this huge amount only Rs 19.4

lakhs have been provided by the Union out of its own funds. Of the remainder, Rs 10 lakhs have been provided by the Government of Bombay as a loan, Rs 8 lakhs by way of dairy equipment from UNICEF in return for which the Union has undertaken to distribute milk worth Rs 12 lakhs free to children and expectant mothers in the district, and Rs 2.6 lakhs by way of dairy equipment from the Government of New Zealand under the Colombo Plan, half as a gift and the rest as a loan, interest free.

Anand—The New Perspective

THE importance of the Anand dairy lies, of course, primarily in the stimulus it provides to the production of milk and milk products, the need for which has by now been generally recognised. The development of dairying on a large scale will also tend to raise incomes, while at the same time the establishment of plant for the production of subsidiary products will help to stabilise milk prices and thus raise the incomes of farmers even more. Most important, however, from the point of view of the future of the industry is the form of organisation which has succeeded in establishing itself in the Kaira district.

The Aarey Colony near Bombay is an example of State initiative and enterprise. Though private producers do maintain cattle on the colony, the area itself is owned by the State and so is the dairy. That the Anand dairy should have been set up under the ownership of a Co-operative Union is a tribute to the leadership of the locality and at the same time an example to milk producers of other localities. It opens a new perspective for the solution of problems of rural areas in so far as they can be linked to the production of milk or eggs or other subsidiary foods. Not merely the marketing of these products, but also their processing can be carried out along co-operative lines as has been done so successfully in Denmark.

If the example of Kaira and the Anand dairy is followed in other areas and in other spheres, we ought to see the rapid development of a co-operative sector in the country, a force which would act as a balance to the expanding power of the State in the economic sphere and which at the same time would not be the private sector in the strict sense.

Non-Justiciable Directive

THE Prohibition Inquiry Committee, appointed by the Planning Commission, has recommended nationwide prohibition by April 1, 1958. Judging by the press summaries of the Report, it would appear as though the approach of the Commission has largely been moralistic, and proper consideration has not been given to the financial, administrative and even social aspects of the problem. Shri P Kodanda Rao, in his ably argued minute of dissent, has rightly questioned this rather priggish approach of the Commission to a problem which cannot be neatly pigeon-holed 'as moral turpitude, or a vice, or a sin'. He has also raised the important point, all too often overlooked, that prohibition is a non-justiciable Directive principle. Furthermore, one may pose the question whether it is proper to assign a target date for the achievement of so fundamental a transformation in society as Prohibition implies. What would be the consequences of failure to achieve the target?

It is not merely the financial costs of implementing Prohibition that have to be taken into account in any objective evaluation of the programme but also the social and administrative costs. The administrative machinery today is inadequate even for the implementation of more urgent tasks such as economic development, and it should not be subjected to unnecessary strains. Whatever the absolute ethical merit of total abstention—there is none in enforced virtue, as philosophers like T H Green have long ago pointed out—the fact remains that countries such as England, Norway and Sweden, without enforcing prohibition, have higher standards of health and law and order than India. Admittedly, there is a case for regulating the production and sale of alcoholic liquors in the country, but then this could more conveniently take the form of stringent conditions of sale as in the Scandinavian countries rather than of absolute legal prohibition.

As even the Commission has admitted, the magnitude of the drink problem in the country is relatively small. It is only in a few countries such as France that chronic alcoholism has reached the proportion of a public health problem. In the ultimate analysis, the only real corrective to the problem of drink is a rise in the standard of living. Whether one regards prohibition or temperance as the final solution, both alike

should be regarded as a by-product of more fundamental improvements in society.

Freight Element in Cost

THE decision of the Indian Coastal Conference, representing all the shipping companies engaged in the Indian coastal trade, to raise freight rates by five per cent with immediate effect, is reported to have been actuated by the increasing costs of operation since the last general rise in shipping freights in 1950. In the absence of complete data, it is difficult to fathom the exact reasons for this so-called rise in operational costs—whether it be due to a rise in port dues or in costs of fuel, labour etc. By itself the cryptic statement about rising costs hardly conveys anything, and the rise in freights could always be attributed to this factor, falling any special reasons.

The structure of freight rates in coastal shipping depends upon slightly more complex factors than those which govern trans-oceanic shipping freights, as for instance, competition from country craft, inland transport etc. The inter-relations of shipping freights are largely a terra incognita even to the professional economist, and there has been no systematic study of the problem since Professor Lewis's pioneering work, based on the data for the inter-War period. In coastal shipping, where the average length of the voyage is shorter and the average proportion of time spent in port proportionately greater, port charges also play an important part in determining freights, though here again it is a question of the relative proportions of the different items such as wage-costs, fuel, port dues etc., which enter into freight rates. It would also be interesting to know how far the suspension in varying degrees of coastal shipping traffic during the monsoon months affects the earnings of the companies concerned and whether this has also been a contributing factor in the rise of freights. Of course, this factor has always been operative in the case of coastal traffic, and its impact cannot be regarded as being particularly severe in any one year. To the extent that the freight rates are governed by periodic decisions of the Indian Coastal Conference, the coastal shipping freight market cannot be regarded as being competitive in any accepted sense of the term. This is a world-wide tendency, and it may not be long before the humble tramp

steamer, the only really competitive element in the shipping freight market, is finally squeezed out.

The Government of India, which has approved the increase in coastal freights, should enlighten the public about the factors that have contributed to the rise in costs of operation. In the context of a developing economy, any increase in costs cannot be conceived in terms of unilateral decisions. When the determination of wage-costs in most industries is a matter of public knowledge, there is no reason why the Government should be so secretive in the case of the freight-element in costs of production.

Planning for Poultry

THE FAO Regional Technical Meeting on Poultry Production at Poona last week has focussed attention on India's poultry plans. With the achievement of targets of food-grain production during the first Five Year Plan, we can now pay some attention to increasing the supply of food of a higher nutritive and protective value such as fruits and vegetables, milk and milk products, eggs, fish, meat etc. Development of poultry and egg production must naturally occupy an important place in such concerted efforts if only because their capital requirements are relatively limited and the markets are ready at hand. The disclosure made by Dr Harekrushna Mahatab, Governor of Bombay that a countrywide programme for the development of poultry is to be launched soon will, therefore, be very welcome.

The success of the community development projects has apparently weighed in favour of concentration of development effort on limited areas. The scheme proposes, therefore, to establish a net-work of about 300 development blocks for extension of poultry farming on an organised basis. In these blocks, baby chicks imported from abroad or produced from accredited breeds in India will be housed and maintained in Government farms for periods of four to five months before they are distributed to individuals proposing to take up organised poultry farming. Each development block is to have a small government demonstration farm with about a hundred birds. These farms will not only demonstrate to villagers the technical aspects of breeding and maintenance of poultry but assist in marketing the products. Some 60 such farms already exist in the country, housing a total of twenty thousand birds and these will pre-

Off the Record

Prohibition

the model train of the Lionel Corporation, will all provide objects for loose-lipped wonder for the ordinary Indian visitor; the voting machine, which has simplified recording of ballots, may perhaps be regarded as more practical. The US Trade Mission led by a senior expert, Mr Emil E Schnellbacher, and the most comprehensive trade library will help the business aspect of the Fair.

The object of the British display is not to demonstrate a way of life so much as a way of doing business. Engineering goods of proved worth, construction and building equipment, dyés and chemicals and other articles of utilitarian value will be placed on view. Much the same may be said of the West German show. The Soviet display seeks to prove that her technology is not less superior and that the USSR too has great export possibilities. The Roumanian oil techniques and the products of Czechoslovakian heavy industry will supplement the Soviet bid to impress by Communist achievements.

It is less easy to describe the effect produced by the stalls laid out by Indian industrialists without appearing to be invidious or partial. Tata and Birla industries have exhibited a wider range of products than most other single exhibitors but the total picture—after taking a good look at the stalls of Bird & Co., Killicks, the Jute Mills Association and Bombay Mill-owners' Association, the various motor companies and other leading Indian manufacturers—will certainly be such as to show Indian achievements in a bright light. The Indian private sector, if judged by the parallel display of the Indian public sector managed by the several Ministries, can take much credit. It remains to be seen whether India will succeed in selling something even to those who have come here to sell, at least some of our cottage industry products which have been now effectively presented.

There is matter for pride in this show in whatever way we view it. The Fair may have to be held in future at least once in two years if not annually and in a more businesslike manner, if we wish our exhibitors to come again and again without feeling the cost. Whether the venue should always be in New Delhi may be debated; the coastal cities seem to have many more advantages in their favour.

Roumanian Agricultural Machines

AMONG the exhibits at the Indian Industries Fair at New Delhi are a number of tractors and agricultural machines produced by Roumanian industry. In agricultural work, tractors have to work in soft soil with many irregularities of all kinds. In such circumstances, the possession of caterpillar tractors is a great advantage as the caterpillars penetrate very little and the tractors are thus liable to be bogged down. At the same time, the weight of the tractor has to be low and so distributed that the specific pressure on the ground is very small.

Two of the three Roumanian tractors on show at the exhibition possess these essential characteristics. Having diesel engines with low fuel consumption due to certain special features, these tractors ensure the avoidance of breakdowns through careful filtering of air and fuel. The low speed of the motor ensures durability of the engine.

For achievement of economies in agricultural operations, it is essential that the tractors should be in a position to supply power for other work also. A power take-off shaft with a speed of 540 revolutions per minute does this job in the Roumanian tractors. This can be used

directly for certain machinery, while in other cases a belt pulley is necessary to bring about the transfer of power to stable agricultural machines.

The Roumanians know the advantages of having agricultural machinery specially designed for operation with the tractors in use. A special plough with three furrows, which are removable, is being manufactured. A frame of five furrows is also available for grubbing. A disc harrow for harrowing purposes is also being manufactured.

Another Roumanian product is the universal cultivator, which makes the soil loose up to a depth of 16 cm and which is fitted with various active parts which make it suitable for tending crops sown in rows and requiring weeding.

Among other agricultural machines and tools being manufactured in Roumania are: tedders, plain mowers, mowers and binders, threshing machines, selectors, grain cleaning machines, hammer mills, animal-drawn reversible ploughs, beet mincing machines, etc. Many of these are on show at the exhibition. They are all exported by the State Enterprise for export of industrial products.

THAT the Prohibition Enquiry Committee appointed by the Planning Commission in December 1954 would recommend nation-wide prohibition was a foregone conclusion. For, Article 47 of the Constitution had laid down that "the State shall endeavour to bring about prohibition of the consumption, except for medicinal purposes, of intoxicating drinks and of drugs which are injurious to health". And the Committee's terms of reference were to make recommendations for a programme for prohibition on a national basis. The principle was therefore not open to question. Accepting it, it was left to the Committee to recommend how soon the programme should be implemented and what incidental adjustments were necessary.

Against this background, the Committee had an easy task. It could adopt from the very start the air of moral superiority that goes with the advocacy of prohibition. Drunkenness is stigmatised by all societies, and even 'moderate drinking' is reprehensible since, as the Committee picturesquely puts it 'the moderate drinker is a greater danger to others because he is a very uncertain person.' It is therefore always possible to pose the question of prohibition as a conflict between the moral and the material considerations. There is of course the bothersome question of personal liberty to consume what one likes in a free society. But that is easily answered by the argument that even a free society has to have certain moral standards, and freedom of the individual cannot in any case be absolute if society is to survive.

There is the further argument that in India the drinking habit spread most during the British days, and it is about time that we, as an independent people, regained our freedom from drink also. The Congress, under the leadership of Mahatma Gandhi, made prohibition a prime object of policy for the upliftment of the masses. With the low standards of income prevailing in the country, few could gainsay that the more you drink as a nation, the less you have to eat and wear. From this, it follows that it is immoral for the State to profit from the trade in intoxicants and drugs. To bring up the question of finances when prohibition is being discussed

is, indeed, to mark oneself out as a philistine of a particularly low order.

All this is familiar, and hence the lack of surprise at the Committee's recommendations. Some perhaps believed the Committee would suggest the adoption of nation-wide prohibition forthwith. The Committee has, however, set April 1, 1958 as the target date for attaining this moral standard. The not-too-large interval is to be devoted to making the educative and administrative arrangements necessary for ensuring success of the policy.

The Committee's main recommendations run in two directions. Firstly, it makes no bones about the fact that prohibition will succeed only if everybody in society desires it and is prepared to work for it. Consequently, opinion has to be created through education and propaganda, and through preventive measures such as a progressive reduction in the supply of alcoholic drinks, avoidance of conspicuous consumption of intoxicants in public places, banning of advertisement of such articles etc. In the second place, the legal and administrative measures to deal with the law-breakers should be strengthened. For this purpose, the Committee has made various recommendations.

But the real implementation of the programme lies with the police and the judiciary. The Committee has noted that in recent years, there has been a large increase in the number of major and minor prohibition offences brought before courts in Bombay, Madras and elsewhere, and that very severe penalties should be imposed on illicit manufacture and trade in spirits and liquors if prohibition is to succeed. It may, incidentally, be pointed out that the Committee takes comfort in the thought that such offences did not originate with the adoption of prohibition policies, and that the increase in the number of cases booked is, in part, an evidence of greater efficiency in detection and prosecution. That apart, the Committee has come down in favour of entrusting the work of enforcement to the police and strengthening that force. It has also recommended amendment of Section 110 of the Criminal Procedure Code, with a view to including the illicit traffickers in drinks and drugs in the category of persons engaged in anti-social activities. All offences

connected with illicit distillation and sale of liquor etc. are to be made non-bailable and the punishments imposed should be of a really deterrent nature. The Committee has also made out a case for summary trial of such offences and for provision of adequate protection to witnesses.

Besides the punitive aspect, the Committee has dealt at length with the financial and employment angles to the policy. In regard to the former, the Committee is to some extent strengthened by the Taxation Enquiry Committee's recommendation regarding prohibition. That Commission did not suggest any modification in the general policy of attrition of excise from intoxicants and drugs. The Prohibition Committee goes a step further and suggests that the gross outlay connected with prohibition be treated as an item of expenditure under social capital like education and public health. It is against imposition of specific measures to cover the loss of excise revenue, and in favour of treating this as a charge on the entire revenues of the State. As regards employment, the Committee has little doubt that the toddy-tappers, who would be most seriously affected, could be absorbed in palm-gur manufacture and similar small-scale industries.

Reading the Committee's report, one has the feeling that except the dissenting member, Shri P Kodanda Rao, the others are convinced that the programme they have suggested is eminently practicable and eminently right. Those who have been trying to work out the finances and employment targets of the Second Five-Year Plan will perhaps feel not so sanguine, especially after reading the Minute of Dissent to the Report. But the odds are they will not say so openly. We may therefore look forward to a drink-free state of existence a couple of years from now. What a potential De Quincey will do then, or whether to quote Omar Khayyam and Keats on the pleasures of wine will be deemed an offence, nobody can say. But the future De Quincey could, according to an eminent judge, seek protection under the clause, 'except for medicinal purposes' included in the Constitutional directive.

Legalities apart, Shri Kodanda Rao's Minute of Dissent is in many respects a most damaging one to the Committee. He says that not all the

memoranda received from the public were circulated to the members; a good many of the witnesses who gave oral evidence had not seen the questionnaire or had not adequate time for considered replies. Very little time was given for the members to study the written statements submitted by these witnesses. These are very serious charges, and Shri Kodanda Rao seems perfectly justified in concluding that the Committee's attitude was less objective than selective and propagandist.

This accusation gains further strength from Shri Kodanda Rao's disclosure that neither Bombay nor Madras, which can speak with authority on prohibition experience, favoured a time-schedule such as the Committee has recommended. Bombay suggested, says Shri Kodanda Rao, annual reduction by 25 per cent of the supply of liquor, gradual reduction in number of liquor shops, etc. What he has to say about the Madras view is startling. That State recommended, not orthodox prohibition, but indi-

vidual rationing for life, through permits to addicts. A similar policy was apparently suggested by Madhya Pradesh, though unlike Madras, that State contemplated no time-limit to the issue of permits. Whether or not, this sort of prohibition with permits is easier to administer is a separate question. The point is that Shri Kodanda Rao's minute makes it all too clear that the evidence placed before the Committee had not much to do with the conclusions it has reached.

How far will
15 yards of cloth go?

Fifteen yards—no more—is our per capita consumption of cloth. The industry's target for 1960 is 22 yards per head.

Thirty years ago India was importing the bulk of her textile requirements; to-day, she has the second largest textile industry in the world. One hundred crores of rupees have been invested in this key industry. It employs a million workers and produces 5000 million yards of cloth annually.

In our developing economy steel is essential. That is why the Tata Iron & Steel Company has launched an expansion programme which will raise its capacity.

Season of Festivities

AUTUMN is the brief interlude between the monsoon and the winter. Bengal is at its best in autumn. It is a season of festivities. It starts with Mahalaya. Navaratri (the Festival of Nine Nights) is the centre-piece. This is what Bengalis celebrate as Durga Puja. On the tenth day of the moon, Dashmi, the immersion ceremony takes place. In Bengal, this is known as Vijaya Dashami. In other parts of India, this is celebrated as Dussera. On the full moon day, Bengalis celebrate Lakshmi Puja.

A fortnight later, on the Amavasya night, Bengalis celebrate Kali Puja. Throughout India, Diwali (the Festival of Lights) is observed on this day. On the following day, Bhadratri Dwitya is celebrated in Bengal—the sister wishes long life and prosperity to the brother. And so the season of festivities ends.

Autumn is a brief but enviable season. The dull monsoon is over. And so is the toil. The harvest has been gathered. The barns are full. The climate is agreeable. For, the long wintry night has yet to come. Autumn is the season of home-coming and reunion. This is what the Bengalis celebrate as Durga Puja—the Home-coming of the Mother who is also the daughter. Vijaya Dashmi represents the victory of Rama over Ravana, the Good over Evil. As Dussera, this is the Day of remembrance and reunion. By the time Kali Puja, or Divali, is celebrated, the winter is fast approaching. In every house, in every hamlet, the lamps are lit. Darkness is dispelled. And the journey through the dark winter starts.

To-day, in India, and particularly in Bengal, employment is not brimful. The bazars are not full, so the festival season is not as festive as it used to be. Even so, a visitor to Calcutta now must be agreeably surprised at the mirth and gaiety of this city's inhabitants. Modern conventions help Bengalis to forget their worries for the moment. Mercantile houses pay Puja bonus. Government offices give loans or advances. So everybody buys a present for his near relations and friends. This helps Puja shopping. This year it has been brisker. Friends and relatives are happy. So are all the traders and shop-keepers. But there are some who have their grouses. They are many

who are allergic to noise. There are others who dislike community gatherings. Calcutta is now both noisy and crowded. So, those who can afford go out of Calcutta now. They are the people who are within the upper middle-income brackets. But there are many more who now come to Calcutta. They come to Calcutta to meet their relatives and friends. Bengalis are home-loving people. And this is the season when Bengalis outside Bengal take casual or privilege leave to come home.

Before partition, the movement of population used to be the other way about. Then, Calcutta used to thin out during the Puja season. Eastern Bengalis used to visit their houses in East Bengal. Even among western Bengalis few could, or can, claim Calcutta to be their home town. They also left Calcutta during Puja season. Now, after partition, eastern Bengalis do not go to their villages in eastern Bengal. And, even among western Bengalis, the home-going habit is now less common. That is why Calcutta is impossibly congested just at the moment.

Time changes. With the change of time, conventions and habits change. Durga Puja is a costly affair. Only a few can afford to celebrate it in their individual houses now. So

Durga Puja is now celebrated on a Sarvajanan (community worship centre) basis. Almost every second street in Calcutta has such a Sarvajanan Puja pandal where Durga Puja is celebrated. Everybody contributes what he can. These donations are pooled to finance Durga Puja celebrations. This is the economics of Sarvajanan Durga Puja.

Bengalis are poor people. Partition has aggravated their troubles. Acute unemployment is pauperising them. There are some who frown upon the Bengali Hindus' extravagance during the Puja season. These disciplinarian puritans are not rare. But they are easy targets for fun and ridicule. It is a dismal commentary that some of them are students of the Dismal Science. One would have liked them to be more united in their endorsement of TEC's strictures against conspicuous consumption. To mention this is not to imply that there is any sense or logic in admonishing Bengali Hindus for their spending spree during Durga Puja celebrations. It is refreshing to watch Bengalis celebrate Durga Puja with such spontaneous joy and goodwill. As one watches them enjoying life with such abandon, one hopes they will have the strength to overcome their difficulties.

Balanced vs Unbalanced Growth

(Contributed)

IN current discussions regarding development, it is common practice to discuss the process in terms of the Harrod-Domer formula. For the plan-period as a whole, the average savings, income ratio and the capital output ratio are derived and from those ratios, the average annual rate of increase of income is calculated.

The use of this technique is legitimate only in the case of a process of balanced development. In that case, consumption, investment and income grow at the same rates. The use of the formula then gives the correct year-to-year picture of the whole economy during the Plan period and it is not misleading to speak in terms of the average rates of increase of income, consumption and investment.

However, the use of this formula

becomes very misleading when it is applied to a case of unbalanced development. In this particular case, investment grows at a higher rate than income, and income, at a higher rate than consumption. To put the same things in another way, the savings income ratio and the capital output ratio do not remain constant during the Plan-period but change. Therefore, the average of the savings-income ratio and the capital output ratio fails to give correctly the year-to-year picture of the developing economy. These ratios and the rate of growth of income in this case should be worked out separately for each year in order to get the correct idea about the magnitude of effort necessary during each year.

Russian planned development was

of the unbalanced type. Investment grew at a faster pace than consumption. The outputs of the various capital goods industries were used for increasing their productive capacities further rather than for increasing the productive capacity of the consumption goods industries. Steel output increases are a good index of this pattern of development. The annual rate of increase of the productive capacity of steel was more than 10 per cent during the first two Five-Year Plans of Russia, while the productive capacity of the consumption goods sector increased very slowly.

The limiting case of this unbalanced pattern of development would be when the increase in the productive capacity of the consumption goods sector is zero and all savings are used for the purpose of investment in the capital goods sector. In all cases of unbalanced development, however, ultimately the rate of growth of the consumption goods sector would asymptotically reach the rate of growth of the capital

goods sector and thereafter there would be balanced growth.

Whether to have balanced or unbalanced growth, would depend upon how much a community prefers present income to future income. In the case of unbalanced growth, the rate of growth of income would be slower in the initial stages and then much faster in the later stages than in the case of a balanced growth. This choice involves a political decision and this decision would depend upon the minimum rate of growth of the consumption goods sector with which the community could be satisfied. The lower the rate, the greater could be the unbalanced character of development.

During our Second Five-Year Plan, we intend to have an unbalanced process of development. We propose to increase the rate of growth of the investment goods sector much more than the rate of growth of the consumption goods sector. The success of this plan would depend upon how much we could restrict any increases

in consumption. In the factory goods sector probably it would be easier to restrict increases in consumption if their profits could be tapped for development purposes. The crucial sectors, where it might be difficult to do this, would be agriculture and the small scale industries. If the farmers and the handicrafts men both increase their consumption with increases in their incomes, we might be faced with inflation. Ways and means therefore should be devised for increasing the marketable surpluses of these sectors. State trading probably is one way out. Land tax and higher charges for the services supplied by Government to the farmers as well as the handicrafts men could also be used for this purpose.

It would be realised in this context that greater employment, greater rate of increase of income (ultimately) and reduction in the inequalities of income are conflicting objectives and if a compromise is to be arrived at, it should be one which is more biased in favour of growth.

Views on States Reorganisation—III

Thoughts on the Attenuation of Hyderabad

By A 'MULKI'

The majority is difficult to idealise because it is difficult to imagine G K Chesterton

It will be seen . . . that the Erewhonians are a meek and long suffering people, easily led by the nose
Samuel Butler

THE States Reorganisation Commission seems to have acted religiously upon Emerson's dictum that consistency is the hobgoblin of small minds. A fair example of this is its treatment of Hyderabad. The real issue is not whether there should be a residuary State of Hyderabad comprising Telengana—the inclusion of Bidar is a different kettle of fish—and functioning as a distinct entity from the present State of Andhra, but whether the Commission has made out an effective case for the disintegration of the present composite state of Hyderabad. The cavalier fashion in which the Commission has recommended the carving out of Hyderabad may be contrasted with the almost pathological circumspection with which it has dealt with Bombay and the Punjab. This in itself is indicative of the fact that considerations other than the welfare of the people of Hyderabad have weighed with the Commission.

We are told by the Commission that "public sentiment, both within and without the state is overwhelming and insistent on the need for the disintegration of the State. The Congress Party, though divided on the question whether Telengana should be a separate state or be united with Andhra, is unanimous regarding the issue of disintegration. The continuance of the existing unit for any considerable length of time would, in the opinion of this body, retard the growth of the people of Hyderabad. Every other organised political party that has appeared before us, however disunited on other points, has shown striking unanimity on this question". This is typical of the Commission's approach to the entire problem, which believes that pontification is an adequate substitute for the effort of exact thought. No evidence is given for assuming that Hyderabadis favour disintegration of their state. The opinions of fickle-minded leaders cannot be taken as representing those of the people. If the Commission and the Government of India, who have also made up their mind to divide the State are so very tender to public opinion

why has the deposition of the Nizam—on which public opinion was long agreed—been deferred so long?

If anything will retard the growth of the people of Hyderabad it is the disintegration of the State. The case for retaining the present composite state is the very simple one that each one of the linguistic areas in the state is backward relatively to the respective contiguous areas in Bombay, Karnatak and Andhra; and the merger of these areas at this stage when the people have just emerged from age-old feudalism is hardly calculated to further the interests of the people of the State. These areas will soon become the colonies—an oyster to be pearled at will—of the absorbing states, and have the privilege of being exploited by people speaking their own language, albeit with a different intonation and diction. Hyderabadis are under no illusions about the fate in store for them in whatever state they are merged, certainly not after their experiences since the police action at the hands of imported officials from the neighbouring states. Superannuated and condemned officials from elsewhere descended like a Biblical plague of locusts on Hyderabad and made fortunes while the going was good. This conduct is a fair sample of the beneficent tutelage awaiting Hyderabadis under the new dispensation.

If the remaining part of this article is mostly devoted to the plight of Telengana it is because of the special nature of the problem and the indecent anxiety of some of the Andhra leaders for the merger of Telengana. Some of them had stooped to the extent of saying that they would even have the Nizam as the head of Vishal Andhra rather than forgo the twin cities! Let us look closely into the slightly Kiplingesque pose of "its-to-your advantage—little brother" adopted by the Andhra leadership towards the people of Telengana, and try to find out whether there is an iota of justification for this claim in the light of past experience and current happenings in Hyderabad.

During the heroic satyagraha launched by the Arya Samaj and the Hindu Sabha in Hyderabad in the late thirties, perhaps Hyderabad's finest hour, the champions of Vishal Andhra stood studiously aloof when the people of Hyderabad—Telugus, Marathas and Kannadigas—were facing the bayonets of a regime of Yahoos; the only outside support which Hyderabadis received then was from Maharashtra and Punjab. Then perhaps, the Andhra leaders had no interest in Hyderabad as the twin cities could not in any case function as the capital of 'Spacious Andhra', and it did not matter to these worthies whether the people of Hyderabad—including their Telugu brethren—had elementary human rights so long as they themselves were safe in Bezawada and Vizagapatam. Now that Hyderabad has been liberated—certainly not through the efforts of Andhra leaders—the leaders of Andhra are clamouring like magpies for the twin cities of Hyderabad and Secunderabad as the capital of Vishal Andhra, for the simple reason that there is no other city in the present Andhra which can even be compared, in point of amenities, to these. If the Andhra leaders covet the twin cities so much one may at least expect them to make no bones about it, and not be mealy-mouthed and sanctimonious about being the purveyors of welfare to the people of Telengana. They have given precious little proof of their good will and solicitude in the past and present as will be shown presently.

One might also refer to the cynical indifference of the Andhra leaders and people when practically all the Hindu students of Osmania University were rusticated during 1937-38 for the heinous crime of singing 'Vande Mataram'. No other Indian University—with the glorious exception of the Nagpur University—was even prepared to admit these stranded students. The Nagpur University, under its courageous Vice-Chancellor, the late Shri T J Kedar, braved the displeasure of the Inter-University Board, then dominated by Sir Akbar Hydari's

coterie, by admitting all these students to its colleges. Shri Kedar also went out of his way to help these students through liberal grants of freeships and bursaries. The Andhra University did not move its little finger to help these distraught students, many of whom were fellow Telegus. The reason was simple. This University had been very shrewdly offered by the Hyderabad Government a timely and princely offer of a donation which was subsequently accepted. Before and after this there was an exchange of courtesies between the Andhra and Osmania Universities in the form of their respective Vice-Chancellors delivering convocation addresses at Hyderabad and Waltair. It was cruel irony to hear the Vice-Chancellor of the Andhra University mouthing Barrie-like phrases on eternal verities and human values in Hyderabad when Telugus, among other Hindus, were being hacked to pieces for daring to ask for elementary rights and when students were being rusticated for singing a patriotic song!

These are only two of the many significant incidents in the history of Hyderabad which should expose the hollowness of the protestations of fellowship and sympathy of the Andhra leaders for Telengana. So much for the past. Now for the present and the future.

Among the officials who were imported after the Police Action a fair number was from Andhra, and the attitude and behaviour of these towards the local Telegus is an index of the shape of things to come in Vishal Andhra. The first reaction, and the last, of these officials, in common with imported officials from other provinces, was how best to oust the sons of the soil.

The Osmania University—which today is ruled by an 'entente cordiale' of Razakars and Circars Brahmins—has under an Andhra executive gradually driven out qualified 'mulkis', many of them with high academic qualifications, to make room for raw graduates from Cocanada, Vizag and Masulipatam. The story is much the same in other departments. Any protests are promptly smothered by retorts that the Circars Andhras have superior 'brains' and hence are entitled to rule over the banausic locals, a line of thought which the Andhras themselves would not relish overmuch if advanced by the Tamils. It

is not uncommon to see the coastal Andhras poking fun at the rather racy Telugu dialect of Hyderabad. They are, of course, unaware that Hyderabadis like the late Shri Pratap Reddy kept the spirit of the Telugu language and literature alive in Hyderabad at a time when their brethren in the Circars and Rayalaseema were listening to the Convocation rodomontade of Nabobs.

Opinion today in Telengana is by no means in favour of a Vishal Andhra, the telegrams of weathercock legislators notwithstanding. It should not be overlooked that the most active protagonists in the anti-non-mulki agitation in October 1952 were the local Telugus and the movement itself was largely directed against Andhras from outside the State. Of course, some elements, who were busy chalking up 'go back to Bezvada' on city walls in 1952 have since, for reasons of their own, taken up the cry of Vishal Andhra. For them this is only a period of transition, to adapt Isaiah Berlin's phraseology, from the 'hedgehog' to the 'fox' phase of power politics. The States Reorganisation Commission has done the right thing by the people of Telengana by giving them a separate state. But in the process it has thrown the people of Marathawada, Gulbarga and Raichur to the wolves.

But then to ask for an undivided Hyderabad in these days of linguistic chauvinism is a forlorn hope. At the moment of writing this article even the fate of residuary Hyderabad is in the balance. Leaders of Vishal Andhra from the Circars and Rayalaseema are busy confabulating with interested groups in Hyderabad for precipitating by hook or crook the merger of Telengana and Andhra. A large tented army of bureaucrats is poised in drainless and waterless Kurnool waiting for the signal to entrain for the twin cities. When that day dawns, the people of Hyderabad will realise that the paper safeguards so liberally recommended by the States Reorganisation Commission for the protection of backward areas will be as effective as those provided for Harijans by our sublime Constitution; or at best about as effective as the pie-crust promises of the present Andhra Government when inviting the people of Telengana into their parlour.

Sooner or later, perhaps sooner, historic Hyderabad of Ajanta and

Ellora, the scene of the devoted labours of Meadows Taylor and Chundoo Lal, the researches of Ronald Ross and Aghorenath Chattopadhyaya, the romances of Captain Kirkpatrick, the poetry of Nizam Jung and Sarojini Naidu, of art patrons like Salar Jung, of the sweet-meats, the kebabs and nahri of Char Kaman, the hearth and home of a large-hearted and gentle people with their traditional faith in 'izzat' and 'telzib', will soon be a dim and distant memory which will be cherished for many a long day by former Hyderabadis living under austere regimes.

But then all this is nostalgia, one of the seven deadly sins in the calendar of the SRC except when it takes the form of Aikya Kerala or keeping Uttar Pradesh intact! It is then presumably that the Fabianism of the London School of Economics, the liberalism of the Servants of India Society and the historical humanism of Christ Church can be conveniently forgotten under the aegis of an unusually self-effacing Chairman.

*He who is firmly seated

Views on States Reorganisation - IV

Andhra and Telengana States

(Contributed)

WHILE reactions to the States Reorganisation Commission's report from West, North-Western, Northern and to some extent from South-Eastern India, have received and are receiving considerable publicity, those from South India have gone more or less unnoticed. Maybe this is due to the consideration that the picture drawn by the Commission of the reorganisation of State boundaries in southern India has a wide measure of approval from the people concerned. Maybe also that the pattern of reorganisation proposed for that area represents a closer approximation to linguistic divisions and, therefore, is more acceptable to them. Though the Commission does not recognise language as the sole or even the main consideration in the creation of new States or in the readjustment of existing State boundaries, it is evident that, in fact, it accorded to that factor primacy of place in some of its major recommendations. Those pertaining to Southern India fall essentially in this category.

It is on the whole appropriate that this should be so. Whatever be the other considerations and arguments advanced by the Commission in support of its proposals for redrawing the map of India, it is indisputable that the linguistic factor looms large behind them. At the same time, Southern India is so constituted that it conveniently lends itself to a surgical operation in which more or less clean cuts can be made on its territorial map on the basis of language. To the Commission, this must have been on the whole a source of relief, because without much prejudice to other principles evolved by it in connection with reorganisation, it could accord to the linguistic demi-god the homage due so far as Southern India was concerned.

Linguistic homogeneity could be harmonised in this area with factors of financial viability and administrative convenience and prospects of budgetary equilibrium and economic progress. This attitude, whether expressed or implied, of the Commission is perfectly justified also by the relevant consideration that apprehension of linguistic separatism posing a threat to national unity and security, which was canvassed by some parties at the time of the

Andhra separation, has been found by experience to be wholly unwarranted and baseless.

There are two or three points touching the States Commission's recommendations respecting Southern India, and in particular Andhra and Hyderabad, which deserve careful consideration. Initially, reference may be made to the issue of Madras City, which not long ago was a serious bone of contention between the Andhras and Tamils, but about which hardly any controversy exists at present. The Andhras have now reconciled themselves, it may be hoped finally, to the fact that they cannot sustain any valid claim to the city of Madras or a part of it, though even before the States Commission, they did put up a claim to it. It is good that this is so, and that the Commission has put its seal of approval on the fait accompli of Madras being not only a Tamil city, but also the city from which the new Tamil State will derive its name.

The second issue relates to the allocation of three taluks of the Bellary district, including Bellary town, to the Andhra state. This amounts to the righting of a wrong hastily done to Andhra and to the people of the three taluks, when at the time of Andhra separation, the area was assigned to Mysore State under the terms of the Misra Award. Administrative convenience, particularly in relation to the efficient supervision of the further stages of the Tungabhadra project, long-established trade connections between Rayalaseema and the Bellary district and finally the linguistic composition of these taluks—have induced the Commission to suggest a re-transfer of the area, which is also in conformity with the desires of the people themselves. It would be appropriate and dignified for the Mysore State and the Kannadigas generally to accept this transfer in good grace.

The Andhra-Madras border issue, which has been pending, is a comparatively minor issue, susceptible of adjustment through mutual consultations and agreement. Such adjustment seems possible if aggressive agitation by extremist elements on either side is avoided.

One major issue with regard to Southern India, which has not attracted much attention, but about which considerable discussion and debate is on, relates to the creation of a second Telugu-speaking State out of the eight Telugu-speaking districts of the Hyderabad State, with Hyderabad as the capital. Ever since dismemberment of Hyderabad State came to be regarded as an inevitable preliminary to the creation of a united Karnataka State, the issue of the Telugu-speaking districts has assumed significance. The creation of a Vishal Andhra State with Hyderabad as capital has come to be considered as a solution to a number of problems that have been troubling the Andhra State, particularly the problem of its permanent capital.

The Commission has marshalled an impressive array of arguments in support of the formation of a Vishal Andhra State. At the same time, it has tried to marshal an equally impressive set of arguments in favour of the creation of a separate Telangana State, little realising that in the face of the former, the latter sounds unconvincing. It appears, in short, like some kind of special pleading for those interests in Telangana which have been opposing a composite Andhra State.

If the Commission's view is sound, it would amount to branding the coastal Andhras as being prone to 'exploit' and 'submerge' the Andhras in Telangana for their own benefit. Fortunately, a similar argument, which was widely canvassed before the establishment of the present Andhra State that the coastal Andhras would dominate and exploit the backward Rayalaseema area for their own benefit, has turned out to be unfounded by the actual course of events in the last two years. On the other hand, it is indisputable that the establishment of the Andhra State has strengthened unity between Rayalaseema and the coastal districts and has promoted a closer identity of interests and feelings between the two areas. If the Telangana districts form a part of Andhra, there is little doubt that a similar identity of interests between them and the Andhra State would emerge.

The Commission's own view of the advantages of a Vishal Andhra State convincingly proves the case for such unification right from the very beginning. It will automatically resolve a number of administrative and economic problems that confront the present Andhra State and that are likely to confront the separate Telangana or Hyderabad State. Administrative efficiency, economic progress and budgetary stability, apart from linguistic affinity, will all be ensured in the two areas if such unification takes place. Apprehensions of the exploitation and submersion of Telangana interests in a composite Andhra State have no validity, because when a somewhat backward area is joined to a comparatively advanced one with which it has affinity in other respects, it will naturally lead to the advancement of both, particularly in view of the possibility of the advanced area being anxious to carry the less advanced one along with it.

The States Commission has either missed the real point behind the apprehensions of the more vocal sections among the Telangana Andhras or it has not been able to appreciate it in the correct perspective. Opposition to the creation of a single Andhra State from these sections proceeds mainly from caste and sectional motivations, from the fear that in a composite Andhra State, one particular caste in the coastal districts would attempt to dominate the rest of the territory. It is also true that this particular caste in the coastal districts itself fears the domination of another caste if Telangana is part of a single Andhra State.

These fears and suspicions are mutual and actually cancel themselves out. On the periphery is another apprehension that if Vishal Andhra is not established now, that fact would be exploited by the Communists for their political advantage. It is not also unlikely that while the Communists vociferate in support of a Vishal Andhra State, they actually would prefer a separate Telangana, which can still offer them a happy ideological hunting ground. It is a clinching argument in support of Vishal Andhra, which the Commission did not or could not take cognisance of, that such a State with its larger resources and more efficient administrative set-up would be able to deal with prospective Communist revivalism in that area more effectively than if

Telangana had to deal with it by itself.

In any event, the Congress as a party cannot remain a complacent witness to the predominance of casteism and its manifestations, not only because it is committed to the eradication of caste influences, but also because casteism is not conducive to the development of the spirit of national unity or a national outlook. In a large state wherein there are greater opportunities for the inter-play of a diversity of interests and viewpoints, the narrow outlook that casteism and sectionalism are prone to foster will have less chance to grow. In the ultimate analysis, it is the will of the common people that should prevail in a democratic set-up, and there is more than a possibility—indeed a strong probability—that the common people of the Telangana area will plump for a merger with the present Andhra State.

The Commission has provided for the unification of the residuary state of Hyderabad or Telangana with Andhra after the general elections to be held in 1961, "if by a two-thirds majority the legislature of the Hyderabad State expresses itself in favour of such unification". This, however, is a suggestion without much practical relevance or validity, for the simple reason that the forces which at present are opposed to a single Andhra State, because it would affect their caste or personal interests, will have acquired greater strength in the intervening period and stabilised their position in the new State. Almost insuperable obstacles can be envisaged in the realisation of a Vishal Andhra State five years hence. If the State does not materialise now it has little chance of materialising in 1961.

It is gratifying that the agitation in favour of Vishal Andhra is pitched in a subdued and dignified key. There is expression of disappointment that the Commission did not favour a Vishal Andhra State after acknowledging its advantages but there is simultaneously an expression of hope that the position will be righted by the Government of India and the Congress High Command.

If the long-term and larger interests of the two areas, Andhra and Telangana, are to be served, as it is agreed, they will be by their being constituted into a single State, it is preferable, in fact imperative, that this consummation should be brought about in the immediate

future. It is generally agreed that the initiative for the modification of the Commission's recommendation regarding Telangana should come from that area itself. That is necessary. But the leaders of Andhra can set the ball rolling by consulting the Telangana leaders on this issue, particularly as the latter may like to be 'wooed' a little before accepting the advances.

There may be nothing inherently wrong in two States existing side by side in which the same language is spoken. But where it is desirable and possible to have a single State of manageable proportions, which also answers the criterion of linguistic homogeneity and other considerations, that need not be ruled out.

Demographic Trends in South-East Asia

THE importance of the population problem in the countries of south-east Asia hardly needs to be emphasised. No discussion of the problems of these countries is in fact complete without a reference to population pressures and rates of growth of population. While the high population pressure has kept income levels and standards of living very low and has also hampered efforts to bring about rapid economic development, one of the most acute problems in these countries has always arisen out of the need to provide increasing employment opportunities to new entrants into the field, a problem made more acute by the high rate of growth of population.

The rates of natural increase in population have not really been very high in any absolute sense; they have been high relatively to the ability of these countries to provide employment opportunities and maintain income levels. The rate of investment necessary to balance the demographic rate has consequently been higher than these countries have been able to achieve easily. It has been quite clear that only organised effort on a large scale would lift these countries out of the morass into which they have fallen.

In this context, demographic trends in the countries of this region since the end of the war are of the utmost significance and must provoke considerable thought amongst economists and policy-makers in these countries. A study of these trends published in a recent issue of *ECAFE's Bulletin** emphasises that the "rate of population growth has recently been accelerating in parts of the ECAFE region" and points out that this acceleration can be traced to "progressive reductions in death rates, not matched in most cases by corresponding changes in the birth rate." The only country in the region where this common tendency is definitely absent is Japan, where conditions in many respects differ markedly from those prevailing in other countries of the region.

there is a definite upward trend. Since this upward trend arises principally out of downward trends in mortality, a careful study of these is necessary. Mortality trends exhibit two definite periods, the first prior to the Second World War, and the second, the current post-war period.

Mortality Trends

Information about long-term demographic trends is available for a few countries only. The authors of the study feel, however, that the similarity of conditions in the countries of the region and the characteristics of these trends themselves suggest that the pattern in all countries is likely to be similar to that found in the few countries for which information is available. The experience of Ceylon and Taiwan is considered particularly significant from this point of view (Table 1). In both, the death rate before 1920 was at a level of about 35 per thousand persons. The corresponding expectation of life at birth was about 28 years. Between the first and second world wars, the crude death rate declined gradually from this level of 35 per thousand, and seemed to be tending towards a limit of about 18 per thousand, which corresponds to an expectation of life of about 43 to 45 years. While the more favourably situated countries could be expected to attain this low death rate without any great change in levels of living, it is clear that a decline of mortality toward such a level had begun prior to the Second World War in all the countries of the region, though some had proceeded much farther than others.

India was one of the countries which had proceeded least in this very desirable direction. The mortality rates which had been abnormally high prior to 1921, being well over 40 per thousand, probably owing to the frequency of famines and pestilence over large parts of the country, showed, during the subsequent decades, a substantial and steady decline. The death rate was estimated at 36 per thousand during the decade 1901-30 and at 31 per

thousand during the decade 1931-40. While this is the pattern of mortality rates, "the generally high levels of birth rates of from 40 to 45 per thousand have not changed very much between the pre-war and post-war period." In Ceylon, there has been a slight fall from 50 per thousand prior to 1900 to 45 per thousand in 1901-10 and to 40 since then. (Table 2). These changes can probably be explained by factors such as the increase in the age of marriage which is in evidence since the turn of the century and the increasing urbanisation. In Taiwan, whatever evidence is available actually suggests that fertility may have actually increased somewhat, while in India, birth rates have fallen from about 50 per thousand during 1881-1920 to 45 during 1921-40 and to 40 during 1941-50. As in Ceylon, however, these changes are not due to any change in marital fertility but have been probably brought about by minor shifts in

Birth Rates

While this is the pattern of mortality rates, "the generally high levels of birth rates of from 40 to 45 per thousand have not changed very much between the pre-war and post-war period." In Ceylon, there has been a slight fall from 50 per thousand prior to 1900 to 45 per thousand in 1901-10 and to 40 since then. (Table 2). These changes can probably be explained by factors such as the increase in the age of marriage which is in evidence since the turn of the century and the increasing urbanisation.

In Taiwan, whatever evidence is available actually suggests that fertility may have actually increased somewhat, while in India, birth rates have fallen from about 50 per thousand during 1881-1920 to 45 during 1921-40 and to 40 during 1941-50. As in Ceylon, however, these changes are not due to any change in marital fertility but have been probably brought about by minor shifts in

the legalisation of abortion.

that the figures are too low.

Introducing from 5th November 1955

Regular night services

by Luxurious 4-engined

Skymaster

Calcutta
Delhi
Madras
Nagpur

via

SAVE precious time (and hotel bills) — fly overnight by new, luxurious Skymaster service, connecting Bombay, Delhi, Calcutta, Nagpur and Madras.

The new service cuts out irritating overnight stops, lands you in time for breakfast — and it is carefully scheduled to connect with 34 morning flights from the big airports. So by midday tomorrow, you can reach almost any important town in India!

Wherever you want to go, whichever flight you choose — Skymaster service makes sure you get there in time! And your IAC ticket covers meals, travel to and from airport, everything. No extras to pay.

that area more effectively than if brought about in the immediate

low levels. Birth rates have shown only slight falls, if at all, and are not likely to be affected immediately by the factors that are bringing about a fall in mortality. If anything, an improvement in health and in survival of women through child-births may tend to increase the birth rates. It is clear that certain trends in the rates of natural increase which emerged from these facts during the pre-war period are likely to have been accentuated during the post-war period.

Rates of Population Growth

A study of these rates of natural increase show that these were high in most south-east Asian countries and areas, notably Ceylon, the Federation of Malaya and Taiwan, during the pre-war period 1935-40, showing a rate ranging from 10 to 25 per thousand per annum. (Table 3) Since the end of the Second World War, because of the factors mentioned above, the rates of population growth have shown a rising tendency. "The period of the early 1950s," the ECAFE study points out, "has witnessed in these countries such high levels of natural increase as 30 to 35 per thousand per annum. These levels are among the highest ever known in the world." (bold ours).

These levels of population growth rates are no doubt to be found at present in these two or three countries only. In the other ECAFE countries, the present levels of the annual rates of natural increase are about 10 to 20 per thousand, roughly comparable to the present rate in India and to the rates observed in Ceylon, Taiwan and Malaya during the pre-war period. The widespread declining mortality of the region, "implies that these other countries also may experience raising trends in natural increase if little relative change takes place in their birth rates."

Japan—An Exception

Japan is the only country in this region in which these common tendencies are not to be found. That country "seems to be approaching a new demographic equilibrium, with both low fertility and mortality." The attainment of such an equilibrium does not, of course, imply that Japan will have no demographic problems but rather that the character of these problems will be different. Among these new problems are those arising out of the aging of the population and those caused by the legalisation of abortion.

Mortality rates in Japan were already low prior to the war, standing at 17 per thousand during 1935-39. The expectation of life at birth which was already as high as 45 years at the beginning of the century rose to 50 years by the end of the Second World War. "This moderate change" it is argued, "was due mainly to a decline in Japanese infant mortality, since life expectancy at age 1 remained fairly constant at the level of 50 years during that period." By 1953, the mortality rates had declined even further until they had reached the low level of 9 per thousand. (Table 1) From the point of view of mortality rates,

it could be argued that Japan was providing the lead which was being followed by the other countries of the region.

The birth rate in Japan is extremely low, being below 30 per thousand. A comparison of the pre-war and post-war periods "shows that Japan is the only ECAFE country where a definite decline of mortality has occurred." Family limitation is probably the main reason for the decline in fertility. Abortion was recently made legally permissible and it is in fact resorted to on a large scale. The decline in birth rate since 1950, when it was 28 per thousand, has been very steep for

TABLE I—DEATH RATES IN SELECTED ECAFE COUNTRIES

Country	Source of Data	Pre-war period		Post-war period

Figures on which relatively little reliance can be placed are presented in parenthesis.

N.A. = Not Available; Reg = Registration; Est. = Estimates

these reasons. It fell to 22 in 1953. (Table 2) A month by month analysis shows an almost continuous decline over the period 1950-54 allowing for the seasonal pattern of births. The gross reproduction rates of Japan dropped from 2.66 in 1920 to 2.40 in 1930, and 2.06 in 1940. There was a short recovery to 2.22 in 1940's as shown by the 1947-48 data, but this was followed by a renewed decline to 1.82 in 1950 and to 1.62 in 1951.

Despite the fall in birth rates, rates of natural increase in Japan tended to rise till 1950, since the decline in death rates tended to be even more rapid. Rates of natural increase were 12.0 per thousand in 1920-24, 13.7 in 1930-34, 13.8 in 1940-44 and 17.3 in 1950. It is only in very recent years that falling fertility has tended to outpace falling mortality, as the latter reached very low levels. The rate of natural increase in 1953 fell again to 12.6 per thousand per annum. (Table 3) In due course, if birth rates keep on falling, as seems very likely, Japan may reach a demographic equilibrium with no change in population at all.

The factors that have resulted in this situation for Japan are not likely to be duplicated in the other countries at an early date. While the fall in death rate in Japan will be repeated in the other countries, there is no reason to believe that the birth rates will show a similar trend—at any rate in the near future.

The study argues, "It is possible—though perhaps not likely in the immediate future—that the increasing load of dependency will induce Asian families to cut down their fertility as the Europeans did a hundred years ago." It must be noted, however, that in Europe the fall in death rates, which was followed

after a time-lag by a fall in birth rates, occurred as a result of industrialisation and consequent rising standards of living. This is not the case in the countries of south-east Asia, where the decline of mortality "is not due to an improvement of the level of living but has been largely brought about by the use of new drugs." The problems which will arise in these countries are to that extent of a different character from those faced in Europe. The experience of European countries may not, therefore, prove very helpful in this context.

It has also been noted in different studies that the time-lags between the fall in death rates and in birth rates in different countries of Europe have differed widely. Only an idea of the social adjustments which will occur as a result of the decline of mortality can suggest after what time-lag, birth rates can be expected to fall appropriately in south-east Asia or whether they will fall automatically at all. The experience of Japan suggests the need for drastic measures, but various reasons may deter the other countries of the region from following Japan's example. The problem is clear; what the solution can be, is a matter for separate examination.

Announcement

We have pleasure to announce that the Head Office of the Company will be removed from 135, Canning Street, Calcutta - I, to **Our Own Buildings at 24, Chitta Ranjan Avenue, Calcutta-12**, on and from 1st November, 1955. Constituents are requested to address all communications to the above new address.

Around Calcutta Markets

Market Outlook

Wednesday, Evening

ABOUT a year ago, the stock exchange boom ended. Today, equities may not be booming, but they remain steady. There is no pessimism in the market. Investors may be hesitant. But speculators seem determined to push equities up. As the Calcutta stock exchange closed for the Puja holidays, the feeling spread that the outlook for equities was promising. It is interesting to go backwards to have some idea of the factors that have influenced market movements in the past year.

From September, 1954, equities started falling. Soon, it became evident that the boom had ended. A sharp fall in equities spread gloom in the stock market. But the continued strength in Tea shares cushioned the fall in equities. Tea prices and tea shares slumped much later. But, by then, other "bullish" factors intervened. That was why the slump was of short duration. For many months, equities remained steady at lower levels.

Many influences helped to sustain the market. Incidental consequences of deficit financing have always had a steadying effect on equities in the last twelve months. As money supplies and money incomes increased, investment support to the market continued. Expectations of a larger Second Plan emboldened speculators to bid equity prices up. But by the beginning of this year, certain doubts developed to restrain stock market activity.

These doubts and uncertainties spring from the reorientated economic policy of the Government. Avadi was a warning to stock markets. Equities are not higher today because many investors are apprehensive that the Government will gradually implement Avadi through industrial legislation. Almost simultaneously, it became known that the Government's intention was to expand the public sector. These fears continue to hamper stock market activity.

Calcutta is the home of the managing agency system. Introduction in Parliament of the Companies Bill created consternation in Dalhousie Square. And, as gloom enveloped Dalhousie Square, Clive Street felt the impact. There is nothing in the Companies Bill to affect equity prices. But the reaction of the business com-

munity to the Companies Bill was adverse. That was why it had a psychologically "bearish" effect on equities.

At this stage, an intriguing development occurred. As the proposed company legislation included a provision that, after some years, no managing agents could manage more than ten companies, the move to corner shares in order to acquire controlling interests in industrial concerns started. There was hectic cornering activity. As a result, many shares were boosted up. This move served to neutralise some of the "bearish" effects of the Government's harsh attitude to the managing agency system.

Cornerers concentrated their attention on Tea and Engineering shares. 1954 was a boom year for the tea industry. As the industry prospered, Tea shares spurted up. Hopes that the prosperity would continue encouraged some capitalists to buy up Tea shares in order to acquire controlling interest in tea companies. By the time this move started, tea prices had begun to fall. But cornering attempts continued. These activities had a sustaining influence on Tea shares. Fat final dividend payments also had a steady effect on tea shares.

If cornering activities partly neutralised the adverse effects of the Companies Bill, there were other influences which continued to have a paralysing effect on equities. As the contours of the Second Plan emerged, doubts deepened whether equities could move up during the Second Plan's unfoldment. Its emphasis on cottage industries, on development of heavy industries within the public sector and its attitude to organised consumer goods industries had a chilling effect on stock markets.

Throughout the past year, contradictory influences have been in operation. For instance, the continued strength in Indian Iron in the last few months has offset some of the "bearish" factors. Indian Iron started moving up in expectation a higher dividend disbursement. These shares continue to be firm in anticipation of bonus or right shares. Whether the continued strength in Indian Iron is justified or not, the behaviour of Indian Iron has had a restraining influence on Engineering

shares. Gradual improvement in sound Engineering shares has been a feature of price movements on the Calcutta Stock Exchange in the last few weeks.

Strength in Engineering shares augurs well for the future of equities on the Calcutta Stock Exchange. Even so, it would be unwise to ignore the consequences of another developing event. Soon, a Bill to regulate stock market activity will be introduced in Parliament. This legislation is likely to have a "bearish" effect on equities. In recent months, the Government has given many indications that it is anxious to curb speculative activity in stock markets. On more than one occasion, New Delhi has issued directions to stock exchange authorities to check speculation in particular shares. This is a move in the right direction. These precautionary measures are necessary to prevent the consequences of a runaway boom.

Kirloskar Engines

THE ninth Annual Report of Kirloskar Engines Ltd., for the year ending March 31, 1955 discloses satisfactory working results. The production of oil engines in 1954-55, is the highest so far, and considering that the company's products have been well received both in India and abroad and that efforts are being made to develop export markets in Germany and Middle and Far Eastern countries, Kirloskar Engines might confidently look forward to a promising future.

Net value of sales during the year under review amounted to Rs. 56.76 lakhs as against Rs. 39.01 lakhs in the previous year, and the improved sales performance has been reflected in the profits earned by the company. Thus, profits for the year 1954-55, after provision for depreciation amounted to Rs. 4.38 lakhs against Rs. 1.18 lakhs in 1953-54. In the year under review, a sum of Rs. 1.96 lakhs was credited to the Depreciation Fund, bringing the latter to a total of Rs. 9.81 lakhs. As against this, the company has a machinery valued at Rs. 18.69 lakhs as on 31st March 1955.

Out of the net profits earned during the year, the directors have recommended a dividend of 5 per cent on 'A' (Rs. 10) and 'B' (Rs. 100)

Boom Prevails

Thursday, Morning

AS anticipated here, the upward trend in equities was accelerated during the last week. Although the Stock Exchange authorities recently instituted measures to curb unhealthy speculation, bulls have remained convinced of industrial prospects, as evidenced by large disbursement of dividends. Annual accounts of companies that have been published are encouraging. Even the maintenance of the dividend in the case of Indian Iron and Steel Co. had no deterrent effect, as hopes are held for a right issue some time or the other. In the event, equities, on the whole, registered a further spectacular rise, the leadership this time being shared equally between steels and textiles.

Both Tata Steels and Indian Irons ruled firm, the latter giving strength to the former and enabling it, in the process, to advance to the previous official peak level. Actually, in the early part of the week, the rise in Tata Steels was particularly sharp because of the little bearish effect on Indian Iron by the declaration of the same dividend as last year. It may be noted, however, that Bombay is reported to have absorbed about four lakh shares of Indian Iron from Calcutta. Calcutta operators are not unaffected by the comparatively depressed state of the jute market.

Cotton mill shares in general made further headway with prices recording new high levels on active bull support coupled with bear covering. Central India evoked fresh buying on hopes of brighter prospects for the Company. The annual report showed a profit of Rs. 39,632 as against a trading loss of over Rs. 18.51 lakhs in the previous year. Among other scrips, Bombay Dyeing and Century ruled steady. There was reaction in the former on rumours that there might be rationalisation soon. Century witnessed a hectic rise.

There were several bright spots in the miscellaneous section which remained on the whole firm. Persistent speculative buying and covering sharply pushed Bombay Burmah to new peak levels. There was a gain of as much as Rs. 25 compared with the highest level reached in the week before. Sugar shares drew sustenance from hopes of higher dividends. Belapurs which opened the week at Rs. 355 advanced by leaps and

bounds to record the highest for the week at Rs. 375 at which level they have been held. Premier Construction rallied smartly to Rs. 191 while Tata Chemicals moved up to Rs. 20. A C C recorded a peak level of Rs. 220 to close a shade lower at Rs. 219-8.

Cotton

New Peaks Reached

THE cotton futures market opened the week on a distinctly bullish note and prices reached new high levels. Two factors combined to bring this about. While reports of damage to the crop following heavy rains in some cotton tracts were an important bullish factor, a more immediate cause was strong manipulation by the bull syndicate. The new crop February contract opened the week firm at Rs. 642 and marched onward to a new peak of Rs. 654-8 before closing the week somewhat lower at Rs. 651-12.

In the Sewri spot market, Vijay was in the limelight on the support of a prominent group of mills who continued to buy this variety on a

fairly large scale. Close on the heels or Vijay came 320F Punjab, about 1000 bales of which have been purchased by a big textile unit at Rs. 125 ON. Vijay also featured prominently in the export section. Shippers were reported to have gone in for this style presumably against their outstanding sales abroad. There were reports of sustained enquiries from Continental countries as also from Hong Kong and Japan but the volume of business that materialised was small.

Meanwhile, the question of U. S.-aid cotton is still hanging fire. It may be remembered that this scheme was first proposed as far back as December 1954, and the scheme continues to remain in cold storage. The prolonged delay in the Government making its decision one way or the other is presumably due to the disinclination on the part of traders to comply with the Government's alleged insistence on payment of a deposit of Rs. 1 lakh before they are allowed to import this cotton. Traders are not interested enough to pay deposit for the import of U. S. cot-

ton. They feel comparable varieties of long staple cotton—and what is more, with a price advantage—could be had from East Africa or Egypt.

Oils and Oilseeds

Castor May Crosses Rs. 100

A NOTABLE event in the oilseeds market during the week under review was the sharp rise in the price of Castor futures which, for the first time in several months, crossed the Rs. 100-mark. In keeping with the firm trend in this section, other sections also displayed a perceptible undercurrent of firmness. Towards the close of the week, there was a shift in favour of linseeds causing a little reaction in groundnuts, castor and kardi and nigar.

Sentiment in general was influenced by three factors. In the first place, fears of crop damage owing to the recent heavy rains aggravated the sense of scarcity due to paucity of floating stocks. Secondly, arrivals from Khandesh were halting and uncertain owing to transport difficulties, a necessary concomitant of heavy rains, particularly with regard to country roads. Thirdly there was increased demand from shippers and millers. This apart, during the early part of the week on expectation of a fresh export quota for established shippers, both Vanaspati dealers and speculators were inclined to go long in both groundnut delivery and oil. On foreign account good business is reported to have been done for about 1000 tons during the week. Before the close of the week, however, the expected announcement of the export quota was released although the actual quantum of the quota has not been mentioned. Groundnut oil R/R found regular buyers and improved from Rs. 11-12 to Rs. 12-6 during the week to be placed at the close at Rs. 12-4.

In the case of Castor May, a new peak level was established at Rs. 101-4 on Tuesday. Favourable advices from the spot section and prospects of increased purchases by the U. S. A. at higher prices led speculators to cover their short sales in futures. As a result, the early easiness was replaced by a firm undertone and May contract closed the week distinctly firm at Rs. 100-4.

The unusual firmness in linseed and linseed oil was due mainly to paucity of stocks and good overseas demand particularly from Australia which accounted for about 50 tons. This led to Punjab going in for linseed ready and delivery and its

oil. Ready linseed improved by a rupee a cwt. from Rs. 24 to Rs. 25. Delivery improved from Rs. 23-8 to Rs. 23-14 and closed the week on a firm note at Rs. 23-12. Linseed oil ready quoted as. 6 higher at Rs. 14-12 at the close as compared to the opening at Rs. 14-6.

Bullion

Futures Trading Resumed

AFTER a period of suspension extending well over three months, forward trading in bullion was at last resumed on Monday (October 24, 1955).

Recalling the causes which led to the closure of trading in forward bullion, the President of the Bombay Bullion Association drew the attention of the members to what the Bombay market had been able to save "by locating and remedying in proper time the malicious squeeze". He added: "We had an outstanding business of about 7000 bars of silver which would have been normally carried to the levels when we would have lost round about Rs. 20 lakhs

because the market has since risen by Rs. 11".

Referring to the Government's conditions in respect of the amended bye-laws he said "we have no alternative but to run the market in terms of the bye-laws imposed on us and accordingly we are starting trading in terms of the new bye-laws."

When futures trading started, it was on a buoyant note. In the absence of sizable selling, both the metals forged ahead, activities being confined to professionals and spot houses with scarcely any outside interest.

Arrivals in the local market as well as in upcountry centres were unexpectedly heavy and there was perceptible shrinkage in demand for the spot metal with the result that there was considerable selling by spot houses and the earlier gains were almost erased as a result.

Gold was comparatively firm although hedge selling at higher levels occasioned a small reaction here too. At the close silver quoted Rs. 170-9 and gold Rs. 95-3.

Village and Small Scale Industries

HAND and household industries have been given a position of vital importance in the Draft Plan-frame for the Second Five-Year Plan. True, they are not part of the final objective of the Plan-frame which is to increase national income at a certain rate and to provide employment for those who will come into the working age-group within the next five years. But they are crucial in the sense of being essential steps towards realisation of the objectives. The latter however have to be viewed not in isolation, but in relation to the subsequent plans. The increase in income aimed at is to be realised in stages, and what is achieved in the next plan period will lay the foundation for greater achievements in the subsequent plan periods. This is the idea behind the principle of unbalanced growth which has been accepted in the Draft Plan-frame. The proportion of the national income diverted to future production and the manner of its disposal which governs the allocation to heavy industry are being guided by it.

For the country to be able to support this relatively large investment in heavy industry or capital assets which do not immediately lead to a flow of consumer goods, it is necessary to look to other avenues of maintaining the regular supply of consumer goods, in the absence of which heavy investment will lead to large money incomes without a corresponding supply of consumer goods. Hand and household industries are expected to take care of the latter; so the first question to be asked is, "Will this sector be able to deliver the goods so that planned investment may be pushed on without resulting in a runaway inflation?" Since the responsibility for maintaining consumer goods supply has been deliberately put on hand and household industries in preference to the consumer goods industries which are to be allowed a limited expansion, it makes the question of supply of goods more important than provision of employment in this sector. True, the village sector is believed to offer opportunities of employment, but if the supply of consumer goods can be maintained at the required level, formation of social capital, construction activities and provision of social services can be made to take care of employment, even if the village sector fails to absorb substantial numbers.

To the very important question of hand and household industries being able to deliver the goods, the Karve Committee does not offer an answer. It cannot, however, be blamed for not doing what it was not asked to do. The Committee was required to frame a scheme for the utilisation of the resources to be earmarked for these industries in the Second Five-Year Plan with special reference to the following:

- "(1) that the bulk of the increased production during the Plan Period of consumer goods in common demand has to be provided by the village and small-scale industries;
- "(2) that employment provided by these industries should progressively increase; and
- "(3) that production and marketing in these industries is organised, in the main, on co-operative lines."

Let's look at PROGRESS—Stanvac Quiz No 1

YOU KNOW THAT INDIA'S 5-YEAR PLANS MEAN A BETTER LIFE FOR ALL. BUT DO YOU REALISE THE PROGRESS **ALREADY MADE** UNDER THE FIRST 5-YEAR PLAN? TEST YOUR KNOWLEDGE AGAINST THE QUESTIONS AND ANSWERS BELOW.

1 IN 1953-54 INDIA ACTUALLY GREW MORE RICE THAN THE PLAN CALLED FOR. IN THREE YEARS HER RICE PRODUCTION HAS INCREASED BY:

A) 1,460,000 TONS
B) 4,250,000 TONS
C) 637,000 TONS

2 COTTON IS ONE OF INDIA'S MOST IMPORTANT CROPS. BY 1954-55, THE AREA OF LAND UNDER COTTON HAD INCREASED BY:

A) 1,252,000 ACRES
B) 3,746,000 ACRES
C) 624,000 ACRES

3 THE PLAN INCLUDES PROJECTS FOR MAKING INDIA SELF-SUFFICIENT, AND ALSO FOR EARNING FOREIGN CURRENCY. IN 1954-55 EXPORTED INDIAN GLASSWARE EARNED:

A) 6 LAKHS
B) 12 LAKHS
C) 20.4 LAKHS OF RUPEES

STANDARD-VACUUM ARE PROUD TO PRESENT THIS TOPICAL INFORMATION ON INDIA'S PROGRESS—AND PROUD THAT OUR THREEFOLD ACTIVITIES OF **PRODUCING, REFINING AND MARKETING** OF PETROLEUM PRODUCTS ARE CONTRIBUTING TOWARDS IT.

ANSWERS

1 4,250,000 TONS—AN EXTRA 25½ LB. OF RICE FOR EVERY MAN, WOMAN AND CHILD IN THE COUNTRY!

3 OVER 20.4 LAKHS OF RUPEES WERE EARNED BY THE EXPORT OF INDIAN GLASS—VALUABLE FOREIGN CURRENCY TO BUY VITAL IMPORTS!

2 3,746,000 ACRES—AN EXTRA ACRE OF COTTON-GROWING LAND FOR EVERY FOUR AT THE BEGINNING OF THE PLAN!

4 372,365 BICYCLES—MORE THAN THREE TIMES THE NUMBER MADE FOUR YEARS AGO!

4 IN INDUSTRY, TOO, INDIA'S OUTPUT HAS RISEN STEADILY. IN 1954-55, THE NUMBER OF BICYCLES MADE WAS:

A) 372,365
B) 60,260
C) 124,120

Visit INDIAN INDUSTRIES FAIR, New Delhi, October 29—December 15

Later it was suggested to the Committee that as part of its terms of reference it might examine and report on the organisational pattern needed for the proper development of village and small scale industries, and that while considering this matter, it might draw upon the views of the State Governments also.

Also, though the terms of reference of the Committee were confined within the Draft Plan-frame, the vexed problem of definition which is by no means unimportant was left out from its purview. For 'small scale' industries have assumed a connotation which marks them off sharply from the usual type of village industries; this term is often used to signify the use of power, and by and large, it overlaps with the so-called medium-scale industries which are predominantly, though not exclusively, auxiliary to large-scale industry. In the problem of definition, therefore, is implicit one of the most controversial of the issues that are currently agitating the public mind. Is the Second Five Year Plan with all its bold claim of changing the pattern of the national economy to be tied down to medievalism and Lounder in the impossible attempt to combine huge capital investment in heavy industry with the hand-pounding of rice and the Ambar charkha? Are we to discard science and stoutly refuse to apply reason in everyday affairs of life which brought about the Industrial Revolution in other countries? The Draft Plan frame, however, looks upon village indus-

tries merely as a stop-gap arrangement.

At one of his press conferences, Prof. Mahalanobis explained that hand and household industries were a suggested solution for being followed "not for ever, but for five or eight years, to get unemployment under control.... We shall supply small machines, and electricity to the household sector to increase productivity. That is the only way in which the standard of life can be improved." Prof. Mahalanobis also conceded that to the extent that supply of consumer goods from the village sector falls short, the deficiency will be made good by relaxing restrictions on organised industry. But where the Draft Plan-frame goes wrong—if that is the implication—is in thinking that improvement of techniques is necessarily dependent on the bulk supply of capital goods, which is by no means always the case.

If the Committee did not pronounce on the ability of the village sector to supply consumer goods in the required quantity, it could not give a firm estimate of its employment potential either. In effect, the recommendations of the Committee, as indicated by the allocations suggested for different industries, follow the usual pattern of demand that has been voiced by the interests that are active in these fields. Cotton weaving (handloom) gets the largest allocation viz. Rs 80 crores, out of a total of Rs 260 crores. Small-scale industries come next, with an

allocation of Rs 65 crores. Cotton spinning and Khadi get Rs 23 crores, vegetable oil (ghani) Rs 13 crores and so on. The pattern of allocation is not related to the pattern of demand for consumer goods which is likely to emerge and which the Committee makes no attempt to estimate.

Finally, productivity is neither the sheet anchor of the Committee's recommendations, nor does it even figure as a criterion in its choice of alternatives. On the contrary, it turns down the recommendation of the Kanungo Committee that a proportion of the hand looms should be gradually converted into power looms every year, so that productivity and efficiency may not be entirely lost sight of. Again, on the question of hand-pounding of rice, the Committee sides solidly with those who will have no truck with hullers or any improvement.

To the credit of the Committee, however, it should be said that it has commented, very particularly, on the absurdity of the present situation in which the village and small-scale industries are handled by different Ministries. Bringing them together under one Ministry is an essential first step to which it has rightly drawn pointed attention. The stand taken by the Government members on the Committee, however, suggests the inadvisability of incorporating officials in such committees of enquiry. There are better means of getting the views of the Government which in any case has the last word.

Step by Step

AN interim inference may be drawn from the deliberations to date of the four Foreign Ministers' Conference at Geneva. Both sides have gone to Geneva to bargain for concessions from one another. Both are conscious that each side is anxious to prevent an atomic war. With certain ultimate reservations, there is agreement on this issue. It follows that, except under certain aggravating circumstances, a period of uneasy peace will replace the preceding decade of "cold war". This was the achievement claimed by the four Heads of State at the 'summit' conference. Subsequent events have belittled their achievement. A sense of security should have led to a progressive betterment in the world situation. Instead, it has fostered a feeling that, with an understanding to avoid an atomic war, diplomatic efforts can now be intensified

to maintain a world balance of power through creation of spheres of influence. On all the issues under discussion at Geneva, the Western Powers' attitude is influenced by this basic consideration. Russian policy implies this aspect of the problem. But she has the diplomacy to feign sincerity. This may be machiavellian. But Russia can plead in defence that her diplomacy stems from the Western Powers' mental reservations.

Once these underlying motives are realised, it becomes clear how, and why, M Molotov manages to maintain the diplomatic initiative at Geneva. Both sides have enunciated their respective proposals for reconciliation of issues in dispute in Europe. From the plan proposed by the Western Powers, their intentions are evident. Russia's original proposal is decisively more logical.

Her amended plan answers the basic objections of the Western Powers. They are unwise in insisting that unification of Germany must precede any plan for European security. They concede the relation between the two issues by offering a non-aggression pact, even as Russia's original as well as the modified plan for European security involves a simultaneous solution of the German problem. It is difficult to understand why the Western Powers' proposal does not imply a parallel solution of both these problems. Here, Russia is more logical. There are indications that the Western Powers may concede the Russian claim for a simultaneous solution of the problem of Germany and of European security. Washington can only blame itself for letting Moscow have the diplomatic initiative on this issue. It stands to reason that

a "step by step" plan for a parallel solution of these two problems is the most logical.

If the wider framework of the Russian plan for the parallel solution of the twin problems that threaten peace in Europe is more constructive, her proposal for the solution of the German problem is equally more democratic. It is significant that the Western Powers do not deny Russia's interpretation of their plan that it implies creation of a future united, armed Germany as a NATO partner. This, Russia can, or will, never accept. This is not the only aspect of the German problem on which Russia retains the diplomatic initiative. While the Western Powers imply that the occupying powers, they and Russia, will decide and arrange how the two Germanys are to be united into a single sovereign State, all the proposals made by Russia leave the initiative to the Germans themselves to decide their future status and alliance. Russia has only one reservation. Either the future, united Germany is to be neutralised, or arrangements for a system of European security must be such as to offset the implications of a united, remilitarised Germany. America may not, but both Britain and France will, endorse the substance of the Russian policy to Germany.

Russia's amended proposal for a sixteen-nation security pact for

Europe is primarily aimed at preventing admission of a future, united, sovereign Germany into NATO. It is an ingenious proposal. But only those who have not carefully followed Russia's policy since the conclusion of the Austrian Treaty will be surprised at M Molotov's new plan for European security. It involves the creation of a demilitarised zone in Europe along with the conclusion of a European security pact. It was inevitable that the buffer zone, now proposed by Russia, will include both halves of Germany. But it is not without significance that the buffer zone, proposed by Russia, will, besides the two Germanys, include "all or some neighbouring States". It is, therefore, clear that Russia has no objection to include Poland, Czechoslovakia, Hungary and Rumania in the buffer zone. It is, in essence, the Eden proposal for creating a demilitarised zone or zones in Europe as a preliminary to phased disarmament. It cannot be expected that this new Russian plan will be accepted by the Western Powers without certain amendments. There is scope for modification of the new Russian plan for European security. Though the American Secretary of State is sceptical, it is a good augury that the British Foreign Minister recognises that the second proposal is an improvement on the original Russian plan for European security.

At Geneva, the British Foreign Minister has repeatedly stressed the need for the continued existence of defence pacts. Russia's new plan for European security concedes this claim by excluding any proposal for abolition of NATO and its Eastern counterpart in the next two to three years, though it provides for ultimate elimination of all such military alliances. Any such concession may reflect Russia's desire to reach a workable arrangement on the issue in dispute in Europe. But it focusses attention on the main source of world tension. There can be no lasting peace without disarmament. But developing events indicate that the Western Powers are interested in making Russia realise that a working agreement on the issues in dispute can be reached even without an understanding on the basic problem of disarmament. This means that NATO, the Warsaw pact, the Baghdad pact, the race for armaments in the Middle East, SEATO and similar other military alliances will continue. Desire of the four Foreign Ministers to reach some understanding, however imperfect, on the disputed issues, is understandable. But it would be idle to pretend that world tension can ease materially as long as military pacts continue and the faith in the balance of power theory persists.

Weekly Notes

No Doctors for All!

THE question of expertise that the Planning Commission can command or intends to use comes up all along the line, if its recommendations are not to be dictated by the Ministries themselves. The latter usually are hidebound by inflexible precedent; to suggest this is neither to cast aspersions on or show disrespect to the worthy civil servants who run the departments. Besides being hidebound, policies and measures worked out by the departments are rarely inspired by a vision of all round development or informed by that sense of urgency to impart which we need a separate Planning Commission. But just as Ministers inevitably surrender themselves to their secretaries when they lack grasp of the problems of their respective Ministries and also the character, drive and determination to direct affairs effectively, members of the Planning Commission find themselves in a helpless position in the absence of their own independent expertise. This happens, to repeat, all along the line. If in the case of railways the Planning Commission has not so far tried to assess existing capacity, in the case of a national Health Plan it is being led by the nose as in other things.

To end the present paradox of extreme shortage of qualified doctors, and the lack of adequate openings for the medical graduates who come out year by year, which leads to overcrowding of private practitioners in the bigger cities, medicine has to be socialised. An essential first step for it is a revolutionary change in the present system of training of doctors. A six years' course and Rs 50,000 per head all told cost of training cannot be squared by any stretch of imagination, with the needs of the country, if the half a million villages and small towns are to have the minimum of health service. But even to suggest that the period of training could perhaps be reduced and the cost brought down will cause consternation among the upper ranks of the medical hierarchy. In the past, even Major General Sokhey would not hear of it, but the times have changed and there are more open minds even among the medical profession who realise today the compulsions of social medicine in a

poor country. But who will get them together to work out a practical national health Plan?

Meanwhile the formulation, not of such a plan, but something else is under way. The Co-ordination Committee of the Health Panel and the Planning Commission has met. It is expected shortly to finalise its recommendations which will form the basis of a national health plan.

Fresh Exodus from East Bengal

SENSE of insecurity or impossibility of earning a livelihood, which is the more potent factor at the moment behind the fresh exodus of Hindus from East Bengal? Over-shadowing both is the unchanging, unvarying and ever-present fear that Hindus can have no future in an Islamic state. True, there has been nothing in the recent political developments in that unhappy state to make the Hindus feel less secure than they had done before. On the contrary, the eclipse of the Muslim League in East Bengal for a time awakened the hope, though not in the hearts of the East Bengal Hindus, perhaps, of a change for the better—the hope that the semblance of a secular, democratic state may replace the projected Islamic state. Despite the liberalism and broad-mindedness of the present Chief Minister of East Bengal, the League has managed to re-establish its hold on the centre. The Hindus certainly do not feel more insecure than they did in the past, but the hopes aroused by the electoral honeymooning has vanished and they have scarcely any reason to feel secure. The remnants of Hindu professional classes in the East Bengal capital who are tolerated because they cannot be easily replaced have no acute economic problem. In fact quite contrary is the case for a fortunate few and barring pinpricks such as income tax probe and currency regulations which deny them all facilities for remittances, they have nothing to complain on that score. Few of them, however, any longer think of East Bengal as their home where they can live with their family and bring up their children.

But question of security apart, if Hindus find it impossible to make a living, to what extent is it due to discrimination or any special disability to which they may be subject? Pro-

portionate representation in the services is the sort of thing that is usually thought of on such occasions and quite naturally too. For something could be done about it at the top political level. But if one compares the numbers who are leaving and the number of jobs that could possibly be offered to the Hindus, as also the occupational distribution of people who are coming away, it would be obvious that representation in services may be a good talking point at Government level. It may even ease a little the sense of insecurity if an appreciable number of Hindus are given higher administrative posts but it will not touch the heart of the economic problem.

Shri C C Desai has indeed a challenging assignment if he has to rehabilitate the Hindus in East Bengal, for it is nothing short of economic rehabilitation of East Bengal itself. Only if the economic conditions in East Pakistan improve, can Hindus and Muslims make a living.

Within the general frame work of the East Bengal economy, however, the occupational pattern of the Hindu population creates some special problems which are well nigh insoluble. Not many of them are cultivators; so they will not benefit from the acquisition by the State of intermediary interests in land which is now on the cards. Where and how will the displaced rentiers be absorbed? To be able to do his job well, Shri Desai has also to ensure that the rate of economic development in Pakistan does not fall too far behind that in India. Surely, in addition to slowing down rehabilitation of refugees, it is not suggested that India should slow down development also in order to discourage exodus of Hindus from East Bengal.

Instead of all this idle talk, what the two governments can easily do, both to reduce the sense of insecurity and improve economic opportunities, is to relax restrictions on the movement of men and money—and improve travel and remittance facilities. Four hour detention at Darshana does not appreciably affect smuggling nor does Pakistan's ostrich-like attitude to remittances visibly reduce free market dealings in currency or raise the real exchange rate of the Pak rupee.

Are Railways Doing Enough?

THE daily average loading of goods wagons on the Central Railway showed a 14 per cent rise last month, compared to what it was in the same month a year ago. This is on the broad gauge. On the metre gauge also, there was a substantial improvement, loadings being 11.6 per cent higher than in October last year. This has been possible, we are told in a press note, by more extensive employment of the principle of "directional loading", which enables better clubbing of consignments. Moreover, wagons are now carrying heavier loads than before and if the weight of goods loaded last month is compared to what it was a year ago, the performance is even better than the increase in the number of wagons loaded suggests.

All this, we are further told, is not due to directional loading alone. There are other reasons. Among the measures recently introduced to improve operational efficiency are increased hours of working at goods sheds and night transshipment at break of gauge points. This helped to cut down the time taken for turn round of wagons. More efficient working in marshalling yards has reduced the period of detention of through wagons while quicker release of wagons from 'sick sidings' and quicker turn out of wagons from workshops have increased the number of wagons available for loading. Though it is last month's performance that is highlighted, presumably because it is the best so far, over the period of a year, the increase in goods carried have been far in excess of the increase in the number of wagons and engines working on the line.

The attention drawn by the press note is very timely indeed, for the allocation to railways in the draft Plan-frame has come in for a lot of criticism and it is now generally accepted that the earlier plan put up by the Railway Board was woefully inadequate. And though at the moment with all this talk about perspective planning and the general uncertainty created by agitation over the re-organisation of states, plans and estimates are more fluid than ever before, it is on the cars that railways will get more, indeed so much more that the entire Plan-frame may be changed beyond recognition as a result. It would be very pertinent at this moment to scrutinise the idle capacity in our railways and in the transport system

generally, before a final decision is taken on their financial requirements. Are we getting enough from our railways?

Sizing up Idle Capacity

TRUE enough, the Railway Board publishes in its annual report fairly exhaustive data from which those who have the patience and perseverance may gather some idea about their operational efficiency. No

member of Parliament, however, wastes his time on this unrewarding labour. Amenities for 3rd class passengers make news, increased number of air conditioned coaches creates goodwill among people in high places. But net ton miles per wagon day or per train engine hour is of little immediate profit to anybody. The Railway Minister trots out these figures as a matter of routine but the variations in any

NEW INDIA STORIES FROM LIFE . . . 2

'My advice saved this boy's future!'

Years ago, I persuaded my good friend and neighbour to take out an insurance policy. He thought I was being fussy, when I brought up the question of his son's education. His son was just six months old then!

Ten years later, my friend was struck down in the prime of life. A sudden heart attack, and he died almost at once. I took over the guardianship of his son.

Today, the boy is studying to be an engineer. The New India Life Assurance Policy his father invested in has paid for his education. And imagine my feelings, for indirectly I had ensured a successful future for the son of my friend.

An insurance policy taken out now
may one day stand
between you and disaster.
For full information, write to

THE NEW INDIA ASSURANCE CO. LTD.,
Mahatma Gandhi Road, Bombay 1.

case are too small, there is no drama in them and they are too monotonous to interest anyone. Let us take the latest figures available, viz. for 1954-55. Here are the main findings:

1 In 1954-55 the average speed of goods train on Indian Railways greatly decreased as compared to 1951-52.

2 Engine miles per engine failure (i.e., the number of miles that would have been run by the engine normally had there been no failure) increased in 1954-55 as compared to 1951-52, 1952-53, and 1953-54.

3. Net ton-miles per train Engine Hour decreased in 1954-55 as compared to 1953-54.

4 (a) Wagon miles per wagon-day showed a slight increase in 1954-55 on the broad gauge as compared to the previous year.

(b) Wagon-miles per wagon day showed a very marked decrease in 1954-55 on the meter gauge as compared to previous years.

If an average is taken of broad gauge and metre gauge, there is practically no improvement made 1954-55 in the wagon-miles per wagon day as compared to the previous three years.

5 (a) Net ton-miles per wagon day on broad gauge increased in 1954-55 as compared to the previous years.

(b) Net ton-miles per wagon-day on metre gauge decreased appreciably in 1954-55 as compared to previous years.

Here, too, an average of the two gauges show little progress.

6 (a) Average daily loadings (of four-wheeler wagons) on broad gauge increased slightly in 1954-55 as compared to previous years.

(b) Average daily loadings (of four-wheeler wagons) on meter gauge hardly showed any improvement in 1954-1955 as compared to previous years.

This makes depressing reading, the Central Railways hand out does not. One has only to look at this picture and that, and the temptation become difficult to resist to enquire why has not Parliament wanted an enquiry into the operational efficiency and economy of working of our railways? Projections from past data served up along with fragmentary data on the transport component of individual projects may tell us something about future requirements, but they can throw no light on this crucial question. Would it

not be more sensible to ask how much more can we get out of our railways without much substantial capital investment, before the allocations are finalised? The Planning Commission can certainly commandeer or import the expertise needed to size up existing idle capacity.

There are small things which escape notice. A year ago the Railway Board asked all the zonal railways to introduce night loading i.e. upto 9 p.m. instead of 6 p.m. as hitherto, wherever necessary. We should expect appreciable results even from such simple measures, perhaps some of them have already been reaped. It would be good to know if the other railways have also some thing to show comparable to what the Central Railway has achieved.

Looking For Oil — Deshi Way

"EARTHQUAKES to order

"A small, controlled earth tremor is one of the geophysicist's most important tools in his quest for the world's crude oil resources.

"These earth tremors are set off by small explosive charges buried in the ground. When the geophysicist explodes a charge, 'shock waves' are sent downwards into the earth, and are reflected by layers of rock deep in the earth's crust.

"The waves that return to the surface are picked up on sensitive receivers. By measuring the time between the detonation of the charge and the return of the various 'echoes', the geophysicist can glean valuable information about the strata beneath him. Indeed, he can often draw an 'underground map' of the area and so predict where there might be oil."

This is from an ICI advertisement, reproduced free of charge! And an ad. in so respectable a paper as *The Economist* means that it must have passed the test of advertising ethics set by whatever association there might be in Britain to check up on these things. Prospecting oil may not be as simple as all that and the ICI may not be able to supply the specialised equipment needed for 'Seismic Prospecting'—they advertise only the explosives and detonators used for the purpose—but the story does not look so very different in the Burma Shell film in which they show prospecting for oil in Assam.

This, it may be thought, is making light what is taken in simple trust as not only the mystery of mysteries, but also the biggest capital venture viz. striking oil in these days when virgin fields have all been mapped, and duly acquired by the oil companies from Sheikhs and others.

A little while ago we were told oil was right around the corner, and of all places, in West Bengal, the only point that remained to be explored was whether the great crack had pushed out all the oil into the Bay of Bengal or reserve could still be tapped in the Sunderbans. Now the Ministry of Natural Resources which is responsible for such things does not belong to the group which gets what it wants. But West Bengal means Dr Roy and so prospecting did not lack a sponsor. The outcome was the Indo-Stanvac Petroleum Project for the joint exploration of petroleum for which in the budget for 1954-55 a provision for Rs 25 lakhs was taken. Now Americans believe in "Live and let live". So to the complications of oil exploitation, which are bad enough, they have added a system of subsidies and contracting out. In this particular case, the job of exploration was contracted out to another firm which specialises in this sort of thing. Of course, since the Government of India was a partner in the project, Indian personnel was to be associated with it but right in the beginning, they came into a head-long collision, with the American team doing the prospecting. American technicians have to be tough, otherwise they would not be American technicians. In this particular case they seem to have over played their part and what happened afterwards no one knows for certain. For a Russian team is now here to do the geophysical survey or to help the Geological Survey to improve its organisation for the purpose. Whatever it be, one no longer hears about oil in West Bengal. Even the more imaginative of the news agencies have given up filing stories about it.

What happened to Indo-Stanvac?

WILL some member of Parliament table a question and ask what happened to the Indo-Stanvac Petroleum Project? In the last budget also, credit was taken for Rs 29 lakhs under this head. But in the notes on important schemes in the Explanatory Memorandum, nothing was said about this project except

the financial provisions. This was intriguing in itself, considering that a year earlier, the Memorandum had hinted at interesting possibilities. To quote from it:

"The Standard Vacuum Oil Company carried out an aero-magnetic survey of the West Bengal alluvial covered tract of 25,000 sq. miles for exploration of hidden oilfields. The data collected during the aero-magnetic survey indicate possibilities of favourable results but this forms only the first part of an extended investigation and further ground survey work and boring for oil will be necessary before it can be said with certainty that anything positive will ensue."

Nowadays even inventions are no longer accidents: they are designed, have to be planned and paid for. Oil has a peculiar habit of springing up where, it may be suspected, the oil magnetes want it to spring up, in response to the complex and delicate world-wide pattern of investments of the oil companies. That is perhaps why after lying undiscovered for ages, the oil bearing strata in Assam came to light all of a sudden at a convenient moment, after Stanvac threatened to appear on the Indian scene in a big way.

May be there is something in the ad. Prospecting may not be such a holy mystery after all. But—is it not high time that we were more resource conscious and let our boys fool around with the new gadgets which have now become so handy?

Safeguarding Life Fund

THE section of the Insurance Act dealing with misfeasance in respect of the life fund has been amended by the very unusual process of the promulgation of an ordinance. The purpose is to widen the scope of this section so that those playing with the life fund may not escape on the technical ground they were not "directly concerned with the affairs of the company" in question. Section 106 of the Act reads as follows:

"If on the application of the Controller of an insurer or any member of an insurance company or any policy-holder or the liquidator of an insurance company in the event of the insurer being in liquidation the Court is satisfied that by reason of this Act the amount of the life insurance fund has been diminished every person who was at the time

of the contravention a director, manager, liquidator or an officer of the insurer shall be deemed in respect of the contravention to have been guilty of misfeasance in relation to the insurer unless he proves that the contravention occurred without his consent or connivance and was not facilitated by any neglect or omission on his part etc."

By the amendment, persons who may not be directly connected with the affairs of the company may also be made liable for misfeasance under certain circumstances. The court may compel the parties both to restore money or property which they have wrongfully taken and for losses suffered by the insurer due to their misdeeds.

A new Section has been added to the Act which empowers the Administrator and to the court to ensure that property does not disappear in

the guise of "benami" transactions and for this purpose the court will have powers to ascertain facts regarding the nature of the interest of any person in any property whether standing in his name or otherwise. The property of private companies which are controlled by such persons can also be attached under the aforesaid provisions.

Comment is superfluous. Physical custody of securities, representing the investments of the life fund, with the Reserve Bank, for example, which has some times been suggested, is really, quite superfluous. It will also interfere with the flexibility of operations necessary for the most profitable utilisation of resources. Perhaps a record of all the transactions in these securities carried on during the year could be made a part of the routine check as a safeguard.

Hyderabad State Bank

(Constituted under the Hyderabad State Bank Act with Liability of Members Limited)

Authorised Capital:	O.S. Rs. 1,50,00,000/-
Paid-up Capital:	„ 75,00,000/-

From the Calcutta End

That Puja Feeling

CALCUTTA was on holiday for the last ten days of October. In the first half of last week, Bengalis celebrated Durga Puja. They spent the second half of the week in offering and accepting Vijaya greetings. On Sunday last, they worshipped Lakshmi, the Goddess of Wealth. From the beginning of this month, they resumed work and their normal life. The care-free days, the gay, holiday mood, are over. Calcutta is again busy. Offices have opened. Dalhousie Square is no longer deserted.

Autumn is at its best now. The rains are over. The climate is cool. The sunshine is bright. The sky is blue. Work has been resumed. But the holiday mood still lingers. In overcrowded trams and buses, one hears office-goers discussing this year's Puja celebrations. In cafes, one hears serious-minded youngmen compare and criticise this year's Puja supplements published by Calcutta's numerous dailies and periodicals. This holiday mood will last till Diwali.

This year's Puja celebrations were less noisy, but more crowded during the days when it was not raining. They are all welcoming the ban on loud speakers. There is much that can be said against the Calcutta Police. But there is one thing the Calcutta police know. They know how to regulate traffic. It was perfect on the night when immersion took place.

One may add a footnote. Buses and trams on that night were not more crowded than those are every day during 8 to 11 a.m. or during 5 to 7 p.m. That was because more State and private buses were run on the immersion night. It should be possible to run more buses for a couple of hours in the morning and evening every day. Some such arrangement may ease the traffic congestion during the busy hours.

Durga Puja celebrations are over. Throughout this week, variety entertainments will be held in Sarvajani Puja pandals. Some forms of these entertainments like the jatra or the tarja are having a welcome revival. Those who are not-too-young prefer these art-forms to modern songs by various artists. During the Puja, there is something for everybody. If the kumars, the drummers, the writ-

ers earn some extra money during this season, why should not singers and folk-artists also earn some extra money?

One has had occasion to muse over some strange contradictions in Bengal to-day. One such contrast depressed one as one watched the immersion processions. *Alti* is a form of devotional dance danced before the image of Goddess Durga every night for the first three nights. That *Alti* is a picturesque-dance-monument, came vividly to one's mind as one watched a Sindhi lady imitating this dance-form almost to perfection. *Alti* is not very popular in West Bengal. But, at the immersion processions, teenagers, were seen dancing some Latin American dance-forms to the accompaniment of bag-pipes. One felt sad at this intrusion of morbid modernism.

Over and over again, this incomprehensible dualism in life, society, culture, politics and economics of present-day Bengal has been stressed here. Take *Kirtan*, for instance. *Kirtan* is a form of devotional song which is typically Bengali. There are serious-minded persons who are making commendable efforts to revive *Kirtan* in its pure form. One may have one's doubts whether *Kirtan* is amenable to Svaralipi (notation). Variation, interesting diversion, is the essence of *Kirtan*. But such attempts at Svaralipi have been made, one gathers from a distinguished *Kirtanwallah* to revive and to maintain it in its pure form. The Calcutta University has engaged the services of an expert to make notations for *Padavali*. There are *Kirtan* performances which are well attended, where virtuosity is highly appreciated. *Kirtan* performances at fashionable theatres are packed to overflowing, though the tickets are fairly high-priced and the standard of performance is rather poor. One does not expect virtuosity at mass performances of *Kirtan*. But one wonders how a Bengali who keenly appreciates *Kirtan* in its pure form can also be so enthusiastic over *Khanda Kirtan* (the modern popular version).

If *Kirtan* is characteristically Bengali, Bengal still maintains the lead in film-making. Bengalis have made many films of which they can be proud. *Pather Panchali*, directed and

produced by an artist of a well-known advertising agency firm and financed by the West Bengal Government, is a great film. Its sound recording and music direction are not faultless. But, it is the best film yet produced in Bengal. Altogether, it is perhaps the best film yet produced in India.

It is a magnificent achievement for the director. It is a tribute to the West Bengal Government that it has patronised and financed the production of this film. It is a reflection of the Bengali's appreciation of creative effort that *Pather Panchali* is a box-office success. And yet, puzzling as it may seem, the rush and demonstration at the opening show of an indifferent film at a nearby cinema-house was so heavy that Police had to make a mild lathi charge!

As in appreciation of fine arts, so, in the normal economic life, Calcutta is a bundle of contradictions. A visitor to Calcutta cannot escape the conclusion that it is a City where only a millionaire or a pice-hotel-wallah can live. For the rich, Calcutta offers a variety of amenities and conveniences. But the rich are too few in this City. There are many pice-hotelwallahs. There are many middle class people. This last section of the City's population leads a miserable life. It is surprising how the middle-class manages to exist in this City.

Calcutta is a hopelessly costly city. And, a middle-class person cannot get value for his money. He cannot afford the rent he pays. But he pays it, and yet does not get any comfort that his opposite number in, say, Bombay is used to at less cost. He cannot pay the high charges that doctors ask or the high prices for medicine that druggists demand. And yet, there are many doctors here who must be objects of envy by their Bombay colleagues, as also many druggists here who must be thanking their stars that they are doing business in Calcutta and not in Bombay. There does not seem to be any co-relation between the average income and the cost-of-living in this City. This may sound nonsense to an economist. But, then, there are not many sociologists who do not know that the rapid impoverishment of the middle-class in the major menace to Bengal and Bengalis.

Letters to the Editor

Tariff Commission on Rubber Tyre Prices

H T Parekh

I HAVE read with interest your article on "Fair Prices of Rubber Tyres" in your issue of 8th October 1955. I agree with you that there is little justification for bonus to labour not being allowed as an item of cost. What is, however, more difficult to justify is the Commission's assumption in determining fair prices. In previous enquiries the Commission adopted the formula of 8% on gross block for calculating fair profits. In the present enquiry, it must be set to the credit of the Commission that the basis adopted is that of capital employed. But the Commission's assumption that a gross profit at the rate of 10% on capital employed should be permitted must be regarded inadequate as well as unfair to industry in general.

The Commission has adopted this formula without any explanation or justification. A gross profit of 10% is equal to a net profit of about 5½% when allowance is made for taxation at 45%. How is any industry to pay a reasonable return to the investor and plough back profits for development out of a total return of 5½%? Or a basis such as that adopted by the Commission no industrial development would be possible. Had the Commission taken as its basis a net profit of 10% after allowing for taxation, its conclusion would have been nearer the mark because that would enable a reasonable return to the investor and also permit provision of adequate reserves.

The Commission has itself found it difficult to justify this basis and the weakness of its argument is best disclosed in its following remarks:

"In calculating fair profits, we do not consider it proper to take into account the additional dividend liability incurred by the company by issuing bonus shares".

The Commission accepts calculation based on capital employed and in the same breath rejects that part of the capital which was credited by capitalisation of reserves. It is indeed surprising that the Commission should resort to the specious argument that only original or "historical" capital should be taken into account and no account taken of capitalised reserves.

This line of reasoning would deter not only foreign capital but also

domestic capital, if it is extended to other industries.

The best argument in the Commission's favour was the comparative profits earned by the Dunlop Rubber Co. (India) Ltd. and the parent concern in U. K. The relatively higher profits in India would obviously warrant some price reduction but not on the grounds put forward by the Commission.

[The Commission's obiter dicta on bonus shares are unfortunate. Shri Parekh is certainly on firm ground in criticising the historic basis of valuation to which the Commission turns while unearthing the past 'excess' earnings of the company. But for judging present performance and for fixing fair profits for the future, the Commission does not adopt this basis. Capital

employed, which is made the basis for determining fair profits for the future, includes bonus share also and it is in any case much larger than it was in 1951. Returns on this basis, the Commission argues, would be adequate to meet the company's commitments and also make reasonable provision for reserves. Profits on this basis will enable shareholders to get much more than 5½ per cent net of income-tax, after setting aside reasonable reserves.]

Shri Parekh's observation, however, that higher profits earned by the Indian subsidiary, as compared to the parent company, are the "best argument in the Commission's favour" ignores the contention that as the parent company has to incur all the expenditure for research and development, its profits are necessarily lower, the implication being that they have to be compensated by higher earnings of the subsidiaries —Ed.]

E B Refugees in Other States

YOUR correspondent in Calcutta writes often and on on the problems of East Bengal refugees—this is really welcome. But his reports are not well based on facts; they are reports of press reports and even then, not very well summarised.

In the issue of 22nd October he notes (and I remember almost the same in the past issues) "East Bengal Hindus can be blamed for their incapacity to adapt themselves to new environments". This is the usual propaganda made by the Central Government officials concerned and also by some State Government officials, and echoed by a section of irresponsible press reporters, who just repeat what they are told and who do not take the trouble of going for themselves into this question of the settlement of the refugees outside West Bengal.

East Bengal refugees have very well settled down in the Andamans and in Naini Tal but they have failed to do so in Bihar and Orissa, because Bihar and Orissa, did not (and for that matter, the Central Government and State Government of West Bengal did not) take the trouble of looking at the lands where these refugees were to be settled. Human beings can be settled even in deserts, but not in an absolutely unwelcome atmosphere. Of course the absence

of any possible means of livelihood was also a reason for their failure to settle. I can write from my experience gathered from some of those who came back that if they are to be blamed, their minimum wants should be met first.

Your correspondent also refers to 'Plan outlines' about the schemes formulated to rehabilitate the DPs and he does so in connection with the Conference of the Rehabilitation Secretaries. The Ministers concerned have by now met and deliberated on the problems. Both as a corrective and a rejoinder to your correspondent's points, let me quote the following from a press report:

"The main impression gathered at the conference, however, was that it did not seem to produce any substantial schemes for resettlement in other States of the new arrivals (about 8 lakhs) despite the sympathy and concern about the magnitude of the problem expressed by other States participating in the conference" (The Statesman, Calcutta, 26-10-1955).

Those who attended the above conference in their official capacity are more frank, off the record, but they would not care to go into print.

'Attenuation of Hyderabad'

(From an Andhra Reader)

AS an Andhra who believes in the desirability of the immediate formation of Vishalandhra, I may be permitted to reply to some of the points raised by 'Mulki' in his 'Thoughts on the Attenuation of Hyderabad'.

I am at a loss to know on what precise grounds he is defending the retention of the present Hyderabad State. The State as it now exists has no inherent homogeneity and its boundaries have been set by what the British powers let the Nizam hold. What unity there has been, has been imposed from the top in an administrative and political sense by a feudal oligarchy, which your contributor has been most vehement in criticising and rightly so. As for the common people of Hyderabad, the ties between the peasant in Nalgonda and his counterpart in Aurangabad or Raichur—mulki all, in the real sense of the term—were nothing more than tenuous. It is idle to pretend that there is more in common between them than with their counterparts in Andhra, Maharashtra or Karnataka.

Your correspondent also makes much of the supposed apathy of the Andhras towards the sufferings of the Hindus of Hyderabad in the days of the Asaf Jahi dynasty. It may be remembered that that was the time when Andhra, like the rest of the country, was engaged in the struggle for freedom from the British—surely a more formidable opponent than their 'Faithful Ally'. The alleged misbehaviour of some of the officials—even the pronounced anti-Andhra bias of your correspondent hasn't led to his describing all of them as Andhras!—is a matter for regret but individual misdeeds cannot condemn a people. The Osmania University is mentioned as an instance of the Circars Andhras ousting local candidates. The Vice-Chancellorship of Osmania is, I believe, an elective post and if these allegations were true, the present incumbent would not have been re-elected by a body largely composed of mulkis. In any case, it would be interesting to find out how many Circar Andhras have been imported to displace local mulkis 'with high academic qualifications'.

The rest of your correspondent's diatribe against the Andhras may be dismissed as the sentimentalized outpouring of one nostalgic for what according to the writer himself were the not-so-good old days. The mention of the Circars Andhras poking fun at the racy accent of Hyderabad's Telugu speakers is hardly an argument, even if true. Accents differ from place to place and it is not uncommon to see one group making good-humoured fun at the expense of others but this cannot be made a serious argument any more than that differences in accent between a Mancunian and Cockney make either of them less English.

The author's nostalgia has led him into belief in the cultural unity of the State. What in common, for instance, do Ajanta and

Ellora have with the scene of activities of European adventurers with or without local harems? Or again to say that as a result of disintegration, kababs would no longer be available is on a level with saying that the British should not have departed from India as crumpets and muffins might not be available. Surely, the gourmets of Hyderabad, who raise kababs to the level of political argument could also be depended on to see that the kabab shops do not close down even if Vishalandhra was formed.

Your correspondent is understandably not enthusiastic about the fact that no less than 69 out of 95 Telengana legislators have pleaded for Vishalandhra. No one can deny that they are all mulkis and they certainly know what they are doing.

Britain's Budgetary Crisis

THE supplementary budget proposals presented to Parliament by the Chancellor of the Exchequer this week defy all common understanding and reason. When the inflationary impact of the 1954 budget was first felt at the beginning of 1955, all had anticipated that the April budget would supplement the monetary restraints that were then called into being. But the opposite was the case—the standard rate of income tax was reduced and the ingenious "investment allowances" given to private industry were maintained. The Chancellor in those days—and those were election days—persisted in protesting that there was no "crisis". Now when the trade returns and the balance of payments of the United Kingdom reflect a favourable trend, the Chancellor chooses crisis measures to meet what is hardly a critical situation. It was therefore inevitable that Mr Gaitskell of the Labour Opposition should characterise the Chancellor's April 1955 policy as a "masterpiece of political deception" and that "he must go". It is equally inevitable that an exposure in these terms should receive widespread sympathy in the country.

This inconsistency in the Conservative Government's economic policy is, however, only an apparent one. It is now clear that when the Tories assumed power in 1951, they were playing for high stakes. There was first the need to maintain for themselves the power to undo all that Labour had conceived and put into practice in the transformation of Britain into a "welfare state". Next there was the long-term aim of re-establishing Britain as a world power and, more particularly, as the foremost Colonial power. In economic terms this had meant for the Conservatives a world in which the direction of trade and payments would be dictated by that vast economic and financial complex which is the City of London. In choosing these paths, as it is now clear, the Conservatives were prepared to overcome obstacles such as a General Election by ways and means which, to say the least, were unusual in British politics. In order to win the General Elections they deceived the electorate by what the Labour Opposition now terms "bribes".

They spoke alluringly of "doubling the standard of living in twenty-five years". When the time comes, as it has now come, to call off the "bribe" they devise measures which are not only out of keeping with the exigencies of the moment, but also utterly distasteful and reactionary. That these measures were, in any event, politically dangerous is obvious; that they would provoke sustained bitterness on the industrial front, however, appears to have had little influence on Tory aims and thinking.

The budgetary measures themselves suggest that the Conservatives are bent on converting the system of taxation and revenue in Britain into an utterly regressive one. While the income tax is left untouched, application of the purchase tax is widened with little regard to the income groups which are most touched by that tax. To quote Mr Gaitskell,

"I believe the Chancellor is doing this because he contemplates later on converting purchase tax into a general sales tax—convenient to collect, but extremely regressive".

The new budgetary proposals bring within the purview of the purchase tax a whole series of indispensable household goods, most of which could never be conceived of as being in the luxury or consumer-durable class. It is this indiscriminate application of the purchase tax which makes it most difficult to see how the British consumer could accept the Chancellor's plea for "a restrained demand". To the higher income groups the burden of the new tax is negligible and these groups will therefore not cut back on their demand. For the poorer sections of the population, the purchase tax on indispensable household needs will likewise lead not to a cut in their consumption but rather to an increase in their cost of living and it is here that either by a gross miscalculation or by wilful abandon, the Government courts one of the most serious of crises in industrial relations. Who can now oppose demands for wage increases on the part of the Trade Union movement?

This assessment of official policy is serious enough. But by another deception, a new development in

economic policy is introduced which leads for the first time to a major reversal of the welfare facilities normally provided by the State. The deception was that the authorities had to cut down on their own expenditure in order that the supply of goods and services in the country would be able to meet demand at unchanged prices. In informed circles there was little doubt that the cut in Government expenditure would take the form of a pruning of the military vote so that the current £4,800m. rearmament programme would be reduced to a level which the economy could bear. In fact, the cut in Government expenditure has taken the form of a severe attack on the Government's and Local Authorities' housing policy. The standard housing subsidies which are granted by the Government in order to keep Local Authority house rents at a level commensurate with income standards will now be recast. In conjunction with this the cost of Local Authority borrowings will rise and, further, under Government direction, the housing outlays will be substantially reduced next year.

Another feature of the unusual proposals of the Chancellor of the Exchequer is that relating to the measures designed to cut down on the level of investment demand in the country. Instead of withdrawing the 1954 investment allowances granted to private industry so that the extent of new investments taking place in the country could be reduced to levels which the economy could bear, the Conservative Government has rather made a direct attack on the nationalised industries. The various plans for re-equipment and expansion in the Gas, Electricity and Coal industries are now to be held back so that, in the first place, Mr Butler will be able to bridge the gap between demand and supply and, secondly, so that private industry can continue with their own plans, whether economic or not, without legislative encumbrances.

The great problem which these measures suggest and which is currently being debated in the House of Commons is whether they will solve the problems of inflation and rising prices. It was expected that the budget would be directed to the solution of all these problems. And

yet the first reaction of the Stock Exchange, that prime indicator of economic trends in Britain, was one of a rise in industrial share prices. As the economic commentator, Sir Oscar Hobson, put it, "the majority opinion in the Stock Exchange interpreted the budget as inflationary" and the question inevitably arises why this budget is inflationary. The answer of the Stock Exchange speculators is unequivocal. To them the Chancellor has not attempted to cut the current expenditure of the Government and because he has raised the purchase tax and the postal charges he has added another few points to the cost of living. This must inevitably be a correct interpretation of the outcome of the supplementary budget

since in this interpretation the Stock Exchange has the support of the entire Labour movement—the Railway workers, the Miners, the Tobacco unions have already all jumped on the band wagon of increased wages. They claim that "the higher prices dictated by the budget" justify rapid and drastic action in tabling their demands. The Chancellor of the Exchequer had aimed, and very unsuccessfully so, at dulling the demand for higher wages by pushing up the distributive profits tax by 5 per cent. to 27½ per cent. In response, the British Petroleum Company has announced an interim dividend of 5 per cent, tax free, thus bringing up its profits distribution to a level of 43 per cent. in one year.

The Financial Times has now recorded that "the first reactions to the budget have been distinctly unfortunate". It claims, after having forsaken the Chancellor of the Exchequer, that the Government's increase in the cost of living "happens to occur at an exposed point where everybody is bound to take notice of it". Similarly, the other supporting organs of industry and finance are having second thoughts on both the wisdom of Mr Butler's proposals and the need for an autumn budget. They are suggesting that the unfortunate reactions will lead not to a solution of the problems of the British economy, but rather to their exacerbation. In this view they have the whole-hearted support of the British people.

Tata Power Supply Companies

ALL the three companies of the Tata Hydro-Electric group, viz., Tata Hydro Electric Supply, Tata Power and Andhra Valley, have shown impressive working results during the year ending June 30, 1955. Revenue from sales of energy has recorded considerable expansion and the improvement in net profits has enabled the Directors to strengthen the financial position of the three companies. The rate of dividend has been maintained at 7½ per cent.

Total sales of energy by the three Hydro Companies during 1954-55 amounted to 1263 million units, which required the generation of 1283 million units by the Hydro Stations and purchase of 155 million units of thermal energy from the Bombay Electricity Board's Plant at Chola.

During the year under review, the Hydro Companies completed arrangements to obtain from the World Bank, a loan equivalent to U S \$ 16.2 million (Rs 7.77 crores) in various foreign currencies to finance equipment and services required for the Trombay Thermal Project. The loan agreement was executed on November 19, 1954 in Washington.

The accounts of Tata Hydro-Electric Power Supply for the year ended June 30, 1955 indicate all round progress in the operation of the company. Thus, judged on the basis of the energy produced and sold, the revenue earned therefrom, the efforts being made by the company to obtain capital for further expansion of operations, and the progress made on the thermal power project at Trombay, the results achieved by the company are indeed gratifying.

During the year under review, the company sold 253.73 million units of energy as against 228.64 million units in 1953-54, and the revenue earned from the supply of power was higher at Rs 75.68 lakhs than the previous year's figure of Rs 62.33 lakhs. Total expenses of the company rose by 10.56 lakhs during the year to Rs 46.53 lakhs, and of the increase about Rs. 9.7 lakhs were on account of the purchase of thermal power. On balance, net profit in 1954-55 amounted to Rs 25 lakhs, an increase of Rs 2.29 lakhs (or 10.12 per cent) over that earned during the previous year.

The company has made an allocation of Rs 6.02 lakhs to the depreciation fund during 1954-55. With the year's addition, the cumulative total amounts to Rs. 1.41 crore and against this, the company has fixed capital valued (at cost) at Rs. 4.42 crores, as on June 30, 1955. While the contribution to General Reserve has been maintained at Rs. 1.25 lakhs, that for contingencies has been increased by Rs. 0.2 lakhs to Rs. 2.21 lakhs during the year under review.

The construction work at Trombay site is said to be progressing according to schedule and the first 50 MW unit is expected to go into service in October 1956, followed by the second unit in April 1957. All equipment has been ordered and the progress of manufacture is being inspected and expedited by a team of inspectors deputed by the company's consultants.

Tata Power profits on the other hand show a slight decline from Rs. 55.32 lakhs in 1953-54 to Rs. 53.32

lakhs in the year under review. This is to be explained mainly by the rise in expenses of about Rs 30 lakhs from Rs. 88.58 lakhs in 1953-54 to Rs. 118.95 lakhs in 1954-55. Revenue from the sale of energy was higher this year at 1.92 crores as against Rs 1.58 crores in the preceding year.

Andhra Valley profits have increased from Rs 25.82 lakhs in 1953-54 to Rs. 28.79 lakhs during the year under review. Revenue from power supply similarly increased from Rs. 89.27 lakhs to Rs. 1.08 crores in the same period. The rise in net profits has probably enabled the company to make a slightly increased allocation to contingencies reserve—Rs. 2.69 lakhs in 1953-54 and Rs. 2.88 lakhs during the year under review and a sum of Rs 2 lakhs has been transferred to the Deferred Taxation Reserve (nil, last year).

Why Not Retain Hyderabad?

Raghu Jagirdar

This is a down to earth and vigorous demand for the retention of the present State of Hyderabad by a Congressman who has no nostalgia for kababs or Hyderabad culture.

The author is a member of the Rajya Sabha and belongs to Gulbarga, a border bilingual district, which under the new dispensation may go to Karnataka. For the people of his district, however, Mysore is at the back of beyond; it is with Hyderabad that they have their ties which are more than a century old now.

WITH all the pious aspiration of the States Reorganisation Commission for the 'emotional integration' of different language groups, the Commission has unwittingly caused a wave of mental disintegration throughout the country. Every State has somehow begun to think in narrow terms. Some have even gone to the extent of accusing the Report of having "released political passions, communal suspicions and provincial rivalries all over the country."

It is an irony of fate that a Commission, which was empowered to redraw the map of India, should have shown signs of nervousness instead of following firm principles based on solid foundations in its 267-page report. As if unnerved by the pointed finger of a martyr, Sriramulu, at its very birth, this high-powered Commission seems to have gone astray in its struggle to escape from the consequences of its own creation. Otherwise, there would have been no reason for confusion over its original stand of high principles and later surrender and inevitable retreat.

Contradictory Findings

Whatever be the other reactions to the SRC Report, it has failed to evoke that enthusiasm that was due to its far-reaching recommendations with regard to the future map of India. Perhaps, even such a map would have been readily acceptable as one coming from a high-powered body if there were no elaborate high-sounding arguments on the one hand and unconvincing or contradictory findings on the other. No conclusions have been based on any firm principles applicable to the whole of India. The main trouble was not so much over the bulk of the language areas as over their borders, and the claims and counter-claims accompanying them, which the Commission has left unsolved. The border dispute has been allowed to rage on furiously.

With its confused thinking, the

Commission has only presented self-contradictory evidence. The Commission at the very outset, while declaring its stand against accepting language or culture as the determining factor—since 'the idea of a federating unit, organised as the political expression of a single group, would inevitably encourage exclusivism'—has itself fallen prey to the idea of linguistic division, with the exception perhaps of Bombay State.

So far as the people of Hyderabad State are concerned, the SRC's entire assessment and conclusions are neither based on, nor related to, facts. Its attitude can in no way be helpful to the healthy growth of nationalism in this country. It has failed to make out a genuine case for disintegration, save by surrendering to nauseating slogans of bygone days.

The most that can be said is that the SRC has helped in sacrificing a composite State at the altar of linguism, i.e., casteism, though it might have proclaimed itself against any sort of appeasement. There could be no meaning today in attempting to find fault with the origin of a former feudal State. Whatever be its former anti-national tinge, now this self-same, much-hated 'historical accident' is fulfilling a most vital need, consistently with India's present spirit of nationalism.

Focal Point

It cannot be denied that of all places in India, Hyderabad stands out as the focal point in every sphere. Not only is it India in miniature in all aspects, but also the meeting place of the South and North. What the situation demanded was not its nominal retention in a truncated form, but the effort to make other States, wherever possible, follow such a composite pattern or tradition. To deprive an existing State of such a character may mean depriving the country of a heritage.

All the talk of disintegration by a

certain type of people means nothing more than inherent suspicion of one another, and that too, strangely enough, after India has become free. The SRC would have done the right thing if it had suggested the formation or adoption of a fool-proof "one State two languages" or "one language two States" formula so as to serve as a safety device against the dangers of fascistic fanaticism. This might have to some extent enabled those in the South to fight the growing menace of linguism.

A politician may find in the SRC recommendations new avenues for an adventurist future, but those people in this State who have roots in the soil or the common folk in the countryside are simply perplexed and perturbed over the Commission's proposals for the disintegration of language areas. What such disintegrated areas are to achieve which they could not hope to achieve by continuing in the present set-up, is difficult to understand. How these areas will fare in a new atmosphere and new set-up has received no consideration at all. Disintegration may at the most satisfy for the time being either the fanatic or self-centred fringe. Where the fanaticism will lead India to, is a problem worth pondering over.

In respect of Hyderabad, the Commission seems to have lost its direction and failed to take the right and logical course, which it has itself advocated for bilingual Bombay or with regard to the question of retaining Karnatak Bidar in the nine Telengana districts of Hyderabad. The problem of Hyderabad is not so simple as to be disposed of off-hand. The Commission has not cared to go deep into the matter or tried to know the feelings and wishes of the people in the countryside.

Border State

After all, Hyderabad happens to be a sort of border State; hence it is not just a unilingual or bilingual entity. It has even a trilingual

Branches at: NEW DELHI BOMBAY KANPUR

aspect. Its territory is spread over the Karnatak districts of Bidar, Gulbarga and Raichur, the Marathwada districts of Nanded and Osmanabad and the Telengana districts of Mahboobnagar, Nizamabad, Adilabad and also the Hyderabad district. There are over 508 thousand Telugu, 368 thousand Marathi, 833 thousand Urdu and 261 thousand Kannada bilingual speakers.

The extent of bilingualism in the whole State is 14.2 per cent; it ranges from 13 to 18 in Marathwada, 13 to 21 in Telengana and 17 to 22 per cent in Karnatak; and in Hyderabad district, it is 20 per cent. At least a population of 2,653,118 are bilingual who speak another Indian language besides their mother-tongue. Thus bilingualism is fairly extensive. The census records show that in these districts one out of every four is bilingual.

Instead of trying to know the real needs and aspirations of the people, the Commission has only relied on the evidence of certain busybodies and invariably on that time-worn slogan of disintegration. That slogan might have served at the beginning as a sort of argument to carry on an agitation. But today after the miserable experience following police action, thanks to the behaviour of the neighbouring linguistic enthusiasts, that slogan has lost its glamour and actually yielded place to a sort of fear and apprehension. The recent Mulki movement or the rising indignation against people of the adjoining language areas is too fresh to need mention here.

The Commission, in its verdict, says that "public sentiment both within and without the State, is overwhelming and insistent on the need for the disintegration of the State." How it arrived at such a conclusion is difficult to understand. In the first place, "the public sentiment" prevailing "without" has no meaning, since it has nothing at stake and its demand may be opposed to local wishes and interests. As far as sentiment "within" is concerned, it has no valid sanction. Enlightened opinion feels that the slogan of dismemberment was solely meant to get rid of the Nizam's rule.

To stick to the slogan even after the emergence of a democratic setup on the part of political leaders is nothing but an attempt to save themselves from being dubbed as inconsistent by their political opponents. Moreover, in the past, when

this slogan was raised, the question of reorganisation of States was not before the people, and any decision for the wholesale liquidation of the State without a clear verdict of the people on this specific issue would not be democratic.

"Free Association"

The Commission has preferred to make sweeping remarks that the three "areas were substantially united only under the authority of the Asaf Jahi dynasty. The unity was not based on a free association of the people." What a discovery to make about Hyderabad, as if it could not be applied with greater force to other parts of India! Where and when was that "free association" ever thought of before the advent of the British? Which is that State which has not been "substantially united under the authority" of some power or the other, not to speak of UP or even the SRC's composite bilingual Bombay of Gujarat and Maharashtra?

That attempt to dub Hyderabad as an artificial unit is simply irrational. In fact, every State is an artificial unit, including the States proposed by the Commission. India is one, having the same culture and history; and any division is nothing but artificial. These artificial "substantially united" areas in the Deccan came together after the arrival of Allauddin or the settling down of the Bahamanis, long before the advent of the Mughals or the Asaf Jahis. Whatever may be the reasons, Aurangabad, Golkonda, Bidar and Gulbarga have somehow lived a common or "substantially united" life for over six centuries; and never before in history have the people of Aurangabad, Golkonda and Gulbarga or Deogiri, Kalyani and Malkhed been dependent on Bombay, and Poona, Kurnool or Mysore. The people of these areas have lived and suffered together in the past during great upheavals; and they naturally feel that just when freedom has come, they are being dismembered and deprived of the joys of a "substantially united" life in their joint march to freedom.

Deccani Culture

The Deccan culture may or may not be different from that prevalent in former British India; but its contribution may be deemed somewhat different. Call it by any name, Hyderabad has evolved, whether in rural or urban areas, a common social and economic outlook and a way of life, which may not be easily

understood unless one lives in the Hyderabad atmosphere.

The Commission may find it surprising, but this common culture based on understanding, tolerance, and fellow-feeling has been a major contribution to the quest for unity in India. There was some significance when the Prime Minister himself declared close on the heels of the Police Action that the people of the State would be given a chance to decide about their future and that the police action was confined to the removal of feudal rule.

The SRC seems to be more enthusiastic in the case of Hyderabad than in respect of the rest of India over divisions on geographical and demographic lines. The Commission conveniently forgets that these "demographic features" apply with greater force to the rest of India as a whole than to Hyderabad. India has an individuality and variety unlike the regimented or common pattern and mode of living in Western countries. In what way can "demographic features" be more varied between Aurangabad and Warangal than between Cutch and the Goa borders, which the composite Bombay State, the handiwork of the Commission, itself represents?

No Need for Hurry

The Commission seems to be living in a world of its own. Otherwise how can "the apprehensions felt by the educationally backward people of Telengana that they may be swamped and exploited by the more advanced people of the coastal area" differ in the case of the Marathwada and Karnatak districts of the same State? Taking into consideration the same state of affairs and all the disadvantages and disabilities which Telengana would face in Vishalandhra, the Commission could have adopted the same impartial attitude towards the common backward Marathwada and Karnatak regions.

There was no need for such hurry at this juncture when these backward regions after centuries of subjection were just settling down and looking forward to development through various schemes. By allowing the Tungabhadra or Raichur area to develop, the Hyderabad people naturally feel that the Commission could have not only allowed the continuation of the same administration that planned the project, but also tried to help the progress of Hyderabad State and its

Kannada areas. All this linguistic distribution could have waited as the accent is no longer on mere agricultural development, which was perhaps dependent on linguistic homogeneity. The accent now is on industrial development. Industrial development may be dependent on the availability of natural resources, but not so much on linguistic homogeneity.

Karnatak Bidar has, however, been retained by the Commission in residuary Hyderabad State for the sake of the solidarity of India. In the present Assembly, out of 96 members from Telengana, 50 belong to the Opposition and 44 to the Congress. With the addition of 11 Congress members from Bidar, the strength would be 55 Congress as against 50 Opposition in a House of 105. Instead of such a precarious majority in spite of Bidar, why not include Gulbarga and Raichur, which have the same affinity and contiguity as Bidar with Hyderabad? Why this hazardous break and dislocation of life in these contiguous districts by splitting and forcing them to join Karnatak-Mysore? Moreover, Raichur and Gulbarga do not differ much from Bidar, whose "undoubted Karnatak areas are also somewhat remote from Bangalore and Mysore."

Urdu-speaking Population

Speaking about Hyderabad City, the Commission takes into consideration the position of 45.4 per cent of the Urdu-speaking population. And likewise for the retention of Bidar in residuary Hyderabad, it pleads for the Urdu-speaking population, apart from advancing other considerations such as "that administratively, Bidar has very close links with Hyderabad" etc. Of the 86.2 per cent Hindu population, the larger section is in the eastern half or the Telengana area than in the western half or Marathwada and Karnatak areas. Of the six former Muslim capitals in the State, two, namely, Golkonda and Hyderabad, are in the centre, and the remaining four, namely, Aurangabad, Daulatabad, Bidar and Gulbarga, are in the Western half. These are the very portions which the Commission has strangely sought to wrench from Hyderabad to be added to the remote regions of Mysore or Bombay on untenable arguments.

A little calculation will show that out of 11.8 per cent of Muslims, a total number of 53.3 per cent live in urban areas; and Hyderabad City

accounts for 22.0 per cent of their total population. In Bidar, which has received special consideration from the Commission, their percentage is 42.9. The Commission, which is so loud in its pleadings to tag Bidar to Hyderabad City, with a Muslim population of 44.7 per cent, again conveniently ignores the fact or fails to apply the same consideration to Gulbarga and Aurangabad where the percentage rises to 48.3 and 43.9 respectively.

Common Life

What really weighed with the Commission in deciding on dismemberment of the State is rather difficult to understand. After all, the area is a contiguous one; and, for good or bad, the people have lived together for the past so many centuries. Somehow, a common life has been evolved, which has stood the test of time; at least, here in the Hyderabad regions there has not been so far that virulent caste or language antagonism, which is so vehement in other parts of the country, especially in the South.

Taking into consideration these overwhelming factors, there is need for a detached view and for allowing the status quo in the case of

the present Hyderabad State. Already in the wake of the disintegration proposals of the SRC, there have been dismal portents of parochialism; selfishness is turning friends and colleagues into opponents and rivals in a race for territorial possessions. In a struggle for power between Telengana and Andhra all sorts of manoeuvre may be tried. Some may even raise for their selfish ends, the bogey of "India in danger" at the sight of Hyderabad State just as the League used to raise the bogey of "Islam in danger" at the sight of the Congress.

The SRC, instead of solving the problem of the future set-up of India, seems to have created more problems for future generations. After all, the Report is not such a sacrosanct document needing immediate implementation. Reorganisation is not a half-hearted measure, and it cannot be implemented in a hurry in the midst of mounting tension all round. Redrawing of the map for administrative or development purposes may become necessary only when the country has sufficiently advanced industrially and not otherwise.

Industrial

announces SUBSTANTIAL increase in
BONUS

WHOLE LIFE Rs. 18 per 1,000 per year
ENDOWMENT Rs. 15 per 1,000 per year

for the
Triennium ending 31st December, 1954

Observations of the Valuing Actuary

"The valuation results are Excellent (Surplus Rs. 66,48,698/-). It is a matter of great satisfaction that it has become possible to declare Higher Rates of Bonus after maintaining a Strong Reserve Position of the Company and the carry forward (Rs. 10,77,872/-) to the policyholders' account which I have recommended will enable you to maintain your Bonuses at HIGHER LEVELS in future years."

Vishalandhra

(Contributed)

The contributor dispels the fear that regional interests will clash in an integrated Telugu State. On the contrary, when things settle down, the fairly even population of Telengana, Rayalaseema and Circars will of itself ensure the maintenance of balance between the three component regions which in co-operation could add to the strength and stability of Vishalandhra.

THE report of the States Reorganisation Commission cannot but have caused some disappointment in Andhra. The setting up of the State of Andhra in October 1953 has been regarded by most Andhras as but the first step in meeting their desire for a separate State. Out of the 32 odd million Telugu-speaking people in the country—incidentally the largest linguistic group after Hindi in the Union,—barely 21 million were included in Andhra. It would have, of course, been too much, and perhaps even wrong to hope that all the areas where Andhras were in a majority would now be included in an expanded State, and indeed Andhras were quite prepared to meet the viewpoints of other States in this regard more than half way. The abandonment of the claim to Madras City despite its historic Telugu associations and its sizable Andhra population, it would be recalled, was a condition to the creation of the Andhra State. Similarly, the Andhras, though hoping otherwise, are not seriously perturbed about the Commission's decision to retain the Telugu area of Ganjam and Koraput in Orissa and Kolar district despite its Andhra majority in Mysore. A reciprocal gesture of goodwill over Bellary was the least Andhras could have expected in return from Mysore. As the Bellary issue has engendered undue animosity on the Karnataka side, the facts may bear repetition. It is true that Bellary District as at present constituted i.e. minus Alur, Adoni and Rayadurg talukas which form part of Andhra has a Kannada majority. The Misra Award going apparently more by the single criterion of language gave the area to Mysore, but the SRC have repaired the damage done to Andhras in this regard. For though the very basis of Andhra was linguistic, administrative convenience has played no small part in shaping its boundaries and the SRC have rightly combined the criteria of linguistic affinities with those of financial and commercial links and administrative convenience. It was this argument that has made them recommend the retention of Kolar in Mysore, about

which incidentally the protagonists of the Karnataka area have been astonishingly silent.

Tungabhadra Project

In the case of Bellary the controversy has assumed an acrimonious form especially in view of the importance of the Tungabhadra project. This project was the joint endeavour of the composite Madras and Hyderabad States and was specifically designed to irrigate the arid and chronic famine regions of Rayalaseema and Southern Hyderabad. The construction of the dam was completed in 1953 but it is regrettable that utilisation of Tungabhadra waters has not yet been made possible. While part of the blame for this would rest on an inadequate appreciation by the engineers connected with the Project of the technical difficulties of terracing the undulating fields in Rayalaseema and preparing the ayacut, the Andhra Government has felt that the obstructionist tactics of the Mysore Government in whose area the headworks now lie were no less significant a factor. It was particularly aggravating that the Tungabhadra Project's benefits so long cherished by the peasants in the parched plains of Rayalaseema should now be denied through the inefficiency of engineers and the machinations of politicians. The Tungabhadra Board set up by the President in terms of the Andhra Act and presided over by a senior and respected civilian has not been able to do anything effective about Andhra's complaints against Mysore and the Andhra Government was seriously considering referring the matter to Presidential arbitration. That the SRC were convinced about the justice of Andhra's claim in this regard is evidenced by their statement that "it will be somewhat unsatisfactory if the Andhra Government has, even after the redistribution of States, no access to the headworks of the project in which it is vitally interested." The Tungabhadra project was, after all, meant for the benefit of Rayalaseema and the Commission are to be congratulated on their courage and wisdom in recommending the retransfer of Bellary so as to eliminate the chances of friction with regard to this project. The Andhra case would be reinforced with the construction of the high level canal and the preparation of its ayacut as well as immigration from Andhra into Eastern Bellary. It is to be hoped that Karnataka will accept with good grace the SRC recommendation over Bellary especially in view of the restraint shown in Andhra over Kolar. For its part, the Andhra Government should do nothing to make the Kannada population in Sirugappa, Hospet and Bellary talukas feel that they are either aliens or inferior citizens.

Future of Telengana

The satisfaction in Andhra over the decision of the SRC to incorporate the three Bellary talukas has been more than outweighed by the SRC's proposals regarding the future of Telengana. The case for Vishalandhra could not have been put better than by the Commission. "The advantages of a larger Andhra State" say the Commission "are that it will bring into existence a state of about 32 millions with a considerable hinterland, with larger water and power resources, adequate mineral wealth and valuable raw materials. . . . Another advantage of the formation of Vishalandhra will be that the development of the Krishna and Godavari rivers will thereby be brought under unified control. . . . The economic affiliations of Telengana with existing Andhra are also not unimportant. . . . Telengana will also be able to save a great deal of expenditure on general administration, in case it is not established as a separate unit. . . . This will also solve the difficult and vexing problem of finding a permanent capital for Andhra; for the twin cities of Hyderabad and Secunderabad are very well suited to be the capital of Vishalandhra". These passages have been quoted at some length to show that even the Commission feel that not only on the basis of linguis-

tic and cultural affinities, but also on grounds of economic complementarity and administrative convenience and developmental needs, the case for Vishalandhra is certainly very strong and convincing. The way the Commission have dealt with the case for Telengana indeed appears clinching and it appears unnecessary to repeat the advantages which Vishalandhra would bring about. Why have they recommended a six year probationary period for Telengana giving the right of veto to just over one-third of the legislators in 1961? The arguments advanced by the SRC for a separate Telengana are based on financial and psychological considerations which it would be seen do not stand the test of close security. They make a reference to the fact that excise revenue accounts for Rs. 5 crores annually in Telengana, and the result of unification might be "the exchange of some settled sources of revenue out of which development schemes may be financed for the financial uncertainty similar to that with which Andhra is now faced".

If thereby it is suggested that unification would lead to the Telengana districts going dry and sacrificing the excise revenue, could not the Commission have recommended instead that for a few years the Telengana districts should remain wet? In any case, with the possibility of country-wide prohibition by 1958, even this argument loses its force. If financial viability were so important a criterion, several States in the Union may not have stood the test. Andhra itself in 1953 was considered to be not strong financially, nor does the condition of viability seem to have been applied with regard to Karnataka. The other point made by the Commission is that the claims for the location of future development projects in Telengana may not receive adequate attention in Vishalandhra. This is a baseless fear, in any case the Planning Commission's approved draft of projects in the Second Five-Year Plan as submitted by the Hyderabad Government would certainly have been carried out in Vishalandhra. In a period of planning the likelihood of inadequate consideration to the development of particular regions is less; in any case, in the proposed Nandikonda and Kustapuram projects the benefits can be shared between the two areas in agreed measure. It may be useful to recall that similar apprehensions were given expression to by Rayalaseema leaders many years ago and the Tungabha-

dra scheme figured in many of the discussions that led ultimately to the Sri Bagh Pact. The demand for such a project was a hardy annual at almost every budget session of the old Madras Assembly, the Andhras from the Circars taking no less an interest than those from Rayalaseema in pressing for its early implementation.

The Commission has also referred to the fears of the educationally backward people of Telengana being swamped and exploited by the people from the coast. If the Commission felt so strongly about the danger of merging a so-called backward area with a more advanced one, how do they defend the merger of Marathwada and Kannada areas of Hyderabad with Bombay and Karnataka where the gap is at least as great, if not greater? In any case, similar fears were expressed by Rayalaseema before the creation of Andhra; that they were exaggerated has been proved by events. The location of the capital in Kurnool, the expansion of educational facilities in that region and the setting up of the Sri Venkateswara University have gone far to dissipate what fears did exist. Similarly, in Vishalandhra, Telengana would have little to fear; the location of the capital in that area and the existence of a first rate university would doubtless be supplemented by an expansion of educational facilities in that region. In any case the population of Telengana at 12 million is not so small as to lend itself to exploitation by about the same number of coastal Andhras. In fact a delicate balance would be created between Rayalaseema, Telengana and Circars in Vishalandhra where no single group could exploit any of the other two.

If these are then the arguments for a separate Telengana the Commission's plea for such a State fails to convince. In particular, the recommendation that the future of Telengana should be decided after six years is likely to lead to unnecessary uncertainty and instability. The Commission aver that opinion in Telengana is yet to crystallize itself. This is no longer the position. No less than 69 members of the Hyderabad Assembly out of the 95 from Telengana have expressed themselves in favour of an immediate merger with Andhra; this number does not include any of the Congress ministers and deputy ministers. Since then, it is significant that Shri B Ramakrishna Rao the Chief Minister and Nawab Mehdi Nawaz Jung the only

Muslim member of his Cabinet have come out with public statements in favour of the immediate formation of Vishalandhra. In view of this, it appears unnecessary to allow the small group of Telengana legislators backing Shri Chenna Reddy and Shri Ranga Reddy to have the veto on the formation of a larger Telugu State, but this is what the Commission have unfortunately done. It has been said that the fear of Communist rule in Telengana has been responsible for some of the Congressmen hitherto neutral veering round to the cause of Vishalandhra. This does less than justice to the Communist Party who have been resolute champions of Vishalandhra from the beginning despite their being fully aware that their strength in a larger Telugu state would be relatively much less. The real opposition to Vishalandhra seems to be from the small caucus among the Telengana Congress legislators who count for something at least in the politics of Hyderabad and who now fear that they will cease to wield any influence and become nobodies in the larger political area of Vishalandhra.

It is also possible that the Kapu (Reddi) caste in Hyderabad fears a loss of its power and influence. Vested interests there always will be in retaining any status quo but this does not mean that they have to be accommodated. In particular, where the undertone of the argument is based on caste considerations, there is even less case for supporting it. On their part the Andhra leaders should give generous assurances to the people of Telengana that their particulars interests would in no way be jeopardized. The SRC seem to think that a pact on the lines of the Sri Bagh Pact may be impracticable but there is no reason to believe that this is the case. The Sri Bagh Pact has been working satisfactorily in Andhra and there is no reason why an extension of that principle could not be attempted. The meetings that have taken place between the Andhra and Telengana leaders would, it is hoped, allay the fears in the minds of the Telengana leaders and ensure positive result in the immediate formation of Vishalandhra. As things settle down, the fairly even population of Telengana, Rayalaseema and Circars will of itself assure the maintenance of balance between the three component regions, which in co-operation will undoubtedly add to the strength and vitality of an integrated Telugu State.

Reach any city in India by midday tomorrow

Luxurious new *Skymaster* night service connects 5 cities
—gives choice of 34 morning flights onwards

SAVE precious time and unnecessary expenditure on the way — fly overnight by new, luxurious Skymaster service, connecting Bombay, Delhi, Calcutta, Nagpur and Madras.

The new service cuts out irritating overnight stops, lands you in time for breakfast — and it is carefully scheduled to connect with 34 morning flights from the five big airports. — So by midday tomorrow you can reach almost any important town in India!

Wherever you want to go, whichever flight you choose — Skymaster service makes sure you get there in time! And your IAC ticket covers meals, travel to and from the airport, everything. No extras to pay.

Floods in Delhi and Punjab

Kumud Bhushan Ray

LATE in the rainy season this year, disastrous floods occurred in Delhi and the two Punjabs resulting in heavy loss of life and property. A glance at the accompanying map will give an idea of the extent of the ravages caused by this disaster. Delhi and both the Punjabs are in the dry north-west. The Indus and the Sutlej rise in the Tibetan Plateau, north of the Great Himalayas, where the monsoon does not reach. It is a dry region. Between the Great and Lesser Himalayas lies the Kashmir Valley, in which rise the Jhelum, Chenab, Ravi and Bias. The Kashmir Valley is also dry. Only the northern slopes of the mountains in this valley have forests. There is more shade on these slopes, the snow remains longer and moisture is not dried up by the sun. The southern slopes are bare rocks or are covered with short grass or shrubs. South of the Kashmir Valley, in the sub-Himalayan region, the rainfall ranges from 30 to 40 inches. Further south lies the broad alluvial plain, which may be divided into three parts. The north-eastern part along the foot-hills, partly in Punjab (P) and partly in Punjab (I), has 30 to 40 inches rainfall. The south-western part, lying wholly in Punjab (P), has a rainfall of 5 to 10 inches. The south-eastern part in the Punjab (I) has 20 to 30 inches rainfall.

Except the north-eastern part, all the rest of this region has thus little rainfall, and needs canal water for growth of crops.

Irrigation Canal

There are three canal systems, supplying water for irrigation to the south-western part of the Punjab plains:

- The Upper and Lower Jhelum Canals from the Jhelum River,
- The Upper and Lower Chenab Canals from the Chenab River, and
- The Lower Bari Doab Canals from the Chenab River,

There are three canal systems, supplying water to the south-eastern part of the Punjab Plains for irrigation:

- The Upper Bari Doab Canals from the Ravi River.
- The Sirhind Canals from the Sutlej River, and
- The Western Jamuna Canals from the Jamuna river.

The Eastern Jamuna Canals, also from the Jamuna River, supply water for irrigation to a part of the West U.P.

Condition of River Channel

With torrential flow in the rainy season, channels of the rivers in the Punjab plains have become more than a mile wide in places. Sometimes water overflows the channels, submerges river side lands, and there is destruction of crops and flood damage.

In the dry season, the flow is shallow and feeble and the discharge very little, most of the water being diverted into the canals.

Rise in River Bed Level

Uncontrolled erosion of river banks goes on in a river channel, increasing the channel width and consequently its sectional area, so that the velocity decreases. The power of transportation of silt load being thus decreased, a current of water deposits part of its silt load. With greater deposit of silt load in parts of a channel, islands are form-

ed. Erosion of banks also forms bends, lengthening a river channel. In a widening and shallowing channel, 'hydraulic mean depth' goes on decreasing. In a lengthening channel, the 'slope of water surface' goes on flattening. Both of these cause decrease in velocity, so that the discharging capacity of the river also decreases.

With decreasing velocity, a current of water cannot transport the whole of its silt load, part of which is deposited and there is gradual rise in the river bed level.

High River Banks

With rise in river bed level, there is corresponding rise in flood water level. With decreasing discharging capacity, a river is not able to accommodate and drain away its flood discharge; the flood water level rises higher than river banks, water flows away from the channel, river side lands are submerged, and there are flood damages.

When water flows away from a channel, there is a sudden decrease

in depth of water over the river banks, as compared to that in the river channel, and a considerable part of the large silt load is deposited on a small width of river banks. The level of river banks rises, and ultimately becomes higher than the river side lands.

This explains how by dynamiting the high river banks, it has been possible to make river water disperse over river side lands, thus lowering the flood water level in the Sutlej near Bahawalpur.

Diversion of Water into a Canal

When part of a river's discharge is diverted into an irrigation canal, there is lessening of discharge through the river channel. Moreover, silt-excluding devices at the Canal Headworks exclude the coarser silt, while diverting water into the canal. Thus more silt passes down the river, which has to be transported by a lesser volume of water, having a lesser velocity. There is thus silt deposit on the river bed, downstream of a canal headwork, as a result of diversion of water into a canal.

With silt deposit on the river bed, its channel goes on deteriorating, and this deterioration extends down-

stream. With an extensive system of canals, there is thus progressive deterioration in the rivers Jhelum, Chenab, Ravi, Sutlej and Jamuna. The channels of these rivers have broad sandy wastes of river bed in the dry season.

In normal years, the discharge of the rainy season can be drained away by the deteriorated channels, except that at certain points in some of these rivers, banks are overtopped and there are flood damages. The run-off from abnormal, heavy and prolonged rainfall, as that of 1955, which occurs once in about 50 years or so, cannot be drained away by these deteriorated rivers. Colossal flood damages thus occur.

River Training

After the construction of a canal, no action is taken to ensure that the river channel, below the canal headwork, does not deteriorate. River Training Works, however, are necessary, in order that a river is able to perform its primary function of drainage.

Deepening a wide and shallow river channel in the dry season is done by Steamer Companies in India, by assisting a river to utilise the great force of its current of

water, by the use of 'bandals'. These are temporary expedients, as the bamboos driven into the river bed for the 'bandals' are undermined and topple over, with a rise in the water level and increase of velocity in the flood season.

An improvement in the 'bandals', known as "permeable screen" is able to maintain its position in a river channel in the flood season. A line of 'permeable screen' assists a river to utilise the great force of its current of water, to deposit silt and form new parallel river banks, by reclamation of parts of a wide and shallow river bed, thereby developing a narrow and deep channel between the newly formed parallel river banks. The higher velocity and greater discharging capacity of a narrow and deep channel enable a river adequately to perform its function of drainage of water.

The cost of 'permeable screens' for rivers in the Punjab and the Jamuna, will be between Rs 20 and Rs 40 per running foot, depending on the dry season depth of water in the river. Part of the cost of river training works by 'permeable screen' can be made up by the sale of fertile lands, reclaimed from the existing wide, sandy waste of river bed.

Around Bombay Markets

Overbought Position

FOR the second settlement in succession, there was an appreciable rise in the budla rates, indicating a distinctly overbought position in the Stock Exchange in Bombay. As in the case of the previous settlement, the technically unhealthy position was preceded by frenzied speculation which boosted up prices all round, some of the leading counters exceeding the highest levels touched during the year. This was particularly noticeable on Tuesday when the quotations were at their peak for the week. On the same day, strangely enough, there was a break towards the close, when the pivotal scrips lost heavily. Thus, Bombay Dyeings lost about 15 points, Century 11, Kohinoor 9, Simplex 7½, Central 8½, Swadeshi 8 and Indore-Malwa as much as 21 points in the course of the day.

The trend for the greater part of the week, however, was such as to strengthen the hands of the bulls. The sharp rise in the values of their holdings further emboldened the bulls as a result of which shares which had been coldshouldered before became favourites overnight and were in keen demand. As the bulls gained fresh vigour, the shorts were forced to cover their sales in an advancing market. Consequently scrips changed hands at prices which bore no relation to the true worth of the companies concerned. True, the bulls were not entirely left unhurt. In fact, they were caught in their own trap when, on the settlement day, they had to pay through their nose abnormally high budla charges in respect of some of the scrips.

Thus, the carry-over charges for Tata Ordinary and Indian Iron ranged from 11 as to 13 as and 8 to 10 as, respectively. Bombay Burmah budla moved up from Rs 10 to Rs 12-8, certainly a high budla notwithstanding the closure of books. The carry-over charges in respect of Scindias were very high at 8 as while those of National Rayon, Bombay Dyeing and Tata Chemicals were also appreciable.

While prospects of industrial advancement in the country following the Second Five-Year Plan and other allied factors may be adduced in favour of a further rise in prices,

a substantial reaction to set right the technical maladjustment cannot be ruled out as a probable outcome of the continuous rise for the past few weeks. In fact, the odds seem to weigh more in favour of the latter course.

Steel shares, despite an irregular fluctuation towards the middle of the week, made further headway, with Tata Ordinary touching a new high of Rs 267-4. The shares received ample support at small setbacks from considerable shortcovering as well as fresh buying. Although on the settlement day both Tata Ordinary and Indian Iron suffered a sizeable reaction on heavy unloading by bulls, the losses were made good by replacement buying.

In the cotton mill section, Bombay Dyeing led and touched a new peak of Rs 596-4. Manipulation by interested parties to rig up these shares

Thursday, Morning

was strongly hinted at in market circles. Prospects of renovation of its mills pushed up Central India. For the same reason, India United also attracted keen attention. Apollo Mill which had been neglected by operators hitherto were sought after by bargain hunters. Indore-Malwa registered a jump of 20 points during the week. But all these gains were erased on Tuesday as stated earlier.

Banks and electric shares also moved up in sympathy. While Central Bank made further advances, Bank of India, which recently shot up by 15 points, were inclined to consolidate their gains. Electric shares kept steady with scattered business.

Among miscellaneous counters, Bombay Burma moved ahead to new high levels on short-covering as well as fresh buying. ACCs, National Rayons and Premier Con-

struction ruled steady at Rs 215-4, Rs 235 and Rs 186 respectively.

Cotton

Bull Grip

ALMOST throughout the week cotton futures danced to the tune of the bull syndicate who were inclined to the view that considerable inroads had been made on the new crop by untimely rains. As against 56-57 lakh bales originally estimated, bulls now put the crop at around 47-48 lakh bales. This apart, they believe that the quality of the crop has deteriorated. Besides, in view of the American surplus cotton disposal plan which is to be launched from the New Year, the bulls foresee a reduction in, if not a complete abolition of, the export duty on cotton, in order to enable Indian cotton to meet the competition of US surplus cotton which is going to be virtually dumped on world markets. In view of this firm bull grip on the market, for the above reasons, even the announcement of an additional bonus export quota of one lakh bales of ¾" cotton and a quota of 50,000 bales of Bengal Deshi went almost unnoticed. This quota had been long expected by a section of the trade who were in fact actively campaigning for it. In the light of the alleged large-scale damage to cotton, however, it is problematic how far this country can afford to export cotton.

Towards the close of the week, there was a sharp break in cotton futures, suggesting slackening in the bull grip. According to market circles, this might have been occasioned by a disruption in the ranks of the bulls themselves rather than by an external factor. In the event, there was a sharp set back in prices and for the first time in the past few days the February contract turned easy. Cotton future closed around Rs 662-0. The highest and lowest levels during the week were Rs 669-12 and Rs 655-4 respectively.

In the spot market at Sewri, mills which had been holding back so far started picking up their requirements as well as buying new crop contracts.

Official permission to commence business in new crop May (1956) futures is reported to have been received by the East India Cotton Association. The date of commencement of the contract is expected to be fixed by the Board at its next meeting on Friday.

Oils and Oilseeds

Market Firm

THE oilseeds market, on the whole, presented a firm pattern of trading. True, the market was little weak immediately following the release of the HPS groundnut quota as overseas buyers were inclined to wait for a while before entering into fresh commitments. Thus, Continent quoted £4 lower than the prices offered before the quota announcement. Groundnut oil was also offered at lower prices. Shippers who had been able to dispose of about 1000 tons of oil at around £103 per ton could not get anything better than £100 per ton. If some business was done even at this level, it was because exporters were still able to have a fair margin of profit. However, the market entertains hopes of better business in the near future. It is presumably because of this that groundnut ready delivery and oil RR found encouraging support, prices advanced and closed firm.

In the castor section, ready, futures and oil prices have continued their upward trend. May futures touched a new high during the week. America is reported to have shown keen interest in Brazilian oil at around 13 cents per lb. On apprehensions of a lower Brazilian crop, US has been showing increasing interest in Indian oil. Mainly on account of this, there has been an appreciable rise in the May contract

which went up to as high as Rs 106-10 before closing at Rs 105-10.

Other seeds were sympathetically firm with linseed closing at Rs 24-6 as compared to Rs 23-12 last week while Kardi and nigar closed firm at Rs 14 and Rs 23 respectively.

Bullion

Gold Steady

SINCE its resumption, forward trading in silver has not yet had a full week's session, trading being interrupted by holidays. During trading sessions, however, silver displayed a hesitant undertone, while gold was relatively firm, and moved up.

Two factors combined to bring this about. In the first place there was speculative support and then there were also apprehensions about devaluation in the UK. Besides these, traders took inspiration from the recent experience in the spot market. The pre-Puja demand for gold from Calcutta to the tune of 60,000 tolas has also contributed to the firm trend in the Bombay market, where the daily offtake of gold was reported to be around 5,000 tolas against the arrivals of only 2 to 3,000 tolas. The floating stocks have therefore, been eaten up and are now estimated to be only around 15,000 tolas. With prospects of immediate entry into the Bombay market of upcountry interests, traders expect continued steadiness in the market.

Recent Developments

Wednesday, Evening

BOOM conditions prevailed on Dalal Street during the days Clive Street was closed for the Puja holidays. This was the main reason why the Calcutta Stock Exchange opened firm after the Puja holidays. Both Dalal Street and Clive Street have now developed an irregularly lower trend. But this is mainly due to occasional profit-taking. There is no selling pressure, though buyers seem reluctant to lend support to the market at these higher levels.

Recent price movements in equities indicate that speculators are inclined to the view that the stock market boom is likely to continue. Basic economic conditions are not unfavourable. There is absolutely no reason why equities should slump. Whether equities should be booming, is a different matter altogether. There is no doubt that the stock market atmosphere is "bullish". Even so, it is time for a proper assessment of the influences affecting market movements.

"Bull" Factors

Some developments are evidently "bullish". Money supplies are increasing. There has been a considerable expansion in banking resources in the current year. Money incomes are also expanding as a sequel to deficit financing. Success of the two successive loans floated by the States visibly reflect the growing volume of surplus, investible resources. This is a dependable factor behind the recent spurt in equities.

Sometime ago, two apprehensions were widely entertained. There were fears that the Government, encouraged by the success of the loans, might decide to issue fresh loans. These fears have not yet materialised. There were also fears that, following an expected further rise in Bank Rate in Britain, the Bank Rate might be raised here also. These apprehensions vanished when the British Government announced that a supplementary budget would be introduced in Parliament. There is nothing in the emergency budget to cause dearer money in Britain.

Wider Issues

These are technical factors. But recent market behaviour indicates that investors have overcome the feeling of depression caused by the

Companies Bill. It will be recalled that the Finance Minister cited the continued steadiness in stock markets as a sure indication that genuine investors had nothing to fear from the Companies Bill. Managing agents may feel disturbed, but shareholders have nothing to lose through incorporation of the Companies Bill into the statute book. There is something in the Finance Minister's argument.

To enumerate the "bullish" factors is not to gloss over the disturbing developments. Soon, the Government will introduce a Bill in Parliament to regulate trading in stock markets. There are provisions in the Bill which may have an immediate chilling effect on stock markets. Besides, there is evidence that New Delhi is anxious to curb speculative activity on stock markets. In recent months, the Government has more than once issued directives to stock exchange authorities to take measures to curb speculative activity. There can be no quarrel with these moves to ensure that savings are not utilised for speculative purposes, but are diverted to productive channels.

So far as the Calcutta Stock Exchange is concerned, there is another disturbing development. There are rumours that the West Bengal Government is exploring the prospects of a turnover tax on stock market trading. It is more than time for the West Bengal Government to introduce such a levy to increase the budgetary resources for financing the second Plan. Such an impost is not likely to have any lasting "bearish" effect on equities, as Dalal Street's experience suggests. But, in a "bear" market, this and similar other developments cannot be ignored.

Changed Pattern

This is the wider background against which some of the interesting trends on the Calcutta Stock Exchange have to be assessed. There has been a definite change in the pattern of stock market movement in Calcutta. Jute shares are in the doldrums. Even speculators have, by now, realised that Tea shares have no prospect in the immediate future. And the boldest speculator is afraid of dabbling in Coal shares.

This explains why Jute and Coal shares are friendless, or why Tea shares are gradually losing ground.

In their hunt for new, promising groups of shares, speculators have long ago discovered the prospects for *Miscellaneous and Engineering* shares. Engineering shares started moving up two years ago on the ground that secondary engineering industries must fare well during the second Plan period. Later, these shares were boosted by cornerers. Activity by cornerers is no longer an active influence in operation. But speculators have rediscovered the prospects of Engineering Shares during the second Plan period.

Paper shares have been supported for a long time now on the belief that these shares will move up as the demand for paper improves due to growing literacy. Recent market movements indicate that speculators are always on the search for picking up small-priced sound shares. This explains why many Miscellaneous shares are gradually moving up. These are not unencouraging developments. But there are doubts whether the Calcutta Stock Exchange can go on booming, while Jute and Coal shares remain inactive and Tea shares continue to be irregularly lower.

Let's look at PROGRESS—Stanvac Quiz No. 2

YOU KNOW THAT INDIA'S 5-YEAR PLANS MEAN A BETTER LIFE FOR ALL. BUT DO YOU REALISE THE PROGRESS **ALREADY MADE** UNDER THE FIRST 5-YEAR PLAN? TEST YOUR KNOWLEDGE AGAINST THE QUESTIONS AND ANSWERS BELOW.

1 IRRIGATION SCHEMES ARE A VITAL PART OF THE PLAN. BY 1953-54, THE AREA OF LAND UNDER IRRIGATION HAD INCREASED BY:

A) 8,100,000 ACRES
B) 1,300,000 ACRES
C) 2,700,000 ACRES

2 EXPORTS OF EVERY KIND ARE VITAL TO A COUNTRY'S PROSPERITY. DURING 1954-55 INDIA'S EXPORTS OF SALT TOTALLED:

A) 4,575,280 MAUNDS
B) 1,505,211 MAUNDS
C) 631,010 MAUNDS

3 THE ORIGINAL TARGET FOR TELEPHONES HAS BEEN SO FAR EXCEEDED THAT A NEW TARGET HAS BEEN FIXED. THE NUMBER OF TELEPHONES PRODUCED IN 1954-55 WAS:

A) 8,233 B) 16,078
C) 48,234

4 THE PLAN CALLS FOR NEW SCHOOLS, EDUCATION FOR ALL. BY 1954, THE NUMBER OF NEW SCHOOLS WAS:

A) 28,063
B) 25,700
C) 12,400

STANDARD-VACUUM ARE PROUD TO PRESENT THIS TOPICAL INFORMATION ON INDIA'S PROGRESS—AND PROUD THAT OUR THREEFOLD ACTIVITIES OF **PRODUCING, REFINING AND MARKETING OF PETROLEUM PRODUCTS** ARE CONTRIBUTING TOWARDS IT.

ANSWERS

1 8,100,000 ACRES OF ADDITIONAL FERTILE, PRODUCTIVE LAND—TO GROW MORE FOOD FOR INDIA!

2 4,575,280 MAUNDS OF SALT WERE EXPORTED IN 1954-55, EARNING RS. 3,367,900 IN VALUABLE FOREIGN CURRENCY!

3 48,234 TELEPHONES WERE PRODUCED IN 1954-55. THE ORIGINAL TARGET FOR THE ENTIRE PLAN WAS 25,000 TELEPHONES!

4 25,700 NEW SCHOOLS HAD BEEN OPENED BY 1954—WONDERFUL PROGRESS IN PROVIDING EDUCATION FOR THE CITIZENS OF TOMORROW!

Near-Boom Conditions 1351

AROUND BOMBAY MARKETS
Diwali Prospects Brighter
Than Ever 1352

CURRENT STATISTICS 1356

WITH everything made so fluid by the redrawing of the map of India, one should have thought that Diwali could be celebrated only with mixed feelings. As the day approaches, the lines of the map are being drawn, erased and redrawn. Does it mean breaking up and undermining that feeling of unity and cohesion which even the most ardent of patriots would not consider strong enough, as it was? But the gloom is dispelled by Diwali cheers. The Indian economy has shown remarkable resilience. After the country became free, the bad years have been left behind and one by one, what looked like stubborn bottle-necks have been gradually broken. Indeed, after the food shortage was overcome, things have been on the whole smooth-going. Bumper agricultural crops have changed the outlook of the economy and even falling agricultural prices, which were once regarded, and not without reason, as an insurmountable difficulty in the path of further progress, have been partly checked, very largely without any special measures of assistance. In any case, falling agricultural prices have not withheld the progress of industry, and industrial production has set new records, one after another.

But can we forget that industrial production for which we have an index contributes no more than five per cent of the total national income? It is the prosperity of agriculture and the level of activity in this sphere of small scale, village and cottage industries that still spells joy or despair in the countryside. Of this we know no more than that the urge for development is slowly but steadily penetrating the country side also and what more is needed to speed us forward than the desire and determination for doing better and still better?

Truly can the Government claim that the single largest achievement of the Five Year Plan has been to make people plan-conscious; it has made them take stock of their present situation, look around and think of better things. Age-long apathy is slowly giving place to hope; hope is being kindled in many hearts which had forgotten what it was to hope and strive. This is not to say that the urge has yet become sufficiently strong to result in action among all sections of the people. That is not yet. But freedom in the eyes of even the lowliest is slowly acquiring, however faintly, some semblance of content. As this urge gathers strength, many problems which now appear to be insoluble will become easy of solution, but in what precise manner we do not know yet.

Discussion about the Second Plan goes on apace. The gap between aspiration and achievement is not appreciably narrowed thereby, but the will to achieve has been asserting itself in no unmistakable manner. For no suggestion has come up that the gap in resources necessary for the Second Plan, for example, should be sought to be bridged by lowering the targets; on the contrary, the consensus of opinion, both at the highest political level and among the common people, is that the targets should be stepped up rather than brought down.

Many Diwalis have come and gone since the advent of freedom and each had its own aura as well as the hanging clouds. Hopes have faded and new hopes have gleamed; but through them all has flickered a deeply felt urge for better things and for greater endeavour and today it burns brighter than ever before.

Those who deal in coastal statistics, what measure can they take of the depths? Or to change the metaphor, what can meteorology say about the seismic waves, the tremors that shake the bowels of the earth? What indication can market indices give of the economic forces that shape the lives and destinies of our submerged millions, who do not even come within the ken of the market economy? Subject to these limitations, on the eve of Diwali, one cannot help taking stock of, and forming one's own judgment about, the prospects that Diwali holds. Elsewhere in this issue, an attempt has been made to survey the stock exchange, bullion and commodity markets from this angle. Prosperous agriculture and record industrial production has tinged the outlook in all these markets, and the result of the assessment, on the eve of Diwali, is bright enough to dispel the shadows cast by future uncertainties.

Market movements, however, are affected more by the immediate and the tangible than by factors that are distant and remote. No student of the Indian economy or of developmental problems, however, can fail to be overawed by the great divide that sets apart the two sectors of the economy, if one is allowed this permissible measure of over simplification.

How does agricultural prosperity sustain the development of the entire economy and how is the fat of the land to be fed into industry? Community Projects and agricultural extension have been launched with this end in view and have got off with a flying start. The programme of village industries, originally thought of as an integral part of community development, is now being given a wider, but not a sufficiently wide, orientation. Development so far, however, has been more effective at the industrial rather than the rural axis, despite the remarkable increase in agricultural production which is by no means to be slighted. The natural trend, and in many respects a desirable trend, of this development would be to put back the fruits of it into the agricultural and village industry. How are resources to be drawn from one sector to the other to ensure the continuity and speed of development? The growing urge for it, which is increasingly becoming evident, will no doubt find a solution, but it would not be damping the Diwali spirit to draw attention to this basic problem, so

that its solution can be brought nearer.

The emotional urge for language groups to come together can be a powerful drive for national development, if it is properly guided. Active participation in development can give an outlet to the energies that have been wasted hitherto, in the

West Asia

IT would be rash to conclude that the recent arms deal between Egypt and Czechoslovakia is the root cause of revived fighting between Egyptians and Israelis in the demilitarized zone of El Auja. It may have hastened the border clashes, but it has not directly caused the breach in the armistice agreement. To interpret the Egyptian arms deal as a direct cause for the violation of the armistice terms is to confuse issues. Two separate issues are involved in the disturbed situation in West Asia. These issues may not be entirely unrelated. But to stress the casual relation between the issues in question is to misinterpret the developing situation in this region.

Colonel Nasser has shown intimate familiarity with international power diplomacy. This explains the timing of his arms deal with Czechoslovakia. By accepting supplies of arms and technicians from a Communist State, the Egyptian Premier has successfully exploited the keen diplomatic rivalry between Russia and the Western Powers for creating spheres of influence in West Asia. His arms deal is partly a reflection of Egypt's aspirations to outbid Turkey as the leader of the Moslem world, even as it is a tribute to Soviet diplomacy that Russia has succeeded in exploiting Egypt's political ambitions in exerting her influence on developments in West Asia. To emphasise these political trends is not to suggest that Colonel Nasser has any Communist leanings, or that Egypt's foreign policy is to align herself with the Communist bloc. Non-involvement in the East-West tension remains the essence of Egypt's foreign policy.

Moscow can have no direct interest in creating any permanent tension in West Asia. But Russia must necessarily be vitally interested in neutralising the political domination and interest of the Western Powers in this region. West Asia is a strategic area, rich in oil. In both oil

absence of such an outlet, in bickerings and purely parochial conflicts. This is the time to remind ourselves that an expanding economy is itself a solvent of destructive and mean impulses that feed on the self. It can lift up men who are born heir to a kingdom and have fallen into a pit. To this great endeavour, let the country awake.

as fuel for a potential war and in West Asia as a global strategic point, Russia is keenly concerned. For the first time in recent history, Russian diplomacy has succeeded in making its influence felt in West Asia. She has achieved this diplomatic triumph without any direct participation or involvement on her own part. Egypt is buying arms not from Russia, but from Czechoslovakia. So is Afghanistan. This oblique move leaves ample scope for diplomatic manoeuvre for Russia.

Russian diplomacy has already had the intended effect. It has forced the Western Powers to make approaches to Russia to help the situation in the border zones between Egypt and Israel. Despite supplies of arms by Czechoslovakia to Egypt, America and the Western Powers are showing reluctance to help Israel with arms and ammunition. Israel still maintains military superiority. Israel is seeking help from the world Jewry to finance purchases of arms and ammunition. If border clashes continue, the arms race is likely to assume alarming proportions. But that stage has not yet been reached. Meanwhile, the Russian diplomatic move has focussed attention on the wider strategic issues in West Asia. By a single diplomatic move, Russia has succeeded in creating a situation in which the Western Powers have been forced to consider whether they should seek terms from Russia for an agreement on issues relating to West Asia.

Suggestions have been made that a four-Power agreement should be concluded to limit supplies of arms to Israel and Arab States. This is an aim which is devoutly to be desired. There is no reason to apprehend that Russia will be reluctant to enter into such an agreement. For such an understanding is not likely to prove an obstacle to Russia to extend her influence in West Asia. Her successful diplomacy has strengthened her bargaining position. To those who are inclined to blame

Russia for attempts to create spheres of influence in West Asia, there are two answers. If the Western Powers can continue to dominate West Asia's politics and oil resources, there is no reason why Russia should not seek friends in this region. Not Russia, but the Western Powers started the diplomatic rivalry. Russia was provoked to create a neutral belt in West Asia by the establishment and extension of the Baghdad pact. This military alliance, which extends from Turkey to Pakistan, is an open attempt by the Western Powers at strategic encirclement of Russia. She has, therefore, every right to demand a price, in the shape of modification of the Baghdad pact, for her participation in any four-Power agreement to limit supplies of arms to Israel and Arab States.

Here, it is necessary to revert to the main theme of this article that the issues involved in West Asia are separate, though not unrelated altogether. Colonel Nasser may be opposed to involvement in the East-West conflict. But he is a staunch nationalist. There are two main aims in his policy to the neighbouring States. He has succeeded in one of his aims. Britain has quitted the Suez Canal. His other aim is to make West Asia a region where only Arab or Moslem States will exist. Egypt has never accepted Israel. Colonel Nasser is one of the leaders of the Army group which has always denied that Egypt has lost the war for Palestine. He concedes that Egypt lost a battle in the Palestine war due to corruption and treachery of the Palace. This was the main inspiration behind the successful rebellion of the Army group. It has never made a secret of its wish to wage "a second round" of the battle for Palestine. This is one of the reasons for the renewed fighting between Egyptians and Israelis in the demilitarised zone, though it would be unfair to blame Egypt alone for breaches of the armistice agreement.

Statesmanship demands that Egypt accept the realities of the situation. Israel has come to stay. Israel's status as a separate, sovereign State cannot be denied. Egypt and other Arab States must agree to live in peace with Israel. First things must come first. Border clashes must first cease. Armistice terms must be honestly implemented so that negotiations can start. It is by now clear that Russia has established her claims to be one of the four Powers who will have to

guarantee the frontiers of Israel and Egypt. Once the frontiers have been firmly fixed, Russia and the three Western Powers have to undertake jointly to guarantee the territorial frontiers mutually agreed upon by Egypt and Israel. In return for recognition of Israel, Egypt and Arab States have the right to insist on a lasting solution of the problem of Arab refugees. This is where the former Dulles proposal for an international loan to Israel to enable her to assume the responsibility for Arab refugees comes in.

Colonel Nasser has grown in stature since his assumption of power in Egypt. India and other Bandung countries rely on Colonel Nasser to pursue a policy which can ensure

Egypt's claim as the moral leader of the Arab world. Egypt's refusal to recognise Israel can only lead to a disturbance of peace in West Asia. There is a further danger that such a policy may provide opportunities to Russia and the Western Powers to tighten their grip on West Asia. Korea and Indo-China are stern reminders to Egypt of the ugly consequences on West Asia of any possible "little war" between Israel and Arab States. Colonel Nasser has a grave responsibility to maintain peace in West Asia. There will be hope that the Egyptian Premier will have the courage and statesmanship to ensure peace in West Asia so that Egypt can play her destined role as the leader of a stable, democratic, peaceful Moslem world.

Greetings

Malaya and Communists

Our Malaya Correspondent Writes:

THE excitement in Malaya at the moment is to do with this meeting of Tungku Abdul Rahman and the leader of the Communists, Chin Peng. The Government officials are making most active attempts to stop Tungku Abdul Rahman saying any more than that if the Communists stop fighting, then we will not punish them for their terrorism (although we may detain them).

The point is that not all Communists are terrorists nor are all terrorists Communists and the government, by identifying the two, have got themselves into a hopeless position. All that has to be done is to declare that all Communists who wish can come down from the hills and form political parties but that all those proved to have committed terrorist acts will be tried in the ordinary courts of justice and not by special tribunals. But the government officials are not prepared for that. For the last three years they have been following the wrong propaganda line and are practically forcing Tungku Abdul Rahman into the position of an open fight against the British government or against his own party.

The British government never seems to learn that once you have conceded independence, you have to go the whole distance or not at all. But once on the slope, the sooner everything is handed over, the better.

From this point of view, British Guiana proved a bad bet and I expect the colonial officials in London to regard Malaya as a possible British Guiana which just goes to show how little they know about this part of the world.

Cabinet Minister, Happy Mother

SOME of Denmark's export problems have been put forward pointedly by the Danish Minister of Commerce, Industry and Shipping in the latest issue of the Annual "Denmark Exports" which comes out as a Special Edition of the Borsen, Denmark's Commercial and Shipping daily. Even a cursory glance at this Annual will show the wide range of industries which Denmark has been running of late, in addition to shipping, fishing, dairy and farm products, for which of course Denmark has always been well known. The

Danish Minister of Commerce, Industry and Shipping, who is the first woman to hold such a position in any country in the world got into the Cabinet from the Consumer's Council of which she was the President. And she started her career by studying economics in an University. The smaller countries have to use the most advanced techniques to be able to hold their own. The high standard of economic studies of the Scandinavian countries generally has always commanded admiration. Economists have an assured status there. But from the Consumer's Council to the Cabinet must indeed be a remarkable feat. And besides meeting the exacting demands of her post, Mrs. Lis Groes is the happy mother of nine children.

Denmark has been steadily increasing her industrial exports but getting into balances of difficulties in the process, as her imports have expanded at a rate double as fast as that of exports. The Danish Minister of Commerce complains that the treatment of Danish trade by international organisations has been unfair. Denmark freed a major part of her imports but her exports continue to be severely damaged by high tariff, subsidies and state trading by foreign countries.

All these present baffling obstacles to her high quality products of agricultural origin, which account for

two thirds of Denmark's total merchandise exports. Restriction on imports and exorbitant tariffs exclude Danish agricultural products from a large number of potential markets.

It is ironical to find not only U.S.A., but Britain also in the dock, and being arraigned for protecting and subsidising home agriculture which puts the bulk of Danish exports in a very difficult position. Yet Denmark holds firmly to the GATT through which alone she can hope to get a fair deal some day. She is thankful even for small mercies, such as stabilization of tariff bindings which the GATT has made possible. Along with the other low tariff countries, however, Denmark finds herself in a position of particular disadvantage in another way, for she can offer little by way of tariff concession in order to bring about a multilateral reduction of tariffs. Denmark is one of the few countries in the world today which still clings pathetically to the advantages of international division of labour, and is bitter that these advantages are distorted through tariff protection to the detriment of increased standard of living. Naturally Denmark finds little to gain from bilateral agreements and has to work steadily through the procedure of consultation the GATT offers for multilateral solutions of the problems of her commercial policy.

The Indian Iron & Steel Co. Ltd.

NOTICE

THE Thirty-eighth Ordinary General Meeting of the Shareholders of The Indian Iron & Steel Co. Ltd., will be held on Monday, the 28th November, 1955, at 11-00 a.m. at the Registered Office of the Company, 12, Mission Row, Calcutta, to transact the following business:—

- (1) To receive the Directors' Report and pass the Audited Accounts for the year ended 31st March, 1955.
- (2) To declare a Dividend on the Ordinary Share Capital.
- (3) To elect Directors.
- (4) To appoint Auditors and fix their remuneration.

The Share Registers of the Company will be closed from the 15th November to the 25th November, 1955, both days inclusive.

Calcutta,
10th November 1955.

By Order of the Board,
Martin Burn Ltd
Managing Agents

NOTE: If the Dividend as recommended by the Directors is passed at the Meeting, it will be paid on or after the 5th December 1955, to those shareholders whose names are on the Company's Register on the 25th November, 1955.

present
the *All-Indian* Typewriter

Equipped with the confidence, resources and experience gained from 58 years of pioneering achievement, Godrej have entered another progressive phase in their development by introducing for the first time a Typewriter, made in India, at a very remarkably low price.

The Godrej spirit of enterprise is reflected in the planning, designing, engineering and building of a Typewriter comparable to any today, in spite of major difficulties and problems.

The Godrej Typewriter embodies the latest advances in typewriter engineering to ensure ease of operation and efficient performance. Of the 1,800 components only 4 items: the types, key tops, rubber platen and one spring are imported, costing a negligible Rs. 30/-. All other parts are designed and manufactured by the skilled Godrej engineers from the very best materials available.

As soon as the Hindi keyboard is finalised, the Godrej Typewriter will be available in Hindi also.

BRIEF SIZE : Rs. **630**

SERVICE AFTER SALES GUARANTEED

- ★ Pleasing & hard-wearing colour; resists accumulation of dirt.
- ★ Perfect-grip feed-rollers.

Justice to Roads

THE Indian Roads and Transport Development Association have urged the Planning Commission to do full justice to the claims of roads in the Second Plan. In the absence of the President, Mr D A Nadrishah, this demand was voiced by Mr A D Wenzel, the Vice-President, who presided over the last annual general meeting of the Association held in Bombay last week. The progress of road building, Mr Wenzel said, had been fairly satisfactory during the First Five Year Plan, and 90 per cent of the development programme was expected to be completed by the end of 1955-56. The Nagpur Road Plan, however, was not going to be realised even in the Second Plan period. The balance of 57,000 miles of roads which remain to be completed, if the Nagpur road Plan was to be achieved, would cost Rs 530 crores. The Draft Plan-frame had allocated only Rs 350 crores to roads which amount was likely to be scaled down to Rs 250 crores. This, Mr Wenzel complained, was inadequate.

There is nothing like leather. And the Association strongly feel that Government has been treating road transport very unfairly and giving undue preference to railways. The Association had assessed the overall transport requirements of the First Five Year Plan at about 30 per cent over the pre-plan facilities. But while this estimate was accepted in the case of railways, it was not adopted in the case of road transport on the ground that the required number of vehicles would not be available and that the necessary capital might not be forthcoming.

The preference shown to railways, Mr Wenzel complained, could not but slow down the development of roads. In fact, railways were now claiming as much as Rs 1500 crores out of a total development expenditure of about Rs 5,000 crores, i.e. 30 per cent of the total. He felt that it was unfair that such a large proportion of the development expenditure should go to one nationalised service when private capital was forthcoming to develop other modes of transport.

Now if adequate transport was not forthcoming to take advantage of the roads—whatever may be the reason for it—would not the investment on roads be unprofitable and unwise? Idle capacity in any form is a social waste. Whether it is high tax on motor vehicles, high

price of petrol, the import policy of the Government with regard to trucks or mistaken policy of nationalisation of road transport—it is immaterial what the reasons are—if roads are not likely to be fully utilised for carrying traffic, could not investment be diverted elsewhere where it would be more productive?

Idle Capacity

THERE is a prima facie case for scrutinizing the existing 'idle capacity' in roads as much as in railways. This is a point which the Indian Roads and Transport Development Association cannot be expected to look into or appreciate. Their angle on it, however, is simple and straightforward, that is to remove all obstacles to development of road transport. The Association, of course, are all for the fullest utilisation of roads and for more roads. And Mr Wenzel wants it to be done by giving due encouragement to private capital which is willing to develop road transport.

He is, however, on more firm ground in pointing out the absurdity of still continuing the restrictive provisions of the Motor Vehicles Act which had been introduced at a time when the railways, way back in the 30's, were being badly worsted in the competition with road transport.

Ironically enough, R T Os are still being employed by the authorities to see that no licences are issued to road carriers where they carry goods over a distance of 75 miles or more on roads which run parallel with railways. This is certainly an anachronism when there is not enough transport available, by road or rail, to carry all the traffic that offers.

We did not choose the easy and straight path of first developing enough transport on roads before venturing on manufacture of automobiles. Automobile interests want more cars and trucks to be put on the roads by reduction of taxes on motor vehicles and speedier road building, but not by making trucks and cars cheaper by freer imports. Private carriers are being held back both by high costs and by the restrictive policy of State Governments who are developing their own road transport. Reliable data on road utilisation are scarce, if not non-existent. But even so, from the general look of things, it appears that a case could be made out for temporising the road building pro-

gramme until the country is in a position to avail fully of the roads that are built. A proper phasing of programmes is essential to planned development.

Wheat Prices

AT the meeting of the International Wheat Council next March, India is likely to press for a reduction in the price of wheat sold under the Wheat Agreement, first signed in 1949 and subsequently revised in 1953. There are more reasons than one to support India's case. In the first place, domestic production of wheat has shown remarkable improvement, especially in the last two years. In 1954-55, India had a record crop of 8.5 million tons. Secondly, world stocks of wheat are now much larger; that the benefits of improved world supplies should be passed on to the signatories of the Agreement, at least in part, will not need much arguing. Finally, although the Agreement provides for the sale of wheat at prices which are below the ruling market prices, the underdeveloped countries in particular find it hard to bring the wheat in. Freight charges are excessive and often importing countries find that the landed cost is inflated by as much as 40 per cent with the result that unless the Government of the country concerned is prepared to subsidise the sale of wheat imported under the Agreement, it would not sell at all, prices being prohibitive. For instance, it is estimated that consumer prices for such imported wheat, without subsidy, in some parts of India would be 50 per cent higher than those paid by consumers in the US, Canada, Switzerland and the UK.

It is only natural, therefore, that efforts should be made to get a price concession. India has been progressively reducing the quantities of wheat bought under the Agreement. India's purchase which averaged 12 lakh metric tons per year between 1949-50 and 1953-54 declined to only 6.5 lakh metric tons in 1954-55. During the current year no purchases have been made yet.

Under the original Agreement, India had to buy a guaranteed quota of 1.5 million tons per year; this was subsequently revised downwards to 1 million tons in 1953. As indicated above India's purchases have been going down each year and her requirements are now so low, an effort also would be made to seek a revision of the quotas for guaranteed purchases under the Agreement.

Deposit Insurance

WHILE inaugurating the Ahmedabad branch of the United Bank of India, Shri R G Saraiya said that Indian Banks should try to evolve a system of deposit insurance, if necessary with the assistance of the Reserve Bank of India, to ensure safety of deposits to clients of modest means. This is not the first time that a proposal for some form of deposit insurance has been mooted. It has no doubt a superficial attractiveness, particularly in a country where the banking habit is not well developed. But closer examination would show that it is strictly not necessary as an adjunct of sound banking development.

It is essential to see the problem of safety of deposits in its proper perspective. It is obvious that the problem really concerns the weaker banks and as such a proposal for a system of deposit insurance to cover the entire industry is hardly necessary. Even in regard to the weaker units, there are more economical alternatives such as amalgamation, sounder banking methods in regard to employment of funds, etc. At present the major portion of deposits are banked with the stronger units, who would not be interested in deposit insurance, and to confine deposit insurance to weaker units would be to create an invidious distinction within the industry which is far from strengthening the insured banks and would further undermine depositors' confidence in them. Furthermore, deposit insurance might even conceivably act as a drag on attempts to improve quality of banking, which is ultimately the best guarantee of depositors' funds.

Admittedly, bank failures are not entirely a thing of the past in India but even so, they are happily few in number and virtually insignificant in relation to the total deposits in the country. Besides, with the assumption of State control over the Imperial Bank of India, and the proposal to take over the remaining State-associated banks, the State has acquired a vital stake in the stability of banking. The private sector in banking is dominated by well-managed institutions, who would hardly need deposit insurance. One should not be misled by the experience in the USA where historical and institutional reasons, such as memories of 'wild cat' banking, the legal and political obstacles to branch banking, the fear of the 'money trust' have created a milieu favourable for deposit insur-

ance. In India we have got on well without deposit insurance and the authorities have enough statutory and moral resources to combine stability and progress in banking without reliance on institutional devices of the deposit insurance variety.

Indo-Arab Trade

THE Union Commerce Minister, Shri D P Karmarkar, remarked, while inaugurating the Indo-Arab Trade Conference in Bombay, that there was considerable scope for the expansion of trade between India and the Arab countries, with whom India today has an adverse balance of trade. This appears to be an optimistic view of the matter. It would be idle to under-estimate the very real difficulties in developing export markets in a politically volatile and economically unsophisticated area like West Asia. In the first place, there are physical difficulties such as the virtual ban on foreigners, particularly non-Muslims, in countries like Yemen and Saudi Arabia. In fact ARAMCO has had to reduce its American employees to the barest minimum in deference to Saudi sentiment. Of course, this difficulty may not present itself in Egypt, Syria, and Lebanon. Then there is the language barrier which should not be under-estimated as English firms have learnt to their cost in Latin America. Then again xenophobia is endemic in this region and Indians have not escaped it as evidenced by the prejudice against Indian employees and traders in Kuwait, Bahrain, and elsewhere.

Besides, the Indian trader in West Asia or elsewhere for that matter, has not shown the resourcefulness and adaptability of the Greek or the Arabian. The traditional Indian exports to the region, such as textiles, will soon have to contend with the domestic industry which is being developed fairly rapidly in Egypt; Indian tea has always had a hard competitor in Ceylon tea; the ability to export light engineering goods presupposes an adequate supply of spare parts and an efficient after-sales service. It is reported by European firms operating in this area that consumers are apt to be unduly insistent on making unreasonable 'after-sales' demands on suppliers. A prospective export market has to be carefully studied and nursed and this takes something more than occasional commercial exhibitions of the type that was held in Cairo some time back.

There is, however, a nucleus of commercial penetration in the

branches of Indian Banks. These, along with branches of Indian insurance companies, should spread themselves out farther afield in West Asia. Indian shipping companies, who have not yet been able to compete effectively with foreign lines in the lucrative Haj traffic, could also furnish another source of export income. India undoubtedly has an international reputation in these areas which might yield commercial dividends in the long run. The Sudanese welcome to Indian personnel is an encouraging augury. The dominance of the rupee currency in the Persian Gulf is another vital asset. Nevertheless, one has to temper optimism with caution.

Office of Speaker

THOUGH we have had and still have men of outstanding ability and distinction of mind and demeanour functioning as Speakers in this country, the institution of Speakership as such has yet to evolve into its truly conventional form of being wholly above party and partisan controversy. The example of Speakers in the pre-Independence days, however inspiring in itself, cannot have much relevance to the present state of affairs. In those early days, Speakers were not only presiding officers, but also in a sense crusaders for the wider freedom of the country. If they could not or did not divest themselves of all association with the political movement or if they occasionally figured in the arena of controversy even, there was something to be said for that. Political freedom rightly appeared to them to be basic to all other freedoms, particularly the limited one enjoyed by the legislatures of those times; and in fighting for the former, they were actually doing their duty by the latter in a larger and more significant sense than the limited scope of their office then might be said to have allowed in a superficial sense.

With the advent of freedom, all this has changed; and what thinking people would look for in the office of speakership is not political advocacy or championship of particular causes, but maintaining the dignity and privileges of legislative bodies and holding the scales even between contending interests. It is not the crusading spirit or the heroic pose, but the judicial temperament, a high-minded aloofness from passing controversies and a magnanimity of heart and mind that are required of Speakers in free India. Active poli-

tionians, who cannot be accommodated in the Cabinet or given any other suitable office and who nevertheless have to be kept satisfied or at least silenced, are not necessarily the best candidates for the august office of Speakership. Not that this is how Speakers come to be recruited these days; but the danger is always there. In any case, the temperament that one would associate with a Speaker of the conventional type is yet to manifest itself in an adequate measure in this country.

Shri Mavalankar's Appeal

IT was only last week, at the three-day conference of presiding officers from all over India at Shillong, that Shri G V Mavalankar, speaker of the Lok Sabha, repeated his appeal to his fraternity to eschew party politics, making a particular reference to the present linguistic controversy. He said that Speakers in their personal capacity might feel strongly on the issue of the proposed redistribution of States, but it would not be in keeping with the responsibility and dignity of their office to take sides in public and uphold particular claims, as some Speakers have unfortunately been doing. More such issues are likely to crop up in future; and if a bad precedent is to be set now, the result can hardly be beneficial to the institution of Speakership. The Speakers of today have both the privilege and obligation to set a pattern of demeanour which is likely to hold good as long as the practice of parliamentary government continues in this country. Lasting conventions and traditions are to be built now—in the formative years of freedom; and it is anything but encouraging that this aspect of the question has not yet received the attention it deserves, or rather it has not yet found adequate expression in practice, the annual conference of presiding officers notwithstanding.

This proclivity to partisanship on the part of some Speakers in the political sphere is not always likely to be kept outside the limits of legislative bodies. And even if, in actual practice, it may not influence the proceedings of a legislature, there is the possibility of a certain degree of suspicion being created in the minds of the people, not in intimate touch with legislative proceedings; and this touch of suspicion should be enough to undermine slowly the prestige of the high office of Speakership. It is not enough if Speakers are impartial and just; they must also seem to be so. Meanwhile, there is an impres-

sion gaining ground in certain quarters that the Opposition or minority view in legislative bodies does not always get the scope for expression that it is entitled to. In this context, the Governor of Bombay, Dr. Harekrishna Mahatab, had some sound advice to tender only a few weeks back. In a full-fledged, vigorous democracy, it is not so much the majority as the minority that needs the considerate attention of presid-

ing officers. In any case, the latter must get its due without question. To some extent, all these difficulties are bound to resolve themselves if care is taken in the selection of candidates for speakership, attaching more importance to their frame of mind, temperament, learning and wisdom than to their political record, and also if a certain element of permanency is introduced into the office of Speaker

Changing Pattern of Company Management

H T Parekh

WITH the passage of the Companies Bill in the Lok Sabha and Rajya Sabha the controversy over the future of the managing agency system can be regarded as ended, at any rate for the time being. During the next five years, efforts will be directed at collecting evidence which will form the basis for future government policy in regard to company management. At this stage it will perhaps be appropriate to indicate the forces already at work in changing the pattern of company management which may well blur the differences which distinguish joint-stock management in India from that in industrially advanced countries.

It is essential to realise at the outset that abuses associated with managing agency system such as corruption, maladministration, misappropriation of funds, etc. are not peculiar to the system for they have been in evidence in cases of banks and insurance companies also which have no managing agents and which are wholly director-controlled. That is, the abuses arise from the personnel managing rather than from the system of managing agents.

Remuneration of Managing Agents

What is really conspicuous in managing agency is the excessive remuneration charged for management, being a fixed percentage of profits at a high level of around 10 per cent whereas in other countries management is carried on on the basis of fixed salaries, largely unrelated to profits. Particularly in cases of large corporations this makes a material difference though admittedly in case of small companies, where salaries of officials are fixed at a comparatively high level, the difference may not be marked. In this direction the new legislation prohibits other forms of income to managing agents such as commission on sales and purchases, office allowance and also disallows remuneration based on production or sales. The cumulative effect of these restrictions is bound to be substantial. The legislation, however, accepts the principle of remuneration to managing agents being related to net profits at a fixed percentage not exceeding 11%. This is an advance over 12½% advocated by the Company Law Commission.

What, however, is a greater advance over the recommendation of the Company Law Commission is the limitation of remuneration to 7½% where management rests with "Secretaries and Treasurers" instead of with "Managing Agents". This is a highly progressive feature of the present legislation because it takes one further step forward in reducing the excessive remuneration allowed for management and thereby narrows down further the gap between reward for management in India and in other countries. It is true that the incidence of this measure will only be felt to the extent managing agencies are transformed into "Secretaries and Treasurers". Such adaptation will itself be a test of enlightened management.

It has to be remembered that while in foreign countries remuneration for management may not vary with profits, handsome remuneration is paid to a large number of top executives among whom are included President, Vice-Presidents, Chairman, Vice-Chairman etc. In India such posts seldom carry separate remuneration and when allowance is made for the aggregate of such remuneration, it would amount to substantial sums and would therefore constitute a considerable percentage of a company's profits. For instance, salaries and other remuneration of three top executives of General Motors amount to \$1.8 million though this formed only 0.225% of the company's net income. In the case of the American Viscose Company total remuneration of three top executives amounts to 3% of net income after taxes. The particular advantage of remuneration in form of salaries, even if large, as against percentage of profits, lies in the fact that as the enterprise and its earnings grow the incidence of salaries of executives to total earnings goes on declining while when the remuneration is linked to profits, the burden on the company grows and reward for management therefore becomes disproportionate and excessive.

Judged from this angle, the members of Lok Sabha who advocated a sliding scale of percentage of profits as remuneration made a valid point. Dealing with this point, the

Finance Minister indicated that this matter could better be dealt with individually for each unit though it is not clear how this would be possible. Perhaps the same purpose would be served even better if leading companies in India were voluntarily to adopt such a course by limiting their remuneration to say 5 per cent of profits as their earnings tend to rise over previously laid down limits, as has been done by a textile mill, viz., Delhi Cloth Mills.

It is of interest to note that in respect of new floatations a tendency is already noticeable of dispensing with managing agency altogether and promoting companies which are wholly director-controlled. The recent floatation of the West Coast Paper Mills is an instance.

"Secretaries and Treasurers"

With rapid strides which science is making, managerial firms, more than ever before, require the services of specialists such as technicians, accountants, administrators, lawyers etc. to work in close co-operation with business men. Many of the existing agency houses suffer from lack of organisation and suitable personnel and also from over-centralisation of authority. In so far as they are family firms run merely on hereditary lines without proper distribution of responsibility, their efficient running will only be to the extent that the top executive is energetic or able. In so far as members of the family step immediately into responsible position without qualification or experience, the managerial set-up will be gravely defective and the managed concerns must suffer in one way or another.

Only to the extent managing agency houses shed their character of being close family preserves and admit outside talent on equal footing into their organisation so as to benefit the managed companies, the managing agency system will be able to justify its existence and continuance. Modern enlightened form of capitalism demands recognition of the principle of equality of opportunity and its active operation in the field of management. Such voluntary divesting of authority by present managing agents and admission of outsiders to participate

in the high rewards of management will go a long way towards helping the survival of the system, albeit in a form modified to suit modern conditions. Rationalisation of management along these lines is an urgent necessity.

The new provision in company law of "Secretaries and Treasurers" implies this reform and has validity only in so far as it is based on this concept. From this angle, there is much to be said in favour of a public limited company operating as the managerial firm, preferably as "secretaries and treasurers", instead of private limited companies working as family firms with a nominal organisation, unassisted by talented or qualified staff enjoying equal status. A public limited company as set up by several foreign managing agency houses in India for management is free from many of the defects associated with managing agencies and could well be adopted by Indian Agency houses. The partial loss of authority and profits which the change may cause to present agents should be willingly borne so that opportunity for management may be thrown open to many more deserving people and the feudalistic pattern of company management may be ended. In the absence of such reform the hands of those demanding termination of the system will be much strengthened.

Choice of Directors

The Company Law reform will also have far reaching significance in the managerial field in another direction. Through several specific clauses the ultimate authority for management is vested in the Board of Directors whose powers have been greatly expanded while pro tanto the powers of managing agents have been cut down. The responsibility of the Board of Directors has thus greatly increased. Even in the choice of directors the age limit of 65, restriction to 20 companies, restriction of ex-officio directors to two must mean a Board of Directors more alive to its responsibilities. Directors will henceforward be less of figureheads or busy-bodies and the Board will have to be less of a packed house than hitherto.

It is a matter for close examination how far the prevailing practice in India of having a Board of Directors largely consisting of outsiders needs modification. Such outside directors formally attend meetings of the Board but take little inter-

est in the actual management of the companies. They are largely preoccupied with their own affairs and devote little time to study the working of the companies concerned.

On the other hand, in foreign companies a large number of directors are full-time, technical or other specialists, who have often risen through merit and hard work. Almost all foreign companies operating in India have their senior full-time officers as directors and very few directors are drawn from outside. Such a homogeneous Board of Directors perhaps works more efficiently. It would be a desirable trend if companies in India were to modify the present practice of packing the Board of Directors with business magnates who may be successful and able in their own businesses but lack the time and energy, as also any interest, to discharge adequately their responsibility as directors on various concerns. It would make for efficient running of companies

if Boards of Directors are constituted more by full time workers and outside people are represented only to the minimum extent necessary. What is desirable is the change of proportion and greater emphasis on workers rather than on "leading lights" for effective conduct of the company's affairs.

Without important modification in the structure of managing agency firms and of Board of Directors, further industrial development would be difficult, particularly when we take account of modern industries such as automobile, air-crafts manufacture, chemicals etc. which all depend more and more on scientific advance and its incorporation in industry. The business man with his great qualities and judgment is no doubt indispensable, but he must be the first to appreciate his own limitations and be ready to absorb and integrate the new forces of science so that industry may march along modern lines.

DEEPAVALI

Deepavali is the symbol of our heritage and culture through ages long gone by. In it lies the message of goodwill to the State and the Community as also of safety and security of the nation both individually and collectively.

On this auspicious occasion of hope and cheer, HINDUSTHAN extends its Season's Greetings and Good Wishes to you all.

Britain's Share of Europe's Trade

THE evidence of weakening British competitive power as is examined in the latest quarterly report of the Economic Commission for Europe has been generally described in Britain as "disturbing". With the exception of the trade in chemicals, the ECE has found that Britain's share in Europe's trade has declined absolutely as well as relatively to other countries in the past year. In contrast, Western Germany has emerged as a greatly expanded economy dominating the trade of Europe and taking an even larger chunk of that trade.

The evidence provided by the ECE is both interesting and illuminating. The German gains in the West European market have been most spectacular in those commodities which are currently subject to most competition. In the European car market Germany has been advancing at Britain's expense. Similarly, more of railway rolling stock and ship-building contracts have gone to German firms. Even in textiles—a traditionally British export product—recent figures indicate that the Netherlands and the three Scandinavian markets have turned more to Germany for their supplies.

The reasons for the shift in the competing shares for the West European market inevitably, but not solely, rest on the question of price. It would appear from the statistics provided in the ECE Report that Britain's export prices have fluctuated more, and thus have contributed to the instability of her competitive power in world markets.

UK and West German Export Prices in July-August 1955

1st Quarter 1954 = 100

	U. K.	West German
Total Manufacturers	103	101
Engineering Products	103	100
Chemicals	—	96
Textiles	100	100

The comparative instability of Britain's export prices can, of course, be explained in terms of the over-spill in domestic demand and the attractions of the home market to British exporters. And there is no doubt that the Chancellor of the Ex-

chequer's last supplementary Budget was founded on this understanding of Britain's trade problems. The reasoning of the Economic Commission for Europe on these matters runs somewhat on different lines. The report shows with considerable clarity that the ratio of exports to turnover in the West German heavy and light engineering industry has been falling since the last quarter of 1954. This, says the E. C. E. report, is a sign that the internal boom in investment and consumption of durables was beginning to act as a brake on exports in West Germany. In other words, almost at about the same time as Britain was experiencing the first symptoms of an inflationary internal demand for goods and services, West German exports, too, were being held back by a high level of internal investment and durable consumer demand. It is, however, more possible, and here the ECE report states that it is a strong possibility, that the falling ratio between exports and turnover in the machinery and automobile industries, both in Germany and in the United Kingdom, was the result not so much of the impact of home demand, but of export markets tending to become less expansive than before.

The lesson that can be drawn from the well-argued ECE report is that there exists, rather strongly, a possibility of what the Financial Times terms a "cyclical recession" some time in the first half of next year. The policy of retrenchment—of holding back or cutting down on particular forms of investment expenditure—which appears to be the hallmark of almost all the measures that are emanating from the Treasuries of European countries must thus be seriously questioned, lest once again policy finds itself out of time with the actual course of economic events.

The New Treasury Bill

An event of some importance to the London money market took place during the past week. The new Treasury bill—a bill of 63-day maturity—has been introduced by the Bank of England as yet another instrument of short-term government finance. Up to now, the authorities have always followed the practice of giving all bills issued at public

tender a life of three months. It was long recognised that Treasury bills of varying dates should be used as in other countries, so as to simplify the task of official borrowings from the banking system, thus ensuring an even balance between the movement of funds in and out of official hands.

The new Treasury bill is largely necessitated by the requirement of the official policy of credit squeeze. The discount houses have been found to be reluctant to accept short-dated bills from the authorities on days when credit happens to be in good supply since they are afraid that on succeeding days the shortage of money may become so acute that they will be forced to borrow from the Bank of England at penal rates of interest. Now, with the issue of both 91 and 63-day Treasury bills, the authorities will be able to adjust the amount of bills falling due for payment so that repayments could fit in with the amount submitted for tender.

The new Treasury bill was introduced in the public tender for the week ending November 4th. The average rate of discount for the £50 million of 63-day paper came out at a shade under 4 1/8 per cent and that of the 91-day maturities at a little over 4 3/32 per cent. A week earlier the public tender rate was 4-1/16 per cent.

Background to Devaluation

Report on Currency & Finance 1954-55; State Bank of Pakistan, Department of Research, Karachi
Pages 180, Price Rs 3-8.

AMONG the many practices Pakistan has adopted from India is the publication every year by its State Bank of a Report on Currency & Finance. Not only in its external format but in its contents and even more in leaving more things unsaid and to be read between the lines, the State Bank's Report follows very closely our own Reserve Bank's annual publication. This year's Report of the State Bank is of particular significance as it provides the background, as it were, to the decision since taken to devalue the Pakistan Rupee.

Pakistan has moved a long way from the happy situation she found herself in after Korea when she was riding on the crest of a commodity boom. The balance of payments position had begun to cause anxiety as early as 1951-52, with the collapse of that boom and though the Report mentions that in 1954-55 the balance of payments registered improvement, it noticeably soft-pedals the fact that this improvement was accomplished through heavy and progressive slashing down of payments (mainly imports) from a level of Rs. 287.9 crore in 1951-52 to Rs 130.3 crores in 1954-55; this was necessitated by the steady deterioration in export earnings and other receipts from Rs. 240.6 crores in 1951-52 to only Rs 133.9 crores in 1954-55. This decline, of course, has been the result largely of the considerable worsening of Pakistan's terms of trade and in the case of raw jute, in particular, the volume of exports as compared with the earlier year has shown a rise, though the receipts have barely been three-fifth of that in 1951-52. The relative decline in receipts from cotton exports has been no less severe, though with the impetus of rising international tea prices, receipts from tea exports has shown a sizeable increase.

The sudden collapse of foreign demand for her two main export commodities had serious repercussions on Pakistan's internal economy; the growing volume of stocks in both these commodities naturally affected production and raw jute production had slumped to 447,000 tons in 1953-54 from a level of 1,218,000 tons

the previous year. Cotton production also suffered a setback and it is not difficult to imagine the domestic consequences of lower production in the form of declining purchasing power; on the other hand the severity of the imports cut had driven the cost of consumer goods, most of them essential and many again imported, to new high levels. The justification of the decision not to devalue had been declared to be that of protecting the interests of the producers of the main export commodities and of reducing the cost of living. The fortuitous circumstances after Korea had vindicated this stand but by 1955 it had come to be realised that non-devaluation had cost the nation dear.

Against this background, it is little wonder that Pakistan devalued her currency. The decision to do so was no easy one for the maintenance of the 2½d rate had unfortunately become a matter of 'face'; on economic grounds, of course the decision was well high necessary; indeed the surprising part of it was that it was delayed so long.

In the light of this experience and the decision to devalue, the statement in the opening paragraph of the Report (which incidentally paints a far brighter picture than is warranted) that "the continued expansion of economic activity of W. Europe and the recovery in the USA helped to sustain the markets for commodity exports" is rather difficult to accept at its face value.

The section in the Report on Industrial Production is of interest in that it reveals the very significant achievement of Pakistan in this field in the brief span of eight years. Much of the success of the effort at industrialization has been due to the pioneering work of the Pakistan Industrial Development Corporation. 19 of the projects sponsored by the PIDC in such diverse fields as paper, woollen textiles, sugar, cotton ginning, insecticides and cotton textiles have already gone into production while schemes in respect of cement, fertilisers and the Sui Gas pipelines are nearing completion. It is a record of which the PIDC can legitimately be proud, and our own

national Industrial Development Corporation which is organised broadly on the same pattern might well profit by a close study of the working of its Pakistan counterpart.

That the growing industrialization of the country has, however, not really diversified the economy sufficiently to allow for any substantial influence of non-seasonal factors in Pakistan's credit pattern is revealed in the discussion on money and banking. That the banking habit is spreading but tardily is evident from the fact that of the increase in money supply during the year no less than two-thirds was in the form of currency. Incidentally, there is no attempt in the Report at an analysis of variations in money supply beyond stating the obvious fact that it was due to a rise in bank credit, a favourable payments position and increasing development outlay. The necessity of ensuring credit for economic development has prompted the State Bank authorities to relax their eligibility criteria; bills having maturity up to 5 years drawn for the purpose of financing schemes of agricultural and industrial development are now discountable with the State Bank while proposals are under way to set up an industrial bank.

The section on Public Finance which is an additional feature this year is useful though such banalities as "Public finances serve both as mirror and instrument of economic growth" may well have been avoided.

The Second Five Year Plan —Some Methodological Considerations

K S Rao

For appropriate developmental planning it is necessary to pool the knowledge of economists, statisticians and other technical experts in different fields, in order to complete the work initiated so brilliantly by Prof Mahalanobis. The scientific approach in the Draft Plan Frame calls for nothing less.

The author, one of our leading econometricians, argues persuasively and convincingly for operational studies in order that policy makers may have appropriate scientific criteria for programming of activities, so that instead of purely subjective preferences, policies may be based on observation and valid inference.

THE first five year plan period is coming to a close with March, 1956 and the Plan-frame for the second Five Year plan has been before the public for some time. The plan-frame has aroused keen interest even though the interest has received a temporary set-back owing to the publication of the States Reorganisation Commission's Report. The second five year plan, however, is busily under preparation and is expected to be before the public before the end of the first plan period. At this stage it will not be out of place to make a critical appraisal of the methodological considerations useful for the finalisation of the second five year plan.

The approach of the first plan was simple and did not present any methodological problems. The accent of the plan was on agricultural development with river valley multi-purpose projects and community development projects as parts of it. Firstly the various projects were defined and their costs estimated. An estimate of the money available was made and by readjustment, the priorities and sizes of the projects have been brought into equilibrium with the money available. The evaluation of the progress of the plan was mainly on an expenditure basis. The tempo of achievement was measured by the tempo of expenditure. Even though the method of evaluation of the progress of the plan leaves much to be desired, the basic approach of the first plan was sound, considering the purpose for which it was intended, namely, agricultural development, so very necessary for the development of the other sectors. Because of the primary accent on agricultural development, problems of employment and industrial development could not be given much attention in the framing of the first plan. The first plan on the whole laid a basic and correct foundation to subsequent balanced economic development of the country.

When it came to drafting the second five year plan, attention was

given to those aspects which are more important than only continued accent on agricultural development. Because of the nature of the targets that the country has chosen to place before itself for achievement during the second plan period, the method of approach adopted in the first plan is no longer sound and applicable. It seems now the appropriate time to examine whether the scientific approach adopted in the Draft Plan-frame is not severely restricted by the lack of the development of economic concepts, aiding economic decisions in the planning and programming of the development of the economy most suited to our conditions, however good they may be for economic decisions arising in the economics of other countries.

The Objectives and Approach

The objectives of the second five year plan as placed before the country from time to time by Pandit Nehru and other leaders are as follows:

- (a) to increase national income,
- (b) to increase employment,
- (c) to usher in a socialistic pattern of society, and
- (d) all these to be done within the democratic frame work of the constitution.

The approach for achieving these objectives can be summarised as follows:

- (a) For increasing income, use increasing tempo of investment for increasing national income by twenty five per cent over the plan period.
- (b) For increasing employment, (1) restrict expansion of factory production of consumption and use labour-intensive methods and (2) encourage construction, social services, etc.
- (c) For a socialistic pattern of society, enlarge the scope of the public sector.

In the execution of the plan some bottlenecks may arise. In the case

of the various bottlenecks noted below the following devices have been prescribed for adoption:

- (1) In case of insufficient finance, use deficit financing,
- (2) In case of market mechanism going out of gear, use restrictions, controls, common production programme etc.
- (3) To avoid bottlenecks of physical resources, use matrices of physical input-output structures.

For the planning and programming of investment,

- (1) Use capital-output ratio as a criterion of choice between alternative investments.
- (2) Conserve foreign exchange for investment in basic industries, and
- (3) The increased demands for consumption goods arising out of the new investments is to be matched by the supply of the same from quickly maturing capital-light and labour-intensive hand and household industries.

The accent in the second five year plan is on investment on basic industries for the following purposes: (1) to secure economic independence and (2) to develop steel plants (a) for meeting demands for steel from various industries (b) to make machinery for setting up further steel plants and (c) to make machinery for consumption goods factories, in part to be exported and in part to be used ultimately in the production of consumption goods.

This, in short, is a summary of the Plan-frame and the basic approach to it as revealed in the plan papers. The approach for the attainment of the objectives is quite good as far as each objective and the corresponding approach are concerned but taking them as a whole, it is not clear how far they are in equilibrium or at least mutually consistent or even necessary. For example, for increasing employment a restriction is ought to be placed on the expansion of factory production of consumption

- Holiday concessions**
- ★ Concessional return tickets during DIVALI and CHRISTMAS holidays will be issued provided the chargeable distance between the stations is 150 miles or more.
 - ★ Tickets are available for completion of the return journey within 15 days including the date of issue or date of commencement of the journey in the case of return tickets issued in advance.
 - ★ No break of journey is allowed either on the outward or return journey.
 - ★ Full particulars can be had from Station Masters concerned.

goods. This in fact is not in the best interests of accelerated development of income and the economy as a whole. Increasing employment by itself is purely distributional in character and without a corresponding increase in the per capita production, especially wage-goods, there may not be a development of the economy so as to give rise to the planned twenty five per cent increase of national income over the second five year period. The common production programme may not be a success as it is not necessarily in conformity with conditions of economic equilibrium. Controls and other restrictions may have to be resorted to in order to prevent the market mechanism going out of gear.

Also, the methodological approach is in part financial and in part one of physical resource budgeting. The physical resources budgeting method is quite necessary for avoiding bottlenecks but by itself it cannot be operationally smooth under conditions of democracy. On the other hand, the traditional concepts of macro-economics such as national income, total output, investment etc. which are the common tools of industrially developed democracies like the United Kingdom and U. S. A. are not necessarily the best concepts for facilitating decisions of developmental planning under the aegis of a democratic type of constitution in an underdeveloped country like India.

Western Economic Concepts not Enough for Proper Planning

Aggregates like investment capital-output ratio for an industry do not give any indication of priorities in planning even though they do provide measures of evaluation of the progress and success of the execution of the plan. Concepts like the capital-output ratio and employment generated are concepts which serve the purpose of an individual entrepreneur for deciding between priorities. But they do not necessarily serve the purpose of planning on an entire economy basis to be streamlined with the working of the economic forces in a democratic set-up.

The economic concepts used in the preparation of the second five year plan are concepts which have been developed in the West or in Russia to meet the requirements of their economic thinking suitable to their socio-political institutions and the state of development of their economies. They are not necessarily

convenient for all purposes and cannot provide scientific criteria for the planning, programming, and execution of investment.

A Social Engineering Approach Needed

The problem of planning in an underdeveloped country like India must be approached as an engineering problem from the point of view of society as a whole and must be defined in operationally convenient and feasible concepts. For an optimum allocation of the limited resources of the country for an accelerated development of the economy, it is necessary to have criteria of determining the appropriate technique, size and number of firms within an industry and between the various industries. As it is, the aggregates cannot give any guidance in the matter and the planning has to proceed on a guess-work basis as far as the operational details are concerned. Suppose, for example, the country decides to have ten factories of a particular size and technique for manufacturing cement and five textile mills. How are we to set up a criterion of choice between, say, the fifth unit in the cement production and say, the third in textile manufacture? At present there are no criteria. The Planning Commission do not seem to have investigated this problem nor is there any indication given by them so far that they are studying it.

Demand alone cannot be the sole criterion in the determination of the priorities between specified units of one industry and another for programming of resource-utilisation in development planning. Demand and supply no doubt play an important part for the economic existence and viability of a particular unit but it is essentially an individual entrepreneurial view for planning whether to get the particular unit into existence or not. The Western concepts are all woven round this particular view. The individual entrepreneurial view is not at all concerned with the accelerated development of the economy as a whole, for which the criteria are rapid growth of incomes, employment and more even distribution of incomes in tune with the structure of the economy working under democratic conditions with the minimum of interference with individual drive and initiative. From this point of view, it is necessary to investigate the ramifications of bringing into existence a unit of particular size and technology in an

industry at a certain level of development of the economy as a whole. Any particular factory generates incomes and employment not only locally but also throughout the various sectors of the economy. The factory draws its materials in a raw and semi-manufactured state from various sectors, thus generating income and employment throughout. The cumulative multiplier effects on income and employment generation as also on prices and other related economic variables relevant for economic planning have to be investigated. The multipliers of income and employment of a particular unit provide the necessary criteria of preference, indifference or rejection of one item with respect to another in planning and programming of economic development. The multiplier effect of income and employment generation in the economy occasioned by bringing into existence one individual unit is akin to a chain reaction set up by the fission of the atom. One new activity gives rise to supporting activities and those in turn, to other supporting activities and so on. A survey conducted shows that a factory going up in the area even though it would employ only 150 people directly would give rise to business activity enough to employ 1,100 persons at the level of incomes obtaining in the USA. The purchasing power created would go to buy produce from 6000 acres of farm land in the locality. On the whole the increased economic activity would lead to state and federal taxes of nearly 2.5 million dollars, receipts of nearly half a million dollars by the local truck owners, constructional activity to house 300 homes and business for 30 grocery and other shops etc.

It is indeed very regrettable that no attempt is made to conduct micro-economic surveys of the above kind in India which are so very essential for proper planning. We talk in terms of aggregate borrowed from Western economic theories. When we do not know how best to break up the aggregate which any way will have to be done in the execution of the plan, the mistakes can aggregate and make the scientific character of the plan illusory.

Reorganisation of Technology

The common production programme advocated in the Plan-frame is viewed only from the point of employment and does not take the inevitable condition of economic equi-

brium between units of unequal economic efficiency within the same industries. It will be a great strain on the economy to force it to bear the burden of inefficient units retarding the pace of economic development. A better plan would be to disintegrate the technical side of the production of any particular commodity into various intermediate stages and determine, for the largest possible multiplier effects of income and employment generation, the appropriate nature of the size and organisation of the manufacture of the commodity at each stage. Spinning, for example, has necessarily to be done in a large scale unit, as economies of scale lead to a cheaper product. When it comes to weaving, a large size unit, as it has been noted by the Kanungo Committee Report, does not necessarily have an advantage over a smaller unit. In the match industry, too, it has been found by the Khadi and Village Industries Board that the operation can be carried on as a household industry.

In the manufacture of machinery for the production of various commodities it is worthwhile to investigate the possibility of simplification and standardisation of the various components parts. If this is done, after determining the appropriate technology and organisation suitable for an integrated development of the country as a whole, machine parts for assembling various types of machines can be produced on a large scale at a very cheap rate and the problem of capital accumulation will not then be such a difficult problem as at present. Conditions peculiar to our country will then be to our economic advantage in competition with other industrially developed countries.

Now we are thinking in terms of either village industries of primitive technology or large scale industries of the Western type. The former is economically inefficient and the latter inefficient from the point of view of employment generation. With the existing technical knowledge, either available directly with Indian technologists or imported foreign technicians, it is possible to reconstruct the appropriate quantum of a production unit optimal from the point of view of the multiplier effects of both income and employment generation by disintegrating technology into the most economic types of production. What seem to be the drawbacks for rapid development can

then be transformed into accelerators of development.

A machine is designed in America or the U. K. for the best solution of the problem of least-cost. Wages are far higher in these countries than in India. The machines, especially their speeds and labour utilisation points, are determined for the lowest labour costs. The same machine, under Indian economic conditions, can be speeded up and more labour associated with it. By a proper adaptation to Indian conditions, it is possible to have

(1) a more intensive utilisation of the machine per hour leading to greater production,

(2) larger amount of employment, and

(3) greater amount of profits at the same time.

The author has given an example

elsewhere from the textile industry. Thus it is possible for India to compete effectively with Western countries.

Conclusion

A comprehensive engineering and econometric investigation has to precede the finalisation of the second five year plan. Economists without the knowledge of statistics and technology or statisticians without the knowledge of the other two and technologists of a similar variety or a mere committee of these people cannot necessarily produce an integrated picture. People with the necessary specialised knowledge have to be relied on for the purpose and it is hoped that the Government experts will see the wisdom of bringing together various people with the necessary specialised knowledge wherever they may be found in the country.

Inter-State Problems of Sales Tax in India

L C Gupta

IN a federal constitution, taxes levied by one state are not always confined in their effects to the boundaries of the taxing state. They may give rise to inter-state complications—fiscal, legal and administrative. The operation of the sales tax in India illustrates some of these. The situation was summed up by the Taxation Enquiry Commission as follows:

"From the point of view of industry, the main problem arises from the need to produce and sell at competitive prices. To the extent that the rates vary much between different States—if raw material, for instance, is not taxed at all in one State, but is taxed high in another—this competition may be materially affected. Since the organised industries tend individually to be made up of different concerns specialising in different processes, the total might well turn out to be high of a tax that is collected at each of the stages. Also, many industries, especially the bigger ones, are interested in buyers all over India; their special grievance is the lack of an all-India uniformity in rates and regulation. The State Governments face a problem of evasion which is seemingly intractable. The interests of States often clash and co-ordination, as we have pointed out, has become difficult. This in turn has meant new hardships for trade and industry."

Article 286 of the Constitution aimed at solving some of these problems. A legal battle has raged over the interpretation of the Article almost from the very beginning and so vague and ambiguous is its language that it has been subjected to two varying interpretations by the Supreme Court. The actual working of the Article during this short period has revealed the inadequate and unsatisfactory character of the present provisions and it has become urgently necessary to bring about a change in them. The issue is under the active consideration of the Government of India at present.

Freedom of Inter-State Trade

We propose to examine the various suggestions made in this connection, including those made by the Taxation Enquiry Commission, and to see how far they satisfy such diverse interests as those of the State gov-

ernments who are interested in their own revenues, those of the dealers who are the tax-payers, the consumers, the trade and commerce etc., etc. Before undertaking this examination, it is necessary to set out some general principles. The first, as also the most important, is the principle of freedom of inter-state trade and commerce. The expansion of our economy has in no small degree resulted from the free flow of inter-state trade and the development of a great nation-wide market for our industries. Moreover, inter-state economic ties are the strongest bonds of unity and ought to be fostered rather than weakened. The principle of freedom of trade which is accepted in all federal constitutions is laid down in Article 301 of our Constitution. It implies that the States are to be prohibited from levying taxes which burden trade and commerce in such manner as to cause obstruction in its flow.

Clause (2) of Article 286 of the Constitution states:

"Except in so far as Parliament may by law otherwise provide, no law of a State shall impose, or authorise the imposition of, a tax on the sale or purchase of any goods where such sale or purchase takes place in the course of inter-state trade or commerce."

The Clause was, however, rendered entirely inoperative as a result of the judgment of the Constitutional Bench of the Supreme Court in the case of the State of Bombay vs. the United Motors (India) Ltd., delivered on March 30, 1953. The majority of the judges held that Article 286(1) (a), read with the Explanation thereto and construed in the light of Articles 301 and 304, prohibited the taxation of sales or purchases involving interstate elements by all states except the state in which the goods were delivered for the purpose of consumption therein. The latter state was left free to tax such sales or purchases. The effect of the Explanation in regard to interstate dealings was to convert such inter-state transactions into intra-state transactions and to take them out of the operation of Clause (2) of that Article.

Th's interpretation gave to the importing state the right of imposing

a tax in respect of goods delivered in that state. It could collect either a purchase tax from the resident purchaser, or a sales tax from the out-of-state seller. Thus this interpretation not only infringed the principle of freedom of inter-state trade but also gave extra-territorial operation to the sales tax laws of the states. If the states had chosen to collect a purchase tax, it would not have affected inter-state trade so badly and would not have produced such an intolerable situation, as the collection of a sales tax from out-of-state dealers which the states found to be more profitable for them.

The levy of sales tax on out-of-state dealers involved, besides the direct burden of the tax, an added burden or an invisible tax, on account of the inconvenience and costs of compliance with the sales tax laws of many states. The costs of compliance are specially heavy for the out-of-state dealers. The hardest hit were dealers who sold their goods in a number of states and who had, therefore, to be conversant with the different sales tax laws of all those states, to keep separate accounts of transactions with dealers of different states, and to submit books of accounts and sometimes to appear before Sales Tax authorities in a number of states. This would have paralysed the flow of interstate trade. The Central Government had, therefore, to call a Conference of Officials in November 1953 to devise interim relief measures for the trade.

Earlier Decision Revised

Recently, the Supreme Court, in the case of the Bengal Immunity Co. Ltd. vs. the State of Bihar, re-examined the earlier decision of the Court in the Bombay appeal. In its judgment, delivered in September 1955, it gave a new and different meaning to Article 286. The majority decision was:

"We are definitely of the opinion that, until Parliament by law, made in exercise of the powers vested in it by clause (2) provides otherwise, no State can impose or authorise the imposition of any tax on sales or purchases of goods when such sales or purchases take place in the course of inter-state trade or commerce, and

THE IRON HORSE IN A STEEL CAGE

Chittaranjan is the largest locomotive manufacturing unit in Asia, designed to build 120 locomotives and 50 spare boilers every year under single shift production. In the construction of these immense workshops no less than 11,000 tons of STEEL were used.

The largest structure in the whole Project is the Main Assembly Shop, which measures 1,000 feet long, 212 feet wide and rises to

a height of 75 feet. From this massive workshop roll India's locomotives—the visible results of the new industrialisation of India.

11X-46

the majority decision in the State of Bombay vs. the United Motors (India) Ltd., in so far as it decides to the contrary, cannot be accepted as well-founded on principle or authority."

In view of this interpretation, the Court held that the Bihar Sales Tax Act, "in so far as it purports to tax sales or purchases that take place in the course of inter-state trade or commerce, is unconstitutional, illegal and void."

This new interpretation of Article 286 by the Supreme Court ensures complete freedom of inter-state sales or purchases. The principle of freedom of trade is thus restored. At the same time, it puts an end to the irrational system of taxing out-of-state dealers.

Scope for Evasion

The immunity of inter-state trade and commerce from state sales taxes, however, gives rise to another problem. It opens the door to avoidance of tax if consumers and unregistered dealers residing in one state are permitted to enter into direct dealings with out-of-state sellers. The possibilities of such avoidance are greater in the case of persons residing in border towns and in the case of mail-order-business. The new interpretation of Article 286 by the Supreme Court enlarges the scope for such avoidance by taking away the right to collect a tax on transactions in the course of inter-state trade or commerce from the exporting state as well as the importing state. Even before, when the prohibition operated only on the exporting state, the importing state being allowed to impose a tax on inter-state dealings, there was considerable room for avoidance and evasion of sales tax. The Taxation Enquiry Commission refer in their report to such avoidance which arose out of restrictions contained in Article 286. They observe:

"... because of these restrictions there was greater scope for avoidance of tax, entailing an indirect loss of revenue on almost all States. Traders in one State started to sell direct to unregistered dealers and consumers in another. Similarly, consumers of valuable commodities tried to get these from dealers in another State rather than buy the articles from their local dealers. The practice grew for sales of goods within a State itself to be shown in the books of accounts as having been made to fictitious deal-

ers outside the State and these goods having been resold by those dealers to consumers within the State. For valuable commodities, like motor-vehicles, jewellery, watches, etc., this practice became very common. On transactions that could be shown to be in the course of inter-state trade, the exporting State was prohibited under Article 286 from levying the sales tax, and if goods delivered as a result of these transactions were shown to be received by individual consumers or unregistered dealers, neither could any tax be levied on them by the importing State. Thus many of these transactions escaped sales tax altogether."

Lack of Uniformity

Some difficulties also arise on account of the lack of uniformity of rates and exemptions in different states. Differences in the treatment of raw materials in different states are especially open to objection. If rates of tax on raw materials are not uniform and some of the states exempt them altogether, the competitive capacity of manufacturers in different states, is affected materially. This may create an artificial advantage for industries in some states, and hence, cause diversion of industry from the most economical locations. The Essential Goods Act, 1952, enacted by the Parliament under Clause (3) of Article 286 of the Constitution, does not eliminate this lack of uniformity though almost all the important raw materials are included in the list of 'essential goods'. One reason is that the Act does not apply to rates in force in the various states before the passing of the Act. Moreover, it cannot eliminate an advantage arising to an industry located in a state which exempts raw materials from taxation altogether.

Central regulation of rates levied on raw materials is important for another reason also. The raw material may be sold within a state to the manufacturers but the manufactured product may be exported to other states. By levying a tax on the local sales or purchases of the raw material, the state will be able to transfer the fiscal burden of the tax to the residents of other states. This is undemocratic inasmuch as the residents of other states who ultimately bear the tax in this case have no voice in the legislature of the taxing state.

Finally, there is also the problem of bringing about co-ordination in the sales tax laws and administra-

tions of different states. This is necessary so that there is no inconsistency in the sales tax laws of different states and there is a co-ordinated approach to the various inter-state problems.

We must now look for a satisfactory solution. One of the suggestions which, no doubt, has the merit of resolving all the problems discussed above, but which must, nevertheless, be dismissed, is that sales tax should be altogether abolished or replaced by other taxes such as excises, customs and octroi. Sales tax has come to occupy a place for itself from which it cannot be dislodged.

Arguments against Centralisation

Another suggestion which has been very popular among the business community is the centralisation of the tax. Perhaps the enthusiasm of the business community for centralisation has waned after the Supreme Court's new interpretation of Article 286 of the Constitution. As inter-state complications arise because the right of sales tax levy belongs to the states, they would automatically disappear on centralisation. But centralisation cannot be accepted without looking to other aspects of the levy as well. On account of the very great regional diversity of economic and social conditions in India, the pattern of production, consumption and trade differs widely from state to state. This means that the rates of tax on different articles, the list of exemptions, the class of dealers liable to pay tax, may have to be different in different states. Now, centralisation of the tax would mean uniformity of levy in all respects and this would clearly be undesirable in the conditions obtaining in the states. A sales tax which is not adapted to the local conditions of production, consumption and trade would become burdensome to the producers, consumers and traders. Moreover, a change in the local conditions of trade requires a prompt adjustment in sales tax, but such adjustment cannot be carried out if the tax is centralised.

The Taxation Enquiry Commission found that the sales tax possesses 'strong local moorings'. If one analyses the circumstances in which sales tax has developed differently in different States in India, "there can be discerned in each State a definite degree of relationship between the tax system initially adopted and certain relevant characteri-

You didn't know you lived in the Oil Age? Tut! Tut! You wake up to your early morning tea for a start . . .

Tea. Processed, packed and transported with the help of machines. Machines that are in some cases powered and in all cases lubricated with one or more of the many petroleum products refined from crude oil. Burmah-Shell supply industrial lubricants to tea estates all over India.

Now take a look at your letters. Some sea mail, some air mail. Ever stop to think what brings your correspondence? Nine times out of ten it's oil.

Over eighty per cent of the world's sea-going shipping is powered by oil. So is all the world's aircraft, of course. In most of India's big ports ships are fuelled by the Bunkering Service, operated by Burmah-Shell, while the Burmah-Shell Aviation Service covers every Indian airport.

And talking of communication . . . the telephone!

When telephone cables are joined underground the joint is sealed with bitumen to keep it dry. To insulate wires in telephone exchanges—and in radio sets—paraffin wax is used. Bitumen and paraffin wax. Products of oil, again. Yes, over 15,000 Burmah-Shell employees have a lot on their plate—helping you and every other man, woman and child in this country to live a twentieth-century life.

BURMAH-SHELL . . .
IN INDIA'S LIFE AND PART OF IT

stics of the economy of the State." It is true that in some federations such as Australia and Canada, the sales tax is levied by the federal or central government in the form of a single point levy at the first point of sale but the same system cannot be applied to India because of the very great diversity of economic and social conditions in different states. Apart from this, there is another ground for rejecting centralisation. Sales tax is now a major source of revenue in most of the states and has become an integral part of their revenue systems, which would be dislocated if the tax is taken out of the states' jurisdiction. It may be argued that this need not be so, because the proceeds of the tax can be allocated to the states. This view ignores that the sales tax has made the state revenue systems more flexible and elastic to meet changing revenue needs and centralisation would take away this advantage. All the state governments are, therefore, opposed to centralisation.

Purchase Tax as Alternative

A simple solution which has often been suggested, especially to check avoidance of the tax without interfering seriously with freedom of inter-state trade, is a purchase tax levied by the importing state on local purchasers of outside goods. In the USA, some states levy a 'use-tax' on out-of-state purchases of goods on which a sales tax is not payable in the state. At the Conference of Officials, called by the Government of India in November 1953, to consider the difficulties of trade on account of taxing of non-resident dealers, a purchase tax was proposed as a long-term solution. The state governments, however, were not prepared to replace a sales tax on non-resident dealers by a purchase tax on local purchasers on account of the meagre revenue possibilities of the latter. It should be noted that after the decision of the Supreme Court in the Bengal Immunity Co.'s case, the states cannot levy a purchase tax even on consumers and unregistered dealers on their out-of-state purchases unless the Constitution is amended. The collection of a purchase tax is administratively feasible only in the case of a few important commodities whose purchasers or users can be easily traced, such as motor-cars, radios etc. The purchase tax would, therefore, provide a solution which would be incomplete and not very attractive from the point of revenue.

Matthal Commission Proposals

We come now to the proposals of the Taxation Enquiry Commission. The salient features of their proposals are as follows:

(1) The sphere of inter-state trade should be taken out of the purview of state taxation and placed in that of the Centre.

(2) The Central government should levy a sales tax on inter-state transactions, but the collection of the tax should be entrusted to the exporting states in order to avoid duplication of administrative machinery. Receipts should be appropriated by the exporting states.

(3) The rate of sales tax on inter-state transactions should be low. The Commission suggest a one per cent tax but when the goods have been sold to an unregistered dealer or consumer of another state, the rate of tax should be the same as for internal transactions in the exporting state. A higher rate on direct sales to consumers and unregistered dealers is necessary to check avoidance and evasion.

(4) The Central government should have the power to regulate state's sales tax on "goods of special importance in inter-state trade" which would comprise the important raw materials viz., coal, iron and steel, cotton, hides and skins, oil-seeds and jute. On these goods, the states can have only a single point levy at the last stage of sale or purchase by a registered dealer or at the point of export to other states and the maximum rate would be 3 ples per rupee or nearly 1½ per cent. No other sales tax shall be levied on them either by the exporting or the importing state.

Conflicting Demands Reconciled

It would at once be seen that the Commission's proposals are aimed at solving more than one problem. They try to secure not only that the burden of tax on inter-state trade is kept within reasonable limits, but also that there is maximum possible uniformity among states in the matter of inter-state trade. At the same time, they are calculated to combat avoidance of tax by the method of out-of-state sales or purchases. The collection of the tax at the exporting end by the exporting state is likely to prove economical in practice as it would also be convenient from the point of view of the traders. The proposals are likely to prove satisfying from another point of view also, viz., that of revenue. The proposals

seem to reconcile the interests of the States as well as the dealers. Moreover, the regulation of tax on raw materials so as to secure uniformity of their tax treatment in all the states, would eliminate difficulties due to lack of uniformity.

The Commission have also considered the question of co-ordination among the states in regard to their sales tax laws and administrative organisations. They recommend that the principles for determining whether a sale or purchase of goods takes place (i) outside the state (ii) outside the territory of India and (iii) in the course of inter-state trade and commerce, should be embodied in an all-India law enacted by the Parliament. This would remove difficulties arising from lack of consistency in the present sales tax laws. On the other hand, the Inter-State Taxation Council, proposed by them, would help to bring about greater administrative co-ordination by arranging periodical meetings of the heads of sales tax departments of all the states at least once a year to discuss questions of mutual interest.

The Rate of Tax

The proposals need modification in one respect, viz., the rate of tax proposed on inter-state transactions. The Commission propose that the rate of tax on inter-state transactions should be one per cent when the transaction is between two registered dealers. This one per cent central tax on inter-state trade is likely to prove somewhat burdensome on trade because this tax would be in addition to any single or multiple point tax leviable within the states. The Commission have recommended a rate of half per cent only for multi-point sales tax within a state. The rate at the stage of inter-state sale should not exceed half per cent because these goods would have to pay tax again at a later stage when they are finally sold to the consumer. When, according to the recommendations of the Commission, only one-half per cent should be payable at each stage of sale within a state, it is difficult to understand what prompted the Commission to recommend one per cent on inter-state sale which is in fact just one of the stages of sale till the goods reach the final consumer. However, in order to check avoidance of tax, when the purchaser in one state is a consumer or an unregistered dealer, the rate of tax should be the same as is leviable on internal transactions in the exporting state.

Constitutional Amendment Necessary

The implementation of the proposals will require amendment of the Constitution and vesting of greater powers in the Central Government. As the Commission observe:

"In the absence of more powers for the Union than now vest in it

—that is to say in Parliament and in the Central government—the inter-state sphere of sales taxation is occupied by constitutional rigidities, occasionally diversified by judicial interpretation, instead of by law and administration that can adapt themselves to changing needs."

It is to be hoped that the proposals of the Taxation Enquiry Commission can be operated with simplicity. However, the subject is such that only actual experience will show how far the proposals can solve the present problems without giving rise to new ones.

Silver Jubilee of Bombay Co-operative Insurance

THE story of the Bombay Co-operative Insurance Society Ltd.,—which celebrated its Silver Jubilee this week—is an example, unfortunately a rare one, of what co-operation can achieve in the field of insurance.

The Society was established in 1930 by the efforts of some eminent co-operators of Bombay such as the late Hiralal Kaji, and was registered under the Co-operative Society's Act. Before the society could transact any insurance business, however, it had to deposit a sum of Rs 25,000 with the Government of India; but since the Society did not have, and even today does not have, share capital, the amount was raised by the issue of debentures carrying 6 per cent interest. These debentures have, however, since been redeemed excepting for three of the value of Rs 750 which have been retained in token of the continuity of association by those who helped to found the Society.

Since its inception, the main aim of the Society has been to reach people of small means and offer them the benefits of insurance. Accordingly, policies for as low an amount as Rs 150 were issued under the Rural Branch and for Rs 1000 and above under the ordinary branch. Even today, the Society issues policies for any amount, the minimum being Rs 200 and policies for Rs 900 and lower sums are ordinarily issued without medical examination.

Thanks to the enthusiastic efforts of the sponsors of the institution and the encouragement given by the Co-operative Department of the Bombay Government, the society made rapid strides and by 1936, its membership totalled 3,276 and it had built up a business of Rs 28.23 lakhs, from which it derived a premium income of Rs 1.57 lakhs. That the society was able to have its own building in 1937 was another indication of the rapid progress it was making.

The Society's actuarial valuations carried out in 1933 and 1936 revealed a surplus, though the second valuation yielded more satisfactory results. In 1936, the Society declared a bonus at the rate of Rs 15 per Rs 1000 sum assured on whole life policies and Rs 11 per Rs 1000 sum assured on endowment policies.

Although subsequently the Society had to face some difficulties, it resumed its thread of progress again.

The actuarial valuation for the

year ending December 31, 1954, has disclosed a handsome surplus of Rs 9.45 lakhs, which has enabled the Society to declare a bonus of Rs 14.8 per Rs 1000 on endowment policies and of Rs 17 per Rs 1000 on whole life policies.

The three main lines of activity of the Society have been

- (1) Taking insurance benefits to rural areas,
- (2) Organising textile workers under co-operative insurance, and
- (3) Financial support to the co-operative movement.

Although the Society has been issuing policies for small amounts in order to bring life insurance within the reach of the rural people, it has not been able to do any considerable business in rural areas and steps are now being taken to canvass business through rural co-operative societies in select areas in the first instance. The Society, however, has succeeded much better in extending the advantages of life insurance to workers in the textile mills, particularly in Ahmedabad, where it worked through the Textile Workers' Co-operative Bank. In Bombay City also, a number of co-operative credit societies of textile workers have popularised insurance amongst their members with the help of the Society. Every year nearly 30 per cent of the Society's business comes from low income groups in the shape of policies for less than Rs 900.

The Society has been directly assisting the co-operative movement by investing its funds in co-operative institutions. A sum of Rs 20 lakhs has been invested in debentures of Co-operative Land Mortgage Banks. The society has also invested Rs 5.25 lakhs in the shares of other co-operative societies and has lent Rs 13.5 lakhs to co-operative housing societies. In all, the Society has placed Rs 38.75 lakhs or 25 per cent of its investible funds at the disposal of co-operative institutions and thereby strengthened the movement.

Considering its record, Dr. Punjabrao Deshmukh, the Minister for Agriculture, the chief guest at the function in celebration of the silver jubilee of the Society, was on very firm ground indeed in holding up the Bombay Co-operative Insurance model when he said "Insurance has a social purpose and it cannot be given a free run by private, competitive, or profit making interests".

Co-operative insurance, he implied, could be an alternative to nationalisation. Now mutual societies have no shareholders either; there is profit motive in that whatever the benefits, they pass on automatically to policy holders. Co-operators, however, claim superiority for their particular brand on two grounds. One is that control and management in their case is really democratic, there being no vote by proxy and no polls at meeting of shareholders—one member, one vote. Agents cannot, therefore, pull the strings and control the show. Another factor in their favour is the manner in which insurance can be woven into the fabric of co-operation and its benefits passed on, through the movement, to a wider circle, particularly to men of small means like workers in factories and agriculturists in the field. To the latter, however, insurance, co-operative or commercial, has not yet been able to percolate.

V. 1791

India Made Typewriters

TYPEWRITERS wrought a silent social revolution in the West, being perhaps the most important single agent in drawing away women from their homes and putting them to work in offices instead of doing their domestic chores. But we forget that when the first typewriter came, women did not take to it readily as ducks take to water. To begin with, the pioneering lady typewriters—that was what they were called—needed to be sturdy women, unlike their present-day slick counterparts. To press the keys, as they then were, what was needed was a blacksmith's blow and not a delicate feminine touch. Later advances changed all this but the present ease of operation and efficiency of performance were reached only by stages.

True, one of the trio who first put the machine in the market way back in 1867—they were not the first inventors, however—could well claim that "I feel that I have done something for women who always have to work so hard". The early lady typewriters, however, had not only to be Amazons, the social stigma that attached to their profession was not easy to overcome. This was a new type of husband hunters or home breakers against whom respectable city men had to be on their guard. When in 1888 a couple of ladies were employed for the first time in the Inland Revenue Department in Britain, they had to be locked in a room and fed through a hatch!

It did not take the typewriter long, however, to spell the doom of male clerks who had hitherto been laboriously copying letters in long hand in copper plate script at the rate of 15 to 20 words a minute. But the change-over was so much in keeping with the spirit of the times that the displaced male clerks did not start a Kentish movement to burn down these infernal machines which robbed them of their jobs. Women stepped in in due course and were soon typing out 40 to 100 words a minute as against the elegant script writing which could no longer hold its own against the speed, neatness and perfected print writing of the machine.

If in the West, this innocuous, ubiquitous and now essential part of office equipment wrought a social revolution, in India it stopped the march of the Aryans into the South and initiated a reverse flow of population to the North, East and West,

the colonies of stenographers in Bombay and Calcutta, if not in Delhi, bearing eloquent testimony to this no less significant social movement in this country.

Typewriters, as already noted, did not come with a bang and conquer the world overnight. Their development was a slow process and a painful one for the early pioneers. The English engineer, Henry Mill, who took out a patent from Queen Anne in 1714 for "an artificial machine, enabling one to print or transcribe letters, one after the other, just as when writing by hand..." never got on to the stage of actual manufacture.

The next inventor was William Austin Burt of Detroit to whom an American patent was granted in 1829. After years of painstaking labour, he did actually set up a single machine. But he was no luckier than Mill. His model was destroyed by fire in the Washington Patent Office in 1836!

A cold reception was accorded to the world's first practical typewriter, made in 1867 by three citizens of Milwaukee, Christopher Lathan Sholes, Carlos Gidden and Samuel Saule. To look at, this typewriter was like a sewing machine. Ornamented with gay and flowery designs and mounted on a sewing machine stand, its treadle was geared to the carriage to effect a mechanical return. However, this was the world's first practical typewriter because it incorporated devices like the paper cylinder, line-spacing, and carriage-return mechanism, the escapement which causes letter-spacing, arrangement of type-bar so as to strike the paper at a common centre, printing through an inked ribbon and the position of the different characters on the key board conforming almost exactly to the arrangement now known as 'Universal'. In spite of these devices, only 1200 machines were sold in the first seven years. The total proceeds from patents amounted to only \$12,000, so that Sholes died almost in penury.

Before typewriters came to be standardised, the field was open to all comers and a number of new designs were coming up almost every year. By the beginning of this century, however, the market had been appropriated by a handful and today in the U.S., the biggest market for

typewriters in the world, there are only five manufacturers.

If the typewriters came up through many jots and jolts in the West, in India manufacturing has come up in a slow and silent way. Godrej, the makers of the first India made typewriters, did not need nor ask for Tariff protection. No Government Committee was set up to usher it in, no State assistance was asked for or given and unlike manufacture in many other lines, where a beginning is made with assembling of imported parts and industries continue in that infant stage for an indefinite period, Godrej claims that their typewriters are almost wholly made in India. Of the 1800 odd component pieces that go into their making only 5 per cent in value, amounting to less than Rs 30 for a machine costing Rs 650, have to be imported. The rest are all made in India and made by Godrej in their own factory. As the India made typewriters are sold at only half the cost of the imported machines, they need no protection.

Many of the manufacturing ventures in India have been launched in association with foreign firms who are well established in their respective lines. Many of our industrialists, probably the overwhelming majority of them, incline to the view that this is the only way of making industrial advance, that without foreign affiliation, it is not possible for industry in this country to incorporate improvements in designs and techniques which foreign manufacturers continuously carry out. In fact, some of them go further and insist on participation in the capital of the Indian companies by foreign firms in order to ensure continued and active interest of the foreign affiliates in the Indian venture. Godrej, however, have not taken this line. The model they have chosen incorporates many of the features of other standard typewriters, but it is not a foreign brand that they are putting on the Indian market.

Having developed gradually over a series of years from the manufacture of steel almirahs, office equipment and similar steel products, they were confident of working out manufacturing techniques and have often designed and constructed their own machines, in preference to importing ready made ones, while all the while training up skilled hands in their own works so that today decades of skilled formation is perhaps

Branches at: NEW DELHI BOMBAY KANPUR

their best capital asset. This is of the highest significance, for making of typewriters calls for skilled work on the part of a wide range of operatives and this skill is not easy to import. For technical skill at the top level alone is not enough for this delicate and intricate job. Slapdash methods and extensive equipment alone do not necessarily give the best results in this particular venture which is perhaps the strongest safeguard that Godrej have against foreign manufacturers setting up production here. The fear, however, persists that they may be worsted in unequal competition with established brands, particularly in view of their experience in soap making. It will not be entirely smooth running until the present unsettled position of foreign firms engaged in manufacture side by side with Indian enterprise is straightened out and put on a sound footing. That is necessary for healthy development of Indian industries.

The manufacture of typewriter

necessitated the installation of a balanced plant and machinery involving a heavy capital outlay as also the training of mechanics both for operation of the plant and for after sale service. This skill formation is itself a valuable national asset in view of the country's shortage of skilled labour. The credit for Godrej is all the greater because India is now not only one of the countries in the world which manufacture typewriters, but she is the first in Asia to do so. This claim may appear to be excessive but is really not so, because Japan has not been able to make much headway in this direction, being handicapped by the character of her typography.

The comparatively low cost of the All-Indian Typewriter will place it within the reach of large numbers of people. As soon as a Hindi keyboard is finished by Government, the All-Indian typewriter will be available in Hindi also. Keyboards in the various regional languages will also be available.

Company Notes

Aluminium Corporation

DEMAND for aluminium depends on the development of heavy industries. In the second Plan, these industries will receive topmost priority. Though ordinary shareholders of the Aluminium Corporation of India, Ltd., have again received no dividend, they can take comfort in the knowledge that the prospects are not unencouraging. "It is, however, encouraging to notice", Shri Lakshmipat Shinghanja informs the shareholders, "that industrial uses of aluminium have started, and it is hoped that such demand will grow steadily".

Recent developments confirm Shri Shinghanja's guarded optimism about the Company's future prospects. Expansion projects at the Jaykaynagar plant are well under way. Plans are being actively implemented to double the capacity, as recommended by the Planning Commission. New Delhi has been prompt in granting the necessary licence. It is disclosed in the report on the working of the Company for the year to March last that the means for securing additional finance are under active consideration of the directors.

In making suggestions for the improvement of the aluminium industry, Shri Shinghanja is critical of

the Government's attitude and policy to the industry. In making a plea for due protection to the industry for another five years, he criticises the Government's decision to place aluminium scrap under OGL last year. This had caused dislocation and damage to the indigenous industry. Shri Shinghanja is on firm ground in his complaint that the Government has not taken steps to exploit fully the country's bauxite resources. Adequate availability of good bauxite is essential for the development of the aluminium industry. As the production of aluminium involves considerable consumption of electric power, Shri Shinghanja suggests that hydro-electric power should be made available to the industry at reasonable rates. In his speech as Chairman of Aluminium Corporation, he appeals to the Government to offer financial aid to the home producers of aluminium.

Working results of the Company are not discouraging. Arrears of preference dividends for the two years to March, 1951, have been paid. Production and sales were higher last year. Consequently, gross profits showed an increase. Higher gross profits have been utilised to raise allocations to the depreciation fund and to general reserve.

Orient Paper

THOUGH the ordinary dividend for the half-year to March last has been maintained at eight annas per share, working results of the Orient Paper Mills, Ltd., for the period under reference are satisfactory. Water shortage during the summer was considerably less, and the Company's mills worked satisfactorily during the half-year under review. Sale revenue was higher. There was a windfall income from fire insurance claims on raw material. Thus, after making incidental provisions, the net profit showed an increase.

Satisfactory progress in expansion projects is indicated in the report. Erection of the lime sludge reburning plant has been completed; soon, it will go into operation. Part consignments of machinery for extension have arrived, and the erection is being undertaken according to schedule. To increase the efficiency of the plant, orders are being placed for additional machinery.

Around Calcutta Markets

Near-Boom Conditions

Wednesday, Evening

NEAR-BOOM conditions have prevailed on the Calcutta Stock Exchange in the last few days. Spurt in speculative scrips like Indian Iron has had a psychologically bullish effect on the market. Miscellaneous and Engineering shares continued to be steady because of consistent buying support. But despite the "bullish" atmosphere, Jute, Tea and Coal shares remained depressed. Behaviour of the stock market here conformed to the pattern discussed in these columns on earlier occasions.

Improvement in equities is somewhat surprising because of the Finance Minister's recent statement that taxation will have to be raised higher than the level suggested by the Taxation Enquiry Commission if the Plan-frame's physical targets are to be attained. This is a possibility which should have had a depressing effect on the stock market. On the contrary, equities moved up after the Finance Minister's recent Press statement in New Delhi.

"Bull" Factors

Some arguments advanced in favour of higher stock market prices are intriguing. Market circles are now recalling the Finance Minister's statement, sometime ago, that no fresh taxation will be imposed for the first year or the first two years of the Second Plan. This is interpreted to mean that the second Plan would be implemented through deficit financing at the initial stages.

Two conclusions are drawn from this inference. It is argued that initial deficit financing will have a healthy effect on stock markets. Effects of deficit financing since 1953-54 confirm this assumption. There has since been a substantial increase in money incomes and supplies. Banking resources have expanded. Improvement in the supply of investible funds is reflected in the success of the State loans floated recently.

Deficit Financing

On the assumption that the Government will rely mainly on deficit financing in the first two years of the second Plan, market circles assume that the conditions prevalent in the last two years will be re-

peated in an aggravated form. This seems to be the main reason behind the recent spurt in equities. Once the assumption is conceded, the reasoning cannot be seriously questioned. Even so, there is one aspect of the problem which may be emphasised here.

New Delhi may rely on deficit financing to finance the second Plan at the initial stage. This may augment money incomes and money supplies. But it does not necessarily follow that funds available for speculation in stock markets will increase correspondingly. There is, indeed, a case for the Government to adopt a more aggressive borrowing policy in order to mark up funds released through enlarged deficit financing. Such a policy will be justified in order to minimise the inflationary pressure to the minimum.

Prohibition

Postponement, if true, of fresh taxation for a year or two is a possible "bullish" development. But since the Finance Minister's earlier statement, the recommendations of the Prohibition Committee have been published. These suggestions may upset the Finance Minister's earlier calculations. But market circles interpret the Finance Minister's observations during the recent Press Conference in New Delhi to mean that he is opposed to implementing the suggestions of the Prohibition Committee as it will involve a loss of Rs 125 crores during the second Plan period.

This is the broader background against which recent movements in equity prices have to be assessed. Those who apprehend that the stock market boom may get out of control need the reminder that speculative investors are selective in their support to equities. Take, for instance, Tea shares. In his recent Press statement in New Delhi, the Finance Minister was emphatic that nationalisation of the tea industry was not under contemplation by the Government. And yet, Tea shares did not move up after this assurance.

Why Hesitant

This week's auction results explain, as well as emphasise, why investors are hesitant about Tea

shares. Export demand was less active. Export auction prices were lower. So were internal sale prices for tea. Investors are not optimistic about the dividend outlook for Tea shares this year. Developments to date confirm their apprehensions. This illustrates that speculators are not pushing equities up without any rhyme or reason.

Consider, again, the depression in Jute shares. Stock figures, released by IJMA on Tuesday, are highly satisfactory. Stocks of jute goods with the mills are now lowest in the last few years. And this, despite a year of increased working hours. This is positive proof that sale of jute goods are outpacing the rising production. Even so, Jute shares are not moving up. This is another illustration that speculators are not blind in their activities.

Engineering Shares

Only those shares or groups of shares are moving up which have good prospects. Engineering and Miscellaneous shares are booming. Paper shares are gradually creeping up. It is common ground that paper, miscellaneous and engineering industries are doing well, and that these industries would be faring better during the second Plan period. Recent company reports justify the spurt in these groups of shares. Many companies in these groups are paying higher dividends, and are increasing their capital structure.

Sudden spurts in Indian Copper and Indian Iron were features of stock market movements during this week. Rise in Indian Copper is justified by the announcement of an interim dividend of ten per cent. Improvement in Indian Iron is less justifiable. It is partly due to the consistent rise in the Tata Steel. To some extent, it is due to expectations that the Company will issue right shares. Only after the announcement of steel retention prices by the Government will it be known whether the Company will issue right or bonus shares. Meanwhile, it may be of interest to note that both Indian Copper and Iron are well below the peak levels touched during the week at the time of this writing.

Diwali Prospects Brighter Than Ever

Thursday, Morning

WHAT prospects does Diwali hold for the stock exchange? The economy in general has shown remarkable buoyancy and bright Moorat is expected on all hands. The basis of the optimism that is in the air lies, of course, in the substantial improvement in agricultural and industrial production that has taken place. Indeed, both these have exceeded the most optimistic expectations. Despite floods in Delhi and Punjab and the earlier flood damage in Orissa and elsewhere the food position has been assessed by Government experts as satisfactory enough to ensure sufficiency without imports. To the continuous improvement of industrial production there are no impediments in sight. Falling food prices, which caused concern at one stage, are now a thing of the past.

What is most encouraging is that pessimists who had predicted dire consequences following the decline in the purchasing power of agriculturists have been proved to be in the wrong. Lower agricultural prices have not affected sales of industrial products nor given rise to unsold stocks, or interfered with the steady expansion of industrial or agricultural production. On the contrary, at the moment, alarming reduction of stocks of mill cloth appears to be the problem. Mills' stocks of cloth, as far as can be gathered, are low by all counts. But there does not seem to be a corresponding activity in the cloth market which suggests brisk transfer of stocks from the mills to the hands of dealers. Now dealers would not be interested in acquiring stocks nor would the mills be able to make forward sales right upto January, unless market anticipation of demand was sufficiently encouraging. So, from the stock market angle the indicators are almost all favourable.

The Second Plan

On the top of it there is the ambitious programme for industries in the second Plan. What does it all add up to? But what the stock market has to consider carefully, however, is not the general prospects of the economy; even the ambitious programme for industries would not by itself be an unmixed benefit for

the stock exchange, until the role of the private sector and prospects for taxation become less obscure than they are today.

There's the rub. But the prevailing optimism is so infectious that the market is much less worried about possible bear factors than it was at the time of last Diwali, though for the better part of the year it has been trying to pull itself together, after the shake up given to it by the Avadi resolution. Besides, last year at this time Dalal Street made no secret of its apprehensions. Its performance during the year, however, had been impressive, reflecting the growing strength in the Indian economy under the impact of larger development expenditure. It was the commodity markets which were less buoyant, under the impact of a larger agricultural output in India and fall in speculative demand overseas, following relaxation of international tensions. Well, there has been another year of bumper crops and international tensions are further eased but agriculture has not held up improvement in industry; things have worked the other way round.

Diwali to Diwali

A straight comparison of the quotations of the leading scrips over the last 12 months will show that

Diwali to Diwali Price Range on Bombay Stock Exchange

	Moorat 1954	Highest	Lowest	Nov 10, 1955
Tata Ordinary	223- 8- 0	270-12- 0	222- 8- 0	267- 8- 0

Tata Hydro	150- 0- 0	157- 0- 0	141- 0- 0	153- 0- 0
ACC	182- 4- 0	222- 8- 0	173-12- 0	214-12- 0
Belapur	298- 0- 0	388- 0- 0	299- 0- 0	383- 0- 0
Bombay Burmah old	463-12- 0	712- 8- 0	452- 8- 0	609- 6- 0
National Rayon	211- 8- 0	248- 4- 0	195- 8- 0	244- 0- 0
Premier Construction	162- 0- 0	194- 0- 0	140-12- 0	186- 0- 0
Scndias	17-11- 0	19- 1- 0	14- 7- 0	17-10- 0
Tata Chemicals	19- 3- 0	20- 8- 0	12-15- 0	19- 1- 0

despite the uncertain future of the private sector, the threat of higher and new taxation, for instance taxation of capital gains that is to come some time or other, the market leaders have forged ahead. And what the quotations do not show are perhaps even more significant—definite pressure of investible funds seeking an outlet, which has widened investment activity, though it has not yet led to floatations of many new issues, and consolidation of gains that cannot be dismissed as purely speculative.

Growing Strength of Economy

The year opened with some uncertainties for the stock markets, for the Avadi resolution accepted by Government meant, or was expected to mean, a shift in emphasis in economic policy in favour of a socialistic pattern of society. In the Draft Plan-frame for the Second Five Year Plan submitted later, which was accepted by the National Development Council, the highest political body in the country, the aim was defined not even as "socialistic" but as that of a socialist pattern of society. This shift in emphasis raised a host of questions and doubts about nationalisation, and rationalisation of jute and cotton industries, not to mention higher tax burdens and particularly the taxation of bonus issues. At last

one of these uncertainties, namely the last one, was removed by the Finance Minister. But the others, though they continue to crop up now and again, have not prevented the stock market from responding, and responding in an enthusiastic manner, to the growing strength of the domestic economy.

Signs of returning confidence could no longer be left in doubt. And Dalal Street, despite the introduction of Security Contracts (Regulation) Bill late in December, welcomed the new year on a markedly bullish note. Helped by a good start, the market has gone up by leaps and bounds through the rest of the year, though there were the usual occasional reactions and recessions. The second quarter of the year did not record a speculative rise in values but the trend remained predominantly bullish. Lack of animation in this quarter was more than made good in the months of April, May and June and the end of the second quarter saw equities at the highest level for the quarter. Again in the third quarter of September, the generally bullish pattern of trading

was evident, reflecting the inherent strength of the market.

Again in the third quarter ending with September, there was a further extension of the bullish pattern of trading. This was sufficiently impressive to bring out the inherent strength of the market. Along with genuine investment, there was also a spate of speculative activity and an attempted corner, by a single bull operator, of some of the leading scrips. This resulted in heavy deliveries on the settlement day on September 1. Matters, by then, had gone too far and in order to cry a halt to unhealthy speculation, the Stock Exchange authorities decided to impose twin curbs on individual margins and budla charges, as also a ban on option business. The measures had the intended effect and the tempo of speculative activity slackened perceptibly. But this did not prevent the market from reaching new peaks, which were, in some cases, the highest for the year.

Sustained Bullish Under-tone

The working results of the companies themselves have contributed

no little to restore the confidence of investors and also to strengthen it. Most of the company results gave eloquent testimony to the growing strength of the economy; higher dividends and large bonuses helped further to attract investment enquiry. As a result, throughout last month, and in the first ten days of this month, the stock market displayed a substantial bullish undertone.

Tata Ordinary, which quoted Rs 214-4 on December 2, last year, reached the year's peak and the highest level in its career on November 9 at Rs 270-12, closing steady at the time of writing at Rs 267-4. Indian Iron, which quoted Rs 33-15 towards the end of November last year, moved up to the record level of Rs 42-8-6 to close at Rs 42-5.

As a matter of fact, October was the month which brought about a near-boom condition in the market, with prices shooting up in a manner that had not been witnessed for many years. In this month, Tata Ordinary registered a rise of Rs 20. Bombay Burmah (Old), which declared a final dividend of Rs 26-4

per share, making a total of Rs 37-8 on the ordinary share of Rs 125, rose from Rs 586 to Rs 710. Scindia also returned to favour after the increase of 5 per cent in coastal freight rate and reports of firmer conditions in the freight market. They improved from Rs 16-4-0 to Rs 19 in the course of October. Bombay Dyeing and Century recorded gains no less spectacular, Dyeing moving up from Rs 538-0 to Rs 596-4 and Century from Rs 435 to Rs 486-8. Thanks to their excellent working results and possibility of higher dividend, ACC made a gain of Rs 21 at Rs 220 on October 31, and moved further up to Rs 222-8 in the first week of this month.

Rise Broad Based

Even in the semi-gilts, which do not normally attract much speculative activity, some of the gains recorded last month were striking, if not spectacular. Thus, Bank of Ind'a, which quoted Rs 154 on October 3, rose as high as Rs 171, recording a rise of Rs 14. Bombay Burma (New) improved from Rs 209 to Rs 250 while Phaltan Sugar gained over thirty rupees, going up to Rs 172. It will be thus seen that the rise has been fairly broad-based, and that striking advances have been recorded alike in speculative and non-speculative counters.

Among the small priced shares, B B Petrol, BIC and Indian Copper met with considerable speculative as well as investment buying towards the end of the year. Higher dividends and possibilities of the issue of bonus shares were the main factors responsible for a substantial rise in the quotations for these shares.

A Technical factor—A Surprise Packet?

Though there have been factors enough in operation which indicate the inherent strength of the market, some of which have been cited above to support the view that the improvement recorded has a firm basis in expanding investment demand, the part played by speculation, however, cannot be distinguished so easily nor can the operation of speculative factors set out precisely as against genuine investment activity.

A notable feature of the stock market during last month was the steady rise in the carry-over charges at successive settlements. This indicates a heavily overbought position, and it is not conducive to mar-

ket health. One cannot, therefore, rule out the possibility of a technical correction, in the near future. In the light of this, it is quite on the cards that the Moorat night may present the operators with a surprise packet.

Bullion

NARROW MARKET INVITES MANIPULATION

THE bullion market has finished the year with moderate gains. As compared to last Diwali, gold has gone up by about Rs. 9 per tola at Rs. 96-4 while silver at Rs. 171-4 is higher by Rs. 11 per 100 tolas. It is of some significance, however, that silver is now practically at the highest level of the year. The lowest rate recorded for silver was Rs. 152-1 in December from which the market gradually moved up to Rs. 171-2 in April. By June, silver again slipped back to Rs. 154-12 but from this level, the market started moving up once again.

In gold, the lowest rate recorded for spot during the year was Rs. 85-12 and as in the case of silver, the rate moved up to Rs. 98-14 in April but slipped back to Rs. 89-6 in May. Thereafter movements in gold have been comparatively narrow but the undertone has remained steady.

Bullish Trend

The early weakness of the bullion market is to be attributed to the sharp fall in commodity markets before Diwali last year as a result of bumper crops. The market thereafter recovered, partly in response to the seasonal demand and partly as a result of check to smuggling, following the developments in Goa and keener vigilance by the authorities.

The bullion market has not, however, been immune to manipulations by professional operators who seem to have tightened their hold, taking full advantage of limited floating supplies and virtually complete absence of imports. These manipulations led to recurrent crises and squeezes. One operator was credited with having commandeered all the floating supplies and forward trading had to be suspended from July 12 onwards. The by-laws were again amended to meet the new situation and only three weeks ago, forward trading was resumed in bullion after the market had remained closed for more than three weeks.

In view of the prevailing inflationary psychology, limited stocks and higher purchasing power, the outlook for both silver and gold at Rs.

171 and Rs 96 respectively appear to be somewhat bullish.

Cotton

DAMAGE TO BUMPER CROP

THE output of Indian cotton has steadily gone ahead and the cotton textile industry has been relieved of its major headache. The supply position has become comfortable after remaining on a subsistence level where production was chasing consumption and consumption in turn, chasing production, right from the partition in 1947-48 to 1952-53. From 1952-53, the tide turned and in 1953-54 control on cotton was released. In 1954-55 season, the supply position became so very easy as to induce the Government to reduce the floor prices by Rs. 50/- per candy. Measures had also to be devised to prevent prices from possible collapse and the Government of India announced on February 8 its decision to suspend, with immediate effect, the quota system of allocation of Indian cotton to mills.

Comfortable Supply

In terms of the new order, mills are even permitted to seal cotton freely and exports have been encouraged by suitable reduction in export duties from time to time as well as by grant of liberal export quotas. In view of the record world production of cotton during the current season, the anxiety of exporting countries in general to boost exports and of U S in particular to liquidate its surplus stocks, the prospects for fresh export of Indian cotton has become somewhat dim. Government, however, is alive to the situation and it may be hoped that the remaining export duty will be removed in case it is found to hamper exports.

Changed Basis for New Contract

Though the official estimate of acreage as well as production were placed at 18.3 million acres and 43 lakh bales for the year 1954-55, trade estimate of the crop was 53 lakh bales, including 2.7 lakh bales for extra mill consumption. The target for cotton has been fixed provisionally for the Second Five Year Plan at 20.42 million acres and 55.86 lakhs bales. The preliminary trade estimate of the crop at 53 lakh bales for the season has been lately revised downward to about 47 lakh, after the recent heavy untimely rains in several cotton growing tracts.

The quality of the first arrivals of the new crop has not been upto

standard. All factors have resulted in an appreciable recovery in prices. The I C C Feb. 1956 delivery contract, which was sold down to Rs. 610 by the end of September from its earlier high level of Rs. 641-8 towards the close of August, was boosted up to Rs. 669-8 and closed around Rs. 656 on the 9th. It is to be noted that the basis of the Hedge Contract for the current season has been changed from M G Jarilla 25/32" to M G Jarilla (A) Staple 13/16", tenderable up to 2/32" 'on' and 1/32" 'off'.

As cotton has been brought under the provision of the Forward Contracts (Regulation) Act, 1952, the by-laws of the East India Cotton Association had to be amended in deference to the wishes of the Forward Markets Commission. A system of graded margins has been introduced, while the controversial Section 55 has been amended with a view to reflect fully the spot prices while fixing price differentials.

With regard to price movements during the year, it may be noted that at the time of last Diwali, ICC February 1955 was quoting at Rs. 619-8. The lowest rate touched was Rs. 543-12 for I C C May 1955 delivery on April 13, and the highest rate recorded was Rs. 700 for I C C April 1955 when that contract went off the board on August 25.

Damage has been done to the cotton crop this year, and both the quantity and the quality of the crop have been affected. Hence the tendency of cotton prices to firm up. The crop has still to pass the crucial winter season and therefore it is not possible to be dogmatic about the eventual outcome. Moreover U S export policy is to be reckoned with. In view of these uncertain factors, it is difficult to forecast price outlook. But even so, one would not be rash in suggesting that the likelihood of decline from the present rate of Rs. 656 per bale is limited.

Oilseeds

INDIA EMERGES AS SUBSTANTIAL EXPORTER

THE oilseed crop year 1954-55 has been remarkable in many respects. The total oilseed output of over 57,00,000 tons was an all time record and the target laid down in the First Five Year Plan of 55,00,000 tons was exceeded. India re-entered the world export trade in oilseeds and oilseeds products in a real big way first time since World War II. Exports of oilcakes have begun and new markets for cottonseed oil and

Vanaspati have been established. Yet manufacturers of Vanaspati have found internal prices reasonably steady and thank the Government for its handling of the export policy.

At the beginning of the 1954-55 season, oilseed and oil prices were declining at a rate which created considerable anxiety to Government, farmers and traders alike. The primary reasons were:

- (1) a good crop in the previous year,
- (2) little exports to remove the marginal surplus,
- (3) general deflationary trend in all commodity prices resulting from higher production,
- (4) the decline in world prices of oils and fats due to their adequate supplies and
- (5) the anticipation of a good crop in the new season.

The price of ready groundnut oil in Bombay on 1st November 1954 was Rs. 1,000 and, despite Government efforts to maintain prices at about this level through reduction in export duty and grant of liberal export quotas, the price level continued to decline and reached a level of Rs. 805 in February. A very large export quota in February and increasing consumption of oil by Vanaspati and other industries had a tonic effect on the market and the price stabilised around Rs. 900 until June. It spurted to a high level of Rs. 1,040 in July due to late rains but since then has been fluctuating between Rs. 870 and Rs. 1,000.

The trend in industrial oils like castor and linseed was similar. Linseed oil prices began to rise rapidly in the second quarter of the year when it became apparent that Argentina would not be a serious competitor and the demand for Europe increased. Similarly castor oil prices improved in the second half of the year when prospects of exports to USA improved owing to reduced competition from Brazil.

Oilseed output in 1953-54 was very satisfactory but as prices continued to be on the high side, Government did not permit any exports until the prices continued to be on the high side. Government did not permit any exports until the prices began to decline rapidly with the onset of the monsoon. Government announced export quotas in August 1954 to stabilise prices but as the new crop was expected to be better, prices continued to fall. Government followed a very liberal export policy announcing export quotas at fre-

quent intervals and varying export duties with an eye on the domestic and foreign price levels. This had a healthy effect on the market and prices achieved a measure of stability unknown in this field for years.

The surplus from two crops helped to achieve a sizable improvement in exports. In the first 9 months of 1955 India exported nearly 180,000 tons of vegetable oils from Bombay and Madras, besides 47,000 tons of oilseeds and 105,000 tons of oilcakes. Among the oils, groundnut oil accounts for nearly 60% of the total exports, but castor and linseed oils with figures of 29,000 and 28,000 tons also indicate a remarkable improvement after having lost the markets to Brazil and Argentina for some years through higher prices.

An encouraging feature of the export trade has been the beginning of exports of cottonseed oil and its cake. It is a pity that while oil mills are lying idle in large numbers, the increasing output of cottonseed, which can easily yield one to one and half lakh tons of good edible oil, besides yielding other valuable by-products, continues to be wasted. Free exports of cottonseed oil and its cake have given good impetus to cottonseed crushing. To expand output rapidly, however, Government must help to spread the technical know how specially required for cottonseed crushing.

Similarly low groundnut oil prices and free exports have helped to increase Vanaspati exports to over 10,000 tons in 1955. Shri K D Malaviya rightly suggested in his speech at the recent Oil Symposium in Bombay that India must endeavour to export more processed articles than raw materials to encourage employment and earn larger foreign exchange from the same exportable surplus.

One familiar with the oil and oilseed industry and trade must often wonder whether there has been any effective effort to develop this aspect of our economy along with the others. The increase in oilseed output has been almost entirely due to good rains and increased acreage. Improved methods of cultivation have yet to reach farmers. The oilseed crushing industry remains neglected being caught in the ideological controversy of the cottage vs. modern methods of production. Let us hope the Oilseeds Crushing Industry Inquiry Committee will show Government how to obtain more oil at lower cost for Indian consumers, the forgotten factor in Indian planning, and for exports.

Save valuable working hours!

FAST NEW Night Air Service

by Luxurious 4-engined

Skymaster

to **BOMBAY-CALCUTTA**
DELHI-MADRAS via NAGPUR

SAVE precious time and unnecessary expenditure on the way — fly overnight by new, luxurious Skymaster service, connecting Bombay, Delhi, Calcutta, Nagpur and Madras. The new service cuts out irritating overnight stops; lands you in time for breakfast — and it is carefully scheduled to connect with 34 morning flights from the big airports. So by midday tomorrow, you can reach almost any important town in India! Wherever you want to go, whichever flight you choose — Skymaster service makes sure you get there in time! And you have complimentary meals, free travel to and from airport, everything. No extras to pay.

Deshmukh on the Draft Plan

ACCORDING to Shri Chintaman Deshmukh, the draft Second Plan is expected to be placed before Parliament in the early part of the next budget session and finalised before the end of the financial year. For a document of such importance, the period allowed for discussion is so short that it makes one wonder whether presentation to Parliament is being viewed as a mere matter of routine unavoidable in the present system of Government. It is possible that the draft could have been tabled in the current session of Parliament had the States' Reorganisation business not intervened. But as things have turned out, it has to wait until a clearer picture of the federating states emerges, so that the details may be reshuffled to suit the revised State boundaries. There is, therefore, a very valid excuse for the delay in submitting the draft Plan.

This would not have been a matter for grave concern if the details had been worked out and kept ready for revision. But from what Shri Deshmukh said the other day, it would seem that the Planners have not yet got to that position. Indeed, it is not even clear now whether the draft Plan to be presented to Parliament will be substantially the same as the Draft Plan-Frame that has been under discussion during the past six months or more. In this situation, it seems certain that the Planning Commission and the Government and the legislatures will find it a colossal task to complete their work according to schedule.

Shri Deshmukh indicated that the public sector's outlay under the Second Plan would be more than Rs 4,800 crores. Assuming that this covers both the 'investment' and 'current' expenditures set out in the Draft Plan-Frame, there is thus already an addition of over Rs. 500 crores to projected expenditure. The Finance Minister did not disclose why this addition has been made, and which sectors benefit from it. Maybe the Planning Commission has been persuaded by the Railways that the provision for transport in the Plan-Frame was woefully inadequate for moving the additional output. Or the Commission might have considered it essential to step up the outlay on "social overheads". Or, again, the acute shortage of steel now being experienced may have led to a revision of the steel target.

One may go on in this vein and speculate on the possible reasons for the enlarged outlay in the public sector. But there is little doubt that this increase is not due to any single item. Nor is it conceived as a means of raising the employment target. The Finance Minister apparently felt that during the Second Plan period, additional jobs created would be of the order of eight million as compared to the target of 10 to 12 million jobs in the Draft Plan-Frame. This must cause great surprise and even greater debate, since the targets for outlay and employment have tended to move in opposite directions. Does this mean that in the process of revision, emphasis has been mainly on the capital-intensive projects? Or is it merely a re-appraisal of the employment effect of the projects originally included in the Draft Plan-Frame? There is little doubt that Parliament will pay special attention to this aspect; and if the House feels that the employment target must not be reduced on any account, either the size or the pattern of investment or both may have to be altered again.

This question of balance between the investment and employment targets is not the only one in doubt. Even more nebulous is the relationship between projected outlay in the public sector and expected or planned resources. The Draft Plan-Frame found it difficult to pinpoint the sources of finance for the outlay of Rs 4,300 crores envisaged therein. Many have questioned the feasibility of covering an outlay of that order, with deficit financing confined to about Rs 1,200 crores. How then will the additional Rs 500 crores be found? Very little light was thrown on this by the Finance Minister. In fact, he has confessed that nationalisation as a means of augmenting the public sector's resources has not been seriously or precisely thought out. Not that nationalisation, undertaken on a scale or form hitherto contemplated, would have added in any significant measure to the public sector's resources. But even the little that could have been so garnered is an uncertain quantity. Apparently, Shri Deshmukh and his colleagues hope that taxation and borrowing can be stepped up sufficiently, and that deficit-financing will take care of the rest.

So much has already been said about the taxation and borrowing targets in the Draft Plan-Frame that there is little point in discussing it here in detail. There is, however, one aspect to all this which is of some importance. If we assume that substantial deficit-financing will be resorted to, how is that likely to affect the taxation and borrowing prospects? So far, it has been the practice to look at the likely increase in national income over the period and relate the taxation receipts to the aggregate. This has been criticised on the ground that much of the increase in income will be in spheres like agriculture and household and hand industries, which do not attract much tax. But there is the other question, viz., the secondary effects of government expenditure—deficit financed or otherwise—on the money incomes from which larger taxes or loans may be expected. It would be worthwhile looking a little more closely into the money-flows during the period of the Plan, in addition to the pattern of national income at the end of the Plan period, in order to facilitate an appraisal of the movement of funds between the public and private sectors all along the line.

In the meantime, one has to recognise the shifts that have occurred during the past few months in the

background. The short-supply in respect of steel has turned out to be larger than had been believed, so that we have not only had to reimpose controls on that commodity but to plan for much larger imports as well. The position in regard to agricultural commodities—food and non-food—is still comfortable, but only just so. On the stock exchanges and organised markets, the general tone is one of bullishness—reflecting to some extent the optimistic expectations regarding the scope for private initiative and enterprise. The position is, in other words, not one in which the attitude to the magnitude of deficit-financing can be one of, so to speak, 'more or less'. On the other hand, all these indicate an in-

tensification of economic activity which, while limiting somewhat the scope for deficit-financing, might itself contribute more to the fisc in the form of taxes and loans. The Finance Minister can, to some extent, feel more confident in his expectations regarding the usual sources of revenue and the ability of the market to stand increased government flotation of loans. He will perhaps get a clearer picture of the position by the time Parliament meets for discussing the draft Plan and the budget for the next year. But with all that, one still wonders how and where he is going to find the money for balancing the additional outlay of Rs. 500 crores or more now being envisaged in the public sector.

Diplomatic Bankruptcy

LACK of imagination and statesmanship has been distressingly evident during the three weeks of bargaining and counter-bargaining by the four Foreign Ministers at Geneva. It is not their fault that they have failed to reach agreement on any of the specific issues under discussion. But it is a reflection of their diplomatic bankruptcy that they have miserably failed to recapture the Geneva spirit. It is clear that the four Foreign Ministers lack the vision of the four Heads of State. It will be argued that the four Foreign Ministers assembled at Geneva to explore whether the specific directives of their Heads could be implemented. This limitation, under which the four Foreign Ministers deliberated at Geneva should not be minimised. But they cannot escape the accusation that, failing to reach agreement on specific issues, they had not the wisdom even to explore the prospects of carrying the achievement of the four Heads of State a step further.

Much has been sought to be made of the achievements of the conference 'at the summit'. It would be uncharitable to belittle the success of the July talks at Geneva among the four Heads of State. But it would be appropriate to analyse the 'summit' conference in its proper perspective for a realistic appreciation of its attainments and of what it failed to achieve. It was not the immediate objective of the four Heads of State to reconcile the world issues in dispute. Their aim was to discover whether both sides were willing to negotiate the issues in dispute in or-

der to ensure peaceful co-existence. They did not, though it is not widely realised, reach agreement on the principle of peaceful co-existence in all its wider implications. But they succeeded in reaching an agreement that negotiations should start on the issues in dispute. This was no mean achievement. But this achievement was possible because of a negative influence. Both sides understood that each side had realised that an atomic war could not be waged as such a war would destroy civilisation.

What in July last was widely applauded as the Geneva spirit of peace has since degenerated into a "hydrogen stalemate". Russia and the Western Powers mutually agreed that neither side would start an atomic war. This did not mean that there was any agreement to ban war, or to ban atomic weapons. It has since been argued that an atomic balance of power is the most sure deterrent to war. It would, thus, be arguable that the four Heads of State arrived at an agreement not to start an atomic war, but they did not agree not to wage war. This was the state of world affairs as the four Foreign Ministers assembled at Geneva. Even at the early stages of their deliberations, it became evident that both sides were talking at each other. To avert failure and disappointment, the four Foreign Ministers should have reversed their strategy. They should have soared above quarrelsome issues to concentrate their attention on principles. It was within their power to project the earlier understanding in relation to atomic warfare on a wider sphere.

It should not have been difficult for the four Foreign Ministers to issue a joint declaration by the four Powers to renounce the use of force. By such an agreed statement of policy, they could have perpetuated the Geneva spirit.

As members of the United Nations, Russia and the three Western Powers are committed to renounce the use of force in settling disputes. And again, Washington demanded such an undertaking in Moscow. Over and over again,

US Secretary of State has insisted on an assurance from Communist China that Peking must make clear beyond the shadow of a doubt that it has no intention to use force in settling disputes in the Far East. NATO and many other similar military alliances have been created by the Western Powers. These military pacts have provoked counter-alliances by Communist States. But both sides have repeatedly affirmed that their respective military pacts are defensive in nature and purpose. As the ostensible policy of both sides is not to

start an aggressive war, there would have been no difficulty for the four Foreign Ministers to issue a joint declaration renouncing the use of force. Such a declaration alone could not have resolved all the world issues in dispute. But after the understanding among the four Heads of States about atomic warfare, it would have helped further the establishment of an atmosphere in which the disputed issues could be discussed more calmly and objectively.

It would be idle to pretend that the specific issues which were under discussion by the four Foreign Ministers were not complex. But it is clear from the deliberations of the four Foreign Ministers that mutual suspicion and fear have introduced additional complications into each and all of the disputed issues. It is difficult to appreciate the allegation that in insisting on European security first, Russia has violated the directive of the four Heads of State. In their emphasis on German reunification first, the Western Powers are liable to a similar accusation.

If the Western Powers suspect that Russia's ulterior motive is to establish a Communist State in a future, unified Germany, Russia is equally suspicious that the Western Powers' design is to create an armed, unified Germany as a NATO partner.

As on Germany, so on disarmament, the approaches of both sides are vitiated by mutual fear. It is clear that the Eisenhower plan for 'open skies' and inspection of ground forces and armaments is based on the Western Powers' reluctance to accept Russia's good faith. Russia's proposal to ban atomic weapons reflects the Western Powers' superiority in nuclear weapons of warfare. Her plan for reduction of armaments is not accepted by the Western Powers as they suspect that they are not fully aware of Russia's present strength in armed forces and armaments. Each of the four Foreign Ministers is now a sadder, but not a wiser, man after their wranglings for three weeks. Far more disquieting is the common man's disappointment over the diplomatic bankruptcy of the major Powers.

Weekly Notes

U S Loan for Tata Steel

SHRI J R D TATA'S cryptic statement on his return from New York this week that the planned expansion programme of the Tata Iron and Steel Company would be gone through and that the necessary finance would be obtained from the Export-Import Bank will set at rest doubts on that score which have been current for some time.

It was known that Shri Tata's mission to the United States was concerned among other things with the obtaining of financial accommodation on a fairly substantial scale. Preliminary reports had not been very reassuring about the possibility of success. Shri Tata gave no details of his deal with the Export-Import Bank, but it is to be presumed that these will be made available in an official statement from Bombay House soon.

Reequipment in the Air

SHRI TATA, who attended a meeting of the International Air Transport Association in New York, made a pointed reference to the tremendous developments that were taking place in aviation in Europe and America. His reference to the superiority of the DC-8 pure jet aeroplanes over the Super-Constellations, with which Air-India International is equipped at present, only serves to emphasise the ever-present problem of keeping up with the latest developments faced by any international air carrier.

While not replying directly to the question whether the Air-India International Corporation intended to purchase these planes, J R D indicated his interest in them and added that "the Corporation always stood in the forefront of technical development in aviation." If this position is to be maintained, however, the Corporation will have to make up its mind soon, for a major process of re-equipment seems to have started in the air transport industry. Shri Tata himself referred to an American airline company which had already placed an order for 45 DC-8s with the manufacturers. If Shri Tata was referring to Pan-American Airways, which has in fact placed an order for 45 new large long-distance planes, other information suggests that his statement must be subjected to a correction. Only 25 of the new planes ordered by Pan-American are to be the new Douglas DC-8, the other 20 being the Boeing

707, which is also a pure jet airliner. The value of the combined order runs to £96 million, which should give some idea of the magnitudes involved.

Though Shri Tata did not mention the fact, the jet planes are not the only planes in the field for long-distance flying with particularly the North Atlantic or the Pacific runs in mind. The Bristol Britannia, a long-range turbo-prop received an order for three planes with an option for a further five from Canadian Pacific Airlines at a value of £3½ million (without options). These planes are evidently cheaper, though of the same size. These are British planes, while both the jet aircraft are of American manufacture. Obviously also, these planes are cheaper than the jet planes though their capabilities and operational economies might well be different.

Planes on Paper

IT may be noted that all these three types of planes—the two jets and the turbo-prop—have not yet been flown, tested or for the matter of that, even built. Even the various features that are to go into them have not been finalised, though of course the broad outlines are apparent. It follows from this that the many claims made on their behalf may not necessarily be substantiated. All the three planes are to be giants, capable of carrying a hundred to a hundred and fifty passengers over long distances, the Atlantic passage non-stop being the measure of their range. They are expected to differ radically from earlier types in many salient features and in their equipment, and, most important, they are expected to become available only from 1960. The many orders already placed for them indicate that unless Air-India places an order at an early date, it may not obtain delivery until much later.

In the medium-range of up to 2,500 miles also a large number of new orders have been placed, mainly for turbo-props. Two American operators, Eastern Airlines and American Airlines, have ordered a total of 73 Lockheed Electrics for £20 million. The Air-India International might perhaps gain more by thinking of these planes than of the long-range jets or even the long-range turbo-props since it does not have to plan for non-stop North Atlantic flights at least as yet. Of course, if its competitors use the longer-range and

presumably faster aircraft on the same routes as the Air-India International, it might not be left with much choice.

Steel Imports

SINCE the domestic output of Steel cannot be increased until the Rourkela and Bhilai plants go into operation, the rising demand for steel in both the public and private sectors has, of necessity, to be matched by additional imports—or left unsatisfied. The gap in availabilities is estimated at over a million tons, which is by all accounts a substantial amount for any one country to supply at short notice. The frantic efforts now being made by the Government of India to procure whatever steel is available in any part of the world will, therefore, cause no surprise. With limited supplies available in the United Kingdom, and with dollar considerations imposing restrictions on increases in imports from the USA, India has started tapping other sources. Besides the 40,000 tons of finished steel already obtained from the USSR, orders for another 60,000 tons are to be placed with that country. Czechoslovakia and Japan are other likely suppliers, should the prices and terms of offer prove acceptable. It is reported that India might even purchase on a barter basis about 30,000 tons from the People's Republic of China. All of this will, however, cover only part of the requirements, and it is more than certain that steel will be very much of a bottleneck commodity in the months to come.

Obviously, this shortage will persist through the greater part of the second Five-Year Plan. And by the time the new steel plants supplying the domestic market, demand may well have taken a further jump. Against this background, there can be no question about the rightness of the emphasis on steel in the Second Plan. Indeed, one might now wonder if we are not going too slow in the matter of steel production. On the other side, the acute shortage in steel supply today will mean a recasting of the foreign exchange budget for the Second Plan. We have now to pray for a succession of good monsoons, so that our foreign exchange resources could be made available for steel without our having to starve ourselves to death.

Bombay's Future

THE decision of the Congress Working Committee on the future of Bombay City, though inevitable in the circumstances, has, far from giving any special cause for satisfaction in any quarter, had a somewhat chilling effect on all the parties concerned. Though for the cosmopolitan-minded people of the City as such, there can be some immediate negative solace in the fact that the metropolis, the scene of their endeavours and a perennial source of inspiration and pride, does not go to any particular unilingual territory for the time being, the possibility of the present decision being reversed five years hence, is a disturbing factor. That can only mean that the battle for Bombay, as it has come to be picturesquely described in certain quarters, will continue during the five-year period, possibly with increasing intensity and bitterness, imparting a sense of uncertainty and unreality to all the doings of the City. And that is not to speak of the very real danger of the coming elections in the City being fought on the question of Bombay's future and a bloc being formed in the would-be legislature of Bombay City to carry on the campaign in the legislative arena through every means known to parliamentary obstruction. In fact, the crucial battle for Bombay will be fought, not five years hence, but in the very next elections, and the pattern of political alignment that emerges then will show whether the experiment of a separate City State can work or not.

The policy of leaving an issue open has little to commend it—except perhaps political expediency. The Working Committee has been wise in deciding to do away with the five-year period of uncertainty visualised by the States Reorganisation Commission for Telengana. That it has not been able to apply the same consideration to Bombay is a matter for regret. With no possibility of the differences among the various claimants to Bombay City being reconciled, the Working Committee was fully justified in recommending that the City be formed into a separate State. Having been forced to that conclusion, the Committee could well have made its decision final—in the sense of its not being open to reconsideration at all. If a showdown was unavoidable, the present was the best time to face it along with the innumerable other minor crises brewing in other parts of the country over the linguistic question. The bad pre-

cedent set in the case of Bombay is only too likely to encourage hopes of reconsideration and revision in other quarters too. That way, the problem of linguistic reorganisation will never come to be settled. And as long as it continues to be a live issue, the nation's attention and energy will be diverted from more important national tasks and frittered away on futile rivalries and bickerings.

Only Solution

SHRI S K PATIL, who, more than others, has tried to emphasise the special status of Bombay in the country and secure recognition for it too, is himself not very happy about the decision of the Working Committee. But he has sought to hug the hope that an earnest effort would be made to give the Working Committee's solution a fair trial and that meanwhile all controversy and agitation over the future of the City would be set aside. At least, that is the essence of his appeal to the people of Bombay; and though there are large sections who are one with Shri Patil in seeking enthusiastic response to his appeal and fulfilment for his hope, the fact cannot be overlooked that in such matters a determined, fanatically-inclined group, though not numerically overwhelming, could nevertheless cause considerable embarrassment and even hindrance to the smooth working of the administration. Indeed, in retrospect, it seems as though the proposal made by the States Reorganisation Commission for a bilingual State with Bombay as the capital was not only fair and practicable, but also highly conducive to the progress and prosperity of this part of the country. It is doubtful, at this stage, whether there can be any return to that proposal except on a basis which cannot be fair to all the parties concerned. And so the only way out is the Working Committee's recommendation to make Bombay City a separate State which, if accepted in grace and sportsmanship by all the disputants, could yet guarantee the importance of Western India and ensure the smooth progress of the proposed three States, Maharashtra, Gujarat and Bombay.

It is not only in the negative sense of a way out of a difficult situation that the Working Committee's proposal, preferably without the five-year period of trial, demands attention. There is a positive aspect to it too. Bombay City has the resource, talent, strength and, more than all, the will to be a State in it-

self, however small in area. It could be a model State—and a compact, congenial laboratory for experimenting with political ideas and ways of progress and applying them to the rest of the country. And it has evolved, and it could continue to evolve, a way of life—broad, tolerant, harmonious and forward-looking—a contribution of the highest significance to free India. Bombay is miniature India, representative of every nook and corner of the country and capable of imparting its impulses to the remotest parts. And though in certain respects, it might have lost some of its former importance to Delhi, it still continues to be the soul of modern India. And to give it a habitat and a field of expression of its own is in itself a desirable end, even apart from considerations connected with the linguistic reorganisation of States. That is all the more reason why the Working Committee, coming to an unavoidable decision on its future, should have put on it the seal of finality.

Arabs and Jews

AS the border tension mounts, both Israel and Egypt seem determined to have a show-down. Israel has been too hasty in rejecting Sir Anthony Eden's proposal. Britain is prepared to act as mediator to settle the dispute between Israel and Arab States under certain conditions. Colonel Nasser, Egypt's Prime Minister, is no less adamant in his threat that Syria and Egypt, "now united, would drive out and free the Islamic world of Zionism".

Both the British Prime Minister and the President of the United States have stressed the sinister implications of an "arms race" in West Asia. Even if Sir Anthony's accusation be conceded that Russia has made the move to gain popularity among Arab States, it would be wrong to conclude that the supply of arms and technicians by Czechoslovakia to Egypt has created the frontier disturbances between Israel and Egypt. This is not to deny that the race for armaments in West Asia is a deplorable development.

While the U S State Department is diplomatic in warning Israel and Arab States that America will be "strongly opposed to the side which starts a war", Sir Anthony's proposal to end the dispute has certain constructive aspects. No impartial observer can endorse Arab States' stubborn refusal to recognise Israel. But their claim for frontier readjustments will have to be considered in

any serious negotiation for a peaceful settlement of the dispute between them and Israel.

In the Mansion House speech, Sir Anthony made the suggestion that Israel and Arab States should start discussions for a negotiated settlement of the dispute in order to reach a compromise agreement on the issue of frontiers, proposed in the U N resolution in 1947 and those delimited in the armistice agreement of 1949. On behalf of Israel, Mr Sharett has rejected this suggestion, though he has expressed Israel's willingness to make "minor concessions" in relation to the existing boundaries.

M Sharett has enumerated reasons for Israel's reluctance to accept Sir Anthony's proposal. Arabs had not only rejected the original 1947 resolution of the United Nations, they started an aggressive war against Israel. Mr. Sharett implies that Israel is entitled to the boundaries fixed by the armistice agreement in 1949 by right of occupation. Under the armistice agreement, Jordan and Egypt held territories in the former central Palestine and the Gaza strip to which they are not entitled under the 1947 U N resolution. M Sharett is emphatic that Israel will not cede territory, though she is prepared to make minor concessions in the interests of a peaceful settlement. It will be recalled that Egypt ignored Mr Ben Gurion's recent offer at peaceful negotiation "without prior conditions" on the argument that there could be no peaceful settlement without an agreement on these "prior conditions".

This is the immediate cause of the border tension between Israel and Egypt. One vital fact emerges out of the developing situation in West Asia. It is clear that Arab States will insist on a readjustment of frontiers, as indicated in the 1947 UN resolution. This makes it all the more imperative that the United Nations should act promptly. There is urgent need for the United Nations either to reiterate, or to suggest amendments to, the original 1947 resolution.

There is another reason why the dispute between Israel and Arab States should be immediately considered by the United Nations. Despite the 1950 Agreement, whereby America, Britain and France undertake to guarantee the frontiers between Israel and Arab States, it is necessary for the United Nations to initiate fresh discussions on a plan

for a guarantee of mutually agreed frontiers by the major powers under the direct auspices of the United Nations.

Korea

MANY attempts have been made to solve the Korean problem, but no tangible progress has yet been achieved. At Geneva last year, Western Powers and Communist States succeeded in reaching an agreement on Indo-China. But both sides admitted failure in their efforts to arrive at an agreed solution of the Korean problem. Korea still remains divided. Deeper reasons and motives which explain the failure of repeated attempts to arrive at a lasting solution of the Korean problem are reflected in the recent acrimonious debate on Korea in the Political Committee of the United Nations.

Two separate issues emerged as the Political Committee continued the debate on Korea. America proposed that a representative of South Korea should participate in the debate, but he should not have the right to vote. Syria proposed that representatives from both south and north Korea should be invited to take part in the debate. Shri Krishna Menon, on behalf of India, was logical in his amendments to both the American and the Syrian proposals. He argued that, as parties to the dispute, representatives of north and south Korea should not be allowed to participate in discussions on India's report on behalf of the Neutral Nations' Repatriation Commission. He, however, insisted that representatives of both north and south Korea should be invited to attend the debate, as non-voting observers, on the U N Commission's report on unification and rehabilitation of Korea.

Syria accepted the amendment proposed by the Indian delegate, but the U S delegate refused to withdraw his original motion to invite a representative of south Korea, but to deny any such invitation to a representative of north Korea. Reunification of Korea is the avowed aim of the United Nations. This is an objective which cannot be achieved without a mutual agreement between north and south Korea on arrangements for uniting the divided country. It stands to reason that the representatives of both north and south Korea should be invited to the debate by the United Nations on unification and rehabilitation of Korea.

To such a demand, the American delegate retorted by informing the United Nations that Washington believes that it would be "unthinkable" to extend any such invitation to any representative from north Korea. In discussions in the United Nations, America has, over and over again, pursued a policy which militates against the fundamental aims of the United Nations. Washington needs the Syrian delegate's dignified reminder that the United Nations' aim is not to create a new State in Korea, but to ensure reunification of Korea in peace.

Employees' Insurance

THE Employees' State Insurance Scheme, which was started some three years back, is to be extended to the city of Madras from November 20, 1955. With this extension, the Scheme will cover around a million workers and their families, but this fact is unfortunately not as well known as it should be. Framed along the lines of the UK National Health Scheme, it seeks to offer wider and better medical facilities to industrial workers. The cost of these facilities is to be borne partly by the workers themselves and partly by employers and Government. It also needs whole-hearted co-operation from the medical profession for its success. There have, in the past few years, been difficulties in working out a formula acceptable to all the parties involved. However, the fact that the Scheme has been adopted in several large industrial agglomerations indicates that slowly but surely the idea is gaining support.

As at present, the Scheme applies only to industrial workers. It is expected that in the Madras City area, about 50,000 workers—manual, clerical and supervisory—drawing monthly salaries up to Rs 400 will benefit from the Scheme. These are all employed in perennial factories using power and having a labour complement of 20 persons or more. That at this stage the Scheme should be restricted to the organised section of non-agricultural labour is inevitable. But when enough experience is gained, it should be possible to devise ways of extending it to the large number of workers outside the organised industries. Otherwise, it may well come in for criticism on grounds of equity, since the workers in organised industries constitute, so to speak, the 'better-off' class amongst labourers.

The State of the French Economy

AS a contrast, the French economy has reached a particularly interesting stage. Unlike that of her neighbours, French economic policy continues to be expansionist and most remarkable of all, and the country is currently enjoying its first postwar surplus in the balance of payments. The change in the economic situation is variously interpreted by French commentators—the most interesting of these is that relating to the ending of the war burden in Indo-China; these same spokesmen claim that more of France's ills will be remedied if appropriate measures for the pacification of North African problems are adopted forthwith.

Early in September, the Minister of Finance announced a "progressive reduction in the cost of money"—a reduction from 7 to 6½ per cent in the interest rate for long term loans by the Credit National. More than that, the Minister announced a new but peculiar French measure—where the loans required offered some "benefits to the National economy", they could be underwritten in large proportion by the French Treasury. Finally, as the British Chancellor of Exchequer was toying with the idea of reconstituting the British Capital Issue Committee, M. Pinillon, the Finance Minister, announced a "return to complete freedom" for new private share and bond issues which would no longer require prior authorization of the State.

These measures reflect fully the policies which M. Mendes-France had conceived and spoke about but did not have the opportunity to put into effect. The need for considerable internal investment in France was also prescribed by the various Organs of the OEEC and the UN Economic Commission for Europe. Earlier than that the Monnet Plan for Industrial Modernisation was based on the understanding that something like 15 per cent of the national income would be devoted to industrial re-equipment and investment. The Monnet Plan was, however, largely sacrificed by the exigencies of the times and in particular by the Colonial wars which have been France's unfortunate lot in the whole of the post-war years. More fundamentally, however, the difficulties which

make a sustained level of industrial expansion a virtual impossibility are two in number: first, the limited mobility in manpower and secondly, the definite attitude favouring restrictionism fostered largely by almost a whole decade of industrial stagnation.

There is now little doubt that the bias in favour of protection largely contributed to the stagnation of industry. The cost structure of industry was so burdened by taxes imposed as it was on the most efficient enterprises and branches of the economy to the benefit of the less efficient ones. The tax burden on French industry becomes very heavy because of the exceptionally large fiscal privileges granted to French agriculture. The odium with which French farmers regarded M. Mendes-France can well be imagined when he commenced his anti-alcoholic campaign. In fact French farmers pay very low tax while at the same time receiving state subsidies in varying amounts.

The Faure regime has wisely found that any tampering with the agricultural sector is politically too dangerous. It has, however, encouraged industrial investment through an expansionist monetary policy with little regard to its inflationary consequences. France is fortunate, however, in being able to achieve, for the first time, a balance of payments surplus—and French economic thinking no doubt works on the lines that as long as this surplus is maintained, a parallel investment programme can be pursued.

In the first nine months of 1955, the balance of trade reflected an export surplus of \$5 million. For the same period a year before, the country had a deficit of \$154 million. This remarkable change has been explained not in terms of a fall in imports but rather in terms of a "sharp rise in exports". As for the balance of payments, French statistics which are available for only 1954 show a dramatic rise in invisible income (including US aid) between 1953 and 1954, thus converting the regular deficit of over \$500 million into the first post-war surplus of \$194 million.

By all assessments, however, the external surplus must be regarded as "irregular". The unfavourable

composition of French exports leaps to the eye when compared with that of Western Germany and Britain. While French exports of fuel and raw materials are roughly of the same magnitude as, and food exports larger than, those of the two countries, French exports of manufactured goods are far smaller. The structure of French exports thus presents the picture typical of a half-industrialized country in its heavy dependence on the export of raw materials and food.

In spite of the foregoing, French economy has enjoyed a boom in common with the rest of Western Europe. Since 1950, French production has risen by 40 per cent—less than that of Germany or Italy but more than either of Belgium, United States or Britain. In the last 12 months alone there has been a 11 per cent increase in output. This favourable picture has thus caused the French Finance Minister to declare:

"There is at the moment no question in France of anti-inflationary measures liable to put a brake on the increase in production—France's rising output guaranteed against imbalance between supply and demand".

This "rising output" has been achieved at a tremendous cost—considerable subsidies to a basically inefficient agriculture. It is difficult to see how monetary policy by itself, will, even in the long run, be able to straighten out what is basically a lop-sided economy, and more particularly so, for a country that claims to be industrialized.

Colombo Plan: A Recherche

P K Basu

A MEETING of the ministerial committee of the Colombo Plan for the economic development of South and South-East Asia was in session at Singapore last month to draw up the fourth annual report, leaving two more to follow in due course to complete the balance sheet. One initial trouble is, of course, that South-East Asia is not a precise concept. In 1951, countries which joined the Colombo Plan, namely Ceylon, India, Pakistan, British territory of Malaya, Borneo and Vietnam, were all of them members in a world of similar ideologies and even political institutions. Gradually, countries outside the sterling area were invited; and this year the meeting was attended by representatives of twenty member countries: India, Pakistan, Ceylon, Malaya, Singapore, British North Borneo, Sarawak, Burma, Cambodia, Nepal, Indonesia, Laos, South Vietnam, Thailand, Japan, the Philippines, Australia, Canada, New Zealand and U. S. A. Indeed, Japan's membership of the Colombo Plan is perhaps the most significant feature of economic development of the South-East Asia concept.

The working of the Colombo Plan during the last four years provokes a critic to remark that perhaps it has disappointed its prophets. It has not yet laid the foundation of the "regional" pattern of economic development of the countries in the South-East Asia taken together. And it has yet to provide a blueprint of economic progress in individual countries with their respective problems of poverty and backwardness. The three published reports of the Consultative Committee provides us with nothing more than a balance-sheet of money spent on various items, when directly or indirectly influence the economic development in some of the countries in the region. But how the money is spent, where it is spent are no less important issues than why it is spent; and also where the money comes from. Perhaps, the time for revising our thoughts is opportune now when world conditions permit consolidation of ground, already covered or even lost. In 1951-52 with the outbreak of the Korean War and substantial improvement of the terms of trade in favour of Colombo Plan countries, self-financing of the plan was made considerably easier. But

the decumulation of stocks and the slump in agricultural prices which followed was a severe test for the countries to stick to their last; and the second annual report testifies to the successes of their attempt. The third annual report published last October from Ottawa has a tone of complacency, though it ignores grave policy decisions and reappraisal of priorities needed to fulfil the objectives of the plan.

The three main themes of the Ottawa Report, which require further analysis, are: (i) the dependence on imports has diminished; (ii) the rate of growth of expenditure on the public sector is an adequate measure of the economic progress already achieved in the region, and (iii) the idea of self-help has been substantiated by the effects of the internal transfer of capital and know-how within the Colombo Plan countries.

The plan's basic target was to reach self-sufficiency in food. In 1954, the total rice crop was higher than the record level of 1953. Production of sugar, vegetable oils and seeds also showed an increase. But while food production per capita remained still below the pre-war level, falling prices of rice during the last 12 months or more stressed the need for avoidance of complacency. The excess of exportable surplus over the world demand for rice adversely affected the balance of payments of two main rice exporting countries of the area, namely Burma and Thailand. The importance of a stable market was reaffirmed, when a serious recession following a mild drop in U. S. production in the third quarter of '53 to the first quarter of '54 was precariously avoided by increased demand from the industrial nations of the non-dollar world. In point of fact, in contrast to the ups and downs of the preceding years, export-import prices have remained relatively stable this year; tea prices had a steady boom, rubber prices have fallen a little; while cotton and jute remained practically unchanged. But the report has regrettedly slipped up in not substantiating its programme of reducing imports with the expansion of exports, since the importance of export earnings is tied up with the whole question of "regional" planning. Since international specialisation of the world economy is not to be based on the neo-classical dichotomy of indus-

try and agriculture, industrialisation of agricultural economies must follow a pattern, which should be both trade-creating as well as trade-diverting. Empirically speaking, with the imposition of quantitative restrictions and the adoption of anti-inflationary policies, while the total value of imports by all countries in the area in 1953 was reduced by 30 per cent below the 1952 level, the value of exports declined by 20 per cent. The relative changes in prices can be explained by the price-elasticity of supply of the manufactured goods vis-a-vis primary products. Most of the countries in the region export mainly one or two staple commodities. Hence, while price-adjustments can be avoided by taking recourse to barter agreements, multilateral bulk purchase and buffer-stocks schemes, the composition of exports must gradually change in favour of manufactured articles and processed metals.

To what extent the expenditure on the public sector is a sound measure of economic development, depends not only on the composition of investments in various countries i.e. the relative importance of the public vis-a-vis private sectors of the economy, but also on the soundness of the projects in the public sector. Of course in public utility investments, which has so far been the main item of expenditure, there is very little problem of coordination, but now that we have passed that stage, economic planning would be necessary in drawing up a priority list of feeder industries on a "regional" basis. The target is twofold: first, to meet the 'regional' demand for products, in which the countries in question have the maximum possible advantage; and secondly, to create a 'regional' market for import-substitutes in products in which the countries in question have the maximum potential advantage.

Regional Planning or Self-Sufficiency?

Despite great hopes expressed at the Singapore Conference as well as in the Ottawa Report, only a beginning has been made in the idea of economic development through self-help within the framework of public planning on an individual-country basis. India is the only country in the area to have established a Planning Commission and to have launched a

five year plan as early as 1951. Pakistan established a Planning Board in 1953 and is still in the stage of drafting the first plan. In Indonesia, where the Planning Board advises on current projects, this is still in the stage of drawing up a long-term programme. If the economic development of each individual country is to be dovetailed within the framework of the regional economic development of South-East Asia, not only the administrative boundaries between the policy decisions of the Colombo Plan Secretariat and those of the Planning Commission of member-countries must be clarified but also the arguments in favour of economic planning in a closed economy must be weighed against the advantages of 'regional' planning. There is hardly any emphasis on the economic possibilities of regional specialisation in our first Five-Year Plan in India. On the contrary, the assumption of a closed economy is very pronounced in the draft Second Five Year Plan. While chances of setting up a High Authority on the lines of the European Coal and Steel Community in the Asian countries are rare, if one delegate from the Colombo Plan Secretariat is represented in the Planning Commissions of member-countries to advise on various issues which require a 'regional' policy decision, overlapping may be avoided and economic specialisation made easier.

While countries in the area have not been successful in tapping all the internal sources of capital for the self-financing of their plans, helping each other with capital, aid and technical cooperation is a development in the right direction; and deserves notice and appreciation. But until the transfer of capital operates freely through the channels of private investment, there is a lot more to be achieved in that direction.

All the contributions made by USA, U. K., Canada, Australia and New Zealand belong to the category of foreign assistance, the importance of which should diminish with the success of economic development in the Colombo Plan countries. Recipient countries are helping each other as well according to their respective ability to utilise their savings. Release of sterling balances to Commonwealth countries in the region to the tune of £42 million per year as agreed in the Ottawa Conference has not only enabled the countries to draw upon their foreign balances accumulated in the past but also provided an important part of the region

with full convertibility of their currencies—which has made trade between countries freer as well as easier. Japan's membership in the Colombo Plan preceding the new sterling area trade agreement between Japan and U. K. is therefore one of the most significant features in the success of the Colombo Plan, inasmuch as the advantages of a convertible currency will be extended beyond the Commonwealth members of the Colombo Plan and will multilateralise trade within an extended region in the South-East Asia.

There is one other point which deserves attention; a case for giving the provision of expert services an absolute priority over the provision of material aid or capital. For while unemployed resources abound in the economies of the region, technical know-how is and has always been a scarce factor. It is a source of satisfaction that the new aid offered by Britain would mainly be used on technical training and finances required for the equipment for training. Flow of the right kind of technician is however a great administrative problem.

Assumptions Challenged

The Colombo Plan was begun with the best of intentions, namely for the purpose of the economic development of South-East Asia (i) through mobilising surplus capital of advanced economies, (ii) through utilising savings and redistribution of capital between underdeveloped countries of the region, and (iii) to promote the practice of economic planning for the development of the private as well as the public sectors of the economy so that it will be able to attract private loan capital from foreign investors. In a sense, the aim was to get started. And while the end was ambitious, the basic assumptions on which it was built up, suffered seriously from logical inconsistencies, in the first place. The idea of a group of complementary economies aiming at self-sufficiency requires clarification. Though it was assumed that economic development in the area would be eventually carried on within the framework of public planning, the Colombo Plan was originally drawn up to attract foreign capital to bridge the gap between commitments and availability of indigenous capital for the whole 'region'. Unfortunately, the emphasis has gradually shifted from an attempt to consolidate the economic plans of different countries to the purely financial and administrative

aspects. As soon as the member countries will be able to pay their way, the Colombo Plan will have nothing more to do with them. Now a 'region' which can pay for the economic development of the countries constituting it, may not be a suitable economic bloc within which a particular framework of development planning will yield best results. Does the Colombo Plan aim at the economic development of a number of underdeveloped countries in South-East Asia without itself being a development project for the whole 'region'? Maybe, it is just a question of emphasis; and yet the definition and scope of regionalism in the economic development of this particular group of countries, is an issue usually evaded, if not carelessly treated in drawing up the priorities of the plan. An economic 'region' is based, not on geographical situation alone, nor on the availability of sufficient capital and raw materials whereby surplus countries can compensate the deficit ones; but on whether the region consists of a group of competitive markets for complementary economies—so that a new pattern of world trade is evolved.

To sum up, it is necessary to re-examine the inter-relationship between (i) availability of finance, (ii) existence of markets, and (iii) the priorities fixed for regional economic development. If development of multi-project irrigation schemes and projects like the steel plants and refineries were some of its main targets, the work of the Colombo Plan would have been merely to open an investors' information office for the nations which would be interested in investing surplus capital in underdeveloped countries. Whether out of sheer generosity or in recognition of their long-term interest, or possibly to avert a slump in their own economies, or perhaps even in the hope of extending the frontiers of a 'free' world, many countries outside the Colombo powers have taken great interest in fulfilling the objectives of the plan by contributing finance and know-how in no little measure. Whether the same results could not have been reaped by extending the scope of the IBRD is not the question. That the Colombo Plan has been a great success in the first two years of its inception goes without saying.

The Problem of Markets

In the long-term, however, we must be quite clear about our target. Since this is industrialisation, there is not only the problem of finding

initial capital, which in some cases can be financed through borrowings in the foreign market but also a greater and a more fundamental problem of securing a degree of capital accumulation, which will sustain the pace of steady growth. Availability of domestic savings whether out of export earnings in the foreign market, or as a residue from higher income generation, is ultimately the result of the pace and pattern of industrialisation. Savings evolve in the process of economic development, provided economic development follows the right path. Existence of markets is as important a criterion as availability of savings in the theory of economic development. That supply does not create its own demand in a 'free' market, where consumers' choice is more important than the producers' whim, is often forgotten in these days of branded products with huge costs of selling and advertisement. But when neo-Keynesians with their faith in collectivistic ideologies try to dig old Say from his grave, though not always admitting that they are doing

so, and base their theories of capital accumulation on the assumption of a constant savings ratio or propensity to consume, and a constant acceleration coefficient i.e. capital-output ratio, they are apt to forget that in a world where private investment, inequality of incomes and consumers' choice are assumed away, economic planning becomes more a Statistician's delight, than an Economist's headache. That the theory of capitalistic accumulation is intimately connected with the theory of markets, is borne out by the facts of economic development in U. K., Japan, U. S. A. and even in U. S. S. R., though in the last two cases the home market was more important than the foreign market. While Japan owes her economic development to the opening of the U. S. market for raw silk, railway development in the British Empire helped industrial revolution in Britain, not only by increasing the demand for British steel rails but also by opening new and secure markets abroad for British products for well over a century.

Thus in a closed economy, the market needs analysis, both from the point of view of aggregate spending in the economy and the factors affecting it, e.g. income-distribution, systems of distributive trading etc., and also from the point of view of the changing components of investment between inventories and commercial and productive types. In an open economy, the main problem concerning markets is one of 'regionalism', i.e. the problems of co-ordination connected with the regional pattern of industrialisation, with a view to the longrun balance of payments position (i) within the Colombo Plan countries themselves; (ii) with the Non-Dollar world and (iii) with the Dollar world. The extent of specialisation will of course depend upon institutional factors, such as the monetary-fiscal policies in individual countries engaged in trade with each other. All that the Colombo Plan can expect to do, is to break the vicious spiral of low savings, low investment, low income and poverty.

Planning in India

(Contributed)

THE object of this article is to make an introductory survey of planning in India with reference to the First Five Year Plan, and then to attempt an appraisal of the broad features of the tentative framework of the Second Five Year Plan.

Planning for economic development was first thought of in a practical way 17 years ago when the Indian National Congress formed the National Planning Committee. This Committee under the Chairmanship of Shri Nehru collected valuable material, but its progress was affected by political upheavals in the country after the outbreak of the war. After independence the urge for planning gathered momentum due to the necessity of an overall control to co-ordinate the efforts of different authorities to promote schemes for economic development and social welfare. The Planning Commission was constituted in March 1950 with the task of appraising the available resources in the country and suggesting plans for their most effective and balanced utilisation. The final report of the Commission was available in December 1952. It contained the details of the First Five Year Plan for the years 1950-51 to 1955-56. The objectives of this plan were necessarily limited by the prevailing conditions of instability in the economy of the country due to shortages and inflationary pressures as well as to the disturbed conditions following partition. The main objectives of the plan programme were to restore to the pre-war level the production of consumer goods by the end of the five year period and generally to lay a foundation for bolder plans in future.

Before we go on to attempt a survey of the First Plan, it will be better to refer to some basic facts. The population of the country has increased from 1900 to 1951 by about 52 per cent to 356 millions. This phenomenal increase has not been accompanied by any dynamic change in the structure of the country's economy. The increase in population has been absorbed mostly by agriculture and more than two-thirds of population today depend upon agriculture for their sustenance. With the low yield from agriculture and unrelieved pressure on land due

to lack of development of organised industries, our national income has remained too meagre to allow any reasonable margin of savings and investment. Our economy is thus entangled in the vicious circle of low national income and low rate of savings which in turn leads back to low national income.

The First Five Year Plan

In the First Five Year Plan the highest priority was given to agriculture, Rural development and Power and Irrigation projects. Out of the total expenditure of 2249 crores in the public sector, 44 per cent was set apart for agricultural sector combined with Power and Irrigation projects; 24 per cent for Construction and Social services and an equal amount for Transport and Communications. The sector for Industries and Minerals came at the tail and the expenditure planned for it came to the balance of 8 per cent only.

The first plan period will come to a close in March 1956. It will be possible to review the achievement of targets for the period fully only at the end of the plan period particularly because the expenditure in the last two years of the plan is expected to be about half of the total outlay in the whole period. From the periodical progress reports available it can, however, be concluded that the progress in different sectors has been satisfactory on the whole. In the irrigation and power plan, the benefit targets for the first four years of the plan are reported to have been achieved to the extent of more than 80 per cent. In the all-important sphere of food grains, the target of increase of 7.6 million tons over the plan period was exceeded in the third year itself by 4.4 tons. The target for oil seeds was also exceeded in the year 1953-54 and that for cotton in the year 1954-55. The production of sugar and jute, however, lagged behind in a disappointing way. It is no doubt true that three good monsoons successively have been substantially responsible for the increase in agricultural output. This does not mean, however, that the benefits proceeding from extension of the irrigated area and other schemes in the plan period could not claim any credit for increased production. It has been estimated that 40 per cent of the

increase can be ascribed to providential help in the way of good monsoons.

The plan initiated a fundamental scheme for Rural development through Community Projects and National Extension Services started in October 1952. The essence of these schemes is to set free the creative energies of the people and to draw upon their voluntary contribution for effecting improvements in the technique of agriculture as well as in the general living conditions and outlook in the rural areas. The novel feature of these schemes is that they have to be financed substantially through voluntary contributions of the people themselves. Though numerically some satisfactory progress seems to have been achieved, the situation cannot be considered altogether happy. Even till today it has not been possible for the States to evolve an organisation suitable for schemes which lay their emphasis on building from below. The Planning Commission has stressed time and again that it is not the intention to depend for results on formal official compliance with targets imposed from above which may be achieved through induced popular participation.

The increase in agricultural production has been accompanied by a similar improvement in the industrial sector also. Industrial production has increased by about 40 per cent in the first four years of the plan. Specially notable has been the increase in the production of cement, ammonium sulphate, bicycles, sewing machines, and several light engineering industries. The sugar industry has, however, been a disappointing exception and it has actually shown a decline for the second and third years of the plan.

Let us turn now to the financial aspect of the plan. The pace of expenditure was very slow in the first two years. The slackness was due largely to organisational difficulties, the time taken in evolving schemes and to some extent to the necessity of a cautious approach in the prevailing economic conditions. The expenditure has been substantially stepped up in the third and fourth year; and by the end of the plan period the shortfall is not expected to be of a very large magnitude. Save your heirs the burden of

CRIPPLING ESTATE DUTIES

If you are a landlord, industrialist, or other large estate-owner, in the event of your death, have you considered what difficulties your heirs will have to face if they do not have ready cash to pay the death duties on your estates? It can mean either forced realisation of assets, or sale of business or property, or surrendering of assets and property to Government. For Death Duties have to be paid before legal possession of your estates can be obtained by your heirs!

To help you help your heirs, the Bombay Mutual has evolved a scheme whereby it becomes easy for you to provide your heirs with the necessary cash to enable them to take possession of their rightful inheritance without hardships.

ESTATE DUTY POLICIES DELIVER ESTATES INTACT

The Bombay Mutual Estate Duty Policies are designed to prevent the disintegration of your estates in the event of your death, and to enable your heirs to take possession without incurring heavy liabilities. The following are the chief advantages:

1. The amount of the Estate Duty Policy is available immediately on the death of the policy holder—no tedious and irritating legal and other formalities are required.
2. The amount of the Estate Duty Policy is free of Estate Duty.
3. The premiums on these policies rank for income-tax abatement, subject to the usual limitations.
4. It prevents the disintegration of property in the event of the heirs being unable to provide the amount of Estate Duties on their own.
5. In the case of claims arising under these policies, policy moneys would be considered for payment direct to the Estate Duty Authorities.

TEMPORARY ASSURANCE

Under Section 9 of the Estate Duty Act 1953, gifts made within a period of 2 years prior to the death of the donor are liable for Estate Duty. This risk of death within 2 years of making gifts can be adequately covered by a two-year Single Premium Temporary Assurance Without Profits Policy.

THE ECONOMIC WEEKLY

for the plan, reveals some good as well as bad features. The good features are the performance of the Centre in almost reaching the estimated surplus from current revenue in the third year itself though the success in this matter may be largely ascribed to the boom conditions in the wake of the Korean war. The yield from small savings and loans from public has also been very heartening. The greatest disappointment has been caused by the failure of the States to realise the anticipated surpluses from current revenue. They could get only Rs 160 crores or roughly 36 per cent of the total estimated sum of Rs 413 crores in the first three years. Similarly the contribution of Railways has also been very poor. Against the anticipated yield of Rs 170 crores over the plan period, they contributed in the first three years only about Rs 75 crores or roughly 44 per cent. These circumstances indicate that it will be necessary to take extraordinary measures to increase the yield from States revenues and Railways in future.

As a summing up it can be said that the First plan has been making a satisfactory progress on the whole. The increase of production in the industrial sphere and in Agriculture even though providential to some extent will serve as a spring-board for greater achievements in the periods to follow. The growth of unemployment and a fall in agricultural prices during the First plan have been the only disquieting circumstances which provoked a serious study of these problems.

Draft Framework of Second Five Year Plan

It must be said to the great credit of Prof. P C Mahalanobis that he has produced in the draft plan frame for the Second Five Year period a remarkably concise and thoughtful outline. He has presented in it a set of concrete projects, as contrasted with the First Plan which was in substance, more of a forecast than a plan with any dynamic operational programme. This draft plan has already received the blessings of the National Development Council and deserves therefore the fullest possible discussion of its objectives and the means suggested for attaining them.

The objectives of the Second Plan as defined include not only the ultimate ends but also the methods proposed to attain them. The over-all objective is to increase the National

income by about 25% over the Plan period and achieve a more equitable distribution of income. In attaining this, certain methods of what may be called sub-objectives have also been prescribed. Thus:

(a) the Public sector is to be expanded so as to advance towards a Socialistic pattern of Society;

(b) basic heavy industries are to be developed;

(c) the production of consumer goods is to be increased through household or hand industries and through factories only in commodities which do not compete with hand industries;

(d) agricultural produce is to be increased along with equitable distribution of land;

(e) social welfare in the sphere of housing, health and educational facilities is to be advanced; and

(f) finally unemployment is to be liquidated within less than 10 years. During the plan period, however, the volume of employment is estimated to increase by some 11 million jobs.

In conformity with the above aims and objectives targets have been provisionally fixed for factory producer goods, factory consumer goods, hand-made consumer goods, agricultural and associated pursuits, rural development, transport and social services. In the words of the plan-frame itself,

"the basic strategy would be to increase purchasing power through investments in heavy industries in the public sector and through expenditure on health, education and social services; and to meet the increasing demand for consumer goods, by a planned supply of such goods so that there will be no undesirable inflationary pressures. Planning would be thus essentially a feed-back process of matching a continuously increasing (planned) demand by a continuously increasing (planned) production giving rise to a steadily spreading economy."

The most notable feature of the plan-frame is the stress it lays on industry. In the industrial sector itself, the pride of place is given, in terms of investment to basic and heavy industries such as Iron and Steel, Heavy machinery, Cement and Chemicals. Equal importance is, however, attached to the development of household and hand industries. The Industrial chariot is to be drawn by two horses—heavy industries and hand industries. The pro-

November 19, 1955

gress will necessarily depend to a very large extent on the pace of development of the hand industries. The necessity and implications of this dual policy form the key to a correct appraisal of the plan and must be clearly visualised.

It is well-known that our capacity for investment is severely limited by the low level of domestic savings. The other pressing problem is that of existing unemployment coupled with the prospect of an increase of some 1.8 millions in the labour force every year. The scarcity of capital and wide-spread unemployment are the two circumstances which govern more than anything else the structural basis of the plan.

It is recognized that India's salvation lies in rapid industrialization and basic heavy industries are vital for this purpose. But these heavy industries are capital-intensive and do not offer any large scope for increasing any employment. Attention has therefore to be paid to the development of labour intensive industries which do not make any large demand on our scarce capital which we have to earmark for basic industries. Again the heavy industries will generate a large demand for consumer goods which they themselves will not be able to supply. The increasing purchasing power and consequent demand in consumer goods has to be made therefore by increased production of these goods somewhere else. It is in this context, that the role of household and hand industries achieve its full significance. Apart from releasing scarce capital resources, these small enterprises have larger employment potential and would meet substantially the demand for consumer goods which will emerge from large investments in basic industries, construction work and social capital. It is therefore proposed in the plan-frame that "until unemployment is liquidated or brought under control, it is necessary to prevent competition between factories, and household or hand industries by not permitting investments to be made in such consumer goods factories as would prevent expansion or lead to a shrinkage of employment in hand industries".

In the immediate future the factory production of consumer goods is to be expanded only to increase the supply of essential goods, non-competitive with hand industries, and of goods for export to earn foreign exchange. It is further stated in the plan-frame that once mass unemployment has gone, the aim

Reach any city in India by midday tomorrow

Luxurious new *Skymaster* night service connects 5 cities
—gives choice of 34 morning flights onwards

SAVE precious time and unnecessary expenditure on the way — fly overnight by new, luxurious Skymaster service, connecting Bombay, Delhi, Calcutta, Nagpur and Madras.

The new service cuts out irritating overnight stops, lands you in time for breakfast — and it is carefully scheduled to connect with 34 morning flights from the five big airports. So by midday tomorrow you can reach almost any important town in India!

Wherever you want to go, whichever flight you choose — Skymaster service makes sure you get there in time! And your IAC ticket covers meals, travel to and from the airport, everything. No extras to pay.

would be to provide cheap power and small machines to the household sector to increase productivity per worker. At this stage factory production of consumer goods would also be increased. We have now covered broadly the outline of the Industrial sector as envisaged in the Second Plan. The thesis contained in these proposals has provoked widespread criticism and is easily the most controversial of the various objectives underlying the plan-frame.

We may briefly sum up now the targets for production in the Second Plan. In all the basic heavy industries, the production is expected to be increased by more than 100%. The production of steel will rise by 285%, of pig iron by 350%, of fertilisers by 300% and of aluminium by 700%. In the other spheres, the targets have been set up in such a way as to remove the deficiencies that have occurred in the First plan and also to further expand the social services and transport facilities consistently with the main objectives of the plan. In particular, the national extension service and where possible, the community projects would cover the whole of the rural area by the end of the Second Five Year Plan.

As a result of the programme of production investment and development during the plan, the volume of employment is expected to increase by 11 million in the following way:—

	Million
1) Agricultural and allied pursuits	1.5
2) Mining & factory establishments	1.7
3) Household enterprises, construction	3.0
4) Communications, Railways, Banks, Insurance	0.4
5) Wholesale and retail trade, transport excluding railways	2.0
6) Profession, services and the rest	2.4
	11.0

It is noteworthy that employment in the non-agricultural sector is expected to show a phenomenal increase of 9.5 millions over 42.5 millions estimated to be employed in this sector already.

Let us now see how this ambitious plan is to be financed. It is not enough for a plan to be statistically perfect; it is also necessary that the resources necessary should be available at the right time. Against the total outlay in the public sector of Rs 2249 crores in the first plan, the

expenditure in the second plan is estimated to be 4300 crores. The net investment, however, will be only 3400 crores, the balance of Rs 900 crores accounting for current expenditure. The net investment in the private sector is estimated to be 2200 crores. In the public sector the net investment in the second plan is to be double the plan estimates of the first plan and in the private sector the figure is 40% higher. It should be clearly understood that out of the total outlay of Rs 2249 in the first plan in the public sector it has been estimated that the investment expenditure would be Rs 1600 to Rs 1700 crores only.

Out of the total of Rs 5600 crores of net expenditure both in the public and the private sectors, Rs 1400 crores are to be invested in industry. Further, out of this amount of Rs. 1400 crores Rs 1100 crores have been allocated for basic heavy industries such as Iron and Steel, Heavy Machinery, Cement and Chemicals etc. and only the balance of 300 crores will be available for consumers goods to be produced by hand industries and factories both combined.

The magnitude of the effort involved in raising the necessary finances in the public sector must be measured in the context of total Government expenditure which includes, in addition to the expenditure on the plan, non-development as well as development expenditure outside the plan. In addition to the expenditure of Rs 4300 crores for the plan, it is estimated that the Government will spend another Rs. 1100 crores on development outside the plan and Rs 3400 crores in non-development directions. The total outlay of expenditure in the plan period for the Government will, therefore, be Rs 8800 crores. This total is expected to be financed as follows:—

	Receipts.	Crores of Rs.
1) On the Revenue Account		5200
2) Loans from the Public		1000
3) Railways and Miscellaneous funds		200
4) Foreign Assistance		400
		6800
		6800

Additional taxes and loans and profit from State enterprises Rs 800 to 1000	
Deficit financing Rs 1000 to 1200	2000
	8800

The figure of 5200 crores as receipts on the Revenue Account has been estimated on the presumption that the total receipts from tax and non-tax revenue will continue to come in at the current rate of 8.5% of the National Income. For the rest of the items no concrete basis has been mentioned.

The magnitude of effort involved in the plan may also be measured in other ways. In order to achieve a net investment of Rs 5600 crores over the plan period, it will be necessary to raise the rate of net investment to 11% in 1960-61 from the current rate of about 7% of the National income. Expenditure on the plan in 1955-56 has been estimated to be Rs 600 crores. In each of the five years of the second plan the comparable expenditure will have to be on an average Rs 860 crores. It may be remembered that during the last two years of the first plan, the plan expenditure estimated to be on an average Rs 570 crores has had to be deficit-financed to a large extent.

Some Basic Considerations

Among the several aspects of the draft plan which have been widely commented upon are notably the ambitious size of the plan relative to the resources available; the structural set-up of the industrial sector and the methods suggested to relieve unemployment. We may now attempt a brief review of the essential points involved in these criticisms.

It has been suggested that the plan frame has started at the wrong end in so far as it has first fixed the targets and then proceeded to find the real resources necessary for the rate of investment necessary to achieve them. The criticism in this approach may have its origin to some extent in the analogy that this type of physical planning bears to planning in communist economies. However, the important thing is to determine whether necessary resources for investment at the rate prescribed are available in the country and whether they can be mobilized effectively in accordance with the plan. Since the plan depends for its motive power on the expenditure in the public sector it becomes necessary to examine carefully the sources from which finances are to come for meeting public expenditure.

The receipts on revenue account are expected to be Rs 5200 crores. It would appear that a considerable amount of effort and reform will be necessary in order to keep up the rate of 8.5% of the national income for tax and non-tax receipts of the

Government. The increased National income is to be shared widely among people in the low income groups. It may not be possible therefore for a considerable portion of the increased income either to be saved for investment in the private sector or to be made available to the Government by way of taxes.

It is apparent from the analysis already referred to that any gap in the investment target and budgetary resources will have to be met by deficit financing. The plan frame has suggested that deficit financing to the extent of Rs. 1000 crores to Rs 1200 crores over the plan period can safely be undertaken. The true function of deficit financing as envisaged in the plan frame is to enable the Government to mobilise the savings of the people to the extent to which the investments planned cannot be met from budgetary surpluses and foreign assistance, subject to the limit set by the threat of inflation. It is recognized in all quarters that to some extent deficit financing is absolutely necessary inasmuch as a larger money supply will be needed when the monetised sectors of economy are to expand relatively to the non-monetised sector and that larger money supply will in any case be needed commensurate with the increase in National income. The stability of the country's economy and the absence of any inflationary pressures further encourage the theory that deficit financing in a limited way can be undertaken without any dangerous repercussions. On the other hand, the critics warn that deficit financing is a dangerous instrument to be handled without caution, as it may, in the absence of an adequate increase in production of consumer goods lead to an inflationary rise of prices with consequences which are only too well-known. It is no doubt possible, they suggest, to restrict consumption and to promote savings in a forced way through an inflationary rise of prices, but it becomes a problem to keep the process in check and enforce overall controls so as to distribute the burden of savings in the different sectors of society equitably. Past experience shows that no amount of controls and rationing which in themselves need a cumbersome administrative setup can mitigate the hardships on the poorer and hence the larger section of society in any satisfactory way over a long period. It is therefore crucial that deficit financing is not undertaken beyond the extent to which it is necessary to meet the

needs of an expanding economy. To the extent to which the planned production of consumer goods through household and hand industries and through factories materialises it should be possible to resort to deficit financing on the scale envisaged in the plan without any risk of dangerous inflationary pressures. There is need, however, of proceeding with caution and vigilance in this matter and as far as possible attempts should be made to minimise the gap between investments and domestic resources so that we do not have to rely too much either on foreign assistance which may not be forthcoming, or on excessive deficit financing which may lead to a run-away or galloping inflation. Nothing will be lost also by preparing in advance a technique for fighting the inflationary pressure that may develop, despite all the caution and vigilance. The policy of the plan-frame is that "deficit financing would be undertaken on the scale necessary to bring about the greatest possible expansion of production without introducing permanent and all-embracing rationing of essential commodities". Nevertheless it is of fundamental importance that the possibility of having to meet an inflationary situation should be recognised before launching on deficit-financing on a large scale.

We may now review briefly the approach of the plan to the problem of unemployment. It has been said that the policy in the Industrial sector has been unduly influenced by the problem of unemployment. It is assumed in the plan-frame that unemployment is a temporary and short term problem and can therefore be relieved substantially by short term methods which can be discarded after the problem is brought under control. The short term method suggested in the sphere of industrial sector is the expansion of hand industries which should be protected for the time being from competition from factory produced goods and which should be sheltered from technical improvements which have the effect of reducing employment opportunities. This is a somewhat surprising thesis considering that the total volume of employment expected in household enterprises and construction together in the plan period has been put at 3 million only. Since the expenditure on construction is envisaged to be Rs. 1350 crores, the employment opportunities in the hand industries could not have been expected to be so large as to

justify so drastic a step. It is also well-known that in the hand industries there is considerable amount of under-employment and production, to some extent at any rate, can be increased without any increase in employment. Besides, the longer the protection to the hand industries, the more difficult will it be for them to withstand competition at a later stage. And if the hand industries are not to continue in the present form, in the long run, the people employed will have ultimately to find employment elsewhere. Even if the problem is solved in the short period, by employment in 'protected' household industries the problem of adjustment will be aggravated at a later stage. It has been rightly said therefore that the proper approach would be to treat unemployment as a long term problem which should be dealt with gradually by attuning it to the general plan of development, in any case the considerations of employment-potential should not inhibit positive steps for improving the productivity of cottage industries.

One result of the theory of employment advanced in the plan is a severe restriction on factory consumer goods. This may result in loss of efficiency in the factory industries also. Besides so much depends in the second plan on increase in the supply of consumer goods that it may be unwise to rely for it more or less completely, on hand industries which may not rise to the occasion due to difficulties inherent in widely dispersed small units of production. It should be noted that expenditure on small industries in the first plan did not even come up to half of the plan figure during the first four years.

We have seen that the success of the plan depends to a large extent on whether the demand generated by increased expenditure is met adequately by the supply of consumer goods. It is necessary therefore to determine the exact pattern which the increased demand will follow in order to be able to adjust the supply to it. Unfortunately, no attempt has been made anywhere to compile any statistics for the distribution of national income during the plan years in different categories of income. It is obvious that the character of demand will vary according to the sectors of society whose income increases substantially; for example, if the increase of income takes place mostly in the rural areas, the excessive demand generated will be less

for foodgrains and more for other goods such as cloth, shoes, houses etc.

In the end it may be mentioned that once targets for production have been fixed, financial resources necessary for the required investment will have somehow to be found. Whether these resources are found ultimately through increased yield from taxes, profits from state enterprises, or through deficit financing, the implementation of the plan successfully will be a challenge to the administrative talent in the country. It is for this reason that the draft plan recommends that immediate and urgent attention should be paid by the Government to overcome administrative difficulties which may come in the way of efficient planning. Clearly, the administrative limit will in practice modify and govern both the economic and the political limits to the size and achievements of the plan. With necessary institutional reforms and administrative efficiency, which must indeed be taken for granted, and with reasonable good luck, the draft plan's targets can be achieved. From the point of view of the country's needs for rapid development the targets are certainly not too ambitious.

Indianisation of Personnel In Foreign Firms

LATEST statistics regarding the employment position of Indians and non-Indians in foreign controlled business enterprises, both in terms of total employment and in terms of distribution over different salary groups, indicate a trend towards improvement in the position of Indians, at any rate so far as the quantum of employment is concerned. Thus, while total employment increased from 13,788 persons in 1947 to 23,763 persons in 1955, the number of Indians has risen from 6,162 in 1947 to 21,242 in 1955; on the other hand the number of non-Indians first rose from 7,623 in 1947 to 8,270 in 1951 but has subsequently declined to 7,526 in 1955. The strength of foreign personnel increased somewhat between 1947 and 1951 but since then, there has been a gradual decline.

While the pace of Indianisation may be considered satisfactory, it is the nature of Indianisation that is perhaps more important. It is, no doubt, true that the strength of Indian personnel in foreign firms is progressively increasing — having risen by about two and a half times between 1947 and 1955. But what is rather striking is that the number of non-Indians remains almost stationary, though there has been some reduction in the course of the last two years. Thus, the number of non-Indians in 1955 at 7,526, when compared to the figure of 1947, viz., 7623, is almost unchanged.

The analysis of Indianisation of the staff in foreign enterprises is, unfortunately, confined to the progress in the employment of Indians and their distribution over different salary groups. From the information contained in the Press release on the subject, one cannot answer such questions as whether the same pay and emoluments are being given to Indians for doing the same job, how many key posts are held by Indians, what the degree of control that is vested in Indian personnel is, what the status of Indians vis-a-vis their foreign counterparts is etc. It is these things which would, perhaps, be more revealing and interesting than the distribution of personnel by salary groups.

An analysis of employment by salary group shows that owing to the increase in the number of

Chinese, Pakistanis and Brit'ishers in the lowest pay-group of Rs. 300—499, the proportion of Indians has slightly declined; their position in the salary group Rs 500—999 has shown noticeable improvement, while in the higher salary group of Rs 1000 and above they are still not comfortably placed. It is found that non-Indians (especially the British) continue to dominate the posts in the salary group Rs 1000 and above—both technical and managerial—as may be seen from the figures in the accompanying table. It is, no doubt, true, that compared to previous years the position in 1955 shows some improvement. Thus, the number of Indians in this salary group has increased from 1,406 in 1950 and 2,290 in 1952 to 3,995 in 1955, while that of non-Indians has decreased slightly from 7,104 in 1952 and 7,008 in 1954 to 6,810 in 1955. Nevertheless, there is a hard core of foreign personnel, in the higher salary group, which is practically unchanged. Thus, the number of Non-Indians in the pay group Rs 1000 and above in 1955 at 6,810 is higher than the 1947 figure of 5,844 and is practically the same as in 1950 (6,871) since when the move for Indianisation may be said to have gained momentum.

A noticeable change, however, which has taken place is that the number of categories of concerns in which non-Indians hold more than two thirds of the posts in the salary group, Rs 1000 and above, has declined from 9 in 1954, to 5 in 1955, viz. Plantations (89.6 per cent of the posts) Jute (86.6 per cent) Banking (78.1 per cent) Agents, Merchants (68.4 per cent) and Transit and Transport (66.9 per cent).

The break-down of foreign personnel by nationalities shows that among the non-Indians, employed in foreign firms, as against 6,901 of British nationality in 1947, there were 6,747 in 1954 and 6,462 in 1955.

Only a thin film of oil protects these huge hydro-turbines!

How Gargoyle Lubricants are helping India's river-valley projects

AT INDIA'S river-valley projects, huge hydro-turbines turn ceaselessly to convert water-power into electricity. Only a microscopic film of oil protects the turbines and alternators from destruction; without it, they would grind to a stop — valuable equipment would be ruined!

That is why correct lubrication is vitally important. In India, as in so many other countries, Gargoyle Industrial Lubricants — famous for 89 years — are chosen to protect crores' worth of equipment.

There's a right Gargoyle Lubricant for each industrial need. Backed by our experience, correct lubrication — with Gargoyle Lubricants — can help to reduce costs and protect machinery in your plant.

Steady Trend

Thursday, Morning

THANKS to Diwali holidays, the week under review had only four full days of trading, punctuated, of course, by an hour's trading on Sunday (Moorat). Sentiment, on the whole, remained steady throughout the week with the Moorat session characterised by narrow fluctuations. Tata steel which opened on the Moorat at Rs. 267-8 lost one point initially to recover and close at the same level. Indian Iron which opened on a better note at Rs. 42-3 went down to Rs. 41-15 but regained the lost ground at the close.

In the textile section, Gokak, Khatau, Kohinoor and New Great ruled firm all closing the Moorat session at the highest levels, while Bombay Dyeing, Central India, Simplex and Swadeshi remained steady. Both Srinivas and Tata Mills were listed ex-right.

In the Bank section, UCO Bank shares attracted considerable support and moved up to a new peak level of Rs. 54-8 before closing at Rs. 54.

In the miscellaneous counter, Belapur, B I C, Great Eastern Shipping, Indian Copper, and Tata Chemicals had a satisfactory session on the Moorat day. Despite the maintenance of the status quo in dividend, Belapur were able to make good the loss sustained in the kerb and ruled steady. ACC were steady to firm on revival of hopes for a dividend of Rs. 9-8.

For the rest of the week also, the market continued to rule steady. In fact, on Wednesday, excepting for steels, which did not move up very much, all the other counters had a very satisfactory performance. In the textile section, Century, Bombay Dyeing and Kohinoor attracted considerable investment attention, India United Ordinary and Preference and also Srinivas and Tata Mills (which were declared ex-right) received unusual support at the hands of speculators. Srinivas which opened at Rs. 223-12 jumped to Rs. 247-8 while Tata Mills were pushed up by more than four points to Rs. 55.

In the miscellaneous section, Belapur registered a new high, although it opened on a weak note due to disappointment at the maintenance of dividend, a rise in which was generally anticipated. Thus, after being done up to Rs. 360 before Diwali,

these shares were taken up to as high as Rs. 380 on Wednesday before closing at Rs. 379. BIC ruled firm registering an increase of seven annas. Indian Copper were also keenly sought after. Banks and insurance also ruled fairly firm at around high levels.

Cotton

Buoyant Conditions

ALTHOUGH the cotton futures market opened on a distinctly subdued note, what with heavy bull liquidation and short-selling, the close of the week saw cotton futures being lifted up to new peak levels. In fact, new crop February which opened at Rs. 654-8 gained as many as 23 points to record the highest level, viz., Rs. 677-8. This was due mainly to speculative buying on a large scale coupled with heavy bear covering. Besides, the spot market at Sewri ruled very firm on Wednesday giv-

ing ample support to the futures where the turnover was reported to be around 35,000 bales. Even at close, the market ruled distinctly bullish with February being placed at Rs. 676. The May contract also moved in tune with the February contract and closed firm at Rs. 654-3.

At Sewri, almost all varieties of cotton were keenly sought after with business to the tune of about 6000 bales having been done on Wednesday. Wagad was of particular interest and was bought at even as high as Rs. 601. Vijay moved up to Rs. 172 ON and there were buyers for Vijay (any station) even at Rs. 162 ON.

Oils and Oilseeds

Mixed Showing

THE oilseeds market had a mixed showing with the prices in the castor and linseed sections at a relatively higher level, while ground-

Nigerseed Ready	23- 8	23-12	23- 8	23-12
Oils :				
Castor Oil Com. (per quarter)	11- 4	11- 5	11- 4	11- 5
Groundnut Oil R. R.	12- 3	12- 4	12- 1	12- 4
Linseed Oil	15-14	15-14	15- 8	15- 8

nut, both seeds and oils, were depressed.

Thanks to heavy buying by crushers and exporters, Castor May prices were lifted up early in the week to Rs. 105-10. But this rate could not be maintained for long owing to the relatively poorer offtake locally. Moreover, the weakness in groundnut and oils also prompted bull liquidation and bear selling in the castor futures and as a result, prices toppled down to Rs. 102-10 at the close.

Linseed ready and delivery were exceptionally active and although there was a slight recession in values in sympathy with groundnuts, the closing quotations were distinctly better than those recorded last week. Thus, Linseed went up to Rs. 27-12 on Wednesday and February-March quoted Rs. 25 as against Rs. 27 and Rs. 24, respectively in the previous week.

Kardi and niger ruled moderately steady, the former closing the week at Rs. 13-12 and the latter at Rs. 23-8, respectively.

Company Notes

IISCO Working Results Impressive

DETAILED data, included in the reports and accounts of Indian Iron for the year to March last, confirm the impressive financial strength of the Company, which the summary released at the time of the dividend announcement indicated.

Last year's working results were outstanding. This encouraged the directors to make both verbal and written representations to the Government for raising the dividend. But the Government advised the directors not to increase the dividend as the Company had heavy indebtedness on loan account, and would have to provide large amounts out of its own resources for financing expansion projects.

Steadiness in Indian Iron, even after the announcement that the dividend is merely to be maintained, is partly due to the disclosure that the directors were in favour of raising the dividend. In this context, it is of interest to note their observations in the annual report.

It is admitted by the directors that last year's working results must be considered exceptional and can in no way be regarded as constituting a standard for the existing plant. It is further explained in the report that last year's highly satisfactory working results are due primarily to the

Bullion

Firm Tone

In the bullion market, trading in the gold section began weak but was firm at the close, while in silver it was more or less the reverse. Gold which quoted at Rs. 95-3 last Wednesday, slipped down to Rs. 95-5 towards the beginning of this week. At the close, however, there was a distinct improvement in both gold & silver presumably due to Diwali demand. However, profit-realising intervened at this stage, and there was a general let-down in sentiment in which gold suffered a heavier loss. Silver which quoted at Rs. 172-12 at one time during the week declined on Wednesday to Rs. 171-5.

Trading in second settlement (Magsar) in silver and gold started on Wednesday. Magsar gold was quoted five annas above Kartak at Rs. 96-4-6 while silver Magsar was at a premium of twelve annas over Kartak at Rs. 172-1.

large excess of production of steel over the estimated output of 290,000 tons adopted by the Government for the purpose of fixation of sales retention prices for the year.

Output of steel ingots at Burnpur was higher at 528,118 tons compared with 347,861 tons in the previous year. Output of pig iron was higher at 715,601 tons compared with 579,440 tons. The total of saleable steel was higher at 461,013 tons as against 291,147 tons. Despatches of steel increased to 449,050 tons against 256,615 tons in the previous year.

Allocations to all kinds of reserves are higher by Rs 86 lakhs at Rs 203 lakhs. Provision for depreciation has been increased from Rs. 80 lakhs to Rs 120 lakhs. A sum of Rs 59½ lakhs has been transferred to plant Rehabilitation Reserve. General Reserve gets Rs 43.7 lakhs while a sum of one crore of rupees is allocated to Works and Ore Mines New Extension Reserve. Net profits are Rs. 2.88 lakhs higher at Rs. 66.99 lakhs.

In the year under review, orders were placed for almost all the main items of plant required for the 1953 extension projects. The link with the D V C electrical system has been completed.

Bombay Mutual

THE Valuation Report of the Bombay Mutual Life Assurance Society, Ltd., for the triennium ending December, 31, 1954, discloses excellent results and a noticeably larger surplus has emerged than at the previous valuation, which has enabled the Actuary to recommend higher rates of bonus.

The Report shows a surplus of Rs 1.01 crore as against Rs 29.6 lakhs for the previous triennium (1949-51). After taking the net amount of tax refunds, the total profits available for distribution at the end of the valuation period amounts to Rs 1.17 crore. The Actuary has recommended the distribution of this profit among the participating policy holders in the shape of reversionary bonuses, as follows:—

- (1) Rs 19 per thousand sum assured per annum under the Whole Life Assurances and other assurances of a similar nature,
- (2) Rs 16 per thousand sum assured per annum under the Endowment Assurances and other assurances of a similar nature, and
- (3) a further Rs 2 per thousand sum assured per annum to both types of assurances under policies paying premiums at the 1947 rates, in view of their higher bonus earning capacity.

New Business

As on the date of valuation, there were 205,972 policies assuring a sum of Rs 43.88 crores as against 196,399 policies and Rs 39.72 crores respectively at the time of the last triennial valuation. The Life Fund has since increased from Rs 11.48 crores in 1951 to Rs 15.32 crores at the end of 1954.

Expenses

The expense ratio for the triennium was 16.69 per cent, a little higher than in the previous triennium. The ratio does, however, show a tendency to decline towards the statutory limit. (17.37 per cent in 1952; 16.79 per cent in 1953 and 15.9 per cent in 1954.)

Lower Mortality

A steady improvement in the mortality experience of the Society is another feature of the valuation Report. The ratio of actual deaths to those expected on the basis of the Oriental (1925-35) Table of Mortality Rates, was 53 per cent in 1952, 49

per cent in 1953 and 41 per cent in 1954. For the triennium it averages 48 per cent, as against 60 per cent in the previous triennium (1949-51). Actual death claims for the triennium as a whole were, according to the Actuary, a little less than 50 per cent of those expected on the Oriental Table of Mortality.

The average net rate of interest on the Life Fund for the triennium 1952-54 at 3.59 per cent is slightly lower than that earned in the previous valuation period, viz., 3.72 per cent.

Electricity Undertakings

PERHAPS the most important problem with which the Electric Supply Industry is faced today is to secure a fair rate of return on investments, though there are others almost as important, such as the building up of a reserve to meet the needs of expansion and future tax obligations, the threat of nationalisation etc. A Bill to amend the Electricity (Supply) Act 1948, which is before Parliament now is intended to remove the obstacles in the way of further development of the industry. In this context, the observations made by the Chairman of the Federation of Electricity undertakings in India, at the eleventh annual meeting, at Calcutta recently, merit careful consideration.

Securing a fair return on capital, sufficiently attractive to enable the raising of capital for development has been one of the thorny problems of the industry. The Bill to amend the Electric Supply Act, one of the objectives of which is to provide for a fair return to the investors in this industry, proposes to link the rate of return on investment to the Bank Rate, and an increase of half a per cent from the present 5 to 5½ per cent based on the present Bank Rate is provided for. The Federation's chief points out that while this link with Bank Rate may be sound on other grounds, there is a possibility of the rate of return going below even the present level of 5 per cent should the Bank Rate be reduced on fiscal considerations unrelated to conditions in the money market. He, therefore, suggests that a floor rate should be fixed.

The industry has been asking for a rate of return which is 2½ per cent above the Bank Rate, i.e. 6 per cent. The Federation considers that the rate of 5½ per cent proposed in the amending Bill is inadequate and in view of the need to maintain the normal

dividend and equity of the investor in the industry, the standard rate of return should be fixed higher than is now contemplated. In the context of the development programmes for the industry in the private sector in the Second Plan period, appropriate incentives need to be offered to the investor.

A recent development which has disturbed the Chairman is the move by States such as Orissa, Travancore-Cochin and Rajasthan to nationalise electricity undertakings. Another development is the proposal of the Punjab Government to modify the Electricity Supply Act, 1910, in its application to the Punjab, so as to substitute other methods of computation to replace the payment of "fair market value", when undertakings are acquired. While this amendment has reference only to undertakings which have already been taken over or would be acquired only after their franchise period, in the context of the plans of expansion before the electric supply industry, proposals such as these, according to the Federation's chief, would serve a damper on private endeavour in the field and adversely affect the industry's efforts to raise

finance for development.

Another important problem before the industry relates to rate revisions, even within the limits prescribed by the Electricity Supply Act. The need for an upward revision of rates arises from higher operation costs. The Federation chief points out that when attempts are made to effect an upward revision in rates to meet the increased operation costs, the undertakings are faced with stiff consumer resistance. And according to the Federation's Chairman, in many such instances, the State Governments have either brought pressure on the undertakings not to increase rates or have adopted an unhelpful attitude. Consumer resistance is usually based on the erroneous assumption that the industry is making huge profits. The Federation chief, therefore, pleads for education of opinion in this regard and a more helpful attitude on the part of Government. Consumers have to realise that development calls for the installation of new plant which is expensive and therefore necessitates increases in rates to enable the industry to meet increased operation costs and service the new capital.

Sources: (i) Ministry of Labour (ii) State Authorities

industrial resources and potentials lead to the inescapable conclusion that India, Russia and China will grow as three major Powers not only in Asia, but in the wider world. It is, therefore, in the fitness of things that these three neighbours will express willingness to exist and grow in peace and friendliness. This explains, and justifies, India's efforts to establish closer contacts and friendship with China and Russia, even as the latter two countries' repeated gestures to India show. Amity between India, China and Russia is an essential condition of peace in Asia. Together, in their common pursuit, they can further the cause of world peace.

Geography combines with strategy to dictate friendly relations between India, China and Russia. This is not denied, but there are sceptics, both within and outside this country, who question the wisdom of India's policy of establishing friendly relations and intercourse with Communist States like China and Russia. They reveal ignorance of the basic foundations of India's foreign policy. Non-alliance with the rival power blocs is an essential aspect of India's foreign policy. Non-interference with the internal affairs of any country and respect for national sovereignty are the two solid foundations of Panch Shila. It was not without significance that non-Communist India and

Communist China were the two countries who first jointly enunciated and accepted Panch Shila as the basis of relations between nations. Nor was it without significance that, at the instance of Shri Jawaharlal Nehru, the joint communique issued by the Soviet Prime Minister and the Indian Prime Minister, at the conclusion of the latter's tour in Russia, included an explicit undertaking by the Soviet Union not to interfere in the internal affairs of nations. Both M Bulganin and Khrushchev have reaffirmed Russia's acceptance of this basic principle of Panch Shila. Russia's foreign policy, M Bulganin assured the joint session of the two Houses of Parliament, is based "on the principle that every people has the right to independent national development in accordance with their own will and interests". M. Khrushchev, First Secretary to the Communist Party in Russia, was equally emphatic that Communism was not an article for export. "We do not compel anybody", he endorsed the Soviet Prime Minister's enunciation of Russia's foreign policy, "to accept our ideas of the reconstruction of society".

These are welcome assurances of Russia's acceptance of the principles of national sovereignty and of non-interference in the internal affairs of nations. Russia's achievements since the October Revolution are

impressive. Both M Bulganin and Khrushchev have taken legitimate pride in social, scientific and industrial progress in Communist Russia. These achievements have been attained through means which are not acceptable to non-Communist countries. There are, similarly, certain aspects of the Western Powers' foreign policy which are not endorsed by many Bandung countries. Even as this does not prevent India, or any other Bandung nation, to co-operate with, and accept aid from, the Western Powers, there can be no harm in seeking friendly aid and co-operation with Communist Russia. India is a prominent member of the "uncommitted third". Her urgent need is to achieve economic progress. Her peaceful foreign policy stems from her economic policy. In attaining this objective, she will co-operate with all nations who desire peace as well as seek friendly material help from those nations who are able to offer such aid. In seeking friendly co-operation and economic aid, India has made it clear to Russia as well as to the Western Powers that she will not accept offers of conditional aid or co-operation. Once this is properly appreciated, there can be no harm, but much good, in mutual political, social, cultural and economic co-operation between India and Communist Russia, or any of the Western Powers.

Foreign Liabilities and Assets

OF the many lacunae in economic statistics that hampered the framers of the First Five-Year Plan, not the least important was that relating to the foreign liabilities and assets position of India. Prior to 1951, the change in the net assets position of India could only be guessed, and it was practically impossible to locate the factors responsible for these changes. The first step in filling this gap was taken in 1951, when the results of the Census of Foreign Liabilities and Assets as at the end of June 1948 were published by the Reserve Bank of India.

That Census gave an idea of the magnitudes of India's obligations to the rest of the world and of India's assets abroad. With the publication today of the Report on the Survey of India's Foreign Liabilities and Assets (as on 31st December 1953) by the Research Department of the Reserve Bank of India, we are well on the way to eliminating the independence on guess-work in this im-

portant field. For this contribution, the Reserve Bank deserves a big hand. And what is more gratifying is that the Bank has already chalked out a programme for filling in the remaining gaps in our knowledge of India's international debtor creditor position, and for reducing the time-lag in the publication of such data.

To turn to the survey itself. Unlike the earlier census, the present survey excluded individuals and partnership firms from its purview, since the Census had shown that the foreign liabilities and assets of these categories constituted a very small proportion of the total. It concentrated further on long-term assets and liabilities (i.e. obligations maturing after one year) for the reason that the short term obligations are owned by and owed to the banking system chiefly, and monthly on data on these are being published regularly by the Reserve Bank.

According to the Survey, India's total foreign long-term liabilities

aggregated Rs 1036 crores on December 31, 1953, while total long-term assets amounted to Rs. 1175 crores. We were thus net creditors vis a vis the rest of the world to the extent of Rs. 139 crores in respect of long term obligations. While the liabilities were fairly distributed between the official and non-official sectors, the bulk of the long term assets was owned by the former. Thus, the official sector comprising the Central and State Governments, local authorities and Statutory Corporations had net assets amounting to Rs. 529 crores, while the non-official sector had net liabilities of the order of Rs. 390 crores. If account is taken of the country's short-term obligations and assets the contrast between the two sectors would be even greater.

This difference between the official and non-official sectors' net position was, however, much more marked in mid 1948. At that time, the net creditor position of the official sector

was higher than that in December 1953 by Rs. 651 crores, while the net debtor position of the non-official sector was lower by Rs. 152 crores. In other words, for the country as a whole, the deterioration in net investment abroad (long-term and short-term) was of the order of Rs. 803 crores between June 30, 1948 and December 31, 1953.

A change of this order over a period of five and a half years seems at first sight too large and might well be viewed with concern by many. But a careful look at the details given in the Survey should make one feel that this 'deterioration' has not been just a matter of extravagance. As is well-known, the net position might worsen as a result of an increase in liabilities or a decrease in assets. In either case, judgement has to be based on the underlying causes augmenting the liabilities or reducing the assets. Quite obviously, a great difference is made accordingly as these means are utilised for financing consumption or investment, and it is at such matters that one should look.

The 'deterioration' in the net position between July 1948 and December 1953 was due both to liquidation of assets and increase in liabilities, though the former was the dominant cause. The fall in assets that could be clearly identified or reliably estimated amounted to Rs. 592 crores, while the increase in liabilities was of the order of Rs. 273 crores. As against these, non-identifiable increases in assets or decreases in liabilities accounted for an improvement of Rs. 62 crores in the net position. It was inevitable that the decline in assets should largely be on official account, since the bulk of foreign assets are owned by this sector. And the Government Sector had, during this period, special obligations to discharge. Subsequent to June 1948, a portion of the external assets of undivided India had to be transferred to Pakistan, and also utilized for currency settlements. These together accounted for a reduction of Rs. 252 crores in our assets. Payment of pensions to British nationals and repayment of railway annuities accounted for another Rs. 57 crores. Leaving these special items on the one side, the net reduction in assets attributable to current transactions was of the order of only Rs. 234 crores in the five and a half years. Remembering that for almost the whole of this period, we had to import substantial quantities of food and raw materials to help

counteract the inflationary pressures in the country, this draft was neither large nor purposeless.

On the side of liabilities, the increase has been roughly equal as between the two sectors, amounting to Rs. 138 crores in the official sector and Rs. 135 crores in the non-official sector. The increase in the official sector's liabilities is due principally to the Wheat Loan, development loans from the World Bank etc.—all of which have been essential for economic development with stability. As regards the private sector, it has incurred debts abroad principally for investment purposes and one might, if one wants, cavil at it either on ideological grounds or because of the sort of investments so financed.

There is thus little cause for worry at the deterioration in our net investment position so far. Indeed, if we had absorbed as much of foreign resources as was envisaged in the first plan, the position would have been worse. It is in this connection worth remembering that the extraordinary payments mentioned above would have had to be made in any case. Had we therefore used up all the resources that were available to us under the Indo-U K Sterling Balances Agreement for purposes of the First Plan, the excess of assets over liabilities in 1953 would have been much smaller. Furthermore, a good part of the increase in the private sector's liabilities represents reinvestments of profits earned in India by Subsidiaries and branches of foreign firms. Excluding this, the actual inflow of private foreign capital works to an annual average of about Rs. 10 crores between 1948 and 1953; in the First Plan, such inflow was envisaged at Rs. 20 Crores per year. There is therefore little point in worrying about the past spending.

There are certain features about the data presented in the Survey that are worth noticing. The totals of both assets and liabilities have, in a sense, been inflated by two items of a very special nature. These are (a) the liability in regard to India's quota in the I M F and capital Stock in the I B R D and (b) the liability in regard to the capitalised Sterling pensions. These liabilities together came to about Rs. 393 crores; and an equivalent amount is taken on the assets side of the official sector. Such a procedure could perhaps be justified in terms of proper accounting. But for an economic assessment of our external position at the moment, they are of little significance. They are, as it were, bygones; these so-

called assets cannot be used for any addition to resources needed for investment or consumption.

Indeed, our 'firm' external assets are much less than is apparent from the Survey. For apart from the items mentioned above, one big 'asset' we own is the debt due from Pakistan. This has so far been taken at Rs. 300 crores, on the basis of the obligations of undivided India taken over by the Indian Union. Whether, when and how this debt will be settled are matters of extreme uncertainty. This it should be remembered is likely to be further complicated by the claims and counter-claims in regard to evacuee properties in India and Pakistan which have yet to be settled. The Survey has for obvious reasons kept clear of these issues. But anybody trying to gauge the strength of India's external assets cannot ignore them. Should adjustments be made for these accounting or uncertain items, it is probable that India's net position will take on a different aspect.

We might finally touch upon the fields into which the additional private investment of Rs. 132 crores has flown since June 1948. As set out in the Survey, nearly half (Rs. 61 crores) the additional foreign investment is in the manufacturing sector, with trading plantations and utilities following in that order. Actually, investment in the manufacturing sector was larger, since the figure mentioned above is exclusive of the investment in oil refineries. This anomaly arises from the fact that at the time of the Survey, the process of transferring assets and liabilities from the branches of the foreign oil marketing companies to the new oil refinery companies had not been completed. Had this transfer been made, the proportion going into the manufacturing sector would have been much larger.

It might finally be noticed that between 1948 and 1953, foreign investment in 'managing agency' firms went up by Rs. 11 crores. This is not by any means an insignificant amount in itself. More than that, it shows an increase of nearly 80 per cent in foreign investment in managing agency firms subsequent to June 1948. What this implies in terms of actual producing units managed by such firms is a matter of conjecture. The Survey does not—and for obvious reasons could not—go into this question. But it will not be long before somebody makes an issue of it.

Weekly Notes

Tata Steel—Expansion Under Way

STEEL is in the news once again this week. Shri J R D Tata has denied the news report, on which our Weekly Note last week was based, that the Tata Iron & Steel Company's negotiations for a loan from the Export-Import Bank of America had been successful. While Shri Tata expressed his confidence that the necessary finance would be forthcoming, he indicated that both the World Bank and the Export-Import Bank were being approached and which of these two bodies would provide the finance was not definite as yet.

Shri Tata's confidence about this subject is evident from the conclusion of the agreement with the Kaiser Engineers Division of the Henry J Kaiser Company regarding the expansion project of Tatas, details of which were announced this week. The entire contract for the design, procurement and construction of the Rs 61.9 crore (\$130 million) project has been awarded to this American firm, which is famous for the speed with which it completes various projects and the scheduled period for completing the present project is only 30 months.

The fact that the constructional contract has been awarded to the American firm does not of course imply that the equipment used will be American. If competitive quotations are forthcoming from American equipment manufacturers, there should be no difficulty and in that case the loan from the Export-Import Bank will presumably be forthcoming. If, however, other countries are able to make substantially lower bids, the Export-Import Bank will not be able to provide any finance and that is why probably the World Bank has been mentioned as an alternative source of finance.

This contingency is by no means remote. The controversy over the "Buy American" Act which flared up over the Chief Joseph Dam incident some time ago points to that possibility. In recent months, a number of contracts for supply of equipment for US Government works have gone to English engineering companies because their bids plus six per cent have still been lower than the lowest American quotations. Quite recently too, the Department

of State has announced that even in "surplus labour" areas where the six per cent rule was not hitherto applied and American firms were given all contracts, a difference of more than 12 per cent would be the maximum preference permitted to American firms. An English firm was awarded a major contract under the new ruling in such an area recently. However, if either way finance is secure this need not worry us much. The Tata Steel expansion project can be taken to be under way.

Credit for Durgapur

IN the meantime, the British Steel Consortium which is connected with the third new steel plant project (at Durgapur?) is reported to have offered India credit to the extent of 80 per cent of the value of plant and equipment ordered from the United Kingdom under the terms of the British export credit guarantee scheme. Interest will be charged at one per cent above the present Bank Rate of 4½ per cent in England.

Investment in Men

DURING the post-war period, the number of persons going abroad for higher education has increased quite substantially. As compared to the pre-war period, the number of Indian students has almost doubled in the UK and quadrupled in the USA. However, it often happens that when such trained persons return to India, there are no outlets for them to utilise the specialised training which they have received abroad. As a result, the investment which the community makes in their training and their innate talents go to waste, which is a great pity when the resources of the country in the form of capital and talents are so scarce.

This national waste could be prevented if the Government tried to estimate the country's requirements regarding trained personnel during say, the Five-Year Plan period and published this estimate so as to guide the students going abroad in choosing their fields of study. Such an estimate would, in fact, be useful even for students in this country. This is an important job for the Planning Commission and a very high priority should be assigned to

it. It is rather surprising that such an elementary and obvious thing does not still seem to have occurred to the Planning Commission.

A Plea for Good Faith

THE speech of Mr E D Sheppard, Chairman of Killick Industries Ltd., appearing elsewhere in this issue, is worthy of serious consideration by all those interested in the well-being and development of India. He stresses very rightly the need for a change in the attitude towards free enterprise, especially in the context of the role assigned to it in implementing India's development plans. For a society which entrusts such great responsibilities to the private sector, it would be neither fair nor profitable to treat that sector with suspicion and contumely. Even as one expects, in a 'mixed economy', the private sector to keep good faith with the public and the Government, these latter ought, in their turn, to keep good faith with the private sector. Only then would a co-ordination of efforts of State and free enterprise be possible and fruitful.

Mr Sheppard has been forthright in his criticism of the vindictive attitude taken by some in regard to the Managing Agency system. He deplores the non-recognition of the massive achievements of that system in the past, and the view that the managerial class in this country receives endowments out of all proportion to the contributions they make to the production of national wealth. There is much food for thought in what Mr Sheppard says. At the same time, one might add that so far, the private sector has spent more time on complaining about the difficulties it faces than on informing the general public of its singular achievements, in terms not of private gain but of social benefit. Also, one might point out that not all critics of the managing agency system are unaware of its contributions in the past; their stand is basically that in the altered circumstances of today, the institutions have to change, and the operating incentives will have to be somewhat different. To the opinion of such, the private sector should pay greater heed; and this will, in itself, contribute to a warding off of the suspicion and venom which Mr Sheppard condemns.

Russia as a Lender

THE recent financial and trade agreements arrived at by Soviet Russia with China, Finland and Yugoslavia, respectively, is a pointer to the increasing interest shown by Soviet Russia in international economic co-operation. The agreement with China provides for the grant of medium-term loans, reported to be equivalent to about £50 million sterling, for purchase of goods manufactured in Russia. It is said that the loan to Finland—of about £3½ million sterling in value—is for strengthening the foreign reserves of the country. In the case of Yugoslavia, the major portion of the credit line of about £60 million is earmarked for purchase of Russian goods, the balance being made available in foreign currency for purchase of goods outside the Soviet bloc.

From one point of view these agreements can be regarded as an extension on a large scale to States on the Soviet periphery of the credit facilities which were available hitherto on a restricted scale to countries within the Bloc under bilateral trading agreements. It is difficult to say whether these long term capital transactions portend a general thawing of Soviet foreign economic policy, and it remains to be seen whether they would gradually pave the way for some relaxation of the Russian attitude to membership of the Brettonwoods institutions.

In this connection it is interesting to recall that Mr Gunna Myrdal, Executive Secretary of the UN Economic Commission for Europe, in the course of his welcome address to the Geneva session of the Trade Development Committee, said that the basic conditions for an increase in trade between Eastern and Western Europe were propitious. He referred to the improvement in credit facilities in both halves of Europe, particularly in regard to accommodation credits for tidying over temporary and seasonal difficulties in payments. According to him, the value of East-West trade in Europe increased from 927 million dollars in the first half of 1954 to about 1 billion 85 million dollars in the first half of 1955. Although during this period, the increase was mainly under exports from Eastern countries, it is expected that this would soon be repeated in a rise in imports from the West.

North-West Asia

MUCH has happened in West Asia since the start of the dispute between Britain and Egypt. That dispute has now been settled. Britain has evacuated the Suez Canal. But it is an indirect sequel to this earlier dispute that MEDO has not come into existence. From the statement of the British Foreign Minister before the first meeting of the Baghdad Pact Council, it would seem that Western Powers have not lost hopes about MEDO. Mr Macmillan is hopeful that the Baghdad Pact will "prove acceptable as a pattern for co-operation with other States in the Middle East". Egypt does not share this hope. London is suspect in Cairo for its machinations to create disunity in the Arab League.

Events in the last ten years visibly reflect the Western Powers' determination to ring the world with military pacts. They are consistent in this policy. If MEDO could not be created, they started wooing Turkey. Turkey is a NATO Power. She occupies a strategic position in the eastern Mediterranean. With Turkey as the base, both the eastern Mediterranean and north-west Asia could be fortified. These military arrangements could be indirectly telescoped into NATO through Turkey. This is the basic strategy of the Baghdad Pact, the west Asian counterpart of SEADO in south-east Asia.

Britain is no longer an Asian Power. America has never been an Asian Power. But, through SEADO and Baghdad Pact, Britain has revived her military interests in Asia. As the sponsor of SEADO, America is now vitally involved in Asian affairs. By her decision to establish military and political liaison with the Baghdad Pact countries she has enlarged her commitments in Asia. She already has separate, bilateral military aid arrangements with Turkey, Iraq and Pakistan. France is a member of SEADO. America, Britain and France, the three major NATO Powers, have, thus, sought to establish military net-works in Asia as offshoots to NATO. These military arrangements have a familiar nineteenth-century look. In the nineteenth century, such alliances used to be negotiated secretly. Today, in the era of open diplomacy, such military pacts are openly arranged. But this difference does not obscure the motive, which remains the same, behind these pacts.

Wheels within Wheels

THERE are other intriguing aspects of SEADO and the Baghdad Pact. These military pacts are counter-arrangements to offset the growth and spread of uncommitted countries and powers. Thailand, Philippines and Pakistan are associated with SEADO. To the extent of such participation, SEADO seeks to counteract the influence of the "uncommitted third" in south-east Asia. Similarly, Egypt pursues a policy of non-involvement. She stands for Arab unity. To counteract Egypt's influence in the Moslem world, Turkey, Iraq and Pakistan have been won over to form the Baghdad Pact.

It was inevitable that the Western Powers' strategy and diplomacy in Asia should provoke counter-measures by the Communist States. All the major powers in East Asia are attuned to the Bandung Powers and neither the Western Powers nor the Communist States are successful in their manoeuvres. But, in west Asia, Russia has successfully countered the Western moves by arranging an arms deal between Czechoslovakia, Egypt and Afghanistan. If and when Iran becomes a strategic base for operation against the Soviet Union, Russia can move troops into Iran under the terms of the 1921 Treaty. The Baghdad Pact has had other irritating consequences. It has damaged Britain's claim as a friend of Arabs, especially at a time when both America and Britain are suspect in the Arab States for their lenient attitude to Israel. This also explains why America is reluctant to become a full member of the Baghdad Pact. In the Western Power's diplomatic strategy in Asia, there are wheels within wheels.

Geneva and After

MR DULLES is both a sadder and wiser diplomat after the Foreign Ministers' Conference at Geneva. He is realistic in his summing up of the second Geneva Conference. At Geneva, all the three Western Foreign Ministers made concluding statements to inform the world that Russia was to blame for the failure of the second Geneva Conference. On his return to America, he has repeated this accusation from Washington. But it is clear from his broadcast address, that he is agonisingly conscious that Russia holds the diplomatic trump card. It is a tribute to the American Secretary of State's appreciation of the intriguing situation in world affairs to-

day that he alone, among his Western colleagues, has the honesty to confess this diplomatic defeat.

Each side has changed its attitude to Germany. Formerly, the Western Powers were insistent that a future, united, armed Germany must have freedom to join NATO. Russia could, or would, never accept such a solution of the German problem. It was unwise of the Western Powers not to realise earlier that such an uncompromising policy to Germany could not lead to any solution. At Geneva this time, the Western Powers were diplomatic. They did not emphasise as much the right of a future, armed, sovereign Germany to join NATO as Germany's freedom to choose her future alliances. Their proposal included a proviso that a plan for guaranteeing European security should be implemented immediately as, and if, re-united Germany chose to become a NATO partner.

This was clever diplomacy. But it ignored the basic significance of the achievement of the 'summit' Conference. From M Molotov's behaviour at Geneva, it is clear that Russia has fully grasped the consequences of the 'summit' Conference. As soon as it became evident that both sides had mutually agreed not to start an atomic war, Russia properly concluded that both time and strategy were in her favour. Russia was no longer apprehensive of any future aggression by a remilitarised united Germany. To Russia, German re-unification was no longer as urgent as a system of European security. She could wait for a solution of the German problem, the more so if it involved even indirectly, future participation of a re-united Germany in NATO.

This was the negative aspect of Russia's attitude to the second Geneva Conference. There was also a positive aspect to Russia's changed policy to Germany. Russia proposes that the German problem should be left for solution by the Germans themselves. This is a fair proposal. It is aimed to win over the people of Germany. Russia has other motives in making this proposal. She hopes that she will be in a position to offer such terms and assurances to Germany as to buy her neutrality. She feels that she will succeed in this policy. That is why she has refused to pay the price demanded by the Western Powers for a solution of the German problem.

Balance Sheet

MR DULLES is honest, if not diplomatic, in his interpretation of the Geneva balance-sheet. So long, the two rival power blocs have waged a "cold war" to start a future war. That "cold war" will go on, but it will now be fought "in defence of peaceful competition". This sounds promising. But it means continued world stalemate. Mr Dulles is more emphatic than his two Western colleagues that there can be no sense in resuming negotiations with Russia as long as she does not change her attitude to Germany. It suits Russia not to change her policy to Germany. It, therefore, follows that America prefers the atomic stalemate to exploring prospects of a compromise solution of the German problem.

It is arguable that a world stalemate, though deplorable, is better than the constant threat of war. Such arguments are based on superficial assumptions. Both sides have mutually agreed not to start an atomic war. But neither side has yet agreed to renounce the use of force. Mr Dulles admits that America will continue her present programmes for defence and security. Continued establishment and fortification of military alliances by the Western Powers will provoke retaliatory diplomatic and military arrangements by Russia. As long as both sides continue such a policy, there can be no lasting assurance that world peace will be maintained.

The Colombo Plan Report

THE Fourth Annual Report of the Consultative Committee of the Colombo Plan makes as usual rather mixed reading, and shows if anything, the very considerable leeway that remains to be made up particularly in regard to levels of per capita food consumption—which though higher than in the early post war years are still below pre-war levels. The seriousness of the demographic situation in the Colombo Plan countries is evidenced by the estimated rate of increase of about 10 million persons per year in the population. On the other hand, the available economic indicators point to a perceptible rise in national income and output in most countries, though the rate of increase was rather uneven; and in a few countries the general economic situation was rendered vulnerable owing to the impact of the fall in prices of exports.

The area as a whole showed a rise in output in major lines of production with the exception of rice which showed a decline in output of 6 per cent mainly owing to a decline in output in India, Pakistan, Thailand, Laos and Viet-nam. Even so the production of food grains as a whole is said to be the second highest level recorded during the post war period. Among cash crops, the production of tea, sugar, cotton, jute, oilseeds and rubber showed an increase. Industrial and mineral production as also power generation recorded significant increases over the previous years, particularly in cement, steel, cotton yarn and fabrics and jute manufactures. But, as the Report says, "While output in the area generally increased, it must be noted that this rise was not for the most part directly attributable to the development expenditure thus far undertaken. World demands and weather conditions have presumably been as decisive as development outlays in determining the level and structure of agricultural production. Many development projects, particularly major undertakings involving large expenditure, remain uncompleted and can therefore be expected to affect production only after a considerable lapse of time". In most countries the general financial position, internal as well as external, eased on account of the international demand for raw materials and improvement in terms of trade. Consequently, most of them were able to finance development expenditure without substantial recourse to deficit financing.

The Singapore session of the Consultative Committee, which prepared the Report under reference, took the important decision to extend the Colombo Plan from July 1957 for a further period of four years up to June 1961. The future continuance of the Plan will be decided at a meeting to be held in 1959.

Black Days

IF any further argument were needed against the inclusion of Bombay City in a unilingual State, it was amply provided by the ugly incidents of Sunday and Monday last. The agitators for the merger of Bombay in Maharashtra would make it appear that they value and love this City more than others; but what they did to the City's reputation and its property on those two black days could not have been expected from any who had the least regard for the metropolis. And if this is a preview of what might happen in Bombay in future, should it by mischance go to a unilingual territory, then the sooner the better elements woke up to the position and started asserting themselves the better. Bombay's name has been sullied, and all the more regrettable is the fact that it should have happened almost on the eve of the historic visit of the Soviet leaders to the City. And neither expressions of regret, coupled as they are with mental reservations, nor a fast, which evidently had little effect on the unruly mobs, can make much difference to what has already happened; nor can it be said to hold promise of any better behaviour on the part of the lawless elements in future. What was blatant on the two days was that some of the men behind the agitation over the future of Bombay have little use for democratic methods, and that they are bent on seizing the City by force, and by tactics which have little to do with human dignity and decorum. That the first nursery of freedom and democracy in this country should have had to witness this sad spectacle is most disillusioning.

If Government and the law-abiding public are to submit to this show of naked force, can there ever be peace in the City? And so far as Government is concerned, would it not amount to its accepting a bad precedent, liable to be capitalised by the mob on other occasions, over other issues and at other places too? The question of questions is whether the leaders behind the agitation over the City's future want the people spontaneously and by their own volition to opt for a unilingual State, or are they to be stampeded and forced into such a State, no matter what their own wishes may be? Were it the former, then the approach of the leaders would have been different. They would have appealed to the reason of the people, and put aside any thought of compulsion. Why has this approach not been made and

kept up? Is it because they treat the opinions and wishes of the people of Bombay as being of no consequence whatsoever? Or is it because the leaders see no possibility of ever being able to convince the majority of Bombaymen of the need and advantage of merging the City in unilingual Maharashtra, and so are trying, in a last desperate bid, to harass, bully and coerce the people into submission? Looked at from either angle, the method in operation is deplorable, to say the least.

Challenge to Democracy

BOMBAY, which has not allowed itself to be bullied by the might of the British Empire, is not likely to get bullied by a handful of agitators. Bombay, which has seen the fullest flowering of democracy, a rare cultural synthesis and way of life which is an inspiration to the rest of the country, is in no mood to have this heritage besmirched by elements that evidently have no great respect for it. What happens to Bombay ultimately is less important than what happens now, and how. Time-honoured democratic ideas and processes face a challenge, and that challenge must be met, irrespective of the passing controversy over the future of the City. Professional trouble-makers and law-breakers, who are evidently ever ready to spring into action at the slightest pretext and who seem to think that pushing peaceful citizens about, holding up traffic, throwing stones at all and sundry, burning buses, police chowkies and the like and paralysing life in the City are a form of diversion—these reckless elements lurking in the city lanes and by-lanes must be made to realise that they cannot have this proud city for a playground. A large majority of the City's inhabitants are peace-loving and they like to be left to themselves. And there is no doubt that even among the agitators, not to speak of their leaders, there are a number who do not approve of undemocratic behaviour and hooliganism. But control of the movement is evidently passing out of their hands into those of the lawless elements. And it is the duty both of law-abiding citizens and responsible men at the head of the agitation to bestir themselves to see that the incidents of the past week are not repeated, and that if it is necessary at all to conduct any agitation, it is done on dignified, democratic lines. In this context, the suggestion made by Shri S K Patil to start an orga-

nisation of volunteers to be called Bombay Guards deserves serious consideration. Goondaism and vandalism must end in the City at once.

Friendly Neighbour

THE warm reception given to King Mahendra of Nepal at Delhi, Bombay and other places is only a small measure of the great regard and affection cherished by the people of India for their brave northern neighbours. Neither alien rule nor the prejudicial utterances and activities of certain interested elements since freedom have been able to snap or weaken the timeless ties of friendship and cultural exchange between the two neighbours. Temporary misunderstandings are bound to arise between any two neighbours; and they might have shown a tendency to arise between India and Nepal too in the first unsettling flush of freedom. But it redounds to the wisdom of the late Ruler of Nepal and the political leaders of that country as also to the deep understanding and warmth of feeling of the leaders of free India that these little causes of possible misunderstanding were never given any quarter. The present young Ruler of Nepal, King Mahendra, has given every indication of continuing the noble tradition of his father both in respect of relations with this country and the democratic evolution of Nepal. The earliest opportunity that King Mahendra has taken to visit this country bears out his regard for India, while the considerable reforms he has attempted in Nepal and the earnestness he has shown in promoting the political progress of his people give ample proof of the spirit of enlightened leadership that he has inherited from his father.

That parliamentary democracy is not yet fully and firmly established in Nepal casts no reflection on any particular individual, as Shri B P Koirala, President of the Nepali Congress, said only the other day. The lack of democratic experience in the past, the sudden upsurge of parties and groups on the advent of freedom, the leeway of centuries to be made up in practically every field of public and administrative activity, mass illiteracy and ignorance and the fact that a large number of politicians there are new to the ways of restraint, tact and compromise that democracy calls for—all these have to share the blame for the political stagnation that prevails in Nepal. And that is not to

talk of the disturbances and eruption of dormant forces that followed freedom. If because of all these, Nepal has seemed at times to take a step or two back for unavoidable reasons, the question is whether the urge to move forward and the earnestness to try every possible method in that direction have been lacking. The indications so far have happily

been that every attempt is being made to avoid the necessity of direct rule or at least to modify it to the extent possible by associating popular opinion with it in the period preceding the proposed general elections. The proposed elections may well solve some of the problems besetting Nepal at present, and the wisdom of political leaders would seem to

lie in making the best of the present state of affairs and expediting the date of the elections. Any proposal or move that is likely to extend the present uneasy interregnum beyond need cannot be very conducive to democratic advance. One hopes that this is fully realised in all quarters in Nepal.

FOR EVERYTHING ELECTRICAL

Every minute of every day someone, somewhere, needs G.E.C. electrical equipment. Everything which is operated by electricity or for the generation of electric power, can be obtained from the G.E.C. — the largest British electrical manufacturing organization.

Belgium and the Belgian Congo

BELGIUM'S colonies and colonial policies have never been subjected to the type of international scrutiny which in recent years has given so much trouble and anxiety to France, Britain, Portugal and Holland. For this, there is little doubt, Belgium is most thankful. The reasons for this virtually complete absence of controversy are, however, not difficult to find. Unlike the other colonial powers, Belgium's foreign possessions are confined to Central Africa—an area about which very little is known and, more important, an area which is too far away to feel either the impact of the Asian revolution or for that matter to taste what is good in European liberalism. The Congo's isolation from the main stream of international events and ideas has been and remains one of the more important contributing factors to the continued stability of the Belgian economy.

Belgium's African colonies are made up of the Congo and the small adjacent trust territory of Ruanda Urundi. In land area, these territories are about three times the size of Pakistan or just slightly smaller than the land area of India. They carry a population of approximately 15 million—99.4 per cent of whom are indigenous African. In economic importance and potentialities the Congo has been generally described as being one of the richest of territories on the face of the earth. This is certainly true.

Economic Consequences

In this despatch your correspondent does not intend to examine the political and social aspects of the Congo-Belgium link, but rather to assess the economic consequences of the relationship. Such an assessment appears necessary since it has always been one of the mysteries of the European economy that, irrespective of the conditions of her neighbours, Belgium has always enjoyed a remarkable stability in its international balance of payments. It is towards unravelling this mystery that the economic aspects of Belgium's colonial position needs assessment.

According to the International Monetary Fund's Balance of Payments Year Book, the Congo, while having a deficit on its current ac-

count amounting to about 1,000 million Belgian Congo francs (50.50 Belgian Congo Frs = US \$1; £1 = 141.40 B.C. Frs. = 141.40 Belgian Francs), has been in persistent surplus in its trade with the dollar area and all countries outside the Belgian-Luxembourg monetary group over many years.

The deficit of the Congo with Belgium arises primarily from its annual interest and investment service payments. In 1954, these payments amounted to 2,500 million Belgian Congo francs. In 1954 the colony had a net surplus on its current account with the United States to an extent of 2,470 million Belgian francs. In the same period Belgium's current trade with the dollar and the hard currency areas was in deficit to the extent of 610 million francs. In the adjoining table pertinent details from the trade figures of both the Congo and of Belgium are given. It is significant that Belgium's regular deficit in its trade with other members of the European Payments Union are also regularly covered by the EPU currency earnings of the Belgian Congo.

Last year the Congo produced 250,018 tons of manganese valued at \$7,017,500 which was about 30 per cent more than the output and value of 1953. Most of this metal is exported to the United States. Zinc production in the Katanga region amounts to over 250,000 tons, while Tungstan output averages 1,000 tons a year and exports last year amounted to \$4 million. Output of such metals as titanium, paladium, thorium and lead has grown considerable to the point of making the Congo the most important world source of the metals. In the production of gold the Congo holds the twelfth place among the gold-producing nations of the world. It

produces annually over 12,000 kilograms of gold.

Raw Materials

The importance of the Belgian Congo thus does not, primarily, arise from the opportunities that exist for Belgium to cover its trade on a triangular basis with the Congo. The Congo's importance arises in the main from the raw materials which it produces for export. Its annual production includes an estimate of something like 50 per cent of the world's supply of uranium. Apart from this, the Belgian Congo is well known as a source for such important non-ferrous metals and other minerals like copper, lead, tin, zinc, diamonds, gold and silver. It is an important source of manganese ore and of cobalt ore. In agricultural commodities, ground nuts and various other vegetable oil seeds, as well as cereals like millet and rice, feature strongly in its production and trade. It supplies almost all Belgian needs of coffee and cocoa. Natural rubber, and cotton lint have also figured in its export list.

The Congo is "big business" and is operated as such by the Belgian Government both in Brussels and in the Colony—always keeping a wary eye on it, even to the extent of sharing in its profits and keeping a Government official constantly sitting on the boards of the big

companies concerned with the Colony's exploitation.

The Congo administration has an interest amounting to a total value of more than \$250 million in the so-called "big five" companies which dominate the productive economy of the Congo. The administration derives more than half of its revenues from the profits arising from these interests. The biggest company is the Societe Generale de Belgique. It distributes to its shareholders dividends aggregating over \$10 million annually. It is probably one of the largest commercial and financial organizations both in Belgium and in the Congo. Its interests in the Colony spread over and cover almost every product and almost every sphere of activity. Its largest subsidiary is the Union Miniere du Haut Katanga, which is Africa's biggest and probably one of the world's largest producers of copper and uranium ores. Its dividend declarations have averaged \$50 million annually since 1947. The Colony's actual production and export of uranium ores are normally maintained as a top secret, but it is known that the United States has provided various financial guarantees as well as actual payments for securing the power to purchase the uranium output of this territory.

No Inflation

The importance of the Congo to Belgium as a source of hard currency, of income from past investments (at about, 2,500 million francs annually) and of basic raw materials can be readily seen. During the war years, the Government of Belgium, with little expenditure commitments, accumulated the considerable war-time earnings of the Congo. In those years the Congo's exports of raw materials—most of them strategic—were taken up fully by the Allied Combined Raw Materials Board. These accumulated earnings were then used by the Belgian Government Purchasing Mission in Washington to purchase goods—consumer and otherwise—for supply to liberated Belgium.

Thus Belgium was the first only European country in the first post-war years not to suffer from inflation. It was also the first country to revive its industry and its economy generally. Ever since, Belgium has been the wealthiest nation, apart from Switzerland, in the OEEC Group. The contribution of the Congo to this enviable position is indubitable.

Neptune Assurance

DURING the year ended December 31, 1954, the Neptune Assurance Company Ltd., completed new life business valued at Rs 60.37 lakhs as against Rs 51.59 lakhs in 1953—an improvement of 17 per cent. Total premium income amounted to Rs 18.51 lakhs as against Rs 15.85 lakhs in the previous year. Net interest income earned in 1954 was Rs 3.39 lakhs, giving an yield of 3.48 per cent on the Life Fund, as against 3.46 per cent in 1953.

According to Actuarial valuation, the expense ratio has decreased to 17.47 per cent in the year under review from 18.29 per cent in the previous year.

Net premium income of the Fire Department in 1954 amounted to Rs 3.11 lakhs as against Rs 2.39 lakhs in 1953, and after meeting all expenses and allocating Rs 1.24 lakhs towards reserve for unexpired risks, a balance of Rs 40,379 has been transferred to the Profit and Loss account. Similarly, after meeting all expenses and providing for unexpired risks, a sum of Rs 17,591 has been carried over from the Accident and Miscellaneous Department to the Profit and Loss Account.

After meeting expenses of management of Rs 3,052 not applicable to any account or fund and writing off Rs 22,000 and providing for bad debts to the extent of Rs 1.24 lakhs, the Profit and Loss Account for the year discloses a loss of Rs 26,499. The balance of profit brought forward from last year (Rs 8,326) and the income tax refunds for the year 1950 together provide Rs 20,501 for appropriation. After paying income tax of Rs 23,462 for the year 1951-52, the accounts emerge with a net loss of Rs 29,460 for the year under review. However, the Actuarial valuation for the triennium, ending December 31, 1954, provides a sum of Rs 40,206 towards shareholders' dividend. When this amount is taken into the accounts of 1954, there emerges a profit of Rs 10,746.

The Actuarial valuation for the triennium ending December 31, 1954 shows a surplus of Rs 4.47 lakhs. After taking into account the income tax deductions at source in the past three years (Rs 1.66 lakhs) less the amount of estimated provisions for income tax (Rs 78,094), the total amount available for distribution is Rs 5.36 lakhs. The Actuary recommends that of this sum, Rs 40,206

be provided for shareholders' dividends and Rs 4.8 lakhs be distributed as bonus to with-profit policy holders as follows:

- (a) Rs 12 per thousand sum assured per annum on participating endowment Assurances and
- (b) Rs 14 per thousand sum assured per annum on whole Life Assurances.

General Assurance

FROM the Forty-eighth Annual Report of the General Assurance Society Ltd., for the year ended 31st December, 1954, one gets the impression that during a year of intense competition for business, the Society was able to achieve encouraging results, especially in Life Assurance business.

The Life Department wrote, in 1954, new business valued at Rs 310.5 lakhs as against Rs 221.1 lakhs in 1953—indicating an increase of 40 per cent.

Total premium income in the year under review reached the impressive figure of Rs 70.7 lakhs and gross income amounted to Rs 103.68 lakhs. After meeting expenses of management, claims etc., the Society was able to add to the Life Fund a sum of Rs 49.8 lakhs as against Rs 39.9 lakhs in 1953. In the result, the Life Fund increased by about Rs 50 lakhs to Rs 449.44 lakhs at the end of 1954.

The working of the Fire Department during the year resulted in a profit of Rs. 1.6 lakhs. The results of the Marine and Accident and Miscellaneous Departments, on the other hand, were not quite encouraging, both of them accounting for a loss of Rs 1.8 lakhs.

On balance, however, as a result of the good working results of the Fire and Life branches of business, the accounts of the Society as a whole, show a profit of Rs 68,054, which together with the profit brought forward from the previous year, totals Rs 1.33 lakhs. After making adjustments for income tax for 1948 (Rs 15,490) and transfer to Taxation Reserve (Rs 10,000), the net amount available for appropriation during the year is Rs 1.07 lakhs.

The Directors have recommended the payment of a dividend at the rate of 6 per cent on the paid-up Capital, which will absorb Rs 60,000; the balance is to be carried forward.

Official Papers

Inland Water Transport in Europe and the USA

Report of the Expert Working Group from Asia and the Far East on Inland Water Transport. United Nations, New York. Page 141. Price 11 shillings.

Reviewed by Hannan Ezekiel

THE development of inland water transport has suffered from considerable neglect in the countries of South-East Asia so far, although in most of them there are considerable waterway systems and transport is an important bottleneck hampering their rapid economic development. If the effects of this neglect are to be overcome in the future, two types of preliminary effort need to be made. On the one hand, the existing waterways in these countries need to be studied, their existing uses and potentialities assessed and their problems and difficulties analysed. On the other hand, the various techniques and types of equipment used in inland water transport systems under various conditions in different countries must be studied to obtain the maximum benefit from their experience in this field. The present report falls into the latter class.

Whatever the utility of such a study, and this can hardly be denied, it might be questioned at the outset whether it should not have followed extensive studies of the first type rather than preceded them as seems to have happened in the present case. In fact, many of the useful suggestions for India, Pakistan, etc., made in the report flow very obviously from the specialised knowledge of the experts about the conditions prevailing on particular waterways of importance in their own countries. The Report notes that "Members from various countries gave a resume of their problems in developing inland water transport and in the light of the experience gained during the tour" recommendations were drafted and finalised. This only emphasises the need for more data on the actual problems existing in these countries. Another feature of the present report which might be noted at this stage is that the working group consisted entirely of technical experts and did not include a single economist interested in transport problems.

The most important chapter of the Report, considering the composition of the group, describes the technical aspects of the inland water

transport system in the countries visited. On most of the waterways in Europe and the United States, it is the practice to carry out extensive towing operations. In other words, in addition to self-propelled vessels for the purpose of carrying freight, dumb craft towed by tugs are used on a large scale. The chapter on "Craft, Methods and Costs" provides technical data on both types of vessels used on each system. In each case, an attempt has been made to relate the characteristics of the vessels used, to the conditions prevalent on the particular waterway, presumably with the object of finding out their suitability for conditions in South-East Asia.

In each case, attention has been carefully drawn to the existence of features through which full advantage is taken of every favourable factor in the waterway system to ensure maximum capacity for carrying freight, the achievement of maximum speed and the reduction of costs. Thus, in the dumb craft used in the Canal Fleet in France, it is noted that "The vessels have no longitudinal stiffening as they operate in sheltered waters, and groundings are rare. The weight thus saved permits extra pay load" (emphasis added). This functional emphasis in the report greatly enhances its value.

In order to bring out the relationship of the functional aspects to the conditions prevalent on each system, the latter are carefully described. The difficult condition caused by rapidly varying water-levels, the shallow bars at low water, the narrow and winding channels with short radius of curvature, the steeply-sloping bed, strong currents, shifting channels and ill-defined banks on the Rhone river are contrasted with the easier conditions found on the River Seine and the Canal system in France. The river training schemes including provision of shiplocks, by which difficult stretches of river are being slowly made easier for navigation, are briefly described and their effects on

the pattern of vessel construction is noted.

While considerable fleets of dumb vessels exist on most systems in Europe and the USA, the Report notes an increasing tendency towards the use of self-propelled craft, particularly in France. This tendency has been encouraged by the increasing mechanisation of loading and unloading operations at many points as a result of which the turn-round time for river craft has been considerably reduced.

The operating techniques of singly-operating vessels as well as those operating in groups with only one powered vessel are examined at some length with particular operation to their economics. It is noted that "push-towing gives better towing efficiency than pull-towing."

The importance of loading and unloading operation has already been mentioned. This is recognised through the devotion to it of a special section of the Report. The volume of freight carried on the inland water transport systems is considerable and in large part this is carried in bulk, a practice which has been encouraged by the development of suitable facilities at all points. "The fact that most cargo is carried in bulk and that large quantities are involved" says the Report, "have made it possible as well as economical to introduce a great deal of mechanization in cargo handling in spite of the heavy capital outlay." The fact that according to estimates "in many cases mechanization has reduced turn-round delays of vessels by 60 per cent" brings out the significance of this factor on the economics of operation. The development of mechanical shore installations is, however, "even more marked in Europe than in the United States because most European rivers have been trained over the entire navigable length and the seasonal range of this water-level is smaller than on American rivers". This shows how many factors are involved in such questions.

From the detailed studies made in France and the United States, the

members of the group have drawn certain conclusions and made certain recommendations for their respective countries. Reading the relevant chapter, one sees quite clearly the advantages that would have been obtained from the present study if more detailed information had been available about our waterways and the problems they present.

The main conclusions of the report are given below, though their tentative character is quite apparent:

- (1) Replacement of steam-engines by diesel engines will, in most cases, be advisable;
- (2) Attention should be paid to training of personnel, particularly for repair and maintenance of diesel engines;
- (3) Possibility of adoption of shallow draught self-propelled craft with screws running in tunnels should be investigated;
- (4) Application of Kurt nozzels seems advisable;
- (5) Feasibility of push and pull towing, especially in Burma, Pakistan and India, should be considered further;
- (6) Increased use should be made of light alloys for shallow-draughted dumb craft;
- (7) A modest start should be made with mechanization of cargo handling operations;
- (8) Water conservancy work should be the responsibility of Governments rather than of private companies.

The specific recommendation of the group refers to the organisation of a demonstration project covering craft design and operation and including experimentation with suitable tugs, pusher craft or other means of moving country boats and cargoes. The group came to the conclusion that "such a project would be extremely useful to development of inland water transport in the region, especially if testing of modern dumb craft were also included."

In the section recording the observations of the group with regard to India, some comments have been made about country craft. "Whereas country craft" says the Report, "will continue to be plying for small-scale traffic, these suffer from some inherent defects and so are not suited for large-scale mechanised inland navigation. These are built of unseasoned local wood and start leaking after a little use. Consequently operation of baling out

water have to be carried out extensively and the boats have to be beached frequently for recaulking. Further, these do not afford adequate protection to cargo against weather and pilferage."

Many of these defects are remediable without much effort and many in the know might disagree with the sweeping conclusion drawn in the report. The recommendation made by Mr Otto Popper and endorsed by ECAFE that "a demonstration project of shallow-draught tugs towing country boats be run for the benefit of the ECAFE region" has in fact much to commend it. Any recommendations in this sphere must necessarily take into account the overall limitations of resources with which the countries of the region are faced. One of the most important reasons for paying parti-

cular attention to inland water transport at this stage lies for these countries in the great improvements in the transport system that are likely to result from relatively little investment. This important fact must not be lost sight of and emphasis should be laid rather on improvements in organization or in techniques of operation which will benefit the country. The Sailing Vessels Committee's Report had concerned itself with those sailing vessels which operated on the coast or across the seas. A study of inland transport and the sailing vessels operating on our extensive waterway systems needs to be carried out today. The present Report, in spite of its competence only draws attention to the urgency of carrying out such a study.

Views on States Reorganisation—VII

Dilemma of Punjab

Sadhu Ram Sharma

THE States' Reorganisation Commission's report was released at a time when Punjab was ravaged by rains and floods of unprecedented intensity. The resulting havoc to life and property obscured to a considerable extent the people's reactions to it for a couple of weeks. From the communal tension prevailing before the publication of the report, it would not have been unreasonable to expect violent reactions from Akalis to a report which according to them is, in its substance as well as in its terminology, couched in the language of the Jan Sanghites. The first reactions of the Akali leader, Master Tara Singh, were in fact, violent. To quote his first press statement made immediately after the release of the report, "a decree of Sikh annihilation has been passed by States Reorganisation Commission. We are face to face with a calamity greater than that of 1947. The catastrophe of 1947 finished thousands of Sikhs. The report of SRC completely wipes them out from the face of the world. With faith in God and our Gurus, we shall fight with our backs to the walls".

The Proposals

The first thing to be noticed in the Report is that the United Punjab proposed by it is a slight variation on the Maha-Punjab demanded by Hindu organisations. The United Punjab is to be created by merging Punjab, Pepsu and Himachal Pradesh. Loharu sub-tehsil of Hissar, however, is to be taken away from Punjab and handed over to Rajasthan. The Report is subject to a minute of dissent appended by the Chairman, Mr Fazal Ali, who suggests the central administration of Himachal Pradesh instead of its merger with Punjab. Maha-Punjab as demanded by Hindu organisations included not only the above three states but also parts of Delhi and three Western districts of UP. But the Commission holds that on administrative and economic grounds, there is no case for further addition of territories to the proposed Punjab State. On the other hand, from a political point of view, the acceptance of such a proposal is likely to have very undesirable repercussions.

The Report came as a surprise and caused great disappointment to Sikhs whose hopes had been raised by earlier forecasts, not borne out by the actual proposals. The Commission, after a detailed examination of the proposal for a Punjabi-speaking state and the Akali Dal's memorandum in its favour, found no justification for the creation of such a State. To quote from the Report, "The linguistic complexion and the communicational needs of Punjab do not justify the creation of a Punjabi speaking State. The creation of such a state is likely to disrupt the economic life of this area. The case for a Punjabi speaking State falls, firstly, because it lacks the general support of the people inhabiting the area and secondly because it will not eliminate any of the causes of friction from which demand for a separate Punjabi speaking State emanates. The Punjab Suba will solve neither the language problem nor the communal problem and, far from removing internal tension, it might further exacerbate the existing feeling."

The Basic Principles

The Commission's recommendations in respect of Punjab cannot, however, be viewed in isolation from the rest of the Report which in general has laid down certain basic principles to be kept in mind while redrawing the map of India. It is in the context of these principles that the suggestion for creating a United Punjab is to be examined. Only the principles having a bearing on the present case may be mentioned. While reorganising States, the Commission stresses that national unity must remain an overriding criterion. Linguistic homogeneity has been rejected as an exclusive and binding principle. Apart from the important factor of financial viability and administrative convenience, there is also need for safeguarding the cultural needs of different language groups whether residing in unilingual or composite administrative units. Amongst the factors more specifically relevant to the case of Punjab are the Commission's emphasis on the need to thwart the particularist and separatist feelings so as to give a deeper

content to Indian nationalism and its vehement condemnation of the 'homeland' concept both linguistic as well as communal. It has to be borne in mind also that the Commission as a general rule lays down that the administrative set up in strategic areas would be determined by considerations of national security. When border areas are not under the direct control of the centre, it would be safer to have large and resourceful units.

In the light of these guiding principles, it will be easier to appreciate the rejection of the demand for a Punjabi Suba and the suggestion for creating the larger State of United Punjab instead. The case for a Punjabi Suba as set out in the Akali Dal's memorandum has been thoroughly examined by the Commission. Apart from general arguments in favour of forming linguistic States, the Akalis have argued specifically that the creation of such States, will remove all causes of unrest and discontent, eliminate the language controversy, make it possible to impart education in the mother tongue and help the people to grow and advance. Punjabi Suba will be a geographically compact unit comprising of seven districts of Punjab, the whole of Pepsu (except Hindi speaking areas of Mohendergarh, Nirwana and Jind) and the Ganganagar district of Rajasthan. Including as it does the seven most fertile areas of Punjab, such a State will be surplus in food, rich in resources and also financially viable. It will be a homogeneous State inhabited by sturdy people which will strengthen the defence of the North Western border especially as it also secures for the country a contented Sikh community.

Opposition to Punjabi Speaking State

The Commission at the outset notes a particular feature of the demand in so far as it is strongly opposed by large sections of the Punjabi speaking people residing in the area of the proposed State. The minimum measure of agreement necessary for making a change in the present arrangement does not exist. "The Dar Commission rightly expressed the view that no linguistic State should be imposed on substantial

minorities opposing them. In this particular case, we may actually be imposing the wishes of a minority on the majority." The Commission finds that there is no real language problem in Punjab at present as Punjabi and Hindi as spoken in Punjab are akin to each other. And the present set up presents no difficulty so far as communicational needs of the people are concerned. There are no distinctive cultural zones in the State and the present arrangement does not stand in the way of the development of Punjabi language and culture.

The majority of Hindus besides do not accept Punjabi as a medium of expression to the exclusion of Hindi. They plead that while they speak Punjabi at home, in their religious ceremonies and festivals, in their schools and colleges, they use Hindi. In any case they are not reconciled to the Gurumukhi script. Even those among the Hindus who accept Punjabi as their language, want it in Devnagri script. The opposition to Punjabi, it must be admitted however, is mainly based on political considerations. The Hindu mind has always taken the demand for a Punjabi Suba as a basically communal demand and has felt that all the cultural and linguistic arguments in its favour have been pressed into service to camouflage the real motives.

Hindi and Punjabi

The Commission notes that "it is not unlikely that large sections of Hindus would seek instruction in Hindi even if a Punjabi speaking State is formed. Whatever the legitimacy of such a demand may be, there is no method by which a person can be compelled to adopt a mother tongue other than that for which he himself shows preference." It may be interesting here to note the figures cited by the Commission. At the Matriculation examination of the Punjab University during the last four years, 73.5 per cent elected Hindi to answer their History and Geography papers and only 26.5 per cent elected Punjabi. Even in six wholly Punjabi speaking districts of Jullundur Division, the percentage of those electing Hindi was 62.2 and that of Punjabi only 37.8. "Motives cannot well be attributed to examinees at University examinations who must have exercised their option on the basis of their own literary needs and family traditions." All this unmistakably points to the inevitable conclusion that Punjab will have to be a bilingual State and Hindi and

Punjabi will have to exist and develop side by side. The recently introduced Sachar Formula recognising Punjab as a bilingual State is, according to the Commission, a more effective solution of the language problem of Punjab than unilingualism. Punjab, according to the formula, has been divided into a Hindi speaking Zone and a Punjabi speaking Zone. At the primary stage, instructions will be provided in Punjabi in the Punjabi speaking Zone and in Hindi in the Hindi speaking Zone. But at the secondary stage both the languages will be compulsorily taught in the two zones. This provides a place of honour to Punjabi as it has been conceded the same treatment in the Hindi speaking zone as has been accorded to Hindi in the Punjabi speaking zone. In offices too, while Hindi is gradually to replace English, Punjabi will take the place of Urdu which along with English still remains the de facto official language of Punjab.

Changing Pattern of Population

The Commission holds the creation of a compact unilingual State impossible also for the reason that with large-scale dispersal of people from Punjab (Pakistan) in Eastern Punjab and with the colonisation of the area under the Bhakra project, the division between the two linguistic zones is progressively becoming less and less real. The creation of such a State as already mentioned is also not going to relieve the tension prevailing in this area as the tension follows communal and not territorial lines.

United Punjab

The United Punjab as proposed by the Commission includes Punjab, Pepsu and Himachal Pradesh excluding Loharu Sub-Tahsil of Hissar district of Punjab which will be handed over to Rajasthan from where it can be more efficiently administered. The new State will have an area of 58,140 sq. miles as compared to the present Punjab's area of 37,347 sq. miles and a population of 17.2 million as compared to 12.6 million. It may be noted that while on the question of the merger of Punjab and Pepsu, the Commission's Report is unanimous, in the case of Himachal Pradesh, the Chairman, Shri Fazl Ali, has expressed himself in favour of retaining that area as a separate unit to be administered from the centre.

Amalgamation of Punjab and Pepsu, it may be noted here, was widely expected. It has been realised by the people both in Punjab

and in Pepsu that Pepsu is an artificial unit and cannot be continued under any scheme of reorganisation. The entire State consists of five disconnected units surrounded by territories of Punjab. Thus it lacks geographical contiguity and physically it is very much a part of Punjab. Moreover it is the smallest Part B State. Administratively also, Punjab and Pepsu have a number of common problems and devices like the Joint Advisory Council and periodic conferences have had to be adopted to achieve a certain degree of co-ordination between the two States. Thus it would be simpler, more economical besides being conducive to more efficient administration, if the two States were merged together. The idea of retaining Pepsu as a "Sikh Homeland" having 49 per cent Sikh population has been viewed by the Commission with great misgivings.

The Commission thinks that Himachal Pradesh cannot stand as a separate unit as its resources are poor and it lacks trained personnel. Thus the integration of this State with Punjab will be advantageous from the economic and administrative points of view. The economy of the region is also an integrated one. For instance, soil conservation in the hills is virtually important from the point of view of the plains. The catchment areas of the rivers Sutlej and Beas are mostly in Himachal Pradesh and from the point of the Bhakra project this factor is of great relevance. For the same reason the need for transfer of some areas of the State to Punjab had already been accepted.

The Commission admits that there is some feeling of uneasiness among some sections of hill people about the proposed merger. Yet the opposition is not so much as it is made out and vested interests were actively fostering it. Some safeguards have been suggested to ensure that the economic development of this area is not impeded. Central Government is to retain supervisory authority over this area, at the same time continuing the flow of central aid for a period of another ten years. It is also provided that the Cabinet should include at least one member from this area. The Commission also feel that strategic considerations too are in favour of the establishment of a strong and more resourceful unit as the India-China border in this region admits of easy infiltration.

Chairman's Dissenting Minute

Shri Fazl Ali, the Chairman, in his 15 point minute of dissent suggests the central administration of Himachal Pradesh, as both genuine and widespread feeling against merger with Punjab exists among the people of the State. Besides, the State is free from the language and communal problems of Punjab. A more important reason he mentions is that, in case of merger, the economic development which is proceeding apace in the State will be retarded. Himachal Pradesh is a backward area on the development of which considerable outlay will be required. As Punjab cannot shoulder the burden, the Centre will be required to spend large amounts of money for its rapid development. Along with other factors, the strategic considerations also point to the advisability of a centrally administered Himachal Pradesh.

It may be interesting to examine some of the political trends in Punjab noticeable from the people's reactions to the SRC Report. One thing that has become sufficiently clear is that the Akali Dal has a widespread hold over the Sikh masses. Akalis have played effectively upon the feeling of fear among the Sikh masses about their domination as a community by Hindus. Nationalist Sikhs are left with not a very significant backing. Even in the case of nationalist Sikhs substantial number of whom are ex-Akalis, it is quite common in Punjab to hear a Hindu alleging that they are Akalis at heart. Sikhs on the other hand bluntly call the Punjab Congress an arch communal organisation as the Congress Government in Punjab also supported the Hindu sponsored demand for Maha Punjab.

Though half of the Punjab Cabinet consists of Sikhs, Akali propaganda utilises the fact that since Independence, there has been no Sikh Chief Minister or Governor in Punjab. Ignorant as the Sikh masses in villages are about the working of the Constitution, they are easily taken in by such alleged discrimination. Somehow or other Akalis have come to the fore as representatives of Sikh opinion. It may be of some interest to note in this context that even the recent willingness of Pandit Nehru to listen personally to the Akalis and the consequent talks at Delhi between Pandit Nehru and Maulana Azad on the one hand and an Akali delegation on the other are in some circles construed as

official recognition of the Akali Dal as representative of important sections of the Sikh community.

Sikh Discontent

It is, however, sufficiently clear that there is widespread discontent among Sikhs. The Commission has realised that "important sections of Sikhs seem to nurse a sense of grievance and seek its redress in a Punjabi speaking State of their conception." One grievance that has been voiced relates to the relative share of the Sikh community in services. While the validity of this complaint has been questioned, there are on the other hand similar complaints from Hindus about discrimination against them. There is no way of ascertaining facts as both the parties have their own facts to offer. Only an independent inquiry may be able to shed some light on this question.

One significant shift in the basis of Akali demand for Punjabi Suba may be noticed. Having failed to convince the Commission about the genuineness of their demand for a Punjabi speaking State, Akalis have overnight ceased talking about a linguistic state. They talk now in terms of the ratio of Sikh population in such a state. The Akali convention on SRC and the subsequent statements of Akali leader Master Tara Singh show clearly that they want a Sikh majority State. The extremist element among Akalis have even been talking of demanding a Sikh Sovereign State. It is interesting to note an amendment moved by a responsible Akali leader, Sardar Pritam Singh Gojran, to the Akali Convention's resolution on SRC Report demanding a Sikh Sovereign State. The amendment, however, was later on withdrawn on the intervention of the Convention's Chairman, Master Tara Singh, who said that such a demand was premature as Sikhs have not yet exhausted all the constitutional methods of fighting for a Punjabi Suba. The creation of a Punjabi Suba or a Sikh majority state according to Akalis, however, is the only means of protecting Sikhs from communal domination and discrimination. Hindus on the other hand take the talk of 'discrimination' as a bogey raised by Akalis to secure political advantage at the expense of the majority. Members of the Akali rank and file have scared the Hindu masses in the villages by their irresponsible and belligerent talk of securing a Punjabi Suba and in some

cases even of forcing a wholesale migration of Hindus. They are themselves to blame if all their moves are blindly opposed by every Hindu on account of the distrust they themselves have created.

There is, however, one healthy sign. The top Akali leaders, after their talks with the Central Government, seem to be in a more conciliatory mood. Akalis are again due to meet the Congress leaders during the next few days and it is not unreasonable to expect that a compromise may be worked out to satisfy Sikhs without provoking widespread resentment from the majority community. One development has, however, to be kept in mind. Hindu communal parties have recently come to the fore by rallying Hindu opinion around them especially as the Congress in Punjab remains a house divided within itself. It is not uncommon to hear ordinary Hindus speaking of the weak-kneed policy of the Congress and vehemently protesting against 'appeasement' of Akalis. Hindu organisations too threaten a 'Morcha' if the report is not implemented in full. But if the proposed United Punjab is created, Sikhs remain discontented. The Congress is thus faced with the dilemma of a compromise.

The Solution

The people in Punjab, however, hope that some solution will be found by the four-man body appointed by the Congress working Committee to consider controversial issues of Punjab, Bombay and Karnatak. Speculation is already current about different solutions. It is however expected that the solution may be founded on Shri Fazl Ali's minute on Himachal Pradesh. Himachal Pradesh may be kept separate under the centre. As a further concession to Akalis, some exclusively Hindu hilly areas of Punjab may also be amalgamated in Himachal Pradesh. That implies a merger of Punjab and Pepsu excluding Kangra, Kulu and Kohistan areas of Punjab and Mohindargarh district of Pepsu. In such a state the proportion of Sikh population will be about 40 per cent which compares favourably with 31 per cent in the present Punjab and 32.5 per cent in proposed United Punjab and 35 per cent in the United Punjab as proposed by Shri Fazl Ali. Recent press reports suggest that Sikhs in general may be satisfied with a 40 per cent ratio and Akalis may also be expected to accept such a compromise.

Depression and Boom in Agricultural Prices —Their Implications

Ayodhya Singh

ONE of the greatest events in the economic history of the world during the twentieth century was the Great Depression of the Thirties. India was drawn into this muddle of the Great Depression mainly because of her position in the world as an exporter. America and many European countries received a serious financial setback by the Wall Street crash of 1929. India's exports to these countries were seriously affected, and hence the wholesale prices of her chief products were greatly reduced. At the same time prices of those goods of which India was not the chief producer fell along with world prices. Prices of competing goods also naturally fell in sympathy.

In course of time, the retail prices and ultimately the harvest prices were also affected to an equal extent. By an all round fall in purchasing power, a vicious circle was created and all the prices began moving downwards. However, the impact of the depression on agricultural prices was more than on non-agricultural prices. The movement in the price parity, showing the ratio between the level of farm and industrial prices¹, can be seen from Table I containing price indices of agricultural raw materials and manufactured jute and cotton, with base, 1928-29=100.

The price indices of 1 and 2 in the preceding table show that while the prices of both the groups were falling, the fall in the former was more precipitous implying a relative worsening of the former against the latter during 1929-30—1934-35. The ratio of 1 and 2 gives us the barter terms of exchange between the producers of the two respective groups. These, on calculation, show that for the respective years, the barter terms of exchange were 96'9, 94'6, 82'4, and 80'0 revealing a falling trend in the former during 1929-30—1934-35.

The bottom was reached in 1933. There was some recovery in the next two years, but it was in the latter

part of 1936 that prices began to rise and the rise was almost continuous till August, 1937. After that the prices began to fall and were generally on the decline till the end of June, 1938, when they showed a slight rise which was broadly maintained till the end of 1938. However, "when the upward movement started in 1933, the rise in prices of commodities in which the Indian agriculturist was interested was painfully slow and halting"². With the exception of a short period from the middle of 1936 to about the middle of 1937, there was during the period extending up to September, 1939, no definite upward movement in agricultural prices.

¹Review of the Trade of India, 1937-38, p. 12.

Table II shows that agricultural prices, particularly of food articles, mostly lagged much behind the prices of manufactured goods and raw materials, and the barter terms of exchange moved against the cultivator, a tendency which was arrested after the outbreak of the war with Japan. Later on owing to the cessation of imports of rice particularly after the fall of Burma, which also brought war almost to the mainland, and the increased demand for food and agricultural raw materials within the country necessitated by a speedy pace of the Indian productive effort to meet the demands of the successful prosecution of the war against the Axis powers in general and Japan in particular, the rise in the prices of food articles and agricultural com-

Madras

SOUTH INDIA, the cradle of ancient Dravidian culture, is rich in monuments of the past. Chief among them is the beautiful seaside temple at Mahabalipuram, near Madras City, admired by visitors from all over the world.

In Madras the old mingles harmoniously with the new. Motorists are proud of their ancient heritage, but have a lively respect for modern progress. That's why they appreciate the virtues of Double-Protection MOBILLOIL and make it a point to look for the Flying Red Horse—honouring a tradition among progressive motorists throughout the world.

the **CLEANING** action
the **PROTECTION** against wear

STANDARD-VACUUM OIL COMPANY (The Liability of the Members of the Company is Limited)

modities was greater than that of raw materials and manufactured articles.

It was in the fourth year of the war that the pre-war parity between agricultural prices and industrial prices was restored, but cultivators in contrast with manufacturers stood to suffer until February, 1943 owing to a relative lag in the upward trend of agricultural prices, as they had been suffering even before for a decade during the depression of the thirties. The U P agricultural parity index (base: year ended August, 1939=100) was 94 in 1940; 80 in 1941 91 in 1942; and 102 in 1943, revealing relative recovery in agricultural prices as against 1939 only in 1943.

Tightening of Controls

However, during the last two years of the war, the tendency of a relative increase in food prices, as against other prices, was not only arrested but actually reversed. The relative decline in food prices was conspicuous in the fifth year, though only slight in the last year. This decline was due to the tightening of controls on food grains and implementation of the main recommendations of the Food Grains Policy Committee, 1943, relating to imports of food grains, extension of rationing, statutory price control, larger production, besides Governmental monopoly procurement of grain and co-ordinated purchases of military requirements. Manufactural prices too recorded moderate declines during the last year of the war mainly owing to the serious efforts made in removing the loopholes and laxities in the system of price control of cloth. The relative rise in raw material and non-food agricultural prices was due to the intensified demand on the part of industries.

The U P agricultural parity index (base: year ended, August 1939=100), which stood at 102 in 1943, declined to 94 in 1944, though it revived in 1945 owing to the relatively greater fall in manufactural prices. The parity index was 100 in January, 104 in February and April, 107 in June and 139 in August, 1945. Though these parity indices are indicative of conditions in U P, yet they roughly indicate the trend for the country as a whole. This leads to the inference that favourable terms of exchange for agriculturists against non-agriculturists, which were conspicuous during 1943 were significantly restored rather at a higher level in 1945 for which the parity index was 109.

Coming to post-war period, we no-

tice from Table III that the price index of agricultural commodities always remained at the top, only remotely followed by that of the other three groups, the relative increase in their prices being the highest during all the years except between September, 1948 and June, 1949, when they, along with food and manufactural prices, showed a net decline while raw material prices showed a gently rising tendency. Among the constituents of the group of agricultural commodities, there was a biased increase in favour of non-food prices, particularly after partition and also after the reversal of decontrolled regime in September, 1948. This suggests that the producers of food articles failed to gain as much from the increased prices as producers of non-food crops. In fact, the aggregate economic gain that accrued to the former was far less in comparison with the latter.

Equal Footing

The raw material prices continued increasing during the post-war period. The increase was quite marked during 1950, when their price index, which always remained below that of manufactured articles since the end of the war, exceeded that of the latter. This signified a relatively higher economic gain from increased prices to the producers of raw materials against the manufacturers though up to 1949 the former's aggregate gain was less than that of the latter. The price index of raw

materials, having come nearer to that of food articles by the end of 1950, brought the former on an almost equal footing with the latter.

The price index of manufactured articles, which remained slightly higher than that of food articles up to November, 1947—till the introduction of decontrol—and substantially higher than that of raw materials up to the end of 1949, lost ground against both the groups, from December, 1947 against the former and from January, 1950 against the latter. On the whole, while manufacturers derived higher gain from increased prices in comparison with the producers of raw materials, their position deteriorated against the latter. Further, their aggregate gain was lower than that of the producers of food articles, though it approximated to that of the latter by the end of 1950. Again their gain was less than that of the producers of agricultural commodities as a whole.

On comparison, it is found that while during the war period as a whole, the highest increase in prices was recorded by manufactured articles followed by agricultural commodities and food articles, the least increase was in raw materials; during the postwar period, the highest increase in prices was recorded by agricultural commodities followed by food articles and raw materials, the least increase being in manufactured articles. This implies that the gains that accrued to manufac-

TABLE III
Variations in Price Indices of certain Groups during September 1954-December 1950- Post-War Period.

Period	Food Articles (2)	Agricultural commodities (3)	Raw Materials (4)	Manufactured Articles (5)
(1)				
1945				
September	264'2	238'2	210'8	242'9
December	278'5	238'8	211'7	235'8
1946				
June	302'8	245'5	226'4	240'0
December	326'0	263'2	235'8	277'8
1947

December	461'0	358'0	345'0	343'0
1950				
June	534'0	380'0	349'0	353'0
December	536'0	396'0	352'0	383'0

Bases and Sources, as given below Table II, subject, however, to the provision that from 1948 onwards, all the indices except that of Food Articles have been constructed by the writer himself on the basis of the Economic Advisers' weekly indices of individual commodities with the original bases just to maintain uniformity with the sensitive series, which was substituted by the General Purpose Series with different base and different groups from April 1948 onwards.

turers during the war period were gradually swamped by the comparatively higher gains that accrued to the other groups during the post-war years. The producers of agricultural commodities, mainly of non-food crops, gained absolutely over time and also in relation to the other groups. Raw materials could also come out of the bottom level, and having superseded manufactured articles, approached food articles in regard to relative gains derived from increased prices. The group of food articles practically lost its wartime position against agricultural commodities and also to a considerable degree against raw materials, though thrashing down the group of manufactured articles by the end of 1950.

Peak Level

In short, the position of the agriculturist vis-a-vis that of the non-agriculturist was far better during the post-war years as compared with the war period and also the pre-war period. The relative gain was at the peak level in 1947 when the U P agricultural parity index (base: year ended August, 1939=100) amounted to 151. Even the lowest parity index in the post-war period (124 in 1948) was substantially above the wartime peak of 102 in 1943. The parity indices for 1945, 1946, 1949 and 1950 were 109, 129, 145 and 134 respectively. While the war period as a whole recorded an average parity index of the order of 95, the post-war average amounted to 133. This apparently leads to the conclusion that agriculturists, who were slightly losing against non-agriculturists during the war period, not only made up for their relative loss, but also achieved substantial relative gains during the post-war years.

Perhaps it is on account of such relative increase in agricultural prices vis-a-vis industrial prices during the post-war years that the "Fund Mission" suggested the mopping up of additional incomes arising out of relatively increased agricultural prices during post-war inflation. The members of the mission were of opinion that adequate taxation is especially important in securing resources for development in view of the large role assigned to Central and State Governments in the Five-Year Plan and the difficulty of private saving. They were convinced that land revenue had lagged conspicuously behind other major taxes and the rise in agricultural prices and incomes during the war and post-war inflation. They calculated that since 1937-38 it had fallen from

second to fourth place among tax resources. Before the war, land revenue accounted for almost one third of the revenue that the Provinces of undivided India raised from their own sources (i.e. total provincial revenue minus devolution of revenue and grants from the Centre), while in 1951 it represented less than one sixth of State revenue from own sources. Further, this trend—continuation of a long-term downward movement in the proportion of receipts from land revenue—is, according to them, mainly attributable to the failure to adjust land revenue to the rising price level. The rise in prices of both agricultural and other commodities and the consequent reduction in the real yield and real burden create a strong presumption in favour of a substantial increase in land revenue.

The case for increased land revenue does not rest on any assumption that farmers' real incomes have increased proportionately to agricultural prices. Clearly they have not. Nevertheless, regardless of the size of the producer's marketable surplus or the development of other prices and costs, the rise in agricultural prices has lightened the real burden of land revenue simply because the payment now represents a much smaller amount of agricultural produce and a smaller proportion of the gross yield of land. Furthermore, the decrease in real yield of land revenue has come about by default rather than by deliberate decision.³ They are convinced that it is possible to raise significantly more from land revenue than the Rs. 340-million which the Five-Year Plan calls on the States to raise over the whole period of the Plan from taxation on land, that is, land revenue and agricultural income tax.

Depicting the so-called agricultural prosperity against the background of pre-war conditions amounts to lack of clear insight into the real character of the agricultural economy of India. It is necessary to bear in mind that the pre-war years were years of depression in agriculture, signifying the failure of proportionate recovery in agricultural prices vis-a-vis industrial prices. In fact, the pre-depression parity between agricultural and non-agricultural prices had been revived only at the end of the war, and hence the mission ought to have based their

³Fund Mission Report, 1953-54; Extract from Staff Papers, I.M.F., Volume III, No. 3; February, 1954, Pages 371.

findings against 1945-46 or 1925-29 levels rather than against the late 1930's, when the parity had tilted too much against the agriculturists who were groaning under the rigid long-term debts (contracted from the village Shylock). The relative rise in agricultural prices during the post-war period, instead of inflating his position, revived a standard only slightly above the poor economic level of 1920's.

And even these gains above the compensatory line did not primarily benefit the ordinary cultivators owing to the non-existence of marketable surplus with most of the petty land-holders, coupled with the backwardness of their marketing methods and the devices of a chain of middlemen. Mendacious dealers purchased agricultural goods at harvest time, as the full benefit can be obtained not immediately after the harvest but later, with the result that large stocks had been lying unsold to the great detriment of consumers, with least benefit to the cultivators from the gap between harvest prices and the subsequent sale prices paid by consumers.

*He who is firmly seated
in authority soon learns
to think security."*

Around Calcutta Markets

Broadening of Activity

Wednesday, Evening

SUPPORT for Coal and Jute shares has been a feature of price movements on the Calcutta Stock Exchange in the last few days. Paper shares remain steady. So also are Engineering and Miscellaneous shares. Speculative scrips developed an irregularly lower trend towards the close of last week, only to revive by the middle of this week. Shellac prices were firm. Both raw jute and jute goods continue to move up.

There has been a broadening of activity in recent days. Coal shares, which were idle for a considerable period, are creeping up. There is renewed buying support in Jute shares. These are welcome developments. But a distressing feature of the recent behaviour of the stock market here may be noted. It has invariably happened that any weakness in speculative counters like Indian Iron has been promptly reflected in equities in general.

Not only clearing shares, but even sound cash scrips have tended to be unduly influenced by fluctuations in Indian Iron. Herein lies a danger. By Monday next, more will be known about the Indian Iron Company's policy relating to capital reorganisation. It is widely conceded that Indian Iron quotations are not likely to be maintained in the absence of any issue of right or bonus share by the Company. Some idea of the Company's future plans will be had from the Chairman's speech next Monday.

If it transpires that the Company has no immediate intention to capitalise reserves, Indian Iron may develop a downward trend. This, as recent experience shows, may have an adverse effect on equities on the Calcutta Stock Exchange. As has been stressed in these columns on earlier occasions, this is a threat to the market morale which cannot be ignored. It is not denied that there is considerable speculative activity in Indian Iron. Nor is it seriously denied that the current values for Indian Iron are based on certain assumptions some of which are debatable.

Coal Shares

Subject to this danger, the recent broadening of activity is a reassur-

ing indication. For a considerable time, Coal shares remained neglected because of the threat of nationalisation. Recent statements by the Finance Minister have had a sustaining effect on Coal shares. It was diplomatic of the Finance Minister to assure the industry that the Government was more interested in raising coal output to the estimated target, included in the tentative framework for the second Plan, than in nationalising the industry.

There will be a relative expansion in the public sector of this industry. But private coleries also will have to expand output considerably. It is, therefore, clear that private coal companies will be faring better during the Second Plan period. This, coupled with the assurance that the Government is committed to paying fair compensation in case of nationalisation, is having a "bullish" effect on Coal shares. At current levels, some of the Coal shares are good "buys" on the assumption that the coal industry will expand in the next five years.

Jute Better

In recent days, investors have been testing the market in Jute shares. Statistics justify such action by investors. For months in succession, stocks of jute goods with the mills have been falling. It is, therefore, clear that exports and sales of jute goods are promising. There is growing Pakistani competition. But it is now realised that Pakistan's capacity to export jute goods has been exaggerated since the devaluation of the Pakistani rupee. Because of Pakistan's raw jute policy, India is able to compete with the Continental manufactures in the world export markets.

Fears, however, persist that, at current prices for raw jute and jute goods, simultaneous business is not always profitable. Both raw jute and jute goods are moving up. Jute goods are going up because data reveal that exports and despatches are promising. But Jute shares are not moving up correspondingly on fears that mills are not making sufficient profits. There are rumours that mills may decide to raise output so as to earn more on the increased turnover.

In recent days, there have been consistent rumours about unsealing of looms. This is interpreted in market circles to mean that the industry is hopeful about exports. It has, however, been argued that, as the mills decide to raise output, raw jute prices may move up further. This is a possibility which cannot be ignored. Meanwhile, there is statistical evidence that mills are switching-over to sackings. This explains why hessian prices are relatively steady.

In an otherwise rising market, Tea shares remain hesitant. This is mainly due to the recent fall in auction prices. Auction prices are falling as stocks on offer are mounting. Some of the reasons for higher offerings are temporary. In anticipation of a reduction in the tea export duty, foreign buyers are keeping away from the Calcutta auctions. It is true that this year's output of northern India tea is higher. It is also true that this year's export demand is lower. Tea shares are not likely to share the current boom in equities. But there are reasons to believe that fears about the fall in tea prices and Tea shares are somewhat exaggerated.

Technical Position

Miscellaneous and Engineering shares are being well supported at all set-backs. Sufficient time has elapsed since the end of cornering activity in these groups to make it evident that these shares are moving up on wider economic considerations. There are many who are suspicious of the continued spurt in Indian Iron and in some other speculative shares. But investors agree with the market analysts that the strength in Miscellaneous and Engineering shares is quite justified.

There has been no speculator rise in these groups of shares in recent days, though both groups remain steady at higher levels. Recent revival of interest in Coal and Jute shares has had one good effect on the market. This has led to a reduction of mainly speculative interest of Miscellaneous and Engineering shares. As the speculative element in the market is widening its interests, the market as a whole is becoming less vulnerable technically.

From the Chair

Killick Industries Limited

Speech of the Chairman Mr E D Sheppard

ADDRESSING the Eighth Ordinary General Meeting of Killick Industries Ltd. held in Bombay on 25th November, Mr. E D Sheppard, the Chairman, said:—

Gentlemen,

It gives me great pleasure to welcome you to this Eighth Annual General Meeting of Killick Industries Ltd. Since we last met together, much has happened and even more is contemplated which will influence the industrial and economic life of the country. Functioning as our Company does as a part of India's industrial life its future will doubtless be affected by these events and by the thinking which authors them. I propose, therefore, in the course of my speech this afternoon, to deal briefly with those issues which will influence the progress and development of the Company.

The Second Five Year Plan

It is gratifying to know that the Private Sector of the mixed economy has successfully played its part during the course of the First Plan by fulfilling its allotted tasks. The Plan-Frame for the development of India during the next five years has now been issued and is the subject of debate and discussion which will lead to detailed definition embracing the targets which are to be achieved and the means of achieving them.

The Private Sector's function during the Second Plan, involving as it does an investment of Rs 2200 crores, is stimulating in its greatness. It will have to exert to the utmost every attribute it possesses in the way of managerial experience, technical skill and financial acumen to be victorious. I have no doubt that Free Enterprise has the inherent ability to succeed, and being, as I am, an unrepentant believer in the efficiency of this system, I might be forgiven for looking forward to the next five years as a period of challenge when it will be possible for the Private Sector to prove in friendly and competitive rivalry with the Public Sector that it is fully well equipped to assist the country to attain its ultimate goal of a Prosperity State—a phrase I prefer to that of Welfare State—through the production of constantly increasing

wealth and by its fair and equitable distribution.

Free Enterprise

But for a variety of reasons, mainly springing from prejudice and the lack of real knowledge, Free Enterprise is today passing through the severest test that it has yet encountered. It operates in an atmosphere of suspicion and mistrust, and is the constant target of many who see nothing but evil in it. As it is of the utmost importance not only for the future of joint stock companies, but also for that of the nation that this question be viewed in a proper perspective, I intend with your permission to take a few minutes of your time in attempting an analysis of it.

The demand for a radical reform of the capitalist system of economics has arisen in India among certain sections of society not only from doubts as to its efficiency but also from deeply held views as to its immorality. Criticism of the system is chiefly based on the charges that it depends essentially on the pursuits of private gain, that it puts individual interest before the common good, and that it leads to great inequality of income. To remedy this state of affairs these people advocate the establishment of governmental control over every aspect and feature of the country's economic system. Only thus, they argue, will it be possible to establish public interest in the place of private gain, and ensure that the means of production are owned and used by society as a whole. The logical outcome of these theories is to press for their translation into practice by the nationalisation of industry, and by a progressively increasing incidence of taxation, which it is claimed will lead to the utopia of an economic democracy and the transfer of industrial power from private to public hands.

On the other hand there are others who are equally convinced that over-centralised economic planning, nationalisation, and high taxation will lead to precisely the opposite results to those for which their advocates hope. These people also claim, and not without reason, that interference on this scale could have unfortunate repercussions leading to a restriction

of political freedom and liberty. In support of this theory they are able to quote Mahatma Gandhi who said: "I look upon an increase in the power of the State with the greatest fear, because although apparently doing good by minimising exploitation, it does the greatest harm to mankind by destroying individuality which lies at the root of all progress".

From the economic angle it is legitimate to consider the experiment which was tried out in the United Kingdom during the first five years after the war, when the precise theories now advocated in India by the exponents of state control of industry were introduced and tried out. It was soon realised that the operation of such a system based on a central authority staffed by civil servants unversed as they were bound to be, in all the complexities of industrial management and company promotion, simply did not work. It led to irrationality, muddle, waste and in general to the very negation of those attributes, which the exponents of the plan had claimed for it. This old-fashioned economic theory was finally discredited by its own fervent supporters at the recent Labour Party Conference in England, when by an overwhelming majority the Socialists of England set their face against nationalisation and the further extension of state ownership as a means of securing its social and economic ends.

In India however there is an immense amount to be done which can and should be dealt with by Government, and which even the most ardent exponent of free enterprise would not suggest that free enterprise should undertake. For example by the construction of multi-purpose river-valley projects our Government has struck a blow for future prosperity and well-being of which it alone was capable. I wonder however whether Government will be able to improve in any way on the Private Sector's knowledge and ability in the Coal Industry, whose future it has been considering in terms of nationalisation.

To my mind the true position is clear and simple, and it is that there is almost certainly no alternative to

the co-ordinated efforts of both the State and Free Enterprise and this is exactly what Government has proposed in its plan for a "Mixed Economy" which will best forward the economic and social welfare of the country while largely reconciling ideological differences. What is important—and vitally so—is that within this concept good faith should be kept with the Private Sector. It has a unique part to play and it is entitled to support and encouragement in the pursuit of its ends. There have been malpractices, and there are evil-doers within its orbit. This is true of every walk of human life in Governments and in personal affairs alike. One fervently hopes that the advance of social thinking will lessen the evil, but its existence, based as it is on human frailty, should never be used as a reason to banish a system which has been tried, and not found wanting, in the evolution of industrial development.

Through the vigorous and fairly directed application of the "Mixed Economy" it will one day be possible for the country to achieve and maintain a standard of national well-being through full and gainful employment. Should this happy state of affairs be permitted to come to pass, I venture to predict that the existing ideological conflicts in regard to the manner and method of economic development will die out, never to be revived.

Taxation

The Report of the Taxation Enquiry Commission was published during the course of the year and many of its recommendations have already been translated into legislative effect. It is expected that recognition will be given to some of the remaining recommendations of the Commission in succeeding budgets. So far as industry is concerned, the major effect of the Commission's recommendations is to assist corporations and industrial projects to develop, while at the same time ensuring that the individuals concerned with, and responsible for these developments, are not permitted to gain from the work which they do.

This result flows logically from the terms laid down for the Commission, namely, to reduce inequalities of wealth and income and yet to promote capital formation for productive enterprise. In point of fact these two conditions are contradictory and irreconcilable. In the result the Commission has first set out

to gain that hoary and outmoded socialistic objective of "Soaking the Rich". Then realising that this "Soaking", which in fact means the elimination of savings, must inevitably result in the drying up of capital formation, it seeks to find a precarious balance for its task, by the granting of a substantial rebate to selected established industries, and giving a "Tax Holiday" to new ones. One may be pardoned if one finds it difficult to agree with this reasoning, and is left to wonder whether the Commission like the popular song of some years ago, has also failed to solve the riddle as to "which came first the chicken or the egg?"

The distinction drawn between individuals in industry on the one hand, and the corporations which they serve on the other may be "good politics" in the sense that it seeks to foster the political aspirations of a socialist dogma, but it is certainly not sound economics. It can only result in the production of people stamped in the mould of drab equality and devoid of incentive to do anything that is new or clever. It is indeed a curious development that the Taxation Enquiry Commission has sought to label dreary changelessness as venturesome and radical, and to condemn initiative and progress as being reactionary and conservative.

However convenient it might be from the angle of furthering the cause of socialistic thinking, it is unfortunately not possible to separate institutions from the individuals who operate them. The disincentive effort which the recommendations of the Commission would produce on the latter cannot but be reflected in the former. A curtailment of consumption, the elimination of savings, and the equalisation of incomes even further than has already been achieved must adversely affect the development of industry, however strong the efforts to sustain it by tax concessions. Industry to thrive and prosper must cater to the needs of expanding markets, and to have these, it is necessary to provide an atmosphere in which there is freedom and enterprise, and the personal ambition to reap the just rewards of initiative and endeavour.

Chairmen of companies, Senior Directors, and highly placed Industrial Executives, are the particular targets of the emotional venom which is generated among politicians and in Parliament in the

matter of high incomes within industry. The popular theme is that these people lead a life of ease and idleness, enjoying luxury and opulence, while in some mysterious and quite inexplicable manner the industries for which they are responsible prosper and thrive and make money for them. What a distorted and fantastic picture this is! If such a state of affairs ever prevailed in the dim and distant past, it certainly has not done so for many a long year. The average high-level Industrial Executives work very hard indeed and certainly many hours longer than do those who are protected by legislation in regard to the number of hours which constitute a working week. Further, whether within the office or outside it, they are never free from anxiety and the responsibility of their charge. With taxation and the cost of living at their existing levels, the salaries which they are paid eventually result in a net accrual to their bank balances each month of amounts which permit of little if any saving and leave no margin for unforeseen eventualities. It will achieve no good and result in considerable harm to the promotion and management of industry if further difficulties are heaped on these people. I quote here from the Bible:

"Let the elders that rule well be counted worthy of double honour,

"For the scripture saith, Thou shalt not muzzle the ox that treadeth out the corn. And, the labourer is worthy of his reward."

The Companies Act

The form of the new Companies Act which became law earlier this week is now well-known, and we are studying the effect it will have on our Company.

More unfortunate than the substance of the changes which are sought to be made in the Companies Bill is the manner in which the profession of industry and business has been debased in the debate which preceded it. During its course Managing Agents were labelled as "Sharks", "Jackals" and "Blood Suckers", and a calculated endeavour was made to depict them as social parasites who, caring nought for the good of the country or of its people, were concerned only with lining their pockets through deceit and double dealing. The massive achievements of many Managing Agency

Houses during the past many years are well known to you, and you know too that such Houses have always been subjected to the stern control of the shareholders and workers of all the concerns they have promoted and managed as well as of the consumers of the various products of their enterprise. It is indeed surprising, therefore, and most discouraging to find that work which one felt might legitimately merit national satisfaction and even a little praise, is in fact dubbed with no evident acknowledgment of exception as being selfish, anti-national and devoid of grace.

It is, I feel, of the first importance that a more constructive and realistic approach towards the apparatus for the promotion of industry in our country should be taken by those who now criticise.

We are also considering the effect which the proposed amendments to the Electricity (Supply) Act will have on the three Electricity Companies.

It is unfortunate that I have had to deplore the attitudes which are today taken towards the Private Sector and Free Enterprise. I have done so because of the strong conviction that it is the inescapable duty of companies like ours, at the present time, to define their views on these important issues unequivocally and in a straightforward manner. Honest and constructive opinion can only do good and should never be resented.

At the same time I would assure you, without any reservation, that it will be the endeavour of Killick Industries to co-operate to the fullest extent with Government and the rest of industry to make a real success of the Second Five Plan. Through its achievement the country will be placed squarely on the road to greatness, and a better life for all.

Our Own Affairs

Turning to the Directors' Report and Accounts I would like to draw your attention to the changed layout this year which I think you will find more convenient and which has been necessitated by further diversification of the Company's interests. You will see that the Balance Sheet has been compressed into one double page at pages 6-7 and that the details of the Reserves and of the various ventures which have been started and maintained by Killick Industries Ltd., such as the Kachidana mining venture and the Steel Files project of John Baker & Sons, have been placed in two separate Schedules at pages 10 and 11. I think that this altered layout of our Balance Sheet and Accounts is

indicative of the new direction in which our Company is beginning to develop.

The new Light Industrial Colony which we are building at Chandivli just outside the Santa Cruz airport will, I hope, be a model of its kind. The first project, namely the Factory to manufacture Engineers' Steel Files was put up in what must be almost record time and is now producing even better Files than are made in Sheffield itself. We have other plans for similar and allied undertakings. We are also in the advanced stages of planning a much larger project further afield. When this project comes to fruition I imagine it will be of such a size that it will be necessary to float a separate managed Company.

The profits for the year under review are considerably lower than the record profits for the year ended 30th June 1954 for reasons which I will explain at question time.

As regards the future however there are grounds for sober optimism. The existing managed companies continue to develop and expand and while immediate returns cannot be expected from the new ventures I look forward to the day when you will have good reason to be satisfied with the contributions they will then be making to your Company's prosperity.

ruled distinctly firm, particularly in the cotton mill section, which recorded sizable gains in the post-Diwali days. The miscellaneous section also was notable for new fresh high levels in certain scrips as for instance, Scindias, ACC and Premier Construction. Needless to say, the tempo of activity in the market gathered momentum under the stimulus of reports of brisk activity and higher prices obtained in the cotton piecegoods market, not to mention the impressive results of Indian Iron and Steel Co. Ltd. for the year ended 31st March 1955. A study of the market trend for the past one month reveals clearly that there has been genuine investment buying and all the rise in prices is not due only to speculative manoeuvring. One factor that can be singled out as having a direct bearing on this bullish trend in the market has been the phenomenal rise in notes in circulation of the order of Rs 150 crores in the past one year. The Finance Minister's reiteration that deficit financing to the tune of Rs 300 crores will have to be undertaken in the remaining part of the First Five-Year Plan has also been interpreted bullishly. In fact, a large section of the market is convinced that the overall trend of the market might well continue to be biased in favour of the bulls, at any rate, till the Budget proposals are announced when a recession in prices might ensue what with the additional taxation proposals and allied bearish factors.

Tata Steel opened the week on a moderately firm note and after reaching the highest for the week at Rs 276-12 closed steady at Rs 276. Indian Irons also were patterned on more or less similar lines and closed the week at Rs 43-9.

As has been stated at the outset, textiles stole the thunder during the week as there was sustained demand for most scrips enabling them to close the week with substantial gains. Bombay Dyeing improved from the opening level of Rs 682-8 to Rs 611-4, showing a gain of nearly twenty points over the week. Apollo shot up from Rs 3-1-6 to Rs 3-7-6 to close at Rs 3-6-6. Other textiles also registered sizable gains and but for the disturbances in the city over the SRC issue, the prices might well have been taken up further.

In the miscellaneous section, Scindias attracted considerable investment enquiry following the company's clarification regarding divid-

end. As a result, there was a sharp improvement and the shares were taken to a new high level of Rs 19-12-6 although at the close it was fractionally down at Rs 19-6-6. Premier Construction also moved in sympathy with Scindias and were bought at as high as Rs 196. Sugar shares remained steady throughout the week.

Oils and Oilseeds

All Round Rise

SCARCITY of floating stocks and sustained overseas demand for castor oil and groundnut oil were the two factors which enlivened the oilseeds market during the week under review and kept the prices steadily moving up. On top of this, when towards the middle of the week, the Government of India's acceptance of the Forward Markets' Commission's recommendation regarding hedge sales in groundnut was announced, speculators became enthusiastic and the announcement was greeted with a further rise in prices all round. It may be noted here that hedge selling in groundnut could now be resumed after a lapse of fourteen years. As the terms of the contract are already in existence, it is only a question of time for actual hedge

sales to be inaugurated in groundnut. As a result of the above announcement, forward business in groundnut oil may be expected to commence for the first time in Bombay shortly.

In the event, there has been an all round improvement in the oilseeds market. Already in the past two weeks, the castor futures market has been registering new high levels. During the week under review also, sentiment in this section continued to be equally bullish and this sentiment naturally infected both groundnuts and linseeds also.

Bullion

Peak Levels

ONCE again there was heavy bull manipulation in the bullion market which enabled both the metals to record peak levels not seen for many years. Although buying enthusiasm was at a low ebb early in the week in both gold and silver, bulls became aggressive towards the close when a handful of them got a firm grip over the market with scarcely any outside interests and the result was a phenomenal improvement in both the metals taking the quotation for gold to the peak level of Rs 98-8 and silver Rs 175.

Around Bombay Markets

Cotton Bullish

Thursday, Morning

THE cotton futures market has been characterised in the week under review by a very strong undercurrent of bullion sentiment with the ruling contract, at one time, making a jump of as much as thirty-two points in a single day. Evidently, the good performance of the cloth market on the moorat day and the entire week following Diwali, has been the main inspiration for the steady appreciation in value both in the cotton futures market and the stock exchange (cotton mill shares).

In the buying spree that followed, all the shorts were caught napping and ginneries in terminal markets were seen vying with each other to absorb the sparse quantities of new crop arrivals. The buying tempo was further accelerated in view of the fact that the quality of the

new crop arrivals have been damaged and the buyers were eager to enter the market early enough to make it possible for them to select the quality and cash in on the opportunity. By reason of these factors, the sentiment was not even affected by the option settlement as was appreciated earlier.

In the light of the above, it is not surprising that the cotton futures market experienced a continued firm trend throughout the week under review. The ruling contract opened the week at Rs 679-8 and sought the highest level of Rs 699-8, not seen so far in this contract, and closed the week at Rs 696-8.

In the Sewri spot cotton market, which was in sharp contrast to the futures market, there was hardly any business of note to report during the week under review. How-

ever, towards the close of the week, large-scale buying of the East African new crop cotton by Indian mills highlighted the market. It was reported that a prominent mill group purchased 6000 bales of Busoga at Rs 1395, Budama at Rs 1375 and Jinja at Rs 1240. The total purchases of East African cotton thus far have been computed at around 30,000 bales. The growing trend towards large scale purchases of East African cotton strongly suggests that the much discussed dollar-aid-cotton scheme has been once again kept in cold storage.

Cotton

Fresh High Levels

There has been no let-up in the boom conditions that were witnessed immediately following the moorat trading, when the Stock Exchange

Ladies' Day in the Oil Age

Oil is no men-only mineral. There is a very strong demand for its services among the so-called weaker sex. Oil helps to dress a lady—and her hair. Helps her to feed the brute. To furnish the home. Oil is a ladies' ayah-of-all-work and a most efficient one, too.

Spindle oils and ginning oils and special textile lubricants mean more saris and dresses in the shops. Cosmetic manufacturers use oil as a base for some shampoos, and nail varnishes. Oil helps the farmers to grow more food. It helps to turn trees into tables. Burmah-Shell oil the wheels in almost every Indian Industry.

Oil is a sport as well as a good servant. Does the lady iron? Swim? She may wear a swim suit fashioned from one of the wonderful new fabrics made out of oil. Does she play snap with a camera? Oil enters into the manufacture of photographic film.

Over 15,000 Burmah-Shell employees cater for India's thirst for oil. They keep a steady stream of oil products flowing to every corner of this vast sub-continent. They are—

United Nations Package Deal

TO-DAY, ten years after the end of the war, the Charter remains unfulfilled. Informed world opinion will not write the United Nations off as a failure. But it is aware of its imperfections. Some of its defects arise from its domination by the major powers, and specially by America. This domination by the big powers is a sequel to its incomplete structure. It is not representative of all the nations. At present, the political committee of the General Assembly is discussing the question of "widest possible membership" of the United Nations. During the debate, the sponsoring nations have introduced an amendment to the original resolution to the effect that the motion under consideration has reference only to the eighteen nations specifically included in, what has come to be known as, the "package deal". This amendment is aimed at excluding from membership, for the present, those nations which are still divided.

America is reconciled to the proposed admission of the eighteen nations. But it will be of interest to note that Cuba, a Latin American country, has put forward a further amendment to the resolution aimed at admitting South Korea and South Vietnam as members. More significant is Kuomintang's opposition to including Outer Mongolia as a member. Though the permanent Kuomintang delegate has not issued any direct threat of veto, Taipei's attitude is adamant. So is Moscow's. Russia has let it be known that she will oppose the "package deal" if Outer Mongolia is not admitted as a member. While the present deadlock is due to Russia's support of Outer Mongolia and the American-backed Kuomintang's opposition to the Russia stand, the problem of the "package deal" has a tortuous history which is revealing.

America is reconciled to the "package deal" only because she has been outmanoeuvred. To begin from the beginning, differences arose between America on the one hand, and Britain and Russia on the other, on the question of membership of the Security Council. Since the "gentleman's agreement" of 1946, an Eastern European power has always been a member of the Security Council. This time, Britain supported the candidacy of Yugoslavia, while Russia originally backed the claim of Poland. In opposition to Britain's and Russia's nominees, America supported the claim of the Philippines on the ostensible argument that non-Commonwealth Asian nations were not adequately represented on the Council. Russia promptly dropped her candidate, Poland, to lend support to Britain's nominee, Yugoslavia. As the issue turned out to be a straight fight between America and Britain, it became clear that a split could not be avoided unless a compromise formula could be evolved.

At the instance and initiative of Canada, and with the support of Russia and Britain, a proposal was framed. This "package deal", relating to admission of eighteen members, was the compromise device proposed by Canada. With eighteen new members, the strength of the Security Council would be increased from eleven to thirteen. It will, therefore, be possible for America to have its nominee, the Philippines, besides another Asian member, into the Security Council. As Russia is willing to support Britain's nominee, Yugoslavia can be the Eastern European member on the Council. That is why, to avoid loss of face, America has agreed

to support the "package deal". But America's attitude to this problem and the motive behind the compromise device of the "package deal" reflect the continuing conflict between Russia and America, which Taipei's subsequent action has only served to emphasise.

Circumstances may have forced America to accept the "package deal". But some of the arguments advanced by the Kuomintang delegate against the admission of Outer Mongolia indicate that the problem of admission of the eighteen new members is being complicated by the consequences of the "cold war". Suspicions are not unnatural that America is fighting the "cold war" in the United Nations by proxy, through Taipei, as she has come to realise, on second thoughts, the consequences of the admission of eighteen new members to the United Nations. Of these eighteen nations, only five are Communist, and the rest are non-Communist powers. So the "package deal" will not materially improve the bargaining strength of Russia in the United Nations. But it will serve to eliminate the dominance of the Latin American group, led by America. There are other implications of the proposal to admit eighteen new members. Kuomintang China is now a permanent member of the Security Council. With the proposed admission of eighteen new mem-

bers to the General Assembly, its composition will so change as to enhance India's prospects of admission in the Council as a permanent member.

These implications must be borne in mind in examining the arguments put forward by Taipei's delegate against the admission of Outer Mongolia. Taipei's delegate is clever in his reference to the Hague Court's ruling against the principle of "automatic universality" of membership of the United Nations. It is possible that the amendment proposed by the sponsoring members to their original resolution is aimed at bypassing this legal objection. But it is clear that America endorses the argument that admission of Communist nations is contrary to political and moral principles of the Charter. Taipei's delegate has also opposed the "package deal" on the ground of human rights. Here, it is not necessary to discuss whether Communist countries, Outer Mongolia or any other Communist Eastern European country, violate the principle of human rights. Of the proposed eighteen new members, two, Spain and Portugal, are Fascist countries. If South Africa, with its policy of racial discrimination, can remain a member of the United Nations, there can be no sense in denying admission to any Communist country on the argument of human rights.

In the interests of world peace, as well as of the United Nations, wider representation on the United Nations is desirable. With the acceptance of the "package deal", two consequences are likely to follow. It will, certainly, rid the General Assembly of its dominance by America and the Latin American bloc. It will also help to lessen the weight and influence of the Big Powers in the General Assembly. All small powers, including Asian-African nations, will welcome both these eventualities. Algiers is a visible demonstration of the growing influence of the Asian-African group of nations in the General Assembly. As this influence grows, the Western Powers will experience obstacles in exploiting the United Nations to further their purposes. Recent experience shows that the Western Powers can no longer rely on their majority in the General Assembly. To bypass the Russian veto in the Security Council, the General Assembly has, for sometime past, been used as the policy-making organ of the United Nations. With the proposed changes in the composition of the Assembly, and with the growing status of the Asian-African group, there may be a tendency to revive the importance of the Security Council. This raises the problem of amending the Charter. But that is a different, though highly complex, problem altogether.

Nagarjuna Sagar Project

YET another step in the adventure of building a New India will be taken when the Prime Minister lays the foundation stone of the Nagarjuna Sagar Project in Andhra. For the South, which has long felt neglected in the matter of economic development, this is a significant event, as the Nagarjuna Sagar Dam will rank among the biggest in the country. The ultimate irrigation benefits of this Project are expected to cover over 31 lakh acres in the States of Andhra and Hyderabad but even on the completion of the first phase in about seven years, the major part of the additional irrigational facilities should be available as over 23 lakh acres distributed in Andhra and Hyderabad States will be irrigated by then.

The project has immense possibilities; the additional yield of food-grains alone resulting from it has been estimated at 1.3 million tons.

When the possibilities of diverting some land at present under food grains to cash crops are considered—especially in the Guntur and Krishna districts—the resulting gains to agriculture may be much greater than is suggested by the figure of food grain. The power potential of the project, viz. 75,000 KW which will be available after the completion of the final project may not appear staggering compared to others. But even this modest supply holds out the prospects of development of Andhra's rich industrial potential which has remained untouched so far for lack of power among other reasons; in the first instance, to supply the needs for the construction and in view of the inaccessibility to the site (the nearest railway station at Macherla is about 10 miles away), the case for setting up a cement works near the site is strong; the analogy of the U.P. Government's

cement factory near the site of the Rihand dam suggests itself.

Incidentally there could be no more fitting occasion than this for Pandit Nehru to announce the decision to form Visalandhra next year as the Congress Working Committee has wisely recommended. For the full benefits of a project of this type to be achieved without administrative delays implicit in a division of responsibility between two states, it would be helpful to have unified control. This was what the States Reorganisation Commission had also in mind.

That the project will benefit greatly the two States of Andhra and Hyderabad is not doubted; there is, however, a disturbing thought: the price that will have to be paid for it and which cannot be calculated in monetary terms. It is that the dam's reservoir will submerge the historic and hallowed site of Nagar-

junakonda which, with nearby Amaravati, bears proud witness to Andhra's Buddhist heritage. We have had assurances both in the Union Parliament and the Andhra Legislature that steps would be taken to remove the relics to a safe site for preservation. Apart from the fact that preservation itself may not be properly done (one has only to see the tragic state in which the relics are kept in Amaravati to have these fears again), what guarantee is there that all the excavation work (and much undoubtedly remains to be done) would be completed before the area is submerged?

A further question suggests itself.

Andhra is watered by two major rivers. The Ramapadasagar scheme on the Godavari is one of the most ambitious projects thought of; could not priority have been given to that over the Nandikonda project so that the archaeological excavations could have proceeded at Nagarjuna Konda in a careful and unhurried manner? If the project had to be on the Krishna, were other alternative sites examined and was the technical superiority of this site so overwhelming as to outweigh the submergence of this site? The Government of India which is taking much pains for organizing, and rightly so, a great Buddhist festival next

year should have convinced itself about these points before abandoning the site of one of the centres of Buddhist learning in India. It is little consolation and almost childish in its naivete to call the Nandikonda dam after Nagarjuna; how does the erection of a pylon at the dam site in honour of Nagarjuna compensate for the loss of the relics. Perhaps the Prime Minister's philosophy which considers the development projects to be the temples and pilgrim centres of New India is being given concrete expression by building the Nandikonda dam at the cost of a famous religion centre of the old India.

PC.438 (A)

How banking serves the COIR INDUSTRY

INDIA is the world's chief producer of coir and coir products, her yearly output being around 130,000 tons. More than half this output is exported, earning about ten crores of rupees in foreign exchange. The coir industry, which is exclusively South Indian, is concentrated in Malabar and Travancore-Cochin, and employs over six lakhs of workers.

Banking has greatly helped in the rapid growth of this industry. The facilities and guidance of a good bank, such as the availability of ready funds when needed, and the collection of dues in any part of the country, are an essential part of good organisation in the coir industry.

We at Palai are proud that so many leading coir goods manufacturers of South India employ the complete banking service we offer.

Current Accounts — Demand Drafts — Telegraphic Transfers — Investments — Letters of Credit — Bill Collection — Deposits — Loans & Overdrafts — Confidential Credit Reports, etc.

★ ★ ★ ★

If you have business interests in the South, it will pay you to open an account with us. Our 25 branches are strategically located, 23 in important South Indian business centres and two in Delhi and New Delhi; and we have correspondents in all important Indian cities. We offer a fully comprehensive banking service at each office.

Our clients can make deposits at any of our correspondent banks, situated in all important Indian towns, and have the amounts credited to their accounts at any of our branches.

PALAI CENTRAL BANK LTD.

Head Office: PALAI — TRAVANCORE

Branches at: Madras, Madurai, Cochin, Quilon, Trivandrum, Mangalore, Bangalore, etc. Also at: Delhi & New Delhi.

A LEADING BANK IN SOUTH INDIA

Weekly Notes

No Decision Yet

IT would be unfair to the Congress High Command to imagine that the latter could have made up its mind about the future of Bombay when the Congress Working Committee has yet to come to a final decision. This the Working Committee is expected to do on the 23rd of this month, in the light of the debate in Parliament on the subject. The great debate on Reorganisation of States in Parliament begins on the 14th and is likely to go on for many days. So, there are many more rounds to go. Mama Saheb Deogirkar, President of the MPCC, on whom has fallen, of necessity, the heavy responsibility of securing agreement by persuasion among different groups has assured the people of Maharashtra that there is no reason for them to lose heart just yet. There would be time enough to move for and press the inclusion of Bombay City in Samyukta Maharashtra till the third reading of the reorganisation bill which will be introduced some time in Parliament.

This being the position in the Congress Working Committee, it is unlikely in the extreme that Pandit Nehru would have taken a firm line on the subject and could be adamant on the adoption of one solution or the other. What was the SRC report about, unless it was to make it possible for people speaking the same language and feeling strong emotionalities to live together to do so and to give suitable expression to this feeling in the best manner possible, with due regard to the administrative, economic and other factors? This the Commission has done, on the whole fairly enough, except in the case of the Bombay State, though the report repeats almost as a matter of ritual in connection with every important issue that the Commission was not guided by linguism as the most important factor.

Though the eventual solution still remains very much in doubt, one can be more certain about what the solution will not be. The proposal of a bilingual State as originally recommended by the SRC or as modified by the MPCC are both definitely out. And so is the Ashok Mehta-

Harris formula for including Bombay City in Maharashtra by giving a special position to it, such as by restoring to the city corporation its police force and establishing a convention for special representation of Bombay interests in the Government of Maharashtra.

Racing Against Time

WITH import control a permanent fixture and industries all sheltering under the Commerce and Industry Ministry's benevolent scrutiny on imports, the activities of the Tariff Commission and Government action on their recommendations have ceased to mean much to the outside public. Whether Government action on Tariff Commission's recommendations means anything at all depends very largely on the import policy currently being pursued or that will be pursued in the future in regard to the particular products concerned. On this crucial point, however, neither is the Tariff Commission very informative nor is Government.

The Commission, however, has been racing against time to complete the enquiries of all those cases where protection currently in force is to expire at the end of the calendar year. Much arrears have been cleared and only a handful of cases must be remaining to be disposed off. This is a striking improvement on the situation prevailing at the end of the last year. But the Commission is modest and is not in the same hurry to publicise its achievements for its Annual Report for 1954-55 has not yet seen the light of day.

Among the bunch of the Reports lately released there is the one on alloy, tool and special steels. The Commission has refused continuation of protection to this industry as "tariff protection has not been effective in securing the establishment of the industry in the country" and it is convinced that "even a high degree of protection will not serve to bring about the desired result, unless it is preceded by a concrete plan for giving the necessary assistance to individual units and rationalising their production". In the case of motor vehicle batteries, on the other hand, the Commission has found that tariff protection has suc-

ceeded so well that it is no longer necessary. There is no striking disparity any longer between ex-works price and the landed cost ex-duty of imported batteries. Government has agreed in both cases and accepted the recommendation. Also in the case of coated abrasives, one of the post-war babies which came up in 1946, the Commission found that the industry has consolidated its position and needs no further protection. This has been accepted by Government.

Aluminium gets an extension for another three years and the protection of automobile sparkling plug industry, which was given protection ad hoc in last August only upto the end of the year has been regularised. The Commission has recommended and Government has agreed that protection should be extended for five years to enable this industry to implement its manufacturing programme. This signifies a deliberate reversal of trend, of the uneconomic method of setting up new industries that has been forced upon us partly by lack of development in the past and partly by the short-sightedness of the manufacturing industries in that the latter have tried to make the whole range of parts themselves, as in automobile or bicycle industry, instead of buying most of these parts from others or encouraging others to set up their manufacture, and confining themselves largely to assembling and making the heavier parts themselves.

An industry on which Tariff Commission had taken a strong line and which has been softened by Government is that of steel baling hoops. Baling hoops are different for jute, cotton and coir. All three have been getting protection since 1947. In the case of coir baling hoops alone, the Commission wanted protective duties to continue. In the case of others it felt that domestic producers were well able to hold their own against imports. The Ministry of Commerce and Industry has accepted these recommendations but not the one about decontrolling cotton baling hoops, in view of the recent revival of demand. The present system of fixing selling prices and retention prices will continue, with periodic revisions, as long as control over iron and steel continues.

American Line-Up on Goa

IT would be foolish to presume that Mr Dulles is a Foreign Minister who is not familiar with international diplomacy. "From Mr Dulles's observations at a later Press conference, the implications of the joint communique, issued by him and the Portuguese Foreign Minister, emerge clearly. Mr Dulles takes elaborate pains to explain away the reference in the joint communique, to Goa as a 'province' of Portugal. Mr Dulles is as grotesque in his emphasis that the inhabitants of Goa have the same rights and privileges as the citizens of Portugal as the French claim that Algerians enjoy the same citizenship rights as those enjoyed by the inhabitants of Paris".

From the Reuter version of the joint communique, issued by the American Secretary of State and the Portuguese Foreign Minister, the circumstances which provoked the two Foreign Ministers to make certain policy statements on colonial issues in Asia and Africa are clear. Equally emphatic is the implication of that policy which Washington cannot disown, as it has been enunciated in a communique to which the American Secretary of State is a signatory.

Two days before Mr Dulles and Dr Cunha issued the joint communique, India's Prime Minister had, in his address at the public reception held in Calcutta in honour of the Russian leaders, challenged the Western Powers to define their policy to the Goa issue. Britain and France still remain "silent" on this issue. But the American Secretary of State has signed a communique which includes a reference to the Portuguese "provinces" in the "Far East." In the communique, the issue of Goa has not been directly linked to Portugal's responsibilities as a NATO Power. But one of the paragraphs of the communique, which discloses that the American and Portuguese Foreign Ministers have discussed the problems of defence within the framework of NATO, reveals that, during their discussions, the interdependence of Africa and the Western world "was also emphasised".

From the joint communique, two inescapable conclusions emerge. America acquiesces in the European metropolitan Powers' policy and determination to retain colonies in Asia and Africa. It is emphatically implied in the communique that America supports the policy of forti-

fying strategic colonial areas in Africa as NATO bases. Though there is no attempt, in the communique, to establish any casual link between NATO and Goa, reference to Goa and Macao as Portuguese "provinces" in the "Far East" would seem to make it evident that America is committed, under the terms of NATO, to defend and protect the "territories" of Portugal, a NATO Power.

All these policy statements and oblique references are included in a joint communique which has been issued after discussions between the two Foreign Ministers on "matters of mutual interest". There is agonised surprise in New Delhi that Washington openly admits that Portuguese "possessions" in India are "provinces" of Portugal, and that these are also "matters of mutual interest" between Washington and Lisbon. It should not, in the circumstances, be difficult for the American Ambassador to India to explain, to his people if not to his Government, why relations between India and the United States are not as cordial as they should be.

Mr Dulles is evidently irritated over the boisterous outbursts of the Soviet "rulers" visiting Asia. M. Khrushchev is accompanying the Russian Prime Minister in their tour of some Asian countries as a member of the Presidium, and not as First Secretary to the Soviet Communist Party. But even the Soviet Prime Minister, not to speak of the First Secretary to the Soviet Communist Party, would be entirely justified in criticising colonialism as a menace to world peace. Consistency may not be one of Mr Dulles's strong points. But it would not be inappropriate to remind the American Secretary of State that, after his visit to Asian countries some years ago, he expressed the opinion that colonialism was not only an invitation to Communism, but also a menace to peace and stability in the countries he had visited.

Faure's Bid for Power

MAURE has won a decisive first round in the battle against his political adversaries. He deliberately provoked his downfall to further his ulterior motives. By his subsequent action in dissolving the National Assembly, he has outmanoeuvred his political opponents. France will go to the polls on January 2, 1956. M Faure's political rivals are in favour of reforming the electoral system. They support single-member constituencies. It is not quite clear

whether M Faure has any serious objection to election reforms. But it is quite clear that he is more interested in hastening the general elections.

M Faure can claim that he has acted according to his convictions. He holds the opinion that a Government should have powers to dissolve the Assembly if it is defeated within two years of assumption of office. M Faure became Prime Minister only nine months ago. This is a democratic policy and procedure. But, with elections on the basis of proportional representation, this policy will involve fresh elections in France every few months. As M Faure's next elections will be based on proportional representation, stability in French politics does seem to be the prime motive of his moves.

Proportional representation favours the chances of Communists and Gaullists against those of Radicals, MRP and Socialists. Gaullists are no longer a united party. Communists have lost their opportunity. M Faure is, apparently, relying on these political trends. But how does his move help him with his party? His party, which has expelled him, is opposed to proportional representation. Is he trying to win the Radical Party away from M Mendes-France, his former Chief? A division in the Radical Party is not unlikely. But his bid for power cannot succeed unless he joins either MRP or Socialists. He is suspect in both these camps. M Faure is playing a risky game in his bid to oust M Mendes-France as the leader of the Radicals.

Chartered Bank to Finance Industry

THE Chartered Bank has set up a Development Corporation with an authorised capital of £2 million for medium-term credit for new enterprises in South East Asia. It is the first exchange bank therefore to take note of the changes through which the economies of the countries in which the bank operates are now passing. For British banking to enter the field of medium term credit for industry is perhaps a greater departure than for an exchange bank to go into fields other than that of foreign exchange. In fact, they have been doing it for long. Whether the intrusion of exchange banking into the field of domestic business in India, which had been such a sore point for Indian scheduled banks, was forced by the decline in foreign trade during the

inter-war depression period, it is difficult to say with certainty.

By entering the field of medium term credit for industries, however, the Chartered will be following in the wake of the Industrial Credits and Investment Corporation and may be able to supplement the latter, since ICIC would be handling permanently new issues and confining itself only to big enterprises. Other exchange banks will doubtless follow the lead given by the Chartered sooner or later. It is an open question, again, whether exchange banks are going into unorthodox banking while Indian scheduled banks stick tenaciously to the austere traditions of British commercial banking, for the accepted view regarding the activities of the latter appears to be somewhat out of date. The fact that Indian banks still carry a high ratio of time deposit to total deposits, by itself, does not argue the case either way.

U S Steel Prices and Deliveries

MUCH attention has been devoted to steel shortage, which was discussed in these columns last week, in the latest issue both of the *Economic Bulletin of Europe* as well as the *Economist*. The Bulletin notes that the United Kingdom and Western Germany have ceased to be significant net exporters of iron and steel in the course of the last twelve months; there has been however a shift, for France and Belgium sharply increased their net exports of iron and steel during the first half of 1955. Partly the explanation of the reduction of British and German exports and the increased reliance of these countries on imports of basic materials lies in the increase in their net exports of their engineering products, in spite of the pressure of demand for these products in their home markets. French exports of these products, on the other hand, continue at a very low level and are smaller in value than French exports of steel articles. UK and Western Germany earn twenty times as much from their net exports of engineering products as from their exports of steel.

The *Economist* reports that in US steel prices have not only been steadily rising but the announcement from the US Steel Corporation of an increase of \$2 per ton in the price of its carbon steel rolled strip will probably swell the trickle of recent price rises into a stream. In fact, steel producers make no secret of it that their prices will rise

still further. They must build up reserves to finance the future expansion and also pay higher dividends, so that they may raise fresh capital from the market by the issue of new shares, the tax concessions which facilitated previous expansion being no longer available. In the US, the industry is not only working to capacity and output is an all time record, present deliveries are inadequate and the producers are unable to give even firm promises for delivery in the earlier months of the next year. Automobile manufacturers are one of the chief causes of shortage and they have upset all expert calculations by taking more steel than thought possible and practically all users are pushing up their requirements. But calculations have not been upset only in the US. It will be recalled that ECE experts two years ago expected surplus capacity to emerge in strip mills as a result of the expansion effected under Marshall Plan unless the old and inefficient units were closed down. These expectations have been belied in Western Europe also.

So, understandably, attention is being focussed on prospects of steel production behind the curtain. While on the subject, it may be noted that US plans for expansion are for no more than three million tons a year for the next five years. And even this is considered ambitious, for it cannot be completed without building new plants which is a very costly affair under present conditions.

Letter to the Editor

Tell Us All About Steel

I HAVE read with keen interest your notes on steel in your last issue. It is indeed high time that Government issued a white paper on steel but all the following points will have to be covered:

1. The estimated demand for steel industry-wise during the next five years as well as the basis on which these estimates are framed.

2. Arrangements Government has already made or is making for the import of steel.

3. Will the same price be charged for imported steel as for domestic steel through a surcharge on the latter or will different prices be charged according to essential and non-essential uses? Or in other words, will the system of allocation be as in the past in that permits for obtaining steel at controlled prices will be issued for essential users

while imports are licensed freely for others who are willing to import steel on their own and pay the much higher prices?

4. In view of the present shortage which on present showing is bound to grow more acute for the next few months or years, what steps are being taken to economise the use of steel? This is of the utmost importance in view of the shortage that is envisaged and the difficulties that are likely to be encountered in obtaining imports, apart from certain general considerations pinpointed by M Khrushchev, when he said during his visit to the Integral Coach Factory at Perambur that 80 per cent of the steel used in the construction of the factory could have been saved by using reinforced concrete! M Khrushchev may or may not be wholly accurate, but there is little reason to doubt his general statement that little serious effort is being made currently to economise the use of steel. To this question, the principle of allocation according to categories is no answer; for the project or purpose for which the steel is required may be essential and of high priority, but it follows by no means that the actual use to which the steel is intended to be put is also essential without an expert examination of the possibility of substitution of steel by other materials e.g. reinforced concrete or timber.

5. Steps taken to induce private sector to expand production of steel.

6. Is it the accepted policy of the Government to allow mixed economy in the steel industry? The question is important and timely in view of the stipulation made in the Industrial Policy Statement of 1948 that Government is committed to non-nationalisation of this industry only for a period of 10 years, that is until 1958. That statement left the question open, what would be the Government policy after 1958 and certainly, if the Government has already taken a decision about this matter, the public has a right to know and should be told about it. No such declaration has yet been made, and the public has a right to know if the expansion programmes agreed to for the existing producers implies a commitment of this nature.

7. Finally, what are the functions of the proposed Steel Board and what are the reasons for the delay in setting up the proposed Board?

Surely it is high time for the Government to take public into its confidence, clear the air and make a definite statement.

"CURIOUS"

Off the Record

Between Two Camps

THANKS to the indiscretions of Mr Dulles, we are now in no position to assess the likely trend of foreign assistance for economic development in the coming years. M Khrushchev has, for reasons best known to himself, practically upset the Geneva apple-cart and given a twist to the concept of competitive co-existence. He appears to subscribe to the view that the best way of selling one's wares is to say that the other man is a cheat and his wares are poison. It may be that he is merely turning the tables on those who have been saying much the same thing about assistance from Communist countries. But it certainly strengthens the hands of those who want their countries and their allies to take an uncompromising stand in their dealings with the Communist world. And Mr Dulles's joint statement with Dr Cunha further contributes to an intensification of international suspicion and ill-will.

Against this background, those who have obstructed assistance to India on the argument that her 'dynamic neutrality' is and has always been a sham and a tactic will shriek with renewed vigour. Why should we, they will say, help India become stronger when we know she is not on our side? On the other hand, there are many who have come to the conclusion that the Western World should now rush more assistance to India and Burma—to forestall the Soviet Union and make these countries see who their real helpers are. Which of these groups will prevail remains to be seen, and on that might depend the magnitude of external assistance that would be forthcoming.

Back of all this are, of course, the roar and the dust of the recent H-bombs let off by the Soviet Union, and the deadlock on disarmament.

Faure's happy idea of diverting resources from armaments to development of underdeveloped countries had little support in July and will have no support now. Inevitably, the countries committed to a policy of negotiation from strength will devote more resources for guns than butter, at home or abroad, in the coming year. The 'summit' talks had no effect on the armaments efforts of the two blocs; but it generated a hope that in the near future,

the world as a whole might be able to concentrate on raising standards of living rather than standards of military power. That hope has, for all practical purposes, become a matter of history.

There is, nonetheless, one aspect of it all that might yet be important. It was part of the strategy of the cold war that for the containment of communism or for promoting world communism, as the case may be, mere military assistance to one's prospective allies was insufficient. Stemming from the thesis that poverty was the greatest ally to communism in the underdeveloped countries, the Western democracies' foreign economic policy had to some extent been directed towards helping the relatively underdeveloped countries to strengthen their economies. That thesis still underlies the argument of those who want the West to rush more economic assistance to India and elsewhere. The fact that the Soviet Union has started offering capital equipment and technical assistance in a big way could well stimulate competition in this field from the non-communist world. Just how much and in what manner the Soviet Union will be able to further economic development in countries like India and Burma is still not clear. But it is not impossible that the very offers which the Soviet Union is making might prompt similar offers from others.

The situation is altogether embarrassing and somewhat insulting to the under-developed neutral countries. Embarrassing because the alternatives facing these countries are that either too little or too much of assistance will be offered by the two blocs taken together. Too little, in case the Western Democracies refuse to help those who have normal trade relations with the Soviet bloc; too much, if the two blocs try to outdo each other. In the latter case, since utilisation of foreign assistance will to a larger or smaller extent involve utilisation of domestic resources also on the projects concerned, the recipient countries may have to pick and choose. And such a procedure could always be misinterpreted. Apart from it all, there is the basic assumption that the underdeveloped countries, parti-

cularly in the Afro-Asian region, are a lot of gullible fish and can be hooked by these baits. It is about time that the rest of the world realised one ineluctable fact. The young democracies in this part of the world are anxious to develop and are willing to take such aid as is bona fide. But for the very reason that they are young, they are even more anxious to preserve their independence and keep out of aggrandising blocs. And they would rather remain underdeveloped than be dependent. To think otherwise is to insult the intelligence and the desire for freedom of these nations.

Burrakur Coal

IN recent weeks, Coal shares have remained steady. This is mainly due to a better appreciation of the Government's coal policy during the second Plan period. To some extent, the recent steadiness in Coal shares is due to expectations of satisfactory working results of coal companies. An increase of Rs 39,000 in the profit of the Burrakur Coal Company, Ltd. for the half-year to June last shows that market expectations are not without basis. Despite higher profits, however, the dividend has been maintained, and not raised.

Though raisings were higher, despatches fell. Repairs to twenty-six ovens were completed. According to the report, the balance of the repair programme will be completed in the current and the next half-years. To ensure conservation of coal as well as maximum extraction, the Company's collieries must be able to continue sand stowing programme. Adequate availability of sand is, therefore, a matter for concern to the company.

Allocations are generally satisfactory. In this connection, the substantial increase in the provision for rope replacement reserve deserves notice. This is due to the fact that the condition of the rope has deteriorated far more rapidly than originally anticipated. It may be necessary to replace the rope in its entire length in the next twelve months. It is stated in the report that this problem is under discussion between the Company and the manufacturers of the rope.

From the London End

New Trends in British Taxation

SOME interesting revelations of the Treasury's intentions were given by the Chancellor of the Exchequer during the Parliamentary discussions on the Finance Bill giving legislative effect to the supplementary Budget proposals. Apparently it now turns out that the flat rate of purchase tax imposed on clothing and furniture in the autumn Budget was merely designed to ascertain how a general sales tax would work out in the next few months. This experiment aims at what Mr Butler calls "the broadening of the basis of taxation" or more explicitly at reducing the present heavy dependence on direct taxes (on income).

This possible change was long foreseen by the Labour Opposition. In the Budget debate last month, Mr Gaitskell had pointed out that the flat rate of purchase tax was merely a step in the direction of a general sales tax and suggested that the extreme regressive character of the change would create uneasiness among the trade unions.

The aims of the Government in broadening the basis of taxation appear to be two in number. First, there is the aim to reduce all-round consumption, which arises from the current inflationary situation of the economy. The second aim is more typical of the philosophic and social outlook of the present Government viz. that of reducing the proportionate burdens of the richer groups in the country arising from a system of taxation which in the period of the Labour Government had become highly graduated and progressive.

It is understood that the Treasury has been looking around to find out how the sales tax has fared in other countries. And it is worth noting that what started off as a purchase tax on a few commodities in the United States has now virtually become a general sales tax in that country. Originally the American commodity tax was levied only on tobacco and liquor. It now covers a wide range of products. In addition to these Federal taxes, many States and cities levy their own sales tax. The sales tax has been often criticised in the United States as being iniquitous. This criticism can no doubt be levelled against any sales-tax system. In Western Germany, there is what is called a turn-

over tax—this is a tax payable on all stages of manufacture and sales. It yields over £1,000 million a fiscal year. Similarly, a turnover tax—a major item in the tax structure—exists in Belgium and Holland. In effect these turnover taxes are so different from the sales tax. It is, however, usual for a sales tax to be collected by the retailer on the sale of the commodity as against the purchase tax or, in some cases, turnover tax, where it is the wholesaler and the manufacturer who collects the tax from the retailer. One of the arguments given as favouring the conversion of the present purchase tax to a sales tax is that the retailer will no longer be compelled to reserve a proportion of his working capital for payment of purchase tax on his stocks before he sells the goods. Further, it is said that when the purchase tax is reduced it is the retailer who suffers, the loss arising from his previously tax-paid stocks. Further, when the purchase tax is increased it is the retailer who is forced by competition to sell his existing stocks at pre-Budget prices.

Against these merits, there is the standard criticism of the sales tax that it is regressive and iniquitous. It was on this ground that the Labour Opposition had made out its case last month. Labour believes that the broadening of the tax system is merely designed to make the revenue of the country more heavily dependent on indirect taxes rather than on the progressive rates of direct taxes on income. It will lead to the poorer sections bearing a higher burden than they currently do.

The changes that are apparently being worked out by the Treasury are topical for two reasons. The Royal Commission on the Taxation of Profits and Income which published its report recently recommend that the Government should give serious consideration to the encouragement of individual and corporate savings by appropriate tax reliefs. It is possibly in line with this general recommendation that Mr Butler has now announced his "broad" agreement to the proposal that the existing profits and profits distribution tax levied on companies be amalgamated into a single corporation tax, and, more important,

to that of reduction of the level of direct taxes on income—particularly taxes required from the higher income groups—on the grounds that it will stimulate savings, provide a larger flow of funds for investment and so make economic growth depend upon the "more natural equilibrium" of the demand and supply of capital.

The suggested changes are topical for another reason. Mr. Nicholas Kaldor, who was a member of the Royal Commission on Taxation of Profits and Income, had suggested to the Commission that they should consider the virtues of a system of tax based on expenditure rather than on income. This suggestion was, however, turned down on the ground that it was outside the Commission's terms of reference. Now, Mr. Kaldor has published a study on the virtues of the Expenditure Tax.

The apparently novel idea of an expenditure tax has, according to Mr. Kaldor, a long history. The idea occurred to Hobbes and was later given full support by John Stuart Mill. In the present century, its most powerful exponent was Irving Fisher. This study is more than timely. For Mr. Kaldor argues that taxation levelled on income rather than on expenditure makes it easy for considerable abuses to take place. And here income arising out of capital gains, which is generally of sizable volume in an economy like that of Britain, completely escapes taxation.

The expenditure tax broadens the basis of taxation. It, however, broadens it by making the burden more heavy on those who have more money to spend—an idea which no doubt will be supported by the Labour Party. More important, under a system of taxation assessed on individual expenditure, income from capital gains (where it is spent on consumption) would immediately fall within the purview of taxation. At the same time an expenditure tax places a premium on savings. Those who wish to save increasing proportions of their income would pay correspondingly less tax.

One problem which necessarily arises from an expenditure tax system of the type suggested by Mr. Kaldor is whether it would not lead to a massive accumulation of pro-

Oil in the day's work

When it's warm work keeping cool in the office do you ever think how much hotter under the collar you'd be without the cooling properties of oil? Yes, *oil*. The oil that keeps your fan freely turning. The oil that lubricates it here and now, the oil in the generators back in the power station and the oil in the transformers in between.

We'd like to point out that Burmah-Shell has enough bulk storage tanks to hold over 200 million gallons of this electrifying substance, oil.

Time for your morning's paper—chase through the In Tray? Perhaps a word about paper will provide a welcome excuse for not buckling down to the grindstone *ek dam*.

Papermaking is one among scores of Indian industries where the wheels are oiled by Burmah-Shell. If you tot up all the wheels and other moving parts that there are in the coal, steel, jute and paper industries—to mention only a few—you'll find it hardly surprising that over 15,000 Burmah-Shell employees are kept on their toes delivering oil where it's wanted when it's wanted (which is almost everywhere almost all the time).

BURMAH-SHELL

IN INDIA'S LIFE
AND PART OF IT

perty on the part of private individuals, thus accelerating the concentration of economic power in the hands of the few. For example, under an expenditure tax system, a person earning more than £5,000 a year can, even at a fairly high standard of living, accumulate property at a greater rate than a person earning £700 a year who tries to maintain a minimum standard. The gap in income between different classes of people can lead to a greater accumulation of capital in the hands of those who earn more. Mr Kaldor apparently sees no objection to the facilities which his tax system provides for such an accumulation of property.

Another new development is that relating to the taxes on companies. As indicated above, the Chancellor of the Exchequer expressed his agreement with the Royal Commission's recommendation that a single tax should be levied on companies rather than the present complicated profits and distributive profits taxes. At the present time there are two taxes on companies. On

distributed profits companies are taxed at a rate of 27½ per cent. and for that proportion of profits not distributed—retained—a profits tax of 2½ per cent. is levied. The Royal Commission, and now Mr Kaldor, claim that this discrimination against distributed profits distorts the market value of shares and has in turn stultified the rate of capital formation. Apparently gross trading profits of companies had increased from £669 million to £2,688 million between 1938 and 1953. The increase in dividend distribution over the same period was from £430 million to £609 million. In other words, while trading profits increased by over 400 per cent, dividend distributions increased by only 42 per cent. It is now claimed that but for the discouragement provided by the differential tax system, the rise in dividends would have been more in line with the increase in company earnings. This situation has led to share values, which are based on dividend declarations, being considerably lower or at a discount compared to what they would have been

if earnings were taken as the basis of estimation. More than that, it is claimed many companies have been encouraged to retain their profits rather than distribute them so that they could not be fruitfully used elsewhere. Thus, whatever other considerations bear upon the problem, the market value of shares is artificially depressed and is an obstacle in the way of raising new capital. In this regard the Royal Commission had recommended that there should be a single corporation tax not connected with the ordinary income tax. Mr Kaldor agrees with this view, but makes the proviso that a corporation tax will be a solution only if capital gains are taxed. He argues that an increase in dividends would have undesirable effects, not so much on account of the increased spending out of dividends itself, but because of the far greater untaxed benefits which shareholders may have obtained in the form of capital gains. The whole matter of taxation in Britain once again appears to rest on whether capital gains are to be taxed or not.

Book Review

A Story that Remains to be Told

The Great Inflation 1939-51 by A. J. Brown, Oxford University Press, London, 1955; pp 321; price: 30s.

Reviewed by R A Jahagirdar

THE second war period was not the most inflationary period in world history for both the first war and Napoleonic war saw greater inflations. But it was the most interesting period for the study of inflation. Prof. A. J. Brown seeks to trace the inflationary process as it developed during the 1939-51 period in different countries in the world. He deals with the impact of war expenditure on the price-wage spiral, the efficacy of price-control measures as also the impact of increased liquidity on interest rates and on inflationary pressures.

The great inflation came at a time when the great depression of the thirties had weakened the people's psychological defences against inflation; to harassed politicians, the war presented itself as a remedy for chronic unemployment; and whichever way we slid, the development of statistical data had made it certain that we would do so, if not with open eyes, at least with full knowledge. With their experience in the thirties the governments of many countries had much confidence in their capacity to control economic affairs, and had little compunction in using it. Finally, developments in economic theory, written in the light of the conditions of the thirties, though not necessarily applicable to these phenomena only, had to be applied and practically worked out in conditions exactly opposite to those in which they had been developed.

All that did not—in fact, could not—prevent inflation; but it did help to control it. At the end of the war, fewer currencies—and these mostly in occupied countries where the restraints to the issue of notes were wiped away by the invaders' very short-period, but very urgent, need to catch hold of as much of goods as possible in as short a period as possible—were tipped off the balance. The price rises in other countries were moderate, considering the degree of mobilisation required in each country and the extent of the world-wide conflict. If the war period is considered as a whole, prices rose sharply till 1942 mostly for two reasons: 1) this was the period when mobilisation was increasing; and 2)

it was also the period when the Governmental control machinery was in its formative stages. From 1942 onwards, price rises were smaller (in the U K and the U S A almost negligible), because mobilisation had by then been largely effected and machinery of control set up. This was, however not the case in India but that again, is quite a different story.

The author puts the end of the inflationary era in 1951 and finds the experience in the post-war period in some respects less satisfactory. For one thing, the end of the war, if it did not see the muddled events after the first war, did not see the end of inflation. What was much worse, the diagnosis of the post-war events, perhaps owing to inertia of thinking, tended to be influenced more by pre-war events than by the fundamental changes in economic situation that had been brought about by the war. And even when the realisation of the situation dawned upon the politicians, ideological predilections against, or lack of faith in, traditional remedies prevented their use. The result was continuation of inflation in all countries, though with varying degrees of intensity. The U S A was probably the first to dismantle controls, but owing to the fear of increasing the debt burden, or of running the banks by reducing their asset values, the Treasury failed to raise interest rates, letting other prices rise instead. In Belgium, the liberalisation of controls was accompanied by a tight money policy which avoided excessive inflationary pressures in the economy. In the U K, even after the disastrous Daltonian era of cheap money, reliance continued to be placed on budgetary methods, accompanied by exhortations for restraints on demand for higher income and by sporadic export drives. In France the doctrine of immobilisme was too strong to permit anything to be done—French prices continued to rise and the exchange continued to fall. The conditions in other countries fell into one or the other pattern described above.

The experience of the whole period 1939-51 was revealing in many respects. It showed that economic forces could be suppressed or moulded

only within limits; the doctrine of Government omnipotence was pricked. The naive refusal of Governments to use monetary policy was a self-imposed limitation which, had it been done away with, would have added to their prestige. However, there was a tendency to equate monetary policy not only with a blind mechanism to control inflation, but a mechanism which inevitably brought about social injustice.

For future guidance Prof. Brown emphasises that the danger lies not so much in possible failure of Governments to adopt appropriate policies as in the failure of economists to diagnose the situation or in the tendency of Governments to be governed by outdated dogmas. With increase in Government responsibility for maintaining economic equilibrium, the economist is becoming an essential part of the administrative machinery; but Prof. Brown finds little reason to believe that the power of economic prediction or of agility in thinking has increased correspondingly.

The factors responsible for the great inflation are summed up by the author as three. The first was, of course, the war and reconstruction after the war which gave rise to excessive demand for goods and services and which was fed mainly by budget deficits. Secondly, there were temporary increases in demand of a speculative nature resulting in price rises which themselves were made permanent, according to Prof. Brown, thanks to the prevalent bias in most economies towards inflation. Prof. Brown calls this bias "the most persistent and troublesome inflationary threat facing the western world". It is because of this bias that long-term stability of the price level of commodities can be purchased only at the cost of recurrent periods of unemployment. "The dilemma which the first sustained period of full employment in the history of industrial civilization has revealed seems to remain with us for some time". That at least is the way the author looks at the future.

There is little of any analysis of events; the book is mostly story and a story which, despite its broad canvas, tends to be dull in its descrip-

tive parts. It may also be questioned whether the use of the Cambridge equations to explain the inflationary process does not make what little analysis there is excessively oversimplified. The great inflation was a product of similar forces acting independently in different countries

—at least during the war period. Once the war was over, the factors responsible for continuing the inflationary trend were more Governments' reluctance or incapacity to adopt appropriate measures than inherent conditions making inflation inevitable. In any account of infla-

tion, moreover, the omission of even a mention of the effects of inflation on capital must be regarded as grave. Prof. Brown's book is not the last word on the great inflation—a more complete history from a more analytical viewpoint remains to be written.

PROGRESS OF THE PLAN No. 1

For over four and a half years now we have been at work to make our first Five-Year Plan a success. The Plan is our first great effort to achieve a better life for every citizen of India by democratic methods. The objectives of the Plan were: **MORE FOOD • MORE GOODS • BETTER SOCIAL SERVICES • GREATER EMPLOYMENT • HIGHER STANDARDS OF LIVING**

The Plan set definite targets for achievement. It provided for an expenditure of Rs. 2,324 crores in five years for all-round development of the country. During the first four years our progress has been impressive and step by step the targets are being achieved. Our economy to-day presents a picture of strength and stability confirming our hopes for greater achievements in the Second Five-Year Plan.

AC 55/113

Ten Years that Changed Poland

Oskar Lange

THE ten years that have passed by since the emergence of People's Poland, constitute a period of most momentous social and economic changes in the history of the Polish Nation. No other epoch in the history of Poland can boast of such profound and rapid changes in the conditions of people's life; in no other epoch were there such creative struggles embracing the entire Polish People. As a result of these struggles, the social and economic structure of Poland has been radically changed, and there has been an economic resurgence.

Pre-war Poland was among the most backward countries of Europe. Nearly two-thirds of her population lived by agriculture, and the percentage per capita of industrial production was far below the world average. The value of per capita industrial production in Poland was thirteen times less than that of the USA, eight times less than that of Germany, and nearly three times less than that of Italy. During the period between the two wars, the economic backwardness of Poland became even more serious. In the period from 1919 to 1938 production never reached the level of 1913; the peak reached in 1938 was but 99 per cent of 1913.

Agriculture in Decline

At the same time the productive forces in agriculture were regressing. The harvests and the number of head of horned cattle decreased steadily; the technical level of agriculture went down. The consumption of artificial fertilisers per hectare declined in 1938 by 46 per cent, as compared with 1928. In the same period, the sale of agricultural machines and implements decreased almost by half. The economic development of Poland was held back by big monopolies which were, for the greater part, in the hands of foreign capitalists. In 1929, there were in Poland 17 cartels; in 1936 their number rose to 379, of which 105 were international cartels. In 1931 the net profit of limited companies was 79 million zlotys and in 1937 it rose to 171 million zlotys. A considerable portion of these profits flowed into the pockets of foreign capitalists who exported it, thus depriving Poland's national economy of a source of accumulation and development of productive forces.

The regression of productive forces of Poland went hand in hand with the semi-colonial dependence of the country on foreign capital. Semi-feudal relationships prevailing in agriculture deepened.

It all resulted in a general pauperization of the working population. The index of real wages in 1935 was lower by 34 per cent as compared with 1913. The number of registered unemployed was more than double the number of persons employed in large and medium industries. The number of 'superfluous persons' among the rural population was estimated at 6 to 9 millions. The indebtedness of the peasantry went on increasing all the time. Consumption by the working population both in cities and in the countryside decreased steadily.

Weak and backward economically, pauperized, exploited by foreign capital and her own ruling classes unconcerned with the fate of the nation, isolated from potential allies by the reactionary and pro-fascist policy of her governments, Poland became an easy prey to Hitlerite aggression in 1939.

Further Destruction

The War and Occupation brought about further destruction of productive forces in the country. As a result of a deliberate, conscious policy of annihilation of Polish population during the occupation, over 6 million people lost their lives and 1.6 million were partially or totally disabled and made unfit for work.

As a result of war operations on Polish territory and the rapacious economy of the occupying forces, two-thirds of industrial and mining establishments, three-fourths of the rolling stock and one-fourth of rural buildings were destroyed. The number of head of cattle fell by 60 per cent. To sum up, 38 per cent of Poland's national wealth was destroyed.

It is in such conditions that the working people of Poland began the reconstruction of their country. The starting point of this reconstruction was land reform and nationalization of large and medium-scale industries.

The land reform, completed in the years 1944-45, resulted in the abolition of landed estates above 125 acres and the distribution of lands was thus obtained among the pea-

santry. In this way over 15 million acres of land passed into the hands of the peasants and over a million peasant families received land, thanks to land reform. Land was distributed, first of all, among agricultural labourers and landless peasants and then among the poor peasantry. Thereby, semi-feudal relationships in rural economy were removed. Over 87 per cent of land in Poland thus passed into the hands of peasants, while 84 per cent of privately-owned farm land under cultivation constitute medium-sized farms. The average amount of arable land owned per head of rural population has doubled.

The nationalization of big and medium industries, completed in January 1946, legalized to a great extent the conditions resulting from the liberation, when a considerable number of industrial establishments taken over by the Germans during the Occupation were left without owners. In principle, the reform applied to all establishments employing over 50 workers in one shift. Moreover, it extended over the entire field of transport including railways and air-ways, the most important storing and loading establishments as well as nearly all banks. The nationalization of big and medium industries, of transport and banks, resulted in the overthrow of the rule of monopoly capital, foreign and native. At the same time, an important socialist sector was created in the Polish national economy. This made it possible for the State to give planned direction to national economy, and it became the main factor in the speedy reconstruction of the country.

Fifth Plan

Planned industrialization of the country became the basis of further economic development of Poland. As a result of this industrialization, industrial production in 1953 was 3.6 times higher than in 1938, and the production per capita of population as much as 4.8 times higher. At present, Poland holds the fifth place in Europe in industrial production. Industrial production per head of population is 92 per cent of the industrial production per head of population in France. Polish industrial output is equal to that of Italy in absolute figures, while the percentage of production per head of popu-

lation surpasses that of Italy. In 1937 industry, along with handicrafts, contributed 30 per cent of the national income, while in 1952 it was 53 per cent. The number of persons employed other than in agriculture rose by about 3 million, as compared to the pre-war period, which means that it more than doubled.

Agricultural production also rose considerably. Agricultural production per head of population is now 30 per cent higher than in 1938. Production per head of population engaged in agriculture is 80 per cent more than before the war.

Thanks to industrialisation and land reform, unemployment and 'superfluous persons' in the countryside vanished. The average of real income per head of non-agricultural population was, in 1953, 40 per cent higher than that in 1938. The per capita real income of rural population rose by 75 per cent. This fact finds its reflection in the considerable increase in consumption.

The social and cultural services play a considerable role in raising the standard of living of the working masses. The number of beds in hospitals rose by 88 per cent as compared with 1938. The number of doctors rose considerably. Illiteracy has been liquidated. While in 1938, 136 persons in 10,000 went to colleges and universities, now there are 316.

Socialist Sector

The industrialization of Poland is intimately connected with the growth of the socialist sector in the national economy which is at present the decisive factor in national income. At present 99 per cent of industrial production is coming off the socialist sector. At the same time, a socialist sector has developed in trade. The wholesale trade is entirely socialistic. The growth of co-operative trade merits particular attention. The co-operatives have at present over 5 million members and 57,000 shops. Trade in the countryside is entirely in the hands of co-operatives. In cities two forms of socialist trade—the State and co-operative trade—exist side by side.

In recent years has also begun the process of socialist transformation of agriculture. The development of production co-operatives is at its root. At present, there are in Poland, over 8,000 agricultural production co-operatives, having over 200,000 members. State farms along with production co-operatives cover

20 per cent of land under cultivation. The development of agricultural co-operatives is an important factor in the modernisation of agriculture, the raising of the agricultural and zootechnical level, and increase of productivity. Already now the harvest and other indices of productivity are higher in co-operative than in privately owned farms.

Thus, the structure of national economy is being systematically orientated in the direction of Socialism. The social structure of the population, too, is in a similar process of transformation. Ninety-five per cent of the non-agricultural population is employed in the socialist sector of national economy. In agriculture small property still dominates; 88 per cent of peasant farms are of small and medium size. The capitalist elements have been pushed out to the very margin of economic and social life. They still retain a certain importance only in agriculture in the shape of kulak farms which constitute 6 per cent of the total number of peasant farms. The working people are nowadays the vast majority of the Polish population. Poland has become a land of workers, peasants and working intelligentsia. The Polish nation is being transformed into a socialist nation.

As a result of these changes, the position of Poland in the international sphere also underwent a change. Poland is no more an object of exploitation by foreign capital; neither is she any longer a mere source of raw materials and agricultural produce for highly industrialised capitalist States. The structure of Polish foreign trade has also changed. Before the war Poland mainly exported agricultural produce and raw materials; she imported finished goods. At present, she imports ever-increasing quantities of raw materials for further processing and industrial equipment, while she exports ready-made goods. The volume of Polish foreign trade, as compared with the pre-war period, has doubled. About two-thirds of trade exchanges are done with the Soviet Union and countries of people's democracies and one-third with capitalist countries.

The aid given to Poland by the Soviet Union as well as co-operation with People's Democracies played an important role in the development of Poland's economy. The Soviet Union extended to Poland credit facilities amounting to 2.2 milliards of

rubles for the purchase of industrial equipment from USSR. Soviet machinery, plants and technical help are of great importance for the industrialisation of Poland. Soviet supplies for light industries, of seeds for agriculture and of raw materials for production of fertilizers are of no less importance.

The development of the productive forces of the country, especially of industry, required the concentration of all efforts on heavy industry, especially on industries producing means of production. During the last four years, the output of means of production increased by 136 per cent while the production of consumption goods increased by 99 per cent. The particular attention paid to the development of heavy industries led to a certain slowing down in the development of agricultural production, which during the last four years increased only by 18 per cent.

Programme for Future

The achievements in the industrialisation of the country, especially in building up heavy industries, make it possible now to raise the tempo of production of consumption goods, both agricultural and industrial, which will bring about a quicker rise in the living standards of the population. The Second Congress of the Polish United Workers' Party, held in March last year, worked out a programme for the realisation of this goal. This programme contains, among others, the following points:—

1. Raising of agricultural production by 10 per cent during the next two years; that means doubling of the present tempo of development.
2. Putting the tempo of development of consumption industries on a par with that of the production of means of production.
3. Lowering of accumulation in the national income which in recent years has been from 25 to 28 percent to 20 per cent.
4. Transformation of the structure of foreign trade so as to increase the import of raw materials for production of consumer goods and of a certain amount of finished consumer goods.

Consequently, the real income of the working population is bound to rise by 15 to 20 per cent in the next two years. The first steps towards this goal were taken by three con-

secutive reductions in prices of consumption goods.

New Perspective

The abovementioned directives of economic policy open up a new perspective for the future and the prospects of increasing national well-being and of ever fuller enjoyment of the fruits of socialist construction.

These directives are a powerful factor in cementing the unity of the nation in the struggle for the economic development of the country and the prosperity of the citizens.

The Polish working class, working peasants and the working intelligentsia look back to-day, with pride, on

the road covered in the last ten years. They look back with pride on the successes as well as at the efforts and sacrifices made on this glorious voyage. The momentous historical importance of the last decade lies, however, not only in the successes achieved already, but even more in the prospects for the future which these successes have opened up.

The Future of Bombay City

Arthur Souza-Godinho

OUR enthusiastic espousal and ardent avowals of the doctrine of non-violence have not entirely succeeded in taming the Adam in us. An unedifying exhibition of his distressing presence in our bosoms was afforded four times in ten days in our city, whose enviable reputation for tolerance was tarnished in unrehearsed displays of violence.

Bombay was not the only place, though, to suffer from such disturbances, for excitement was reported in also Poona and Kolhapur. These outbursts were, however, a minor affair compared with incidents in Rewa where a mob broke through a police cordon outside and inside the Vindhya Pradesh Assembly, entered the chamber while it was discussing the States Reorganisation Commission's report, severely manhandled the Finance Minister, threw a file at the Chief Minister and flung stones and shoes, forcing the Speaker to adjourn the House sine die. So scant was the respect for the sanctity of the House that stones were thrown by the demonstrators just before the House was adjourned. Such incidents are an unhappy omen for the progress of our incipient democracy. They show the extent to which passions can be aroused by issues affecting the inmost lives of peoples.

The interests of democracy are not served by such outbursts, and we have only ourselves to thank if the impression gains currency that a band of rowdies can disrupt orderly existence and hold a city to ransom as it did in Bombay. Occurrence of such deplorable incidents is symptomatic of frustration. A horse will surely kick when it is cheated of a carrot dangled before it.

Our leaders cannot complain at the turn of events, for when their party was in the wilderness and had not tasted the plums of office, it dangled before the people many carrots, one of which was provinces formed on a linguistic basis. The delay in the implementation of this part of the Congress programme has been unconscionably long.

Nor were the interests of democracy served by the Congress Legislature Party's whip directing its members not to vote on the official resolution approving of the States Reorganisation Commission's report,

although they might express their opposition to it during the debate. The whip amounted to a virtual gag. Elements were not wanting outside the august chamber to capitalise on this negative interpretation of democracy.

There is no doubt that such outbursts of ill temper as we have witnessed to our dismay stem from disappointment that the future of Bombay City has not been settled in a manner according with the aspirations of such people as comprise the largest section of its cosmopolitan population. Geographical considerations leave none in doubt about the area to which the city legitimately belongs.

This fact has been recognised by experts. Their views are reinforced by the pronouncements of public figures noted for their sober judgment. Such views have, however, availed the champions of a United Maharashtra naught. So far as the latter are concerned, the problem would seem to be very much where it has been all this time, and their dis-appointment is understandable in the circumstances.

Formation of a separate state for Bombay City is a counsel of despair, they feel. Detached from the hinterland to which it belongs, the City will be in about the same condition in regard to its vitality as the tail shed by a lizard or an appendage dropped by a crab. Despite assurances and safeguards to ensure its continuing vigour and importance, the City will languish from inanition.

Opposition to the separation of the City can, accordingly, be appreciated. To tear asunder what has been and must go together is partition. Political pundits, constitutional authorities and literary purists may quibble that territorial redistribution and administrative alterations are not partition. This contention is sophistry, for the fallacy inherent in it is patent. Territorial redistribution invariably involves subtraction from one unit and addition to another, but at times it takes the form of separation pure and simple.

Bifurcation of territories organically united is undesirable, as the pages of history are strewn with examples showing that it culminates in irridentism, which invariably ex-

plodes in violence. This tendency is always carried to dangerous lengths in the name of linguistic cohesion and self determination. Forces of unrest are unleashed, and unless effectively quietened, thrive on themselves.

A classic example is at hand. Britain was the pioneer among nations in our times to practise partition. The scene is our own country 50 years ago, when Bengal was divided, in 1905, into two provinces: (i) Bengal, and (ii) Eastern Bengal and Assam. This administrative redistribution of the functions of an area originally conducted from a common source was deeply resented. It evoked strong and violent opposition from the people. Serious political unrest followed. Leaders of all shades of opinion were unanimous in their denunciation of the partition, and clamoured for its abolition. The partition was undone in 1912, when the province was reconstituted and Assam again separated as it had been before its incorporation into East Bengal.

Moreover, the proposal to separate Bombay City and confer on it the independent status of a City State is hardly much less different from the demand recently voiced by Tamils in Ceylon for a separate state for themselves in that small island. On the same analogy, one need not be surprised if, amidst the din and strife over Bombay, the residents of Matunga moot a proposal tomorrow for union with Madras or Kerala!

Maharashtrian claims to Bombay rest on unassailable grounds as has widely been acknowledged, but no useful purpose will be served by a tedious reiteration of the familiar arguments. It is true that diverse communities have pooled their resources and labours, and contributed, each in its own way, to the raising of the imposing fabric which Bombay City is. Yet, one cannot deny that Maharashtrians were in the vanguard in the early days, a century ago, when the foundations of the city's present greatness were being laid. This fact may be gleaned from old records.

Thus, Maharashtrian names figure predominantly among the early graduates of the Bombay University, which was established in 1865. Even

a cursory glance at the records of the Town Council which preceded the establishment of the Municipal Corporation shows that Maharashtrians were at that time in the forefront of public life. This fact is evidenced by the names of several streets in what was then the city of Bombay lying outside the Fort. The names of Maharashtrians loom large, also, among property-holders in the last century, as old surveys and title-deeds show.

The British were undoubtedly the first to realise the immense potentialities of Bombay as a great entrepot of commerce and trade. The opportunities for successful business which they created were soon seized and exploited by, first, the Parsis and, then, the Kutchis, among whom the Khojas, specially, were prominent. They started mills, and it was not long before Bombay became, thanks to their venturesome spirit, India's Cottonopolis.

The overwhelming bulk of labourers in the mills, the port, the railways and the Municipality's outdoor works were none other than the burly Ghatis and the wiry Konkani, while Government and foreign business offices were staffed almost exclusively by Brahmins, Pathare Prabhus, Parsis and Christians. This composition of office staffs in those days may easily be verified by a reference to the records not only of official establishments but also of those foreign firms which have survived unto our day.

The commercial expansion of the city and its growing prosperity soon brought to Bombay a vast influx of people from all over India, who believed that its streets sparkled with gold, just as Dick Whittington thought that the streets of London were paved with gold. Steadily, the original structure of the population underwent a change, creating not only a marvellous demographic mosaic but also the present complexities about the city's destiny.

Meanwhile, opinion in Gujarat is strongly in favour of the establishment of a separate Gujarat State, though they have intimately been associated with every facet of the City's varied life. There is no denying the fact that, by and large, Gujarati business acumen has most conspicuously been connected in the past few decades with the development of the city to its present pre-eminence. There are, obviously, cogent reasons impelling them to sever the

present bonds and strike out on their own. The exit of Gujarati enterprise from Bombay will give Gujarat a unique opportunity to scale heights of prosperity which no other State in India will be able to attain. Every factor is in favour of this clearly foreseeable result. Its soil is productive. Moreover, the area is well industrialised, and new industries are being set up.

The inclusion of Kutch and Saurashtra in Gujarat gives it an unrivalled advantage over the future Maharashtra State. Saurashtra has several ports capable of berthing ocean-going vessels. The new port of Kandla in Kutch which owes its development to Sindhi enterprise, is being built on modern lines, and has an oil terminal to boot. The needs of Gujarat are at present served by the port of Bombay, but once the new Gujarat State is in being, it is almost certain that all cargo consigned to Gujarat will be shipped there directly and not routed via Bombay as at present.

The volume of traffic now handled in Bombay will thus shrink, and the prosperity of the port and the city will suffer. If the port of Bombay will serve the needs of Maharashtra, as it needs must, industrialisation of this region on an extensive scale will have to be promoted as rapidly as possible to ensure that Bombay does not sink to the level of the Heptanesia from which it has been developed.

Meanwhile, fears expressed by business magnates in Bombay have apparently led to second thoughts among Maharashtrians. The picture has been changing almost daily with the conflicting utterances made by leaders of Maharashtrian opinion. A Maharashtrian State without Bombay is not of much importance, so that we find that some spokesmen who were loudest in their demand for Maharashtra with Bombay or nothing are now not opposed to a bilingual state including Vidarbha, which, despite its smallness and similarity to the Part "C" States, whose disappearance is certain, has been made an independent unit, though its population is just about double that of Greater Bombay and its area is practically insignificant compared with the future States of India.

The controversy over Bombay's future has to a certain extent been complicated by the emotion and passion which was imported into the dis-

cussion on the morrow of the publication of the SRC's report. The miasma in the air continues, and unless it is cleared and the problem brought back to the plane of reality, the present acrimony will continue. Such a prospect cannot be viewed with indifference, as it will be a constant impediment in the way of the growth of the country to its proper stature.

Bombay as a city State, with its cosmopolitan population and its diversity of interests, will be, as Shri M R Jayakar, one of the country's elder statesmen, remarked at the celebration of the birth centenary of Sir Narayan Chandavarkar, a place fit for only vermin and worms. Even the boundaries for the proposed city State do not conform with the natural lines of geography. After all, the future of Bombay city itself is at stake. The wishes of its inhabitants, who are striving even today amidst a welter of confusing cries, for its advancement, should be consulted. No procedure would be more democratic.

The proposal that Bombay City will be able, if it chooses, to opt for Maharashtra savours of Fabian Tactics. The reason for the time-limit is not easy to fathom. If it is meant to blunt the edge of the present clamour, the device may not succeed, but may, on the contrary, give it further sharpness. There is no guarantee that uncertainty over the city's future will end, and that it may not be prolonged for another five, fifteen or fifty years. A bold solution of the problem at this stage will avert much subsequent bitterness.

Meanwhile, the attitude of the Sindhis at the present juncture must serve as an eye-opener to those who entertain fears and distrust. Having lost their homeland, the Sindhis, who are striving to build a new settlement for themselves in Kutch, with Gandhidham as its nucleus, find themselves completely swamped in the new Gujarat State. They will be an insignificant minority and find themselves immensely handicapped in their efforts to preserve their traditions and their own distinctive culture. Yet, no clamour has been raised by them any more than one has been raised by the small Maharashtrian community in Baroda, which will be a district of the new Gujarat State.

Hesitant Trend

Wednesday, Evening

BELATEDLY, the IISCO Chairman's speech has had its effect on Indian Iron. It is natural that the set-back in Indian Iron should have had a sympathetic effect on equities in general. But the behaviour of equities on the stock market here is a reassuring indication that the influence of Indian Iron is not as dominating as apprehended earlier. Miscellaneous and Engineering shares have lost some ground, but these groups remain quietly steady.

Technical factors have aggravated the fall in Indian Iron. As it became known that a prominent "bull" operator was finding it difficult to transfer his holdings to the next settlement, even after his willingness to pay as much as four annas as "budla" charges for a fortnight, professional operators sold heavily. As a result, Indian Iron touched as low as Rs 40 some days ago.

Market Position

In the last few days, Indian Iron have steadied down at lower levels. Selling pressure seems to have exhausted itself. That does not mean that the fall is over. There is no evidence of fresh buying. Friday, the clearing day for the Bombay stock market, may be a crucial day for Indian Iron. Market circles here are awaiting settlement developments in Bombay. Current steadiness is partly due to this factor. But it should not be ignored that even professional operators are afraid to sell Indian Iron "short" at current levels.

It was inevitable that Miscellaneous and Engineering shares would feel the impact of the sharp recession in Indian Iron. But it is reassuring to note that these groups have recovered a major portion of the ground lost as a result of the sudden break in Indian Iron. There is no selling pressure in these groups. What is more assuring is that, at all set-backs, these groups of shares attract investment support. This time also investors have lent their support to these shares at lower levels.

It is clear that investors are optimistic about the long-term outlook for Engineering and Miscellaneous shares. But the current steadiness is immediately due to another factor. Some engineering and miscellaneous companies have announced dividend payments recently.

Working results of many of these companies are satisfactory. Some other companies are likely to announce dividend payments shortly. Sellers are, therefore, scarce. Simultaneously, there is occasional buying to pocket the dividend.

There are other groups of shares, besides Miscellaneous and Engineering shares, which have not been materially affected by the drop in Indian Iron. Paper shares have remained steady for more than a year now. Inherent strength in Paper shares is reflected in the fact that the heavy fall in Indian Iron has not had, except temporarily, any adverse effect on these shares.

Coal Shares

Nor has the set-back in Indian Iron had any depressing effect on Coal shares. After a minor immediate fall, as a sequel to the sharp break in Indian Iron, Coal shares are gradually moving up. Throughout the current week, sound coal shares have been creeping up owing to consistent buying support. It is clear that the Government's coal policy during the second Plan period is now better appreciated. It is a welcome development that Coal, Paper, Miscellaneous and Engineering shares remain steady, despite the shake-out in Indian Iron.

Only Tea and Jute shares remain hesitant. Recent developments indicate that the fall in Indian Iron has halted the upward trend in Tea and Jute shares. As long as Indian Iron were moving up, these groups were either steady, or slowly creeping up. But the psychological atmosphere created by the fall in Indian Iron has made operators conscious about the major influences which are causing uncertainty in Tea and Jute shares.

Weekly tea auction results continue to be unsatisfactory. Only those unaware of facts could expect a fall in the tea export duty. But the lower export prices on which the export duty has now been based, shows that even current auction prices here are well above London quotations. This is one of the reasons which is affecting exports. Meanwhile, as current Calcutta auction prices remain, for certain kinds of tea, below production costs, investors feel shy to lend support to Tea shares even at the prevailing

low rates.

Despite the fall in raw jute and goods jute shares remain hesitant. But latest developments are not unencouraging. After prolonged steadiness, raw jute prices are falling. Also welcome is the recent set-back in jute goods. There are abundant indications that foreign buyers are unwilling to buy at prices ruling until recently. Jute shares are not likely to develop a firm trend before the IJMA decision on the question of the unsealing of looms is known. If the sealed looms are unsealed, the market will conclude that the export outlook for jute goods is not unpromising. In this event, jute shares may develop an upward trend.

Technical Correction At Long Last

Thursday, Morning

THE long overdue technical correction came at last and the overbought position of the stock market was lightened when bulls were compelled to liquidate their holdings. In the process, some of the bulls who were bent on manipulating the rates, despite heavy budla charges, did get their fingers burnt. Speculators cried a halt to their buying operations. The question is now being asked if share values bear any longer any plausible relation to yields; indeed the question has been bothering the investing public ever since the Chairman of the Indian Iron and Steel Co. Ltd. delivered his speech at the last annual general meeting. In fact, the subdued tone of his speech occasioned some bull unloading forthwith.

This was further accentuated by reports that the increase in retention prices of steel would fall far short of the market expectation which is around Rs 30 per ton. In the event, Indian Iron declined from Rs 44-5 at one time to Rs 40-12 on Friday last week and were further pushed down to Rs 40-1 on Tuesday this week. After this debacle in Indian Iron, prices of all pivotal issues came tumbling down. As though this were not enough, there were also reports that the Tata Steel Company would not be allowed to issue new shares at par. This also further accentuated the bearish trend.

In the face of the general slump in prices, Alcocks provided the one bright spot and recorded a substantial rise on reports that the Company had secured good contracts in Saurashtra and that the managing agency company was likely to change hands.

Textiles also Succumb

Although most of the scrips in the textile section forged ahead early in the week, they also succumbed to the general selling pressure and lost considerable ground towards the close. Bombay Dyeing, Century and Kohinoor, which enjoyed fairly good support at the opening of the week, receded subsequently on renewed selling pressure.

In the miscellaneous section, except for Alcocks, all the rest were more or less steady. Even Alcocks,

after touching a new high level of Rs 410 reacted to Rs 381-4 to recover at the close to Rs 407-8. Due mainly to tired long liquidation, Bombay Burma had a setback to a new low of Rs 43-12 while ACC and Scindia met with selling but closed better.

Cotton

What, no Export Quota?

Lack of confidence, especially at higher levels, characterised the pattern of trading in the cotton futures market. Often the bulls were in two minds about the strength of the market at a given time. This is understandable with so many uncertain factors at work. In the first place, operators have not yet got over the disappointment caused by the observation of the Union Minister for Commerce and Industry last week to the effect that there were no prospects of export quota for raw cotton. Secondly, the arrival of the new crop might well be a signal for the emergence of selling pressure. Bulls, of course, argue that as there

has been a deterioration in the quality of cotton owing to untimely rains, there was no need to be unduly anxious about selling pressure. On the contrary, the cotton to be tendered may not pass in survey either in February or in May and hence there will be scarcity of good quality crop which would only result in making the available cotton dearer and pushing up the prices in consequence. Caught between these two opposing views, the marginal operators were in a fix. In fact, the market swung one way or the other in accordance with the predominance of one view over the other.

Nevertheless, there was a distinct tendency to firm up at the close, thanks to renewed rumours that the export quota for cotton might after all be announced. Credence was given to these rumours as they were linked up with the visit to the city of the Commerce Secretary, Shri H V R Iyengar. Though no official confirmation came, the market was still inclined to be steady. It is held

THE ECONOMIC WEEKLY

in informed circles that the prospects of an export quota for 50,000 bales of 25/32" staple and one lakh bales of 3/4" staple cotton, in addition to some ad hoc quotas for export to the Iron Curtain countries, cannot be altogether ruled out. As the latter views gained strength towards the close of the week, speculators naturally became active and as a result, the midweek setback in prices was not only corrected but the market improved further. After opening at Rs. 689-8, the February contract crossed the Rs. 700-level on Monday (Rs. 704-8) and improved further on the following day to Rs. 708-0 to close firm at that level on the last day of the week. The May contract also fared equally well towards the end of the week, closing at Rs. 681.

Bullion

Influx of Kutch Silver

Although there was practically no change in the basic position of supply and demand, the bullion market experienced a sharp decline during the week under review. Some of the speculators who suffered heavy losses on the stock exchange were forced to part with their holdings in bullion. And this sudden

spate of liquidation somewhat unnerved the others. This apart, the influx of kutch silver as well as gold has been on a larger scale, and this also adversely affected the market sentiment. The setback, however, did not prevent shrewd operators from accumulating lines in view of the approach of the busy season when offtake is usually heavy. This, in turn, resulted in imparting some strength to the market towards the close of the week when arrivals of kutch silver were reported to have slackened a little.

Silver forward Maghshar opened the week at around Rs. 174-8 and after improving to Rs. 174-12 declined to Rs. 171-8, to finally close at Rs. 173-12.

Gold Forward moved between Rs. 95-4 and Rs. 92-8 and closed at Rs. 94-15-6.

Oils and Oilseeds

Madras Storm may Injure Crop

AS in cotton, in which damage to crop following untimely rains raised prices, the unexpected storms in the South during the past week have imparted some strength to the oilseeds market. As a result, despite

the efforts of speculative elements to keep the market down, the market has developed a distinctly firm trend. The supply position is tight as the crop this year has not been normal and arrivals also have been rather meagre. The unfavourable weather in Madras State during the past week, it is apprehended, will affect the crop and there is every indication to show that the present firm trend may be strengthened in the days to come. It is currently estimated that the groundnut crop this year would not exceed 20 lakh tons as against 24 lakh tons last year.

In the castor section also, there was a steady trend due to paucity of stocks and reported business in castor oil with overseas buyers. The U S A was believed to have bought during the week about 2000 f.p. castor oil from Brazil at around 12.80 cents per lb. while the Continent quoted higher at £112 per ton.

In the linseed section, the trend was weak in the early part of the week, due to lack of demand for Indian oil from overseas. U K and Continent were reported to have bought Canadian oil in bulk, while Argentina has also done some business in oil with the Continent.

Company Notes

Empire's Impressive Valuation

THIS is the second valuation of Empire after the Administrator took over. The Actuary's report, as expected, fully substantiates the claim that under the new management the company has maintained continued progress. For one thing the resulting profits have been large enough to enable the Actuary to recommend an increase in bonus to policy holders from Rs. 10 per thousand per annum on whole life policies in the previous valuation to Rs. 18 and from Rs. 10 to Rs. 15 per thousand per annum on endowment policies.

New Business

Of the three years covered, the last viz. 1954 was a difficult year of adjustments, when competitive reduction of rates of premium led to conversion of existing policies into paid-up ones and switch over to new policies at lower rates of premium. This and the unhappy events of 1951 explain why the total business valued consisting of 137,164 policies assuring, together with bonus ad-

ditions, equalled only Rs. 29.02 lakhs against 136,606 policies and Rs. 25, 60 lakhs as at the date of the previous valuation. Though the total sum assured has not improved much and average sum assured per policy is slightly lower, on all other counts the record is excellent, particularly when it is remembered that a very stringent basis has been taken for the valuation viz. 2-7/8 per cent rate of interest, which will compare very favourably with the basis of valuation adopted in the case of most other companies.

Expense Ratio

The management continues to exercise the same strict control over expenses, and during a period of rising expenses, both the overall expense ratio and the renewal expense ratio have been further brought down from an average of 31.4 per cent and 19.5 per cent for the last valuation period (1949-51) to 27.9 per cent and 19.3 per cent for the three years ending 1954.

Lower Mortality

The mortality experience has also shown a noticeable improvement, the percentage of actual to expected deaths, declining from 66.9 per cent for the quinquennium ending 1951, to an average of 47.6 per cent for the period 1952-54.

Interest

Empire's Life Fund as at 31st December, 1954 was Rs. 10.63 crores, (against Rs. 9.26 crores at the end of 1951) and the net yield on the company's funds at about 3.3 per cent is about the same as at the previous valuation.

The Actuary is gratified to note that he has been able to recommend a handsome bonus, despite the stringent basis of valuation. The result is due, he adds, "not only to the inherent strength of this very old company but also to the prudent management of it on the business and financial side by the Administrator".

Eight annas

Let's look at PROGRESS—Stanvac Quiz No 5

1 THE PLAN CALLED FOR **MORE VANASPATI**—A SOURCE OF IMPORTANT VEGETABLE OILS WE NEED IN OUR DAILY FOOD. IN 1954-55, THE MANUFACTURE OF VANASPATI WAS INCREASED TO:

A) 37,500 TONS
B) 364,017 TONS
C) 225,383 TONS

2 THE COTTON TEXTILE INDUSTRY HAS MADE REMARKABLE PROGRESS. IN 1954-55, IT FURTHER EXCEEDED THE PLAN'S TARGET FOR MILL-MADE CLOTH BY PRODUCING:

A) 1,359 MILLION YDS.
B) 5,076 MILLION YDS.
C) 679 MILLION YDS.

4 MINERAL PRODUCTION HAS INCREASED, TOO, RESULTING IN EVER LARGER EXPORTS. IN 1954-55, EXPORTS OF MANGANESE ORE TOTALLED:

A) 944,922 TONS
B) 311,307 TONS
C) 105,700 TONS

3 MORE AND MORE DRY BATTERIES ARE BEING MANUFACTURED IN INDIA; AND NOW AN EXPORT MARKET HAS BEEN ESTABLISHED. DURING 1954-55, THE NUMBER OF DRY BATTERIES MADE WAS:

A) 251,000,000
B) 148,400,000
C) 49,500,000

STANDARD-VACUUM ARE PROUD TO PRESENT THIS TOPICAL INFORMATION ON INDIA'S PROGRESS—AND PROUD THAT OUR THREEFOLD ACTIVITIES OF PRODUCING, REFINING AND MARKETING OF PETROLEUM PRODUCTS ARE CONTRIBUTING TOWARDS IT.

1 225,383 TONS OF VANASPATI—MAKING THIS VALUABLE FOOD AVAILABLE TO 3½ MILLION MORE PEOPLE THAN AT THE START OF THE PLAN!

3 148,400,000 DRY BATTERIES—11,900,000 MORE THAN IN 1950-51!

2 5076 MILLION YARDS OF INEXPENSIVE CLOTH FOR INDIA—MORE THAN THE TARGET FOR THE END OF THE PLAN BY 376 MILLION YARDS!

4 944,922 TONS OF MANGANESE ORE WERE EXPORTED, EARNING OVER Rs. 12.4 CRORES FOR INDIA.

ANSWERS

Visit. INDIAN INDUSTRIES FAIR, New Delhi—Until January 1

Economics of Co-existence

INFORMED opinion had never any cause for suspicion that India would forsake her independent foreign policy in return for offers of economic co-operation from Communist Russia. Those who had entertained such fears only disclosed their inadequate appreciation of India's foreign policy, and of her inherent democratic leaning. They will feel reassured by the joint statement issued by Pandit Nehru, M Bulganin and M Khrushchev, and signed by the Prime Ministers of India and Russia. No exception will, or can, be taken to the political aspects of the joint statement. But its economic implications do not yet seem to be widely appreciated.

Fantastic nonsense has been talked about the motives behind the Russian leaders' visit to India. It has been insinuated that Pandit Jawaharlal Nehru has been induced to adopt an open-door policy to Russia in return for a promise that Moscow will disown the Communist Party of India. Abolition of the Comintern, though not peaceful propaganda for the spread of the Communist ideology, is implicit in the acceptance of the principle of competitive co-existence. CPI may have been out-manoeuvred. But CPI's dilemma and predicament do not stem from the Russian leaders' visit to India, but from the joint enunciation of Pancha Shila by New Delhi and Peking, and its later endorsement by Moscow.

Informed opinion in the West is not unaware of the implications of Moscow's economic diplomacy. But the West, for reasons which are obvious, is perturbed over what it chooses to interpret as the problem of Communist economic penetration in Asia. There is consternation at what is described as the determined Communist trade offensive. Self-appointed well-wishers of the countries against which Russia's trade offensive is supposed to be directed are warning the peoples and countries concerned that Communist Russia's promise of economic help always lags behind performance. This is inevitable, it is argued, because Moscow has a habit of exaggerating Russia's economic strength. Professor Colin Clark may be goading some diplomats to such exercises in wish fulfilment. But many other competent experts in the West have repeatedly expressed concern over Russia's spectacular rate of economic growth. This is reflected in the hope, expressed implicitly or explicitly, that the Right-wing of the Republican Party in America will consider the implications of Russia's growing trade offensive before it can congratulate itself on balancing the U S budget.

Some of the arguments advanced against Russia's offers of economic co-operation reflect the consternation that these have created in the West. Insinuations have been made that Russia is not interested in offering aid, but only in bargaining economic advantages for her. From the joint communique on economic relations between India and Russia, it is clear that both countries are eager to expand mutual trade. Russia has extended credits, in the shape of deferred payments, to India in relation to the Bhilai steel plant. In the statement signed by the two Prime Ministers, the hope is expressed that, in view of the second Plan's emphasis on expansion of heavy industries, further similar opportunities for economic co-operation (presumably, on similar terms and conditions) will arise. Even so, it is clear that the joint communique on economic relations is

concerned mainly with expansion of mutual trade between the two countries. India is in no position to reject offers of economic aid. But in asking for trade, and not aid, she is in the august company of all self-respecting nations, including Britain.

Some of the exuberant observations of M Khrushchev in his addresses before public meetings have been criticised both within and outside the country. But what he, as a member of the Presidium of the Supreme Soviet, or M Bulganin may have said in their public speeches, is not as significant as the policy statements on crucial occasions. For a proper appreciation of the real motive of their visit to India and of its probable outcome, it is necessary to read and digest the last few paragraphs of the joint statement signed by the two Prime Ministers, the whole of the joint communique on Indo-Soviet economic relations and, in particular, the farewell broadcast address of M Khrushchev, "To build up . . . industry, it is necessary to have your own native cadres, especially the cadres of technical personnel. Your cadres of technical personnel are growing". "But," M Khrushchev assured the people and the country in his farewell broadcast address, "to have more such people in your country, we are willing to share our knowledge and experience so that your country may rapidly cross the complicated and difficult way of creating her industry which was passed by our country."

India is a beneficiary of the Colombo Plan. She has received considerable economic aid and help from America. Bhakra Nangal, DVC and Sindri could not have been erected without American and Commonwealth aid. But it is doubtful whether Indian engineers have acquired the knowledge and experience to build a second DVC or a second Bhakra Nangal. Only twenty-four hours before M Khrushchev's farewell broadcast from New Delhi, Shri T T Krishnamachari had occasion to furnish a reason for scarcity of technicians in this country. In his address in Calcutta before the Associated Chamber, he deplored:

"If behind the foreign investor or would-be investor there is a feeling that by starting ventures in this country the market for home production will ultimately suffer or there is a hesitation to entrust the Indian concerns with the know-how for a period of years, I cannot help feeling that there is an atmosphere of suspicion. The atti-

tude of industry is directed by the atmosphere of suspicion and very often some of these negotiations with foreign capital break off and end in nothing."

TTK is one of the few Cabinet Ministers who is supposed to be a friend of Big Business. But his observations before the Associated Chamber in Calcutta reveal that he is prepared to toe the Marxist line in his interpretation of capitalist economics when the occasion demands it. Some of the intriguing questions and remarks of the Russian leaders during their visits to Bhakra Nangal, DVC and Chittaranjan become clear only when this aspect of economic relations between the industrialised West and the under-developed East is borne in mind. There is ample evidence that the Russian leaders and their technical experts have assured New Delhi and its technical advisers that Russia is prepared to offer not only plant and technical skill, but is willing to impart technical knowledge to Indian technicians and to help this country build machines to manufacture machines.

There is formidable evidence, no doubt, of Communist Russia's progress in technology. But if it has been TTK's experience that foreign capital from Western capitalist countries is reluctant to foster industrialization in India or that it is unwilling to impart technical knowledge and secrets to natives of the country, need one go to Marxist-Leninist economics to seek an explanation for it? The conditions under which capitalist enterprise—foreign or Indian—works in this country, the pattern of development that the Government has in mind, the regulations which TTK's Ministry has laid down for industry—do these not by themselves adequately explain why risk capital should be reluctant to flow to India, except to those soft spots where technological and other advantages give it a sheltered—call it monopolistic, if you like—position? Does TTK seriously maintain that the same obstacles are also encountered in getting assistance at inter-Governmental level or from international agencies?

It has been a pet theme of this paper which has often been aired in these columns that the kind of economy we are aiming at leaves little scope for the free flow of foreign private investments in the form of equity capital though all these years the Finance Minister has been obsessed with the one idea of making such capital flow in. That he has

not succeeded is pretty obvious, but that is not because of any lack of effort or persistence on his part.

No motives need be attributed but the fact is that we are aiming at a pattern of development which leaves only limited scope for the association of western capitalist enterprises with our development. The West has failed to develop, or we have failed to work out, a modus operandi through which adequate assistance can come forth and be effectively utilized. Russia has not to face those impediments which capitalists enterprise puts in the way of the western powers.

For the present, and for some decades to come, Russia can have no such negative attitude to under-developed countries. Industrialisation of these countries is not contrary to the ultimate interests of Communist Russia. Through offers of economic co-operation, Russia can hope to win friends among under-developed Asian and African countries. She has another over-riding consideration for adopting such an economic policy. Such a policy alone can lead to a gradual shrinkage in the markets for capitalist countries, a process which has been, and will remain, the prime motive behind Moscow's diplomacy.

Developing world events lend weight to the interpretation stressed here. Before this interpretation can be endorsed fully, two questions must be answered. Is it safe for India to pursue an open-door policy to Communist Russia, with all the implications of such a policy? India has received aid from both America and the Commonwealth without lining-up with the Western Powers. There is, therefore, no reason to assume that India will not succeed in securing economic co-operation from Communist Russia on the explicit understanding that such help is free from political or economic strings. There are, on the other hand, certain major considerations which Russia must bear in mind before she agrees to help India to create a native cadre of technicians and to build a machine tool industry. She must have a reasonable assurance that a future India, so economically strengthened with Russia's help, will not lineup against Communist Russia. In New Delhi's foreign policy, she now has this assurance. There are, however, certain circumstances which may upset the present calculations of both Communist Russia and non-Communist India.

Wool Gathering in Coal Fields

THE statement made by Shri T T Krishnamachari on coal is unexceptionable as a political statement. The railways and the three new steel plants in the public sector will be the biggest consumers of coal. Besides coal is definitely in the public sector in the Industrial Policy Statement of 1948; so the Minister for Commerce and Industry was not in a position to give any assurance that the industry would not be nationalized in the future. He himself, therefore, took a dim view of the future of private enterprise in this sector.

Now way back in 1948, when the Industrial Policy Statement was made, it was clearly laid down that in the case of coal, "the State will be exclusively responsible for the establishment of new undertakings, except where, in the national interest, the State itself finds it necessary to secure the co-operation of private enterprise subject to such control and regulation as the Central Government may prescribe." What has the Government of India done in all these years to discharge the responsibilities which it took upon itself in 1948? What are the new collieries that it has opened and what preparations has it made to increase the production of coal? The demand for coal has been steadily going up during these years and in the next five years, it is estimated, coal production has to be stepped up from an annual 37 million tons as at present to 60 million tons. How exactly is the Government going to set about its business and how could it have gone on all these years doing nothing about discharging the responsibilities which it had so solemnly taken upon itself?

Let us consider for a moment what it means to keep the sword of Democles hanging on the private sector so that colliery proprietors would be entirely justified in allowing their assets to run down and in not taking any more care than the minimum necessary to beat the law and turning their face resolutely against planning long term development. If the Estimates Committee are to be believed this is what has happened. The collieries, they say, have been wasting metallurgical coal which badly needs to be conserved. Their methods of production are uneconomic and result in higher costs; technically colliery operations leave much to be desired. Producers have not shown

any enthusiasm for adopting adequate safety measures nor are they likely to take initiative in introducing mechanisation or in improving their labour relations, both of which are essential for attaining the Plan target. The Committee come to the comforting conclusion that in the long run, nationalization is essential. But only in the long run, so the Ministry of Production may go to sleep again.

But that is neither here nor there. What about stepping up production to 60 million tons? There has been a lot of bargaining between the private and public sectors for their respective shares of the increase. Out of the total increase of 23 million tons, the private sector is expected to get 8 million tons while the public sector will produce the rest. To change the metaphor, what makes the public sector stick its neck out and go in for expansion, when the noose is dangling over its head? There are reasons for it, but all of them do not meet the eye. The Finance Minister has given an assurance that the private sector will be fully compensated for the fresh investment incurred for raising the additional 8 million tons, notwithstanding the amendment to the Constitution after which compensation ceased to be a justiciable issue. But what about maintaining present output which also will entail substantial investment by way of replacement, particularly if the maintenance is to be done properly, with due regard to economical operation and future development? The people who run the collieries are hard headed business men and it is to be presumed that either they have received the needed assurance on this point also, or they do not believe that the Government really means what it says or is capable of carrying out its professions.

The economy cannot be run without coal and the second Plan cannot be implemented without more coal. Whoever can deliver the goods, will have the last say in the matter; so colliery owners may have to keep on shouting but they need not worry, not seriously.

The Government scheme for raising 15 million tons in the public sector, it has been estimated, will involve a capital investment of Rs 75 crores and Rs 30 crores of working capital. The scheme for expansion, however, is thin and has not

yet been worked out in a manner that gives any reasonable assurance of its workability or about the final result. True, financial considerations may not be the determining factor where larger national interests are involved, but it is worth noting in passing that of the 11 Government-owned collieries, six have been running continuously at a loss, three were running at a loss in some years while only two were making any profits between 1951-52 to 1954-55. And what about costs? The New Sketch, the well known coal journal, hazards the estimate that in some of the Government collieries, the cost exceeds Rs 46 per ton against the selling price of about Rs. 15 per ton. This may be a guess but not far from the truth, judging from the general experience of public undertakings which may do better in the future, but the public sector has yet to win its spurs in the field of coal production.

Those who believe in a public sector and have taken the Avadi resolution seriously cannot feel happy about this state of affairs. Socialism is a serious business; it is not wool gathering. And no country can progress towards anything by following a dog in the manger policy. There is another aspect of the coal industry which will cause equal misgiving. It is that the Coal Commissioner has found and the Estimates Committee agree that regulations have completely failed and if collieries are to serve national interests, they have to be taken over. It is a pathetic admission of defeat indeed for the Coal Commissioner to say that regulations have failed when he is the person responsible for enforcing them! Whether it is conservation of metallurgical coal, or sandstowing, or even the adoption of safety measures, nothing can be done without nationalisation. If this is accepted, then the only alternative left is full fledged state capitalism. This is certainly not what Avadi had in mind.

Whether it is the final figure or not, a production target has been fixed for the private sector. But how is the increase going to be allocated among different coal fields and individual collieries? What is the breakdown of the total by grades? And what about coal prices and allocation? Nationalisation as an ultimate solution does not solve any of these issues.

Weekly Notes

British Experts on Soviet Steel

THE Soviet offer of a million tons of steel to India confirms the earlier reports about steel behind the iron curtain. Though Russia has never been a significant exporter of steel, after their return visit to the Russian steel industry, the team of steel experts from Western Europe were left in no doubt about its efficiency, superior technique and capacity to compete in this field. The British team's report has not been published but some of the individual members of the team have given out their reactions. The British visitors found that much of the Russian plant resembled the American in design. Technically, however, the industry has been standardised on "good western practice" rather than displaying outstandingly new developments. Output per head in the larger integrated plants, one of the British experts estimated, was broadly comparable to the "top end" of British plants.

The data on comparative costs supplied by the British experts are as follows: Iron ore is abundant and cheap. A lower grade (38 per cent iron) ore was available to the blast furnace operator at a little more than one third the price of (imported) ore in Britain. Coking coal was slightly dearer, but other coal cheaper, particularly in relation to oil, which may explain the shift they noted from oil firing to producer gas. The low real wages of the Soviet worker, according to the British team, is the measure of comparative advantage which the Soviet Union has got. The upshot of it all is summed up by one of them thus:

"So long as the Russian worker accepts half the real standard of living of the British worker and achieves a somewhat comparable level of productivity, Russian industrial products can well be sold cheaply on world markets".

Which means that for Britain, there is "every reason for a very real concern over the competitive power of Russia."

Clearing the Peronist Mess

IT is not often that professional economists are in the limelight, even though the present generation has produced economic statesmen of the highest calibre. The appointment of Dr Raul Prebisch, the Executive

Director of the Economic Commission for Latin America, as Economic Adviser to the new regime in Argentina is a richly-deserved recognition of a perspicacious economist, who has left his impress on the working of the Commission in the form of exceedingly competent Economic Surveys of Latin America. The very first of these Surveys made a penetrating analysis of the problems of growth, including the terms of trade and the diffusion of technical progress. In fact these Latin American studies have as unmistakably the Prebisch touch as their European counterparts have the Myrdal touch, and they are certainly far above the ordinary run of the economic publications of the United Nations and its affiliated bodies.

Dr Prebisch's new assignment consists partly of unscrambling the Peronist scrambled egg. His report on the economic consequences of Peron forms the starting point of the economic policy of the new regime. He is reported to have advocated a liberalisation of the economic apparatus of the former regime with its paraphernalia of a syndicalist society. The abolition of multiple exchange rates was among the first fruits of Dr Prebisch's recommendations. Foreign capital and enterprise may also be called upon to play an important role in course of time, if his other recommendations are carried out.

An Argentinian national and a product of the University of Buenos Aires, Dr Prebisch was the General Manager of the Central Bank of Argentina from 1933 to 1944, when he initiated the experiment of the bank issuing its own securities for the purpose of reducing the liquidity of the banking system. He went into voluntary exile on the advent of Peron. In the present state of fluidity of Argentine politics it is difficult to say how stable the new regime will be, but there is no doubt that it has chosen the proper economic mentor.

Great Eastern Wins Its Case

THE Great Eastern has won its point. There is no doubt about it, though the company had to go to the extent of submitting its resignation from the membership of the Indian Coastal Conference and the Indian National Steamship Owners' Association to convince the others

of the error of their ways. This was, however, only a gesture, an essay in the gentle art of persuasion. For, Shri A H Bhiwandiwalla, the Chairman of the Company, told the shareholders at the annual meeting that the Great Eastern "fully appreciates the importance of wholehearted collaboration among the shipowners in order to build up a vigorous shipping industry for India. It is, therefore, a matter of great relief as well as of gratification to me that the other members of the Coastal Conference have unanimously evolved a formula which, subject to certain agreed safeguards, will allow charters on the coast to supplement owned vessels and also to replace them in case they are transferred overseas. As soon as this understanding was reached, the notices of resignation were withdrawn".

The controversy appears to be entirely pointless. Why use a race horse to draw a hackney carriage? There seems as little sense in confining ships that can do a much better job overseas to coastal waters, particularly to force a 10,000 tonner into it, when the draught on the Hoogly makes it physically impossible to operate economically a vessel larger than 8,000 tons on the Coast?

Shri Bhiwandiwalla has taken the opportunity to put in a word for freedom of a charter both ways, for Indian companies to charter foreign vessels and use them on the coastal run as well as to charter out their own vessels to non-Indian concerns, this being the secret of successful chartering all over the world. Then there is also the general question of tramp shipping which carries 40 per cent of our overseas trade but not even one per cent of the tramp ships that enter our ports carry the Indian Flag! The second shipping corporation, which has so long been in coming, should be definitely for tramp shipping, he said.

Ships are getting increasingly difficult to acquire. Shipyards the world over are booked ahead for the next two to three years, and costs are the highest ever. How can tonnage be expanded quickly enough, even if the Government followed a stable and dynamic policy? The need for a second ship-yard is obvious and the demand for it would be widely endorsed; and so will be the demand for tankers under Indian Flag.

Pattern of Employment

IT will not be news that the total volume of employment in the organised private sector of the city of Calcutta declined by 3.7 per cent in the first three and a half years of the first Five Year Plan. But some of the findings of an enquiry, undertaken jointly by the departments of economics and of statistics of the Calcutta University at the instance of the Planning Commission, may serve to remove some of the popular misconceptions about the course of employment since the beginning of the first Plan.

Unemployment has been growing since 1951; 1953 was the worst year. There was some improvement in the employment situation in 1954. These broad findings are not contrary to popular impressions. But the major findings of the survey would seem to contradict some of the prima facie assumptions of economic development between 1951 and 1954. Informed opinion had been aware of the growing unemployment in the last few years. But the steady growth of industrial output and the comparative lack of mechanisation had fostered the impression that rising unemployment was due to fluctuations in employment in the tertiary sector. So far as employment in Calcutta is concerned, this impression is not confirmed by statistics.

Between 1951 and 1954, the volume of employment in the various office establishments in Calcutta rose by 2.2 per cent. It has been rising steadily every year with the exception of 1953. But employment in the works, factories, etc., has declined consistently by 6.4 per cent over these years. Though the rate of decline slowed down, employment in these works did not, unlike that in office establishments, revive in 1954. Factories and office establishments in Calcutta are not unrepresentative of the all-India make-up. Also, the sample on which this survey is made seems to be fairly adequate. It may not, therefore, be unreasonable to assume that the behaviour of employment in Calcutta faithfully reflects the pattern for the country as a whole.

Equally interesting are the survey's findings on the trend of employment among different groups of employees. In office establishments, the strength of the subordinate staff remained almost the same. In works and factories, employment among unskilled, semi-skilled and skilled workers declined. But in both office establishments and in factories,

the number of assistants, officers and managerial staff increased. In office establishments, the number of officers increased by 9.2 per cent. Those who are never tired of deploring the deteriorating economic status of the educated middle class may find some solace in the survey's finding that the volume of employment available for the educated middle class has increased in the organised private sector. In the public sector also, the subordinate staff seems to have more than maintained its position.

Growing unemployment among the educated middle class is the major economic menace to Bengal and Bengal. It should, therefore, be welcome information that in both offices and factories, the number of officers and managers has increased, despite the overall decrease in employment. There is, however, the other side of the medal. Can it be that this trend in employment is an indirect consequence of high taxation? To the extent that this employment trend is a reflection of unduly high establishment charges, the consumer, the investor and perhaps, the Treasury may have a legitimate grievance.

Railways' Operational Efficiency

IT must have cost the Railway Board a terrific mental effort to

overcome its resistance to a probe into the operational efficiency of Indian Railways. This it has woefully neglected and has not encouraged others to look into. As a part of the Indo-US technical assistance programme, we may be soon having a team of American experts for recommending steps that could be immediately taken to reduce the increasing pressure on the rail transport system.

Apart from short term measures which can be implemented quickly, the team will also carry out a thorough survey, as a result of which we may expect a long term programme to be implemented by stages. It is to be hoped that the programme will not be heavily capital intensive, and that it will enable the Indian Railways in the next few years to attain optimal utilization of the existing capacity without much additional capital investment. The team will also examine problems of rail-sea co-ordination at expert level, primarily for the shipment of preliminary bulk cargoes to lighten the present load on railways of heavy coal traffic. In view of its rich and wide experience in this particular field, USA is obviously the country to look to for the right type of technical assistance.

Letter to the Editor

Economics for Economists' Sake?

WHO wrote that review of Lewis in your issue of the 3rd? With due humility, I shall say that my reactions were similar. I also felt that the idea of export trade for stimulating the growth of under-developed economy was suggestive; but export what? I could not follow Lewis in his forays into International Trade. Only one objection I have to the review, in fact, to one word—'qua economist' or economics. This 'qua' business won't do in discussing any plan for under-developed economies. First: planning posits a theory of State—therefore, it is political economy and economic juristics. Secondly, under-developed economy has, by definition, a highly sophisticated but irrational social structure which restricts the transition to rational economy. India has had no economy in this sense of rationality.

She has only had Society and some history, that is, traditions. All that is going, no doubt. But what is going must enter into the analysis of going, that is, a going concern?

So 'qua' is symptomatic of a fashion merely, a fashion that is more indicative of vested interests, intellectual exclusiveness and snobishness than of the needs of a discipline. Art for Art's sake (Wilde, Pater, Goncourt were snobs); economics for economists' sake? If not, for whose sake? It seems that such pure creatures are not interested in India. They are pre-occupied with their discipline solely, and wholly. I am also for discipline but not at the cost of reality, of an insight into it. But all young men are economists whereas I am a 'sociologist', that is to say, a realist.

That's my objection to the word 'qua' and also to one remark by Aye-a-Sigh in his article "Economists Panel—the Pity of it, Iago", in your Draft Plan-frame Number of June 18. Such words are vain because they remind me of the vanity of one discipline to hold the key to the Universe. "Vanitas Vanitatum". Still the review was very good, indeed. My congratulations to the author, whoever he is.

Calcutta Insurance's Excellent Valuation

STEADY increase in new business, leaving out the abnormal jump in the boom years of 1948-51, a striking improvement in mortality experience and handsome yield on the investments of the Life Fund are the highlights of the seventh Valuation Report of Calcutta Insurance Ltd., for the triennium ending December 31, 1954. The valuation has disclosed a surplus of Rs. 9.01 lakhs and the Actuary has recommended the declaration of a reversionary bonus at Rs. 17 per thousand per annum on whole life assurances and Rs. 15 per thousand per annum under other classes of assurance.

There has been an appreciable expansion in the value of new business written by the company, and although the business procured during the triennium 1952-54, at Rs. 2.81 crores, is much lower than the record figure of Rs. 5.23 crore at the previous valuation for the four-year period ending December 31, 1951, business written in each year of the valuation period is satisfactory both from the standpoint of the lives assured and the sums assured.

Year	No of policies	Sum assured (Rs. crores)
1952	3,115	0.80
1953	3,296	0.84
1954	4,120	1.17
As at the end of the valuation period		

1952-54, total net business in force amounted to Rs. 5.17 crores against Rs. 4.73 crores at the end of the previous valuation period, 1948-51.

The Company's Life Fund stood at Rs. 1.40 crores at the end of the latest valuation, as against Rs. 0.99 crore at the end of the previous valuation and the net yield on the Life Fund during the triennium averaged 4.14 per cent. Since the valuation has been made on the basis of a 3 per cent rate of interest, the actual rate earned leaves a comfortable margin, which contributes to the surplus substantially.

On the basis of Oriental's 1925-35 Ultimate Table, the ratio of actual to expected deaths has shown a striking improvement, dropping steadily from 80 per cent at the 1943-47 valuation to 64.3 per cent at the valuation for 1948-51 and to an average of 45.1 per cent at the end of the triennium under review.

The average renewal expense ratio during the triennium declined to 17.5 per cent from an average of 18.5 per cent at the last valuation. The Company expects to be able to bring down the expense ratio further, as it has now crossed the Rs. 5 crore mark in respect of business in force, and has entered the next large-sized group of insurers, who are allowed a lower expense ratio under the Insurance Act.

On the basis of the results of the valuation and the Company's experience respecting mortality, the Actuary forecasts equally good results for the next valuation also.

Turner Morrison

THOUGH interested buying of shares is no longer an active influence on the Calcutta Stock Exchange, rumours have been current for some months past that some companies whose shares are not listed on the Calcutta Stock Exchange are either on sale or are likely to change hands. Such rumours have been current in relation to Turner Morrison and Co. Ltd. According to rumours circulating in the market, a minority shareholding of Turner Morrison has been purchased by British Indian Corporation. Shri Haridas Mundhra, who recently acquired controlling interests in Jessop, Richardson and Cruddas and B.I.C., is reported to have stated that he is purchasing a shareholding in Turner Morrison on behalf of one of the units of his group of companies.

Turner Morrison have interests in shipping, trade, and industry. They are managing agents of the Lodna Coal Company, Angelo Brothers and Alcock Ashdown, the well-known Bombay engineering firm.

Off the Record

Thinner Top-dressing for the Second Plan

THE fact that this year's annual general meeting of the Associated Chamber of Commerce was addressed by the Minister for Commerce and Industry, instead of the Minister for Finance as in the previous years, probably means something in itself. The occasion is usually reserved for a major announcement of policy, particularly policy vis a vis private investment and enterprise. In the past, as in this year, it has been the practice of the president of the session to comment on the handicaps to private initiative, affirm the eagerness of entrepreneurs, especially foreign, to contribute their utmost to the planned development of the country and exhort the Government to make it possible for them to do so by suitable adjustments in fiscal, foreign exchange and labour policies.

It is probable that in the past, the Finance Minister took on the task of replying to this because of the great stress laid on financial matters by the presidents of the Chamber's meetings. Subsequent to the last meeting, the Avadi session of the Congress, the publication of the Taxation Enquiry Commission's report, the preliminary work on the Second Plan etc. have perhaps given the business men an idea of the inevitable shape of things to come. Government initiative in regard to expansion of steel production, coal-mining and power generation have probably turned the thoughts of private business to the future role of Government as a competing producer. Maybe this explains, in some measure, the appearance of Shri T T Krishnamachari at Calcutta instead of Shri Chintaman Deshmukh. Or it could just be an evidence of increasing agreement in the Cabinet on matters of policy regarding large-scale private industry and trade. Or it might merely be that Shri Deshmukh was busy otherwise.

Whatever the reason, it is a good thing that Shri Krishnamachari, who for one reason or another has been considered more sympathetic to organised private industry than many other members of the Cabinet, has been the mouthpiece of Government on this occasion. He has been very lucid and very forthright in explaining policy in regard to private investment, foreign capital and labour.

There is no question now but that Government's adherence to the policy of building up a socialistic pattern of society is wholehearted and real. And there can equally be no question about the determination of the Government not to bargain the country's independence, political and economic, for a mess of foreign aid.

Some of Shri Krishnamachari's statements deserve to be remembered not only by Clive Street but by many others. He drew attention to the fact that no Government worth its name could frame its domestic policy always with an eye on its effects on foreign capital. It is, of course, true that inflow of foreign capital would be of assistance in furthering the objectives of the Second Plan. But such an inflow could only provide, to use the Commerce and Industry Minister's felicitous phrase, "top-dressing". One cannot over-

emphasize the relevance of this point. The elementary fact that in order to put to use such foreign resources as become available, we shall have to utilize complementary domestic resources in a considerable measure is apt to be forgotten even by those who ought to know better. It is even less appreciated that unless foreign assistance is used in such a way that, by association, the quality and quantity of domestic productive resources improves no lasting upward trend in development will be established. It follows from these that the vital role of foreign assistance will have to be that of making domestic resources more effective rather than of supplanting them. Like independence, economic development can never be a gift from one country to another. Each country has to sweat for it, or go without.

That India has rich fields to offer to private enterprise to develop is not disputed. But the richness of these fields cannot be measured in terms of immediate pecuniary gains alone. This is an inevitable corollary to the need for sweating; the easiest avenues for quick profit, such as consumer goods industries, have to have a relatively low weight in the apportionment of investible resources. And genuine enterprise has necessarily to take a long view of things, and has to count among the returns on its investment the excitement of pioneering new industries and creating for themselves as well as for others new opportunities for the exercise of their talents. This applies to foreign enterprise no less than to domestic enterprise.

Shri Krishnamachari's plain speaking comes at a time when the whole question of the place of foreign assistance, private or otherwise, in the Second Five Year Plan is in a somewhat unsettled state. This is not just because N Khrushchev has irritated and upset Mr Dulles and Sir Anthony Eden and complicated the aid business. Basically, there is as yet no concretisation of the plans for spending or for raising the resources necessary for the public sector. The size of the public sector's plan is poised precariously at Rs. 4800 crores, nearly half of which is more than what is reasonably expected to be covered by existing taxation and enhanced borrowing.

"One has no protecting
power save prudence."

Additional taxation, foreign assistance, deficit financing—which, between them, have to fill the gap—are all indeterminate. Apart from the Draft Plan estimate for deficit financing of Rs 1000—1200 crores, not much progress has been made in deciding whether this is feasible, adequate or inadequate. And this cannot be settled unless opinion crystallises on how much we can get from additional taxation, how much from abroad, and to what extent the public sector's expenditure could be tailored to suit these.

This is rather a pity. For extreme pre-occupation with the arithmetic of financial resources can play tricks with the planners' thinking. Way back in April, the Panel of Economists suggested in their Memorandum that instead of worrying too much about the five-year total of deficit-financing, we might go ahead with whatever priority projects we want to implement in the first two years of the Plan, see how much deficit-financing occurs and take a second look at the prospects for the remainder. This was advocated, it would seem, on grounds of caution. But it could well be argued that such

a procedure would have both a psychological and practical significance. The psychological gain is the one emanating from flexibility. And the practical gain is that the effects of deficit-financing in the first two years or so could be closely watched with a view to discovering whether and to what extent it adds to the incomes of those individuals or institutions who can be 'tapped' through additional taxes or loans. This is vital because this determines, along with the general increase in national income, the extent and directions in which further tax measures become possible—and, by implication, the future course of deficit-financing.

But the ineluctable fact is that the Governments, Central and State, cannot soft-pedal in the matter of taxation and borrowing. This has to be recognized, and whatever may be the amount of foreign assistance flowing in, it cannot obviate this trend towards higher taxation. And private enterprise has to take this into account in assessing possible returns on its investment. It is noteworthy that just when Shri Krishnamachari was telling the Associated Chamber of Commerce that he can-

not hold out any hope of lowering taxation, as a means of offering incentives, Shri Deshmukh was explaining to the Finance Sub-committee of the Congress Parliamentary Party the need for greater effort in the direction, amongst other things, of taxation. Shri Deshmukh is further understood to have observed that even the Draft Plan estimate of Rs 400 crores of foreign assistance seems now to be on the high side. Which, in other words, means that the top-dressing for the Second Plan may be very thin indeed.

That, probably, is a little unfortunate in the short-run, but by no means a tragedy. Indeed, it might help us realise more clearly the sacrifice and sustained effort necessary for implementing the Plan. What Shri Krishnamachari has done is to point out to the entrepreneurs also that some adjustment in their attitudes is required. Given that adjustment, the disincentives to business enterprise and inflow of private foreign capital may turn out to be less real; but to refuse to make this adjustment will be to shun reality altogether.

Attlee: Man of Moderation

THE departure of Mr Attlee from the British political scene is certainly an event of considerable moment. His resignation now paves the way for a struggle for leadership which might well give cohesion and unity to the many factions which make up the Parliamentary Labour Party. The principal contestants for the enviable post of "H M Leader to the Opposition" and thus the alternative Prime Minister have already started lobbying in an effort to win over without regard to the consequences which such a struggle necessarily involves for the prestige of the Party. And in a significant way, the contestants each represent viewpoints and factions which in the past have been reconciled and where not, kept at bay, by the experienced hand and skilful disinterest of Mr Attlee. Mr Morrison has found the question of his intentions, if not elected, to be "cruel and terrible". As for Mr Bevan, his (political) hatred for Mr Gaitskell has at the time of his resignation led him into an adroit withdrawal from the struggle in support of the veteran Mr Morrison.

Mr Attlee, who rose from a small-time social worker in the slums of Whitechapel to be the first Socialist Prime Minister with something like a workable majority, was, and remains, essentially conservative in outlook and demeanour. The Times has called him "a great Englishman"—a characterisation pregnant with meaning. Patriotism for the English is a value almost wholly assessed in terms of adulation for existing institutions, and in particular, for institutions like the British Empire. And the Englishman in Mr Attlee did certainly contribute greatly to the continuance of these institutions or to what the Times now otively calls "English-speaking democracy". In less thinking, but more popular circles, the "Social Revolution" or the inauguration of the Welfare State in the first five years of the post-war period in Britain was supposed to have been presided over by Mr Attlee. Equally Mr Attlee's reputation stems from the independence which he is supposed to have brought to India, Pakistan and Ceylon. That either of these developments could justifiably be considered in terms of more fundamental forces is often forgotten. What is more remarkable is that his con-

tribution to these developments is based on the remarkable grounds of his "considerable patriotism" and "political courage".

It is certain that historians will come to recognise Mr Attlee as one of the more skilful preservers of "British" institutions. In this, he equals the most English of British political statesmen and leaders. Like his more robust contemporary, Sir Winston Churchill, Mr Attlee was of essentially Victorian origin and his instinct was, therefore, guided by the materialism of the middle class or bourgeoisie from which he came. A Tory in his youth, he was moved by the poverty around him to join the Labour Party. In the general confusion and disillusionment surrounding the "sell-out" of Mr Ramsay MacDonald, this "unknown" man was placed at the helm of an essentially ideological movement, and ever since, it has been the fortune or misfortune of the British Labour movement that Mr Attlee was able to exercise moderation and caution, whenever basic questions relating to the social, economic, and political environment came to exercise the minds of the labouring classes. The Times has described this most elegantly:

"Here is an honest man who leading an ideological party in an ideological age has held simply to his principles of common right conduct".

He was able, when called upon to be Prime Minister in 1945, to state without hesitation that all those great resolutions of the Labour Party Conferences "have become obsolete" and, therefore, been "tacitly dropped". He injected what many of his apologists term "the realities of political power" into the Parliamentary Labour Party when the Labour landslide shook the country in 1945.

On imperial questions and on foreign affairs, the direction which he gave Ernest Bevin or to the Colonial Office often put these aspects of Government outside the field of party politics—bipartisanship has been the hallmark of British party opinion on almost all external affairs. In one important way, however, Mr Attlee became so overwhelmed by the pressures of the Cold War that he allowed develop-

ments to occur which at times caused surprise and diffidence to his chief opponent, the then Mr Churchill. It will be remembered that when in 1951 the Conservatives regained power, Sir Winston made it his duty, as one of the first acts of his office, to obtain an undertaking from the Americans that they would not use their air bases in Britain without the consent and sanction of the British Government. It was this agreement which for once secured the otherwise waning status of Britain in the Anglo-American alliance.

By the time this despatch appears in print, the new leader of the Labour Party will have been elected. There can, however, be no doubt that whoever occupies the leadership, the election will have been conducted with recriminations and intrigue, and that these will all have a permanent effect on the structure and the homogeneity of the party. At the time of writing, the trend of Labour opinion appears to place the chances of Mr Gaitskell fairly high relatively to those of Mr Morrison. Mr Gaitskell's attributes arise largely from the fact that he is possibly the clearest thinker in the Labour opposition today. That he belongs to the right wing and that he comes from the University rather than from the work bench is, of course, likely to make him less of a popular figure in the Labour movement. Those who scheme and intrigue for the sake of the party are now aiming to find a place for Mr Bevan in the leadership in such order as to give the new leadership a sufficiently working class colour and thus remove the donnish and "superior" bearing with which Mr Gaitskell approaches political problems. It is a fact that the Trade Union wing of the party is powerfully in favour of Mr Gaitskell. On the other hand the constituency parties treat him with an odium no less serious than that with which Mr. Bevan treats him. It is most difficult to see how a leadership can in the present circumstances be chosen which will be able to find support and, more important, give confidence to all the sections that make up the Labour Party.

Speech of the Chairman Mr A H Bhiwandiwalla

THE following is an abridged version of the Speech of the Chairman, Mr A H Bhiwandiwalla, at the Seventh Annual General Meeting of the Company held on December 16, 1955:—

Gentlemen,

It gives me great pleasure to welcome you all at this Seventh Annual General Meeting of your Company.

Before proceeding further I must refer to the misfortune that has befallen us this year in the sudden death of my old friend and colleague, Shri Navinchandra Mafatlal, which has filled me with great sorrow and a keen sense of personal loss. The tragedy is heightened by the fact that such a valuable life filled with so much enterprise should have been prematurely cut short in the midst of its manifold activities. A business man and industrialist of outstanding calibre, Shri Navinchandra had been a pillar of support to your Company from its early days. His untimely death has not only left us poorer, but has deprived the Indian business community of one of its ablest leaders.

Review of Progress

As you will notice from the Report and Accounts which have already been circulated to you, the working of your Company during the year ended June 30, 1955 has, on the whole, yielded satisfactory results. The cargo lifted amounted to 5.54 lakh tons as against 5.16 lakh tons in the previous year, although the larger ships were employed in the overseas tramp trade to a much larger extent than ever before. The gross freight earnings, inclusive of charter hire receipts, increased by Rs. 38 lakhs, from Rs 171 to Rs 209 lakhs. This improvement was due to a favourable freight market and the addition of two ships to your fleet. The gross profit for the year, however, amounted to Rs 30.34 lakhs as against Rs 440.30 lakhs in the previous year.

The present market value of the fleet well exceeds its original cost of acquisition; a sum of Rs 82 lakhs has been accumulated in the fleet depreciation reserve; liquid cash amounting to Rs 50 lakhs is available for future expansion. These

facts testify to the financial soundness of your Company.

One unit of the fleet was sold during the year, but orders have just been placed in Japan for a motor vessel of 12,080 deadweight tons as closed shelter decker, costing around Rs 120 lakhs. With the addition of the new Japanese-built ship, the fleet will consist of 8 vessels with a total of 61,371 deadweight tons.

Hurdles Ahead

We are fully conscious of the keen desire of the Government as well as of the public that the Indian-owned tonnage should grow at a much faster rate. Nor need I assure that your seven-year-old Company, which has hitherto done its best in building up its own fleet, is only too eager to play its appropriate role in fulfilling this national aspiration. But the problem is far from easy. First of all, there are unusual difficulties at present in acquiring fresh tonnage. Practically all the world over, shipyards are fully booked with orders for the next two or three years, deliveries are unusually long, and prices have soared to record levels. Second-hand tonnage, too, is extremely scarce, with prices ruling abnormally high. Our own shipyard at Vizag has only a limited capacity to build and deliver ships; and even that capacity has been very seriously affected by long delays in construction.

On top of this, the problem of tonnage expansion encounters another stubborn difficulty, though of a different nature, namely, the lack of a stable, clear-sighted, dynamic shipping policy. Shipping is a highly capital-intensive industry—a 10,000 d.w.t. modern cargo vessel costs well over a crore of rupees, or as much as the entire capital of a fair-sized shore industry. Shipowners, as businessmen, can embark upon such large-scale capital outlay only when they are reasonably assured of the prospects of economically working these floating factories. Until this condition is satisfied, the expansion of our shipping is bound to remain slow, as it has hitherto been the case.

Coastal Charters

The instability of official policy is illustrated by the decisions that were

taken from time to time about the employment of coastal charters. In November 1954 a decision was taken to eliminate chartered tonnage from the coast, which became effective from the 1st of April. As the tonnage position on the coast progressively deteriorated, it was soon found that Indian-owned vessels were no longer adequate to cater to the traffic. Accordingly, time-charters were again allowed, though at first in a piecemeal fashion. In October last the shipowners reached a unanimous decision that the ban on charters should be lifted for a period of two years subject to certain agreed safeguards. The Consultative Committee, at its last meeting held in Bombay on November 28, arrived at decisions, the net effect of which is to allow a substantial relaxation of the ban on charters. We are now painfully retracing the step that was hastily taken a year ago.

Resignation from Conference and INSOA, and Its Withdrawal

You are no doubt aware that your Company, while building up its fleet, took a long view and acquired, whenever possible, large oil-burning units that could be economically employed in the overseas trade. In doing so, your Company had always taken it for granted that such units would be allowed freely to go overseas whenever opportunities occurred, although initially they could be licensed only for coastal trading. It was unthinkable that the Government could be averse to such a policy when it was so obviously conducive to the development of our shipping. Yet the ban on charters introduced last year was followed by a de facto ban on the overseas employment of our larger vessels so that these vessels, for all practical purposes, suddenly came to be treated as coasters, and nothing else.

You can well imagine the intolerable situation this unexpected development created for your Company. There was the immediate problem of meeting firm commitments for lifting sugar from the UK to India. What upset your Company most is the fact that, owing to the draft restrictions on the Hooghly, it is not possible to operate economically a vessel larger than 8,000 d.w.t. on

the coast. Your Company has been fully alive to its coastal obligations as entailed by coastal reservation; and it has been ever ready to meet them to the fullest extent. But the obligation is to maintain adequate tonnage on the coast so as to carry a given quantum of cargo. Surely, it would be an unwarranted extension of the obligation to insist that all the cargo must be carried exclusively in owned vessels. It would be logical to insist that no tonnage should be withdrawn from the coast unless, more or less simultaneously, equivalent tonnage, whether owned or chartered, were substituted. But what logic could there be in insisting that there must be no charters, and that no vessel must therefore be withdrawn from the coast, even when, for some vessels, this involved a 25 to 30 per cent waste of their carrying capacity?

For a time the prospects of your Company looked bleak, though for no fault of its own. In such a quandary your Company saw no other alternative than to submit, as a mark of protest against an unrealistic policy, notices of resignations from the membership of the Indian Coastal Conference and the Indian National Steamship Owners' Association. This step, let me assure you, was only a measure of our desperation; it was taken only as a last resort, and with the greatest amount of reluctance. For, your Company fully appreciates the importance of wholehearted collaboration among the shipowners in order to build up a vigorous shipping industry for India. It is, therefore, a matter of great relief as well as of gratification to me that the other members of the Coastal Conference have now shown full appreciation of our point of view and have unanimously evolved a formula which, subject to certain agreed safeguards, will allow charters on the coast to supplement owned vessels and also to replace them in case they are transferred overseas. As soon as this understanding was reached, the notices of resignation were withdrawn.

Larger Issues

The question of coastal charters is directly linked with larger policy issues which I would like to touch upon, even if briefly. There can be no question about the objective that one hundred per cent of our coastal trade should be carried in owned vessels. It has our wholehearted support. But the moot point is how soon we can do so. Coastal self-

sufficiency obviously depends on the rate of tonnage expansion. In dealing with this issue, we should remember several important considerations:—

First, the Shipping Policy Sub-Committee in its Report of January 1947, had assessed the coastal trade at 24 lakh tons per year, for which, under the conditions then prevailing at our ports, we would have needed at best 150,000 gross tons or, say, 7 to 8 per cent of the 2-million gross ton target recommended by it. Today our fleet, coastal and overseas combined, consists of only 480,000 gross tons; the traffic has already gone up to 28.5 lakhs; with the present slow turnaround of ships at our ports, we would need around 260,000 gross tons, or about 55 per cent of the present fleet. Would it be a wise policy to immobilise such a high proportion of our small fleet on the coast?

Second, the coastal trade itself is growing; in fact, had there been enough tonnage, owned or chartered, to carry all the cargo that has been, and is being, offered, more especially coal and salt, our traffic in the current year would have easily crossed the 3-million ton mark. The growth in coastal traffic is bound to be accelerated when the second Plan, with its emphasis on basic industries, gets into its stride. Insistence on immediate coastal self-sufficiency will correspondingly reduce our capacity to expand in the overseas trade. Would it be wise to relegate, even if unwittingly, our overseas shipping to the status of a secondary objective and go so slow with it, especially when both the public and the Government have been demanding more rapid progress in this field?

Third, at present we carry only about 5 per cent of our total overseas cargo. Is it the best policy for us to be one hundred per cent self-sufficient on the coast along with 95 per cent dependence on foreign vessels in the overseas trade? Or, shall we be better off by reducing our overseas dependence on foreign-flag vessels to, say, 90 or 85 per cent, even though this may mean a corresponding increase of charters on the coast? Should we not judge the issue, above all, from the angle of what course would maximise our earnings of freight and foreign exchange?

Fourth, our Government has

been importing large quantities of bulk cargo which is carried almost entirely in overseas charters even at a time when the charter market is unusually high. How can we reconcile such complete dependence on overseas charters with the unwillingness to allow any coastal charters at all? Since coastal charters, which can well be old and low-speed vessels, even coal-burners, are, as a rule, appreciably cheaper than overseas charters, would it not be desirable to use Indian ships as far as possible for the ocean carriage of bulk cargo and to charter less ships for the purpose, even though we may need correspondingly more charters for the coast?

And fifthly, the reserved coast has been acclaimed as the nursery of Indian shipping, and rightly so. Yet the concept of a nursery can be meaningful only when the coast is consciously utilised, to help our shipping so that it may be better equipped to venture out of the sheltered waters. A wise shipping policy will, therefore, give every possible inducement to the shipowners to build up fleets of deep-sea vessels by using the coast whenever possible to meet the challenges on the high seas.

The present policy is pursuing a course that is diametrically opposite. Your Company, over the last year, has been repeatedly denied permission to employ its larger vessels in the overseas trade; they were tied down to the coast even when this entailed a serious waste of their carrying capacity. By pursuing such a policy are we not throwing away what could be the biggest advantage of coastal reservation and hindering, instead of helping, the growth of our deep-sea tonnage? Are we not thereby converting the coastal nursery into a coastal strait-jacket, and inadvertently nursing our infant shipping into a permanent weakling?

Uneconomic Coastal Working

The first and foremost task before an under-tonnaged country like ours is to build up its tonnage as fast as possible and to ensure, as best as possible, that the expanded tonnage will find gainful employment.

By far the most important factor that is now hindering a more rapid expansion of the coastal fleet is the precarious character of coastal working. Costs of operation have gone up all along the line, including prices

of ships, stevedoring labour, salaries of floating as well as shore staff, bunkering; and, superimposed on all this, is the extremely slow turnaround of ships at our ports. Given the high costs of operation, a 10 per cent increase of coastal freights, as desired by the shipowners, would have been more than justified, especially since the freights have remained practically unaltered since May 1951. The Government, however, suddenly decided to intervene in this matter and, after holding it up for months, finally agreed only to a 5 per cent increase.

A good deal has been said in the past about the privileged position enjoyed by Indian shipowners in the reserved coastal trade. Let us not overlook the fact that the privileges do not include what is the inherent right of businessmen in other industries, namely, to adjust rates or prices to cover a rise in costs.

Dock Labour

The worst factor affecting the costs of operations is the steep fall in the output of stevedoring labour since the introduction of the decasualisation scheme and the consequent delays in the turnaround of ships. It has been playing havoc with our shipping. For an 8,000 d.w.t. coaster one day's extra delay at a port means a direct loss of Rs 4,500 to Rs 5,000. To this we have to add the extra port dues.

For more than a year Indian shipowners, with a striking unanimity, have been drawing pointed attention of the Government to the crippling effect of the port delays and have been pressing for effective remedies. The Dock Labour Enquiry Committee, which was appointed as a result, submitted its recommendations early in September. To judge from the brief press reports, the Committee has made balanced and constructive recommendations which, while fully safeguarding all legitimate interests of dock labour, should go a long way to restore healthy conditions at the ports and put an end to the ruinous delays. Yet up till now we have heard nothing about the decision to implement these recommendations. The overriding urgency of the problem has long been recognised by the Government as well as the public. It certainly brooks no further delay. It is our ardent hope that the Government will soon come to grips with it and settle it satisfactorily.

Port Facilities

There is also a great deal to be

done by way of improving the existing port facilities. Without up-to-date mechanical appliances for handling bulk cargoes, our ports will never be able to ensure a sufficiently quick turnaround of vessels. Besides, measures like better maintenance of equipment, adequate supply of spare parts, more and newer cranes, better utilisation of godown sheds, etc. could immediately raise the overall efficiency of our ports. Such improvements ought to be effected forthwith, since even if a piece-rate system is introduced, as recommended by the Dock Labour Enquiry Committee, the dock workers will be able to give the best possible output only when they are given better tools and greater facilities.

Rail-sea Co-ordination

Lastly, for the future of coastal shipping, there is the all-important question of proper co-ordination between rail and sea transport. As you might recall, last year I had occasion to bring to your notice how our railways were increasingly cutting into the coastal trade, particularly into the coastal shipment of coal, and how this, in its turn, was weakening the very foundation of our coastal shipping. Since then the nature of the problem has changed—today the coast is faced with a shortage not of cargo, but of tonnage; the total traffic in the country has been growing; the railways, unable to cope with it, have already begun to pass increasingly more cargo to the coast; this trend will almost certainly be accentuated in the coming years. In fact, transport is fast becoming a major problem in our economy; on it will largely depend the success of our second plan.

In such a context it is particularly important to form a realistic estimate of the anticipated traffic and to allocate as much of it as possible to coastal shipping. This is undoubtedly the most important task before the Rail-Sea Co-ordination Committee which is now investigating this matter.

Tramp Shipping

For a rapid expansion of overseas shipping our best hopes lie in early and systematic development of tramp shipping. It is unfortunate that hitherto so little attention has been paid to such a vital matter. Talks of floating a Second Shipping Corporation with the primary object of promoting the tramp trade have been in the air for one whole year;

but little headway has so far been made in this direction.

According to the best available estimates, the total dry cargo in our overseas trade amounts to 13.5 million tons. Of these no less than 5.7 million tons were carried, in 1953-54, by tramp steamers. It has been further estimated that, in the same year, 524 tramps entered our ports, but other than Calcutta which would no doubt account for another couple of hundred tramp ships. Of these 524 tramps, 519 were foreign-owned; only the balance of 5 carried the Indian flag.

These figures, rough and ready as they are, reveal a pathetic situation. What justification could there be for such an overwhelming dependence on non-Indian tonnage in our tramp trade? And when our Government is the largest single shipper in the country and controls several million tons of dry cargo, what could be more logical than to build up our tramp tonnage to carry, as far as possible, our own cargo?

All advanced maritime countries have developed liner and tramp trade, and both these wings of shipping are flourishing side by side. All that we need to do is to follow their example and pursue, in the same spirit, the same policy of co-existence between the liner and the tramp.

Letting out Indian Ships

A de facto ban has recently been imposed on letting out Indian-owned cargo vessels on a time-charter basis to non-Indian parties. Yet two-way time-chartering is an integral part of shipping, especially of the tramp trade; at times this is particularly useful in covering business risks; besides, long-term chartering out of ships at favourable rates can directly stimulate tonnage expansion since it widens the opportunities for gainful employment of vessels and also enables a shipowner to plough back booked profits on a planned basis rather than depend on anticipated profits from trading, which may or may not come true; for all these reasons it has been extensively resorted to by other maritime countries. There is no reason why the same freedom should not be allowed to Indian shipowners subject to whatever reasonable conditions may be found necessary to prevent any dislocation of regular trades.

Tanker Trade

Our overseas trade includes 3.5 million tons of petroleum and pet-

roleum products. In addition, it is estimated that about 18 lakh tons of refined products from the Oil Refineries will need to be distributed in coastal tankers. The Indian fleet does not contain a single tanker, whether for the overseas or the coastal trade.

The Government recently assured the shipowners that in view of the peculiar hazards of the tanker trade, they would be prepared to grant special concessions to those who would be willing to venture into it. Should this inducement fail to produce the desired effect, the Government will themselves go ahead and acquire a couple of tankers. In any case since the tanker trade has hitherto been completely neglected, it would be very desirable to acquire immediately some tankers, second-hand if necessary, so that an early start may be made in this line of business.

Hindustan Shipyard

Last year I had occasion to refer to the relatively high cost of ships built at the Hindustan Shipyard. As I then remarked, the principle of the U. K. parity price, as applied to Indian-built ships, in effect means that Indian shipowners are required to give a part-subsidy to the Shipyard when, in fairness, the entire subsidy that might be needed by our young shipbuilding industry, should come direct from the Government. I am glad to note that this matter is now seriously engaging the attention of the Government, and I hope that a satisfactory formula will be worked out soon. Since the price of ships will directly affect the competitive position of our shipping, it is important that the shipowners should be allowed to acquire tonnage at competitive prices.

A Second Shipyard

The question of starting a second shipyard in India has been blessed by the Government in principle. Early steps in this direction would appear to be not only desirable, but very necessary. Unless the capacity of our own shipbuilding industry is substantially raised, our ability to expand the merchant fleet will, in all likelihood, be seriously affected. Besides, on a long view, the comparative advantages of this industry lie definitely in favour of India. With our low-cost labour and low-cost steel there is no reason why, after another decade or so, India should not be able to produce ships at costs well below those of Western countries.

Equity Capital

Hitherto coastal reservation and liberal Government loans have been the two main props of our shipping policy. These were historic steps without which it would have been impossible for our shipping to show anything like the progress it has made during the last few years. But it would be unrealistic to assume that this is all that our shipping needs. The rate of progress is still far too slow; and it can be speeded up only when we are able to evolve a more comprehensive and more adequate shipping policy. Coastal reservation has to be supplemented by measures that would ensure economic working on the coast.

Besides, all over the world shipping has been developed with the help of large-scale risk-bearing equity capital. In India it has to make-do with interest-bearing Gov-

ernment loans, which carries the liability for repayment within a prescribed period. Such loans, welcome as they are in the prevailing circumstances, cannot take the place of equity capital. Here is a grave deficiency that our industry is faced with. It can be partially remedied if, as proposed by the shipowners, profits when ploughed back into the industry, are exempted from taxation. There is no doubt, however, that equity capital on a substantial scale can be attracted into the industry only when the Government, through appropriate measures, makes it possible for the shipowners to earn a fair return on the capital. For, only then will the investing public feel sufficiently confident about the future of the industry and will be willing to invest their savings in it.

Conclusion

Today we stand on the threshold of historic developments. The second Five-Year Plan, with its emphasis on basic industries and its bold targets, is now in the offing. Our economy, thanks to the far-sighted policy courageously pursued by our Government in so many fields is now marching from strength to strength. We, as shipowners, do not want to lag behind in that march. It is no longer enough for us to dream of high tonnage targets; the time has come when we must do our best to realise them. Our most pressing need today is a more adequate and more imaginative shipping policy directed to tackle the problems mentioned above. Such a policy, I have no doubt, can greatly speed up our progress and will hasten the day when India will be able to take her rightful place among the maritime nations of the world.

Before concluding I would like to express my appreciation of the help we have continually received from the Director-General of Shipping and his staff, and of the co-operation of our own staff, ashore and afloat, and of our Agents in India and overseas, which has made another year of successful operations possible for your Company.

I am grateful to you, Gentlemen, for having so patiently listened to this survey of the position of your Company and of the larger problems that beset our shipping industry as a whole. May I now request you to adopt the Report and the Audited Accounts for the year ended 30th June, 1955.

The Industrial Disputes (Amendment) Bill

Mrinal Kanti Bose

THE Industrial Disputes Amendment Bill will come before the Lok Sabha at its next session. It is of outstanding importance both for employers and employees and requires therefore most careful consideration. At the outset I must point out that the Bill coming, as it does, after the declaration of policy of the Government that it aims at a socialist pattern of society, reflects none of the characteristics of that pattern. It assumes, on the contrary, that the relation between capital and labour must continue as it is. The Bill gives no scope to workers to participate in the management of the concern. In my opinion that Bill should be re-drafted so as to reflect the socialist pattern of society. I shall, however, confine remarks to the Bill as it is.

Should be Renamed

I propose that the Bill should be renamed Labour Disputes Bill. Already bank workers and insurance workers have been included within the scope of the Bill by certain amendments. Even now the definition of "Industry" is so wide that various other classes of workers have been included as coming within the scope of the Act, such as employees in hospitals and dispensaries, and employees of the Universities.

The main feature of the Bill is the setting up of three types of Courts, namely, Labour Courts, Industrial Tribunals and National Tribunals. The Labour Appellate Court is abolished. The courts proposed to be set up have jurisdiction over subjects specifically mentioned in the schedules given in the annexure of the Bill.

Another important feature of the Bill is the introduction of a provision for a certifying officer whose duty would be to go into the question of justness or otherwise of the standing orders provided for in the Industrial Employment (Standing Orders) Act, 1944.

Features—Good and Bad

It is proposed to empower both the certifying officer and the Labour Court to take into account the fairness or reasonableness of the Standing Orders before they are certified. Under the present law only the employer has the authority to frame Standing orders and modify them from time to time according to his

discretion. The existing Act provides that if any employer wishes to make any change in the conditions of service applicable to workmen such as wages, contribution paid or payable to the Provident or Pension Fund, hours of work, rest and interval, compensatory and other allowances, leave with wages and holidays, starting or alteration or discontinuation of classification of grade, withdrawal of any customary concession and privilege, introduction of new rules of discipline, rationalisation, standardisation or improvement of plant or technic which is likely to lead to retrenchment of the employees and increase the reduction in the number of persons employed or to be employed, he has simply to notify the changes proposed by him. Under the new amendment he will not be able to do so.

A workman may, within 21 days after the notice of standing orders, apply to the certifying officer to have the standing orders modified. The final decision will rest with the Labour Court concerned. There are several other improvements made in the Act. It must be said at the same time that there are reactionary proposals as well. There are again provisions, new in their nature, but which are of doubtful value. There are several defects in the existing Act which have not been remedied.

Taking a view of the whole picture, however, one would think that the employers rather than the workers will gain more if the Amending Bill is passed into law as it is.

Executive Over-shadows Judiciary

I shall give certain illustrations. One serious defect in the existing Act is the discretion that has been given to the Government to refer or not to refer a dispute to a Tribunal for adjudication. Another defect, even more serious, is the discretion left to the Government to modify or reject an award given by the Tribunal even when Government is a party to the dispute. There have been many cases where these discretions have been improperly exercised in the interest of the party, generally the employer. These defects have been left in the Amending Bill as they are, without any modification. The abolition of the Labour Appellate authority only makes the executive Government even more un-

restricted in the exercise of its arbitrary power. The new Bill should have left to the parties concerned the freedom to move either the Labour Court or Tribunal or National Court. It should have been left to the Court concerned to decide on preliminary objection if it was proper for the Court to entertain the dispute. As matters stand now, it is the executive that overshadows the judiciary so far as the Labour Judicial machinery is concerned. The number of Labour Courts and Tribunals should be sufficiently large to deal with the number of disputes. The executive Government should not have the power to reduce the number of cases by its free will.

Section 33

Here is an instance of how privileges to the workers given by one hand have been taken away by the other. I refer to Section 33 of the Industrial Disputes Act. That Section provides against the victimisation of workers who have moved the Tribunal for redress of their grievances against the employers. The original section (Section 33) was a bar against the employers for altering, to the prejudice of the workman concerned in the dispute, the conditions of service applicable to him immediately before the commencement of the proceedings and punish him, whether by discharge or otherwise, "save with express permission in writing of the conciliation Board or Tribunal as the case may be". If the employer contravened this provision, the aggrieved employee could move the tribunal with a complaint in writing and the Tribunal on receipt of such complaint was to adjudicate upon it.

This has been changed in the new amendment. The employer would now be in a position to change the conditions of service of the employees, punish them whether by discharge or otherwise. All that he has to do is to apply to the presiding Court for "approval" of the action taken by him. In the statement of Objects and Reasons given in the amending Bill, it has been stated in justification of this change that "employers have complained that they are prevented from taking action even in obvious cases of misconduct and indiscipline unconnected with the dispute till long after the offence has been committed."

All that the employer has now to do in such cases is to pay to the discharged or dismissed workman one month's wage pending the proceedings of the case for "approval" of action taken by him. If the delay in the disposal of such cases is the excuse, who knows that the proceedings in connection with the cases of the approval will not take as long a time as that in connection with the complaint made by the workman?

This change has obviously been made under the pressure of the employing class and in their interest.

"Protected" Workmen

Another change has been made in Section 33 of the Act. It refers to workmen who have been described as being "protected". It is explained that a "protected workman" in relation to an establishment means a workman who, being an officer of a registered trade union connected with the establishment, is recognised as such in accordance with rules made in this behalf. It is forgotten that every establishment may not have one union and a number of similar establishments may have only one duly registered union. Then again the condition is "recognition". Recognition by whom? Employers at present have no obligation to recognise even registered unions. It is further provided that in an establishment, the number of workmen to be recognised as protected workmen shall be only one person of the total number of workmen employed therein, subject to a minimum number of five protected workmen and maximum number of 100 protected workmen. This number is grossly inadequate. As if this is not enough to adversely affect the interests of workmen, it is provided that the appropriate Government may make rules for the distribution of the number of protected workers among various Trade Unions, if any, connected with the establishment, and the manner in which the workmen would be chosen and recognised as protected workmen. My suggestion is that the choice should be left to the Trade Unions concerned. They should also decide as to the number of protected workmen in every establishment.

Section 29 (Punishment)

There has been an improvement in the amending Bill in regard to the penalty for breach of settlement or award. Section 29 of the Act provides for only fine for breach of any term of any settlement or award. This has been changed in the amending Bill into one of imprison-

ment for a term which may extend to six months or fine or both. It is well known that employers, generally speaking, are very reluctant to give effect to awards which they do not like. Almost equally unwilling are the Government to enforce the award in such cases. In the Act there is no provision for imprisonment. In the amending Bill, the Court trying the offence may take steps for the realisation of fine but there is no provision as to the power for the enforcement of imprisonment. Why is the provision silent on this point? Obviously Section 34 of the Act relating to cognizance of offences will continue to apply. This section provides that no Court shall take cognizance of offences punishable under this Act, save on complaint made by or under the authority of the appropriate Government. Here is an amazing fact. So far as punishment by fine is concerned the Court will have authority but for imprisonment it is the Government that must move. Is it for sympathy to the workers or the employers?

As for Courts and other authorities that have been set up under the amending Bill, certain observations are called for. There may be an

arbitrator or a conciliation officer or a board of conciliation, a Labour Court, a Tribunal and a National Tribunal.

There is no provision for arbitration in a dispute in the present Act. The amending Bill is an improvement in this respect. The conciliation officer and the Board of Conciliation will be continued, only their recommendations will not be binding on the parties.

The jurisdictions of the Labour Court, the Industrial Tribunal and National Court have been defined. The reference to the National Tribunal will be made by the Central Government and it will cover disputes which involve questions of national importance or which are of such a nature that establishments situated in more than one state are likely to be interested in, or affected by, the dispute. The jurisdiction of the Labour Court and Industrial Tribunals have been defined in the second and the third schedules. It is difficult to understand the principle that has been followed in defining the jurisdictions. Both include matters of major and minor importance. For instance, discharge or dismissal of employees, illegality or otherwise of a strike or lock-out come within the jurisdiction of a Labour Court while such questions as hours of work or rest and interval, leave with wages on holidays come within the jurisdiction of the Industrial Tribunal. Would it not have been simpler to have one designation of Courts, either Industrial Tribunal or Labour Court, to dispose of the cases specified? The qualifications of the Judges of such a court might have been those of the Industrial Tribunal. The importance does not lie so much in the nomenclature of the Court as in their number and in the qualifications of the Judges and assessors. It is proposed that there will be one National Tribunal. I doubt if this will suffice.

As for public utility services, their number is six including Postal and Telephone service and any industry which supplies power, light or water to the public. The number in the amending Bill has been increased, excluding some and including others. Coal, cotton textile, food-stuff, iron and steel, Defence Establishments, service in hospital and dispensaries and Fire Brigade service have been mentioned as public utility services. Transport is the common factor. But it is difficult to see why the other items are included. Disputes in these concerns may also be

referred to the relevant authority but it is at the discretion of the Government. Inclusion of cotton textile in the Public Utility Service has obviously been made in the interest of the textile magnates.

The definition of "workman" has undergone some change in the amending bill. "Workman" in the Bill includes any person whose functions are "supervisory or technical". That is no doubt an improvement but a limitation has sought to be imposed by the provision for the ex-

clusion of any person "who is employed mainly in a managerial or administrative capacity or who being employed in a supervisory capacity draws wages exceeding Rs. 500 per mensem". It will often be difficult to draw a line of demarcation between a person working in a supervisory capacity and another discharging mainly managerial or administrative function. Besides, the "basic" salary should be Rs. 500 as many persons who may be willing to come within the definition of workman draw Rs 500 or more inclusive of

allowances. As regards others whose basic wages are more than Rs 500, the discretion should be left to them whether they would be willing to come within the definition of "workman".

From the modified definition of workman persons employed in the police service or officers or other employees of prisons have been excluded. Is not a policeman a worker? Why should he be deprived of the privilege of fighting for his rights as any other employee?

Organizing Hand-loom Weaving

—A Year's Experience in Orissa

Shrimati Haimanti Chakravarty

What follows is an unvarnished and first-hand account of the writer's experience during the year she was engaged in organizing hand loom weaving for a project that is being run in Orissa by the American Friends Service Committee.

The account will be found exceedingly interesting as raw material for the study of cottage industries. What appears below, however, is not the official version of the report but the first draft of a note prepared by the author for submission to the Friends headquarters in Philadelphia.

ORISSA textiles, which comprise a great variety of weaving and designs from many parts of Orissa, have long been appreciated outside the state. But as there was no steady and dependable supply of standard materials, they remained more or less a rarity, with little commercial possibilities beyond occasional sale at rather high prices of particular pieces of weaving. The tie-dye materials for which Sambalpur has a reputation were no exception to this general rule. An occasional consignment of table-cloth or bed-spread reached Calcutta but regular orders could not be placed with the certainty of getting the specified colour and design. This was the general state of weaving, when we started our project in Barpali.

The Weaving Project.

Awakening of Nationalist sentiment has led in recent years to a demand for designs and materials which are typically Indian, and along with it, interest in cottage industries and handloom weaving is reviving. Moreover, in order to lessen the pressure on land, Government has been supporting village industries in various ways so that supplementary employment may be created for villagers in their own homes. It is increasingly being recognised that village artisans and weavers will have to fall back on land, if mill-produced cloth puts them out of employment. The competition between mill-made and handloom cloth is real and obviously, only the cheaper goods will appeal to people who live on the margin of subsistence. It is interesting to note, however, that in our area where tradition is very strong and standards of clothing very high (being a centre for weaving), even the poorest women wear sarees that cost Rs 10 to Rs 15. When asked, they say that three handloom sarees will last them a year, but mill-made sarees will not. Among men, on the other hand, use of mill-made dhoti

used to be almost universal. I once asked a weaver how he could expect to sell his woven materials if he himself wore mill-made dhoti? He told me it was the "fashion", but later, neither he nor the other weavers appeared in anything but home-woven materials.

Statistics, social survey and report prepared about the weavers in our thana by our social analyst had given us a preliminary idea of the caste-composition of the weavers and of the caste distinctions among them as also of the vocational specialization of each of the four divisions of the group. The actual work with the weavers began in the spring of 1953 when some of our members went to Bheran. This is a village in the thana of the same name, 11 miles from Barpali as the crow flies across a river and a nala. It is accessible by vehicle only during six months of the year. This village is well-known for its tie-dyeing technique and execution of fine details in designs on cotton materials. Friendly relationships had been established with the weavers of the village on market-days and we had an invitation to come to their village, which we gladly accepted.

The first six months went in acquainting ourselves with the socio-economic problems involved in weaving. Bheran, was chosen as a typical weaving village as knowledge gained here could be used in other villages in the project area and elsewhere. We intentionally selected this village outside the Barpali thana. The reason for this was that if our attempt failed or there was hostile criticism in this new field of activity, it might not affect the project adversely in its early period of establishing itself in our area. Also, one of us had been selected to deal with aspects of industries and co-operatives in Barpali thana and an attempt at working with weavers in our project area might have impeded her work, if we did not succeed.

During the early months, we got a great deal of encouragement from the Government in our attempts at standardising designs, material and colours. A grant of Rs 500 was received in July for experiments. This was the first official recognition of our work and also our initial working-capital. Later in the year, we got a standing monthly order for kerchiefs and an order for 6,000 yards of designed material. This made the villagers realise that the Government was interested in helping them in their work. Government was also interested in the adaptation of old designs to modern use and wanted to collect samples of these adaptations for copying and use at different weaving centres. In March, 1954, the largest single lot of these samples was acquired by the Government at the Exhibition in Cuttack during the Weavers' Week. The samples fetched more than Rs 1,000. Adaptation of old designs, however, was incidental to the work among the weavers.

Economics of Weaving

The daily wages for adult unskilled male labour in Barpali is Rs 1-4-0, and that of a woman As 12. A weaver, or rather a loom, involves the labour of three persons—of the man who weaves, the wife who does the dyeing, tying and setting of the loom and of a young member of the family who does odd jobs, of which there are many in a weaving shed. Such a weaver is happy if he can have enough to do for five days in the week, earning Rs 2-8-0 a day. This means that a highly technically skilled person plying the trade of a weaver earns less than a daily labourer who carries earth for road building. Among the Harijan weavers or the Gandars, a great number take to manual labour to keep themselves going during the months when demand for cloth is slack. Few of the weavers own land for it is only those who can set themselves up as middle-

advance on some order, though knowing fully well that it will not come forward except under special circumstances. But it gives them a satisfaction if they get such an advance even though it may not be really necessary.

Their needs are few. Their houses are usually mud-huts with a thatched roof; a joint family may have one or more looms. The men weave, the women prepare the yarn, the dyes and the patterns, and are co-workers with the men and an economic asset to the family.

Women are Co-workers

The status of women in these social groups is high and at the time of marriage, the bridegroom has to pay a brideprice for his wife to her father. Wives are treated well by their husbands as their livelihood is dependent to a great extent on their help. A very remorseful husband one day came to ask my help to bring his wife back from her parents' home where she had gone after a domestic argument. His loom was lying idle for want of spun silk. In another case a wife died and the husband had to hire himself out for wages under another weaver who had a mother and wife to work the initial stages of yarn for the looms. A drain on their resources is the habit of gambling in the villages and extravagant expenditure on ceremonies and seasonal festivals.

The general practice has been to work through middle-men who give the weaver his yarn, cash advance and an order for certain materials. The advances in cash are generally paid back when the woven material is brought back, but a further advance is again taken, with the result that over the years, loan keeps on increasing. The mathematics of such a loan is beyond the capacity of calculation of the weaver and unpaid loans pass on from father to son. Generally only the interest is paid up and the capital stands, but the interest paid is often many times the initial loan amount. There is almost no way for the weaver to get out of such a situation. It results in apathy and hopelessness and is a bar to new enterprise, new beginnings and improvement in looms, tools and patterns. In a few instances some weavers to whom this state of affairs had become intolerable have managed to get out of it by getting a loan against further work from our project. This is strongly resented by the middle men in the villages who see a threat to their position and purse in the work of our project in their area.

And yet, middle-men are also taking advantage of improved weaving and the designs introduced by us. As there are no patent-rights on designs, these very patterns are

used by other weavers by the project for material and sold in the state. They are far from being of standard colours that seemingly they are produced but as sweated labour. The pressure of are now rubber stamps sent from our project, avoid having inferior sold elsewhere under the our project.

Designs-Foreign and National

In weaving, as in other fields, artistic crafts, imitation of western designs was in fashion a time but the insistence by our project on original local patterns and colour-schemes has created a demand for indigenous patterns in excess of what we are able to produce on the basis we have set up. A much larger staff is needed, especially for supervision, and co-operative production at a high level can alone ensure a steady demand for designs and materials peculiar to our region.

So far my contact has been mainly with two groups of the weaver-community, the tassari, or raw-silk-weavers, and the tie-dye weavers. Expansion would include all groups in our area and beyond. The following villages have come forward for assistance.

Total looms	140

As a loom represents about three persons, about 420 persons have found whole-time or part-time occupation for six months in the year. In this are not included people who are engaged by weavers and who come occasionally to me, for some rush order.

Felt Needs

Certain felt needs have been repeatedly expressed by the weavers: They are:

- (1) A dyeing centre for yarn.
- (2) Arrangements for whole-sale supply of yarn direct from mill.
- (3) Adequate marketing arrangements for sale of product.
- (4) Establishment of a Co-operative Weavers' Association.

(5) Adherence to local designs and patterns.

The toughest problems that have to be faced seem to be:

- (1) Lack of credit facilities.
- (2) Indebtedness to middle-men.
- (3) Out-dated marketing practices.
- (4) Standardization of goods and patent rights on designs.
- (5) Inter-State competition.

This note is the outcome of my experience over one year and covers only the main points. The weavers' problems are closely tied with village life as a whole and they cannot be isolated. The stress and strain, the happiness and sorrows of all are reflected directly in each weaver's home as his own sorrow or joy.

Around Calcutta Markets

Obscure Trend

Wednesday, Evening

ONE clear fact emerges from the recent price fluctuations on the Calcutta Stock Exchange. Drop in Indian Iron may not have caused any loss of market morale. But it is equally clear that equities are not likely to move up as long as Indian Iron remain hesitant. It is, in this context, not without significance that clearing rates for Indian Iron, fixed on Tuesday, are lower than those of the previous fortnightly settlement.

By far the most disappointing development of the last few days is the set-back in Coal shares. These shares were moving up on the argument that the Government was interested mainly in maximising coal output during the second Plan period, and not in nationalising the industry. Improvement in Coal shares on some such ground offered the stock market a welcome respite as it was feeling the impact of the drop in Indian Iron.

Coal Outlook Bleak

TTK, Shri Reddy and Mr G A S Sim, President of the Associated Chamber, do not share the market's optimism. Mr Sim is pessimistic of the outlook for the coal industry. As the Chairman of Bengal Coal, he should know what he is talking about. TTK has confessed that he shares Mr Sim's pessimism about the coal industry. On Tuesday, the stock market here is forced to revise its views about

the coal industry in the light of opinions expressed by the President of the Associated Chambers and by the Union Ministers of Commerce and Production.

TTK informed the Associated Chamber that the Government could not give any undertaking that the coal industry would not be nationalised. Coal was one of the industries included in the 1948 Resolution as fit for nationalisation. Steel projects and the Railways are the major consumers of coal. As the Railways and the three new steel projects belong to the public sector, there is every justification, TTK claimed, for nationalising the coal industry. There is nothing wrong with this logic. But "bears" should not ignore that TTK was talking about long term prospects.

No Change

There is nothing new in the information furnished by either the Commerce or the Production Minister. It is not news that the private sector of the coal industry will be allowed to expand output by only eight million tons as against the planned increase of 23 million tons by the end of the second Plan-period. But the authorities reaffirmed the Government's policy of paying full compensation, in the event of nationalisation, to those private collieries which undertook expansion projects. Though the Production Minister

has refused to offer any guarantee to the private sector in the coal industry that coal will not be nationalised, the statements by the authorities in the last few days have not, in any substantial aspect, altered the known policy of New Delhi to the coal industry. That being so, the fall in Coal shares may seem to be due partly to psychological factors. But the same psychological factors suggest that Coal shares may take time to regain the recent buoyancy.

Depression

In the last few days, events have coincided to foster a depressed feeling on the stock market here. There were hopes that the load of mounting tea stocks will gradually ease as the Calcutta market gets habituated to clearing larger stocks through local auctions. These hopes have not yet materialised. Auction prices are falling. Export demand remains poor. Consequently, Tea shares are slowly losing ground. Buyers are keeping away from this counter. Selling pressure is not urgent. But in the absence of investment support, Tea shares are gradually falling.

For a long time, Jute shares have remained friendless. Developments in the last few weeks have not been discouraging. Since the release of data relating to stocks at the end of October, there have been expectations that IJMA may decide to un-

seal the sealed looms. End-October data about mill stocks of jute goods proved clearly that exports and despatches of jute goods were satisfactory. End-November data, released a few days ago, confirmed the healthy state of the industry.

Looms Unsealed

Reports current to-day, Wednesday, indicate that IJMA has decided to unseal 2½ per cent of the sealed looms. There were expectations that 6½ per cent of the sealed looms would be unsealed. At present, 12½ per cent of the total loomage remain sealed. That only 2½ per cent of the sealed looms will be unsealed, is capable of more than one interpretation. On this report, the goods market has developed a steadier trend. This can only mean that the gunny market was confidently expecting unsealing of a larger percentage of sealed looms.

On the assumption that sealed looms will be unsealed, jute goods were falling while raw jute prices were steady. Raw jute prices are likely to remain steady on the news that 2½ per cent of the sealed looms will be unsealed. Though the stock market's reaction to the reported IJMA decision could not be known as the market was closed on Wednesday, it should have a sustaining influence on Jute shares.

Investors are not likely to enter the market for Jute shares immediately. But sellers should become scarce.

Looms Unsealed

It is unfortunate that Coal shares, which have had a sustaining influence on the market in the last fortnight, have developed a downward trend. Also discouraging is the continued drop in tea auction prices, which is affecting Tea shares adversely. No less disturbing is the uncertain trend in Jute shares. All these uncertain factors are being aggravated by the drop in Indian Iron. Only Paper and Engineering shares remain quietly steady. Can these groups of shares succeed in propping the market up to higher levels?

That depends on the developing circumstances. If Indian Iron fail to move up, the market as a whole is likely to remain uncertain. Recent developments indicate that even Engineering shares may need some wooing before these can look up. Whether Paper shares alone can remain steady when all other counters are falling or remaining stagnant, is doubtful. Last Tuesday's clearing rates for other forward shares were not discouraging. But some days must elapse before the market is likely to take a decisive trend.

Karanpura Development

FROM a perusal of the report of the Karanpura Development Company, Ltd. for the half-year to June last, the reasons behind the recent spurt in these shares become evident. It is disclosed that the Government's programme is to quadruple the output of coal from this area in due course. Sales of fireclay were satisfactory. There are good prospects for increased sales of limestone.

According to the managing agents, prospects for Scott and Saxby, Ltd., a subsidiary of Karanpura, for the coming year are fair. As the recent improvement in Karanpura Development is partly due to rumours about legal decisions, it will be of interest to note that the Company's legal advisers think that the appeal against the decision of the Patna High Court may be heard by the Supreme Court before the end of this year.

Raisings improved, but despatches were lower. After the necessary provisions and allocations, there remains a debit balance which is being carried forward. Under the advice of the Company's lawyers, the ordinary dividend has again been passed over.

Around Bombay Markets

Bullish Fervour Returns

Thursday, Morning

DESPITE heavy budlas paid on Friday, the pattern of trading in the stock market during the week left no doubt about the return of bulls. The flare-up in prices after the close of the market on last Friday, however, was due to a paucity of floating stocks and did not indicate any fresh development. Profit-taking and heavy carry-forward charges brought about some nervous long liquidation on Monday and the closing was at the day's lowest. Towards the close of the week, however, bulls had got back their grip on the market and equities regained most of their earlier losses.

Steels were active throughout the week. Opening at Rs 268-12, Tata Steel reached their highest for the week on Monday at Rs 273, helped by bear covering and renewed speculative support. After fluctuating between Rs 266-8 and Rs 268-8 on Tuesday, they closed steady at the latter level. Indian Iron opened at Rs 40-10-6 ex-dividend (against cum-dividend closing last week at Rs 42-1) and closed steady at Rs 40-11, although at one time they went down as low as Rs 40-1. The highest for the week was Rs 41-5-6.

Among textiles, most of the scrips were able to make striking advances under the stimulus of satisfactory offtake in the piecegoods market and encouraging exports. Century were prominent and rallied to Rs 515 on strong support from Calcutta. However, in the long liquidation towards the close of the week, they had to bear the brunt of the selling pressure. Bombay Dyeing and Kohinoor also suffered and declined at the close to Rs 608-2 and Rs 361, respectively, from the week's highest of Rs 618-12 and Rs 365.

In the miscellaneous section, banks and insurance shares were steady while electrics displayed a distinctly subdued tone, at the beginning of the week at any rate. They were adversely affected by the Electricity Bill the provisions of which are regarded as un-helpful to electricity undertakings. Towards the close, however, electricity shares also picked up and almost recovered their lost ground.

Since they have been quoting ex-dividend, Bombay Burma seemed to have lost their glamour. Alcock

were in the limelight on reports of a change in their managing agency.

Cotton

Strong Sentiment

ALTHOUGH the cotton futures market opened on a subdued note, sentiment in the main continued to be predominantly bullish. This did not, however, prevent the market from registering occasional dips. Thus, on the opening day, prospects of export subsidy on American cotton unnerved the bulls and the market opened lower at Rs 707-8. Again, during the middle of the week, when doubts arose about fresh quota for export, the market lost several points. Towards the close, again, reports of increased arrivals in up-country centres generally depressed prices.

In spite of these unfavourable factors, there was an undercurrent of

firmness in the market, which asserted itself on Friday, when the February Contract jumped by over 14 points on heavy speculative buying and registered the highest quotation for the week at Rs 724-8. Reports of a barter deal between India and Russia for exchange of Indian raw cotton and textiles for Russian steel was responsible for it. When these were officially denied, there was an immediate setback. However, at every dip, there was resistance and the market managed to maintain a firm undertone well up to the end of the week, when the February contract closed on Tuesday at Rs 717. The May contract also moved more or less in line with the February contract and closed firm at Rs 639. The market was closed on account of Solar Eclipse on Wednesday.

During the week under review, Government announced a change in its cotton import policy. The link

between the import of East African cotton and that of US cotton under the aid programme has been severed and both mills and shippers will now be allowed to import non-dollar cotton, without any obligation to import US gift-cotton. This was generally welcomed by the trade which also welcomed the Government's decision to restore the facility, provided to importers previously, of importing on their own account.

In the international field, reports that the US might very shortly launch sales of cotton on a big scale at cut-throat prices imparted a bearish tone to all the world cotton markets. This may be necessitated by the expansion in US cotton production, despite severe acreage limitation, and the sharp decline in exports of US cotton. Whatever be the reason, cotton producing countries outside the US would take a strong exception to such a step which would run counter to the avowed declaration of the US Secretary of Agriculture that the US has no intention of dumping her cotton overseas. Moreover, the policy of selling cotton at rates much below those prevailing in the home market will amount to dumping. Fuller reactions to this development in the world cotton markets will become known when the US starts her cotton sales programme from January 1, 1956.

Oils and Oilseeds

Firm Tone

THANKS to untimely rains in the south and the consequent damage to the crop, the oilseeds market continued to be firm all round. Arrivals in dribbles in terminal markets produced a bullish effect, as there was a general tendency on the part of the trade to revise crop estimate downwards. This apart, steady buying by Calcutta dealers and Vanaspali interests enlivened the groundnut section, where ready delivery and prices of quality groundnuts improved considerably. The bullish trend was further sustained by firm foreign advices. Italy was reported to have bought about 2,000 tons of oil at around £109 while Burma was reported to have bought oil at around Rs 1450 per ton. Groundnut HPS quality, (the validity of the quota of which has been extended by another month, up to March 1956), was also sought after at £82.

Groundnut ready quality started the week at Rs 25-4 and steadily advanced to the peak at Rs 25-8 on Friday and closed quietly steady at Rs 25-4. December-January delivery

sharply moved up from Rs 24-13 to Rs 25-6 at which level it closed on Tuesday. February-March delivery also ruled firm, closing at Rs 25-14 the highest level being Rs 26-6 reached on Saturday. Oil ready which improved to the highest level of the week at Rs 13-6 on Saturday, came down a little, at the close, to Rs 13-4.

In the castor section, there was a distinct improvement at the close of the week. Castor May opened at Rs 107-8, gradually improved to attain the highest level on Friday at Rs 111-8, but closed fractionally lower at Rs 109-12. Sentiment in Castors was mainly influenced by heavy buying by prominent local speculators and covering by Saurashtra and South Indian traders.

Linseed was also firm for the greater part of the week. After opening at Rs 27-12, linseed ready closed firm at Rs 28 while February-March quoted Rs 26. Kardi and niger were placed at the close at Rs 14-8 and Rs 23-8, respectively.

Bullion

Bull Support

THANKS to reports that Government are taking steps to keep a close watch over smuggling activities, there was fresh bull support and bear covering, causing a firm-up in prices of bullion during the week. Bulls continued to hold a firm grip on the market, despite heavy arrivals of katcha silver and gold.

Gold arrivals on the last day of the week were reported to be around 2,000 tolas as against an offtake of 3,000 tolas. Arrivals of unrefined gold were placed at 4,500 tolas.

In the case of silver, arrivals and

offtake on Tuesday amounted to five bars apiece while arrivals of unrefined silver were 27 bars.

Gold Magsar opened at Rs 94-15 and after fluctuating between Rs 95-5 and Rs 93-12 closed at Rs 94-13. Gold spot bullion improved to Rs 94-14 on Thursday before closing at Rs 94-6.

Silver Magsar opened at Rs 174-0 and after touching a new low level of Rs 173-13 on the same day closed lower at Rs 173-10.

Indian Aluminium

SPURT in Indian Aluminium some days ago was due to factors which had been in operation for sometime to cause improvement in some Engineering and Miscellaneous shares. Some of these shares are being bought on dividend considerations or on rumours of capital reorganisation. Both these factors were responsible for the recent spurt in Indian Aluminium.

Recently, the Company announced an interim dividend of four per cent on ordinary shares. An extraordinary general meeting will be held on January 16 next to endorse a scheme to split the existing ordinary share of Rs 100 each to ten shares of Rs 10 each. This Company, which is associated with Aluminium Limited, a Canadian concern, has plans to establish a smelter of 10,000 ton capacity at Hirakud in Orissa.

To finance this plan, fresh capital will be necessary. On the assumption that the Company's present plan to split the existing shares into smaller units is a prelude to issuing right or bonus shares, Indian Aluminium were bid up some days ago.

West Germany Opens Window on South Asia

THE recovery of West Germany has ceased to be headline news. It is now an accepted and accomplished fact. So, when one is told that, West German steel production has lately been running at a rate higher than that of Britain, one is no longer excited about it. But what hopes does the industrial recovery of West Germany hold out to the under-developed countries of the world? We know more about West German exploits in Latin America than in this part of the world though the Federal Republic has staged a come-back to India also and in a big way. But it has done so in a form which is so very different from what it was before the war that few of the old names would be found among the German trade agencies that have set up business in India. Krupp-Demag, of course, have attained all-India fame. They are not only building the steel plant in Rourkela, but they have also taken the contract for planning a brand new steel town. They hope that the careful balancing of industrial requirements in this model steel town of Rourkela, will help the inauguration of similar projects in other tropical countries. But Krupp-Demag are not only supplying India; They are supplying and installing metallurgical plants in Egypt and Burma also. At the moment, they have under construction a steel plant in Egypt.

All this is from Handelsblatt, the well-known commercial tri-weekly published from Dusseldorf, which has brought out a special South Asian Number opening a trade window on this part of the world. Trade is, however, no longer the proper word, for the issue does not feature the bazaar scene, nor pagodas and palms. New markets are, of course, the aim for which West Germany's heavy industries and basic chemicals provide a solid foundation. Far from shrinking from industrialisation of Asian countries, West Germany actually welcomes it, for industrialisation opens up wide opportunities for selling equipment and supplying technical skill. And though the new factories of South Asia may produce consumer goods, experience has shown that a progressive raising of the standard of living of people brings about increased consumption also; so that, for example, despite the establishment of domestic industries in India, exports of con-

sumer goods from the Federal Republic continued to be 25 per cent of the total.

In this South Asian Number, the potentialities have been studied from the standpoint of German industry, and the situation in the countries of South Asia has been surveyed by well-known experts of the countries concerned. Thus, Shri B M Birla writes on India, the Chairman of the Pakistan Industrial Development Corporation surveys the situation in Pakistan, Indonesia is covered by her Director-General of Foreign Economic affairs and so on.

And turning over the advertisements in this lavish production, what names to conjure with: Jena Glass Works, Bayers for chemicals and dye-stuffs, Koppers, Humboldt; and there are, of course, many others.

The Federal Minister of Economics, Professor Erhard, writing under the caption "New markets are our aim", says that West Germany's foreign trade with West European countries and their overseas posses-

sions presently accounts for the major portion of her total foreign trade—but this by no means implies that the Federal Republic is confining its attention or even the weight of it to West European markets. "The aim of our trade policy is, and will remain, the opening of new markets, in which the Federal Republic can buy the necessary products for its economy and dispose of its goods". The recent liberalisation in West Germany, all the German contributors agree, holds out immense possibilities of expansion of trade with South Asia.

Professor Erhard concludes: "Possibilities are afforded in the countries of Southern Asia which, although fully appreciated in economic circles, have by no means been utilized to the desired extent. It would give me much pleasure if this Special Supplement contributes to a closer economic contact with the individual countries of Southern Asia."

This purpose will be adequately served.

Valuation as at 31st December, 1954 Reveals Excellent Position of the Company.

Let's look at PROGRESS—Stanvac Quiz No 6

YOU KNOW THAT INDIA'S 5-YEAR PLANS MEAN A BETTER LIFE FOR ALL. BUT DO YOU REALISE THE PROGRESS ALREADY MADE UNDER THE FIRST 5-YEAR PLAN? TEST YOUR KNOWLEDGE AGAINST THE QUESTIONS AND ANSWERS BELOW.

1 MANUFACTURE OF RAILWAY WAGONS IN INDIA HAS MADE GOOD PROGRESS. IN 1954-55, THE NUMBER OF WAGONS BUILT REACHED:

- A) 3,559
B) 10,689
C) 12,121

2 EXPORTS ARE VITAL TO A COUNTRY'S ECONOMY. IN INDIA'S EXPORT TRADE, LEATHER FOOTWEAR IS AN IMPORTANT ITEM. IN 1954-55, EXPORTS TOUCHED:

- A) 1,570,500 PAIRS
B) 523,200 PAIRS
C) 261,100 PAIRS

STANDARD-VACUUM ARE PROUD TO PRESENT THIS TOPICAL INFORMATION ON INDIA'S PROGRESS—AND PROUD THAT OUR THREEFOLD ACTIVITIES OF PRODUCING, REFINING AND MARKETING OF PETROLEUM PRODUCTS ARE CONTRIBUTING TOWARDS IT.

3 INDIA PRODUCES MORE TEA THAN ALL THE OTHER COUNTRIES IN THE WORLD PUT TOGETHER! IN 1954-55, INDIA'S EXPORTS OF TEA AMOUNTED TO:

- A) 455,433,000 LB.
B) 651,701,000 LB.
C) 151,811,000 LB.

4 SUGAR REFINING IS THE NATION'S LARGEST FOOD PROCESSING INDUSTRY. IN 1954-55, THE AMOUNT OF SUGAR PRODUCED BY THE COUNTRY'S FACTORIES REACHED:

- A) 525,000 TONS
B) 296,000 TONS
C) 1,570,000 TONS

ANSWERS

1 10,689 WAGONS—NEARLY THREE TIMES MORE WAGONS THAN IN THE FIRST YEAR OF THE PLAN!

2 1,570,500 PAIRS OF LEATHER FOOTWEAR WERE EXPORTED, EARNING FOREIGN CURRENCY TO BUY VITAL IMPORTS!

3 455,433,000 LB. OF INDIAN TEA WERE EXPORTED TO COUNTRIES THE WORLD OVER, EARNING OVER Rs. 146 CRORES!

4 1,570,000 TONS OF SUGAR—AN ALL-TIME RECORD, EXCEEDING THE TARGET FOR THE END OF PLAN BY 70,000 TONS!

If Not in Five Years...

THERE is growing interest in economic development. Aspirations have run high ever since Independence; they are now running higher still. The rate of spending in this last year of the first Plan, we have it on the authority of the Finance Minister, has been speeded up so fast that at the end of it no one should be able to say that achievements, at least in regard to the First Five Year Plan, have fallen far short of the target. If 85 per cent of the allotted expenditure is actually incurred by the end of the financial year, it should be considered fair enough. This may or may not impress everyone of us. Some may shrug their shoulders and say, the First Plan was child's play compared to the task that has been set for the second Five Year Plan. The target for the second Plan has been raised further. This was to be expected, considering that estimates of expenditure have a way of going up when projects come to be looked into more closely. And they go up even higher in the process of actual completion. This happens, not unoften, even without any substantial changes such as rise of prices, difficulties of importation or worsening of the international situation.

Higher targets, however, have to be matched by greater efforts, but efforts in which direction? This was the crux of the problem when the Draft Plan-frame was presented. Since then, various issues raised by the Draft Plan-frame have been widely debated. Controversy has raged on several fronts—the relative shares of the private and public sectors in the allocation of investment; proper balance between consumer goods and producers goods, particularly heavy industries; and finally, the respective claims of village and household industries on the one hand and of the organized consumer goods industries, which are all in the private sector, on the other.

Apart from ideological grounds, the claims for factory industries producing consumer goods has been buttressed by the argument that an adequate supply of consumer goods has to be ensured in order to match the increase in money incomes resulting from the heavy investment that is being planned. On the other hand, on ideological grounds as well as on the ground of employment, a politically influential campaign has been launched in favour of village industries. Countering this claim, the over-riding consideration of efficiency and productivity was also being presented, rather haltingly and apologetically, by Government economists as well as by others who can speak more freely. In this welter of controversy, however, the problem of finding adequate resources for the Plan has almost been lost sight of.

This may appear too sweeping a statement, but it is not. This was brought out clearly at the last meeting of the Panel of Economists which was called upon to advise the Government. The review of the progress made so far in the formulation of the Plan given by the Finance Minister on this occasion further confirms it. It is not that economists are able to contribute much in Panel meetings. These meetings serve more as occasions when the Planning Commission is provoked into laying its cards on the table and taking the public into its confidence on the various controversial issues. As the full text of the memorandum prepared by the Planning Commission for the Panel meeting has not been

The Economic Weekly

Fort, Bombay Phone: 23406
Annual Subscription Rs. 24.

released, but what has appeared in the Press is revealing enough.

It would be unfair to suggest that all the members of the Panel were equally unaware of or unconcerned about the extent of the gap in resources or that they were unwilling, if not unable, to show the same boldness in suggesting the means that they had done in upholding the ends. True, there were some who thought that the outlay proposed in the public sector was "on the high side" and that it would be desirable, "if possible", to reduce it somewhat. The general view, however, according to a PIB handout, was that in view of the amount sought to be deficit-financed, "it was essential to pay special attention to the kind of social and economic climate necessary to increase the resources available to Government" and also "to have ready for implementation an appropriate scheme of regulatory measures for preventing the emergence of inflationary pressures in the economy".

Major increases in allocations proposed are for transport and communications, principally railways and for industries in the private sector; this is partially offset by a cut in heavy industry, but social services get more. So the final total of investments planned for the public sector

goes up from Rs 4300 to Rs 4800 crores, and that for the private sector from Rs 2200 to Rs 2300 crores.

The Draft Plan-frame left a gap of Rs 800 to Rs 1000 crores in resources after allowing for deficit financing, of Rs 1000 to Rs 1200 crores and taking credit for external assistance for Rs 400 crores. This gap has now been reduced by half to Rs. 400 crores. But how? Largely by the simple process of doubling foreign assistance to Rs 800 crores, raising the total of loans by Rs 200 crores, and taking larger credits under Provident Fund and other debt heads. The real effort towards closing the gap is represented by 100 crores of additional taxation and another 100 crores from railways. The months spent on discussions on deficit financing have only brought the realisation of the necessity of appropriate counteracting measures, in case....

The increased resources for the public sector will roughly cover Rs 1000 crores current expenditure out of the Plan outlay of Rs 4800 crores leaving the investment part of it, viz, Rs 3800 crores, to be financed by draft on private savings. And to this has to be added the investment requirements of

the private sector, now put at Rs 2300 crores. Obviously the Finance Minister has been encouraged by the recent signs of improvement in the money market, but has not stopped to consider how larger savings in the urban centres can be reconciled with the social objectives of the Plan, the realisation of which is equally essential for the full implementation of the Plan. For the Plan outlay to be reached, saving will have to be stepped up from its present rate of 6 per cent of the national income to 10 per cent by the end of the Plan period. How is it to be done? On the basis of voluntary decisions as to savings and consumption? This is precisely the social policy set for the Plan, for development with stability. Had not there been an election ahead, probably the Planning Commission would have spelled out the objectives differently and more clearly: No deficit financing beyond what is needed to maintain an adequate money supply (400 to 500 crores); no development beyond what can be conveniently financed from near-present rates of taxation and borrowing. After all, if resources do not flow in, the Plan can be extended to six years or more. It will come to that in any case, since the public sector is slow in spending.

Sudan Plumps for Independence

IN the three-cornered fight between Cairo, Khartoum and London, Khartoum has won a dramatic victory. While London and Cairo have been pursuing a strategy of indirect approach, Khartoum has won the battle by its surprise tactics. It has out-manoeuvred both its opponents. The Sudanese Parliament passed a resolution declaring that the Sudan was to become a "fully sovereign Republic". The Governor-General was requested by the Sudanese Chamber of Deputies to ask the co-dominion Powers to recognise forthwith the Sudan's status as a sovereign Republic. A five-man commission is to assume the powers of Head of State. A Constituent Assembly is to be formed to frame independent Sudan's constitution. Thus the Sudanese Parliament has, through unilateral action, ended a prolonged period of hesitant and halting negotiation.

Since the start of the dispute between Egypt and Britain, the Sudan has emerged as a problem. Britain never denied Egypt's moral claim to the Suez Canal. But London

never accepted Cairo's claim that the Sudan was part of Egyptian territory. Cairo was prompt in recognising that it could not stick to its original claim. Both Britain and Egypt advanced claims and counter-claims about the Sudan. Both offered the Sudan independence through union with their respective countries. London soon discovered that Khartoum was not enthusiastic about Sudan's future status as an associate of Britain. Whether with more skill and diplomacy, Cairo could have secured Khartoum's consent to union with Egypt, must now be regarded as barren speculation. When Major Saleh Salem failed in his mission, it became evident that the Sudan was not in favour of union with Egypt.

When both London and Cairo discovered that Khartoum was determined to reject the claims of both, they signed the Condominium Treaty in 1953 empowering the Sudan to decide its future status. Elections were held so that Parliament could convene a Constituent Assembly to decide the issue. Then followed a

period of stalemate. To end the uncertainty, Khartoum demanded a plebiscite. Egypt accepted the suggestion promptly. After some hesitation, Britain agreed to hold a plebiscite to decide the issue. To enable the holding of a plebiscite under the joint auspices of the co-dominion Powers, the Treaty of 1953 was amended. A seven-nation neutral commission was established to supervise the proposed plebiscite. Meanwhile, in Khartoum the situation had been changing rapidly. Developments indicated that the politically conscious elements in the Sudan had been clamouring for a speedier solution of the problem. Resolutions passed by the Sudanese Chamber of Deputies reflect the political cross-currents in Khartoum.

Two factors have helped the Chamber of Deputies to take the initiative. Some days ago, leaders of the two religious sects arrived at an agreement on the Sudan's political problems. EL Mirghani, leader of the Khatmia sect, and EL Mahdi, leader of the Ansar sect, came to an under-

standing to form a "united national front". EL Mirghani's move meant that the Ashigga Party, the only organisation in favour of union with Egypt, was now reconciled to independence for the Sudan. Through union, these two influential sects were in a position to dictate terms to Sayed Ismail el-Azhari and his Government. It is evident that Azhari has, in his turn, taken the initiative to retain his position and prestige. As soon as he discovered that the rival sects had patched up their quarrels, he encouraged the Chamber of Deputies to take moves to prevent the slow and complicated procedure of a plebiscite.

Khartoum's political moves have been hastened by the recent ugly developments in southern Sudan. If Khartoum demands independence in preference to union with Egypt, southern Sudan claims a recognised status in the future independent Sudan. Tribal chiefs in the south are suspicious of political domination by northern Sudan. Though the August rebellion in the south was quelled, the situation in southern Sudan remains grave. This is an aspect of the Sudanese problem which may be exploited by either of the co-dominion Powers. Khartoum is not unaware of this potential source of trouble. In anticipation of some such danger, the Sudanese Chamber of Deputies has passed a resolution that southern Sudan's demand for a federal status should be duly considered by the Constituent Assembly. This has been a wise move. It is clear that an agreed constitutional arrangement between the two parts of the Sudan is an essential condition for peaceful progress of the future, independent Sudan.

Basically, this is a problem which the Sudanese must solve themselves. But the co-dominion Powers can be of help. Though there may be internal political differences and disputes, on the fundamental issue of the Sudan's future status, there has been unanimity within the country. And it is good that the co-dominion Powers have also decided to accept the realities of the situation. Whatever the future brings, close co-operation between Cairo and Khartoum is an essential condition of progress in both Egypt and the Sudan. Wisdom, therefore, dictates that Cairo should encourage Khartoum further to stabilise its new status so as to facilitate friendly relations between Egypt and her neighbour in the future.

Annual Number 1956

THE next Annual Number of The Economic Weekly will be issued on January 26, 1956, and will contain a minimum of 120 pages bound neatly in art cover. It will be priced at Rs 2/8/- per copy.

This bumper issue will highlight the major questions of policy and analysis that arise in connection with India's Second Five-year Plan. The size of the investment budget, the widening gap in resources, policy in regard to large and small scale industries, the employment potential of the next Plan—these and many other related issues will be adequately covered.

For details regarding advertising space in the Annual Number, please contact the undersigned.

Supreme Court Rebuffs Again

WHATEVER one may think of the Constitution which Dr Ambedkar gave us, Government certainly will have little reason to feel happy about the work of the Law Ministry to which must have fallen the prosaic task of fitting the then current laws into the frame-work of the Constitution. Whenever some body has the necessary resources and the determination to press the issue and carry it far enough, Government gets it in the neck. And, quite undeterred by the snubbing it gets from the Supreme Court, it sets about doggedly, to revalidate what had been declared to be invalid. To be fair, this is done when the issue in question involves larger purposes of the State. Where, without such rectification, the execution of important State policy will be held up, the final recourse is an amendment of the Constitution. On occasions Government has not shrunk from amending the Constitution.

But where this extreme remedy is ruled out, attempts to validate invalid sections of existing Acts some times leads to a situation which perplexes the layman. A case in point is the Act which set up the Income Tax Investigation Commission. After the reverses that Government suffered in the Supreme Court, this Commission, Shri M C Shah, Minister for Revenue and Civil Expenditure, stated in reply to a question in Parliament, has not exactly been disbanded but has been put into cold storage. That is what he meant though the actual words used by the Hon'ble Minister were "the Commission had been formally kept in existence for the investigation of certain cases" such as those under the Travancore Taxation on Income (Investigation Commission) Act and for dealing with certain miscellaneous pending matters, both administrative and legal, such as custody of records, rectification of mistakes and references, and suits both by or against the Commission.

What the Hon'ble Minister did not tell Parliament was that after the decision by the Supreme Court in May last year that Section 5(4) was ultra vires, the designation of the "Authorised Officials" of the Income-tax Department who had been working for the Investigation Commission had been changed into that of

Income-tax Officers, Special Circles. There was another change. Instead of reporting to the Commission, they now report to the three Directors who have been appointed to look into these 'special' cases, not called so by name, in order to avoid the stigma of discrimination that is forbidden under the Constitution.

Business as Usual?

TO carry on business as usual, the Income-tax Act had been amended, first by an ordinance which was later regularised by passing a Bill in Parliament, by which a sub-section was added to section 34 of the Act to enable the Income-tax Department to reopen cases going back to the period beginning on 1st day of September 1939 and ending on 31st

day of March 1946—the period of war profiteering and large concealments—but only in those cases where the income which escaped assessment for any such year or years was likely to amount to Rs. 1 lakh or more. Here's the rub, as a layman sees it. But did not the Law Ministry smell discrimination in this provision? The Supreme Court held this week, inter alia, that the above amendment had made section 5(1) of the Investigation Commission Act obviously discriminatory, and it was, therefore, ultra vires of the Constitution.

What happens now? Some more legislative contortions or a spell of hard work for a change for the Law Ministry to straighten out Income-tax Laws once for all?

Dr Lohia has a Field Day

THE above may be cited as an example, from a common sense point of view, of illegality arising from a lack of formal consistency; the difference is between tweedledum and tweedledee over which lawyers waste their time. To the latter, of course, such a view appears not only heretical and disrespectful, but utterly wrong headed. For judges administer the law as it is laid down; it is not their business either to help the Executive or to dispense justice in the commonly understood sense of the term. If the law so often turns out to be an ass, clearly it is the legislators who should be blamed.

There is another kind of illegality which arises in the administration of law—the familiar cases are those of infringement of civil liberties—in which it is not clear whether the administration is to blame or the Law Ministry, the former for exceeding its discrimination or the latter for not removing much deadwood from the legal system—Sec. 144 of the I P C and the rest of it. And so Dr Lohia goes round the country, having a field day. He is doing good work that way and is helping Nehru's Government in a very constructive manner but one wonders if instead of being left to private enterprise, the matter could not be and should not be handled more competently by the public sector, at an expert level, by the Law Ministry or any other department of Government which is supposed to be responsible for handling these things.

so little as **TEA****

What salt means to you!

How long ago man discovered salt is lost in antiquity, but he learnt that it came from the rocks and the sea. As he realised the value of salt, he made it an article of currency and commerce.

Science has gone far since then, and today it has learned to make many and varied uses of salt. Can you imagine your common salt being turned into a number of heavy chemicals, such as soda ash, caustic soda, bicarbonate of soda, magnesium chloride, bleaching powder and bromides? Can you imagine getting along without salt in the twentieth-century?

At the Mithapur Works of Tata Chemicals, salt and other marine products are extracted from the sea and converted into these alkalis and heavy chemicals. They find their way into many other factories where paper, leather, soap, glass, textiles and pharmaceutical products are made.

Here, then, is an industry using the boundless waters of the sea to keep the wheels of other industries moving. It is the aim of Tata Chemicals to assure the country of a national supply of these basic chemicals.

Employees' State Insurance

THE Employees' State Insurance Corporation at its meeting last week considered the report of the Actuary on the financial aspects of medical care and decided to extend the medical benefits under the scheme to the families of the insured employees also. In doing so, the Corporation has conceded a long standing demand of the employees, which it had accepted in principle, but not given effect to earlier, in view of the uncertain financial implications of the extension of the Scheme.

The Actuary has reported that the finances of the Corporation will permit of an extension of the benefits. However, this raises an important question. How does the Actuary recommend the taking over of additional responsibility in respect of employees' families with the same financial resources as before? It could only mean one of two things: either the Corporation was so far collecting contributions in excess of the cost of medical care that it provided or that it was not providing adequate medical care at all, or that the insured persons were not making use of the facilities offered by the Scheme.

Another aspect of the scheme which must be causing serious concern is the system of provision of treatment through a 'Panel' of doctors. A review of its working has led the Corporation to suggest that the Panel should be substituted by the Service system in Punjab. It appears necessary to find out whether the Panel system is really effective, whether the right kind of medical men enroll themselves on the Panel and whether the employees insured are inclined to go to the doctors to whom they are attached.

The provision of hospital facilities has so far been confined to reservation of beds in existing State hospitals exclusively for the treatment of employees. The scheme envisaged the construction of additional hospitals jointly by the Corporation and the State Governments. Another decision of importance taken at the last meeting was that State Governments or the Corporation would be free to undertake construction of hospitals on their sole ownership. To the extent that it may speed up building of hospitals, this decision is welcome, in view of the extension of medical benefits to the families of employees.

British Labour Party

IN timing his retirement, Clement Attlee seems to have succeeded in choosing his successor. It was an open secret that he did not like Mr Morrison to succeed him; uncharitable commentators have alleged a long-standing personal animosity between Mr Attlee and Mr Morrison. It is not necessary to assume any such animosity to appreciate Mr Attlee's disapproval of Mr Morrison as the next leader. Mr Morrison is committed to the extreme Right wing of the Party. If the leadership had passed on to him, it would have prejudiced the future of the Labour Party.

Mr Attlee chose the moment of his retirement for a dual purpose. If he did not like Mr Morrison to succeed him, he did not also support Mr Bevan's claim. In the last three years, Mr Attlee has, in his quiet but ruthless manner, succeeded in overcoming, for the present at least, the growing Bevanite challenge. He has

THERE will be no issue of The Economic Weekly on December 31, 1955, as the office will remain closed on account of Christmas and New Year holidays.

We, therefore, take this opportunity of wishing all our readers and patrons a Happy Christmas and a Prosperous New Year.

achieved this by yielding to Mr Bevan on some crucial issues. In Mr Bevan's own camp, there are now aspiring politicians who do not support him on all the issues. Like Mr Morrison, Mr Bevan, too, is committed irrevocably to one wing of the Party. Mr Attlee does not want the Party to be weakened through dissensions. Mr Bevan's succession might have split the Labour Party.

Mr Gaitskell's nomination as successor to Mr Attlee was a foregone conclusion. It was common knowledge that he was being groomed for it. Transport House likes his Right-wing sympathies. As Transport House dominates not only the party machine but also the Parliamentary Labour Party, Mr Gaitskell's choice was almost inevitable. He is a brilliant economist. His integrity is beyond dispute. He has something else, which his former Chief, the late Sir Stafford Cripps, lacked. Transport House always

suspected the late Sir Stafford as a visionary. Mr Gaitskell is more acceptable to Transport House as a realist. Bevanites may resent Mr Gaitskell's Right-wing affiliations, but the moderate Left has welcomed Mr Gaitskell's brilliant performance during the debate on Mr Butler's supplementary budget.

Mr Gaitskell is young. He is able. He is ambitious. His nomination should, normally, perpetuate his leadership for many years. Well-wishers of the Labour Party hope that he will reach a compromise agreement with Mr Bevan to further the interests of the Party. Mr Morrison has resigned, and Mr Bevan may not choose to function as Mr Gaitskell's deputy. Political incompatibility between Mr Gaitskell and Mr Bevan is no secret. But, it is hoped, that in the wider interests of the Labour Party, both will agree to lead the Party in partnership. Mr Bevan has shown his disinclination to disrupt party unity. But it would be wrong to base conclusions on purely personal equations. Today, the British Labour Party is at the cross-roads. It is more than time for the Party to decide whether it should stay Labour or turn Socialist. On Mr Gaitskell's statesmanship depends whether the battle for succession will be fought again in the near future.

Malaya

TWO tentative conclusions will be drawn from recent developments in the Malayan peninsula. Whitehall seems reconciled to the view that self-government is the best antidote to Communism. Those who are convinced that colonialism is the major menace to peace, as well as a constant invitation to Communism, will welcome this belated realisation by Whitehall. If Whitehall does not go back on its promises to the Chief Ministers of Singapore and of Malaya, it is to be presumed that London, unlike Washington, has arrived at the conclusion that the Communist menace to south-east Asia is no longer immediate or urgent. Since the Geneva Agreement on Indo-China, many informed persons have been inclined to the view that SEATO is an irrelevant intrusion. One wonders when, if ever, Washington will endorse what London now accepts by implication.

When Mr Marshall, Chief Minister of Singapore, returns to his country after his successful mission to Lon-

(Continued on page 1531)

Letter to the Editor**Economics of Co-existence**

IN the editorial in your last issue entitled, "Economics of Co-existence", you express preference for aid at Government-to-Government level. But what does India want? Money? Or technicians, and plant and machinery? I think, the latter, men particularly. That being so, how can governmental level aid or aid through international agencies help India? This is what you say: "... the fact is that we are aiming at a pattern of development which leaves only limited scope for the association of western capitalist enterprises with our development. The West has failed to develop, or we have failed to work out, a modus operandi through which adequate assistance can come forth and be effectively utilized. Russia has not to face those impediments which capitalist enterprise puts in the way of the western powers."

Capitalist enterprise puts impediments in the way of western powers. That's precisely the point. Thus,

even Government-to-Government, or an international agency aid cannot adequately ensure technical knowledge to native engineers. Here you assume duality between Western Governments and Western private capital. I doubt how realistic your interpretation is. But, you will surely agree, that no such duality can exist in Communist Russia.

Now recall the presidential address of Mr G A S Slim at the annual general meeting of the Associated Chamber of Commerce:

"(The foreign investor) ... looks for conditions which enable him to send to and retain in India a reasonable number of his own nationals to look after his interests".

Industrial progress (meaning ability to industrialize through own resources and skill) in Communist satellite countries is now widely advertised. Similar development can be expected though Indo-Soviet mutual trade and economic co-operation. Your third para from the

end is liable to the interpretation that western private capital is opposed to Avadi. But, that is either beside the point, or alternatively, just the point which supports my thesis.

There is one aspect about the thesis I was developing on which I have doubts. Russia can depend on Nehru. Russia, I presume, has come to the conclusion that Congress will rule India for, at least, a decade more. But when Nehru is no more, what sort of Congress will rule India? T T K said in Calcutta that the "socialistic" pattern does not mean socialism in India! Without Nehru, Congress will be Hindi-speaking, Amber Charkha, Khaddar-capped Right. Or, have Moscow's astrologers assured Krushchev that Nehru will live and remain PM for at least a decade? Do you know the answer? I don't.

A Study in Mass Reaction

Soviet Leaders' Visit and After

INDIA is certainly becoming world-conscious. This has always been true, relatively speaking, of her educated classes who imbibe their learning through the medium of English and therefore know much more about the history and geography of England or of Europe than about their own country and their own past. The Indian daily Press has pandered to this foreign-mindedness and toed the line. Though Indian news is appearing more and more on the front page, even today foreign news gets the pride of place in the Indian newspapers in striking contrast to the popular press in any other country.

This foreign-mindedness, however, can be ascribed only to the microscopic, educated minority and however much ordinary people may try to imitate their superiors, it can be said that the masses do not suffer from the same obsession with things foreign. True enough, they have respect for the achievements of the foreigner. Villayet is still the el Dorado, America the land of superlatives, and to such as have found knowledge of world affairs percolating to them, Russia and the Soviet world appear as the land of heroes—countries that have challenged, and challenged successfully, the might of the West. How much this admiration is also tinged with vicarious pride for the latter's achievements in uplifting the worker and the peasant, is, however, an open question.

Demands of Policy

That question is being raised, insistently and embarrassingly, by the mass popular receptions extended to the Russian visitors. Indeed, the number of foreign politicians and potentates who have been lately visiting India is as noteworthy as the popular receptions accorded to them. Government, of course, may have its own reasons for impressing visitors with the warmth of popular welcome; and the warmth may also be carefully graded according to the demands of State policy. This is apparent in the State arrangements made for receptions to the King of Saudi Arabia and that of the King of Nepal, who have appeared one after the other. But that does not explain the crowds in the streets, the people lining up along roads to have a glimpse of the Saudi king. One could

understand Muslims' enthusiasm for the keeper of the holy places of Islam, but in Bombay at least the reception was by no means an all-Muslim affair. And what is one to make of the mass enthusiasm for foreign leaders which far exceeded the enthusiasm shown by the people for their own leaders, Pandit Nehru not excluded? Calcutta has known great crowds receiving Mahatma Gandhi or Jawaharlal; but the crowds that turned out to welcome Bulganin and Khrushchev, by all counts, outvalled by far those drawn even by Jawaharlal or Gandhiji. How does it happen? One could understand it if the visitors were none other than Stalin, who had become in the people's eyes a historic figure of world eminence. Certainly none of the present Russian leaders measure up to that.

Curiosity and Tamasha

Due allowance must, of course, be made for people's curiosity for the exotic and pre-occupation with things foreign—anything vilayeti is good—and the weakness of the Indian crowds for tamasha, and, of these again, Calcutta crowds are the most excitable and Bengalis emotional. There is also a strong ambivalence in people who have just won their political independence. The age-old resentment against the West is as deep to-day as it was ever before despite the deceptive imitation of Western ways by top classes and the always-deceptive politeness of the Indian to the Westerner. Any nation which could resist or challenge British might was only too likely to evoke our admiration. The Boers were heroes in our eyes; Germany drew our admiration, and this was the reason why the INA could capture the imagination of so many people, however difficult the very same people might have found it to swallow the exploits of Japan. How much of this element was behind the welcome to the Russians? Between the resurgence of Asian pride and Russia's successful challenge to the West, there need be no identification. Many Westerners resent that Russia should to-day pose as an Asian which she is not.

The first re-actions in Delhi were summed up by our correspondent as follows (the despatch was delayed in transit and could not appear in time,

and the lines were written when the visitors were still there):

"It is easy to see in the rousing reception the people of Delhi accorded to the Russian leaders the growing popularity of Communists or even Communism. One has to go below the surface if one is correctly to interpret popular feelings. In fact, the people, swept by a wave of intense national feeling, were only returning the welcome Shri Nehru had had in Russia. They took it as a matter of national honour and did their best to excel the Russians in the game. And they did beyond expectations. Indeed, the Russian receptions paled before the Delhi welcome. That a country where welcomes can be ordered and organised strictly according to pre-arranged plans was beaten is in itself a measure of our national sentiment. This is not to deny that official encouragement and even pressure were at work behind the show that was put up. But this pressure element was present precisely in circles which shun everything connected with Russia like poison.

A Sales Drive

"The Western Press has seen in the visit of the Russian leaders a sales drive, but the commodity to be pushed cannot be neutralism for India is already wedded to Panch Shila. Meant seriously or not, the Soviet leaders have offered to share with India their industrial and scientific experience. This bid for Indian friendship finds expression even in the Industries Fair, which the Communist countries alone seem to have taken seriously. Instead of displaying costly household gadgets and durable consumer goods, they have put on show heavy equipment which India would need for her planned development.

"One would be wrong again, to call the Russians super-salesmen. Whatever may be their intentions, they are as blustering and as ill-informed as the average American. Their patronising tone is as likely to offend Indian sentiment as does the American. At the Qutab Minar, M Khrushchev, innocent of Indian history, dropped a brick when he pompously claimed that the old historic monument was built with slave labour. Little did he know that slavery was never the basis of production in

India. Nor did the kings of the Slave Dynasty rise as popular leaders. At Agra he seemed to be unaware that Indians at the time of the Great Moghuls were not starving to death."

At every street crossing in New Delhi, traffic was held up while traffic islands were decorated for Bulganin's visit. And as you waited in your car or your taxi, the loud-speaker blared at you

"you have seen what a reception Russia gave to Pandit Nehru; you must turn out in lakhs to give a similar reception to Marshall Bulganin". It was not intended to make the

Probe Into British Tyre Industry

FROM press reports, it is not possible to assess fully the results of the labours of the British Monopolies Commission which had been studying the tyre industry and trade for the last three years. But its unanimous recommendation that the present system of consultation among manufacturers on prices should be ended and the majority recommendation that manufacturers should no longer be allowed to make retail prices in any way binding on dealers has given rise to a piquant situation. Dunlop, who control nearly half the British business, contend that it is wrong to suppose that because uniform retail prices prevail under the present system of consultation among manufacturers, they would be different if there were no consultations. Neither does the Commission think so, but nevertheless it recommends — and all the members of the Commission agree — that the trade association consultations, consultation on costings and recommendations on prices should be abolished, being against the public interest. Even when this is done, there may not be much price competition but the Commission feels that "it is certain with them there will be less".

The Tyre Manufacturers Conference, on the other hand, maintain that without voluntary consultation among manufacturers on prices, there would be cut-throat competition in the industry, as a result of which weaker manufacturers would be eliminated and the survivors will have to raise prices in order to recoup their losses from the rate war. So, motorists will have to pay more eventually.

The enquiry has thrown some light on one aspect of the monopolistic competition of which the public had hitherto little knowledge viz. secret discounts paid to distributors. This shows that though tyre manufacturers fixed identical prices for the ultimate consumers, they might not have been getting identical prices themselves. There is, therefore, competition so far as dealers are concerned; but the manufacturers do not allow the resulting price cuts to be passed on to the ultimate consumer.

The Indian Tariff Commission did not, however, approach the problem from this angle; its task was cut out for it differently by its terms of reference. The Commission, how-

ever, had also in view restoration (or introduction?) of competition in the tyre business. To this end, it recommended that some import should be allowed and at least one new unit should be encouraged to set up production; besides, it also wanted wider Indian participation in the capital employed in the industry. The structure of the industry here follows closely that of Britain. To quote from the Economist: Only 11 companies make tyres in Britain, though three more "manufacturers" have their branded tyres made for them by others. Seven are foreign-controlled: Goodyear, Firestone and Dominion are owned wholly, and North British owned up to 50 per cent, by American companies, Michelin and Bergougnan by French, and Pirelli by Italian. British tyre and Rubber was originally owned by Goodrich, but the American company sold most of its holdings in 1934. Avon has some technical liaison with Sieberling of Akron; Henley's, John Bull and Davies are smaller companies with no foreign connections; and India, the second largest British-controlled company, is owned by the largest, Dunlop.

Dunlop is by far the largest manufacturer in Britain: in 1951 and 1952, with its India subsidiary, it accounted for about 47 per cent of the tyre industry's turnover, and for more than 40 per cent of the industry's "loose" tyre exports; it has also ten tyre manufacturing subsidiaries and associate companies overseas. Even so, tyres account for not much more than half of Dunlop's productive capacity.

The tyre manufacturers also account directly for about a quarter of retreading business (by value) and supply most of the materials used by the hundred or so other concerns that do retreading. Dunlop and India in 1952 did about eighth of retreading turnover, and another eighth through two retreading companies owned secretly, Regent and Tyres (Scotland); in 1953 Dunlop openly bought another major retreading company, and the Monopolies Commission thinks it probable that the group is "now responsible for well over 30 per cent of the total sales of remoulds".

The three-quarters of new tyre out-put sold at home go to four different markets, with different trading terms.

Original Equipment for new vehi-

cles: Sales to the largest vehicle makers are subject to no restriction, but in 1952 the Commission found that most of them were charged identical prices for tyres of the same size and type in similar quantities — about 40 to 60 per cent below retail prices. Less important vehicle manufacturers are charged identical prices, which follow a Dunlop list.

Under Mileage contracts the makers keep passenger transport operators' fleets adequately tyred: the tyres remain their maker's property, being serviced and replaced as necessary. A common formula, which gives a rate per vehicle mile, is used with the schedule of identical retail prices and quarterly statistics of operation to set the basic fee.

All contracts for Government business are put out to competitive tender.

Retail sales in the Replacement market are done at identical prices for the same size and type of tyre. These retail sales are also altered simultaneously. There is no binding agreement on manufacturers to set common prices, though the Tyre Manufacturers' Conference makes quarterly estimates of future costs using returns from ten of the eleven makers, and recommends price changes based on these. Tyres remoulded by the manufacturers are also maintained at identical prices; the other retreaders have an association that recommends minimum prices—usually at a similar level.

Another interesting sidelight: Dunlop has been secretly buying its way into the distributive trade and currently controls about 20 per cent of tyre distribution in Britain, though half of its sales are of other makers' tyres!

Is Marshall a Free Agent?

(From Our Singapore Correspondent)

NOW that the world has left the days of private diplomacy behind, it appears that every official dignitary from Prime Minister downwards tries to claim support from every other country for his own point of view. In this attempt to make others comment, victory is assured whether the other country's Prime Minister keeps quiet (implying agreement) or speaks out (implying that he is important enough to be commented about). It is against this background that the recent visit of Mr David Marshall, the Chief Minister of Singapore, to India must be assessed. Singapore is a small "country". It is split into innumerable factions, both racial and economic. Even within the sub-divisions of Chinese or South Indians, there are sub-sub divisions which, until the Japanese war at least, were content to acknowledge the supremacy of the Government and to go about their business.

But since the war, increasing insecurity has made every community less and less certain of its own position to carry on as it had done in the past. Every individual, while increasingly stressing his loyalty to his own community as an individual, also tries to jump on the bandwagon, which, to him, appears most secure. In this maelstrom, the political parties have each tried to organise support from as many small sectional communities as possible. Singapore consists of an overwhelming majority of Chinese. Each of the main political parties, the Conservative, Progressive and Democratic Parties, the left-wing Peoples' Action Party and the centre Labour Party, depends overwhelmingly on the Chinese vote to retain power. Within the Chinese, all economic groups are represented from the multi-millionaires to the unemployed.

At the last elections, the majority of the Chinese voting supported the left-wing parties. The Labour Party, of which Mr Marshall is head, was surprised at the support it received. Its original manifesto was confined almost entirely to self-government but, on taking over power by a bare majority, the party soon found that its policy was insufficient to meet the immediate demands of the situation. In trying to live from hand to mouth, it was fast losing the support of the

poorer Chinese, who had put it into power. The various strikes which have taken place in the colony as a result of the dissatisfaction felt by the lower paid workers over the status quo found the Labour Party unprepared. In several instances, the Government in power found itself in the unhappy predicament of urging the workers to strike against themselves. Instead of stepping forward resolutely with a comprehensive policy of minimum wages and compulsory arbitration, the Government did very little except issue conflicting advice to both sides. Even on such a subject as citizenship, Mr Marshall is accompanied by one Government representative of UMNO, the Malayan Alliance Party, who

is going to oppose Mr Marshall on this issue during the talks with the Colonial Office. It is unreasonable to expect the Colonial Office to resolve the citizenship dispute when the Government itself is divided on the question.

It is against this background that one must estimate Mr Marshall's visit to India and Indonesia. By fixing himself firmly in the public eye, he is attempting to associate himself personally with the issue of independence and thus get support for his party. It is too early as yet to say whether this policy will be successful. The audience in India must carefully distinguish between the issue of whether Singapore is to be given self-government from the issue as to whether the Labour Party, of which Mr Marshall is head, should be the chosen vehicle of freeing Singapore from "colonial rule". As a consummate actor, Mr. Marshall is extremely concerned to use every trick of which he is master to keep Singapore and his party before the public eye. As he himself said on one occasion, as a lawyer he had been successful in getting 24 of his 25 clients acquitted on a charge of murder, and he was going to complete the hat trick with self-government for Singapore.

Under these circumstances, it is rather shrewd of the Colonial Office to keep its head as much as it is doing. It is following the policy of giving all its support to the elected representative of the people, Mr Marshall, and keeping its mouth shut. At the present time, the Labour Party of Singapore is kept in power with the support of the only member of the UMNO Alliance in the Assembly. He represents the islands around Singapore. But should one more member of the Party leave the Government benches, as Mr Lazarus, the late President, left the Party, then there can be no alternative to a fresh election, the outcome of which is bound to be greater support to the left-wing Peoples' Action Party. Such a situation can only be forestalled by very much better personal discipline within the Singapore Labour Party and a gradual lessening of Mr Marshall's influence for more democratic representation. At present there is very little sign of this internal re-organisation.

HEAD OFFICE
4, CLIVE GHAT STREET
CALCUTTA

BOMBAY OFFICE:
FORT: Sir Pherozeshah Mehta Road

in 1952 and glass factories, though registering a small rise, were fewer than in 1950.

Productive Capital

In contrast to this variation in the number of factories, productive capital consistently moved upwards, increasing by over 51 per cent from Rs 482 crores in 1948 to Rs 731 crores in 1952. Fixed capital of Rs 301 crores in 1952 was Rs 105 crores more than in 1948, and working capital increased by Rs 145 crores to Rs 430 crores during the same period.

The increase in working capital is partly explained by the steep rise in prices of industrial raw materials, their index (year ending August '39=100) rising from 431 in 1948 to 608 in 1951—when working capital also rose to the maximum of Rs 438 crores; this index receded to 454 in 1952, and working capital also registered a decline of Rs 8 crores. The increase in working capital is also partly to feed the increased fixed capital.

Employees

The number of persons employed, however, did not follow this upward trend—it fell from about 17,04,000 in 1948 to about 16,48,000 in 1952. This may indicate growing unemployment in the country in the latter years and may also indicate that surplus labour in the industries was being corrected by increasing input of capital.

The trend of employment in the two categories of employees, however, did not show such uniformity and moved in opposite directions. While the number of workers declined from 15,46,000 in 1948 to 14,68,000 in 1950, employees other than workers increased by over 5,000. Again, while the number of workers increased thereafter to 14,96,000 in 1952, the number of other employees declined by 9,000 during the same period.

Earnings of employees consistently increased throughout the period, except in 1950. As Table I shows, the total earnings of employees as well as average earnings per employee in 1952 were far above those in 1948. Only in 1950 did the total earnings decline by about Rs 5 crores; but earnings per employee were well maintained even in that year. The increase in total earnings is explained to a certain extent by the movement in the working class cost of living index (All-India 1949=100) from 97 in 1948 to 103 in 1952.

The gross ex-factory value of output shown in the Census is not a measure of the increase in production, as it includes changes due to price variations.

Value added by manufacture, though increasing absolutely, declined in 1952 relatively to the amount of productive capital, indicating that the rate of investment was higher than the rate of increase in the value of manufactures.

Changes in labour productivity, as measured by the value added by manufacture, appear erratic, though there seems to be an upward long-term trend which is due mainly to the fact that increasing amounts of capital are being associated with an almost stationary labour force. Value added by manufacture is, of course, much influenced by changes in the value of manufacture; while interpreting the figures in Table II, it is necessary to remember that the whole-sale price index of manufactures (year ended August 1939=100) rose from 340.6 in 1948 to 395.5 in 1951 and then fell to 377.5 in 1952.

The Census of 1952 continues to show the lopsided character of our

industrial structure. Cotton textiles are the biggest industry from every viewpoint. Heavy industries are little developed. Chemicals, however, moved from the seventh position in 1951 to the second position in 1952, from the standpoint of productive capital employed. A major part of this increase was the result of inclusion of the Sindri Fertiliser Factory in the Census of 1952.

Regional Distribution

Table III sums up the position of some of the States. With Rs 238 crores (more than 32 per cent of the total) of productive capital, Bombay State led in 1952. West Bengal came second with Rs 158 crores of productive capital. Bombay also had relatively more working capital (Rs 156 crores) than West Bengal (Rs 84 crores) because of the concentration in Bombay of cotton textiles which require more working capital.

Vindhya Pradesh (not included in the table) had only Rs 14 lakhs of productive capital which shows not only the extreme backwardness of the State, but also the extent of regional disparities.

INDIAN INDUSTRIES, 1952

	Fixed Capital	Working Capital	No. of Persons Employed	Pay- ments to employees	Gross ex-factory output	Value added by manufacture
	(Rs. lacs)	(Rs. lacs)	('000)	(Rs. lacs)	(Rs. lacs)	(Rs. lacs)
1. Cotton Textiles	7629 (25.3)	16678 (38.8)	685 (41.6)	9374 (46.7)	41363 (34.9)	11895 (37.9)

Wages, Employment and Cost of Living During War and Post-War Boom

Ayodhia Singh

The time is not inappropriate perhaps for an examination of the experience of the war and post-war boom years as regards movements of wages, employment and cost of living. This is the first of a series of two articles, slightly re-cast from the author's doctoral dissertation, which brings to light some aspects of the behaviour of wages and prices which may be of more than historical interest.

The first part deals with wages and cost of living, the second with the question as to how far higher costs of living were offset for the working class as a whole by larger opportunity of employment.

IT is generally accepted on all hands that whenever a price boom occurs, prices increase first and at a higher rate than money wages and costs. When as a result of increased prices the cost of living begins to rise, a demand for higher wages is firmly put up. With an advance in wages which form a substantial part of costs, the latter too begin to move upwards. In brief, any increase in prices is only subsequently followed by that in wages and costs but rarely in the same proportion.

However, when we come to study the price-wage relationship as it existed during the World War (1939-45) in India, a peculiar phenomenon is noticed, which contradicts the theory of relative rigidity of wages during a price boom. An attempt has been made in Table I to calculate the extent of the wage lag* or wage advance (as the case may be) by comparing the index of average annual earnings of the factory workers of all industries put together during 1939-45, with the corresponding indices of working class cost of living at four representative industrial centres viz., Bombay, Kanpur, Calcutta and Madras, with 1939 = 100 as the base of both the series.

Table I shows that as a consequence of the war time price movements of wage goods, the initial stages of the war period were marked by relative flexibility of wages against those of cost of living in all the four centres. There was what may be termed in the present context a 'wage advance' rather than a 'wage lag' bringing a positive advantage to wage-earners all over the country. This trend was most significant in

*'Wage lag' measures the extent to which the wage index remains behind the corresponding cost of living index and similarly 'wage advance' implies the extent to which wage index exceeds the corresponding cost of living (the bases of both the series being the same).

the case of Madras, where almost throughout the war period (except 1945) the rate of increase in wages was higher than the rate of increase in the cost of living. The relative lag in the cost of living continued increasing up to 1943, the magnitude of the wage advance for 1940, 1941 and 1943 respectively being 4.2 points, 5.4 points and 34.2 points. In 1945, the five year old trend was actually reversed with the emergence of a positive wage lag of the order of 7.9 points.

The Calcutta the cost of living index did not rise in the same proportion as the earnings of wage-earners either in 1940 or in 1941. There was nothing like a positive wage lag. On the other hand, the war stimulated earnings in a greater degree than the cost of living, which lagged behind by 8.8 points and 6.4 points in 1940 and 1941 respectively. In the second half of the war period, however, the wage lag was conspicuous though after a tremendous increase in 1943, it declined moderately in subsequent years, the wage lag for 1943, 1944 and 1945 being 85.0 points, 54.3 points and 55.8 points respectively.

Table I—Wage lag during the war (Base 1939 = 100)

	1940	1941	1943	1944	1945
Bombay					
Working Class cost of living index	103.9	114.6	212.6	219.4	217.5
Index of average earnings	107.0	112.9	182.0	204.0	207.2
Magnitude of wage lag	-3.1	1.7	30.6	15.4	10.5
Kanpur					
Working Class cost of living index	105.7	117.3	291.4	299.0	293.3
Index of average earnings	107.0	112.9	182.0	204.0	207.2
Magnitude of wage lag	-1.3	4.4	108.8	95.0	86.1
Calcutta					
Calcutta W.C. cost of living index	98.1	106.5	267.6	258.3	263.0
Index of average earnings	107.9	112.9	182.0	204.0	207.2
Magnitude of wage lag	-8.9	-6.4	85.0	54.3	55.8
Madras					
Working Class cost of living index	102.8	107.5	169.8	195.3	215.1
Index of average earnings	107.0	112.9	182.0	204.0	207.2
Magnitude of wage lag	-4.2	-5.4	-34.2	-8.7	7.9

Sources: Original indices of working class cost of living taken from the Indian Labour, Year Book 1949-50.

Index of Average Earnings: Indian Labour Gazette 1946-48

The rate of increase in wages as against the rise in cost of living was relatively high in Bombay. There was a wage advance to the extent of 3.1 points in 1940. From 1940 onwards, however, wage advance was replaced by wage lag whose magnitude was 1.7 points in 1941, 30.6 points in 1943 and 10.5 points in 1945. Thus in the initial stages of the war the rate of increase in wages was faster than the rise in the cost of living in Bombay but in the later stages, wages failed to keep up with the rise in the cost of living, although the extent of wage lag progressively declined from 1944 onwards.

The Kanpur cost of living index did not increase in proportion to the increase in earnings during 1940, the wage lag being negative to the extent of 1.3 points; from 1941 onwards, wages failed to adjust themselves to the rising cost of living. The magnitude of wage lag was 108.8 points in 1943, 95.0 points in 1944 and 86.1 points in 1945.

The preceding analysis warrants, the inference that wages in relation to the cost of living were relatively flexible in the initial stages of the

boom, but not in the later stages. This is contrary to the universally accepted belief that wages fail to increase pari passu the rise in the cost of living in the initial stages of a boom, and that they are comparatively flexible only in the later stages.

What is the explanation of this departure from the traditional belief? Perhaps the employers were in a position to increase wages to an extent higher than those warranted by the increased cost of living in the initial stages of the war, due to still higher increases in their profits arising from rising prices of non-wage goods. Greater increase in industrial profits compared to cost of living in the industrial centres during the early phase of the war explains how the industrialists could pay wages higher than those warranted by the rising cost of living, as can be taken from Table II.

It seems probable that when prices began to rise after the outbreak of the war, expectations regarding their further rise were so high as to induce the employers to pay wages higher than those warranted by the rise in the cost of living.

II

LARGER EMPLOYMENT AS AN OFFSET

TWO factors which played a prominent part in alleviating the rising cost of living for the working class were increased earnings, and increased employment. The extent of relief derived from increased employment during the war is analysed in this section.

Table III shows an all-round increase in employment during the war, though the rate of expansion was not uniform. It was highest for textiles in the Punjab; for food, drink, and tobacco in Bombay; for

engineering in C P and Berar and the Punjab; for chemicals in Madras; for Railway workshops in Bombay; for minerals and metals in the U P; for wood, stone and glass in the Punjab; and for ordinance factories in C P and U P. Employment in gins and presses which recorded an overall decrease of 20.7 per cent affected Bengal and U P most, while in Madras the prewar level of employment was maintained in these industries.

The main trends in regard to the employment position during 1939-45 were as follows:

1 Total employment in factories increased from about 17.5 lakhs to 26.4 lakhs or by 50.9 per cent.

2. Owing to the conditions created by the war, the rate of growth in governmental and local fund factories was considerably higher (245 per cent) than in private factories (35.0 per cent.) though it may be noted that government factories accounted for only 17.3 per cent of the total factory employment.

3. While overall employment went up by 50.9 per cent, employment in seasonal factories actually declined by 4.9 per cent.

4. Employment in textiles increased by 23.7 per cent, in engineer-

ing by 96.9 per cent and in Railway workshops by 108.9 per cent.

5. Bengal continued to occupy the first place in industrial employment but Bombay was gradually catching up. Of the total factory employment in 1945, 28.1 per cent was in Bengal, 27.8 per cent in Bombay, 10.5 per cent in Madras and 10.4 per cent in U P.

When variations in employment are studied in relation to the corresponding variations in the cost of living, we can measure the extent to which changes in employment in different regions offset the burden imposed on the working class by the increased cost of living during the war period. In other words, the measurement of the 'employment offset' would determine the position of the wage-earners during 1940-45 in relation to 1939 (the pre-war standard). The 'employment offset' would mean the percentage relief available to the wage-earners through an increase in employment against the corresponding increase in the cost of living. If Eb and Cb respectively mean employment and cost of living in the base year, and Ec and Cc respectively mean indices of employment and cost of living in the year of which we have to calculate the employment offset, then the formula for the calculation

Table II Index of Industrial Profits and Cost of living Indices (Base August 1939=100)

Period	Industrial Profits	Kanpur	Working class cost of living Calcutta	Bombay	Madras
1940	138.0	111	106	107	109
1941	187.0	123	115	118	114
1942	221.8	181	144	150	136

Delhi

RICH in the history of two vividly different eras, Old and New Delhi provide a wonderful contrast between past and present. Moghul civilization is perpetuated in the splendour of the Kutub Minar, Jama Masjid and the Red Fort; while the Central Secretariat, Parliament House and Rashtrapati Bhavan reflect the graceful simplicity of modern architecture.

Proud of their magnificent heritage, Delhi motorists have a lively respect for progress. That's why they appreciate the virtues of Double-Powered MOBILGAS, and make it a point to look for the Flying Red Horse — honouring a tradition among progressive motorists throughout the world.

STANDARD-VACUUM OIL COMPANY

V. 2132

of the 'employment offset', (E O), would be
$$Ec - Eb \times 100 = EO * Cc - Cb$$

With the help of the above formula, an attempt has been made in Table IV to calculate Eo at the end of the war in relation to the pre-war level. This formula can serve our purpose only so long as Cc is greater than Cb. For instance, it will fail when the two are equal in which case the resultant denominator and E O become equal to zero. Its application is thus confined to a single base series rather than a chain index series.

Apart from the general indication that during the war period there was an appreciable increase in the volume of employment along with the rise of cost of living in different industrial centres, Table IV shows no single homogenous trend in the relationship between the two variables. The extent to which hardships involved in the increased cost of liv-

ing were neutralized by the increased quantum of employment varied from region to region. To illustrate, from the viewpoint of cost of living alone, U P labour was the worst sufferer, that of Bengal being moderately better off, that of Madras though least affected over the whole span of the war was only slightly better off than labour in Bombay in 1945. However, when looking at employment offset, we find that the position of Bengal was the worst, the E O for Bengal being 19 as against 38 for U P. Madras wage-earners who suffered practically to the same extent as those of Bombay on account of increased cost of living could secure the benefit of E O only to the extent of 37 against 50 in Bombay.

Thus the relative position of wage-earners in the four regions as indicated by the relative variations in the cost of living indices during the course of the war was substantially altered as a result of the impact of

increased employment. At the end of the war, Bombay wage-earners were least affected and wage-earners of Madras were slightly worse; Bengal wage-earners were worst affected, those of U. P. being only slightly better.

Table IV

Employment offset in different Regions during 1945 against 1939

Regions	Ec	Eb	Cc	Cb	Eo
Bombay	157.8	100	217.5	100	50
Madras	142.0	100	215.5	100	37
U. P.	173.0	100	293.3	100	38
Bengal	130.2	100	263.0	100	19

*The author is indebted to the late Prof. J. N. Das Gupta for his guidance in the framing of this formula.

Ec = Employment Index in 1945
Eb = Employment in 1939; Cc = Cost of living in 1945; Cb = Cost of living Index in 1939; Eo = Employment offset.

Views on States Reorganisation - VIII

Bombay as Capital of Maharashtra

G K Cholkar

THERE are only two proposals of practical importance:

- (i) Bombay as the capital of a new linguistic State, Maharashtra, and
- (ii) Bombay City as a separate State by itself.

These two proposals are not of the same status. The first is an independent demand for a new territorial arrangement. The second is a conditional proposal. Those who make it have nothing against the existing arrangements. They suggest that if the existing Bombay State is to be broken up for forming new linguistic States of Gujarat, Maharashtra and Karnatak, the City be dissociated from this scheme and incorporated into a separate State. It would also be true to say that the break-up is opposed (by those who oppose it) chiefly because it might involve assigning the City to one of the three new linguistic States.

This makes it clear that there is no need to consider the advantages of a separate City State for Bombay as compared with the present position. It is necessary to consider only the disadvantages of the City being the capital of a new linguistic State as compared with the present position of the City. Against them,

must, of course, be considered the advantages.

Apart from advantages and disadvantages, it might seem also necessary to see to whom Bombay City "belongs", but such an examination would hardly be worthwhile. In whatever way the future of Bombay is settled, the City must really "belong" to the nation as a whole. There is one point, however, to which attention may be drawn. The fact that those who prefer a City State would equally favour continuing the existing arrangements implies that they do not want a City State because, in their opinion, Bombay "belongs" to the people of the City. On the other hand, those who make the other proposal include many who believe that Bombay City "belongs" to Maharashtra. From this, one conclusion as regards future possibilities may be drawn. If Bombay is made a City State, those who consider this "unjust" would always labour under this sense of "injustice". But if Bombay became the capital of Maharashtra, there is a possibility that those who oppose it now may be less opposed to it in future to the extent that the disadvantages resulting therefrom prove to be less than anticipated now.

The disadvantages of incorporating Bombay City in Maharashtra were vividly brought out by Shri K M Munshi in a note on "Linguistic Provinces and the Future of Bombay" which he wrote in 1948 for the Dar Committee. From that, the following may be quoted:

To annex the Bombay City to United Maharashtra formed on linguistic basis, therefore, would have the result not only of destroying the cosmopolitan character of Bombay but of placing the non-Marathi speaking population in cultural subjection.

Those in charge of industry, trade and finance in the city of Bombay and its suburbs are predominantly non-Maharashtrians Serious apprehensions are entertained in various quarters regarding the possibility of the domination of a uni-lingual people in the life of Bombay City in case it is to be joined to a linguistic province.

If Bombay City is handed over to Maharashtra alone, the City will lose its multi-lingual character, its trade, industry and commerce will be seriously affected; and the non-Marathi

speaking majority will be subjected to the political domination of aggressive linguism.

These are very serious matters. In regard to them, two observations may be made. First, assuming that the protagonists of a new Maharashtra State include some mischief mongers, there would be others who are as anxious to avoid results of the kind apprehended by Shri Munshi as he himself is. Secondly, it is not really a question of what Maharashtra would do to Bombay City but what any State Government can constitutionally do to damage the economic life of a city or to violate the rights of cultural minorities. This latter problem is a very important problem and it was discussed from an all-India point of view by a Bombay journal, the *Tata Quarterly*, long before the fierce controversies raised by States Reorganisation put these into cold storage for the time being.

Linguistic Minorities, an all-India Problem

The journal mentioned above, in its April 1954 issue, wrote:

"The Commission would do well to give careful attention to the problem of linguistic or cultural minorities and set out in detail the responsibilities of a State towards them. It should be remembered that the problem has to be examined even if no new linguistic State is established because unilingual States like Bengal, Bihar, Orissa already exist. The problem might be even more important in Hindi speaking areas if there are people in such areas who consider themselves to be more 'nationalist' than others because the national language happens to be their mother-tongue. The very existence of several great languages in India raises the problem of minorities and the best course is to face it squarely.

"A State must provide as many schools as are required in order that almost every child could be taught in its mother tongue. In schools and colleges, Hindi must be compulsory. College education may be in the regional language, but in every city there must be at least one college which teaches and examines students in Hindi and which may be attended by any student irrespective of what his mother tongue is. A person should be entitled to receive a reply in the language used in his letter.

"In recruiting staff, a State may insist on sufficient knowledge of

Hindi but must not in every case insist on a knowledge of the regional language. Where necessary, employees who do not know the regional language may, however, be made to learn it.

"In its relations with business a State Government should not be able to introduce considerations of domicile, language or the like. It should be wrong to say that a business concern should give larger employment to 'local' people or conduct its business in a particular language.

"Fortunately, the Constitution not merely makes all this possible but indeed visualises it. The spirit of the Constitution must live and inspire leaders everywhere, but it is up to the Centre, if necessary, to enforce the required action. Money spent in being generous to minorities serves a great national purpose and the Central Government, when it

allots grants to States, should show special consideration for States which incur substantial expenditure on providing educational and cultural facilities for the language minorities in their territories."

In the economic sphere also, the Constitution empowers the Centre to take measures to protect the national interest against prejudicial actions of State Governments.

Conclusion as regards disadvantages

If the leaders of different States, in collaboration with the Central Government, evolve an all-India policy for the protection of the cultural rights of minorities and for the preservation of economic unity and if the Centre for the same objects makes proper use of the powers it has under the Constitution—then apprehensions of the kind expressed by Shri Munshi and others will not result. Then there will be

no serious risk in allowing Bombay City to be part of Maharashtra.

Advantages of Linguistic States

Before considering the advantages of incorporating Bombay in Maharashtra, it is necessary to see if there are any national advantages in redrawing State boundaries on a linguistic basis at all. This broad question has been examined carefully by the *Tata Quarterly* which suggests that the interests of India as a whole may be said to comprise the following four basic objectives:

- (i) We want State Governments to actively pursue the economic development of their regions and, for this purpose, use the powers they have in a manner fair to other States and without detriment to the national economic unity.
- (ii) We want the various regional cultures to flourish and thereby provide for the evolution of a national culture.
- (iii) We want the recognised regional language to develop sufficiently to meet the requirements of modern life and we want Hindi to become the national language.
- (iv) We do not want "linguism" to be a continuing force in political affairs.

For the realization of these objectives, it is desirable to entrust State Governments with responsibility for the development of regional languages and cultures while it is left to the Centre to provide facilities for the fusion of regional cultures by such means as cheapening railway travel and the promotion of national language. In view of this, State boundaries should correspond to divisions of the main distinctive regional cultures. Basically, therefore the lay-out should be a linguistic lay-out inasmuch as a regional language represents a cultural pattern. Sometimes it is suggested that instead of linguistic States, there should be "economic" States. This is a myth. Economic factors cannot by themselves yield a unique pattern of territorial divisions which may be taken to be the best. Further, to quote the same source, "there is no necessary conflict between 'linguistic' States and States capable of shouldering their economic responsibilities. Provided the broad criteria of the kind suggested above are satisfied, 'linguistic' States could do well in the economic field too. In

fact, the formation of culturally homogeneous States might provide some additional stimulus for economic development if it induces people to bear larger sacrifices for common benefit and to collaborate more readily with the local Government with the same object. Apart from this, the production of technical and craft books in the regional languages, which will be encouraged as a result of the establishment of "linguistic" States, will react favourably on the material progress of the people."

The conclusion is that a linguistic re-distribution of State boundaries would serve a great national purpose if the Centre, in collaboration with the States, takes adequate measures for safeguarding the national interest in economic and cultural life.

Advantages of Incorporating Bombay in Maharashtra

A preliminary clarification may be made. A linguistic State, once it is formed, will be like any other State in regard to the powers the Government has or the rights the citizens enjoy. Though initially a State is formed on the basis of the principal language spoken in its area, such a State need not be called "linguistic" all the time. In fact, even if in future the composition of language groups in the border areas or in cities like Bombay changes, there is going to be no second revision of boundaries on a language basis.

In one part, the advantages to be considered here are the advantages of including Bombay in a large State in which there are also rural areas as against incorporating the City into a separate State by itself. The advantages are social, economic and political. "As a city and the neighbouring countryside react favourably on each other in a number of ways, they should advisably be in a common political entity, the State." Conservatives should remember that a City State, which includes a large industrial population, will probably be more radical or leftist than a State which comprises both urban and rural areas. A part of the revenue raised in a city in Sales Tax goes for the development of agriculture, irrigation, etc. in rural areas. This is indeed as it should be. Under the Constitution, a State Government has important responsibilities in regard to rural life and these cannot be discharged adequately if the cities claim separate state-hoods for themselves. However well Bombay as a City State advances indus-

trially, it would do less than its duty to the country if it did not contribute to the development of surrounding rural areas.

In view of the foregoing, if the present Bombay State is to be broken up into separate States of Maharashtra, Gujarat and Karnatak, it is desirable to assign the City to any of the new States rather than make it into a separate State by itself. As between Maharashtra, Gujarat and Karnatak, the City would more easily go to the first-named for two reasons:

- (i) The City is contiguous to Marathi speaking areas on the mainland.
- (ii) The largest single language group in the City is Marathi. According to the Census of 1951, out of the total population of 2.8 million in Greater Bombay, the mother tongue of 1.2 million is Marathi. Gujarati, the next largest language group, is spoken by only half a million.

"New Look" for Bombay

Bombay City as the capital of Maharashtra would be a little different from what it is now, but it would be different in a constructive sense. It would make a more conscious and purposive contribution to the development of the culture and the economy of Maharashtra. Non-Maharashtrians might come to know Maharashtra a little better and the proportion of them having some knowledge of Marathi may increase. But there should not be any fewer opportunities for the development of other cultures on the basis of mutual respect. The Maharashtrians in the City are keenly conscious of the desirability of the City proving to be a generous host to people coming from different parts of India, both in the North and in the South, and from other countries.

If Bombay is made a separate City State, then too the City would tend to be different from the city as we know it to-day. As a wholly urban area catering solely to its own requirements, the City might acquire some charms of Hongkong. But Hongkong, which is the melting pot of the cultures of every nation in the world, has no constructive side of its own. The direction which Bombay as the capital of Maharashtra will take will be more constructive. Bombay will still remain a city belonging to India or in fact an international city, but it will have something of its own just as Paris, which is very much a world-city, is still a French city.

Are you coming by Air-India International

or going country bus?

By air or by road, you travel by oil. Oil in the form of fuel, oil in the form of lubricants.

If you take a tonga after dark there is oil (or there should be) in the lamps.

Just about the only way to travel without relying on oil is on horseback. Even then it's all Chowringhee to Colaba that some part of your kit—your breeches or spurs—was manufactured with the help of oil.

You even travel *on* oil; for bitumen, a product of refining process, is widely used for road surfacing.

When you put out to sea you'll find oil ruling the waves from the engine room.

Aircraft in India, both jet and piston-engined, use the Burmah-Shell Aviation Service; private cars and public transport use fuel and lubricants supplied by Burmah-Shell. We oil the wheels in textiles and in the iron and steel industry. We supply bitumen for roads. In every major Indian port there is on tap the Bunkering Service operated by Burmah-Shell. Who says we're not—

IN INDIA'S LIFE AND PART OF IT

Conjuncture

Wednesday Evening

REASONS which started the fall in equities some days ago were interesting. Tata Steel began falling on reports that America would reduce aid to India next year because of India's economic flirtations with Russia. New Delhi's refusal to sanction the issue of new shares by Tata Steel at par was a contributory factor. As Tata Steel fell, Indian Iron dropped. Set-back in Indian Iron had sympathetic effect on speculative scrips here. As Indian Iron and speculative scrips dropped, equities in general were affected.

Market operators were not alone in anticipating that Washington might react adversely to the economic outcome of the Russian leaders' visit to this country. Some of the agency messages seemed to confirm these apprehensions. Mr. Dulles has, subsequently, tried to remove such fears. But there are still doubts whether the American Congress will vote the larger appropriations that are now being made by Washington for aid to Asia and the "Middle East".

Fears

Behind these fears and the consequent fall in equities lie deeper influences. Stock markets seem apprehensive that New Delhi's open-door policy to Russia may alienate the Western Powers. This is a modified version of some theories current in Washington that India has aligned herself with the Communist bloc. This is, of course, nonsense. Soon, the stock market should realise that such fears are baseless. But it is not without significance that Pandit Nehru has found it necessary to reassure those who are in need of any such assurance that India's friendship with Russia does not mean that she has enmity towards America or Britain or any other nation.

Apart from these wider political issues, there is another factor which has been responsible, to some extent, for the fall in Iron and Steel shares. These shares were moving up until recently owing to, among other reasons, the developing steel shortage. Recently, control on steel was reimposed. Efforts made by New Delhi to ensure imports of steel from Britain and America were not very successful. In the circumstances, it was diplomatic of Russia to

offer one million tons of steel in the next three years. This will not solve the problem of steel shortage. But it is not difficult to understand how such an offer can have a temporary 'bearish' effect on the existing Iron and Steel shares.

Russian Steel

Such short-term effects on stock markets cannot be avoided. But the Russian steel agreement will be welcomed on wider grounds. It is evident that, beyond a certain level, steel shortage can slow down economic activity. Supplies of one million tons of steel by Russia in the next three years will partially help to relieve steel shortage. This is the immediate, and welcome, outcome of the Russian leaders' visit to this country. Irrespective of the speculators' immediate reaction, the Russian steel agreement is a decided gain.

New Delhi's refusal to permit issues of new shares at par is another reason for the fall in Tata Steel. In recent months, many companies have issued right or bonus shares at substantial premia. In comparison with these companies, Tata Steel's current position and future prospects are much more bright. That Government's insistence may cool the ardour of speculators, is understandable. But reports, if true, that the Company is in favour of issuing new shares at par only will cause surprise. Tata Steel Company is one of the few concerns which should be able to issue new shares at premium in order to facilitate the financing of expansion projects.

Technical Factors

These wider issues combined with the vulnerable technical position to cause a landslide in Tata Steels. Set-back in Indian Iron was a sympathetic movement. But it is of interest to note that, in the immediately preceding settlement for Tata Steels, deliveries were heavy. In Indian Iron, the technical situation has been vulnerable for some months past. Has the recent shake-out improved the technical position? No doubt, the situation is now healthier. But the position still remains weak, although the present holders have, admittedly, holding capacity. Weak bulls have been eliminated.

But the bull position in Iron and Steel shares still persists.

IJMA'S decision to unseal 2½ per cent. of the sealed looms had a steadying effect on Jute shares initially. But the set-back in Indian Iron and the continued weakness in Coal shares halted the rising trend in Jute shares before it could gather momentum. There are other reasons why Jute shares have not developed a confidently upward trend. Relative price movements in raw jute and jute goods indicate that simultaneous business is still not quite profitable. Current reports of jute companies confirm this apprehension.

IJMA Decision

Since the release of end-October stocks of jute goods with mills there have been talks about the unsealing of looms. End-November data of mill stocks showed a slight increase in stocks of heavy goods and a small fall in stocks of hesian. Even so, expectations that sealed looms would be unsealed persisted. At present, 12½ per cent. of the looms are unsealed. That only 2½ per cent. of the sealed looms are to be unsealed, is interpreted by the market to mean that exports and sales are not so encouraging as to permit the unsealing of a larger percentage of sealed looms.

Tea shares continue to be in the doldrums. Auction prices are still falling. So are Tea shares. It is clear that the tea industry has become a prince or pauper industry. In 1954, the tea industry was booming. In 1955, it is slumping. Such rapid changes in the fortunes of this industry underline the delicate balance between the world supply and demand position in tea. There are some who doubt whether world demand for tea is likely to improve much. That being so, it is clear that the adjustment may have to be effected on the supply side. Here is the trouble. Despite declining world demand, exporting countries are producing more.

When Indian Iron and Coal shares fail to impart strength to the market, it is not difficult to appreciate why Paper shares also lose ground. This is what is known as the incidental consequences of conjunctural market influences. But

investors can draw some solace from the fact that the fall in Paper shares has been negligible. Paper shares are not likely to move up unless the market as a whole resumes the upward trend. But it would be hasty to sell out Paper shares or Miscellaneous and Engine-

ering shares. These latter groups of shares are also off colour at the moment. But it is symbolic of the strength of these shares that investors have not lost confidence in these equities.

Soon, the market will be closed for Christmas holidays. As January

approaches, budget factors will start influencing equity movements. Market circles are now arguing that, for the next one or two months, the stock market may remain hesitant. This is not an unreasonable assumption. Stock markets, if not history, have a habit of repeating themselves.

PROGRESS OF THE PLAN No. 2

ON THE FOOD FRONT

One of the major achievements of the Plan has been on the food front. When we started on the Plan there was an acute food shortage in the country. The Plan set a target of 76 lakh tons increase in production of foodgrains by the end of 1956. Within three years we had exceeded the target with 114 lakh tons of additional foodgrains. The progress has been kept up during 1954-55 and the additional food production has increased by another 2 lakh tons.

This notable success has been due to the Grow More Food campaign, good monsoons, improved methods of farming and greater facilities for irrigation. Vast areas of land have been reclaimed, canals have been dug, wells have been sunk and all restrictions on food, like rationing, have been removed.

*The People's plan
FOR THE People's welfare*

DA-55/117

Around Bombay Markets

Becoming Yield Conscious?

Thursday, Morning

DALAL Street opened pretty firm, and despite higher budla charges, bulls were active. It took hardly any notice of the Finance Minister's warning that the implementation of the Second Plan might involve additional taxation and a drastic cut in consumption. Towards the close of the week, however, activity dwindled. The enthusiasm of the bulls earlier in the week is to be explained mainly by such favourable factors as the encouraging advices from the cotton and textile markets, revised profit estimates of some mills in the light of their current year's performance, hopes of early relaxation of control on the production of cloth and finally, reports about modifications in the Electricity Bill. As a result, there was concentrated speculative activity in a number of miscellaneous industrials, and share values were taken up to heights which bore no relation to yields.

An anomalous situation has arisen in which many shares are quoting on a 3 to 3½ per cent tax-free basis, at a time when one can get a yield of 4 per cent taxable in the case of Government securities (3 per cent, if it is tax-free) and an yield of 3.75 per cent tax-free in the case of first class Debentures like Standard Vacuum, Burmah-Shell or Caltex 5¼ per cent issues. It is not unlikely that bulls would soon get wise and start selling out. In fact, towards the close of the week, something like this happened when steel shares faltered, spreading a bearish wave all round. What brought about the decline in Tata Steel shares was the fresh uncertainty about the new issue of steel shares. One version is that the shares will be issued at par in the proportion of 3 shares to 2 held, another being that the new issue will be one for one at par or at Rs. 25/- premium. As yet, no confirmation is available. The week closed on a distinct bearish note and most of the scrips slipped back from the rates touched earlier in the week.

Tata Steel opened around Rs. 270-8 and after moving up to Rs. 272 on active bull support, reacted sharply to Rs. 266. Although subsequently, there were signs of improvement, in the general liquidation that followed, even this level could not be sustained and the price dropped to

the lowest level of the week at Rs. 260. Closing was, however, higher at Rs. 263-0 against Rs. 268-8, last week.

Excellent reports of working of some mills helped a good many textile scrips to record substantial appreciation in values. Century and Finlay which rose as high as Rs. 528 and Rs. 372 respectively, were particularly bright. When there was heavy liquidation in steels towards the close, textile scrips also declined in sympathy, Bombay Dyeing, Century, Finlay and Central India recording the lowest levels of the week at Rs. 572-12, Rs. 511, Rs. 350 and Rs. 163 respectively.

There was revival of interest in select scrips in the miscellaneous section, with A C C providing the centre of attraction. Opening at Rs. 228-12, ACC went up to Rs. 233

popular, with Walchandnagar in the lead rising to Rs. 265-10. Belapur and Phaltan were not far behind at Rs. 373-8 and Rs. 261-0 respectively, the highest touched during the week; but they closed lower at Rs. 367-8 and Rs. 256.4 respectively.

Cotton

Firm Undertone

THE undertone of the cotton futures market remained firm throughout the week under review despite occasional setbacks. Opening at Rs. 721, the ICC February contract rose sharply by 24 points to touch a new peak at Rs. 745 on Wednesday. The factor which helped to maintain this bullish undertone was the well-founded apprehension of a scarcity of cotton to be tendered against the ruling contract. In fact, this fear weighed so much with the market that even a threat from the

Minister of Commerce and Industry at Government might be obliged to take measures to cry a halt to an undue speculative rise in prices, which has been characteristic of the market for some time now, failed to reverse the trend, at any rate, not for long. Bull operators argue that as long as there is paucity of tenurable cotton, the rising trend cannot be halted. They drew further encouragement from the reported assurance given towards the close of the week by the Union Minister that there was no need for cotton interests to be perturbed over the scheduled disposal of US surplus cotton. In the event, cotton futures edged ahead.

There was moderate activity in the spot market at Sewri during the week. There were sustained enquiries for African cotton, in which business on a modest scale was reported almost every day, by both Bombay and Ahmedabad mills.

Some changes have been made in the distribution of export licences for Red Cocanada, which were intended to be given on the basis of first-come first-served. From a notification issued by the Deputy Chief Controller of Exports, Madras, it now appears that the quota for 5000 bales of Red Cocanada is open for fresh distribution among shippers who can produce evidence of firm sale. The reallocation of this quota against proof of firm sale has been welcomed by shippers who have always commended this procedure as the soundest and best workable.

Bullion

Bearish Trend

THE forward market in bullion opened on a bright note, under the stimulus of encouraging advices from the share and the oilseeds markets, weakened as the week progressed and both gold and silver closed with sizeable losses. There was, in the initial stages, some buying by outside interests, particularly of gold, and effect was enhanced by the application of Teji option. There was also a distinct improvement in gold offtake in the spot market early in the week. This improvement was not, however, shared by silver which suffered from discouraging advices from Calcutta.

Gold had a setback in midweek on selling by outside interests who had earlier extended their support. The bearish trend was further aggravated by persistent weakness in equities. Besides, the spot section had to face a selling wave. On Monday, follow-

ing reports of larger arrivals of gold, sellers predominated. In sympathy, silver also drifted lower but the extent of decline was not as pronounced as in gold, for arrivals in silver were comparatively small and offtake continued to be steady. Although gold opened weak on Tuesday due to long liquidation, it moved up later on support from Delhi traders.

Oilseeds

Sustained Demand

THE oilseeds market continued to rule firm, gains in groundnuts being particularly handsome. The downward revision of crop estimates, scarce arrivals in terminal markets and sustained demand from crushers and vanaspati dealers helped to maintain the firm trend noticed during the previous week. Trade estimates place the groundnut crop at around 20 lakh tons as against 22 lakh tons estimated earlier. The Madras groundnut crop does not seem to have suffered much but arrivals from Hyderabad and Khadesh have been alarmingly small. What little arrived from Saurashtra and Maharashtra was quickly absorbed. In the event, prices were naturally firm. Madras is reported to have sold about 6000 tons of hand-picked groundnuts to UK at around £82 per ton while Canada was reported to have bought large quantities at around £86 per ton. Most of the export quotas granted to exporters and co-operatives have been exhausted in the process.

The announcement of an export quota for castor oil has been long overdue. Free export licensing expires at the end of this month and trade circles feel that it is high time that the authorities came out with an announcement in this regard before it is too late. Castor is a non-edible oil. It has established itself as a good foreign exchange earner, especially of dollars. There is no reason why the release of a further export quota should be delayed.

Groundnut ready quality opened at Rs 26-4 and steadily moved up to week's peak of Rs 28-12 from the closing level of only Rs 26-4 at the end of last week.

Groundnut February-March delivery also moved up to as high as Rs 29-2 on Wednesday and closed firm at Rs 28-14.

On heavy speculative support and bear covering, castor May was pushed up to a new high level of Rs 119-8 and closed at Rs 119 as against the opening level of Rs 110-12.

Both linseed and its oil also firmed up and closed at Rs 29 and Rs 18 respectively.

(Continued from page 1508)

London, Tengku Abdul Rahman, Chief Minister of Malaya, will meet Chin Peng, the Communist Guerilla leader, for negotiations to end the emergency. Next month, the Tengku will go to London for talks on Malayan self-government. Meanwhile, the undertaking given by Sir Donald MacGillivray, the High Commissioner, that the continuance of the emergency will not postpone or delay plans for self-government of Malaya is expected to strengthen the Tengku's bargaining position in his forthcoming talks with the Malayan Communist Party. Mr Marshall is reported to be less optimistic than the Tengku that the discussions with Chin Peng will be fruitful. But developing circumstances would seem to lend weight to the assumption that the Communists in Malaya will have the sense to reach a compromise agreement so as not to delay the time table for transfer of power to Malaya.

MCP cannot be unaware that, in the absence of an agreement with the Tengku government, the alien Government will have an excuse to prolong Malaya's status as a colonial country. Sir Donald's offer is a deliberate device to enable the Tengku government to dictate terms to MCP. It would be unfortunate if the Tengku falls into such a trap. Both the Tengku government and MCP want independence for Malaya. They have a common interest in reaching a compromise arrangement. Thus alone can the transfer of power to Malaya be effected according to schedule.

Singapore's political progress is seemingly less rapid than that of the Malayan Federation. Mr Marshall was recently in London not for negotiations on self-government, but to fix an agenda for all-party talks in April next. Mr Marshall wants control over all affairs except foreign affairs and defence by 1957. At Singapore, Britain still has a major naval base in Asia. Importance of Ceylon and Singapore as naval bases is beyond dispute. If Ceylon could become an independent country, there is no reason why Singapore cannot attain a similar status. To Britain, naval bases in this part of the world cannot be more significant than dollar arsenals. More relevant are the future relations between Singapore and the Malayan Federation.

Company Notes

Indian Mutual

INDIAN Mutual of Madras has been coming up, judging from its last annual report for the year ending December 31, 1954 and its valuation for the triennium ending December 31, 1953, which enabled the Association to declare a bonus of Rs 18 per thousand on Whole Life and Whole Life limited policies and Rs 15 per thousand on Endowment assurances.

The year ending December 31, 1954 was a very good year indeed for the Association during which it collected new business amounting to Rs 120 lakhs, improving upon its performance of the previous year by Rs 17.55 lakhs. Total premium income during the year increased from 23.16 lakhs in the previous year to 25.77 lakhs and the Life Assurance Fund was augmented by Rs 15.89 lakhs to Rs 1.33 lakhs. The Association's mortality experience has also been steadily improving and claims by death fell from Rs 2.08 lakhs in 1953 to Rs 1.69 lakhs in 1954.

Lucrative Investments

The comparatively high net yield it could secure on investments is another creditable achievement of the management, considering that more than 65 per cent of the funds were invested in Government and approved securities. The net yield was maintained at 4.3 per cent to which it had risen in 1953, from 3.9 per cent in the previous year. The Directors expect further improvement in the future. For this, presumably, they must be looking to their investments outside Government and approved securities which account for 27.1 per cent of the assets, which are distributed between mortgages on properties, loans against surrender value of policies and house property.

Renewal expense ratio which had risen to 16.83 per cent in 1952 was subsequently brought down to 16.16 per cent in 1953; however, it rose slightly to 16.5 per cent in 1954.

The Association took over during the year the Life business of the Associated Assurance Ltd., of Nagpur. This was done with the approval of the Controller of Insurance and on the basis of valuation by the Association's own actuary and that of an independent actuary. The total liabilities of the business transferred amounting to Rs 1.13 lakhs was covered by assets of equal value in Government securities and other investments.

I never realised flying overnight saves so much money!

Time really is money to me. I can't afford to waste valuable working hours. That's why I chose IAC's night service. But I never realised how many other expenses it would save

Travel to and from the airport costs nothing! An IAC luxury coach takes you both ways — so comfortable, quick and convenient

Airport staff take charge of your luggage, put it on the plane, load it on the coach when you arrive — there's nothing to pay

During the journey you are IAC's guest. And what a fine breakfast they give you at the airport — no extra charge, of course

After breakfast, you step straight into your connecting plane. No overnight stops — so you spend nothing on accommodation!

Now fly overnight by luxurious 4-engined Skymasters

New luxurious Skymaster services connect Bombay, Delhi, Madras, Nagpur and Calcutta. Carefully scheduled to connect with 34 early morning flights from the 5 great airports, Skymaster service cuts out irritating overnight stops, saves all unnecessary expense on the way!

For details contact an I.A.C. booking office or your Travel Agent.
