THE exhaustive figures of industrial output released in the Report of the Ministry of Commerce and Industry for 1954-55 show a substantial increase in production during 1954. The improvement in industrial production in 1953 over the previous year was also substantial, but it had been accompanied by definite contraction in a large number of industries. There were few industries which did not show an improvement in 1954. The year could be described as one of consolidation. Of the 56 engineering industries which recorded increases in production, in most cases the increase was due to better utilisation of capacity rather than installation of new capacity. The resultant higher ratio of output to capacity is naturally welcome, since low utilisation of capacity is a national waste. It was pointed out last year, that the position might not be as bad as it appeared from the published data in view of the known tendency of certain industries to inflate their rated capacities. Unless an independent authority was to judge capacity, little reliance could be placed on these figures. That the figures can be misleading in the opposite direction is evidenced by production trends in certain industries. In the case of wood screws for instance, while capacity declined from 4,636.1 thousand gross in 1953 to 4,496.0 thousand gross in 1954 due to elimination of one unit, output expanded from 2,571.7 thousand gross to 5,098.4 thousand gross. Actual production in 1954 was thus more than capacity as several units worked two shifts. But why should not many more units work two or even three shifts, given our shortage of capital? The question is pertinent and it puts an entirely different complexion on the picture of utilisation of capacity that emerges

from the published figures. It is one more reason, if one were needed, why estimate of capacity should be made on a more firm basis so that it may become a useful, instead of a purely ornamental, figure.

The Ministry Report points out that, "several industries including sewing machines, ball bearings, hurricane lanterns, textile draw frames, tools, rubber belting, wood screws and power transformers actually worked extra shifts." These are all light engineering industries, some of which find export markets. Demand obviously played a major part in determining the level of output in most of them as there were no serious bottlenecks operating on the side of production. For most of the industries listed above, output was higher than capacity, while in some of the others, obviously inadequate demand has prevented output from exceeding capacity, though it is still fairly high.

Among the mechanical engineering industries, the performance of sewing machines stands out. This is a case, unfortunately not too frequent, where the "infant industry" argument in favour of protection has been justified. Within a matter of years, the industry has been able to stand on its own feet, protection has been withdrawn and the output during 1954 was at the level of 80,000 units, almost 200 per cent of the industry's rated 'capacity' whatever the latter might mean. Among other industries that have exceeded capacity in this group are hurricane lanterns and ball bearings. The latter was the only industry in 1953 to show an output more than capacity and in 1954, it has exceeded last year's figure by over 50,000. Another industry in this group which has made substantial progress is bicycles. Output rose from 264,000 in 1953 to 350,000 in 1954, which is nearly 85 per cent of capacity.

Though not outstanding, the recovery in the production of agricultural implements, which showed a sharp decline in 1953, from 8,046 tons to 12,010 tons is notable. This is still, however, less than 50 per cent of capacity, a fact which should occasion considerable thought. For most industries in the group of mechanical engineering, the number of units has not changed, yet an increase in capacity has taken place in some, reflecting a tendency towards expansion of existing units. That new units were not being established though the existing units found it possible to expand their capacity suggests an intriguing situation. It would be too hasty to read in it the operation of the law of the survival of the fittest. A possible explanation might be that new units were kept away by the general belief that

production was falling or at any rate, that only a small proportion of total capacity was being utilised though in particular industries, expansion was stimulated by rising demand or the profitability of production even at low levels or merely by changes in import licensing policy. Such an expansion of capacity without change in the number of firms is seen in umbrella ribs where capacity rose from 165,000 to 360,000 doz sets and production from 150,937 to 246,646 doz sets. Welding electrodes also reflect a similar situation. In both cases, output expanded simultaneously with capacity, in the case of umbrella ribs less than proportionately, but in the case of welding electrodes much more than proportionately.

Other industries in this group showed only a small increase in output. Their slow rate of expansion should be a matter of concern in view of the more favourable conditions prevailing during the year, whether of demand or of raw material supply and transport. Industries which registered a fall in output were clocks, shafting and steel structures. As in all these cases, output also formed a very small proportion of capacity, an investigation by the Development Wing of the Ministry of Commerce and Industry into the conditions of their working would seem to be called for. It would not be too much, indeed, to expect from the Development Wing case studies of some of the 'successful' industries like sewing machines, ball bearings and bicycles as well as of the obvious failures like clocks, shafting and structures. Such studies should throw considerable light on the structural problem of industrial development being faced by the country.

In the group of machinery, the production of textile machinery including ring frames, carding engines, bleaching, dyeing and finishing machinery recorded an increase. Of these, the output of carding engines actually doubled. How industrial policy reacts on industrial development is well illustrated by the position of automatic looms. There was a slight fall in their production "on account of the present restrictions on the installation of new automatic looms". The position of this industry illustrates the loose ends that will have to be taken care of when all out emphasis is put on the development of

heavy industry and machinery-manufacturing industries in the country, and a general ban is placed on the development of organised consumers' goods industries. Replacement demand from existing large-scale consumer industries will not be adequate to sustain machinery-manufacturing industry in all cases where such industries have already developed within the country.

Production capacity of automobiles has been deflated as a result of the Tariff Commission probe, from 84,000 in 1953 to 40,000 in 1954. The latter, we are told, is the capacity for production, not

for assembly and is made up of the manufacturing capacity of the six firms whose schemes for the progressive manufacture of automobiles have been sanctioned by the Government. No attempt, however, has been made to distinguish production from assembly either for actual production in 1954 or in the rated capacity for earlier years with the result that comparability has been lost but confusion persists. Production for the last three years was 15,300, 13,926 and 14,462 but even the last figure, for 1954, is not for production alone, but also includes assembly. A note adds that "the production of automobiles in 1954 showed a slight decline from that

Patent Everbright Steel Rs. 185

in 1953". Industries ancillary to automobiles all show an improvement in production, without any change in capacity. This is particularly striking for spark plugs, the output of which rose from about 24 thousand to over 112 thousand.

The explanatory note on diesel engines given in this year's report shows how misleading the bare figures published annually can be. Only eight of the 15 units mentioned for 1953 were actually in production during that year and output was only a fraction of capacity. The picture is not as bad as it appeared to be from the figure published last year. In 1954, production has expanded sharply and there may be some hope that the upward trend will be maintained. Fuel Injection Pumps went into production only in June 1954.

Yet, actual output was 3,938 against capacity of 4,500, a creditable achievement if the figures can be taken at their face value.

The electrical industries "had a good year in 1954 in contrast to the fall in production recorded by it in 1953". Bare copper conductors and domestic refrigerators, however, suffered a decline in output. The production of gramophones, the fall in which had attracted attention last year as a possible indicator of economic trends, has shown a recovery though output is still only about 25 per cent of capacity. Among the metallurgical industries 13 of the major items listed showed increases in production and only three experienced a decline. Output of antimony which is manufactured from imported ore quadrupled in 1954

compared with 1953. Production of 97 items recorded under chemical industries registered increases. Sulphuric acid and caustic soda reached new highs and production of soda ash declined because one of the units was closed for six months for installation of new plant and equipment. Significant increases are recorded in production of bichromates, zinc chloride, copper sulphate and hydroquinone. The expansion in the production of fertilisers at Sindri has been widely advertised. Output increased both of superphosphate and ammonium sulphate, the former having doubled. Ceramics, glassware, plastics, paints, and all the other groups of chemical industries showed a rising trend. The general trend indicated by the published figures is undoubtedly welcome but the weak spots must be discovered and eliminated.

Weekly Notes

Pakistan Imbroglio

THE two wings of Pakistan do not move together; they go their own separate ways. While West Pakistan passes from crisis to crisis, the eastern wing is getting deeper and deeper into continuing economic depression. In the last fortnight following the Federal Court decision that the dissolution of the Constituent Assembly could not be challenged through a writ issued by the Sind Supreme Court for the technical reason that the authority given to such Courts had not received the Governor-General's consent, there has been a furious spate of emergency legislation. That the only non-Muslim judge on the Federal Bench, an Englishman, dissented, may be noted in passing but it would serve no purpose to call into question the fairness of that judgment, for the simple reason that the restoration of the Constituent Assembly—irremovable and unrepresentative—would not have made things any better.

The result of a favourable judgment has been the inauguration of an Ordinance Raj and what is euphemistically called emergency legislation, continuing the legal fiction invented in the British days. There is one difference, however, in that the British Governor-General was subject to the control of Parliament through the Secretary of

State; Ghulam Mohammed need look to no one else. The zonal scheme which has long been brewing has been made into a reality by a stroke of his pen. Those in India who have been watching these developments in the neighbouring dominion with increasing anxiety have not all been able to draw comfort from the appointment of Dr Khan Sahib as the Chief Minister by the issue of an ordinance with immediate effect. "A good man gone wrong", "Meeting opposition half way by taking the wind out of the sail of Paktoonistan agitation", these are the usual public reactions. What spoils this pretty picture is the opposition of the Frontier Gandhi to this integration of the West, even though his own brother has been appointed as the Chief Minister to it. Pathans can neither be bought over so easily nor can opposition be quelled by emergency legislation. As a set-off to this spate of emergency legislation, there is the promise of general elections to be held in a year or so, but to those at all familiar with the political situation, this concession to democracy will carry little conviction and bring even less comfort.

East Pakistan which had the benefit of a general election only a year ago has fared no better. The fresh efflux of refugees from it poses a problem for India of a different nature from that posed by the poli-

tical convulsions in the West. In neither wing, however, is propaganda being directly aimed against India. To soften internal dissensions, feeling is being whipped up, instead, against Afghanistan and American aid remains the only prop to support the present regime.

In his speech while presenting the budget to a press conference, the Pakistan Finance Minister recounted Pakistan's achievements in the economic sphere, of the growing self-sufficiency in cloth, paper, cement and shoes, of the progress in the manufacture of woollen goods and sugar, and announced a large allocation for development in the next year. If the economic situation thus presented conforms to reality, how explain the growing depression in East Bengal which more than anything else is driving the Hindus to seek a living elsewhere? In the chronically strained relations with India there are occasional breaks or hopes of lessening tension. A recent instance was the agreement reached on transit trade between the two parts of West Bengal, now separated, through Pakistan. There are proposals every now and then that the two Prime Ministers should meet. But who should meet whom, who can speak for Pakistan today? The vacuum widens and it bodes no good for any country to have such a vacuum right across its border.

New Industrial Capacity

THOUGH no substantial increase in industrial capacity was recorded during 1954, many plans for expansion were submitted to the Ministry of Commerce and Industry and obtained its sanction. Licences were also issued during the year for starting a number of new industries or widening the range of products in existing industries. A glance at the Appendix to the Ministry Report which lists the licences issued will show how diverse is the structure of industries going to be. Among these the most striking ones are for the sugar industry for which 23 new units have been sanctioned, 12 in Bombay, two in Madras, one on Mysore, two in Hyderabad and two in Andhra. UP and Bihar have not been given any new licences though 16 sugar mills in UP, but only one in Bihar, have been given permission to expand. It looks like an afterthought that the possibility of manufacturing sugar machinery within the country should be considered after all these licences have been given. Manufacture of jute machinery has also been under consideration though no expansion of capacity in the jute industry has been applied for or sanctioned except for 300 looms for a jute mill in Assam. In cotton textiles, expansion has been licensed only for spindles though looms and printed cloth are

also mentioned, but amounts are only nominal. The expansion contemplated in this section is largely art silk and staple fibres. Automobile parts, cement, dyestuff and heavy chemicals as well as pharmaceuticals and drugs and electrical machinery figure prominently among the new licences issued. So does expansion in paper industry. In bicycles half a dozen new units have been licensed and expansion sanctioned in the same number for existing units. Sewing machines have two new comers.

Loose ends in industrial policy appear as much in the new licences issued as elsewhere. Glass and ceramics, not only for industrial uses but also crystal glassware and artistic glass figure among the licences. So does soap and other toilet goods. It will be some time before these loose ends left in the first plan period are tied up. One should be prepared to find them in the next year's report also. But some order should emerge gradually, if the talk now in the air of setting up a proper structure of industry in the Second Plan does not end up in some pigeonhole. An examination of the new industries licensed during the year do not show unity of approach.

Genie that brought back TTK

THE poor Minister of Production was heckled in Parliament as

no other Cabinet Minister has been heckled for quite a long time, and for no fault of his. Shri K C Reddy is the Minister of Production alright. But the big decisions do not rest with him. That drive and energy are not his strong points is not relevant in the present context. He is one of those who chooses to stand and wait; for they also serve, who stand and wait. Though directed at him in the first instance, it is not Shri Reddy who was the target of attack. The vehemence with which Parliament attacked the transfer to the Ministry of Commerce and Industry what it thought to be the legitimate function of the Ministry of Production left no room for doubt that it resents that the latter should be given so much say in the matter.

When the Cabinet itself does not co-ordinate, the problem of co-ordination has to be resolved by individual ministries. This is effected through a method of grab and hold as you can, though in this particular issue logic is as much on the side of TTK. After all, if he is to be responsible for the industrial policy of the Government, how can he be left out from such important decisions as the expansion of the steel industry, though the latter happens to fall in the public sector? To whichever sector an industrial undertaking may fall, it is the ministry primarily responsible, as in the

present case the Ministry of Commerce and Industry obviously is, for maintaining supplies, that has to look after it. What the Parliament seemed to resent most was not that there should be logic in industrial policy, but that it should be at the cost of powers and privileges of the Production Ministry. Shri Reddy, defending his own self-abnegation, was both generous and honest but, nevertheless, cut a very sorry figure in that role. The basis of division of powers and responsibilities between the two ministries was the issue. The Production Minister's defence that no rigid line could be drawn and that the guiding factor has to be convenience, provoked the question "Whose convenience". To this, the Production Minister had no ready reply.

Logic, however, is a two-sided weapon and cuts both ways. If, after Avadi, as the Prime Minister is believed to have put forward himself, the public sector is to be increasingly more important, logic also demands that the Production Ministry has to be strengthened and its sphere of operations gradually expanded, not curbed. It has to be the focal point of attention, as representing the public sector. In the eyes of the public it is not so and after the shown down in Parliament, surely the Production Ministry will not appear in any brighter light.

What happened to the Commerce Minister's irrevocable decision to quit? True, he returned very quietly to Delhi and resumed his duties without much ado, as if nothing had happened in the meanwhile and business was going on as usual. On the other hand, TTK returns triumphant. Though his "irrevocable" decision to resign has been altered, he comes back with flying colours having won every single point on which he had occasion for dispute. How could he get round Pandit Nehru's objection to handing over steel to him, thus undermining the public sector and lowering its prestige in the public eye after the Avadi resolution is anybody's guess. No one would attribute it either to the Commerce Minister's hold on the country or to his strong following in Parliament. What was it, then, that worked the trick? The south is a factor to be contended with in the deliberations at New Delhi. But it is a disturbing thought that what lies beyond the Vindhyas might still be forgotten had it not

been for its potential nuisance value, such for instance as lies in its ability to raise hell over the question of compulsory Hindi. Dravida Kazhakam has been in this case a good genie, even though it has backed up a Brahmin in the process.

Asian Conference—Delhi and Bandung

Our Delhi Correspondent writes:

AS this is being written, an Asian Conference has begun at New Delhi. There appears to be a lot of confusion about this conference and the Afro-Asian Conference to be held in Indonesia about the middle of this month. The two conferences are really distinct. This is a non-party or all-party 'private' conference of all Asian countries, including the Soviet Union. It has been sponsored, not by the Government of India, but by political parties—the Congress, the Praja Socialist and the Communist Party. The delegates have been selected on a non-party basis and include representatives of industry, art, science, etc. It is quite different from the mainly political governmental conference, which is to meet at Bandung in Indonesia, with the primary purpose of liquidating colonialism in Asia. But the general philosophy is the same. Pandit Nehru is trying to bring together the peoples of Asia and probably his mind is playing with the idea of a confederation of Asian peoples with foreign policy as the principal function of a common Government for Asia.

It is a curious coincidence that when the United Nations was being formed, Churchill said that real international organisation would, in his opinion, begin with a Council of Europe and a Council of Asia! Little did he know then that he would retire before the first could be formed and the second would be brought about through the instrumentality of a man, whom he described, at the time, when the House of Commons was debating the India Independence Bill moved by Attlee, as "a man of Straw!"

SILENT REVOLUTION

Forged by Fords, Oke by Russians

A TEAM of eminent economists and statisticians from the Soviet Union visited Nilokheri township and the community development centres yesterday. The party included Professor Degtyar of

Moscow University, Mrs Rubinstein, a prominent social worker from Russia, Prof Rubinstein and Prof Pisarev.

The visitors were taken round the extension training centre, the social education organisers' training centre and the block development officers' training centre. They also visited Butana, a village, where they saw the community centre and also inspected water supply and sanitary arrangements.

Giving his impressions, Prof Degtyar said that, through the community development programme, a correct approach had been found for the solution of India's problems of rural welfare. He added that the silent revolution which was being effected in India through the community programme reminded one of the whole process of reconstruction in Russia after the end of the Czarist rule.—*Times of India*, April 4, 1955.

Off the Record

Of Relative Prices

PRICES of manufactured goods do not move closely in correspondence with prices of raw materials or even of wages. The conditions of supply of manufactured goods are not the same as those of agricultural produce. The relation between different groups of prices is complex and not the same factors operate in each case, the strength of the factors vary, the relative importance of the factors widely differ between short and long periods. Supply, however, is usually more elastic in the case of manufactures in that it is more amenable to control and manufacturers are usually able to avail themselves of this advantage, subject to such restraints as are imposed by the presence of idle capacity, higher wear and tear of machinery when plant is worked more intensively in peak periods and so on. There are, also, various degrees of market imperfections.

The disparate movements in the prices of manufactures as compared to those of raw materials and food-stuffs after agricultural prices began to fall has attracted much attention of late but the question posed by the complete insensitivity of the prices of manufactures, in the wholesale price index, for example, has not been satisfactorily answered. Taking the Economic Adviser's index, while prices of food articles have fallen by nearly 20 per cent in the last twelve months and those of industrial raw materials have fallen by some 15 per cent, prices of manufactures have not fallen at all. In fact, they are a few points higher than a year ago.

True, the price index for the manufactures group has been generally sticky compared to that of other groups. When agricultural prices were shooting up in the pre-Korean years, they did not rise to the same extent. On the other hand, since the recession early in 1952, while other prices have been falling almost continuously, except for an initial decline in the first six months, prices of manufactures have shown a remarkable firmness. How is this to be explained?

Attention has sometimes been drawn to some particular factors. Industrialists of Bombay have just reason to complain that the cost of living index in this centre should

fail to reflect falling prices of food grains. But had it done so, would the prices of manufactures in this centre, of cotton textiles, for example, followed suit? There may be other factors such as export demand, which enables industry to maintain home market prices high or internal demand that is quite unaffected by the fall in money incomes in the agricultural sector which may be presumed to have taken place in consequence of falling prices. If the increase in the volume of agricultural production is compared to the fall in agricultural prices, on a very rough indication, agricultural incomes may have slightly declined rather than remained intact.

The possible effects of exports have been mentioned. To what extent import policy helps to keep up or bring down prices of manufactures is another factor which may have an important bearing on the question. But like many others, it cannot be ascertained statistically. The list of items from which the subgroup of manufactures is made up,

eg, textiles, metal products, iron and steel, machinery, shoes, etc, can give little indication, because it is not a fair sample of the supplies available for consumption in the country. In the base year to which the index continues to be linked, industry did not have the same relative importance as in the years during and after the war. Besides, the index is too heavily weighted by textile products and the manner of its construction insulates it effectively from changes in either the volume or in the value of imports.

All that has been said above would be an anti-climax, if one were to go a little further and break down the index into its several constituents. The result would be found amusing. There is much dead wood to be removed, here as elsewhere, in the Economic Adviser's index—dead as the dodo is the quotation, under vehicles, of Chevrolet 4 sedan cars, ex-plant, Bombay. General Motors have long departed. The Economic Adviser's Office may not still know but why do they tempt the irresolute

for your

CHILD'S

Welfare INSURE WITH

Branches Throughout India

by quoting whisky by the case at Rs 252 a dozen?

Taking the sub-groups, the relative movements are shown in Table I below.

Here the contrary movement of manufactures stands out, but take the group of manufactures price index by itself (see Table II on this page) together with the weights and one would not know what to make out of it. Why, then, try to build up anything on such a slender basis of facts? True, the Finance Minister may quote the index to the nearest decimal point, but such naivete—in others less eminent—it would be downright dishonesty—is the privilege only of those who take an empyrean view and frame their policies accordingly. But what are humbler folks to do? One has "gotta use words."

The less exalted, however, have more homely ways of looking at things. The statistician to the UP Government who brings out the *Review of Economic Conditions in Uttar Pradesh* is one of them. The latest issue of this publication which is for 1951 gives the index number of agricultural prices in UP from 1947 to 1951 (base: 1939=100) as also a set of index numbers for industrial wholesale prices in UP (base: 1948=100). The exact figures do not matter but the broad conclusion that emerges is that the agricultural parity price index for UP has been falling from 1949 onwards. And this leads the statistician to this comforting conclusion which is free from all statistical complexities:

"The enormous increase in the prices of industrial raw materials without corresponding increase in those of manufactured articles, shows that the industries have been handicapped by having to pay higher prices for the raw materials (and not merely for labour), on the one hand, and having to sell the finished product at comparatively low prices, on the other. The fact that prices of manufactured articles have not been allowed appreciably to rise, is also a pointer to the business community being alert in doing its bit in "holding the line" and not necessarily in charging what the traffic will bear, in the days of scarcity."

This was the situation in 1951. It will be three years hence that the current situation will be reviewed in this journal. So those who are curious, will have to wait that long to know what UP Statistical Depart-

ment thinks of the contrary movements of agricultural and industrial prices that have now come into such prominence. But there is no reason to suppose that the compiler will have to squirm or turn and twist. After all, those who had been doing their bit in "holding the line" should in all fairness be entitled to their just reward. Commenting on the relative decline in the cost of raw materials consumed by manufacturing industry and the relatively greater fall of cash crops compared to food crops, the latest issue of the *Tata Quarterly* considered it a notable result, should the data be correct, because during the regime of price controls, the incidence had generally fallen more on manufactured articles than on raw materials required for their production and more on food grains than on cash crops. The balance is now being restored. "If, therefore, prices of commodities which were for a long time subject to control have improv-

ed their relative position mainly because of a fall in prices to which controls did not extend, the policy of controls may be said to have happily vindicated itself in the end."

There is a sinister ring about this word, 'vindication'. If controls were vindicated then, does it not imply that food prices have an incipient tendency to rise in a rising market and in an accelerated fashion? And that, conversely, falling food prices, by augmenting supplies on the market, tend to bring about a further fall? After all, the improved food situation is the one asset on which we are banking on for so many things. It will not turn into a liability, even though the market process of squeezing out food from the not-too-well-fed growers were stopped, provided the incentive goods that the Government now intends to supply actually reach the cultivators and do not disappear into the bowels of others as they have done so far.

From the London End

The Economic Survey for 1955

WHEN the late Sir Stafford Cripps was Chancellor of the Exchequer, the Labour Government had thought that it would not be such a bad idea for the State to dabble in a bit of economic planning. In those years, it will be remembered, the Budget was the main instrument of economic control and direction; and each year as the Budget was about to be presented, the Chancellor issued planned targets for production, investment and exports. These targets were presented in an official document called the *Economic Survey*. With the Budget becoming less important as an instrument of State policy, the *Economic Survey* has accordingly become only an official appraisal of past developments and an indication of likely future trends.

The *Survey* which has just been published, is a cheerful document. It recalls that 1954 was a successful year for the United Kingdom. Production continued to expand; living standards rose; there was an increase in the rate of industrial investment and a high level of personal savings was maintained. In overseas trade and payments, the UK continued to earn a substantial surplus on current account in the year as a whole, and if defence aid is excluded, the surplus was of the same order as 1953. This optimistic and bright picture is unprecedented. All the previous *Surveys* were pretty grim, the periodic crises which have up to now been the feature of the British economy have usually been the main topic of analysis in the past issues. The current review certainly indicates a turn in the tide of events. True, certain pressures continue to affect the British economy but these are by no means of the dimensions of 1951 and 1952.

Four particular aspects of the economy as considered in the *Survey* call for particular comment. These relate to the growth of the real income and of its apportionment among the principal demand sectors, the course of the balance of payments, the inflationary pressures which developed, and finally, the monetary measures recently adopted to secure economic balance. The changes in gross domestic output and the manner in which it was absorbed is given in the table below.

LARGER REAL CONSUMPTION

Of the increase in total output and imports, half was due to higher consumer expenditure, one-sixth to increased investment in buildings, plant and machinery, and just under one-third to the rise in exports. Most of the rise in exports is, however, attributed to orders booked at the end of 1953 and this no doubt was an important initiating factor in the expansion of the British economy in 1954; but it was mainly due to an increase of private demand (both for consumption and investment) which kept up the rate of expansion later in the year.

The rising living standards of the British people is reflected in a 7½ per cent increase in wages and salaries—a part of this increase is due to a rise in employment but a larger part is certainly due to higher rates of pay. Total consumer expenditure rose by some £650 million, and if the 2 per cent rise in consumer goods prices is allowed for, there was a real rise of about £450 m in this demand sector.

HIGHER INVESTMENT AND EXPORTS

With the Government running a surplus of about £400 million on its accounts and the public saving over £900 million (after tax) from their disposable incomes, the country was well able to maintain a high level of investment and exports. No exact data on the level of aggregate investment is available but there is no doubt that a considerable rise over 1953 has taken place. In fixed investment alone, an increase of over £125 million is recorded. *Exports in 1954 reached their all-time peak.* In value, the rise was 4 per cent and in volume it was 6 per cent between 1953 and 1954.

BALANCE OF PAYMENTS WORSEN

The change which came over the UK's balance of payments last

autumn is brought out in the payments estimate for the second half of 1954, now published for the first time. In this period there was an overall deficit on current account of £12 million (including defence aid) compared with a surplus of £172 million in the first half of the year. Expenditure on imports had increased by £65 million between the two half-years, while export earnings had fallen by £31 million because of the dock strike. The worsening of the UK's balance of payments was entirely on the non-sterling side. The rest of the sterling areas' balance with non-sterling countries also got worse in the second half of 1954. In consequence, the sterling area as a whole had a deficit of £164 million for the rest of the year, compared with a surplus of £171 million in the first half of 1954. It is this change which explains the fall in the gold reserves and the weakening in the market quotations for sterling late in 1954 and early in 1955.

Two reasons are given for these developments: one was the increase in the volume of UK imports—in part the result of a rising level of industrial production and in consumers' demand, and in part due to special factors, including some stocking-up in anticipation of a rise in prices. The other factor was the worsening in the terms of trade. The deterioration between 1953 and 1954 was of the order of 6 per cent. In addition, the overseas sterling area's position was seriously affected by the fall in wool prices last autumn.

INFLATIONARY PRESSURES

The inflationary pressures in the economy became particularly marked in the latter half of 1954, and the *Survey* explains that these pressures were first recognised when the

Changes in Real Demand and Supplies between 1953 and 1954

£ million at 1953 factor cost

Consumption Expenditure	+390	Gross domestic product	+625
Public Authorities	— 40	Imports	+140
Gross fixed investment and increases of stocks	+175		
Exports of goods and services	+240		
Total change in demand	+765	Total change in supplies	+765

level of imports began advancing at a rate higher than that of exports. What were the causes of these pressures? The favourable advances in industrial production were being held up in the last four months of 1954 by two important sets of bottlenecks. Coal output had not kept pace with rising demand. More than that, the demand for steel was running ahead of home production in spite of the expansion of the steel-making industry in the country. Similarly the increasing demand for basic materials required by manufacturing industry in the latter half of 1954 called for a rising level of imports of non-ferrous metals and of various chemicals. This represented the first bottleneck. The supply of basic materials for the expanding output of the economy from normal sources proved to be insufficient and more imports had to be brought in. Secondly, there was the manpower problem. In 1954 civil employment rose by 1½ per cent, and the number of unfilled vacancies rose by about 30 per cent. Overtime working had to be resorted to, particularly in the metals, engineering and vehicles industries. To a large extent the difficulties experienced in finding enough labour to meet industrial requirements led to a slowing down in the rate of increase of industrial output. At the same time, however, the various demand sectors—particularly that of investment demand—were continuing at an unchanged pace. In this situation it was obvious that the imbalance would be reflected in rising prices and increased imports.

AND MEASURES TO CHECK THEM

The *Economic Survey* reviews the measures taken in February to deal with the situation. The measures were designed to moderate the expansion of home demand by restricting consumer purchases on the hire purchase system, and by making the cost of borrowing more expensive. In this way it was hoped that the demand for imports would be limited and that added encouragement to exports would be given. These measures are likely to have some dampening influence on the pace of economic expansion, but as the *Survey* remarks, "this pace must not be allowed to endanger the maintenance of a proper balance between imports and exports."

What of the future? Here also the *Economic Survey* is just as buoyant and optimistic. While

pointing out that for Britain exports remain of primary importance, it believes that the level at which the international exchange of goods and services took place in 1954 will continue in 1955. It does, however, point out that the storms which emanate periodically from across the Atlantic may jeopardise these prospects, but the experience of 1954 is not without its lessons. The "cold winds" from the United States in the first half of 1954 were countered by an intensification of Britain's trade relationships with the overseas sterling area and with Western Europe. And 1955 is likely to see the colonies among the more important of Britain's export markets.

The problem of costs remains an ever-important one. It was hoped that the rise in industrial capacity would be accompanied with more capital intensive production. In so far as modernisation has taken place, the resulting rise in productivity has helped Britain to face the competitive struggle in international markets. It is to be noted, however, that a not inconsiderable proportion of current investment expenditure is going, not towards the modernisation of industrial technique, but rather towards increasing industrial capacity. In so far as this has taken place, the problem of costs is likely to remain.

UK's Balance of Payments on Current Account (£ million)

	1953	1954 1st half	2nd half	Year

Wage Differentials and the Standard of Living in Malaya

(From Our Malayan Correspondent)

ONE of the interesting side-lights on the Malayan economy is the marked variation in wages and the standard of living of the various communities in the Federation. Both vary markedly as between communities. These differences in the standard of living are reflected in wage differentials on the free labour market.

In the vegetable farming community of Teochiu Chinese among whom I am living, there are three different rates of wages paid to labourers from outside. At the top of the scale are the Chinese who are paid \$8 for a male, (\$1M = about Re 1-9 as in Indian currency) per day *plus* meals. An Indian Tamil recruited from a nearby village is never paid more than \$5 a day and is given his midday meal if he likes to have it. A Malay labourer is never paid more than \$3 a day. When the Chinese employer was asked why he discriminated in this fashion, he said that since the Chinese do more work, they should be paid more. Chinese are invariably employed to dig the ground for the new vegetables, a tough job. Indians are sometimes employed for this purpose and also to cut the thick *lallang* grass which grows quickly on unused ground. Malays are engaged only to clear grass and, whenever possible, they are employed on a contract on so much money per square yard of grass cleared.

WAGE DIFFERENTIALS IN PADDY CULTIVATION

In a neighbouring Chinese rice-growing community, where there is always a shortage of labour in the reaping season, the rates of pay are as follows:

- Malay women who cut the grain From \$1.30 to \$1.50 per day
- Chinese women who cut the grain From \$1.50 to \$1.80 per day
- Malay men, one of whom always accompanies the Malay women, \$3 per day
- Chinese men for beating the rice Never less than \$6 a day *plus* food
- Chinese men on contract \$1.25 per *dan* of rice, if they also reap; 60c per *dan* if employer provides reapers

Malay men on contract 10c to 15c per *dan* less than above.

These are the rates paid by Chinese employers of labour, not on the grounds of racial discrimination but on the grounds of their relative quota of work.

In business a similar system of racial wage differences is universal. A nearby Chinese owner of a chain of picture houses employs only Indians on his staff as the work is easy and does not require much labour. Many of his employees receive only \$60 a month. On the other hand, there are very few Indian businessmen who employ any Chinese. Few Indians operate any large businesses requiring a large amount of physical labour such as tin mines, transport or rice and tobacco plantations. Rubber estates in the Federation employ both Indian and Chinese labourers but rarely do Indians and Chinese work on the same estate. A lot of rubber estates are worked on a contract basis according to which the more rubber trees are worked the higher the rate.

NONE IN GOVERNMENT JOBS

The Government, on the other hand, cannot have different rates of wages for different communities. In the Public Works Department, a labourer is paid \$2.20 a day and, as a natural result, the Department employs only Indians and Malays. Two Chinese recently turned up for employment in the PWD in this district and this was so unusual that the police thought they must be Communists who wanted to take up this work for some ulterior purpose.

In certain trades, however, Indians have made a name for themselves by special ability. The Malayan Railways employ Indians almost exclusively for platelaying and as engine drivers. It is widely recognised by the Chinese that Indian hairdressers are far superior to Chinese and Chinese always prefer to go to an Indian barber for a good haircut. Children who need only a "basin" cut, usually go to the cheapest hairdresser, who, in this case, is often a travelling Chinese who visits the villages.

SPECIALISATION IN CIVIL SERVICE

In the civil service also, specialisation is developing. In English-speaking schools many of the highly paid positions are held by Indians or Singhalese. The headmaster of the local high school gets over \$1,000 a month, which is considerably more than what the European District Officer gets. Higher posts in the civil service are held principally by Englishmen but with the very large number of junior posts held by Malays, it is clear that within the next few years most of these positions will be held by Malays. That the lower Government posts are mainly held by Malays is undoubtedly due to the low commencing salary which only a Malay could live on. A clerical cadet in Kedah is expected to begin work on \$60 a month. Even at the very lowest scale, it seems to me impossible to pay less than \$35 a month for food and lodging. This

Subsistence Economy and Income Estimation

Hannan Ezekiel

WHEN an estimate of the national income of any country differs widely from previous estimates, it becomes a matter of great interest to examine the reasons for such a difference. The estimate of Nigeria's national income made by Dr Prest and Mr Stewart* places it at roughly thrice the level of notional estimates made previously. That Nigeria is an underdeveloped country itself raises many questions of concepts and methodology and for students of national income the answers given to these questions by the two authors are of especial interest. To the extent that these answers are not found acceptable, an opportunity arises to discuss the problems concerned in the light of the arguments advanced by these experts. In some cases, the approach taken may itself suggest further advances. To those not particularly interested in the problems of national income estimation with special reference to underdeveloped countries, the interest of this report lies in the results obtained—the higher level of income and the different relative positions of various sectors—and the light these throw on the economic problems of Nigeria in particular and of underdeveloped countries in general.

The particular problems that arise in the estimation of national income for underdeveloped countries are by now fairly well-known. These call for special treatment though the standard methods used in western countries have sometimes been applied to underdeveloped countries and the result has been considered satisfactory (eg, Creamer, *The Net Income of the Puerto Rican Economy*, 1940-44). The distinction between working and non-working, between production and consumption and between productive and distributive functions are often nebulous in underdeveloped economies. Institutional peculiarities and the relative unimportance of the market economy make it difficult to decide about border-line cases and

yet, such decisions are of vital importance to the results. And the solutions of these varied problems are conditioned by sociology rather than economics. Only an intimate knowledge of the character of social relations and patterns of living prevailing among the people studied can make possible decisions that are at all appropriate to the type of economy, in this case, that of a tropical dependency.

The authors propose to work with the gross domestic product concept rather than what is usually called the gross national income. It is argued that the latter "has the disadvantage that it does not allow the earnings of extra-territorial companies to come into the total". Whether this is in fact a disadvantage is a moot point. For countries like Nigeria where such companies do play a significant part in the economy, the importance of the decision taken on this issue can hardly be exaggerated. Whatever may be the significance of the one or the other for the country itself, there are obviously many advantages in having both totals as information on changes in their relations may itself be so useful in understanding the problems of the economy. The authors, however, have calculated principally the Gross Domestic Product. This has made it necessary to define what exactly "domestic product" means in relation to the product of dual-nationality companies and of Government institutions.

Even more important are the problems that arise in defining "product". Here the question of family activities is crucial. If there is to be a complete assessment of all activities whether performed for oneself, for other members of the family or for outsiders, a number of anomalies are avoided, but this is not the principle adopted in the national income estimation of western countries. The usual rule there is to exclude economic activity taking place within the household with the exception of activities which are similar to those carried out outside, as in the case of food grown for home consumption in the rural areas. The main reason for leaving out other self-produced and intra-family goods and services in these countries is that such work "is largely of a

different character from that done for outsiders". Also, such activities are not likely to vary significantly in the short-run.

The authors hold that "omission or separation of subsistence activity cannot possibly be justified in the case of Nigeria." There are two problems involved in this statement. It seems that while omission of subsistence activity is undesirable, there is no reason why it should not be separated. The authors feel that neither is possible because there is no clear distinction between subsistence and trading activity. As a result, activity inside the family is hardly of a different character to that external to the family. In the case of Nigeria, further, "everyone who is a producer of cash crops is, with the possible exception of some cocoa growers, a producer of crops for his own consumption." This may not, of course, be so in other regions. Yet, the other reasons advanced do support the view that subsistence output should as a whole be included in calculating the Gross Domestic Product. In a sense, national income calculations in other countries also do include subsistence output in so far as they are based on estimates of total production of most crops, whether these are marketed or not. The fact that where production of food, so dependent on the weather is the major subsistence activity, there will be marked fluctuations from year to year suggests another reason for inclusion. There is therefore no adequate reason for excluding subsistence output. If the fact that it is not marketed justifies its exclusion, then, the authors argue, Government products should also be excluded. This is not, however, valid. For in the case of Government product, though it is not sold, its production involves exchange. It is the cost of production which is used as the basis of valuation. The fact that such a basis of valuation is not available in the case of subsistence output suggests that the two cannot be put on the same footing.

The need for separating subsistence output is not in any way obviated by any of these arguments. It should be clearly understood, of course, that the segregation of subsistence is desirable not because of

* *The National Income of Nigeria* by A R Prest and I G Stewart. Colonial Research Studies No 11. Her Majesty's Stationery Office, London. Pages 124; Price 8s 6d.

would leave very little for clothes and washing if the monthly pay is no more than \$60. The minimum pay that a Chinese expects to live and work on is \$100 a month. For example, the person required by law to always travel on the back of a lorry, a very easy job, receives \$120 a month.

It is of course well-known that different social classes in a country have different standards of living but I think Malaya must be almost unique in associating these different standards of living with national communities. A Chinese working for a Chinese would receive a larger pay packet than an Indian working for an Indian, although the work might be the same. "Equal pay for equal work" would in non-professional jobs almost always imply that Chinese should be paid more than Indians or Malays. This difference in pay makes it extremely difficult to organise inter-community trade unions because what an Indian would demand as minimum pay would be far below what a Chinese would regard as reasonable.

WHY DIFFERENT LIVING STANDARDS?

What is the basis of these differences in the standard of living? It seems to me to be largely that the sort of things that each member of a community wants to spend his money on and regards as essential is determined by the social values of the racial community among whom he lives rather than from a national scale. Malays are forbidden wine and tobacco and rarely break this rule to any marked extent. Their ceremonial expenses are very much less than in other communities and they are prepared to spend very much less on food. Many Malays have only one heavy meal a day and during the rest of the day eat remnants. Of course, if they have a lot of money, their consumption increases but they still live predominantly in the countryside and have country values. But Chinese principally live in the cities or have a direct financial tie-up with the cities through selling their tobacco, rice or vegetables to city middlemen with whom they have social and other links. For the

Chinese, wine and tobacco are necessities. Indians occupy an intermediate position.

In my opinion, Chinese manage to retain their higher standard of living because up to now their businesses and enterprises have expanded faster than their population so that they can pay higher wages to their employees. When Chinese are no longer able to find work except by accepting lower wages, their standard of living may drop especially as, up to the present, there is little opening in Government positions for them. Malays and Indians can easily find Government work. That this time of Chinese unemployment is just about here at the present is shown, possibly, by the number of Chinese young men who have recently joined the police and Federation regiment. Most of those joining were forced to do so by economic necessity, although other factors such as the increased allowances in the police probably played their part. The Chinese are at last being pushed out of the Chinese Malayan world and into positions of competition with labour outside.

any doubt about the validity of its inclusion in any national income total but rather because knowledge about its relative importance in the economy can be very valuable in obtaining a clear picture of the working of the economy and of the problems it faces. None of the arguments advanced by the authors suggest that there would be any special difficulty that would make it impossible to achieve such a separation, though some logical and conceptual problems would no doubt arise.

If the line is not to be drawn at the family, where should it be drawn? The compromise accepted by the authors is that "generally we should not try to include the services the individual performs for himself but only those performed for other members of the family". That this decision is the best under the circumstances has to be admitted, but at this stage a statement is made which queers the pitch considerably, "The justification for including all intra-family output, including services," say the authors, "is that the relationship maintained between the members of the family is much more nearly a commercial one than that to which we are accustomed in the West." Granted that intra-family relations are in fact commercialized in Nigeria, it would not be true of many other underdeveloped countries. Would there be no justification for inclusion of such services in other underdeveloped countries where intra-family relations are not commercialised as in Nigeria? The other arguments advanced by the authors themselves support the view that the inclusion is entirely justified.

This approach to the problem of intra-family activities in Nigeria, however, leads the authors to adopt a peculiar mode of valuing these services. The solution adopted is "to take something like the annual sum paid over in bridal prices as a measure of general services. The composition, nature and size of bridal payments varies a good deal from one area to another inside Nigeria but it does not seem far wrong to generalize by saying that it is a lump payment made to mark the acquisition of a wife's general services by a husband and in particular the services of procreation". This treatment, apart from other objections against it, would be inapplicable in other underdeveloped countries. If uniformity of treat-

ment is to be maintained—there are obvious advantages in uniformity—the authors would have done well to reject this mode of valuation. After much laboured rationalization, the authors are only able to claim that for various reasons, "we are hardly likely to overestimate." This is obviously no argument in favour of this particular mode of valuation since underestimation is as undesirable as overestimation in any mode of valuation.

A question may be raised at this stage. What about investment of the nature comparable to subsistence consumption? One's own labour and the labour of one's family may be directly utilised for the production of a capital work and the value of such unpaid work resulting in capital formation should correctly also be included in the national income. The value of such labour may not be negligible and it may also vary significantly. Its importance is well realised since deliberate propaganda is made to encourage voluntary work for public works of a nature beneficial to the community, but even if self-labour is directed to the improvement of one's own land by the building of wells or bunds, etc, there is to that extent an addition to the domestic product. No estimate for such work is made by the authors and their estimate of national income must be considered incomplete to that extent.

That their conclusions may be vitiated by this omission is suggested by what follows. Finding that Government current expenditure forms only 3 per cent of total expenditure at market prices, which is contrary to the usual belief that this proportion should be high in underdeveloped countries, the authors come to the conclusion that this is not true for capital expenditure, "capital formation by public authorities being about a third of the total." This conclusion may not stand if capital formation in the subsistence sector is included in total capital formation and therefore in national income. It is stated elsewhere that "the overwhelming importance of consumption expenditure (£517 m out of £596 m) is in accordance with expectations" and further that, "gross investment as a whole was something like 12 per cent of gross total expenditure at market prices". These statements would be subject to revision in that case.

In studying the implications of the much higher income that has now been estimated by the present

authors, one may well ask: Why were previous estimates so low? The authors feel that it was due "partly to the neglect of the great volume of foodstuffs grown and consumed within the country" and "partly to the neglect of the large mass of internal trading and transport activities," and to the "failure of many investigators to appreciate the significance and importance of the great inland trading centres." While the estimators were not able to obtain detailed data of expenditure by different income or social groups, they find that "not only is there the obvious gap between European living standards and those of the great mass of African clerks, petty traders, farmers and so on, but there is also a more important gap between African and African, on which the present structure of taxation makes little or no impression".

In the light of their findings on Nigerian national income, the authors examine the problem, how far is national income related to taxable capacity for an economy in which so much of the income represents imputed income and is not the result of cash transactions? It is often argued that when national income contains a large proportion of imputed incomes, it is no measure of taxable capacity, the implication being that imputed or subsistence income is untaxable. Or in other words, there is no means of enforcing reduction in such consumption. For Nigeria, however, "a country with a vast amount of internal trading, where practically everyone sells some part of his crops", the authors feel, "this does not ring very true." Taxable capacity in underdeveloped countries is rated low partly because of the absence of cash. There are other means of reducing consumption or may be, of increasing production without raising consumption, even where people do not have any cash or who do not carry out considerable trading activities. At least so far as Nigeria is concerned, the authors do not accept that because an individual has no income, it follows that he has no cash. Even in other underdeveloped countries where trading is not perhaps developed so much, it is not really valid to argue that subsistence producers cannot be taxed though how they can be, is a challenge to the ingenuity of economists and tax authorities. The high degree of income inequality in Nigeria among Africans, to which attention is drawn, underlines the importance of the problem.

Falling Prices in Total Perspective

I D B

(Continued from previous issue)

IT is apparent that abundance has not been general but has been particularly marked in foodgrains, cotton and lately in groundnut. The reaction of these developments on prices has been particularly severe for agricultural labour, for it is reasonable to expect that the entrenched classes in the agricultural economy would pass on the incidence of falling prices to labourers in terms of lower wages and employment.

We are, however, concerned with the worsening of the terms of trade for agriculturists generally, due to the disappearance of inflation and abundance of agricultural output, particularly of foodgrains. Both these developments run counter to the economic assumptions of the First Five-Year Plan. The measure of the loss of the agricultural classes through an adverse movement of the terms of trade (in the sense defined above) may be roughly gauged from Table II below.

The indices for food articles and industrial raw materials broadly indicate the trend in agricultural prices. It is obvious that the position of the agriculturist *vis-à-vis* the industrialist has worsened substantially. As the share of industrial labour (outside the city of Bombay) has remained either constant or has actually diminished due to the linkage of dearness allowances to the cost of living, it is the owners of industrial enterprises who have gained. The other class of people who have gained are the operators in the stock exchanges. There is a close connection between these classes and their finance in business and in the share market. Apart from many other contributory causes, including the boom in the world exchanges, the considerable strength that has accrued to the stock exchanges in this country has been the strong financial position of industrialists who have gained substantially through lower costs, while

their prices have fallen comparatively little, and in fact over the year have remained constant. No wonder that the variable dividend industrial securities index went up between September 1953 and September 1954 by nearly 28 per cent and has since then fallen only slightly.

The trading class, on the other hand, particularly the small *bona fide* trader, has lost in the period of falling prices, as the profit margin for him has diminished and he has incurred losses on stocks. High and rising bazaar rates of interest have borne heavily on him. The middle classes have not gained materially but availability of grain at reasonable prices has meant some relief for them. The fall in the cost of living over the year, though appreciable, has not been pronounced. All this really means that the persistently increasing deficit in middle class budgets has thus given place to a slowly diminishing deficit, but nevertheless the middle class economy still remains a tragically deficit economy.

While we have moved forward to a more valid explanation of the economic situation than is available with government economists, there are yet certain snags in the hypothesis. The principal difficulty lies in the claims of a very substantial increase in industrial output, as would be broadly clear from the interim index of industrial production.

Table III—Volume of Industrial Production

Table II—Economic Adviser's Wholesale Price Index

Year ended August 1939=100

	April 14, 1950 peak of Korean war	April 10, 1954	March 12, 1955
Food articles	414	389	297
Industrial raw materials ..	700	472	419
Manufactures	413	381	380

Now this beats all available estimates of the increase in agricultural output if the indices of industrial production are taken at their face value. The figures of industrial production of the period of black markets and physical controls, however, are not in any legitimate sense comparable to those of a free market economy. During the period of the black market, manufacturers had every incentive to conceal their production from the control authorities so that they should be able to put as much of it into the black market as possible. The textile manufacturers at Ahmedabad were confessing openly to any one who was prepared to hear them that half of their productive capacity was reserved for the black market. In sugar, more fantastic stories were current. The Tariff Board itself convicted the Sugar Syndicate of gross malpractices. Against this background, it would be only correct if the economists were to discount these statistics of industrial production.

INCREASED EXPORTS

Nevertheless it is true that some increase in output has taken place. Why have prices of manufactures then remained constant? The reason for it is to be found in the close relation between exports and increase of production of manufacturers. Almost the whole of the increase in the output of cotton textiles in 1954 over 1953 has gone into exports. Unlike the agriculturists, the manufacturers are a vocal and powerful class and have active contacts in Parliament and in Government circles. They in fact control both the import as well as export authorities and are the real power behind Government's economic policies.

The validity of agricultural statistics may also be questioned for the same reason as in the case of industrial output. There is some truth in it, but there are two differences: The monsoon in the last two years was much better than in the preceding years. No such favourable factor has been operative in industry during the last few years. In fact, imports of machinery have actually declined.

1954-55	..	..	= 55
(Second qr)			

There is another important difference between industry and agriculture, which has often been ignored in the analysis of the economic situation. This is in regard to marketable surplus. If a cultivator and his family produce six maunds of grain, of which they consume four, they have a surplus of two maunds only. If the output increases to eight maunds, the market surplus will increase to four maunds, that is, by 100 per cent. Generally, consumption in the agricultural areas increases in a period of rising prices and falls in a period of falling prices. Hence it is reasonable to assume an extraordinary increase in the market surplus in foodgrains, because cultivators who probably had no surplus to sell have now something to dispose of and others are in a position to increase substantially their supplies to the market partly because they have produced more and partly to offset the effect of fall in prices on their gross money incomes. The immediate effect of a series of cumulative surpluses has meant a considerable increase in stocks with the Government. Already burdened with held-over stocks from the control period, the Government is finding the total pressure of stocks very heavy.

STOCKS

On the other hand, stocks with the manufacturers have actually declined or fluctuated within comparatively narrow limits. This means that they have been able to dispose of stocks either in the internal and/or foreign markets, whatever they have been able to produce. The manufacturers have in fact gained in three ways, (a) through the disposal of their entire current output and in some cases, a part of their stocks, at fairly stable prices, (b) from lower costs of industrial raw materials, and (c) from lower wages bill through 'rationalisation' and general decline in dearness allowances.

In the agricultural areas also, the incidence of the decline in prices has been largely on agricultural labour. The conclusion of this ana-

lysis therefore is that the adverse effect of recent developments has been mainly on labour, both in industry as well as in agriculture. So far as the middle classes are concerned, falling food prices have meant some relief to them but they are harassed by the demands of large and growing families and the insufficiency of employment to absorb their boys and girls as they come of age.

Now what has the Government done to improve the state of the economy? We have been told *ad nauseam* that the Plans will do all the jobs that are necessary to be done. One thing that is clear is the incapacity of the Government, as at present organised, to invest on any substantial scale. The talk of socialism therefore is sheer nonsense, in view of the present organisation of the Government. Private manufacturers will not invest so long as substantial profits can be made by exploiting surplus capacities, since there is a possibility of large-scale nationalisation after the decision to adopt a socialist pattern of society. As for prices, the Government has left them to drift. The present feeling in Government is that the report of the Rural Credit Committee of the Reserve Bank of India will now take full care of the agriculturists and of all their problems. Money supply (note circulation *plus* demand deposits) has of course increased over the year (mid-March 1954 to mid-1955) from Rs 1,713 to Rs 1,855 crores. It is difficult to associate such a rise in money supply with increase in the volume of unemployment except on the assumption of a gross deficiency in the volume of expenditure.

MONEY SUPPLY

Actually, since the beginning of the Plan, money supply has diminished by Rs 150 crores. There is an illusion about development expenditure that needs to be dispelled. Most of the projects were conceived before the Plan and some were actually under execution at that time. The level of development expenditure in the Plan was estimated at 10 per cent over the pre-Plan level. Since the actual expenditure has been below estimates, it is a point to inquire whether there has been any significant increase in actual expenditure.

From this analysis, it should be fairly clear that:

THE ECONOMIC WEEKLY

(a) The major assumptions of the Five-Year Plan, which limited the size of development expenditure—continuance of inflationary pressure and continuing deficiency of food supplies—never held good, the first, not even in the initial stage.

(b) The outstanding achievement of the Indian economy during the Five-Year Plan period, *viz*, a substantial increase in food supplies, was due to a fortuitous combination of circumstances.

(c) Even of that, we have failed to take advantage in good time.

(d) The improvement in industrial production, in view of grossly defective statistics of the black market period, has been greatly exaggerated.

(e) There has been a gross underestimate of the development potential of the Indian economy.

(f) The increase in development expenditure has been negligible compared to requirements as well as to possibilities. This is reflected in an actual decline in money supply of Rs 150 crores during the Plan period.

POSSIBILITIES

The situation, however, is not without its advantages. In fact the economic situation to which we have drifted by now, thanks to the miscalculations of the Government economists, is one which can be most advantageously exploited for creating full employment conditions. The only valid objection to creating employment for the unemployed lies in the consequent risk of inflation. Inflationary pressure has disappeared and deflationary pressure has appeared. A period of falling prices with mounting agricultural surpluses particularly in foodgrains is eminently suited for creating full-employment conditions. In fact we should not wait, for such a coincidence of advantageous factors—advantageous from the point of view of full-employment conditions—may not recur. In fact, it may not last, for already the second forecast of rice shows a drop of nearly 8 per cent in output. Hence the need of speed in taking advantage of the present economic situation, so long as accumulated surpluses can be effectively exploited for countering possible inflationary pressure.

THE ECONOMIC WEEKLY

Minimum Prices for Food Grains

PRICE parity or cost of production, what is the basis of the floor prices which the Government of India has fixed for wheat, rice, bajra, jowar and maize? Twelve crores of rupees, it has been announced, will be advanced for the purchase of wheat to the Governments of the principal wheat-growing States in case prices tend to drop below this floor. This is only for wheat, for the present, but no doubt, if price support becomes necessary for the other crops also, the extension of the same facilities may be expected in due course. The other short-term measure contemplated for price support, besides direct purchases in specified areas where prices tend to fall below the minimum, is the removal of restrictions on internal movement while long-term measures include improvement of rural credit, greater development in rural areas including, naturally, that of cottage industries in order to raise the purchasing power of villages and the large-scale of construction of storage accommodation to enable Government to purchase and store surpluses in good years for utilisation in bad years. The floors, however, have been fixed at a level at which Government is not likely to be called upon to come forward and buy except perhaps in pockets of acute distress.

On the question of parity, the Secretary of the Ministry of Food and Agriculture sought to correct a popular misconception—this is what his observations amount to. There has actually been no fall in parity, he said, only the differential advantage which agriculturists enjoyed until last year has now disappeared. This presumes a knowledge of the movement of price parities into which, however, the Agricultural Secretary has not taken the public into confidence. Some of the components of the price parity that he had in mind, however, he very obligingly specified, *eg*, prices of such manufactured articles as iron, steel, cement, cloth and kerosene. But is he quite certain that taking availabilities also into consideration, and not only the prices, the agriculturist had such a high differential in his favour which now only he has lost? True, since parity is a ratio, it can be adjusted as much by raising agricultural prices as by reducing the prices of the things which the agriculturists buy. But action at the latter end in the past has not proved a conspicuous success; nor is it likely to prove any more effective in the present situation. Hence the case for price support.

While parity between agricultural and industrial prices holds the centre of the stage at the moment, parity between different agricultural prices, as for instance, between those of food crops and cash crops, must not be lost sight of. While the disappearance of the differential advantage which agricultural goods enjoyed until recently may not yet have produced unfavourable repercussions on agricultural production—there is at least a phoney theory which posits an inverse correlation between agricultural prices and agricultural production taken as a whole—price parity between food crops and cash crops does not have the support of any such high theory. This makes the situation somewhat more delicate. This year's bumper cotton crop, for example, is a reality, the lessons of which should not be lightly thrown away. Mill

production of cotton textiles for the first quarter of the year, for which statistics have just been released, has reached an all-time high. This has been made possible because in the cotton mill industry, at any rate, capacity is an elastic concept not subject to too many technological limitations. Production has broken all past records, because mills have had abundant supplies of cotton grown in our own fields.

Prices of cash crops, therefore, could not have been ignored while fixing the minimum prices for food grains that have now been announced. What is the basis on which these particular prices have been chosen as minima? Since the Government talks about parity but produces no figures or indices which can be taken as a criterion for the fixation of minimum prices, cost as a possible basis of price fixation cannot be altogether ruled out, however notional the ideas about costs might be. At least the Krishnamachari Committee on Agricultural Prices was foolhardy enough to suggest that fair prices in agriculture should be determined on the basis of costs of production on representative holdings, including

payment of fair wages to agricultural labour and subsistence to the producers at a standard of life equivalent to that enjoyed by other comparable classes. This was the ultimate objective, the attainment of which would depend on collection of necessary data about costs and, doubtless, on the compilation of which would depend on the collection of such data, the Committee had suggested that agricultural prices should be based on the parity prevailing during the five years 1924-29. Now, to hark back to the years of the depression may not appeal to Government statisticians of the present day, but it would not be prudent to infer therefrom that the Agricultural Ministry has given up toying with costs altogether.

There is no harm if cost studies amuse the Ministry, but why not come out with a straightforward index of prices of the things which the farmer buys cloth, kerosene, salt, gur, sweet oil, iron and steel, bullocks, manures, oil cake and fodder? True, this cuts across the neat classification into agricultural and industrial prices but it would certainly be more realistic, particularly in that it recognises the folly of sharply dividing producers and

consumers goods in relation to the subsistence economy of the Indian farmer.

It is curious, however, that during all this interminable talk about price parities, no one has ever held a brief for regional studies and compilation of zonal indices. A relatively high spatial correlation of wheat prices has been noticed by statisticians; the reasons for it would be worth close investigation. But it would be surprising if a similar claim were to be put forward for prices of rice, the movements of which are desperate in the main. In order to construct an index, it is necessary to determine the weights of the commodities that are intended to be covered. The absurdity of applying weights on an all-India basis to an index, the object of which is to measure changes in farm incomes, is too obvious to need any emphasis. It may be unavoidable and also less open to objection in the case of the usual type of wholesale price index. But for price parities in agriculture, zonal indices are the only ones that could be realistic and useful. Even as abstractions, indices should not fly in the face of reason and everyday experience.

flaunted, alternately by the Ministry of Commerce and Industry on the one hand and the Ministry of Production on the other. Even when these two ministries fell out on the question of steel, differences did not extend to each side putting up its own target. They clearly could not because they had both to fall back on definite projects in various stages of implementation. Much the same holds for the targets for fertilisers or locomotives, wagons and passenger coaches. Were these then the oats that the asses have been carrying so laboriously for the horses to munch?

If these exemplify the sort of data at the disposal of the Panel—and one hopes they do not—not much time could have been spent by the economists gathered at Delhi on working out carefully the physical balances. Does one then assume that the economists looked at these figures, found them not too ambitious in themselves and proceeded to work out in financial terms the broad outline with which these could be fitted at a later date? If that is what they did, neither the horses nor the asses worried about the quality or quantity of oats that was there; they proceeded, to change the metaphor, to chew the cud in a manner reminiscent of the formative phases of the first Five-Year Plan. In other words, the translation of the work into financial terms was perhaps achieved with little trouble; and once that was done, progress was swift, since planning on those lines has been with us for years now.

Admittedly, this is all speculative. But it is not wildly so, since the meagre reports emanating from Delhi are similar to those which appeared in the early years of the First Plan. That apart, one might forget the inconsequential debate on whether it is the statisticians or the economists who do the planning now, and turn to the material available to the outsiders—in whatever order they may be placed in the animal kingdom—for forming an opinion on the shape of things to come in the second Five-Year period. Inevitably, the discussion here has to be in financial terms, since the magnitude of the task to be performed is most easily reckoned that way.

To start with, the Second Plan is expected to involve an investment outlay of Rs. 5,600 crores. One does not yet know whether or not

this is comparable to the outlay envisaged under the First Plan, since that outlay was not strictly on 'investment' in the physical capital formation sense. Financially, that should not make a difference, since the resources necessary for meeting this non-investment but none-the-less developmental expenditure in the public sector will be allowed for before working out the resources available for financing investment. In other words, the difference there

may be in the concepts used for defining outlay in the Second Plan will not affect the magnitude of fresh resources to be raised by the public sector or the deficit-financing to be undertaken. If our esteemed Calcutta contemporary has the right figures, the public sector will have to find at least Rs. 1,800 crores in five years from fresh taxation, additional income from State enterprises and deficit-financing. Given this starting point, what really will be

Where Are the Oats?

ASSES carry oats and horses eat them; this simile was innocently and rather inadvertently, it now appears, used when a flutter was caused in the dovecots of economists by the talk of physical planning some time ago. Economists, it was remarked in these columns, were very much on the defensive and the more talk there was of physical planning the more convinced they were of losing ground to statisticians. But things have happened since then and last week the Economists' Panel met in Delhi to examine and work out what will in effect be a first approximation of the plan-frame. Presumably, the economists and the statisticians were able to agree on a modus vivendi, since the Panel has, it appears, recommended more or less unanimously a plan-frame. Discussion and dispassionate examination of the issues involved both on the physical and financial planes could alone have led to this very large measure of agreement. It would therefore be ridiculous now to ask who won and who lost. To revert to the simile then used, could one then say that the oats were shared between the asses and the

horses? In saying this one may, however, be presuming too much. For where are the oats? The usual press reports give little idea of the sort of material that the Panel had before it when the plan-frame was forged. But a Calcutta contemporary which has the highest reputation for the reliability of its news, has published what looks like the raw material for the Second Five-Year Plan that was submitted by Prof P C Mahalanobis to the Panel of Economists. The enterprising New Delhi correspondent of this journal has got hold of and reproduced the financial magnitudes and the physical targets for the Plan. In view of the fact that both Prof Mahalanobis and the Panel put the size of the second plan at Rs. 5,600 crores, and agree broadly on the pattern of outlay, there is room for believing that Prof Mahalanobis's physical targets do not clash with whatever corresponding financial estimates may be made for them. Those who are better aware of economic processes would not be surprised by this accord. For, in their language, physical and financial targets are just two facets of economic entities which non-economists keep on con-

fusing. To those not so clear in their own minds, the possibility of such a conflict arising is not to be dismissed too lightly. They would look at the conflict arising this way: in the event of the financial contributions proving inadequate for achieving the physical targets laid down, which is to be accorded higher priority over the other and maintained inviolate? Now obviously, the homely doctrine of cutting one's coat according to the size of the cloth does not quite meet the point because one has first to decide what constitutes the cloth in this case.

Leaving this somewhat abstruse point of planning theory aside for the time being, let us for a moment look at Prof Mahalanobis's physical targets. Such of them as are readily comparable to similar ones put up by the ministries concerned show a surprising correspondence. Surely these targets could not have been produced out of electronic machines, from elaborate input output analysis and the solution of a large number of differential equations giving optimal results. Take the target for steel for example. It is the same five million tons which has been

the gap in resources that will need to be met by resort to deficit-financing? As of today, only the Centre has implemented some of the recommendations of the Taxation Enquiry Commission. There is therefore room for presuming a considerable increase in the tax resources of the States, if they really get down to the job of mobilising resources seriously. Even so, it seems unlikely that the tax receipts plus profits of State enterprises, net of unavoidable increases in non-plan expenditure in the quinquennium, will be of the order of Rs 800 crores, which would be necessary to keep deficit-financing down to Rs 1,000 crores in five years.

To get a hang of the proportions, deficit-financing of the order of Rs 1,000 crores will mean an increase in money-supply of around Rs 1,500 crores, if consequential

expansion in bank-money for which means that years money supply with the public will have risen by over 15 per cent compared to present levels. This in itself need not be a problem, if measures to contain inflationary impact of such expansion are worked out and implemented. And this is where physical balances come into the picture. Unless the additional money supply goes with this increase in those markets where planned investment brings forth an increase in supplies, the price-structure will go awry. And the anti-deficit-financing school will have a field day.

One cannot judge at the moment whether or not Indian economy will be able to absorb such an increase in purchasing power. The odds are no doubt in favour of anti-

THE ECONOMIC WEEKLY

icipating that it will. But such a viewpoint assumes that the rate of increase in consumption goods which has been witnessed in the past two years will be not only maintained but augmented in the coming five-year period. At least, it assumes that such shortage in real goods will be of a magnitude that can be met by not-too-radical a departure from the present control phase. On the argument that no acceleration of development is possible unless some belts are basis tightened somewhere, one might dence—w. bother too much about the position to whatever one might choose when, to revert to it. But all this applies to metaphor, the oak to a much-laboured abundant. A couple of these are not too it would be dangerous to need work on such meagre supplies.

THE ECONOMIC WEEKLY

US Defence and Tariffs

AS if raising tariffs against Swiss watches by 50 per cent in July last year were not enough, the US Department of Justice had instituted soon after anti-trust action against American importers and manufacturers supplied by the Swiss watch industry. This naturally brought forth violent protests from the latter, a sample of which will be found in the following excerpts from the statement issued by the President of the Swiss Federation of Watch Manufacturers on the occasion:

"We are astounded that the US Government—not content with legal action against our American customers—is now reaching out 4,000 miles beyond its territorial 12-mile limit and trying to abrogate legal sovereignty directly over our industry here in Switzerland.

"Coming as it does on the heels of the watch tariff decision which struck a grievous blow at the Swiss economy, this action can only be construed as a further indication that the United States is treating the world's oldest democracy and staunchest advocate of free enterprise as a commercial enemy.

"This is additional proof of a deliberate policy of harassing our export industry. In President Eisenhower's action to increase tariffs and the Justice Department's action to prove a conspiracy in restraint of trade, there is a curious contradiction. The first action was successful because the American watch companies convinced the President that the Swiss were sending too many watches to the United States, at too low a price, with no restraints or controls over the distribution.

"And now the Department of Justice claims just the opposite."

This is not the end of the story, however. There is an anti-climax to it. It now transpires that the ground on which tariffs on watches were raised was that of defence. The US Department of Defence has released a hitherto secret report which completely contradicts the reasons given by the US President last July for raising the tariff on Swiss watches. It found after an exhaustive study of military requirements for all types of products which would be produced by the Jewel Watch Industry during war time emergency "that no special or preferential treatment is necessary." And yet, the US President had authorised the tariff increase on the precise

ground that the American watch-making industry needed protection "to preserve its precision skill for national security." The "necessity for defence" myth has been exploded by the Department of Defence in this particular case, but the myth persists. For instance, lace manufacturers want protection because they make mosquito nets which are essential for defence. So do manufacturers of woollen gloves who make soldier's gloves and of cutlery who make military matchsets. And even those who catch tuna fish want protection on grounds of defence because their fleet is needed in war time and the Association of Lead Pencil Manufacturers want it too, because pencils are also indispensable to national defence, though they may not be "directly utilised for combat purposes".

High tariff lobbies in Washington may not be put off, even by such damaging Defence Department disclosures; but British bicycles and some other Continental manufactures against which tariff agitation is being worked up, may gain a respite. The publication has come too late, however, to help Swiss watches.

Out-dated Organisation

AN interesting crisis seems to be brewing in the All-India Scheduled Castes Federation or rather in what remains of it. The apparent cause is the dissatisfaction felt by some of the prominent members over the leadership of Dr B R Ambedkar. One of them, Shri N Shivraj, who happens to be currently President of the Federation, has not only threatened to quit the organisation, but also indicated the possibility of the South Indian unit seceding from the parent body. Meanwhile, the General Secretary, Shri P N Rajbhoj, a close associate of Dr Ambedkar, is reported to have taken the 'final and irrevocable step' of resigning from the organisation as a protest against the 'insufferable conditions in which I have been forced to work during the last few months.' The fact appears to be that the learned Doctor has been doing things pretty much as he likes. Not that this reveals any new trait in him; but the very men who might once have had implicit faith in his political wisdom and who might have followed him without question do not seem to be so inclined now. The reason is obvious. The Doctor's recent political tactics, far from strengthening, or enhancing the prestige of, the organisation, has reduc-

ed it to a position of helplessness that is truly pathetic. The rot had in fact begun with the crippling defeat suffered by the party in the last elections, when on the Doctor's advice the Federation entered into an alliance of convenience with the Socialist Party with advantage to none.

But it may be urged on behalf of Ambedkar that his whims and fancies, however destructive in themselves, are not wholly to blame for the plight in which the Party finds itself. In the new climate of India, with communalism at a discount at least in the political sphere and the accent on constructive endeavour, politics such as the Federation might have pursued with impunity and even considerable advantage in the past have little scope. Though it cannot be said that the grievances of the scheduled castes have been wholly redressed in fact as in law, there is no mistaking the earnest efforts being made by Government, public bodies and enlightened citizens to improve their status. The label of being the down-trodden in the social sense at least is no longer fashionable, thanks to the pride that freedom has given to all citizens and the sense of confidence and security that the laws of independent India have promoted. Grievances are crystallising around economic issues rather than social or communal ones. The Doctor, and with him the Federation that he built up, are behind times by at least a decade. He has been left high and dry by the swift march of events, and the organisation has clearly outlived its utility. While blaming their leader for whatever harm he might have done to the Federation, both Shri

Weekly Notes

Malodorous Indecorum

IF Nandaji's performance in Parliament in the discussion for demand for grants was surprisingly the best, as reported by our Delhi correspondent elsewhere in this issue, what is one to say of the performance of the Minister for Information and Broadcasting in the previous week? To quote from his despatch, which was delayed in transmission and could not therefore be taken in the last issue:

"Dr Keskar tried to put life into the debate, when his grants were being discussed. He is another imitator of the Prime Minister in his style and also in his theory that time is not a matter of any consequence. He took more time than the Prime Minister in the foreign policy debate. But there the comparison ends. Few can at the moment compete with Dr Keskar in his arrogance and ignorance. A substantial part of his speech was devoted to personal threats held out to one of his officers—the Director-General of the AIR. I don't know the gentleman concerned, but Dr Keskar certainly touched the lowest levels of parliamentary debate in his references. He lectured to Parliament that this was a very undesirable practice, but what does he practise himself? . . . there is the Director-General, the great manda-

rin, who was sitting and whose work was being interfered with. Who is he? He is an officer of Government. . . . A large part of Dr Keskar's speech is full of such contemptuous references. Dr Keskar threatened that "there will be interference" with this officer and every officer, "there will be more and more interference, and still more interference". This is amazing language."

If the report is correct, the language is, indeed, amazing. Unfortunately it is also worse than that. To think of the British practice in this connection is natural, not because having imported a parliamentary form of Government, it has to be imitated slavishly but for the very simple reason that since the civil servant cannot defend himself in public, he should in fairness be kept out of political controversy. A Minister calling a servant a mandarin sets up a new low in parliamentary misdemeanour. It is as much in bad taste as it is unwarranted, besides being unsportsmanlike.

Commenting on this remarkable display of bad manners, the Delhi correspondent goes on to say in effect that it is not merely a matter of bad form or lack of sportsmanship but has far more serious consequences. When an officer of prov-

ed integrity and ability, he goes far to say, is put in charge of a responsible position, the Minister is not supposed to interfere in his administration. After the attitude taken by Dr Keskar and some of his colleagues—particular mention is made of the Minister for Communications in this connection—no self-respecting person will be prepared to take up office under ministers who hold such views and we would soon have, in fact, we are already having, a number of important and responsible posts filled with personnel with little to commend themselves except their willingness to please, at any cost.

The results are what could be expected. There has been a falling off in the standard of performance on the AIR, Air Transport Services, The Delhi Road Transport and even in departments where competence and efficiency are of the most vital importance to the nation. It is surprising that the Prime Minister should allow Ministers to violate the rules of the game and so far forget themselves as to disregard common decency and ignore decorum on the floor of the House. The worse things that happen in consequence are however matters of even greater import but they cannot be dealt with in open debate in Parliament.

institution of property would disappear or rather it would belong to society and every one would take according to one's need and there would be complete social equality. It is time that Jaya Prakash were wakened from his dream and brought back to the workaday world. Can't Pandit Nehru do the trick? The Pandit's socialism depends on attracting men of Jaya Prakash's calibre. It is time, he parted company with men who have adopted socialism for a mess of pottage.

PLODDING THROUGH

The Parliament has been plodding through the demand for grants. In between, the Lok Sabha has passed the Fourth Constitution Amendment Bill. The Prime Minister felt greatly elated by the Hitler majorities he secured in both Houses on the reference of the Amendment of the Joint Select Committee. The Committee has wisely restored parity of treatment as between agricultural and industrial properties. The Prime Minister himself, apart from unnecessary personal references to members of the Opposition, was in a modest and reasonable mood as compared to the time, when he was introducing the Amendment. He then breathed fire. It was difficult to believe that we were listening to the Indian Prime Minister in the Indian Parliament. It looked as though we were in the Soviet Union in October 1917 and a revolutionary regime was actually on!

Over a period, and given the chance, the vested interests should know that the Prime Minister is a very reasonable person and is unlikely to disturb them seriously. The slogan of socialism, apart from its value on the domestic front, is not without its uses in the *battle of the blocs*! He assured business interests that "there will be no such thing (expropriation) except by law and except on payment of compensation. Remember that". Who should remember? ... After he had delivered himself against the monstrous doctrine of the divine right to property, he descended rapidly: "... It is right. The possession of property is a thing which we recognise, which we protect." Philosophy again welled up in his mind. "Mind you, I have no respect for property at all. ... I respect the other person's respect for property occasionally ... In life's journey one should be lightly laden ... While not appreciating it (the property sense) I realize and

recognise it is there ... I do not want anything to be acquired except—normally speaking—on payment of just compensation."

Normally speaking—but he keeps on saying every now and then that the times are abnormal. Let those, who bank on his assurances regarding nationalization, remember that the Prime Minister is an unknown quantity in the changing equations of Indian politics. Hamlet, with all his philosophy, did strike ultimately, though suicidally. Strange to say that the outstanding fact of Indian politics is that the Communists alone understand the Prime Minister and he also understands them fully. What a perfect understanding! ... It was the Prime Minister, who said in this very speech: "... the thing that is really necessary is somehow to activate and dynamise (not dynamite) the base of the Indian social structure ... this base of Indian society ... means millions and millions of

THE ECONOMIC WEEKLY

villagers, millions of workers and small earners, unemployed people on the land ... And in activating this base one may have to take numerous social steps of all kinds."

NANDAJI'S SURPRISING PERFORMANCE

In the discussion on the Demands for grants, the performance of Shri Nanda was surprisingly the best. My suspicion is that he is extremely well supported by his secretariat. It is otherwise not reasonable to expect such a logical, well-documented speech from Nandaji. He is reasonably proud, against the background of general short-fall in expenditure on the Plan projects, that his Ministry is likely to overshoot the mark, certainly in expenditure, and in all probability, in actual achievements. ... The overall position ... for the period of five years, implementation will be to the extent of 99 per-cent or a little more." In

THE ECONOMIC WEEKLY

From the Calcutta End

West Bengal's Damaged Economy

CALCUTTA is like that! Sir Winston Churchill's retirement has provoked strange reflections in this city. Opinion differs about the Press in Calcutta. In a country where literacy is low, the Press is supposed to educate the people. In Calcutta, it seems to be the other way about. The average educated Bengali seems to be more literate and informed than the Press in this city. It is symbolic of Sir Winston's greatness that both the Press and the people even in West Bengal are so appreciative of him.

But the average Bengali is more interested in discussing Sir Winston's retirement in the context of conditions in this country. India's historical associations with Britain have encouraged some common traditions and beliefs in both countries. Geniuses may not be ostracised in this country as misfits. But India seems to share the British belief that one does not reach maturity before fifty-five. In Calcutta's streets, cafes and coffee houses, Sir Winston's retirement is provoking discussions about the ageing politicians in this country.

AGEING POLITICIANS

Dr Rajendra Prasad, the President, is old and ailing. But the average Bengali is not worried about his successor. It is agreed that, when Dr Rajendra Prasad chooses to retire, India will have an able President in Dr Radhakrishnan. No one is able to choose the next Prime Minister. Congress has succeeded in choosing Panditji's successor as its President. But even those who have a flair for political speculation are unable to choose Panditji's successor as Prime Minister. Panditji once gave an indication that he would like his mantle to fall on Jaiprakash. But nothing came out of those overtures. Vinobaji has kidnapped Jaiprakash away from New Delhi.

Bengalis are State-proud people. They are not uninterested in indulging in the political pastime of choosing the next Prime Minister of the Republic of India. But they are more anxious to nominate the next Chief Minister of West Bengal. Dr B C Roy is ageing. He is not as fit or agile today as he was a couple of years ago. For his age, he is more than fit. But he is

showing signs of exhaustion. And, not even the most politically informed Bengali is able to nominate his successor. Sir Winston's retirement from active politics has revived these discussions. But these topics have been under discussion for some time in this city.

This was, of course, not one of the topics under discussion at the recent West Bengal Pradesh Congress Conference at Malda. It was a grand show. It was staged and monopolised by Shri Atulya Ghosh, President of the West Bengal Pradesh Congress Committee. There have been rumours in the city for more than a year that he harbours ambitions to be the next Chief Minister of this State. There are many dissensions in this State's Congress Committee. Shri Atulya Ghosh seems to be a typical, successful, Congress boss. But even those who do not like the look of Dr B C Roy seem agreed that Shri Atulya Ghosh would be a poor successor to the dictatorial Doctor.

STRATEGIC STATE

At Malda, the West Bengal Pradesh Congress Conference discussed many issues affecting the economy and politics of this State. West Bengal is a strategic, border State. A strong and stable government for this State is, therefore, of importance not only for this State, but also for the country as a whole. To the Congress party, this, naturally, means that the State Congress must be a strong and united organisation. It was not without significance that Shri U N Dhebar, the new Congress President, attended the Malda Conference.

Much was heard about the need for purifying the Congress. One of the resolutions passed at the Malda Conference enjoined the party members to live up to the Congress ideal of sacrifice and suffering. Both Shri Dhebar and Shri Lal Bahadur Shastri, who inaugurated the Conference, spoke on the resolution. Need for constant touch with the people was stressed. It was, however, not clear from the speeches whether the contact with the people was to be established for winning the elections or for developing Community Projects and the National Extension Service. As this relation was not stressed, one can

only presume that party members are to woo the people so that elections can be won.

WEST BENGAL'S ECONOMY

Even as the Malda Conference started, it became evident how it came about that the Union Transport Minister was presiding over a State Pradesh Congress Conference. Shri Sastri disclosed in his presidential address that India and Pakistan would discuss, at the officers' level, the issue of a rail link between the two Bengals. Such a conference was recently held in Calcutta to discuss the prospects of running of two goods trains between the two Bengals. These arrangements have not yet been finalised. But recent developments indicate that chances of a freer flow of trade between the two Bengals are not discouraging.

It was symbolic of West Bengal's major problems that economic issues dominated the deliberations of the Malda Conference. Of the main resolutions passed at the Conference, one was on the Farakka Barrage. This is one of the projects on which West Bengal's economic rehabilitation depends. It is not yet known whether this project will be included in the second Five-Year Plan. But both the Government and Congress in this State won a moral victory for their claims in the Union Transport Minister's candid confession that he would have voted for the resolution had he not been a Cabinet Minister. Among other things, the Farakka Barrage will solve transport problems between western and northern West Bengal.

UNEMPLOYMENT

It is not customary for a Pradesh Congress Conference to emphasise the economic problems of the Pradesh concerned to the neglect of issues relating to party politics. It is not customary, but it is desirable. Partitioned Bengal's, West Bengal's, main problem is economic. It has become a problem State because partition has damaged its economy beyond repair. West Bengal's economy cannot improve merely by abolishing zamindaries, according to schedule, on the Bengali New Year Day, which falls within this week. Nor can it be strengthened by the completion

of the Farakka Barrage alone.

On the concluding day of the Malda Conference, Dr B C Roy, who did not attend the Conference, made an appeal to the Bengal National Chamber of Commerce to "employ as many Bengalis as you can" to solve the unemployment problem which was assuming alarming proportions. It was clear from the Chief Minister's address before the Chamber that he regarded the simultaneous co-operative, development of small-scale and large-scale industries as essential for the solution of the unemployment problem. His address before the Chamber was significant in his implied admission that he, as head of the State, accepted the State's responsibility to provide the necessary vocational training to those seeking employment.

While the West Bengal Pradesh Congress Committee is concerned only about the Ganga Barrage, Dr B C Roy, the State's Chief Minister, is equally anxious about rapid industrialisation of the Durgapur region. Recently, the British Steel Mission was in Calcutta on its way to inspection of a probable site for an iron and steel plant. It will visit Durgapur during its inspection tour. Both Shri G D Birla, and Dr B C Roy are equally interested that Durgapur should be the location of one of the new iron and steel plants in this country. All thinking persons will endorse Dr B C Roy's repeated warning that West Bengal will perish unless the Durgapur belt is industrialised. West Bengal's existing industries are decaying. It must have new industries to absorb the alarming growth in unemployment.

Letter to the Editor

Federation's Second Five-Year Plan

I HAVE read with interest the special article appearing in *The Economic Weekly* of April 2 entitled "Industrialists Want More Consumption". There are of course some points made in that article on which one might hold a different opinion. But my purpose in writing to you is only to draw your attention to two statements in the article which are factually incorrect.

1. On page 423 there is the following statement:

"The investment proposed in the next five years adds upto Rs 7,200 crores, as against the target of Rs 2,100 crores for the First Five-Year Plan, of which no more than Rs 1,800 crores are likely to be realised in part."

Even a cursory reading of the Note would show that Rs 7,200 crores is the total planned expenditure, *ie*, inclusive of the public and the private sectors. The comparable figure in the First Plan therefore would be about Rs 36 to Rs 37 hundred crores.

2. On page 430 where you refer to the multiplier effect of industrial employment, a reference is made to the percentage distribution of the population between different occupation groups in 1931 and in 1951. I fail to see how percentage figures can be relevant in this context and in any case it would be tricky to try to extrapolate an employment multiplier from a past period when other variables in the system are also likely to be different.

S S Marathe

Federation of Indian Chambers of Commerce & Industry,
28, Ferozshah Road,
New Delhi, 1,
April 7, 1955.

[The first is an obvious slip which is much regretted. The employment multiplier, however, is quite a different matter in support of which the Federation advances no argument. Since a definite figure 6 to 7 was assumed, a general reference was made to past experience to suggest the improbability of such a high figure. Nothing so absurd as extrapolation of the multiplier from previous census returns was ever intended.—Ed.]

Official Documents

Small-Scale Industries in Japan

Report of the Study Group of Small-scale Industry Experts on their visit to Japan. Economic Commission for Asia and the Far East, Bangkok. Pages 293. Price not mentioned.

IN recent years, the countries of South-East Asia have been taking an increasing interest in small-scale and cottage industries. As such industries occupy a prominent place in the economy of Japan, it is not surprising that their organisational and technical structure should attract considerable attention. An official Indian delegation in fact visited Japan some years ago to study small-scale industries. Bombay Government sent a delegation for this purpose in 1951 and the report submitted by the members was reviewed in this journal (December 5, 1953). Only last year the All-India Manufacturers Association sent a delegation to South-East Asia, which among other things made a special study of Japanese small industries. The present report has been issued by a group of experts who visited Japan during April-May 1954 under the joint auspices of the United Nations Technical Assistance Administration and the Economic Commission for Asia and the Far East.

A preliminary point needs to be made. The report covers "small-scale" industry rather than cottage industry as it is known in this country. The use of power, employment of extensive machinery and a large labour force are among the characteristics which distinguish the small industries covered by the present study from cottage industries.

The first question that naturally arises is: What are the causes of their survival? In view of the fact that industrialisation has proceeded at a rapid pace in Japan, this question is very pertinent. The factors listed by the report are highly interesting. (1) Ready availability of cheap electric power and transport in rural areas. (2) Specialisation in production for export with dispersal in manufacturing activities. (3) Cheap labour, through lower wages, longer working hours and availability of appreciable part-time labour. (4) System of sub-contracting with small enterprise, "which minimizes the risks of the large enterprise, since in a trade depression the smaller enterprises absorb the first shocks." The last two points should attract attention from those who would like to decide for

themselves the role that small industries should play in the national economy, while the first two should be properly appreciated in the implementation of any programme for the development of small-scale industries in the country.

The study begins by drawing a very important distinction between the size of the technical unit and the size of the financial and administrative unit. "Technical units of small size in an industry may be quite compatible with large-scale control." That such control need not necessarily mean, though it may, the existence of large firms is clear. In Japan, smaller industries do show a significant dependence on large-scale industry for capital, both fixed and working. Though this solves their problem of finance, it transfers effective control over production to large-scale industry. Such financial control is strengthened by, and, in fact, frequently operates through the sub-contract system of which mention has been made earlier. This system may be regarded from one point of view as a step towards a very desirable integration of large and small-scale industry, but from another, it may be considered a very unhealthy pattern of subordination of small-scale industry to the large units. A different class is constituted by those units which come under the commission merchant's control.

Close integration between small-scale and large-scale enterprise is also achieved on another plane. The large units provide technical assistance and supplies to small-scale industries, while the latter, in turn, supply components to large-scale assembly plants, *eg*, in the bicycles and sewing-machine industry. The main point is that in Japan, "though the individual independent unit is a complete entity, it is often an indispensable part of an organization which ultimately produces finished articles."

But independence from external financing authorities or affiliated large-scale units is also desirable. To enable the smaller units to achieve this, co-operative associations of entrepreneurs are being founded. These are, of course, to

be clearly distinguished from industrial co-operatives, for in them the workers have no say at all. These associations are intended to develop mutual assistance among small entrepreneurs for dissemination of technical and marketing information. When sufficiently strong, these associations can supply credit and guarantee facilities. They can also provide what are described as "common facility" services.

The role of "common facility" service centres in developing and strengthening a large number of cottage and small-scale industries has been discussed in the report for each of the industries concerned. These centres "set up to undertake part or whole of an operation involved in processing or manufacturing an article" have many advantages. They eliminate to some extent differences in production costs and free the individual units from the necessity of having costly and heavy equipment of their own. Uniformity of quality can also be maintained by such centres. If small-scale industries in other countries of S-E Asia form associations and organise some of the services rendered by these centres in Japan, they would be of immense assistance to the growth of small industries, and at the same time reduce their dependence on large-scale factories. The study group, therefore, recommends that such centres should be set up in other countries of the region also.

On the production side, the visiting experts were impressed by the flexibility shown by Japanese industries. Where there is no competition with large-scale enterprises, manual-labour manufacturing methods have been adopted unless found unsuitable otherwise. Where such competition exists, "all possible labour-saving devices are employed in order to achieve economies in production cost." The degree of mechanization also depends to a large extent on facilities provided by "common facility" centres or large-scale units with which the small industry is connected. No predilections on the matter, therefore, restrict the choice of the small Japanese entrepreneur regarding the technique he should

employ.

In the matter of techniques actually employed, the experts were impressed by the extensive use of single-purpose machines in engineering industries for specific operations. This "not only saves considerable time in changing tools, dies, fixtures, etc., on multiple-purpose machines but also ensures better and larger production, making it possible to design better and simpler single-purpose machines in the long run". Being easy to handle, repair and maintain locally, having a low consumption of power and less expensive to install, single-purpose machines are preferred in Japan and have also been approved by the experts of the study group.

The study is not confined to a general survey of the organisation and technical features of Japanese small-scale industry. The principal industries are examined in detail and the conclusions derived for each industry are given separately before being assimilated into the general conclusions drawn at the end. Textiles, ceramics, wood, bamboo and lacquer-ware, paper and paper-products, engineering, and the agricultural and aquatic products—all

these have been individually examined. Detailed information has been given about production techniques and processes, organisation, finance and marketing with special reference to the relation of the smaller industries to large-scale units and "common facility" centres. Some attention has also been paid to the research institutes which do so much to foster small-scale industries by helping them to improve their techniques and reduce costs.

The problems faced by small-scale establishments in the different ECAFE countries and the action that is being taken or is proposed to be taken for solving them have been assembled in an appendix. Readers should be warned, however, that as in most other ECAFE publications, the country report on China is really for Taiwan and what it says about the Chinese mainland should not have found a place in this publication. Even from these scrappy notes, it is easy to see that generally "the structure of the small-scale industry is not based on a planned industrial co-operative set up". It is to remedy this state of affairs that the experts recommend the establishment of an

organisation in each country akin to the Japanese Smaller Enterprise Agency. The report stresses in particular one aspect of the work of this agency which is not usually found in other countries. This is the work of "diagnosis" or industrial efficiency surveys, and the introduction of an uniform accounting system.

In view of the importance of marketing, the establishment of a body like the Japan Export Trade Research Organization (JETRO) and of market research organisations in different industries is also recommended. If these bodies could do careful work, they could undoubtedly prove very useful in countries like India. But how to ensure that the setting up of a multiplicity of organizations does not result merely in wastage of resources?

On the whole, the Study Group has produced a useful report. The wealth of detail contained in the industry-wise studies does not, however, seem likely to serve any useful purpose. It is too detailed to be absorbed by the general reader while being obviously inadequate to assist the technician interested in any particular industry.

Land Gift is World Peace

Suresh Ramabhai

IN May, last year, Vinoba was going round the Shahabad district of Bihar. Out of the 50 households in a village, 22 were of the landless. They needed some 60 bighas of land to make both ends meet. When Vinoba reached the village early in the morning, the local people greeted him with 'Jais' and the slogan, "*Hamare gaon men bila zamin koi-na-rahega, koi na rahega*"! (There will be no landless in our village). Vinoba, folding his hands in acknowledgment, replied, "This slogan is for the morning only; that of the evening is '*Hamare gaon men bila zamin koi na raha, koi na raha*'" (There is no landless in our village now). So please go and work through the day and return to the evening prayer meeting with 60 bighas of land and declare "There is no landless in our village now!"

It went straight to their heart. The Bhoodan workers also were moved. The land collection work began in earnest. They knew no rest till the desired amount of land was attained. Joyously they attended the prayer meeting. After the prayer was over, one old man of the village came to the dais and spoke in a voice choking with emotion, "Brothers and sisters! By the grace of God and the blessings of Vinoba Baba, there is now no landless in our village!"

GIFT OF BULLOCKS

In November, we were in the Purnea district of Bihar. On our way, was a tiny village with 40 homesteads, of which 18 belonged to the landless. The people of the village donated some 50 bighas of land which was just enough to give a tiny plot to each of the landless families. But the condition of eight of them was awful, and they required bullocks too. Bullock donations were called for, and no less than twenty bullocks—ten pairs—were offered, which were distributed to those eight families as also to others. They requested Vinoba to stop for a few minutes and present the bullocks to the needy with his own hands, which he very gladly did.

People in the locality were all amazed. None had dreamt of land gifts. That had, however, now be-

come a reality. Bullock gifts were even farther from their thoughts. But Vinoba disarmed them saying, "The *janata* (masses) are a veritable *Kam-dhenu** who will give whatever is desired. When she could tear open her heart and part with land, parting with bullocks, ploughs or seeds is no pinch at all. She will give you what you want."

In February, this year, our camp was at Manpur in the Cuttack district of Orissa. Every land-owner there had donated his or her entire land in the Bhoodan Yajna. The land has been re-distributed. There is none landless in that village. There is no land-owner either. All ownership is vested in the village as a whole.

It is not only land distribution that has been brought about there, but also a land revolution. Land ownership has vanished for all time. Only He who owns the sky, air, water and everything else owns the land. The rest are *Bhoomi-putras* (land children).

And this is not true of Manpur alone. The first village that was to donate all its land in Bhoodan-Yajna as early as May 1952 was Mangroth in the Hamirpur district of Uttar Pradesh. On 26th January, when Vinoba entered Orissa, he was presented with 93 villages each of which had donated all its land.

On that day, while leaving Bengal and entering Orissa, Vinoba declared:

"The work to be done now is that of *Bhoomi-Kranti* (land revolution). Merely giving land to the landless is not enough. Private land-ownership has to be abolished. Land can only be God's or of the society. If people at any place can fully live upto this idea, it will be the *poornata* (completeness) of the Bhoodan Yajna. Thereafter the work of obtaining five crores of acres and distributing them would become very easy. The people themselves would take it up. I, therefore, expect in Orissa a *paripoorna darshan* (full) of Bhoodan Yajna."

* The divine cow which gives whatever you may want.

LIKE THE GANGA

When Vinoba reached Lakhana-natha Road, his first halt in Orissa, he was asked to address a few words to the large number of people who had gathered to receive him. He said:

"I have spoken so much during the last three and a half years that there should be no need for me to talk much in this State at any rate. My message has already reached here. My hope from Orissa is not small. I am quite confident that now when the Bhoodan-Yajna current has flowed on to this place, it will widely expand even as your Mahanadi expands near the sea. I learn that Sri Mukund Deva tried to bring the Ganga to Orissa. Perhaps he failed to earn the honour. But you will now earn it. This Bhoodan Yajna's current is the Ganga's. May you march with it right to the sea, the sea of humanity!"

Beginning with the gift of 100 acres on 18th April, 1951, about 37 lakh of acres of land have been so far donated as also about 150 villages. Meanwhile, the Ganga has been joined in her course, as it were, by various tributaries—the Jamuna (Jiwan Dan Yajna), the Gomti (Sampatti Dan Yajna), the Ghogra (Buddhi Dan Yajna), the Gandak (Prem Dan Yajna) and the Kosi (Shram Dan Yajna). And now it rushes to merge itself in the waters of the great ocean.

The past four years have clearly shown that of all problems in our country, the land problem is the most acute and vital—basic in the truest sense of the term. But it is equally evident that a mere solution of the land problem will not suffice. Growth of agriculture must be accompanied by that of village industries. The two are inseparable. Again, it is also evident that in tackling the land problem, mere zamindari abolition or fixation of ceiling will be of little avail. What is important is not that the rich be deprived of what they have, but that the poor should get what they deserve and require.

Of course, things will not drop from the heavens and the earth will get only when the sky yields; yet it is quite possible that the process will be held up by intermediaries, be they village panchayat chiefs or those in

the lower rungs of the administrative hierarchy. Zamindari has been abolished in UP all right, and land passed on to Government and indirectly to village panchayats; yet the landless can be reckoned in millions. A ceiling has been fixed in West Bengal no doubt; but the landless have known no change. The Bhoodan Ganga, cutting across barriers, reaches down to the bottom and provides land to those toilers who had never even dreamt of it.

NEW VALUES

But Bhoodan is much more than this. It claims to establish the following new socio-economic values.

- (i) Land and wealth cannot belong to private ownership—they must be owned only by the village or society;
- (ii) The use of the means of production must be given to the producer. Land must go to the tiller and not remain with those who never work on it;
- (iii) The distinction between manual labour and mental work should go;
- (iv) Manual labour—productive physical labour—should be a part of our daily routine even as bathing;
- (v) One must share what he or she has with his or her neighbour.

Thus viewed, land distribution is the smallest part of the Bhoodan programme. The ultimate object is to re-build the entire village structure on a new basis. A beginning is to be made in those villages where land revolution has become a fact—where the dedication to Bhoodan Yajna is complete.

While Vinoba was at Manpur on 26th February last, he expressed his great joy on coming there. In his post-prayer address, he said:

"I experience a sense of extreme gratefulness to God on reaching this place. I have cherished the hope—that hope is now strengthened—that this Bhoodan Yajna, which enjoys the blessings of Providence, will enable the whole of India to make land-revolution a living reality."

TWO POSSIBILITIES

At the recent Puri Sammelan, Vinoba gave a clarion call for land revolution. He observed that systematised and limited violence had

now reached the stage of '*ati-himsa*' (extreme violence). There were now two possibilities. This *ati-himsa* had to transform itself into *a-himsa* or assume more fearful forms and reach the consummation of ending the life, of man on this planet. Urging his audience to show courage, he asked them to prepare for complete *Ahimsa* by eliminating *Ati-himsa*. In other words, he indicated that people had to strain every nerve to found the *danda-mukta* (arms-free) and *Shasan-mukta* (state-free) society. He felt that *Sat-yug* was drawing near and that India was once again likely to be the source of an inspiration making itself felt all over the world.

Addressing the entire humanity from his rostrum, he said:

"Let all of you put your shoulder to the wheel for two years. This call of mine is not addressed to the people of India alone or merely to Sarvodaya devotees, but to one and all. I urge the whole world to leave no stone unturned for two years so that an arms-free society may come into force by 1957."

Proceeding further, he pointed out:

"Wherever you go for land donation, tell them that every *dan patra* is conducive to world peace. Don't you want peace in the world? If you do, won't you offer your share in the Bhoodan and Sampattidan scheme of solving the land problem? Your donation of one-sixth is a vote for world peace."

He concluded:

"Unless we work strenuously for two years to render our society state-free, non-violence will not come. Our work stands for the welfare of the whole world, for the benefit of the entire creation. '*Sarva bhoota hite ratah*' is the motto of this Conference. It is not only a matter of tackling the land issue. We have, in fact, to wipe out all Governments of the world, for they cannot succeed in limiting the sphere of armed conflict. We have to found non-violence. I ask for land gifts for the sake of world peace."

COMPLETE CHANGE

Thus land revolution implies a complete metamorphosis in every aspect of life, social, economic and political. It is to usher in a new world, a new society and a new man. Vinoba has chosen Orissa for the

fulfilment of his mission. Workers there are now concentrating on the Kohraput district where most of the villages have been offered. Vinoba himself will reach there on foot in May next. If they could succeed in securing a sixth of the land of that district or a large number of the 4,000 villages there, it would symbolise the efficacy of the Bhoodan technique. And if land revolution should prove possible in one district, why not in others too? And why not in the whole country indeed?

Marked by misery as her own, Orissa was Gandhiji's beloved province. The Bhoodan workers there are industrious and unostentatious. They may rise to the occasion and eradicate their age-old poverty by achieving land revolution. If this happens, who knows, Orissa which is so poor today and so backward may not only forge ahead as the most progressive of the states in Free India, a mighty surge may break forth from its borders which will sweep all the other states and much besides.

Land Tenure in Nepal

Y P Pant

THE system of land tenure in Nepal is not the same as it is in India. Despite the wide variety of types of tenure prevailing in different parts of the country, three broad types may be distinguished—Zamindari, Birta and the Kipat system of tenure. As compared to India, the zamindar, however, does not possess so many privileges and in theory he is just an intermediary between the Government and the tenant, and is remunerated for the collection of the land revenue by the Government at the rate of about 5 per cent (10 pies out of every collection of one rupee). Again, he does pay the same proportionate amount which an ordinary landholder pays for the land he owns. In Terai, the zamindar usually cultivates the bulk of his land himself and sub-lets only a part of it on contract either in kind or in cash, mostly the latter. Formerly, ejection of the tenants by the zamindar was quite common but this has been legally banned altogether since the advent of the new set up. Legally, he is not entitled to exact feudalistic dues, *begar*, *najarana* and so on, though under the Rana rule, because of the highhandedness and ruthless exploitation of the ruling classes, the zamindars in western Terai used to exercise all these illegal privileges. Even now, the law is the same, though of late, both interpretation and enforcement of the laws are being made more in favour of the tenants.

In the eastern Terai, however, which is much more densely populated, the hunger for land is also more acute and the *batai* systems like half going to the owner of the land and half to the tenant, or five-ninth of the produce going to the land-lord and only four-ninth to the tenant, still prevails. In contrast to the western Terai, where the zamindar possesses and cultivates vast tracts of land with much of labour and capital, in the eastern parts the holdings are small and the zamindar, in majority of cases, does not cultivate his land himself. Most of the tenants in the western part are generally migrants from Gorakhpur, Basti, Baharaich and Gonda districts of UP, who do not sever their link with their village homes and move only seasonally from Bhairawa, Butwal, Berdia, Nepal Ganj districts of the western

Terai. Such cases are not to be found in the eastern Terai, where tenants have got their own homes permanently and no such ties with the neighbouring Indian districts. There thus appears to be greater scope for exploitation of such migrant labour, in the western Terai than in the east.

The Birta system, however, is peculiar to Nepal. These are rent-free lands held by the Ranas and their sycophants and relatives to whom these lands had been given away generations ago as rewards for their loyalty. Birta lands present a serious problem and should be solved as early as possible. Such lands, in no case, are cultivated by the owners or their families but are generally given to tenants at will. Immediately after the set up, a Birta Abolition Committee was appointed to draw up measures for the abolition of the system. At one time, a scheme was put up before the Government to charge revenue on such lands and it was estimated that the State would have gained some Rs 80 to Rs 100 lakhs, had revenue been fixed at the same rate as under the zamindari system. However, the idea appears to have melted into thin air, in spite of the staggering deficit of more than one crore of rupees in the current budget. Pending a proper survey and assessment of the tracts of lands under different systems of tenure (which cannot be estimated even roughly), nothing better than the above scheme of levying revenue on Birta lands appears to be a practicable proposition.

The problem of landless, fortunately, has not assumed such gigantic proportions in Nepal so far, as in India. In some of the hilly regions, however, the problem has appeared of late of extreme scarcity of cultivable land. Efforts therefore should be made towards the reclamation of land in north Terai.

The third type of tenure, the Kipat system, prevails in the eastern most parts of the hilly regions and economically the standard of living of these people can be well compared with the backward classes in India. There are inherited ranks, known as '*sub-bas*' who cultivate or even sub-let their lands to others and in return they have to pay certain contributions to the Government. Every successor will have to pay a part of

his property to the Government but these tribes are so unruly that it is a serious problem even to maintain law and order among them, not to speak of collecting dues properly.

For any scheme of land reform in Nepal, a serious handicap is the lack of uniformity in the land tenure system. For example, the Birta system has about 16 variations. Even though the system may be basically the same, practices and customs vary widely in different parts of the country. And till today, so many things are dependent on social customs and traditions handed down from generations, that such differences are not easy to eradicate. For example, in certain parts of the western Terai, till last year, some zamindars refused to acknowledge even receipts for the contractual payments made by the tenants. All this has been possible because the Government has been generally run during the Rana Rule on the basis of certain assumptions which could under no circumstances be ignored. Again, even at present, the Government has no reliable land statistics and neither landlords nor tenants have any record of rights.

The Government is now seriously thinking of raising the standards of the masses by introducing various measures of reform and land reform figures prominently among them. Approximately 80 per cent of the cultivated land is under tenancy and the problem of land reform has of late come to the fore. The Land Reform Commission appointed in 1952 for setting down as primary policy objectives the control of exorbitant rents and ensuring security of tenure submitted its preliminary recommendations in 1953, of which the more important ones were:

- (a) The preparation of a land record, detailing the terms of tenancy;
- (b) The abolition of non-official intermediary system in the collection of land tax; and
- (c) The security of tenure for cultivating tenants, subject to the right of land-owners to resume possession of a limited area of land for personal cultivation

It is high time that the Government were serious and tried to implement all such measures directed towards the betterment of the peasantry.

expenditure, it will be 107.5 per cent! Why not entrust all the money to the Ministry for Irrigation, Power and Planning? At least, we shall then have all the barrages, dams, reservoirs and the like. Our rivers can keep us usefully busy for quite a time. We need not dig holes in the ground and fill them up again or bury notes in disused coal mines. Here is Nandaji, ready to spend Rs 1,100 crores in the next five years. Why shy at corruption in the execution of multipurpose projects? Let us be realistic. All this money would not have been spent and all these dams and barrages—the places of pilgrimage for the Prime Minister—would not have come up, if there had been no incentives. Payment for corruption is part of the supply price in this country.

Shri K C Reddy, the Minister of Production, also occupied the floor in Parliament for quite an hour much to the irritation of the Chairman, who, I am sorry to say, rebuked him for his long speech. He had really nothing particular to say, and his sole point was that if Parliament and Prime Minister were to show him grace by indefinite retention of job without undue stress on performance, he would not mind his entire work being done by his colleagues. It is rather a very awkward remark to pass that Shri TTK and Shri Reddy have wholly undeservedly lowered the prestige of the south in the north in recent months. Shri Reddy, however, is really an innocent man. He referred to the target of six million tons of steel by the end of the Second Five-Year Plan (1961) as a very remarkable progress! It looked as though we were turning out all the steel right now. But never mind. We have cleverer people, who will have British steel produced in India before the German combine delivers the goods or Soviet collaboration assumes a material form.

Meanwhile there has been considerable progress. So we are assured by a Progress Report issued by the Planning Commission for the third quarter of last year. There is nothing in the Report that is new or has not been shouted from the house-tops for quite some time. The only difference is that the prefatory remarks of Shri V T Krishnamachari, previously characterized by a measure of humility, now strike a note of confidence, with quite a touch of variety. The Baby of the Plan-

ning Commission has grown teeth and is even beginning to bite. This, however, is an insufficient analogy against the background of the fact that the Commission has even conceived the second Five-Year Plan with a total expenditure of Rs 5,600 crores—1,400 crores for large scale, heavy industry, 950 crores for agriculture, irrigation and flood control, 900 crores for transport, 500 crores for power development, 200 crores for small-scale industries, 100 crores for development of consumer goods industries, etc. This pattern of investment and other allied economic and social issues were examined last week-end by Deshmukh-packed Panel of Economists. They missed the bus in the First Five-Year Plan and Deshmukh got the work done by his own bright boys, who, as events have proved, lacked elementary judgment regarding the working of economic and social forces even for the short period. Deshmukh's rebuke in his Banares speech touched the hearts of the economists and they appealed to him to give them a chance. So we have the Panel of Economists determined not to miss the bus this time. It must be confessed that Prof Gadgil of Poona has done a man-sized job. It is only to be hoped that his will not be the croakings of a Cassandra—a la Keynes—his experience of the Agricultural Credit Committee and the Commodity Prices Board having been sufficiently tragic in the past. But if Prof Gadgil takes over, what will Deshmukh's blue-eyed boys do? If they keep quiet, they might earn a promotion abroad. It is only natural that an economic adviser to Government or the Reserve Bank should after all the hard labour that is necessary to keep Deshmukh pleased, be promoted to a cushy job like that of the Executive Director of the IMF or the World Bank. Deshmukh has plenty of these sinecures and they should be satisfied with these plums. It is time—and it would well accord with Chitpavan Brahminism—that D R Gadgil came into his own as the maker of economic policy. How is it that this elder economist, who has for the past several years wasted his energies on such sectional pursuits as the agitation for Samyukta Maharashtra, has not yet spoken about the socialistic pattern of society? It is time, he did; or is it that he has done it in his secret confabulations with the authorities? Can't he utilize his personal influence with Deshmukh, as he knows how, to forge a socialist pattern of society?

Hesitant Equities

Wednesday, Evening

EQUITIES have been marking time on the Calcutta Stock Exchange for the last few weeks. There has been a considerable reduction in the volume of business. In the absence of support, equities have tended to be irregularly lower. But it is of interest to note that selling pressure is not much in evidence. This explains why equities are not falling. Such a description of market movements in recent weeks does not, however, tell the whole story.

Admittedly, there is lack of investment support in the shares which are included in the clearing list. Indian Iron have been fluctuating within a narrow range. In sympathy, the other forward shares remain idle. Even so, on many occasions, Orient Paper and Burrakur Coal were bid up to higher levels on interested buying support. In both these shares, there has been support from knowledgeable quarters in recent days.

INDIAN IRON

Absence of any improvement in Indian Iron must have come as a surprise to "bulls". Output data for the year to March, 1955, are highly encouraging. From the increased output, it is a reasonable assumption that the Company's earnings and profits for the year to March last will be higher than that of the previous year. This will, perhaps, not be denied by those who are reluctant to lend support to Indian Iron at current levels.

But there are two reasons why investors are hesitant about Indian Iron. For one thing, even if the Company's earnings and profits increase, the dividend disbursement may not be higher as the Company has heavy prior charges and commitments. There is something in this argument. But it would be foolish to ignore the fact that higher earnings will enable the Company to strengthen the financial position further.

In the main, Indian Iron, along with other iron and steel shares, remain hesitant because of the uncertainty relating to steel retention prices. This is a factor which affects both Indian Iron and Tata Steel. But investors and speculators are not wrong in assuming that the question of retention prices is of more importance to Indian Iron. Even so, even on last year's reten-

tion prices, it should be possible for the Company to maintain dividend payments.

ENGINEERINGS UP

Despite the irregularly lower trend in Indian Iron and in Jute shares, selective support to Engineering and Tea shares continues. Even though the Engineering shares which are now being supported are the scrips which moved up some months ago due to cornering activities, there is no reason to believe that cornerers are still in the market. It is presumed that Engineering shares are meeting with investment support.

A couple of years ago, Engineering shares started moving up on the argument that secondary engineering industries must expand along with economic improvement according to the Plan. Later, Engineering shares fell, in sympathy with the drop in equities in general, because of apprehensions that the public sector might be expanded at the expense of the private industrial sector.

These doubts and apprehensions persist. But market circles are now arguing that, irrespective of the uncertainties relating to the Government's future economic policy, secondary engineering industries may be expected to prosper as the emphasis shifts to expansion of industries during the second Five-Year Plan. Engineering shares are being bought on some such argument.

TEA DIVIDENDS

Along with Engineering shares, there is selective support for Tea shares. It is not without significance that Tea shares are being supported, though recent auction results are not encouraging. In Tea shares also, cornerers do not seem any longer to be interested. Tea shares are moving up not because of syndicated buying, but because of selective investment support.

There is more than one reason why investors remain interested in Tea shares. Immediately, dividend anticipations are stimulating investment support. Reports are encouraging. In many gardens, the output has been higher. Many companies have sold tea at higher prices. Investors are, therefore, buying Tea shares on the argument that forthcoming dividend disbursements will be higher.

Some speculative investors have shown revived interest in Tea shares since the publication of the report of the Taxation Enquiry Commission. As it became known that the Commission was opposed to taxation of bonus shares, buying started in Tea shares in anticipation of issues of bonus shares. Market circles argue that the proposed amendment of Section 23A of Income-Tax Act may force some tea companies to raise dividend disbursements.

Three factors are, at the moment, hampering stock market activity. Doubts persist whether industrial expansion in the second Five-Year Plan will be mainly within the public sector to the neglect of the private sector. Industry feels frustrated that the State will be the dominant partner in the future exploitation of heavy industries.

Investors are arguing whether implementation of the recommendations of the Taxation Enquiry Commission will be conducive to the development of the private sector. Shri G D Birla complains that the implementation of the Commission's suggestions will lead to a diversion of funds away from the private to the public sector.

Industry is worried that the Commission has suggested that deficit financing should be kept at a minimum level. This means that taxation, direct and indirect, will be raised gradually. And that, industry apprehends, will mean continued diversion of funds away from the private sector. Industry would also seem to be dejected that the inflationary stimulus of deficit financing would not be as strong, as anticipated formerly, if the Commission's suggestion is accepted by the Government.

THE INDIA ELECTRIC WORKS LTD
6 SIR PHIROZSHAH MEHTA ROAD FORT BOMBAY

Story of Co-operation, 1952-53

IN view of the decision subsequently taken by the Government of reorganising rural credit and channelling it through the co-operative societies on the recommendation of the All-India Rural Credit Survey, the progress of the co-operative movement, though the statistics for it are only for the year 1952-53, deserves more than usual attention. This particular year is also of unusual significance for co-operation, being the second year of Five-Year Plan. That commodity scarcity and controls should have been the cause of expansion in the activities of co-operative institutions during the inter-war and post-war years, therefore, does not add to one's confidence in the inherent vitality of the movement in India. But that is the inevitable conclusion that emerges from the *Statistical Statements relating to the Co-operative Movement in India for the year 1952-53*, published by the Agricultural Credit Department of the Reserve Bank of India. Like the previous issues, this report too has appeared after a time-lag of two years; this is hardly calculated to sustain public interest in the working of those institutions because it can throw little light on the state of things obtaining at the time

of publication.

A significant omission in the report, however, is the possible impact of the measures under the Five-Year Plan on the movement. Co-operation has been given a place of pride in the First Five-Year Plan. "The reorientation of the economy in terms of the objective of the Plan", said the Planning Commission "involves a rapid extension of the co-operative form of organisation. The possibilities of co-operation in the vast fields of primary production of cottage and small-scale industries, of marketing of agricultural produce, of residential housing, of wholesale and retail trade are immense. The encouragement of co-operative enterprise in all these fields has to be given the highest priority." It would be natural, therefore, to expect in a report on co-operation covering the second year of the Plan some mention of what the Government did to translate these aims into deeds and with what results. Curiously enough, there is not a word about the Plan in the field of co-operation in an otherwise illustrative and exhaustive report.

Though the movement is now half a century old, it is only during the last 10 years that it has been

expanding at an appreciable rate, judged by the number of societies, population covered, funds employed and range of activities. But the movement continues to be spoonfed by the State. In spite of all the goodwill and sympathy from all quarters, it seems that for many more years to come, State sponsoring, supervision, management and large scale financial assistance will be indispensable.

The number of primary societies of all kinds has been increasing at the average rate of 4,000 a year. There were 1,89,436 societies at the end of 1952-53 compared to 1,85,650 at the end of 1951-52 and 1,81,189 at the end of 1950-51. Of the total of primary societies in 1952-53, 68.6 per cent were credit societies; credit societies accounted for 77 per cent of all agricultural societies. The decrease of 1,500 in the number of grain banks during the year was due to decontrol. Among non-agricultural societies, credit, non-credit and insurance societies have registered steady progress.

The membership of primary societies recorded a rise of 3.8 per cent from 137.92 lakhs in 1951-52 to 143.16 lakhs in 1952-53. Despite

THE ECONOMIC WEEKLY

the increase in the total membership of primary societies, however, membership in agricultural non-credit societies fell steeply from 33,65,243 in 1950-51 to 27,32,047 in 1952-53. It is not quite clear whether this decrease in membership was solely due to the removal of rationing and lifting of controls or it also indicates a weakening of the movement in the non-credit sector.

While the total working capital of all types of societies increased from Rs 306.34 crores at the end of 1951-52 to Rs 327.10 crores by the end of 1952-53, ie, by 6.7 per cent, the bulk of it came from increases in the owned funds of the societies themselves, deposits from individuals and other sources and from borrowing from land mortgage banks and societies on debentures. Though the deposits from primary societies and other co-operative institutions also showed an improvement, it was not large enough to contribute materially to the improvement in working capital. Indeed, the increase of the ratio of owned funds to total deposits from 79.1 per cent in the previous year to 83 per cent in the year under report raises the pertinent question whether or not this is to be regarded as a healthy trend at all. The resources of the societies are too inadequate to meet the demands on them. Continued dependence on external agencies for finance has often been regretted but cannot be helped. It is the other trend, which was so prominent during the year, which is equally an undesirable feature of the movement.

Taking a broad view of development in co-operation since the beginning of the war, it will be seen that working capital has substantially increased. If the average for the five years to 1939-40 is taken as the base, the total working capital expanded from 105 crores roughly to 327 crores in 1952-53, ie, by some 203 crores. This increase was made up as follows:

Share capital	40
Deposits from members ..	16
Deposits from societies ..	13
Loans from Provincial Banks	21
Loans from Government ..	14
Loans from non-members and other sources ..	62
Borrowing from land-mortgage banks ..	14
Reserve funds	23
Total	203

It will be noticed that the most substantial part of the increase came equally from loans and deposits from non-members and other sources, and from share capital and reserve funds, the last two taken together amounting to the same figure as the first item. Contrary to popular belief, however, though Government assistance has increased substantially in recent years, up to the period of the report it was not one of the major items making up the total.

The substantial increase in share capital while deposits lag behind, needless to say, is highly deceptive in that it shows no increase in the savings of the members held in this particular form in preference to deposits. On the contrary, the figures of share capital represent forced saving in that taking up of shares is a condition precedent for availing of borrowing facilities.

To return to the developments in 1952-53, there was a precipitous fall in the amount of loans advanced by Apex and Central Banks alongside a slight increase of Rs 1.1 crores in the loans advanced by primary societies. The total loans advanced by the former fell by 2.2 per cent from Rs 97.95 crores in 1951-52 to Rs 95.86 crores in 1952-53. The report ascribes this to the lack of demand for funds for dealings in controlled commodities following the relaxation of controls during the year.

A particularly disturbing feature is that 'loans outstanding' have been going up faster than 'loans advanced'. The total outstandings of all banks amounted to nearly Rs 20 crores at the end of June 1953, percentage of overdues being 18.6 per cent in the case of individuals and 16.5 per cent in the case

of banks and societies as against 12.6 per cent and 16.4 per cent respectively at the end of the previous year. From the point of view of strength, stability and progress, this trend has to be reversed. Allowing some margin for backwardness and other reasons, a very big percentage of overdues to outstanding remained to be collected in part 'B' States. In Bhopal and Vindhya Pradesh, it was as high as 99 per cent and 98 per cent respectively.

The rates of interest charged by the primary agricultural societies also call for comment. Even in States where co-operation is relatively well developed, eg, Bombay and Madras, the rates are still high; in some States like Assam, Madhya Pradesh, Punjab, Uttar Pradesh, Pepsu, Rajasthan and Manipur, they are as high as 12½ per cent. And this, when the Reserve Bank lends at 1½ per cent and the Government provides large loans on nominal interest.

Inadequate local deposits or the uneconomic size of the Central Banks in some of the States cannot justify the usurious rates of interest still charged. Elimination of the long chain of intermediaries and determined efforts to reduce service cost will certainly lead to substantial improvement in the situation.

With the recommendations relating to the reorganisation of the co-operative movement made in the Rural Credit Survey, and with the efforts of the Central Committee for Co-operative Education to plan and organise the training of personnel together with the large-scale efforts of the Planning Commission, the co-operative movement should be able to look forward to better days ahead.

MORE PEOPLE buy LARGER POLICIES in QUICKER TIME with the ORIENTAL

In 1954, which marked the end of the eighth decade of its history and the beginning of the ninth, Oriental afforded life insurance protection of Rs. 4,668 to someone somewhere every minute of every working day—i.e., nearly Rs. 16½ Lakhs every working day.

IN 1954

OVER 1,23,000 POLICIES WERE ISSUED
ASSURING OVER RS. 47,50,00,000

In conformity with its tradition of serving the people, the ORIENTAL now underwrites every risk that can be insured and, in doing so, it affords the opportunity to its life Policyholders of sharing in the profits of not only life but also all classes of General insurance business.

Bandung

FOR the first time in history, twenty-nine Asian and African nations are now assembled at Bandung to discuss problems of common interest. Deliberations of the Asian-African Conference to date belie fears, expressed at the time when the proposal was first mooted at Colombo a year ago, that there can be no useful purpose in holding a Conference of nations which have no geographical, or political, or economic interests in common. To Indonesia, a south-east Asian Power with affinities to Africa and the Middle East, goes the credit of initiating such a Conference. Enthusiastic response to the invitation, issued to the Asian and African nations after the meeting, some months ago, of the Colombo Powers in Indonesia, was ample indication of her faith in such a Conference. It is inevitable that opinions will differ on issues discussed by a Conference of nations with such varied social, political and economic interests. But the proceedings to date will assure those who are familiar with the bickerings and indecisive discussions at the United Nations.

Bandung was expectantly awaited if only because there the Asian and African nations were to have the first opportunity to discuss their common problems informally, but intimately, with China and Japan. China has emerged as one of the most powerful nations not only in these regions, but in the whole world. Japan's re-gained world status is beyond dispute. According to the preamble to the Indo-China Agreement on Tibet, Peking is committed to Panch Shila as the basis of relations between China and the nations of the world. China's adherence to the Five Principles of Peace was reiterated by Mr Chou En-lai in his joint declarations with the Indian and Burmese Prime Ministers. In his inaugural address before the Bandung Conference, he has re-affirmed China's desire to be at peace with the world, and to maintain regional and world peace through negotiated settlement of disputes. There is nothing in the Five Principles which can be repulsive to Japan. Inaugural address of the head of the Japanese delegation is reassuring. He is emphatic in his assurance that Japan has abandoned her policy of militarist expansionism, and that she is eager to live in peace with her neighbours and the world.

Much has happened since the Geneva Agreement to emphasise the importance of Bandung. Developments in South Viet Nam threaten to prejudice that Agreement. SEATO is widely condemned in Asia and Africa as a violation of the spirit of the Geneva Agreement. America's pledge to defend Formosa is an obstacle to peace in the Far East. In the Middle East, there is opposition to the Turco-Iraqi Pact. In many parts of Africa, political arrangements are being perpetuated which are resented by the peoples directly concerned. Some of these developments are instances of interference in Asian and African affairs by outside Powers. Some others represent imposition and enforcement of policies without the consent of the peoples and nations concerned. These and similar other related problems will inevitably be discussed in detail at Bandung. From the statements made so far, it is clear that all the nations assembled at Bandung are united in their

opposition to colonialism and racialism. Bandung will emphatically endorse Pandit Nehru's warning to the Western Powers not to interfere in Asian and African affairs, nor to try to solve their problems without consultation and consent of the peoples and nations directly involved.

It is neither the intention nor the purpose of the Bandung Conference to form an Asian-African Bloc; or to create any regional military organisation like NATO and SEATO. Bandung is not a move against the United Nations. There is emphasis on the application of the principle of self-determination throughout Asia and Africa. Colonialism and racialism are to be fought jointly and collectively. There is re-affirmation of the resurgent East. But there is no hostility to West, or to the United Nations, dominated by the Big Western Powers. Bandung's major purpose is to proclaim the principle of world peace through negotiation, mediation and conciliation. Colombo Powers are already converts to the principle of attaining and preserving peace through negotiation. Their intention is to extend the area of peace to the whole of Asia and Africa. From the enunciation of Egypt's policy by her Prime Minister, it is clear that the Colombo Powers have an influential ally in Egypt, the leader of the Arab world, in the pursuit of their aims. Asian and African nations are opposed to military pacts and alliances as major means of maintaining regional or world peace. They are determined to resist aggression. But they are equally determined to eliminate threats of aggression through mediation of issues in dispute. In accepting national sovereignty, they undertake not to interfere in the internal affairs of nations. But the proceedings at Bandung have already made it clear that, though committed to non-interference in domestic affairs, they are eager to use their good offices to solve the issues in dispute among some of them.

Final assessment of Bandung must necessarily await the conclusion of the Conference. It is certain that Bandung will go down in history as the visible symbol of the resurgence of Asia and Africa during the second half of the twentieth century. Bandung should be regarded as the logical sequel to, and culmination of, the development which began in Paris some years ago.

It was during one of the rare sessions of the General Assembly of the United Nations at Paris that Pandit Nehru reminded the West that Asian affairs and problems could no longer be discussed or solved in the context of Europe alone. To Paris also can be traced the beginning of the assertion by the small Powers of their growing importance in world affairs. It was when the Berlin Blockade emerged as an imminent threat to world peace that the small Powers asserted their new world status and respon-

sibilities. There was deadlock in the negotiations among the Big Powers concerned. At that crucial phase of the Berlin Blockade, the small Powers had the diplomatic wisdom to initiate informal talks, under their auspices, among the Big Powers. This effort to preserve peace was successful. A compromise solution was found during those informal discussions. War was averted. This was the origin of the Arab-Asian Bloc in the United Nations. On all major disputes in many parts of the world, this Bloc has exercised a restraining influence. Its efforts at solving disputes through negotiation have been in direct contrast to the Western Powers' exclusive reliance on collective security to maintain world peace.

Bandung is not the beginning, but an emphatic reminder of emergent Asia and Africa, and of the growing importance of small Powers in world affairs. These are international developments which are already well established. Bandung has wider implications. It is an attempt by the Colombo Powers to extend the area of peace throughout Asia and Africa. By endorsing Panch Shila as the foundation of relations among nations, Bandung is expected to ensure peace and amicable relations among Asian and African nations. Bandung is essentially an effort to maintain peace in the vast regions of Asia and Africa through negotiated settlement of disputes among the nations concerned. Bandung has a more ambitious objective. There will be hope that Bandung will be a beacon to the wider world to live in peace through settlement of disputes by conciliation. Peaceful co-existence is not the prime objective of Bandung, though the progressive application of the principles proclaimed by the Colombo Powers should result in peaceful co-existence. Asian and African nations assembled at Bandung owe a responsibility to ensure world peace in conformity with their growing world status. They have a common interest in world peace. Bandung can not only enhance the importance of small Powers, but can prevent a third world war by an active and collective endorsement of the Ceylonese Prime Minister's call to Asia and African Powers to offer their good offices as mediators in the conflict between the Capitalist Powers and Communist States.

India and Lancashire

INDIA's emergence as an exporter of cotton textiles in world markets does appear, in retrospect, to have taken her own textile interests and her Government by surprise rather than the others. To whom should the credit for it go? Is it our just desert or merely a fluke? Like augurs of old examining the entrails of a goose, our millowners take a hurried peep at the Japanese mills and come back with woeful tales of our own deficiencies; gloomy forecasts follow about the impending disappearance of Indian cloth from world markets, unless this or that were done. There are variations on the theme but the keynote is the same: reduction of excise duty and "hands off cloth". The Government torn between the importunities of the millowners and pleadings of Gandhians in their own camp, mindful of the political danger of the rural unemployed or under-employed making common cause with handloom weavers in distress, vascillate and try to maintain an uneasy peace on both fronts.

What has brought up this country as a leading exporter of cotton textiles, whether it is the technical excellence of the industry, managerial ability of the millowners, the skill of the textile workers or the self-denial of the cotton grower who has to remain content with a price below world parity—the question has never been answered clearly. Disturbing uncertainty remains about the chances of our being able to maintain textile exports. Every fluctuation in monthly or quarterly figures is bewailed and gives rise to gloomier forebodings. Those who claim to read the future from the past are even today bemoaning the fall in cloth exports in the first quarter of the year to 192.5 million yards from 232.8 million yards in the first quarter of last year. Indian cotton textiles have lost ground to Japan in Burma, which has discontinued the preferential duty so long enjoyed by them; our position in the Sudan is threatened because we declined to buy high priced Sudan cotton, in view of the bumper cotton crop at home and so on and so forth. In these figures is writ large the increasing inroads of Japan in the markets of Asia and Africa. True, there is concerted action, or at least a move for export promotion—standardisation of

packing, inspection before shipment and such others, the usual routine checks for removing tares from corn and preventing malpractices of the garden variety.

The same vascillation, arising from the uncertainty at heart, have led the Government, very unwisely it seems, to receive the British Mission which came to negotiate reduction of import duties on British textiles. Exports of Indian cotton textiles to Britain last year reached the record figure of 133 million sq yards, seven times as much as in 1953. More than half of it, however, was for processing and re-export. To that extent, India is helping Lancashire to utilise its processing capacity; it will not pay Lancashire to produce grey cloth, the cost would be too high.

The reasons why Lancashire has not shared Tory prosperity in Britain—"it is a forgotten community"—is not Indian competition, fair or unfair. Last year, while India increased her exports to Britain sevenfold, British exports of textiles were the lowest for a 100 years; lower, in fact, for any year since the 1840's. There is no uncertainty and little disagreement about the causes the world has changed; other countries have developed their own textile production, consumer preference is moving away from cottons, in which Britain has no particular advantage anyway, to synthetics, the continent has already effected the change-over, Lancashire has to adjust or drop out. Meanwhile, Indian grey cloth can give and has given it breathing space.

It is silly to suppose that Tories can be happy to see this pioneer of industrial revolution fallen on such evil times. That the British Chancellor of the Exchequer did not yield to Labour agitation for restricting imports of Indian cloth was for the very sound reason that restrictionism is no solution for any of Britain's problems and in the case of cotton textiles, placed as she is, it would only have meant opening the door wide to imports from other countries, particularly Japan. Hence the search of a solution by exploring possibilities of increasing exports, among others, to India.

New Delhi was unwise in countenancing this move, for the simple

reason that its own commitment in the matter of excise duties leaves it little scope for a downward adjustment of import duties, particularly when it is its firm policy to restrict imports to luxury goods and British textiles that may find a market here belong clearly to the latter category. At the annual meeting of the Bombay Millowners' Association held this week, Mr Burns pointed out, quite unintentionally perhaps, how tightly the Government's hands are tied. Excise duty and cess on some of the superfine varieties of cloth, he worked out, amounted to 22 to 25 per cent *ad valorem*; they reach as high as 28 per cent in some categories and are not lower than 15 per cent in the case of finer varieties. Britain for her own reasons has been trying to get Japan admitted into the GATT; Japan is now entitled to the most favoured nation treatment which ties down India so badly that it is not possible for her to offer any substantial inlet to British textiles, without inviting a flood of imports from Japan. Even if this measure of accommodation were extended to Britain, it is doubtful, how far she would gain.

Indian exports of cotton textiles to Britain, however, cannot be viewed in isolation. Britain herself would shrink from pressing for it. In yardage however fantastic last year's cloth exports to Britain might look, in terms of value they accounted for no more than £16 m out of a total export from India to Britain of £148 m. That cloth exports were so much higher than a year ago, is quite another matter. On the other hand, British exports to India last year amounted to £115 m and exports of textile machinery alone to nearly £7 m as against her imports of Indian cloth of £16 m which was, in any case, an all-time record. If some modest adjustment of duties could be made, consistent with our policy in other respects, it would not be such a bad idea to allow some marginal imports of finer textiles to give just a little healthy shake-up to the select group of mills in this country which go in for this luxury type of product and reap a reward out of all proportion to their efforts. But the possibilities are limited and the chances of disturbing the complacency of favoured mill magnates remote in the extreme.

Weekly Notes

Criminal Procedure Code and the Press

THE press is with us late and early, except for Londoners who have not had a newspaper to look at for many weeks now except the *Daily Worker*. Indeed, the press strike has come to be accepted and almost overlooked. That London has been without newspapers for so many weeks and yet the skies have not fallen, has shaken, for the first time, the third estate. Fleet Street has begun to be nervous: so people can do without them; the quip about one not being able to pack one's lunch with a radio has begun to wear a little thin. Here, however, the press has been very much with us, particularly with the Home Minister, who is carrying the mantle of his predecessor manfully and sticking up for the clause in the Amendment Bill to the Code of Criminal Procedure, now before Parliament, which protects public servants from libellous attacks from the yellow press. The words are not exactly these; but that is the intention.

Knowing that the Home Ministry is dead-set on getting this clause through, it is an agreeable surprise to find a dyed-in-the-wool Congressman taking up the cudgels on behalf of the press in the staid Rajya Sabha which is supposed to hold elder statesmen who should be on the side of order and decorum, rather than countenance scurrilous writing. Speaking in support of the bill, which is parliamentary good form—comparable to loyalty to the throne resolution with which the Congress used to begin its sessions in the pre-Gandhian days—Shri Raghavendra Rao attacked the clause which authorises civil servants to sue offending newspapers for defamation at Government expense. The points made by Shri Raghavendra were many—to protect the innocent from calumny is a laudable objective, but why discriminate in favour of public servants and leave others, honest citizens, exposed to the same risk? Why, again, protection from the printed word and not from the spoken word which can be as foul and hit just as hard? Then, there is the definition of 'defamation'. "Will it not be a double-edged

weapon whereby even an honest press, for want of sufficient sources for presenting the required evidence on the spot, may itself be hauled up? Have the framers of this measure ever thought of affording equal opportunities or making equal facilities available to the press also?"

A defamed public servant may be called upon, under this clause, either to present his defence and prosecute the press or face condemnation and departmental action. In law, it may be the Government that would sanction the prosecution, but in fact, it would be his superior officer who would first move in the matter. Thus the junior public servant would not only be left at the mercy of the yellow press, but also exposed to the whims of his superior, especially if the latter happens to be of a vindictive type. Will it not then institute a new tyranny? "Strangely enough," said Shri Raghavendra, "the Press Commission, which unfortunately happened to consist of an overwhelming majority of such eminent men, who have had nothing to do with the working and the life of the press, arrived at an unhelpful conclusion, and took a stand broadly in support of the defamation clause entirely in opposition to the interests of the press." Rather than this wrong measure, it is the Press Commission's other recommendation for setting up a Press Council which should be immediately implemented so that the yellow press may be handled properly. Instead of proceeding with it, why is the Government so persistent in pushing on with a measure that has been condemned by every section of responsible opinion in the country?

Student Unrest

STUDENTS in India have often been talked about and talked at; but seldom have been they been talked with. In that respect, the seminar sponsored by the Union Ministry of Education and the Indian National Commission for Co-operation with UNESCO at Hyderabad marks a pleasant departure. The nine-day seminar which started last Saturday has had the advantage of hearing the views of

both teachers and students on a subject of considerable urgency like "the problems of maladjustment in adolescent students and their academic and social surroundings". This question has been figuring frequently in convocation addresses of late; but the diagnosis attempted and the solutions suggested have had the defect of being one-sided and also perhaps somewhat too paternal for the taste of modern boys and girls. After all, the latter are the best judges of what goes on in their minds or causes that restlessness which has often resulted in acts of indiscipline and open revolt; and the present generation of teachers, brought up in a different atmosphere and a different social setting, can, with all their power of understanding, do no better than help the young to probe into the stresses to which they are subject and reveal their essential features.

We have no means of knowing how far the student representatives at the seminar felt free to participate in discussions or suggest solutions. Perhaps a seminar or a public conference, where comparative strangers meet to debate general issues, is not exactly the place for the diagnosis of delicate problems bearing on the complex workings of the human mind. Little groups of teachers and students meeting in a setting of friendliness, frankness and free understanding could perhaps tackle the task better. Nevertheless, it must be said to the credit of the seminar and its sponsors that they have indicated a new and welcome line of approach to the problem by encouraging students to have a hand in its solution.

The First Proper Land Census

HYDERABAD is one of the few States which have taken the census of land holdings seriously. It accepts the importance of accurate and reliable agricultural statistics for an appraisal of agricultural production and formulation of production targets, for a proper assessment of resources and for the implementation of land reforms as well as for watching their progress. Village records, prepared with reference to the registered occupants and not those who actually hold the

lands, convey very misleading information regarding rights in land. The State was therefore early impressed about the necessity of a proper record of rights in land. It has been carrying out the census with due care as the directives and instructions issued to revenue officials by the Land Reforms Division of the Board of Revenue will bear out. The preliminary results of the census for 36 of the talukas, covering a fourth of the area of the State, therefore, merit more than a passing notice.

These figures show that 87.7 per cent of the agricultural land belong to small holders owning less than the basic family holdings; 11.3 per cent belong to middle owners owning less than the ceiling but more than one family holding; and only one per cent of the owners are substantial holders, owning more than 4½ times the family holdings. For purposes of comparison, all land is converted into dry acres according to a standard rate of conversion.

The area covered by the census for which these preliminary results are out, includes Telengana, and in view of the recent history of this district, the findings would not be representative of the whole state, much less of other states. In the other districts of Hyderabad, the number of small holdings is not likely to be as large. An interesting finding of the census, however, is about the fragmentation of holdings. Ownership holdings in the area covered consist of four scattered plots on an average, the number depending on the size of the holding. Substantial owners own at least 10 separate plots. The significance of the latter finding need hardly be emphasized. Large holdings do not mean cultivation in big consolidated farms though so far as economies of cultivation are concerned, this does not rule out those arising from marketing and finance, if not from management also.

India and America

A DIPLOMAT has to be diplomatic in his actions and statements. Mr Sherman Cooper, the new American Ambassador to India, has begun well. At his first Press Conference in New Delhi, Mr. Cooper is reported to have observed that there is no contradiction between Panch Shila, as enunciated by Pandit Nehru, and the basic policies of the American Government. Even those who may disagree with this statement will admit that there should not be any con-

tradiction in the foreign policies of these two friendly nations.

Both India and America are members of the United Nations. Panch Shila is not in contradiction with the fundamental principles of the UN Charter. To emphasise this is not to accept that there is no contradiction between the foreign policies of America and of India. America, like India, desires world peace. But America differs with India about the means to attain and to preserve world peace. America relies on collective security to deter aggression and to maintain world peace. India's foreign policy is based on her conviction that disputes among nations can be settled through mediation.

According to news agency reports of Mr Cooper's Press Conference, Mr Cooper is reported to have admitted that there has been some misrepresentation about India's foreign policy of non-alignment. But he is reported to have assured his audience that there is now greater understanding in America of India's foreign policy of non-alignment. It is good to know that India's foreign policy is now better appreciated in America. But, from Mr Cooper's

Letter to the Editor

"Malodorous Indecorum"—A Protest

I READ with interest your comments in the Weekly Notes under the caption "Malodorous Indecorum" which appeared in the last issue. I am afraid that you have missed the main point in Dr Keskar's speech referred to in the note. If you had listened to the speech or read it carefully, you would not have taken this point for comment. Dr Keskar's contention was that Ministerial interference is inevitable under certain circumstances. According to him, it is the duty of a civil servant, high or low, to carry out the policy decisions taken by Ministers. No officer of the Government can be a law unto himself. If any officer is not in agreement with the policy laid down and becomes indifferent in carrying out the directives, some sort of interference is inevitable and in such cases if the officers concerned approach Members of Parliament and the latter raise the bogey of Ministerial interference, it is unfair to the Minister. After all, it is the Minister who is responsible to the Parliament for the policy of his

definition of it, it seems doubtful whether Washington is even now aware of the basic essentials of India's foreign policy.

One of the prime responsibilities of an Ambassador is to interpret the country to which he may be accredited, to his own Government and the people. Mr Cooper has a responsibility to interpret India faithfully to his own country and Government. To enable him to discharge this responsibility, it is necessary for him to appreciate India's foreign policy in its proper perspective. Non-alignment may be an incidental aspect, but it is not the essence of India's foreign policy. India's foreign policy is based on Panch Shila. It is not a negative, but a positive influence. India is neither neutral nor non-interventionist in the passive sense. Her positive foreign policy is reflected in her active efforts to ensure peace in Korea and in Indo-China through mediation. India is not only interested in extending the area of peace. She is equally active in co-operating with all Powers in maintaining and in preserving peace through negotiation. To define such a foreign policy as one of non-alignment is to misinterpret it.

ministry.

Another point made by Dr Keskar related specifically to the AIR. The methods of recruitment, conditions of service, functions of the various categories of officers, etc, were all in a mess in this particular department because the All-India Radio had developed under emergency conditions. It was, therefore, inevitable that when reorganisation and regularisation of service took place, there were a few who had been adversely affected. In fairness, a Minister should be judged only by the policy he adopts and the way in which he gets it implemented. If Ministerial interference makes the implementation of the accepted policy difficult, then also the Minister concerned deserves blame, but to quote a particular sentence uttered under provocative circumstances, out of the context in which it was uttered, is hardly fair.

Economics of Afro-Asian Countries

OF the African countries represented in the Conference, Gold Coast and Liberia have little contact through trade, history or politics with the other countries, the only common bond being that they are slowly emerging from subjection. The pattern of the economy in tropical Africa is basically agricultural; population density is usually low; self-sufficient village economies are the prevailing type, interspersed with plantations and mining, both developed with foreign capital and technique. Some of them are major producers of minerals. Gold Coast, for example, is a substantial producer of bauxite and the third leading producer of manganese in the world. In recent years manganese imports from this ex-colony have been overtaking imports from India in the UK market. Africa in 1951 accounted for 54 per cent of world production in manganese.

The countries of North Africa, however, are of a completely different character. Here population density is extremely low, compared to the total land area, but pretty high, to the extent that there is stable agriculture, if comparison is confined to those who wrest a living from the limited cultivated area. Countries west of Egypt, however, are still largely pastoral.

In the Middle East also, density is very low, but compared to the cultivable area, it is high. On a pastoral-cum-primitive agricultural economy, economics of oil has made a deep and disturbing impress. Middle East production of oil is only 15 per cent of the world total and US still leads, with half the world's production. The proved reserves of the Middle East, however, exceed those of the US. The land surface is largely mountain and desert; cultivable area hardly comes to 5 per cent of the total. Inequality of incomes and wealth has always been far greater than even in South East Asia because of the land holding system; it is being greatly intensified by the impact of oil economies.

Turkey, however, though geographically a northern extension of the Middle East, is in many ways very different from the rest. Among other things, it is a substantial exporter of wheat. There is not much beyond oil that Middle East exports besides dry fruits and a little grain

and some pastoral products. The countries are dependent on imports for almost all their requirements of manufactured goods.

Egypt again is different. It has a valuable export crop in cotton, also other exports, a fairly developed banking system and it has made a beginning in industry.

Though important exporters of plantation crops and minerals, developed largely under the aegis of foreign capital, it is the substantial development of agriculture, despite very low yields, which marks out South East Asia sharply from the countries of Middle East and Africa. Excessive dependence on exports of these crops is also a feature of these economies. Not only is 50 per cent

of the national income of the countries of South East Asia derived from agriculture and only 10 per cent from industry, but for many of them, exports form 13 to 15 per cent of the national product; for Burma and Ceylon, the proportion is more than double. Bulk of the exports is primary products, accounting for more than 80 per cent of the total; for countries like Pakistan, Ceylon and Thailand, it is even higher. Moreover many of these countries depend only on one or two commodities for their export earnings, Burma solely on rice, Pakistan on cotton and jute, Ceylon on tea and rubber. Since these exports find a market principally outside the region, the economies of these countries are highly susceptible to fluctuations in the world economy through the changing world demand for these products.

Though basically their economies are competitive, those of Japan and to a certain extent of India are complementary in that the latter two countries have manufactures to export which all these countries have to import. If China develops industrially, it may be able to complement the other countries. Therefore, possibilities of closer trade relations between these groups of countries depend on the progress of industrialisation in India, China and Japan. Between China and Japan, again, there is a high degree of complementarity, in that Japan has to export food and raw materials; China can supply some of these and can offer in turn a market for the industrial products of Japan.

Though broadly competitive, it will be seen there is also a degree of complementarity, which would appear to be much greater than it appears on the surface, if certain other factors, normally not reckoned in international trade, are taken into account. When these countries were under colonial rule, some degree of specialisation developed, and this was made possible because of their political subjection under the same power. That is how Burma could develop its rice production and exports; India imported rice from Burma and exported labour and personnel of various types and services such as banking, insurance and lately shipping.

Vrindaban without Krishna

Wednesday, Evening

WITH the Prime Minister away, Delhi is like Vrindaban without Krishna. The capital has lost its political glamour, it lacks lustre. Even when he was here, he had practically abdicated his functions as Prime Minister of India. He was feeling and moving about as the Prime Minister of Asia, treating Nasser and Naim as colleagues in a common government for Asia. In reality, however, a new, somewhat patchy block of 'peace' powers has become visible on the political map of the world. If these patches were painted—what neutral colour should we choose for neutrals, green or blue?—it would present a curious shape not unlike that of a jig-saw puzzle, with tiny Yugoslavia off the Adriatic, Egypt, not long ago defeated by Israel and fast losing its leadership of the Arab powers, the land-locked Afghanistan, overshadowed by the Soviet Union and looking across the Khyber and the Bolan over the plains of the Indus valley, Burma with tenuous authority in its own capital, and Indonesia, which has yet to build up a stable government. Is this a block, which in times of stormy weather can stand the stresses of international conflict? The weakness of Bandung can be imagined from the fact that even Pakistan was able to twist its tail at its very birth. Pandit Nehru is obviously in very uneasy company with Communist China on one side and the agents of the Anglo-American block—Turkey and Afghanistan—on the other.

BANDUNG CONFERENCE

Anti-Israel Muslims may shake the conference not a little, for even Pandit Nehru held the view that the exclusion of Israel from the Asian-African Conference did not appear to him logical. In a very significant political sense, however, the conference is likely to be an eye-opener to Pandit Nehru. Little did Mahatma Gandhi realise in 1921 that the fanning of the extra-territorial patriotism of Muslims through the khilafat agitation would blow up his whole philosophy in 1947! The Pandit would now come to realise that India is just an island in a vast sea of Mohammedan powers stretching from the

Mediterranean through the Indian Ocean to the Pacific. This realisation of the Indian Prime Minister is essential for the development of the Indian polity on sound secular lines. The Prime Minister has many qualities but he shares one common—and costly—misconception with the Mahatma, viz, the anti-secular nature of Islam. It is not Hindu communalism or casteism that will blow up the Indian polity. These are dead horses, whom the Pandit has been unnecessarily flogging for many years past. What can possibly blow up—God forbid—the Indian polity is the historically futile attempt to absorb an anti-secular element within the framework of a secular state.

SAME MISTAKES ON ASIAN CANVAS?

It is difficult to escape the disturbing thought that the mistakes of Indian politics may now be committed on a far larger scale on the canvas of Asia. But what is the Prime Minister to do except to take out the fangs that might possibly bite in the not too distant future? Seen in this light, the Pandit appears a far-sighted statesman, looking across vast distances and differences, to a peaceful, socialist world of the common man—the ideal of the late Dr Einstein, whose death he mourned in such poetic language at Bandung. Strange to say that another statesman—President Eisenhower, the military man, to whom our Prime Minister has made not very graceful references in the past—also spoke in the same poetic vein as Pandit Nehru. Though amidst Asian comrades, Pandit Nehru should realise that there are common bonds of the spirit stretching across the Atlantic to the South China Sea. I confess, however, that this is somewhat uncharitable to Pandit Nehru to whose supernaturalism I owed not a little in the most impressionable days of my life.

Nevertheless I said all that because I am convinced that in any possible conflict with an Islamic country, we shall find all the Muslim countries (including Indonesia) as undependable quantities or possibly worse. It is against this background that I was rather struck by the Pandit's fraternization with Lt-

Col Nasser, Premier of Egypt, and Sardar Mohammad Naim, Deputy Prime Minister and Foreign Minister of Afghanistan. Seated on a picturesque throne modelled on the *Diwan-e-Am* the Prime Minister introduced them as the bride-grooms of the occasion! When a half-million crowd cheered him lustily, he said with good humour: "In tonight's bridal procession, I am not the groom. . . ." Then he went on to speak of Bandung, Panch Shila, Baisakhi, Jallianwalla Bagh, Mahatma Gandhi, class conflict and what not. Col Nasser referred feelingly to our ancient civilization, to his affection and admiration for India, the revolution in Egypt and the treaty of friendship recently signed.

WATCH ON THE INDUS

Sardar Naim spoke briefly and made a veiled reference to the immemorial historical and cultural ties between our countries. The past is always glorious. Mohammed of Ghazni is just a legend. The three Afghan wars were none of our business though the British tried to convince us to the contrary. Lord Auckland brought the gates of Somnath (subsequently proved fake) from Ghazni to prove that the British were the protectors of our religion against the fanatical hordes of central Asia. Now we shall forget all this. It is not without significance that we have a friend just across the Khyber. History is in any case a tricky affair. Not many people know that Ranjit Singh ruled over Peshawar and controlled the Khyber Pass at the time of Lord Bentinck; and Dost Mohammed, ruler of Afghanistan during the first Afghan war appealed to Lord Auckland to get him Peshawar from Ranjit Singh. I have to recall this because I find it difficult to convince anyone that the Sikhs controlled the Khyber just a little over a century ago! If this is true—as it is—who knows what is in the womb of history? It was, I believe, Dr Jadunath Sarkar, who, at the time of the partition, quoted the German poem, "Boys, keep watch on the Rhine." "Boys," so Dr Sarkar said, indirectly, "Keep watch on the Indus!" This explains our Afghan policy.

These two statesmen—Col Nasser and Sardar Naim—like Marshal Tito were invited to address the Houses of Parliament. There was really nothing, nothing particular about what was said to them or what they said. Didn't Wordsworth say, "Earth is weary and heaven tired of the hollow words, which kings and statesmen utter, when they talk of peace and justice!" It was forgotten that there is not a semblance of democracy either in Egypt or Afghanistan. Like Pakistan, they have no constitution. But why say all this? Politics is politics. It is a nuisance, Pandit Nehru said in one of his recent speeches. It is a mask, I would add; and if the Pandit wears it too long, the man might become the mask! Such a consummation is devoutly to be wished against.

REACTIONS TO THE PLAN

It is now possible to size up the reactions to the Plan-frame statistics and estimates for the Second Five-Year Plan. In government circles, the feeling is widespread that Prof Mahalanobis has emerged as a super-economist; the professional economists have missed the bus once again and can't afford to hail a taxi! The reason for this is that the pragmatism of the administrator can easily absorb the physical magnitudes of the statistician, while economic doctrines appear to him as mystic nonsense. The economist is actually a word of abuse among the services and gleefully they sent off Prof Thomas (of Madras) from the Ministry of Finance, Prof Vakil from the late Department of Planning, Prof Gadgil along with his Commodity Prices Board; how they wound up Prof B P Adarkar's show in the Ministry of External Affairs and sent him off on a foreign mission; how gracefully Dr Gyan Chand had to quit the Cabinet Secretariat. They are waiting for the exit of Shri Deshmukh to pack his boys off. Some of them have sought shelter in the administrative cadres. Prof Mahalanobis is trying to organise a statistical service. It is only fair that Shri Deshmukh should do likewise. Prof Mahalanobis has come out on the top. You should not be surprised to find him a Minister of State, if he can manage a seat in Parliament.

The reaction of businessmen to the Plan-frame has been somewhat queer. They think that these five to six thousand crores are small game, that it is necessary to stimu-

late the propensity to consume and that it is advisable in the national interest to have an investment plan of Rs 9,000 crores, if employment is to be rigged up! Incidentally, how much do they expect to make on an investment of this magnitude? Can't the Federation economists make some calculations? It does not matter what capital output ratio they assume, for we all know that it differs from industry to industry, that it is highly unstable, that a monsoon can change it out of recognition etc!

DULL SESSION IN PARLIAMENT

The Parliament has been pretty dull, except for a bit of liveliness when the Finance Minister was found absent, while the Lok Sabha was debating the Finance Bill. They were very uncharitable to the great Finance Minister, however, though in order to win popularity, he has practically scrapped all his tax proposals. It probably wounded their self-esteem that in the economy of Shri Deshmukh, the stock exchanges should be more important than the House of Parliament! If any one doubts this, let him look backwards to the reactions in the stock exchanges to the budget proposals and the following procession of tax concessions. I suppose as a good banker, Shri Deshmukh imbibed the belief that the modern economy is a casino and that enterprise is a bubble on the stream of gambling speculation in the casinos of the stock exchanges!

NATIONALISATION OF IMPERIAL BANK

Nevertheless Shri Deshmukh has proved by the nationalisation of the Imperial Bank that he is also a true socialist. Private interests are beginning to feel that this might just be the thin end of the wedge. Shareholders will, of course, be handsomely paid on the basis of the average market value during the 12 months preceding December 20, 1954, when the Finance Minister announced the Government's decision to take over the Imperial Bank. The stock exchanges have responded beautifully to this announcement of compensation, which means that it is much higher than their expectations against the background of the Prime Minister's unnecessarily fiery speeches, when he introduced the Fourth Amendment Bill. But businessmen are not satisfied with what they have been able to get from the public exchequer and they want the

THE ECONOMIC WEEKLY

preceding boom valuations to be taken into account, for the Imperial Bank fully paid-up share touched a level of Rs 1950 in 1951. Let the friends of big business warn them that they should cash in quietly, so long as Shri Deshmukh is there, for afterwards there might be the deluge, when the Prime Minister is able to get a Finance Minister, who sincerely shares his social philosophy.

WHY NOT NATIONALISE THE MANGANESE MINES?

The nationalisation of the Imperial Bank and the general fondness for the socialist pattern of society are encouraging the back benchers in Parliament to make all sorts of fantastic proposals! There has been a demand for nationalisation of manganese mines on the ground that while the owners of this foreign-dominated industry are making huge profits (two of these firms have declared a dividend of 50 per cent), the workers live under appalling conditions with a wage of Rs 1/2 for males and annas fourteen for females. The member, who introduced it—I believe, it was Shri R K Malaviya—was fairly well-informed but the Minister in charge held that it was impracticable! The nationalisation of mining is imperative in the national interest, but it would be too much to expect the present Government to indulge in this luxury. Socialisation, like self-government, can only be progressive and we can roughly measure the rate, when Pandit Nehru expects not to realise his dream in his lifetime; and we all wish him a long life.

Election Issues

WITH a particularly glorious Easter (in view of the weather, of course) now behind, the country and people face a week and a month of intense public activity and decision. The new Prime Minister has announced the date for the holding of general elections. In the meantime the Budget is to be presented and insofar as it is possible for the Budgetary provisions to include tax changes, these changes are more likely to be in a popular direction. The London press—in the most uneventful of times a controversial one—has been given so long and so enforced a holiday that the people generally have come to accept the situation with a nonchalance which certainly bodes ill for circulations when the strike is over. The coming month, fateful as it is, is thus unheralded by what the late Prime Minister called "the chatter of the London press".

The newspapers not having been around to prepare public opinion, all the preparation that needs to be done is now solely left to the parties. At no time in modern British political history did the outcome of a general election depend so much on party organisation as on the present occasion. The Government party itself is in a strong position. The nation is grateful to Mr Butler for prosperity at home and to Sir Anthony Eden for peace abroad. On the other hand it is possible for the average Briton—particularly the working Briton—to take a good look at the impeccable four of the Tory rulers, Sir Anthony Eden, Mr Butler, Mr Macmillan and Lord Salisbury, and find that their shade of political thinking to be too blue to be in accord with the times or to his own benefit. But this would be possible only if the average Briton is able to weigh up in an abstract sort of a way, as the French are accustomed to, and assess which of the policies advocated comes nearest to his line of thinking. In your correspondent's experience one of the great factors which has swayed public opinion in the past has been the level of Britain's prestige in world affairs—if the prestige is high, no matter how it was obtained or the number of hypocritical actions committed to place it on a high level, then the Government party has a

good chance of winning. In a sense this is a reflection of the weight which herronvolk still pull in British politics. When Sir Winston Churchill spoke of the "lion" and the "lion's roar", he knew that he was striking a chord which never fails to respond and move the average Briton into ecstasy. This, it is believed, was shown in the recent Local election results: the Tories won some 109 new seats from Labour by the slogan—"Prosperity at home and Peace and Prestige abroad".

"Prosperity at home and peace abroad" record of the Tories merits examination. As a statement of fact, it is undisputed. Full employment accompanied by rising wage rates without any pronounced increase in the cost of living is by all counts a feat likely to influence the electorate. Whatever may have been the strains in the economy—and here the adverse movement in the balance of payments will be recalled—they were not of the dimensions which afflicted the British economy in 1950 and 1951. Mr Butler could with considerable justification point out that he was ever watchful and that when the occasion warranted, he applied the brake with decision. There are however some difficulties which slightly spoil this otherwise flawless record. First, while wage rates have moved up, this upward movement has not been at a pace equal to the growth of profits and dividends. The recently published estimates on National Income and Expenditure show that income from employment rose by 7 per cent between 1953 and 1954 while trading profits rose by 9 per cent, and dividend and interest payments increased by just under 10 per cent. This unequal rate of increase in earnings of capital and labour has always been a sore point in industrial relations in Britain and the crux of every industrial dispute that has taken place since the Tories have been in power has rested on this point. While Mr Butler can claim that the sharper rise in dividends and profits is all to the good of the economy in view of his special incentives for these types of earnings to be re-invested in industry, the working-man is likely to remain unimpressed.

The other of Mr Butler's difficulties is the state of the Lancashire

cotton textile industry. The industry's plight is a pathetic one—in contrast to modernisation going on in other industries, and of the adoption of latest scientific techniques, cotton textiles continues to lag sadly behind in everything. Yet, Lancashire attracts a considerable amount of public sympathy. The reason is partly subjective—particularly when the sympathy is from the Tories. The British Cotton industry led the industrial revolution—the pioneer of British industry—and in view of its past, if for nothing else, it has to be maintained. This die-hard attitude has relieved the Tory Government of the responsibility of effecting a smooth transition of Lancashire from being heavily dependent on cotton textiles to becoming a centre of some of the newer industries now growing up elsewhere. But the Tories have now to account to the people who are unemployed or working short-time in Lancashire and it will not be easy.

Similarly the "peace abroad" record of the Tories contains problems likely to become issues of some importance in the electioneering campaign. It is true that peace has been maintained and that Britain's prestige and position has moved forward from the time the Tories took over in November 1951. Sir Anthony Eden can claim that his refusal to take part in the American plan to intervene in the civil war in Indo-China saved the peace in Asia and further that his role in the Formosa dispute has been to stave off a shooting war in that dangerous area. But what he will find difficult to explain is the precarious character of the current peace. No matter how much people may avoid to recognise it, it remains a fact nevertheless that every major initiative in the direction of peace has come from either the Russians or from the Colombo Powers and it equally remains a fact that the current uneasy peace is directly or indirectly the result of these initiatives. In Europe, the drive for a rearmament Germany has been pursued with little regard to its consequences. More than that, all the talk of a "meeting at the summit" remains a dream. In Asia Sir Anthony Eden will have to explain why Britain is undoing the Geneva accords by its participation

in SEATO and more than that, its approval of the Franco-American scheme to put off the elections in Vietnam.

These can become the election issues if only Labour cares to take them up. And here uncertainty is rife. The *New Statesman & Nation* has recorded its hope that only if Mr Attlee would adopt a fighting spirit and "address a militant appeal to all Socialists", these issues can win for the Party a majority in the elections. But will Mr Attlee do this? He is heavily committed

From the Calcutta End

Bengal without Zamindars

ON April 15, 1955, on the first of Baisakh, 1362, the Estates Acquisition Act came into force in West Bengal. On that Bengali New Year Day, zamindars and the zamindari system ceased to exist. All their rights and interests in estates, vested in the Government. On that day, when the Bengali businessmen open new accounts, both the Government and the twelve lakh intermediaries involved opened new ledgers. In the Government's budgetary accounting, "Land Revenue" will remain revenue from the land. But the tenant, and not the zamindar, will pay land revenue direct to the Government.

Those twelve lakh intermediaries also opened new accounts on their New Year Day. Gone are the days of "najarana". No longer will zamindars receive "rent" from the intermediaries. No longer will the intermediaries receive "payments" from those holding inferior rights upto the raiyat, the man at the bottom of the ladder, who had to pay so that the numerous intermediaries, including the zamindar, could receive more than each and all of them had to pay out, in their turn, to those holding superior rights, and finally, to the Government.

"PEACEFUL REVOLUTION"

To Dr B C Roy, West Bengal's Chief Minister, to many emotional Bengalis, this is not the main significance of what happened on first of Baisakh, 1362. To the Chief Minister of this State, the change in tenancy rights is an "epoch-making one which can aptly be called a peaceful revolution." To

to support German rearmament and SEATO. Moreover, he leads a Party which is seriously divided on the very issues which sway at least the more thinking sections of public opinion. The dice appears to be loaded in favour of the Tories and from the present look of things, it appears likely that they will ride home with a majority far larger than they presently possess. With prestige on their side, with people better-off than ever before, and more than that, with an opposition in perpetual crisis, the Tories are likely to have a field day.

any inhabitant of a raiyatwari State, this would strike as a strange and exaggerated claim. On the first of Baisakh, 1362, West Bengal introduced a system of tenancy rights in land which has been long in existence in all the raiyatwari States. There are, however, ceilings on land holdings, which partly justify Dr B C Roy's description of the event.

To the average Bengali, what has happened is much more eventful. It has been hailed as the end of the 162-year-old zamindari system introduced by Lord Cornwallis when he imposed Permanent Settlement in this province. So, the first of Baisakh, 1362, has been celebrated as the end of feudalism, landlordism and the British-created Permanent Settlement. And the emotional Bengali now takes what little consolation he can for atoning for the sins of some of his ancestors.

If some of his ancestors committed the crime of helping the East India Company to establish British Raj in this country, the average Bengali claims that he and his brothers and sisters have paid the penalty in blood and tears. His claim to have initiated, and suffered in, the struggle for independence, is conceded. If, again, the claim is being made, Bengal was the first province in which Permanent Settlement was introduced, West Bengal is also the first State in which such large-scale abolition of the zamindari system has been effected.

REALITIES

It would be uncharitable not to acknowledge the Bengalis' contribution to the struggle for indepen-

THE ECONOMIC WEEKLY

dence. It would be equally unjust not to admit the significance of the Estates Acquisition Act. But it is also just as necessary, to remind the Bengali of certain cold realities. Certainly, he has contributed richly to the struggle for independence. Admittedly, the Estates Acquisition Act is an achievement. But much remains to be done. Calcutta is not within the scope of the Act. Zamindaris elsewhere may have been abolished. But land reforms have yet to be introduced. And, then, zamindari abolition will not bring in the millennium. When will the average Bengali get over his inclination to self-deception?

PERSPECTIVE

Today, when zamindari abolition is being celebrated, it may not be inappropriate to place Permanent Settlement in its proper perspective. Economic history of northern, western and eastern India has been influenced by three broad developments. West Bengal today is what it is because of Permanent Settlement. Bombay's make-up is tinged with the developments relating to the American Civil War. Former, undivided Punjab's, as well as northern India's social, economic and political set-up is a direct sequel to what came to be known as the Punjab group of, civilians.

Bombay, developed into an industrial centre as the American Civil War gave her the opportunity to emerge as an exporter of raw cotton. Punjab attracted the attention of the British steel frame as the educated, agitating, Bengali started creating trouble. As Punjab became the recruiting centre for soldiers for British Raj, the economic development of that Province started. Ambitious irrigation projects were introduced. Punjab became one of the most fertile tracts for growing wheat and quality cotton. Without Permanent Settlement, without absentee landlordism, without rack renting, agriculture developed, and the Punjabi agriculturists grew rich.

It happened the other way about in Bengal. In 1793, Lord Cornwallis introduced Permanent Settlement. It has been criticised as a policy of farming-out of land revenue. Lord Cornwallis's friends supported the measure, then and on later occasions, on the argument that it would help create a class of rich, progressive, zamindars who would have the means and the wisdom to ensure agricultural development.

THE ECONOMIC WEEKLY

1793 AND AFTER

Lord Cornwallis's hopes did not materialise. Terms and conditions of Permanent Settlement were too rigorous. Many old zamindars failed to pay the revenue fixed in perpetuity. Many zamindaris were sold out. A new class of zamindars emerged, who had no interest in agriculture or in land except making money out of it.

This new class of landlords grew rich. But agriculture suffered. It was during this period that the then Government showed more interest in securing the fixed land revenue than in land reforms. Numerous regulations were introduced to strengthen and to consolidate the rights of zamindars at the expense of the raiyats. By then, due to the gradual increase in land values and to general economic improvement, the land revenue fixed under Permanent Settlement helped the zamindars and the intermediaries to grow rich at the cost of the State.

Soon, it became clear that Permanent Settlement was having unintended effects. Many Commissions have since been appointed. Many Acts have since been passed. More treatises have been published on this problem than on any other in Bengal. Under socio-political pressure, the tendency has been progressively toward enlargement of the rights and privileges of the cultivating raiyats. Even the Flood Commission, appointed by the Government in former, undivided, Bengal, which submitted its report in March 1940, came to the conclusion that Permanent Settlement could not be mended, and should be ended. This Commission suggested acquisition of all superior interests in land so that the raiyatwari system could be introduced. This is what Dr B C Roy's Government has just done. Placing a ceiling on land holdings is the only additional feature of the measure now enforced.

EFFECTS

There are few critics of the Estates Acquisition Act. It will lead to a more equitable distribution of land. Abolition of zamindaris is accepted as an essential pre-condition of land and agricultural reforms. It will, incidentally, help absorption of the surplus staff of the Food and Civil Supplies Department. Some of the redundant staff of the zamindars and intermediaries will also be absorbed. But it is not without significance that some of the inci-

dental benefits of Permanent Settlement and the services rendered by zamindars are being duly appreciated.

Zamindars and the intermediaries may have fleeced the cultivating raiyats. Permanent Settlement may have caused considerable loss of revenue to the State. It may have been responsible for decaying agriculture. It may have made the Bengali easy-going and ease-loving. But the zamindar's support and encouragement to art and culture are now being ungrudgingly acknowledged. If the zamindars were connoisseurs and patrons of art and culture, the intermediaries, the upper middle-class strata of society, produced Bengal's able scientists, doctors, engineers, lawyers and professors.

Those who know Bengal will appreciate the different contributions of zamindars and the superior grades of intermediaries to Bengal's life, society, culture, politics and economics. One has, in recent days, heard much about the future of the Bengali middle-class. This is a knotty problem. But no tears need be shed for the superior grades of intermediaries who are now being divested of their rights and interests in land. This strata of society has now established itself in the professions. But the lower middle class and the landless labourer continue to suffer. It is this lower middle class whom future industrialisation is likely to benefit. Promised land reforms are expected to solve the problem of the landless proletariat. Will these expectations be fulfilled?

(Continued from page 488)

Development of commercial crops in Indonesia, similarly, was made possible at the cost of the growing dependence on food imports, because imported supplies were ensured and arranged by the ruling power. Malaya, though not represented in the conference, provides an illustration of the operation of these sources to the highest degree—its plantations and mining were developed with immigrant labour, foreign capital and imported food. Migration of populations in response to economic needs was channelled in a certain manner because of the then existing political set-up, resulting in the influx of Chettiar money-lenders into Burma and Indo-China, of Chinese traders in many of these countries, of the Bengali clerks, Surti rice traders and Tamil coolies to Burma and so on.

The withdrawal of foreign powers has left a vacuum which has not yet been filled. The foreign trade of all these territories continues to be with countries outside this region and it is still being conducted very largely through the old, established channels—through Holland, Britain and to some extent, even through France. The profits of foreign trade, an important source of capital formation in any economy, flow out of this region. These countries have certainly a payments problem; to what extent it could be solved by organising a payments union was recently discussed at an ECAFE conference. We shall doubtless hear more about it. But much more than a payments problem, these countries have the primary problem of organising their foreign trade and ancillary services—exchange banking, insurance and shipping. In exploratory talks for closer economic relations, this group of problems has necessarily to be given the first priority.

Next comes development of inter-regional trade. Excessive dependence on intra-regional trade exposes all these countries to wide fluctuations of income and imports which all of them find crippling. This retards their development. Alleviation has been hoped for, long from some sort of agreement through the good offices of the United Nations to ensure steadier earnings and better terms of trade in obtaining industrial goods. These attempts have failed. True, these countries need industrial goods from the West, but the West also cannot do without rubber, jute, tea, pepper, copra and oilseeds. South-East Asia produces 95 per cent of world's rubber, 96 per cent of jute, 99 per cent of tea, 94 per cent of pepper and 81 per cent of copra, rapeseed and sesum. Collective bargaining is bound to gain for these countries

better terms of trade than they have been able to get so far.

Some alleviation may be found by collective action, through agreement with the principal importing countries, but the major solution has to be sought by other means. Diversification of exports on the one hand and greater measure of specialisation on the other, may be some of these means. All these

countries have taken up or are on the point of launching on development of their respective economies, based on the pattern of trade established in the past. The lines of development that are contemplated hardly take any note of the change that has come over this part of the world. So Ceylon has set out to achieve self-sufficiency in rice, while Burma and Thailand are threatened with burdensome surpluses,

Burma is toying with the idea of setting up a steel industry, though she has neither coal nor iron ore, Japan is bent on pushing her wares in South-East Asia and to recover the trade she had lost, unmindful of the hopes and aspirations of these countries to develop their own textile and other light industries.

There can easily be some co-ordination of their respective plans of development. True, even the basic facts for the study of these economies remain to be collected. For obvious reasons the ECAFE or any of the other existing agencies cannot take up this task or carry it out adequately. Economic maps have to be prepared for these countries which will take note not only of their natural resources but also of man-power, skilled labour and services with the professed and agreed aim of bringing about an optimal redistribution of resources, both physical and human. If this is done, new vistas will open up, widening scope for economic expansion will suggest itself. Backward Asia and struggling Africa will have new hope and realism to guide their aims and aspirations. Emotion and sentiment that have brought these people together, will end up in smoke, until imagination is controlled by knowledge of facts and purposive action takes the place of vague yearnings.

Aspirations can be easily led into less fruitful channels, a payments union is not difficult to organise, if America is prepared to act as the lender of the last resort, but it will not salvage the members and lift them up from the economic morass in which they are sunk today. An economic counterpart to the SEATO may lead development away from what is most desirable into paths that may promise some immediate gains but prove deceptive in the end.

(Central African Federation—Northern and Southern Rhodesia and Nyasaland—dropped out at the last moment)

External Resources and the Second Plan

(Contributed)

THIS is a follow up to the note "Probable Size of the Next Five-Year Plan" which appeared in the issue of March 12, p 342. In that note external resources left over at the end of the First Five-Year Plan was taken as Rs 300 crores. This is made up of Rs 100 crores of loans and aid which is expected to remain unutilised at the end of 1955-56, and Rs 200 crores of sterling balances which would be available during the period of the Second Plan. This estimate made here of foreign exchange resources with which we begin the Second Five-Year Plan as well as estimates of further foreign exchange resources that may be available during the next plan period are subject to the general proviso that foreign balances maintained as currency reserves will make no further inroads on foreign exchange availabilities. This may appear to be an unrealistic assumption when in view of the size of the plan and the probable magnitude of deficit financing, a substantial expansion of note circulation must be taken for granted. There are sound reasons, however, for thinking that such an expansion of note issue may not call for a proportionate strengthening of its sterling backing, or any addition to the currency reserves at all. The existing statutory reserve ratio can be no guide to the future, since imports are going to be controlled for the purposes of the Plan and free convertibility of the rupee is not under contemplation.

If the desirable size of the foreign reserves is viewed, as it should be, from the angle of the probable magnitude of balance of payments over a series of years, instead of being taken as a certain given percentage of the internal circulation, then of course the entire basis of calculation will have to be changed. But even if the latter is taken as the only valid criterion, on a very rough assessment, there is no reason to suppose that the present size of the reserve will be found excessively inadequate.

TRADE BALANCE

This much about the carry over. Now let us assess the possibilities of foreign exchange earnings in the next plan period. From a study of

our balance of payments in the first plan period, it appears that we have been having a sizable surplus (it was more than Rs 80 crores in 1953-54) on balance on private trade, invisibles and Government stores imports. This figure takes into account imports of machinery on private as well as Government account for the purposes of development. If we exclude machinery imports, this balance will be still larger.

Assuming that a surplus of about Rs 80-100 crores on the balance on private trade, invisibles and Government stores imports continue during the Second Five-Year Plan period, we would have about Rs 400-500 crores worth of foreign exchange available for the next Plan. This, of course, assumes that our level of exports would more or less remain stable. This is perhaps a justifiable assumption to the extent that the increase in domestic demand for export commodities resulting from Plan expenditure can be and will be met from increases in domestic production. In cotton textiles, for example, increase in production as a result of modernisation, etc, and increase in handloom capacity would satisfy any increase in demand during the next Five-Year Plan period. In jute industry, the unused capacity could be utilised for increasing production. Similar argument applies to other export commodities. The uncertain element in the calculations, however, is the continuation of demand for our exports at around present levels.

The further assumption that the terms of trade will not change significantly implies that there will be no violent fluctuations in the level of economic activity in the USA. If the US economy maintains its present rate of expansion, demand for our export may actually increase and the terms of trade may, to a certain extent, change in our favour. Any way a small change, say 5 per cent either way, will not invalidate our estimates. In the event of extra-ordinary happenings like the Korean war, however, all these calculations will certainly go wrong. But such events are difficult to foresee.

FOREIGN AID AND LOANS

Apart from balance of current earnings considered above, some

foreign aid and loans would be forthcoming during the next Five-Year Plan period. During the first three years of the First Five-Year Plan, foreign aid has been of the order of about half of one per cent of national income. If this proportion is maintained during the next Five-Year Plan period also, we can expect external assistance of the order of about Rs 300 crores.

External resources would also be augmented by the inflow of private capital, if there is any. However, it is difficult to estimate its size as it depends on a multiplicity of factors over many of which we have no control.

Thus we can safely bank on a minimum of Rs 700 crores worth of external resources for the next Five-Year Plan. It would be Rs 1,000 crores, if our expectations regarding external assistance materialise. It would be still larger if there is an inflow of private capital on an appreciable scale.

ALLOWANCE FOR FOOD IMPORTS

In this estimate, we have not taken into account the possibility of food imports during the next Five-Year Plan period. With the completion of most of our irrigation schemes at the end of the First Five-Year Plan, we may not have to face a serious food problem, even if one or two monsoons fail. However, one cannot be so sure on this point. It is advisable therefore to keep about Rs 200 crores for emergency food imports. This would reduce the size of our external resources available for the Plan to Rs 500 crores without external assistance and to Rs 800 crores with external assistance.

FOREIGN EXCHANGE COMPONENT OF DEVELOPMENT EXPENDITURE

The impact on balances of payments of the next Plan would depend upon the size of the Plan and its pattern of investment. If we are to make full utilisation of our external as well as internal resources, the size and pattern of investment would have to be consistent with our available resources. Moreover, to ensure optimum use of our resources, the planned investment would have to be such as to contribute to the maximum possible extent to our economic development.

In abstract terms, our external resources could be utilised either for importing consumers' goods, thus setting free domestic resources for the development of capital goods industries or for importing capital goods necessary for development purposes and satisfying the demand for consumers goods from domestic resources. An extension of the latter would be concentration on heavy industry and earmarking the bulk of foreign exchange allocations for this purpose so that manufacture of consumer goods could be taken up at a later stage with a considerably reduced cost in foreign exchange. Of course, both ways of utilising our foreign exchange resources could be combined in a way consistent with the Plan objectives.

Which way our balance of payments would be affected during the next Five-Year Plan period would depend upon our available domestic resources and the nature and objectives of the Plan. Only after we have information regarding our domestic resources and the proposed pattern and size of our investment can we find out the probable impact of the Plan on our balance of payments.

We will now work out the probable impact on our balance of payments of a Plan of the size of about Rs 6,000 crores (including the public and private sectors) and with the pattern of investment as given in the following table. The pattern of investment assumed below is illustrative rather than substantive, but from available information, it appears that the breakdown may not be wide of the mark.

Out of the Rs 1,800 crores investment in big industries and mines, it is assumed that 40 per cent or Rs 720 crores would be spent on imports of plant and equipment and stocks of raw materials, spare parts, etc. Assuming a gestation period of about two years, these industries would start production only in the third year. In the third year, assuming a capital output ratio of 5:1 (most of these would be highly capital-intensive industries) and the raw materials cost at 40 per cent of the total annual output, the annual demand for raw materials would work out at Rs 144 crores. Out of this Rs 144 crores, it is assumed that Rs 36 crores would be spent on foreign raw materials. Not counting the first two years of gestation, this would mean an expenditure of Rs 108 crores on raw

materials during the Five-Year Plan period. Further, about Rs 270 crores would be spent on foreign goods necessary for development in the 'Transport and Communications' sector, assuming that 30 per cent of the total expenditure in this sector will have to be incurred on imports. For Power Projects, about Rs 144 crores would be the import requirement. The foreign exchange bill of all the other sectors taken together could be put roughly at about Rs 100 crores. Thus, in all, the direct foreign exchange cost of an investment expenditure of Rs 6,000 crores would come to about Rs 1,300 crores.

INDIRECT DEMAND FOR IMPORTS

As money incomes increase as a result of investment expenditure, demand for goods and services will also increase. But how this demand will be distributed among different goods and services, and how much of it will eventually be directed to imports, however, is a different matter. Planning proceeds on the commonsense assumption that the bulk of this demand would be directed towards food, clothing and housing. Judging from the present trends in production and taking into account the expansion provided for in the Plan, it should be possible to meet this demand from domestic production. A substantial increase in urban incomes, especially those of the middle and upper classes, however, is bound to increase the demand for imported consumer goods. This is confirmed by past experience also. But extrapolation of future trends in demand is rendered easier, and application of results to policy rendered safer by machinery of import control that

has been functioning for many years now and must continue during the currency of the next and many subsequent plans.

The case of food in the event of failure of monsoons has already been provided for, Rs 200 crores being allowed for this emergency.

SIZABLE GAP INEVITABLE

Thus an investment expenditure of about Rs 6,000 crores during the next Five-Year Plan period would give rise to an increase in demand for imports of about Rs 1,300 crores, while the available external resources would be somewhere between Rs 500 to Rs 800 crores. Of course, in the absence of food shortage, these resources would be somewhere between Rs 800 to Rs 1,000 crores. The short-fall would then be somewhere between Rs 300 to Rs 800 crores.

This gap would be smaller if the food situation continues to show improvement and the expected external assistance worth Rs 300 crores materialises. Moreover, it is possible to reduce substantially the direct foreign exchange cost of the investment budget. With regard to investment in industries, the bill for imports could be cut down substantially below Rs 828 crores provided for as some of the plant and equipment may be manufactured at home and some of the raw materials may also be produced within the country. In that case, the gap could further be reduced by Rs 200 crores. Taking all these into consideration, it seems that the short-fall in our foreign exchange resources may be somewhere around Rs 200 crores.

Downward Trend in Equities

Wednesday, Evening

STOCK markets are passing through a phase which is not unfamiliar to those who are initiated in stock market techniques, but which may seem puzzling to New Delhi. After a temporary spurt following the budget, equities have developed an irregularly lower trend. Yet, the tax proposals in the budget were not as stiff as formerly expected. Even subsequent tax concessions, and this is more surprising, are not having any stimulating effect.

Many tax concessions were announced this week. But the stock markets did not respond to these concessions adequately. Of course, Textile shares on Dalal Street steadied-up; Orient Paper, which were moving up because of capital reorganisation plans, improved further as reduction in the proposed increases in the excise duty on paper was announced in Lok Sabha by the Finance Minister. But the general market sentiment remains "bearish".

Stock markets are in a mood which seems baffling even to some experienced operators. Sometime last week, TTK announced the Government's plans for erecting three new steel plants. He was ambiguous, but he was subtle in his vagueness in his statement that the question whether these three new units would be within the public or private sector, or would be executed through partnership between the State and private enterprise had yet to be decided.

TTK and Steel Shares

Those informed operators, who were aware of TTK's threatened resignation and his re-entry into the Cabinet, interpreted his statement in Lok Sabha favourably. Many statements by the Prime Minister and the Finance Minister since Avadi had encouraged the impression that earlier apprehensions about expansion of the public sector at the expense of the private sector during the second Five-Year Plan were exaggerated. So, when the

iron and steel shares remain hesitant. Until recently, both Tata Steel and Indian Iron were apathetic because of the uncertainty relating to the question of retention prices for steel. It is now known that this problem has been referred by the Government to the Tariff Board, and that the Board is now investigating the problem. What the Board will decide is anybody's guess. But current market speculation is intriguing as well as encouraging.

Steel Expansion

It is widely anticipated that steel retention prices will be raised. Rumours are also current that, besides the development rebate, iron and steel companies will receive some income-tax concessions. Both income-tax relief and higher retention prices for steel, it is claimed, will be offered in order to encourage the existing iron and steel industries to implement expansion projects. An acute steel shortage and the Government's declared policy of stimulating steel output lend credence to these market rumours.

These, if true, are encouraging developments. Why, then, are iron and steel shares falling? Because, it is argued, the Government's plans for encouraging iron and steel concerns to expand output are based on certain conditions. It is argued that higher steel retention prices and income-tax reliefs will be allowed on the specific condition that an adequate proportion of the resultant higher profits are ploughed back for financing expansion projects.

Dividend Problem

This is a legitimate condition. Investors and speculators do not deny this. But they argue that any such condition will mean that dividend payments will not be allowed to be stepped-up. That is why, Indian Iron and Tata Steel lack support by investors and speculators

Tea Prices

Apart from the downward trend in Indian Iron, the hesitant tendency in equities on the Calcutta Stock Exchange is mainly due to the recent falling trend in Tea shares. During the last few days, Tea shares have been experiencing consistent selling pressure. Investors are not lending support to Tea shares on the growing realisation that the seller's market in tea has come to an end. In the coming season, there may be a buyer's market in tea. On the argument that next season's tea prices will be lower, Tea shares are being sold. It is argued that if tea prices fall, the industry's earnings and profits will shrink.

While tea prices and the tea industry's earnings and profits are expected to drop, there are possibilities that the industry's production costs may rise. Labour trouble is brewing. It is feared that labour charges may increase as a result of the recommendations of the Plantation Enquiry Committee. There are, in addition, fears that, next year, the State Governments concerned may implement the Taxation Enquiry Commission's suggestion to raise the agricultural income-tax on tea companies.

Despite these ominous possibilities, selective support for Tea shares continues, although there has been an all round set-back in Tea shares in the earlier half of the current week. Some days ago, the dividend season for Tea shares started. Many companies have yet to declare their final dividend payments. This is an influence which will remain in operation for some months. As final dividends are declared, the Tea shares concerned may be expected not only to resist the downward trend, but may even move up.

Jute Stocks Pile Up

Jute shares continue to be neglected. Monthly data released by IJMA reveal why Jute shares are friendless. For the fourth month in

As, month after month, mill stocks pile up, both investors and speculators withdraw their support to Jute shares. Dividends for the second half of 1954 are likely to be poor, so are those for the current half-year.

While exports of jute goods remain unsatisfactory, the chances of lowering the prices of jute goods in order to stimulate exports seem

remote. Raw jute prices remain firm. It is now widely realised that, pending the movement of the new crop, raw jute prices are not likely to decline. And this means that the prices of jute goods cannot be lowered. That being so, it is doubtful whether the expected Argentine demand will be as heavy as now anticipated.

With the drop in Tea shares,

there is now less buying of selected Miscellaneous and Engineering shares. At the time of this writing, the Calcutta Stock Exchange seems to have recovered from the shock of the heavy drop in Indian Iron. But recent market behaviour emphasises the investors' fears and uncertainties about the outlook for industrial development in the private sector.

Not Enough Schools!

Reba Chaudhuri

DOWNTRODDEN people fighting for their freedom have usually a high stake in education; even more than bread perhaps, they see in it the quickest means of breaking their chains. For the essence of political subjection is not the physical restraint on liberty or economic exploitation which goes with it, but the subjection of men's minds. The movement for education, hunger for knowledge and the desire for light have therefore been familiar themes in the saga of political struggle in backward Asia as elsewhere. In the countries which have won their freedom but have yet to develop their economies, transform their society and give their people the fruits of freedom, education may therefore be expected to be given first priority. This, unfortunately, is not the case. Food and economics come first and the system of primary education that was one of the instruments of colonial enslavement, left behind as a legacy, continues to remain a halter round the necks of these struggling people. The domination of ideas is so much more difficult to shake off, tradition hard to break and the fighters of freedom themselves schooled in Western system can rarely take the plunge, break away from the past and start on something that is new, creative and adequate for the requirements of their own people.

To begin with, schooling for all calls for much constructive thinking to which none of these leaders, suddenly called upon to shoulder the heavy responsibilities of running derelict economies and supplying the necessities of life to the teeming population, seem to be able to address themselves. If they cannot apply their minds to the problems, neither can they easily find the means for solving them in the manner in which these problems had been sought to be solved in the period before they took over. And yet in the West, to which all of us in South Asia and in the Pacific region look, whether we like it or not, or admit it or not, compulsory primary education has long been not only an accepted end but an accomplished fact. The West takes it for granted. We, trying to follow the West, struggle hopelessly, finding it an insoluble problem, leave it half attempted, so that compulsory pri-

mary education remains a distant aim to be pursued no doubt, but is not viewed as an aim that can be achieved here and now.

Primary education interests a much wider circle of people than educationists. For instance, it also interests the administrator and the politician but strangely enough, it does not seem to have interested economists and planners to the extent that it should have done. This point was forcefully brought out by the educationists representing a number of countries in South Asia and the Pacific which met in Bombay in December 1952. The UNESCO has brought out an informative report of this conference,* together with a factual background of the problem in the different countries of this region culled from the *World Survey of Education* now in the press. The report is prefaced with a statement of the general issue which attempts to bring out the general outline of the problem which is the same in all backward countries. Finance is mentioned as the biggest single obstacle in the way of universal compulsory education. This is difficult to accept for the simple reason that unless this attitude is changed, for years to come, none of these countries can hope to have primary education, except only for a small percentage of the children of the school-going age. By making finance the essential first step for progress in this direction, education is made dependent on the rate of economic development, which, with the best will in the world and given all the favourable conditions, can at best be only a slow process. Will, then, education have to wait until these countries reach a stage of economic development comparable to that of western countries, when such luxury would be possible? The proposition has only to be stated in so many words to prove how absurd it is.

It has been stated before that economists and planners, that is to say, all those who apply their minds to the problem of finance for economic development, have not taken

* Compulsory Education in South Asia and the Pacific. Studies in Compulsory Education. Unesco, Paris. Pages 157. Price not mentioned.

the same interest in the problem as might have been expected. This is because we do not yet know in statistical terms the magnitude of the problem. One of the recommendations of the Bombay Conference was that we should. No one appears to have worked out in money terms the cost of giving every child of school-going age the minimum of education to make it a fit citizen of a free country, fit to carry on the task of development which all these countries aspire for. If the cost is worked out in each case, whenever development is discussed, we would at least know how it would compare with the cost of other projects that are planned or pressed for. Only then we could see how resources could be found for both and prevent education from being relegated to a secondary position by the demands of economic development.

In the developed economies, development and education do not appear as competing objectives, because inter-dependence between the two is direct, obvious and demonstrable. You cannot have an industrial society and an organised economy unless every individual worker and citizen has been given the minimum of education. In a backward economy of subsistence agriculture, education does not have the same obvious and undeniable economic value. It may acquire that value in certain circumstances, if the content of that education is enriched and made demonstrably functional. But that means thinking out a different system from that which we have inherited ready-made or imitated from colonial administration. And like every other novel experiment, it may be costly too, at least in the initial stages. Hence experiment in this direction is also thwarted by the same obstacle which stands in the way of speedier expansion of the existing system, viz, finance.

Even on the Western concept and without a radical change in the system of the education to be provided, it is easy enough to see why costs are likely to be proportionately higher in the backward than in the more advanced countries, apart from the fact that Western standards of costs have to be accommodated from much lower standards of national

incomes. This is because in under-developed countries the proportion of children of school-going age in the population is much higher, being 15 per cent or more as compared to 8 per cent in UK. These countries have high birthrates and with the little advance that they have been making in recent years, death rates have been going down. Hence the larger proportions of children and the disproportionately higher cost of primary education.

In view of the magnitude of the problem, the Unesco holds conferences every two years for groups of countries to discuss common problems. When the first of these conferences was held in India, in view of the experiment with basic education that has been carried on this country, it was felt that we may have a solution to offer. Basic education had attracted attention hitherto because of the emphasis it puts on developing the creative faculties in the child, instead of equating literacy with education. Literacy, it is now accepted the world over, is not education; it is merely a byproduct. Real education could be imparted through a craft so long as it was borne in mind that the object was not the teaching of a craft, however useful the latter might be. If the child in the process of learning produced something which had commercial value, well, it was just incidental.

Whether the cost of education should be partially met by selling the product of the craft through which basic education is imparted to the child has been a subject of acute controversy. The controversy has also been presented in a somewhat but not substantially different form. It has been maintained that if the child takes home to its parents the products which it helps to make or the produce it helps to grow, *eg* a few yards of cloth or a basket of vegetables, according as the craft chosen is weaving or agriculture, it will help to overcome the reluctance of poor people to send their children to school.

Against the background of the problem faced in all these countries, what India had to offer by way of solution was assured a sympathetic, if not an enthusiastic reception. That was the impression gained in the conference—that all the countries of South Asia and the Pacific accepted basic education as a solution of their problem of primary education. The official report of the

conference, however, does not suggest such as unreserved acceptance of basic education, though some of its features, particularly its economic aspects *viz* its ability to pay for itself in part appears to have received considerable attention in the conference. Now to get on with the report.

Nearly 80 per cent. of the population in South Asia and the Pacific is illiterate and about an equal proportion of the children of school-going age in these countries are not going to school. Article 26 of the Universal Declaration of Human Rights lays down that every one has a right to education, that education shall be free at least at the elementary and fundamental stages, and that elementary education shall be compulsory. In order to give a fresh impulse to popular education, the UNESCO has undertaken a comprehensive programme for stimulating education round the world, education for adults and for children. An international conference for this purpose was held in Geneva in July 1951; the report under review is of the first regional conference for South Asia and the Pacific held in Bombay in 1952.

Previous to this, twelve national and comparative studies have been published on compulsory education problems, providing a broad idea about the extent of the problem in the countries covered and the results of the various attempts made to remove illiteracy. These studies also provide a comparative idea of the magnitude of the problem in these countries.

The countries covered by the present study are still very backward in this respect. They have a population of more than 600 million, of which 15 per cent consists of children between the ages of 6 and 12. The corresponding figure for England and most other advanced countries is near about 8 per cent. Moreover, the population, already so large, grows by one to one and a half per cent per year, (6 to 7 millions). While almost all the countries in this region are expanding their educational facilities, without proper planning this may be too slow to overtake the high birth rate.

The enforcement of compulsory education requires the setting up of new administrative machinery or the expansion of the present administrative arrangements. The problems that arise may differ as between federal and unitary states. The

central problem is how to mobilise all available resources—central, provincial and local—for the development of free and compulsory education. The most important single obstacle is finance. In some of these countries, *eg* Burma, Cambodia and Ceylon, education is financed by the Central Government. In India, it is a state's subject. The cost of primary education is borne by the District Boards, the Local Boards and the Municipalities with the help of grants received from the State Governments. The Central Government only gives block grants to the State Governments for specific non-recurring expenditures. In Pakistan, expenditure on primary education is met from provincial revenues, education cesses, education taxes, local rates, octroi, and grants from Central Government for meeting non-recurring expenditure. In some provinces, an education cess is levied in rural areas at a fixed rate on the land value. Besides these, a primary education tax is also levied on persons in business, trade or the professions according to their income. In some places in Pakistan where compulsory primary education has been introduced, besides educational taxes and cess, provision has been made for the levy of an additional union rate for meeting the cost of furniture, equipment and maintenance of school building etc.

At the present stage it seems to be practically impossible for these under-developed countries to raise enough funds from their own resources to pay for compulsory universal education. The main hope lies in the gradual economic development of these countries, which by raising their national incomes would make it possible to develop compulsory education. In some of these countries, notably in India, attempts are being made to reduce the cost of education by giving up western standards of buildings and equipment. Schools have even been held in the open air and a start has been made in India with basic education under which a part of the expenses is met by selling the articles produced by the pupils in the school.

To speed up the progress of compulsory education, therefore, not only have educational cesses and levies to be imposed, the curricula should also be so orientated towards the basic type that education can also pay for itself, at least partially. There are countries where adequate funds cannot be raised for education

because the national or local resources are very limited and other demands on them are more pressing. Planned advance towards universal compulsory education will also have to depend upon assistance from federal or international sources as the case may be.

The first problem that any scheme of compulsory education faces is in regard to accommodation of the children to be brought to school. A building programme is thus needed to support schemes for compulsory primary education. In practice the responsibility of providing school buildings is in most cases left to the community; in others, the Government pays the rent for accommodation provided by the locality; and in still others the responsibility for school building is placed on the District and Local Boards. For all practical purposes in most countries, responsibility for building continues to be left with the local community. In the changed economic and social conditions, prevalent today, local communities do not appear to be in a position to discharge such heavy responsibilities properly. The quality of buildings provided tends to become increasingly poor with the expansion of schooling. This is very unfortunate, particularly because buildings of inferior structural quality are not only more expensive in the long run, but the distribution of schools over different localities also tends to be unbalanced.

EQUIPMENT

Extension of primary education calls for more equipment, the cost of which is often prohibitive. Cheap but suitable furniture and equipment have therefore to be designed and made from local materials. Whether a child sits on a mat or 'mudda', does not matter, provided it has a light desk of suitable height which can be made of locally available wood. The lack of cheap but suitable reading material is also a big handicap. The books that are available in the market are expensive. The State Governments can meet this deficiency by undertaking the production of suitable reading material for children of the primary stage. The nationalisation of textbook production would eliminate wastage and middleman's profit and would mean not only cheaper books for the children but additional income for the Government, which could be utilised for the free supply of books and other educational materials. To the obvious danger in this, that these books produced by

the Government may become stereotyped and unimaginative, the report suggests no remedy.

SUPPLY OF TEACHERS

For the implementation of the schemes of compulsory education, one of the important problems is how to obtain enough trained teachers for the rapidly expanding number of primary schools. The expansion of the school system has been so rapid that many countries have been obliged to engage teachers with low qualifications in alarming numbers. In service, training through various methods has become as essential as the more regular teacher training programme.

The only efficient way of dealing with the question is planning based upon a study of the various factors involved. The UNESCO Commission on primary compulsory education has recommended 4 approaches or types of training (1) Teachers can be prepared quickly by emergency

courses and then join service, obtaining further training while in service. (2) Longer courses of 2 years or more can be adopted to give thorough preparation to students whose general educational background is good enough. The Commission recommended establishment of rural training colleges with distinctive goals and methods—recruiting students from the immediate countryside. (3) An in-service training system for teachers with inadequate qualification or none at all. (4) Regular training colleges.

To deal with the problem of mass training of teachers Indonesia has devised a special system. This consists of a two years' practical course followed by a correspondence course for another 2 years. Those who have finished their practical training but not their correspondence course are still regarded as trainees. They do not get a teacher's salary but only an allowance and receive a letter of assignment to teach, not a letter of appointment, so that they are forced to complete their course and become properly qualified.

(To be continued)

(Continued from page 497)

How to fill the gap? Several of the following things could be done:

1. We can raise loans from IBRD, USA, UK and Switzerland.
2. We can obtain capital goods as well as heavy plant and equipment to be paid for by exports spread over a number of years, on the basis of bilateral trade agreement.
3. Through our Industrial Credit and Investment Corporation and in other ways, inflow of private foreign capital can be encouraged.
4. We can increase our export earnings by suitable export promotion devices.
5. Foreign tourists' expenditure can be encouraged.
6. Imports of non-essential consumer goods can be further restricted.
7. Foreign balances now locked in the form of currency reserve, can be brought down and utilised for purposes of development.

By means of some of these devices, it appears that we would be able to obtain external resources, sufficient for the purpose of carrying out an investment programme of Rs 6,000 crores.

BANDUNG was not a challenge to Europe or America. At Bandung, Asian and African nations met not to remind Europe of East's domination of the world four centuries ago. Bandung was not a threat to West of East's determination to repeat history. But it was a reminder to West that East had reversed the events of the last four centuries. Bandung was not a challenge to the United Nations. But it was a reminder to the United Nations that the world organisation was not representative of the world. To claim the status and prestige of the United Nations, the international organisation must be representative of the whole world. Many countries in the world are not yet free and independent. Even all independent nations are not members of the United Nations. Many Asian and African nations are not member-states. Bandung was a reminder to the United Nations that no world organisation can fulfill its main purpose of ensuring world peace unless it is fully representative.

Bandung endorsed the principles of the UN Charter. But it was emphatic in its implication that the United Nations, dominated by the Big Powers, had failed to observe the letter as well as the spirit of the Charter. Respect for human rights is one of the basic principles of the Charter. Under the Charter, the people of every country have the right to choose the form of government they like. These Charter principles are aimed against racialism and colonialism in all their manifestations. Racialism and colonialism still persist. Bandung expressed the united opposition of Asian and African nations against all manifestations of racialism and colonialism. Racialism and colonialism are threats to world peace. Bandung has voiced its protest against racialism and colonialism because Asian and African nations desire world peace. They are opposed to both also because of their other obnoxious implications.

Bandung was a reminder to the United Nations that the world's problems cannot be solved in the context of West or of Big Powers alone. To neither the United Nations nor the Big Powers did Bandung issue threats of retaliation. It issued an appeal to the United Nations to admit more Asian and African nations as members so that they could further the cause of world peace. To neither the Western Powers nor the Communist States did Bandung pose a threat of a rival bloc. But to both these rival blocs, Bandung was a reminder to leave Asian and African nations alone. Bandung's main purpose was to extend an area of peace. Asian and African nations assembled at Bandung would welcome opportunities, and expressed their eagerness, to help solve world disputes through peaceful means. But they made it equally clear that they had no intention to become camp-followers of either the Western Powers or the Communist States. Non-alignment is not the essence of the policy formulated at Bandung. But many Asian and African nations expressed preference for non-involvement in the "cold war" between the two rival blocs. This is an incidental consequence of their desire to create and to extend an area of peace.

Despite the compromise policy formulated at Bandung, it is evident that Bandung is opposed to undue reliance on collective security as a

means to ensure regional or world peace. Bandung's preference for reconciliation of disputes through negotiation is emphatic. In this aspect of the policy formulated at Bandung, the Asian and African nations have issued a warning to the United Nations and the Big Powers that the policies so far pursued by both are not likely to ensure world peace. Bandung is not passive in its call to the rival power blocs to leave Asian and African nations alone. Asian and African nations abhor war. They would welcome peaceful settlement of disputes among them. But if, in the event of failure of diplomacy, the rival power blocs start a third world war, they will do so in the knowledge that the nations assembled at Bandung will not join either of the rival blocs in their struggle for power.

The policy formulated at Bandung has also a positive aspect, however, Asian and African nations' desire to mediate on world issues in dispute is implicit in the *communiqué* issued at the end of the conference. There is, besides, a specific suggestion to the United Nations which is aimed at ensuring their effective co-operation in reconciling world conflicts. In demanding admission of more Asian and African nations to the United Nations, Bandung implies that such a policy will enable the small Powers to exercise their restraining influence more effectively. As more of the smaller Asian and African nations become member-states, the United Nations will cease to be dominated by the Big Powers. With such a changed composition of the United Nations, it would be more difficult for either of the rival power blocs to pursue policies which can only make a third world war inevitable. Bandung offers West two choices. Either, the membership of the United Nations should be so changed as to enable the small Asian and African Powers to lend their due weight and influence in the cause of world peace. Or, the Big Powers must leave the Bandung countries alone in the struggle for world domination.

It is not without significance that Bandung's achievements are better appreciated in the Western countries than in some of the countries which assembled there. To take an instance, there has been an undue emphasis in the Indian Press on the differences among the Asian and African nations. There has been a tendency to play down Bandung's moral achievements. Bandung has

served its purpose if only because of Mr Chou En-lai's offer to negotiate with America on Formosa and Far Eastern issues. It is significant that even the American Secretary of State acknowledges this achievement of Bandung. Asian and African nations can justifiably claim that they have been successful in exerting their moral influence on China to desist from the use of force in solving the Formosa dispute. China is committed to Pancha Shila. And the Colombo Powers can take legitimate pride in their achievement in convincing her of the wisdom of settling the Formosa dispute through negotiation. Those who are likely to distort Mr Chou En-lai's Bandung offer to negotiate with America as diplomatic propaganda deliberately ignore the restraining influence exercised by the Bandung nations on Communist China. This is the fundamental significance and implication of Mr Chou En-lai's Bandung gesture.

That Peking's conciliatory gesture is an achievement for the Colombo Powers in their efforts to attain peace through negotiation, is acknowledged by both London and Washington. But America's reaction to Mr Chou En-lai's offer explains why Asian and African nations are not over-optimistic. Peking's diplomatic triumph at Bandung is duly appreciated in London. Britain is, naturally, irritated that Washington has allowed Peking to regain diplomatic initiative in the Far East. Mr Dulles's insistence on cease-fire as a condition precedent to negotiations will be widely endorsed. It will be equally widely appreciated that Peking is entitled to certain assurances for entering into an agreement for a cease-fire in the Formosa Strait. But over-insistence on cease-fire by both Mr Dulles and President Eisenhower as a condition for negotiations with China, to the deliberate neglect of the assurances Peking is entitled, underlines the differences that still persist between Washington and Peking. It is clever of Washington to accept, by implication, Peking's refusal to recognise the Chiang regime in Formosa. But Washington is also adamant in its emphasis that its acceptance of Peking's rejection of the Chiang regime relates only to the issue of cease-fire in the Formosa Strait. From Mr Chou En-lai's offer, it is clear that Peking is interested in negotiating all the Far Eastern issues with America. Washington would seem in favour of restricting the scope of negotiations. While Peking

favours bilateral talks with Washington, America prefers negotiations under the auspices of the United Nations. Differences on the procedural details of the proposed negotiations are not as significant as the implied disagreements on wider issues.

Mr Chou En-lai may not have succeeded in convincing Mr Dulles of his peaceful intentions. But the Chinese Prime Minister seems to have created an extremely favourable impression on the participants in the Bandung Conference. There have been insinuations that Mr Chou En-lai has ulterior designs in his assiduous wooing of the Asian and African nations. Many of the Asian and African nations will endorse the Pakistani Prime Minister's assessment that Mr Chou En-lai is sincere in his peaceful intentions. Many Asians and Africans will also echo Mr Mohammed Ali's remark that his belief in Red China's peaceful intentions does not imply his acceptance of Communism. Acceptance of Communism is not an essential condition for recognising Red China, or for advocating peaceful co-existence. America recognises Communist Russia, but is opposed to recognising Communist China on the argument that such recognition would involve America's acceptance of Communism. This is strange logic. If Bandung leads to recognition of Communist China by some Asian and African nations, it will help extend the area of peace. Bandung has been successful in achieving its immediate objectives. Whether it will succeed in achieving its wider aims depends, to a large extent, on the Big Powers' willingness to accept the realities of the world situation.

Law-Made Confusion in Pakistan

DEMOCRACY in Pakistan is hanging by a split hair which may snap at any moment, if the Federal Court chooses to sniff at it. This will plunge Pakistan in political chaos from which only a revolution or military dictatorship can pull her out. Though not expressed in exactly the same words, this is the threat with which Mr H S Suhrawardy and some of his colleagues in the Pakistan Cabinet are trying to win over opponents to the Constitution Convention which has been summoned to assume the responsibilities of Constitution-making and also to act as the Federal Legislature, in accordance with the Governor-General's latest proclamation.

Ghulam Mohamed started under wrong stars when, disgusted with group politics and petty jealousies amongst its members, he took the bold step of dissolving the Constituent Assembly. Efforts that followed to give a democratic touch by including in the Cabinet persons who had once been branded as enemies of Pakistan, such as Doctor Khan Saheb or Suhrawardy, had their first success in the consolidation of strength, and for a while merger into a single Western Zone and adoption of the departmentally-drafted American pattern of constitution appeared to be *fait accompli*. Little was it realised then that some day the legal repercussions of the dissolution would threaten the very existence of the State. Trouble started when Tazimuddin Khan, Speaker of the dissolved Assembly, vindicated his status as well as that of his Assembly by obtaining from the Sind High Court a decree in his favour, by which the Governor-General's order was declared *ultra vires*. Developments since then, involving several references to the Federal Court and proclamation of ordinances, baffle even the astutest of constitution experts. The climax came with the Federal Court's judgment of April 12 which turned Pakistan into a superlative constitutional conundrum.

Credit must be given to Ghulam Mohamed and his advisers that in this critical situation, unprecedented in case of even countries with centuries of constitutional tradition behind them, he is still trying for a legal escape, instead of resorting to more drastic measures such as military dictatorship. Proclaiming the maintenance of *status quo* until the

Federal Court, whose judicial advice has been sought, gives its decision, he has summoned a Constituent Convention to be elected by Provincial Assemblies. Meanwhile, the preparations for calling the Convention are going ahead. There has so far been very little opposition to this move from the western provinces of Pakistan, but East Bengal, as usual, has been the problem province. It offered such stout opposition that until the Awami League Working Committee met at Dacca on the 25th, it was feared that it would completely boycott the Convention; and with 60 per cent of Pakistanis holding aloof, the constitution adopted by the Convention would certainly have not been a democratic one. The Convention was originally to have consisted of 60 members; its strength has now been increased to 80. East and West Pakistan are to have equal number of representatives on it who are to be elected by the provincial assemblies (their existence being legally debatable, they will be considered as electoral colleges for the purpose), on single transferable votes. Parity has always been a sore point with Bengalis and it was the issue on which the draft constitution, deliberated for over six years, had foundered.

East Bengal's resistance, however, had been perceptibly weakening with growing dissensions in the United Front, particularly between the Krishak Shramic Party and the Awami League. The Central Cabinet, while concerned about the opposition from East Bengal, was not unaware of the weakening of the Front, and several Ministers led by H S Suhrawardy were sent out to exploit the dissension and win over different political groups. From the stand that Fazlul Huq had taken as the leader of the Krishak Shramic Party, demanding the restoration of popular government in East Bengal as a condition precedent for offering his co-operation, he has resiled, realising his inability to form a government without the Awami League which has withdrawn its support to him. He has finally decided on the complete rejection of the Convention proposal and has demanded instead the formation of a Constituent Assembly by direct election on adult franchise and on the basis of population, not parity. Co-operation has also been denied by the minor par-

ties, such as, Nizam-I-Islam and Ganatantric Dal as well as the Congress. East Bengal Muslim League, which won only ten seats in the Assembly, has also rejected the Convention, and demanded the formation of a Constituent Assembly more or less on the lines suggested by Fazlul Huq.

The Awami League was, therefore, the only party which could be worked upon, and H S Suhrawardy being the President of its Central Committee, took on himself the responsibility for winning it over. The tactful acceptance that he managed to win at the adjourned meeting of its Working Committee during one of his earlier visits to Dacca remained, however, to be ratified by the Provincial President of the League, Maulana Bhashani. Bhashani was then a political exile with an order of arrest awaiting him, should he set foot in East Bengal. He had opposed the Convention over the issue of parity, but subsequently yielded to Suhrawardy's persuasions to visit Dacca and make a desperate attempt to save Pakistan from chaos. Ideologically widely separated from Suhrawardy, Bhashani had been named a Communist, and had bitterly opposed American aid to Pakistan. That Suhrawardy should have succeeded in making Bhashani to use his influence to win over the Awami League, is a great political triumph for him; it also ensures the success of the Convention proposal, which was ratified by the Working Committee of the League when it met on the 26th. The postponement of the Convention by a week to May 16 and extension of time for filing nominations are obviously intended to help the Maulana to win over all the political groups belonging to the United Front.

All these are desperate efforts to obtain for Pakistan a constitution which its Prime Minister Mohammed Ali is determined to finalise within six months provided, of course, the Federal Court gives its legal blessing. It is futile to anticipate what course will be left to Ghulam Mohammed and his advisers, if the approval does not come. He is certainly not going to risk loss of face and call back the old Constituent Assembly. As the old Constituent Assembly still exists legally, Mohammed Tazimuddin, its Speaker, has called a session on May 9, but what chance has it, even if it meets, of a fruitful career?

Weekly Notes

No Politics in Budget?

A FAVOURITE of gods and critics alike—Mr Butler is indeed a very lucky man. His 'hunches' have a habit of coming true; and because they come true, the critics take care to apply standards of criticism that are proper—meaning, in this context, standards according to which Mr Butler's budgets get a high mark. In fact, they go further and admonish those who naively look at Mr Butler's latest budget as a set of fiscal decisions based on or related to economic realities. How patently absurd, when the general election is only a few weeks away, not to recognise that a nation's budget is a political document, especially under a system of Government by party! If Mr Butler has kept one eye cocked at the polls, pat him on the back for his practical sense.

It is refreshing to see this eagerness to applaud not only in the confirmed supporters of Mr Butler's party but the high pontiff of economic commentary. When Dr Dalton and Sir Stafford Cripps and Mr Gaitskell recognised the facts of parties and elections, they were most severely castigated for sacrificing national economic interests to the politics of the moment. And when they resisted such temptations, they were complimented for their courage and honesty. But Mr Butler is a different kettle of fish. He can do no wrong, since the standards of criticism are adaptable when he is concerned.

It is of course silly to argue that the Chancellor has to concern himself least with the politics of the moment in his pre-election budget. Here is one more evidence of the miracle wrought by Mr Butler in the past few years.

It is not only the British economy that has become flexible, but standards of budgetary criticism as well. And the amazing thing is that Mr Butler's latest budget can stand up quite well to the criteria which, we are now told, is *demodé* and absurd and grotesque. Disraeli said nearly eighty years ago that the subtle poetry of the British budget is rarely appreciated outside the House of Commons. He apparently underestimated the propensity to change of the world outside Parliament!

UK Turns Against Japan

THOUGH it was US which had sponsored Japan's accession to the GATT and Britain had so long been luke-warm and hesitant rather than hostile, the President of the Board of Trade, Mr Peter Thorneycroft has now come out openly against the proposal. The Government had decided, Mr Thorneycroft announced in Parliament, that for the time being it would be unable to accept the obligations of the General Agreement towards Japan and, therefore, trade relations with Japan should continue to be dealt with by mutually negotiated arrangements. Britain's attitude towards Japan had never before been stated in such forthright manner. Indeed the timing of the announcement is worth noting. The occasion was the declaration of Britain's attitude to the review of the General Agreement on Tariff and Trade. The accession of Japan to the GATT was, however, a separate issue and could have been so treated.

What lends significance to it is the case of Lancashire which has been very much before the public. In an editorial on the subject "India and Lancashire", it had been argued in these columns that Britain could not very well restrict imports of Indian cloth without opening the door wide open to imports from Japan. The solution of Lancashire's problem has, therefore, to be sought in means of expanding exports rather than restricting imports. The latter conclusion remains unaffected, though after this clarification, to the extent that Britain will have a freer hand in regulating her imports, the position is modified a little. India, however, enjoys no such freedom, having committed herself to support Japan's accession to the GATT. Moreover, the more important obstacle to adjustment of import duty on the part of India—which is likely to be decisive—is not affected, of course, by these developments, since this consists in the high rates of excise duties. The clarification of Britain's stand *vis-a-vis* Japan strengthens the bargaining power of the Board of Trade with other potential or prospective importers of cotton textiles, besides India.

Varied Manufacturing Activity

THOSE who are interested in case studies of industry will find more than a handful in Mr Cecil Stack's speech at the annual general meeting of Dunlops. How quickly the pattern of industry is changing, how many new lines of production are being developed, the part played in such development by research and new techniques, financed and conducted by the principals of the foreign companies operating here—Mr Stack lets us have a peep into all these and more. For Dunlops use domestically grown raw rubber, supplementing in part by imports. So thrown in, is a bit of the problem of price parity between agriculture and industry being debated at the moment. It is, however, a pleasant variation on the usual theme. Domestic producers of raw rubber have been given a price raise without car owners having to pay any more. In fact, tyre prices have been cut and motorists can now have tubeless tyres, the latest marvel, at no higher cost than that of ordinary tyres. An entire range of highly developed manufactures, the production of which has been taken up within the country—besides tubeless tyres, a new type of tyres for trucks and buses introduced only last year, industrial transmission and conveyor belting, the manufacture of which was begun only in 1953, high pressure hoses, the production of which was taken up only this year, and so on.

In November 1952, the question of fair prices for tyres was referred to the Tariff Commission. There is no monopoly in the manufacture of tyres. From the pages of the dailies and the more prosperous financial weeklies, the producers glower at one another. But some of them produce, some of them don't, and though all are foreign companies, their foreignness has many shades, in the methods of raising finance, among other things. Considering the complexity of the problem, what should be the fair price in an industry with such a complex structure and world-wide ramifications, it is no wonder that the Tariff Commission has been sleeping over it all these years—and what arrears it has to clear, for prices have to be looked into, in retrospect, from 1946 onwards!

Slum Clearance in Bombay

THE talk of slum clearance has been very much in the air lately. Since the time when about two years ago Pandit Nehru, appalled by the sight of slums at Kanpur, demanded that they be burned down, which demand he repeated later with even greater vehemence at the inauguration of the Vaitarna Dam, there has been some progress. The main obstacle in the way was and still continues to be the lack of finance. The fourth amendment of the Constitution has eased this problem to some extent in that Authority will be able to take over slum areas for improvement without paying exorbitant sums by way of compensation. This was badly needed as a first step. But the difficulty of finding enough resources for clearing the slums, for providing alternative accommodation to those rendered homeless and, more than all, for putting up new buildings on the sites cleared, continues. As Sardar Swaran Singh, the Union Minister for Housing and Supply, said in Parliament the other day, the loan scheme of the Central Government has not evoked much response from the State Governments because the terms are beyond the reach of the agencies directly concerned with slum clearance. The demand has been for a subsidy, and it is good to hear that the Planning Commission has now been asked to consider it.

Cities like Bombay, Calcutta and Madras have long been grappling with the question of slum clearance and some of them, though not all, have also drawn up tentative schemes for the purpose. For lack of finance, these good intentions have remained unfulfilled. The number of slums in Bombay, for instance, was put at 85 some ten years ago. The figure must be far higher now, with more and more slums springing up everywhere for lack of cheap housing accommodation or any accommodation at all and also because some of the ill-constructed, neglected older buildings have been fast becoming slums. The modest scheme prepared by the Bombay Municipal Corporation for gradually clearing them has been lying idle for about a year; and the reason given for this by the Mayor some time back was red-tapism on the part of the State Government. Whether with the amendment of the Bombay Municipal Corporation as

well as that of the Constitution, the position will improve now remains to be seen. The new Mayor, Shri N C Pupala, however, seems to be optimistic. Speaking at a civic conference last week, he announced that the first scheme of slum clearance in the city would be implemented soon after the monsoon. One hopes that this will come true; for as the Governor, Dr Harekrishna Mahtab, who inaugurated the Conference, said, "You know that the Constitution has been amended, much to the dislike of

property-owners and with great enthusiasm, and one of the grounds for amending it is said to be the clearance of slums. Unless some concrete steps are taken immediately, critics will say that all these were eyewash and that nothing was intended to be done."

High Cost and Low Rent

WHAT is true of Bombay is true of other cities too, not to speak of towns. It may be more easy now to take over the slum areas and clear them without spending too much, and even the question of finding some kind of alternative accommodation for those who are thrown out may be tackled with comparative ease. But this is only one phase of the task; the second and the more important one is that of providing new accommodation of acceptable standards to the old tenants of the slums at rents that are within their reach. The lowest rent that may be charged for the most modest accommodation erected with the utmost economy would be higher than what the slum dwellers could be expected to pay. This gap has to be narrowed, and it is not so easy in these days of high cost of material and labour. There is much talk of cheaper construction; but unless the new buildings to be put up at the cleared sites are to be pigeon holes without adequate space or amenity and unless these buildings in their turn are to decay into slums sooner or later, there is a limit to reduction in the cost of construction. Indeed, the new houses will have to meet the needs not only of the present, but also of the foreseeable future which may well come to have improved standards of living; and houses are not things that can be hastily put up and then altered to meet the needs of different times and circumstances or pulled down and replaced by other and better buildings as and when needed. With no prospect of any great economy in construction and consequently with no possibility of any major cut in rent, other means will have to be found to enable slum dwellers to occupy the new buildings put up on cleared sites without any serious strain on their slender purses. Rents may well have to be subsidised which means a further financial burden on the agencies undertaking slum clearance. It is clear that these burdens cannot be shouldered without considerable State aid.

—Fitting Celebration of Buddha Jayanti

ON the night of the full moon will be celebrated the anniversary of Gautama's birth, attainment of Buddhahood and final departure, all of which, according to accepted tradition, falls on the same day. On this night, sitting under a Banyan tree on the banks of the Niranjana, the realisation dawned on the enlightened one that it was not by mortification of flesh that man wins release from suffering and attains wisdom. The futility of rituals and the emptiness of scholasticism and authority, he had realised fully before he took to penance. Enlightenment came through the instrumentality of a simple village woman, Sujata, who was looking for someone to offer a plate of rice pudding as was her usual practice. This she did every evening before she took her own meals. It is a beautiful allegory to comfort distracted mankind that all great truth is essentially simple, that it is always lying near at hand, to be accepted and acted upon. And having found what he had been seeking, Buddha wended his way to holy Banaras and in the deer park at Sarnath, he started preaching the truth as he had found it.

In this deer park was first turned the wheel, the Dharma Chakra, slowly at first, then with gathering momentum, as it began to work on the minds of men, kindling a spark wherever the gospel went and it went very far indeed. The word of the law crossed the seas to Ceylon and travelled across the oceans to Burma, Siam, Cambodia, Sumatra, Java, and Bali, and reached as far as the shores of the Philippines. Overland, Buddhism crossed the Himalayas to Tibet, and the Hindu-kush to Central Asia, sweeping across the steppes to Siberia and Mongolia; it penetrated to China and enveloped that vast land and gave a new life to its ancient civilisation, and from China, it crossed over *via* Korea to Japan.

Wherever Buddhism went, it liberated the minds of men and made the national genius flower as it had never flowered before. No soil was too barren or too hard for that seed, whether wind-blown or sown with loving care and nurtured tenderly. The transformation wrought by Buddhism, the ferment

it brought and the efflorescence it produced in due course in the art, literature and the ways of living of the people who came under its spell, are without a parallel in the history of these lands. That story has not been fully told yet. Fragments of it have been discovered, some happy accident has brought to light some scraps and pieces; by the patient research of a handful of scholars, some of these have been pieced together. Many of these bits and pieces still remain to be put together. To make them into a connected whole, to look for and fill the gaps, will require study and research and the co-operation of the people of many lands. It is a labour for a whole generation or more. The task has yet to be taken on hand. Peoples of these countries have been too pre-occupied with their struggles for political emancipation to be able to attend to the things of the spirit. Even today, their energies are fully taken up by the immediate and pressing problem of consolidating their newly won freedom, setting their houses in order and initiating those economic and social changes which alone can give content to their freedom.

The time, however, has come, with the stirring of a new life among the peoples of Asia, to look for their roots in the past, to trace the history of their thought and to discover the mainsprings of their lives, not in the idle hope of reviving, much less to sink back in the obscurity of the past, but to understand the evolution of their own thought and society. Only thus can the present be meaningful, in the light of the past and light up the path to the future, through harmony and concerted action, to a community of feelings and ideas which alone can lay the foundations of a common pattern of living.

So Buddha Jayanti is a celebration for all Asia; it is not for the professed followers of the faith alone—though they embrace the bulk of the population of Ceylon, Burma, Siam, Ladakh, Nepal, Tibet, Central Asia, Mongolia, China, Korea and Japan, besides the handful in East Bengal who though small in numbers are no less zealous in their faith. It is an occasion to stir the imagination of all those in

Asia and the Far East, who, released from the political domination of the West are anxious and eager to help those of their brethren who are still in bondage, and are equally anxious to save themselves from the snare of involvement, political or economic, which may chain them back to the yoke from which they have just freed themselves.

Awakening in the East has come in the wake of revival of interest of all these people in their own past; it has brought forth a surge of feeling and emotion for everything Buddhist in those lands in which the vast majority of people still mould their lives on the teachings of the Buddha. At long last, control over Bodh Gaya, the hallowed place of pilgrimage of Buddhists all over the world, the Bodhi tree under which Gautama sat, meditated and attained enlightenment, the temple that was erected on the sacred spot by his devout followers two thousand three hundred years ago, has been taken away from the Brahmin priests of the local Vishnu temple and handed over to a committee on which Buddhists are also represented, among others. Viharas and chapels are springing up in Bodh Gaya, donated by the faithful from Tibet, Burma and Ceylon. There is a similar proliferation of buildings in other sacred sites, as in Raja Griha, Sarnath, Sanchi and Nalanda. This has not added to the charm and beauty of these holy spots. The Government of India is now mindful of tourist traffic and is not loath to utilise the opportunity to publicise the Plan. So the visitor to Bodh Gaya sees, on both sides of the road leading to the sacred spot, plentiful irrigation, in pleasant contrast to the dry and arid landscape of the rest of South Bihar, normally blighted by drought. The railway line from Gaya is to be extended, so that visitors may travel by train right upto the Bodhi tree. The sanctity, quiet and charm of Bodh Gaya may not gain from steam locomotion, but it will pay to have a railway line, even though regular traffic may not be there throughout the year.

In the last few years, Buddha Jayanti has been observed in this country more widely than ever before, with ever-widening circles of peoples participating in it. Buddhists of other lands too have been taking a greater part in it than was possible in the past, and the celebration is far from being confined

to professed adherents of the faith. One reason for it is that Buddhist countries are now free and Buddhists themselves have now control of their governments, and they are able to participate in a way not to be thought of in the past. Among the pilgrims lately coming from Burma and Ceylon have been some of the Ministers and other men of influence in their own country. They have brought with them gifts and are willing as also able to sponsor or help the founding of viharas, construction of temples or the endowing of institutions of Buddhist learning.

The Government of India has been co-operative in routine matters, but has not taken any initiative in a big way. The restoration of the relics of Sariputta and Moggallana, the two chief disciples of the Buddha, was perhaps the only occasion when Government showed both initiative and imagination. The invitation to Buddhist countries to participate in the function was a thoughtful and welcome gesture. Besides this, the President of India, Babu Rajendra Prasad, has been taking a personal interest in the Nalanda Research Institute which has developed as a nucleus of Buddhist studies. He has even expressed the hope that it may develop into a university at some future date. But the Government of India does not appear to have blessed the proposal yet nor committed itself in any way.

All these places—why Nalanda alone?—are of hallowed memory and have historic associations and many of them have been consecrated by the presence of the Buddha himself. The garden of Lumbini is one such where the Ashoka Pillar stands to this day to mark the spot where the Buddha was born. But Lumbini is somewhat inaccessible being in Nepal Terai, though even here the Jayanti is being celebrated in recent years and pilgrims have come from distant lands. With the change of Government in Nepal and its growing contacts with India, particularly in view of the programme of road-building that is being jointly put through, Lumbini should soon be rendered accessible to all people. And it may by and by develop into as attractive a centre and draw as many people to it as the other and more accessible places of Buddhist pilgrimage.

But that is not it. The occasion calls for a more fitting celebration and not merely the extension of travel facilities, piling up of more

brick and mortar and the drawing of crowds. Where the wheel was first turned and the gospel sent forth to the four corners of the then known world, the threads have to be gathered together and the strands of thought that spread from it, developed and drew fresh sustenance from many lands, collected again. To call back home what has got dispersed all over the world can be the proud privilege of the land which the Tathagatha had blessed with his presence. In this, India has a debt to discharge to the past.

Legend has it that in the year 67 A D Emperor Ming Ti of China dreamt of a golden image of Buddha and sent an emissary across the Hindukush to invite Brahmanas and Sramanas to bring with them the message of the Tathagatha. When such a mission returned with holy books and relics, a later Emperor caused a palace to be built to receive the honoured guests and extend royal patronage to the good work of translating the canons into the Chinese language. The Chinese are good historians and have left pictograms illustrating the event in which one person is seen reading out from a palm leaf in Sanskrit or Pali, a second paraphrasing the text, a third translating it word for word into Chinese and a fourth polishing and editing the Chinese text. In order to promote this good work, the Emperor himself acted as the Patradharaka, passing on the palm leaf from one to the other. Thus did Indian thought travel to the land of the Hans, and the good work started in the first century after Christ went on, though not without interruption, right up to the 12th century, and many were the scholars and sramanas who went to China to carry the gospel and with it, the treasures of Indian thought and philosophy, many were the pilgrims from China who visited this holy land. The results of their labours are preserved in the Chinese Tripitakas, the extant editions of which run into 2000 volumes or more. This is only the canonical literature; there are innumerable other books, besides, on Indian thought and life, iconography, Sanskrit grammar, rhetoric and Ayurveda preserved in Chinese translation.

Strangely enough, we in India were so superior and indifferent that our ancestors did not take the slightest notice of the development of Indian thought abroad, of the transformation it underwent and the enrichment that it received at the

hands of others.

To understand the heart of Asia and resume these threads that have snapped, scholars have been patiently researching for several decades. Because many of the original Sanskrit texts that have disappeared from the land of their origin and been lost to us have been preserved so faithfully in translations, not only in Chinese, but in Tibetan, Mongolian and even in Central Asian languages and dialects that retranslation has been very helpful in reconstructing some periods of history which had otherwise remained dark, in tracing developments of thought where no links could be found before.

During the last two to three decades, this has been a very fruitful source for Sanskrit and Buddhist studies. In respect of texts discovered in Central Asia and more distant lands, even some of the originals had been preserved, not to speak of the many faithful translations, and today we know that the Sanskrit canons are in every way as pure and as faithful a record of the teaching of the master as are the Pali canons, which alone was regarded as authentic some years ago.

The deer park where Buddha first turned the wheel is undoubtedly the site for a Buddhist University, where every branch of Buddhist thought and of the culture of every country of the world where it penetrated can find its real home. Because India has not taken the lead nor shown any interest in the proposal, Burma has gone ahead and declared its intention of handing over the building constructed for the meeting of the Buddha Sashana Council that is now going on in Rangoon, for founding such a Buddhist University. The proposition has been blessed by many and has already won the support of the Ford Foundation. But Buddhists elsewhere, and others whose interest is purely secular cannot be so sure that in view of the predominance of the Theravada school in Burma, the culture, philosophy and thought of the other great Buddhist sects, particularly Mahayana will receive the same attention or even be viewed with tolerance in the proposed university at Rangoon. India having no denominational interest in any particular sect or school, can afford to offer a home to all and encourage the study of every sect and every faith, in the interest of pure knowledge and for the pursuit of truth, and to seek enlightenment in the very spot from which enlightenment came to the world.

While Nehru is Away...

Wednesday, Evening.

DELHI has been looking towards, practically throughout the week, Bandung. Though the officials of the Ministry of External Affairs are trying to put on a brave face, the general feeling is that the pre-conference expectations have not been fulfilled. Our Prime Minister, of course, has no personal ambition—never had—to become the leader of Asia; but it was generally expected in official circles that he would be acclaimed as such and that the boys of the Asian Chancellories would raise him aloft with a cry of three cheers for Uncle Nehru of Asia. News is seeping in, that in his heart of hearts, the Pandit himself is not a trifle disappointed, that he feels—as can be judged from the final *communiqué*—that the Conference has been as useful (or useless) as a Commonwealth Prime Ministers' Conference and so on. It is clear that the 'bloc' representatives—Comrade Chou on the one hand and the Middle and Far East agents of the colonial powers on the other—played, each in its own way, a masterly game and the neutral powers in fact quite lost their way in the middle. Our Prime Minister played at best the role of an honest mediator or moderator, with Krishna Menon fiddling by his side to attract customers to the beautiful rhythm of neutrality. But it did not quite work. Comrade Chou behaved as though he did not quite need our services. He made direct advances to Ceylon and Thailand, Laos and Cambodia and appealed the Indonesians on the Chinese nationality issue. In fact he blew right at the conference itself by proposing direct talks with the USA. It was strange indeed, if not paradoxical, and all the more significant because of that, that an Asian Conference should have been the forum for direct negotiations between Communist China and Uncle Sam. Perhaps neutrality is acquiring a new political value; but sceptics may reflect on the fact that the mediator in this case was the Prime Minister of Pakistan and the proposal has been communicated to the State Department, via the Pakistan Embassy in Washington. Western powers, therefore, need not feel that their agents in the Middle East have lost their utility and influence.

WHOSE CROWNING HOUR?

Against this background, the drum beating that is now going on seems to be overdone. And drums being beaten louder to give us a feeling of triumph. In this context, Shri Rajagopalachari's hyperbole that the Asian-African conference is a shining light and landmark in the history of civilization has a touch almost of irony, particularly when he concludes that it marks the "crowning hour of Prime Minister Nehru's brave life". Why crowning? Surely he does not mean that the Prime Minister should retire and give place to him in the interests of *real-politik*? The best use that can be made of Rajaji's talents is to post him at Washington. He can then see to it that the USA sinks its stockpile of atomic bombs on a 50-50 basis in the Atlantic and the Pacific. This will bring the world nearer to Nehru's heart's desire.

AFTER BANDUNG—BAGUIO

In the din and noise of the Asian-African conference, it has been overlooked that immediately on the conclusion of this conference on April 24, just on the following day Asian-Western conference commenced at Baguio, and as many as 75 military experts of the eight SEATO powers met to consider

- The establishment of a mobile SEATO striking force,
- Contributions to this force,
- The setting up of a *liaison* training group,
- An intelligence centre,
- Construction of air fields, and
- The working out of a new strategy for the containment of air Communism in Asia.

We are being encircled. We laughed at Pakistan and it came into being. We sniffed at Manila and it is developing teeth. The Prime Minister arrives here tomorrow and he will have enough food for thought. He is scheduled to address the Congress Working Committee. In all probability, he will address the Parliament first, as it is in session and the Speaker has kept the adjournment motion on Goa "open" until the return of the Prime Minister.

TTK NOW DEFENDER OF AVADI

Parliament has been unusually active, despite the absence of the Prime Minister, as also of the Finance Minister, who has been indisposed. Surprisingly, it was TTK, who fought Deshmukh's battle on the floor of the House, when it began to wag its tail strongly during the third reading of the Finance Bill. It appears, there has been a shift in the political groupings within the Cabinet and TTK is now in the Deshmukh camp. He claimed, exactly as Shri Deshmukh had done before, that the Government was moving step by step towards the objective of the Avadi Resolution. Shri N V Gadgil, who has now become a radical socialist (not in the French sense) said that there was nothing either in the policy of taxation or expenditure to indicate in the smallest measure that the Government was moving towards a socialist pattern of society. What about the nationalization of the Imperial Bank and the establishment of a State Bank? The bitterest critic of Shri Deshmukh's economic policies would have to admit that measures such as these, alongside the Estate Duty Act, are well-designed approaches towards the building up of a socialist state on firm foundations.

WHERE GADGIL GOES OFF

Where Shri Gadgil was certainly right was in his reference to the gravity of the unemployment situation. Where he goes wrong is in his desire to make employment a *legal* obligation of the State. What about the Directive Principles of the Constitution? Among these, there is a clause which the Prime Minister read out when he was introducing the 4th Constitution Amendment Bill, that the State shall secure to every citizen *adequate means of livelihood*. Though neither mandatory nor justiciable, these provisions of the Constitution must, according to its letter, *inform all the institutions of social life*. Why does not Shri Gadgil take up this basic issue instead of suggesting doles for the unemployed? Both the Prime Minister and the Finance Minister are rightly opposed to such a demoralizing measure. Shri Gadgil would

do well to table a resolution that Government should recognise the right to work at a minimum or even at a starvation wage. It will compel Government to assess the measure of distress in the country, which is an essential first step and

then formulate policies in the light of facts rather than act on a hunch or yield to sectional pressure. In economics, there is no escape from pragmatism.

Shri TTK's defence of the revised budget proposals cast a serious

and I must say, unfair, reflection on the officials and advisers of the Ministry of Finance: "If we had stuck to the budget and allowed the taxation measures to go through, *we might have perhaps ruined the industries.*" (italics mine.) This means

PLX-26

An entry in the meter-man's book—to appear later as your electricity bill. And an item of expenditure however small should be economically justified. It's at this point, when you're working out costs, that we tell you about the economics of Philips Fluorescent Lighting. As a factor in raising output and maintaining a high level of production the value of adequate and correct lighting is now increasingly appreciated. Philips Fluorescent

Lamps and Fittings give an ample supply of even, diffused, glare-free light. Add to these advantages the factor of economy in running charges: Philips Fluorescent Lamps give over three times more light, for the same amount of electricity, and last many times longer than incandescent lamps. All in all, with Philips Planned Fluorescent Lighting you get the most efficient lighting with the greatest economy.

PLANNED LIGHTING

For expert advice on lighting problems consult Philips Lighting Service Bureau. Calcutta, Bombay, Delhi, Madras, Patna and Lucknow.

PHILIPS
FLUORESCENT LAMPS
AND FITTINGS

that the budget proposals, as originally framed, would have meant the ruination of industries. Surely no one can accuse the Finance Minister or his advisers of such perversity or ignorance, except the Hon'ble Minister of Commerce and Industry?

Compared to the indignity of TTK's hit against Finance Minister below the belt, the passage at arms between TTK and Shri Gadgil was only a petty personal squabble though this is what hit the headlines while the other passed unnoticed. Gadgil's gibe against the Government that it was "a private enterprise affair and not a public institution functioning in the highest interest of the country" TTK took as a personal hit and unfortunately, it developed into one. As he tried to interrupt Shri Gadgil, the latter asked him not to talk, called him "a private enterprise man" and so on. TTK took the lid off Cabinet secrets and regaled the Parliament with the glory of their antagonism, when they were colleagues in the Cabinet. If TTK was not afraid, then when Gadgil was in the Cabinet, surely he was not afraid now when Gadgil was only an MP and "a bundle of nerves and frustration" at that.

COMPENSATION FAIR OR EXCESSIVE?

Shri Gadgil was again in form when the State Bank Bill came up for consideration before the House. He urged that the compensation to the shareholders of the Imperial Bank was "much too much", unfair to the tax-payer and against the spirit of the Avadi Resolution. It is difficult to understand exactly why he suggested 75 per cent of the market value—why not more or less?—but the point he made that the dividends paid by the Imperial Bank should be taken into consideration, in fixing the quantum of compensation cannot be dismissed so easily. The general feeling in the House was that the compensation was excessive; and the defence of Shri A C Guha that the assets acquired would exceed the compensation paid—that surely was not the basis for fixing it—did not quite satisfy the House; nor his theory that the compensation would go mainly to the middle classes. If pressed further, he might as well have added that widows and orphans would mainly benefit for the theory of the stock exchanges is that these are the real share-own-

ing classes and it is anti-social to disturb them.

EXPANSION OF RURAL CREDIT

The proposal for a State Bank was generally welcomed. Sadhan Gupta's criticism that the Central Board would be a preserve of Big Business—as in the case of the Reserve Bank—was trite in that since it was going to be a State Bank, its direction would naturally be in the hands of the Government of the day. Some valuable suggestions were offered, such as that of Ashok Mehta for development of 'credit for housing'. It was suggested that there should be a branch of the State Bank in every *tehsil* or for every 5000 of the population. Though the House was not very appreciative of Shri Guha's performance in the debate, the impression was confirmed, nevertheless, that Government was serious about implementing the Rural Credit Committee's recommendations.

In pursuance of this policy, Shri Guha, the Minister for Revenue and Expenditure, requested the House yesterday to take into consideration a bill further to amend the Reserve Bank Act. The Bill widens the scope of operation for the Reserve Bank in giving loans to co-operatives. Its main purpose is to authorise the Reserve Bank to set up two funds, the National Agricultural Credit (Long-term Operations) Fund and the National Agricultural Credit (Stabilization) Fund. Government has in fact provided more for the first fund than recommended by the Survey—Rs 10 crores instead of Rs 5 crores, plus a recurring grant from the Reserve Bank of not less than Rs 5 crores. The main purpose of this fund will be for making loans and advances to State Governments for subscribing to the share capital of co-operative societies, for making medium-term loans to State Co-operative Banks and for long-term loans to Central Land Mortgage Banks. The second fund would be exclusively for conversion of short to medium term credit, whenever necessary on account of floods, famines, etc. The funds, when established and operated, should make a significant difference to the life of rural communities.

COMMISSION FOR KHADI

There is further evidence of late of a shift in the policies of Gov-

ernment in favour of the common man, particularly in the rural areas. On Monday last, Government introduced a Bill for the establishment of a Commission for the development of khadi and village industries. It will be invested with executive powers to plan, organise and implement programmes for development. It will arrange for training of personnel, organise marketing and sales, establish co-operatives, promote research in techniques, etc. Government will place at its disposal a Khadi Fund and a Village Industries Fund. Actually, boards for khadi and small-scale industries have already been established and have been functioning for quite some time. On Saturday last, the Small Scale Industries Board, set up under the auspices of the Ministry of Commerce and Industry, held its second meeting. It reviewed the progress of work done so far, considered the establishment of industrial groups and estates, model units, the quantum and manner of Central assistance (100 per cent for capital, 75 per cent for other non-recurring expenditure and 50 per cent for recurring expenditure), the appointment of an additional or joint director for small-scale industries in the State Governments, the training of 200 engineering graduates in the techniques of small industries, their usefulness in the community project areas and the programme for these industries in the Second Five-Year Plan.

CHANGES GALORE AND CULTURE

Obviously we seem to be in for quite a good deal of change, what with the introduction of through rail traffic for the Indo-Pak sub-continent, the intensification of Hindi culture (a Commission is being appointed under Article 344 of the Constitution), the decimal coinage and metric system, boys setting up their own schools, not far from Delhi and probably elsewhere in the country and so on. The real author of this silent revolution is arriving here tomorrow along with Col Nasser. The Prime Minister of Sudan arrives simultaneously. We may, therefore, reasonably expect a quickening of political activity. Cultural life has been fairly active with Rukmani Arundale's Bharat Natyam and Miss Brilliant's exhibition of sculptures of our President, Prime Minister, his daughter, Krishna Menon, S K Patil and others.

From the London End

ONLY the very naive and, of course, the faithful, alone would respond to Mr Butler's appeal that his fourth Budget be analysed "in as an objective a manner as possible". A General Election is now less than six weeks off and in this situation the political demands of the moment are sufficiently overwhelming to deter even the most determined Chancellor of the Exchequer from the pursuit of a truly objective fiscal policy. This is all the more true when the Party seeking advantage has a new and as the *Daily Mail* said "unoriginal" leader*. A reading of the massive Budget speech shows the great pains Mr Butler took to give his statement the stamp of impartiality and indifference to the political situation. The impression is inescapable, however, that he must have been under severe Cabinet pressure to make concessions of a vote catching character and that he did not like having to present a Budget in these circumstances.

The economic calculations in the Budget are all based on two assumptions, the validity of which can be much disputed. Mr Butler assumes that the aggregate internal demand would not rise much during the coming fiscal year and, secondly, that the prospective rise in total output would be "at least as great as it has been in the past, if not greater". Assumptions like these are totally out of keeping with the tradition of cautious and conservative calculations which Mr Butler has for the past four years followed his economic policy. But the assumptions are made and certain important conclusions are reached on the basis of which he has made tax concessions amounting to an aggregate of £134 millions. The most important single conclusion reached is that the unchanged domestic demand will leave a sufficient margin of the potential output for an increased level of exports to take place. In this way, Mr Butler hopes (if he is returned) to bridge the widening gap in the balance of payments.

* The *Daily Mail* was by no means being offensive. It found other attributes in the new Premier sufficient to warrant, in its view, public support for him.

A Political Budget

In what appears to be an after-thought, Mr Butler refers to the "resources of a flexible monetary policy" which he may use to assist him in the achievement of this object.

The complex arithmetic of the Budget can be reduced to the following:

The 1953-54 Budget surplus was estimated at £10 millions. The actual surplus turned out to be £433 millions. Of this sum, £134 millions are being given back in the form of tax concessions. The straight reduction of 6d in the standard rate to a level of 8s 6d in the £ will relieve industry of £40 millions, and the remission of 3d in the lower rates will benefit individuals to the extent of £74 millions.

The remission of 3d in the reduced rates is ingeniously combined with changes in the personal allowances, having the effect of raising the levels at which tax becomes payable. In spite of the increased allowances for married men with children, the higher level at which income becomes taxable makes the tax concessions in general more beneficial to industry than to the individual.

Only one change was introduced in the Budget. The Chancellor has halved the rate of purchase tax on certain cotton piece goods and household textiles from 50 per cent to 25 per cent, in order to assist the Lancashire textile industry. The cost of this concession is estimated to amount to £3 millions in a full year. This concession to the textile industry has been severely criticised as being niggardly and as not meeting the full expectations of the industry; but as Mr Butler pointed out in the Budget debate in the Commons, assistance to Lancashire involves a number of complex problems, most of which have an international bearing. Apparently, some steps are being taken on an international level to provide some assistance to the industry and here one would expect that the Government is considering some changes in tariff policy through consultations with various countries, particularly with those enjoying Imperial Preference and others who are members of GATT.

First, take the assumptions. The three demand sectors—personal consumption, Government expenditure and internal investment—all proved to be unpredictable in 1954-55. Government expenditure was considerably less than was estimated, while investment demand leaped forward at a rate faster than the rise in production. Personal consumption rose by £390 millions and this, too, was unexpectedly high. In total, the level of internal demand proved too much and clear inflationary pressures became visible. In the winter of 1954-55, in a series of quick movements, the Chancellor brought into operation the whole weight of his flexible monetary policy, in which the Bank rate was pushed to the level of 4½ per cent.

The fact that output was not rising fast enough (at its unprecedented peace-time rate of 7 per cent per annum) was serious in itself. What was more serious was the swelling of the import content production, occasioned both by a rising volume of imports and a worsening of the terms of trade.

If the Chancellor's assumption that output in 1955-56 will rise by as much as last year is correct, will it not equally be fair to assume that the import bill will also rise proportionately? And, further, would not this rise nullify any increase in export earnings from the Chancellor's expected margin between output and domestic demand? These questions, which are certainly fundamental to his calculations, were largely ignored. The basic assumptions thus are of uncertain validity. With the cut in the standard rate of income tax (and this would mainly benefit business firms) the recent rise in bank rate is to some extent off-set. Business enterprises, in their current mania for enlarging capacity, will certainly increase their investment demand. More than that, personal consumption is likely to rise in view of the current wave of wage increases.

The estimate that industrial production will go on increasing by at least at last year's rate is founded on the hope that the investment activity of 1954 will now contribute to total output. This hope is unlikely to be realised in full. A number of new plants have been erect-

ed. Many of them, however, are still to be tooled, manned, and brought into operation. Thus the demand for capital goods has still to be met and, more important, labour shortage will have to be solved (even with Lancashire working short-time).

In view of the foregoing, the indications are, as Mr Gaitskell, the Opposition expert, suggested, that the Chancellor was "not going to get his increase in exports". And if this is to be a strong possibility, the balance of payments will

worsen and precipitate a crisis. It was this "rather uncertain background", in the words of the *Economist*, which had led the Chancellor into a fit of optimistic forecasting of events. This optimism, most unlike the Mr Butler of the past four years, has become the focal point of attack for Labour Opposition. They have suggested that he is deceiving the nation in the hope of securing a Conservative victory at the General Election. This charge may not be wholly unjustified.

From the Calcutta End

East Bengal Politics

EAST BENGAL is, like West Bengal, a problem State. Partition has made both the Bengals problem States of the two neighbouring nations. Some common reasons make both the Bengals problem States. West Bengal is an industrialised State. But the present system of allocation of revenues prejudices this State's finances. West Bengal's finances are poor. Its industries are decaying. Land is scarce. So unemployment grows. Its people and the State suspect that New Delhi is biased against it and them.

West Bengal must expand or perish. Its economy must expand. It must also expand as a geographical entity. Both these are controversial issues. Both these problems are being complicated by the continued exodus of Hindus from East Bengal. Goalpara is an ugly reminder of the feeling of bitterness in this State. The mood is bitter, but not combative. This issue of boundary readjustment may assume more alarming proportions. If the Boundary Commission can solve this problem, it would be performing a miracle. And miracles, the non-believers say, do not happen these days.

COMPLEX POLITICS

In East Bengal, the problem of boundary readjustment does not arise. Land and space there are. But there is no industry. There is, perhaps, not much of unemployment among East Bengal Muslims. But the Hindus there are suffering from the consequences of deteriorating economy. Both Muslims and Hindus are united in their opposi-

tion to the "Urduisation" of that State. Its cultural and linguistic implications are stoutly resented. Its economic and administrative associations cause frustration among the educated Muslims as they find that they are not masters in their own home State.

Here the similarity ends, and the dissimilarity between the two Bengals emerges. East Bengal's economic problems can be partially solved by a freer flow of trade between the two Bengals. But its economy suffers because of the measures undertaken at the initiative of Karachi. Economic measures introduced since the suppression of the Huq Ministry have created an artificial rise in raw jute prices in Calcutta. Export and price controls and restrictions have not benefited the East Bengal jute grower much. But these irritating annoyances have revived the demand, in Calcutta's trade and industrial circles, for self-sufficiency in raw jute in this country.

East Bengal's politics are as complex as those of West Bengal. In both the Bengals, the underlying economic circumstances influence the course of politics. But Eastern Pakistan seems to have inherited the former undivided Bengal's feeling of resentment against the Centre. This is the basic explanation of the United Front's overwhelming victory in the last elections. This, again, explains the rift in the United Front on the proposed Constitution Convention for Pakistan. Mr H S Suhrawardy was intimately familiar with undivided Bengal's politics. But he seems to have lost touch with East Bengal's

politics. Eastern Pakistan may yet upset the Pakistani Governor-General's apple-cart.

AWAMI LEAGUE SPLIT

It all started with the Pakistani Governor-General's dissolution of the Constituent Assembly. Many laws and ordinances have since been introduced. Legality of all of these are in question. It was wise of Mr Ghulam Mohammed to refer these issues to the Federal Court. Its verdict is now due. But these are issues which are not directly affecting East Bengal's politics. Formation of the provinces of Western Pakistan, into one unit, and the basis of representation of this unit and of the other unit of Eastern Pakistan to the Constitution Convention are the problems which are agitating Eastern Pakistan.

Mr Suhrawardy is the President of all-Pakistan Awami League. Maulana Bhashani is the President of East Pakistan Awami League. East Pakistan Awami League is split on the issue of parity representation between the two units of Pakistan in the Constitution Convention. Maulana Bhashani, its President, has repeatedly expressed his opinion in Calcutta that he demands proportional representation in the Convention. Some of the members of the East Pakistan Awami League have seceded to the Huq Party. Three of its leaders came to Calcutta to persuade Maulana Bhashani to go to Dacca. He has gone to Dacca with Mr Suhrawardy, but he remains stubborn in his demands.

PARITY PRINCIPLE

Only the East Pakistan Awami League supports parity of representation for the two wings of Pakistan in the Convention. Mr Huq and his party are opposed to this basis of representation. Maulana Bhashani is on record that he opposes the principle of parity in representation. In the Press Conference at Dum Dum airport, he repeatedly intervened to counteract Mr Suhrawardy's arguments in favour of parity representation between Eastern and Western Pakistan. There are reasons why even the East Pakistan Muslim League does not endorse the parity principle. East Pakistan's Congress Assembly Party is opposed to the Convention as well as its basis of representation.

Pakistan's constitutional deadlock can be resolved only with the verdict of the Federal Court. All political parties and leaders in both the units of Pakistan desire re-introduction of democracy. But, with the possible exception of a section of the East Pakistan Awami League, one of the groups of the United Front, all parties and politicians in East Bengal oppose the basis of representation in the Convention. So, the problem is where it was at the time of dissolution of the Constituent Assembly.

Mr Fazlul Huq's capacity to stage political come-backs must have surprised those who do not know Mr Huq. He is ebullient. He talked himself and the United Front Ministry out. Dissension ensued within his Party. Some of his flamboyant statements and actions embarrassed his followers. Everybody predicted political wilderness for him. All political prophets are now eating their words. He is, of course, jubilant at Maulana Bhashani's attitude. Maulana Bhashani counts in East Bengal politics. That is why Mr Suhrawardy is wooing him. But Maulana Bhashani knows Eastern Bengal and its people. So does Mr Huq.

BRITISH STEEL MISSION

A few days ago, the British Steel Mission returned to Calcutta after its tour of inspection of all the possible sites in Eastern India for a new iron and steel plant. While in Calcutta, the Mission had discussions with West Bengal's Chief Minister, with the officials of the State Government, and with the officials of the Government of India stationed in Calcutta. Both the West Bengal Government and the officials of the Union Government supplied additional information to the Mission in respect of a possible site for a new iron and steel plant.

Dr B C Roy has repeatedly stressed the urgent need for industrialising the Durgapur belt. His demand for the Farakka Barrage now seems to be conceded by New Delhi. With or without the steel plant at Durgapur, the West Bengal Government has plans for coke oven and thermal power plants there. But the manner in which Dr B C Roy assured Press correspondents of the State Government's industrial plans for Durgapur was an emphatic reminder of the dispute between Calcutta and New Delhi on this issue.

This brings accuracy to all accounting!

Hollerith electrical punched card methods and machines mechanise day-to-day accountancy and create statistical records with speed and economy. Seasonal or incidental analyses, or special fact-finding reports can be prepared without disturbing normal routine. Hollerith is used all over the world, in Government Offices and by Local Authorities. Public Utilities, Commerce and Industry.

The Depressed Areas in Europe

—Curbs to Economic Development

THAT wide regional differences in economic development exist within a developed economy has tended to be overlooked because of the general preoccupation of economists with problems of underdeveloped countries. Regional disparities are, however, of considerable importance in almost all countries, whether advanced or backward as a whole. Raising standards in the depressed areas, apart from its intrinsic importance, may very well be essential in order to ensure steady growth in countries that are already advanced, while in those which are backward, a solution of the problems of these areas might very well hold the key to the attainment of a rapid pace of development of the whole country. The Economic Commission of Europe, therefore, rendered a distinct service by taking up "Problems of Regional Development and Industrial Location in Europe" in its last annual survey of Europe which was reviewed in the issue of April 2.

Taking the deviation of the per capita income of a particular region average per capita income of the whole population as the criterion of underdevelopment, the *Survey* finds that "the poor regions" are generally those situated at the periphery of Europe. "Thus, in all countries of Europe, the levels of economic development tend to be lowest in the regions furthest removed from the relatively small area which developed as the main European centre of activity, embracing England and the valley and outlet of the Rhine." In fact, location of economic activity in Europe, it appears, is "still predominantly determined by historical patterns which emerged in times of economic liberalism and—what is more important—in times when proximity to coalfields and navigable rivers were virtually indispensable to a more developed pattern of activity." Subsequent development of other sources of power have changed the relative locational advantages of different regions, but other factors, notably investment in transport, have prevented any general shift in the location of industry.

REGIONAL DISPARITIES

As a result of this attraction of the European industrial centre at the

Rhine, "national frontiers separate the relatively poorer regions of the richer of two countries from the relatively richer regions in the poorer countries." Regional disparities, again, are much wider in the poor countries than in the rich ones. This is because the poorest regions in the rich countries are generally very sparsely populated, while large parts of the poor regions in southern and eastern Europe are very densely populated. No great accuracy can be claimed for this analysis, because data about regional incomes are so inadequate, but the broad identification of the location and the magnitude of the problem are not affected by the imperfection of data.

WHY LOW PRODUCTIVITY

The explanation for low productivity in a particular region may either be that either all or nearly all the industries in the region have a lower productivity per head than in other parts of the country, or that the region contains a disproportionate share of activities which are generally of low productivity throughout the country, *eg* agriculture. In Europe, in nearly all low-income regions, a particularly large proportion of the population is engaged in agriculture. The level of productivity in these regions, both in agriculture and industry, however, is lower than in the same branches of activity elsewhere.

In the poor countries, the regional disparities are partly due to the fact that they have islands of progress—usually capital city or other large cities—in the midst of a sea of relative backwardness. There is "a general tendency for economic development to concentrate where it has already reached the highest levels." Backward countries have a strong tendency to concentrate the bulk of their limited investments on those areas which are most favoured in terms of known resources and social capital, and which are therefore likely to yield quicker returns.

DISTRIBUTION OF POPULATION

The distribution of population in the relatively underdeveloped or backward areas does not show a uniform pattern. In Thrace and in the Black Sea region of Turkey, population density is greatest on low

quality soil, though specialisation in intensive farming of tobacco and fruit mitigates the effects of excessive density to a limited extent. In Southern Italy, too, rapid increase in population, makes the situation more difficult, when the scope of emigration to richer districts is restricted by the prevalence of unemployment in such districts there, in France, on the other hand, emigration to the richer districts has caused considerable depopulation of the poorer regions, while stagnant population characterises the situation of the country as a whole. In Sweden and Norway, emigration has occurred from the valleys to the regional centres and the region as such has not become depopulated at all.

Differences as between different countries are, of course, many. Certain common characteristics do, however, emerge. Thus the share of population in agriculture is higher and the share in industry lower in poor than in rich regions inside the same country, except in the UK and Belgium. The pattern of trade between regions generally corresponds to that between countries: "the poorer regions do, as a rule export food, forest products and raw materials derived from agriculture to the richer regions and import manufactures and services." Very few regions can be developed through improvements in agriculture alone, though some improvements in local agriculture will of course be essential. Even concentration on agriculture may succeed in areas where conditions are exceptionally favourable, provided a market can be found, within or without the country, for the disposal of the increased agricultural output. In any case, investments in transport facilities and in manufacturing industry, particularly food processing, will still be necessary. Where hitherto unknown mineral resources are discovered in a poor region, assistance from Government will be required in the form of improvements in transport and social capital. It is now widely recognised that "lack of public services, in particular power and means of transport, is a very important hindrance to the development of backward regions". This is so obvious that it can hardly be emphasised enough. There are areas in Eastern Europe where

simultaneous development of extractive and processing industries with the expansion of social capital will yield the best results.

LOCATION OF INDUSTRIES

When the region possesses no natural resources of its own, the alternative to depopulation is the establishment of such manufacturing industries as need not be located near their raw materials. Even where agriculture offers scope for development, a simultaneous programme for establishing industries is necessary. It is, however, of crucial importance to determine first "what types of manufacturing industry can most advantageously be promoted in poor regions." For this purpose, it is necessary to examine the present pattern of distribution of industries in different regions. A study of this pattern reveals "a very characteristic difference between the industrial structure of rich and poor regions which is accounted for by wide differences in a few important branches of industry: in underdeveloped regions, textile, metal, metal-using and chemical industries hardly exist, while they are the predominant branches in all the rich regions." Since none of these industries are particularly dependent on nearness to their customers, witness their large exports, "the pronounced tendency to locate in already highly industrialised regions or in the case of engineering, in the biggest towns, is no doubt much more due to the attraction of a big labour market." Specialisation in skills, accumulated over generations is an important factor, though the importance of this is often exaggerated.

INSTITUTIONAL FACTORS

One institutional factor working to perpetuate the existing pattern of industrial location is the reduction in regional wage differences brought about by the growing strength of trade unions and the introduction of social considerations into national wage policies. Differences in local taxation also have had perverse effects on location in certain countries. Imperfections in the credit market have similar unfavourable effects on those areas which are backward. In fact, the report finds that "branch banks in the underdeveloped regions often serve as a collecting instrument of local funds for investment in the centres, thus depriving the poor regions of the productive use of their own savings," a conclusion which was

found to be true of India also by the Committee of Direction of the All-India Rural Credit Survey.

Transport and freight policy also plays a very important role. The traditional policy of telescopic railway rates for long distance and lower charges for raw materials than for manufactures "tends to free location of manufacturing industry from being tried to raw material sources." In this way, it operates as a centralising influence by reducing the advantages of processing agricultural raw materials on the spot. The development of road transport has reduced the advantages of decentralised manufacturing industries producing for local markets. The tendency for large-scale industries to sell their products at a single price throughout the whole country also encourages centralisation in large consuming centres, for local consumers must subsidise the more distant ones, and the larger the number of local customers the better. This puts local industries which have no local sources of raw materials into a particularly difficult situation.

HANDICAPS FOR POOR REGIONS

While the development of electricity as a source of power instead of coal has apparently favoured decentralisation, the system of power rates in operation in most countries has in fact worked in the opposite direction. All these impediments to the development of poor regions, interacting on one another, reinforce the cumulative process of growth in the concentration areas and make these barriers extremely powerful in preventing the spread of industry to the poor regions. The *Survey* concludes that "these obstacles are of much greater weight in explaining the backwardness of many poor regions than any natural handicaps from which they might suffer." The remedy, to that extent, lies in adjustment of these social factors.

The problem of determining what types of manufacturing industry can most advantageously be promoted in poor regions must be examined in the light of all these considerations. As natural resources do not form the main impediment, the availability of local raw materials cannot be the only criterion for the choice of industries to be promoted in poor regions. If so, the best alternative would appear to be the processing of raw materials, imported from other regions or countries, for local consumption, as this would reduce de-

pendence on imports of manufactures from the richer regions. While this may be desirable for underdeveloped countries "the much closer ties between regions within a country than between countries set narrow limits to the possibilities of developing 'import-saving' industries in backward regions." Thus establishment in these regions of textile industries, for instance, meets with considerable opposition from the traditional textile regions, "whereas the setting up of the more dynamic branches of industry, like engineering and chemicals, is likely to encounter much less resistance."

In fact, even if textile industries may appear to be suitable because they are labour-intensive and import-replacing, they are really unsuitable since they are in a structural decline. There are strong arguments in favour of concentrating development on those lines of industry which show the greatest tendency to expansion, even if they may be of the large-scale type for which the local market alone is not sufficient. The structural problems of the rich regions themselves support such a policy. In most European countries it is quite clear that "it would be desirable to stop the further growth of a very large number of European cities." On this assumption and to prevent further immigration into these cities, it would be "in the interest of the local population to avoid the introduction of new industries of the type which can be expected to expand rapidly in the coming decades." An examination of the industrial structure of the large towns shows that particularly fast expansion of the engineering industries has been one of the main reasons for the rapid growth of these cities. Therefore, new units of these industries and new industries, like nylon, plastics, television, electronics, etc, should be induced to install themselves in the poor regions in the interests of the rich regions themselves.

Long-term considerations for the poor regions also point in the same direction. In these regions, basic improvements in transport, public utilities and housing are urgently needed. These being highly labour intensive, availability of the physical factor poses no important problems. If finance can be obtained, secondary activity in the shape of local services, handicrafts and small-scale industry will be generated so long as these investments in social capital are being made.

April 30, 1955

Two further possibilities exist. If the region is poor in unutilised natural resources, "activity and income may, once the investments are completed, fall back to a level not very much higher than the original one." Some of the new activities set up during the earlier period may actually have to be closed down in that case. Even if this does not happen, because conditions are somewhat more favourable, difficulties may arise at a later stage. Since technical progress will continue in the richer regions, part of the consumption in the regions lagging behind will shift to goods imported from other regions. "Unless demand in the richer regions increases for the products of the poorer, the position of the latter will have deteriorated permanently." But such an increase in demand is unlikely, given the pattern of production in the poor region, unless, eg there is emigration from the poor region. After all, the most rapidly expanding element in the consumption of rich regions is services, which are produced primarily within these regions.

POLICIES FOR REGIONAL DEVELOPMENT

To preserve inter-regional balance, therefore, it would be necessary "to give the poorer regions more than their proportionate share of the most dynamic industries." In other words, to prevent a gap in development at some stage, some leadership in technology is needed. Since the main advantage of such industries lies in their potentialities for future expansion, the amount of employment they provide per unit of capital invested is of little importance.

Two types of policies for regional development are being implemented in different countries of Europe. "One is mainly concerned with influencing the localization of manufacturing industry, while the other aims at co-ordinated development of social capital and extractive industries, in some cases combined with measures to promote the processing of raw materials". The Survey stresses, after examining both in detail, that "far from being alternatives, the two broad types of intervention—the provision of basic investments and the implantation of industries—are complementary." Co-ordination, however, is obviously necessary. Even such rigorous measures as a general control over investments throughout the country

is not an effective means of decentralising industry, if simultaneous measures are not taken to equalize conditions and costs for industry in the different regions. Deliberate establishment of a few industrial centres in some middle-sized towns in the backward regions would help much more than mere negative controls over the starting of new industries in established centres. The establishment of one or more large-scale plants in such a centre may also help considerably by creating an organised labour market and providing the initial stimulus for the starting of subsidiary services like retail shops, restaurants, hotels, lawyers, doctors, etc.

The views of the Economic Commission for Europe on the problems of regional underdevelopment has been presented here in some detail

because they throw light on many problems which face underdeveloped countries also. While there are differences between underdeveloped countries and underdeveloped regions of advanced countries, there is much in common. Besides, even underdeveloped countries have regions which are backward in relation to others; in fact, lack of integration is itself a characteristic feature of their backwardness. Therefore, for such countries also, an increase in the general rate of economic development may very well be dependent upon the adoption of appropriate regional policies. Unfortunately, little attention to such problems has been paid in India, though there is a vague realisation that they are of importance. The present study should stimulate interest in the study of a hitherto neglected problem.

Company Meeting

The Dunlop Rubber Co. (India) Ltd.

Mr Cecil Stack's Review

THE 29th Annual General Meeting of The Dunlop Rubber Co (India) Ltd was held on the 25th April in Calcutta, Mr Cecil Stack, Managing Director, said:

Gentlemen,

The Directors' Report and Accounts for the year 1954 have been in your hands for some time, and with your permission I will take them as read.

I should like to preface my remarks this year by referring to a change in our Board of Directors. Sir Satyendra Nath Roy, who has been a Director since 1948, resigned his seat on the Board for reasons of ill health. His wide knowledge, experience and astute judgment have been of great help to us and I would like to express our sincere appreciation of the valuable service he has rendered to the Company, also the hope that it will not be long before he will be well again.

The Year's Trading

The year under review has generally been a satisfactory one. The volume of sales of all our products was higher compared with the previous year. In terms of production and using our principal raw material, crude rubber, as the basis, we exceeded 1953 by 18 per cent. On the other hand, total sales in value increased only 9 per cent. This difference is largely explained by the reduction made last year in our selling prices of tyres for passenger cars, trucks and buses, motor cycles, cycles and animal drawn vehicles.

Our consumption of crude rubber in 1954 was the highest since our factory commenced production in 1936 and this is indicative of the progress made by the Rubber Manufacturing Industry as a whole, which in my opinion can be regarded as evidence of the sound manner in which the Industry has been allowed to develop. The increasing expansion of India's economy, the implementation of the Five-Year Plan and the emphasis to be placed on Industry in the second Five-Year Plan all help to accentuate the growing importance of our own particular Industry. The development of mechanisation in agriculture as well as the expansion of

Industry as a whole will make demands which rubber manufacturers will only be able to meet by expanding their output and by producing a wider range of articles.

With the exception of Cycle, there was no overall shortage of tyre stocks throughout the year under review but difficulties associated with the distribution of our products continued to be experienced as the result of transport bottlenecks and inadequate availability of Railway wagons.

The net profit for the year was Rs 96,37,915 compared with Rs 92,88,299 for 1953 but because of the selling price reductions already referred to, the ratio to turnover has declined in 1954 from 7.4 per cent to 7 per cent before taxation and from 4.6 per cent to 4.3 per cent after taxation.

Products

Our Technical staff work in close contact with the worldwide Group research establishments of the Dunlop Rubber Co Ltd, the benefits of which are fully available to your Company. In this way we are able to keep abreast of all new developments such as the tubeless car tyre, the introduction of which during the year was an outstanding achievement. This tyre is the most important development since the advent of balloon tyres in 1922. It provides added protection against punctures and bursts. It also retains the air much better than the conventional tyre, thus maintaining a more constant air pressure and so reducing tyre wear. With all its advantages it costs no more than a conventional cover and tube of the same size.

In the truck and bus range our Trakmaster tyre, introduced only the year before, became so popular that it proved impossible to meet the demand. More equipment is now in use which will help to remedy the situation.

Our sales of pneumatic tyre equipment for animal drawn vehicles were well in excess of any previous year; likewise our sales of tractor and aero tyres. In addition, the continued rapid expansion of India's bicycle manufacturing industry helped us to break the record

set the year before in our production and sales of cycle tyres and rims.

In line with tyres, sales of all our other products advanced substantially. The intensity of our sales efforts, supported by sustained publicity, has popularised Dunlopillo Latex Foam Cushioning throughout the country.

The remarkable progress made in our Industrial Transmission Belting business in the previous year continued throughout 1954, and our Conveyor Belting, the manufacture of which only commenced in 1953, is already being used on the major hydro-electric projects as well as in mines, power stations, steel works and numerous factories where the inexpensive handling of large quantities of materials is vitally necessary. Our Industrial Vee Belts and Fan Belts also continue to sell in increasing quantities and as the result, we were able to reduce our selling prices.

During the year we commenced the manufacture of pneumatic tool, welding and high pressure Braided Hoses by the lead press moulded process. This type of hose in long lengths had not formerly been made in India and I am glad to say that our hoses are already proving popular wherever there is a demand for them.

This overall expansion of our manufacturing activities contributed in no small measure to the fact that in 1954 rubber manufacturers consumed approximately 4,000 tons of rubber more than India produced. That the deficit this year is expected to be over 5,000 tons should encourage the Rubber Planting Industry in South India to make serious efforts to increase their production.

Raw Materials

The raw materials supply position was satisfactory throughout 1954, but delays in the clearance of shipments through the Calcutta Port due to labour troubles caused anxiety at certain times. There were no significant changes in prices except of crude rubber of which we were allowed to import part of our requirements because indigenous supplies were insufficient. Prices

ranged between Rs 84 and Rs 150 per 100 lbs as compared with the controlled price for local rubber of Rs 138.

Profit & Loss Account

As I have indicated earlier, the net profit for the year was Rs 96,37,915, and after deducting the charge for taxation the balance of profit available for disposal is Rs 69,45,891 compared with Rs 62,39,833 for 1953. The Directors are recommending the same rate of Ordinary Dividend as for 1953, that is 15 per cent, which will absorb Rs 24 lakhs. The Directors also recommend the transfer of Rs 30 lakhs to General Reserve as against Rs 24 lakhs last year. This will increase General Reserve to Rs 1 crore 68 lakhs as shown in the Balance Sheet. The total amount transferred to Reserves during the last 10 years was Rs 2 crores 45½ lakhs. These appropriations represent shareholders' profits retained and fully employed in the business. I would like to stress here the great need for such conservation of the financial resources of the Company. In addition to the funds required for development and expansion schemes the Company is continually striving to improve the standard of living conditions for its factory employees by providing

more residential, hospital, educational and other welfare facilities. During the last ten years the Company has spent over Rs 80 lakhs on buildings for this purpose and very considerable additional expenditure, depending on the continuing prospects of the Company, is planned for the next three years. The Company's housing estate at present accommodates just over 3,700 persons representing employees and their families, and this number will continue to rise over the next 3 or 4 years if, as we hope, the resources are available to complete our plans.

Balance Sheet

The additions to Fixed Assets during the year amounted to Rs 30 lakhs, consisting mostly of plant for expansion and rehabilitation. The amount of depreciation written off in 1954 was Rs 30,20,000 as against Rs 27,78,000 in 1953.

Stock Inventories at Rs 395,81,000 are Rs 33,22,000 higher than at the close of the previous year. This was due mainly to increased production, raw material prices having remained fairly stable throughout the year. Sundry Debtors are up by Rs 41,40,000 as a result of the greater sales turnover. Bank and Current Balances are also higher than last year, making the

total increase in Current Assets Rs 80,15,000. The net working capital increased by approximately Rs 68 lakhs during the year, which is partially reflected in the closing bank overdraft of Rs 128 lakhs compared with Rs 88 lakhs at the end of 1953.

Employee Relations

During the past year we have striven further to extend and improve our social amenities for employees. The 64 new staff flats constructed in 1953 were all allocated and occupied in 1954, the building of new quarters for the Watch and Ward staff was commenced, as well as additions to the existing facilities for sport, and the survey work was put in hand for the construction of a further 100 married operatives' quarters. Thus we endeavour to maintain our high reputation for working conditions and general labour relations, which have remained consistently good throughout the year. Staff and operatives have continued to exert their best endeavours and have contributed greatly towards the successful outcome of the year's activities. I am sure you will wish to join with the Directors in expressing warm thanks for their loyal and faithful service.

Not Enough Schools!

Reba Chaudhuri

(Continued from previous issue)

GENERALLY, salary scales of primary school teachers are very low. Some countries have, however, raised the status of teachers to that of civil servants with identical scales of pay, while in Afghanistan, Indonesia and New Zealand, the teacher's salary is actually slightly higher than in comparable civil service posts. The UNESCO Commission has recommended that the Government should introduce a single salary scale for all teachers. Women ought to receive the same pay as men for equal work. A considerable wastage of resources takes place because many women teachers cannot devote their full time to teaching and consequently have to give up the profession. This problem can be solved if a system of part-time employment on half pay is introduced.

THE CURRICULUM

The traditional curriculum of the western type still reigns supreme in most countries in this region, and through examinations, certificates and diplomas it prepares students for Government jobs. Yet the heritage of South Asia and Pacific is quite distinct from that of the west. Here emerged a succession of civilisations more varied and more rich than those of the western world. Two difficulties, therefore, arise that have to be dealt with simultaneously. (1) They have to reshape a curriculum which hitherto served the needs of a minority of the population so that it become suitable for all children of school age. (2) They have to find through the schools a cultural equivalent of the political emancipation which most of them have recently achieved and of the social progress which is their aim.

The whole question of making the schemes of compulsory education a success is essentially linked with the problem of improving the content and quality of the curriculum. Unless sociologically and psychologically this curriculum is suitable from the point of view of child and society, compulsory education will not succeed. The present day education has become too bookish. There is not only new matter to add, but there is a lot

of dead matter to be taken away. In this connection, the report gives an account of basic education as conceived by Gandhiji which has been accepted in principle by the Central and many of the State Governments for their primary and secondary schools. The report recommends that serious effort must be made in every country to divest the curriculum of the inert matter which deadens school for child and teacher alike and (1) simplification of the curriculum; (2) co-ordination of the various subjects and contents as well as (3) the introduction of a certain amount of elasticity which would give freedom to the teachers to adapt the curriculum to local needs, group needs and sometimes to individual needs.

EXAMINATION AND CURRICULUM

Learning by rote is still dominant. The emphasis on examinations in the primary school meant that the aptitudes which examinations can measure are stressed at the expense of other important things in school life. "In Asia we are all examination ridden." Whatever syllabus of study is framed, teachers tend to forget everything and concentrate on examinations only. The UNESCO Commission recommended that external examinations in the primary schools, if not abolished entirely, should at least be put on an optional basis.

In western countries a period of 8 years extending from the age of 6 to 14 has been accepted as usual for compulsory education but for most of the underdeveloped countries this period is too long and costly. Countries in South Asia and the Pacific have adopted a schooling of four, five and six years as a means of ensuring that the child will not revert to illiteracy after leaving school. Some authorities have advocated what is known as "fundamental literacy" and consider that seven years is the shortest possible course in educating a useful citizen.

A related difficulty is that of the gradual diminution of pupils from grade to grade. Scientific studies of this phenomenon and its causes are rare. It is partly economic, due to children going to work as they

grow older. Another reason may be retardation, where children fail to be promoted regularly from year to year. This may indicate an overcrowded curriculum or poor methods of instruction or a faulty educational outlook in which standards of attainment become paramount in the minds of the teachers. As a matter of fact a very large proportion of the children leave school before even completing three grades and therefore revert to illiteracy. This is a tremendous waste of effort and money. To prevent it, either the system of examinations should be given up or some other test of fitness adopted which reduces the present large number of failures in class examinations. Promotion for all is one of the means for modifying the present pyramidal structure in which so few who begin at the lowest class reach up to the top.

Uncertain Trend

Wednesday, Evening.

Retention Prices

Developments, however, are not discouraging. Clive Street is thick with rumours that, pending the Tariff Commission's findings, the Government has already fixed the retention price for Tatas. Provisional retention prices fixed for Tatas are reported to be Rs 34 per ton higher than the present level. There are reports that the provisional retention prices for IISCO may be fixed before the end of this week. It is a reasonable assumption that, like Tatas, IISCO also will get the benefit of an increase in retention prices. Despite this possibility, neither Tata Steel nor Indian Iron are firming-up because of apprehensions that the Government may discourage frittering away of the resultant increase in profits in higher dividend disbursements.

Jute Shares Idle

Jute shares remain depressed for obvious reasons. Realisation is growing that the industry cannot make satisfactory profits by buying raw jute and selling the finished product at the respective current prices. Jute goods remain rather steady as raw jute prices continue to be firm. It is clear that foreign buyers are not interested in jute goods at current prices. Expected Argentine orders have yet to materialise. This state of affairs has continued for some months now. It is now realised that raw jute prices cannot decline as long as the Pakistani Government does not change its restrictionist policy. This is reviving the demand for self-sufficiency in raw jute in this country.

Jute shares are no longer popular. For about a year now, Tea shares have had a sustaining influence on the Calcutta Stock Exchange. Recent developments in Tea shares are, however, discouraging. Even if the worst fears do not materialise, it seems that tea prices and Tea shares will not be as buoyant in the near future as in the recent past. It is widely believed that firmness in Tea shares may no longer impart psychological strength to the market as a whole. This is a depressing possibility.

New Group Leaders

There are, however, some other groups which may replace Jute and

pending before the Controller of Capital Issues, would be promptly sanctioned. It would be recalled that the decision on these requests were being delayed pending the publication of the Taxation Enquiry Commission's report.

A few days ago, in reply to a question in Lok Sabha about the undue delay in dealing with the pending applications for capitalisation of reserves, the Finance Minister indicated that the delay was due to the fact that the Government had not yet reached any decision on the problem of taxation of bonus shares. From the Finance Minister's statement, it would seem that, despite the Taxation Enquiry Commission's recommendation, the question of taxation of bonus shares is still under active consideration of the Government.

Drop in Tea Shares

This is one of the reasons for the continued drop in Tea shares in the last few days. There are other reasons why Tea shares are falling. Tea shares were being "talked down" for the last few weeks. Recent auction prices were not encouraging. Experts had been confidently predicting a buyer's market in the coming season. Fears had been expressed that plantation labour wages would move up in the near future. It is widely apprehended that the State governments concerned would implement the Taxation Enquiry Commission's suggestion for raising the agricultural income-tax on tea plantations. Under the combined pull of all these factors, Tea shares have developed a sagging tendency.

Drop in Tea shares coincided with the decline in Indian Iron. Despite the simultaneous decline in Tea shares and in Indian Iron, there is no causal relation between these price fluctuations. Indian Iron dropped a few days ago as tired "bulls" began unloading their holdings. Dealings in Indian Iron are mainly professional. As professional speculative operators found that Indian Iron were not moving up because of absence of investment support, they decided to get out of the market. Indian Iron wilted under the pressure. Indian Iron remain quietly steady at the lower level. But even the recent set-back does not seem to have attracted investment support.

It would be hasty to jump to the conclusion that irresponsible speculative activity in Indian Iron is mainly responsible for the loss of morale on the Calcutta Stock Exchange. Recent behaviour of equities visibly reflects lack of confidence in investors. But investors' apathy is not directly or mainly due to the falling trend in Indian Iron. Drop in Tea shares seems to have deepened the gloom. But Clive Street's disappointing behaviour is due largely to wider economic issues. Avadi may be a long way off. But investors are still uncertain about the shape of things to come.

New Delhi has been blowing hot and cold in the same breath. Though the Finance Minister has lowered or abolished some of the excise duties originally proposed in the budget, the Government's plans for development of heavy industries within the public sector have yet to be fully disclosed. Concessions relating to excise duties may be aimed at stimulating consumption. But there are many who wonder whether the demand for manufactured goods can expand unless money incomes improve.

As the broad outlines of the second Five-Year Plan emerge out of the recent discussions in New Delhi, doubts arise about the future behaviour of demand. Last December, the Finance Minister stressed the need for creating full employment conditions to ensure demand. Recent developments suggest that the problem of unemployment is not receiving as much attention as formerly. These wider economic issues will not be clarified before the second Plan's targets are finally fixed. Meanwhile, doubts about the probable behaviour of demand for goods are having depressing effects on stock markets.

Bonus Issue

There is another factor which is retarding activity on the Calcutta Stock Exchange. As the Taxation Enquiry Commission did not recommend any tax on bonus issues, it was presumed that the Government would abandon its contemplated move to tax bonus shares. Some Tea, Engineering and Miscellaneous shares moved up after the budget on the assumption that the applications for issues of bonus shares,

Tea shares as market leaders on the Calcutta Stock Exchange. Two years ago, Engineering shares came into popularity. There have since been many upswings and set-backs in Engineering shares. But, broadly speaking, this group has since received investment support. For sometime, there was interested buying of Engineering shares. Some of the engineering companies listed

on the Calcutta Stock Exchange have changed hands.

Engineering Shares Steady

Cornering attempts are no longer so active. But price movements indicate that the Engineering shares which moved up a few months ago because of purchases by cornerers remain steady to firm. At all set-backs, these shares receive support.

There is selective support for Miscellaneous shares also. There is a theory that those who have acquired controlling interests in some of the engineering and miscellaneous companies are interested in maintaining the prices of the shares concerned. Even so, it is apparent that investors are interested in selected Miscellaneous and Engineering shares at all set-backs.

Bombay State Transport Finances

THOUGH the Bombay Legislative Assembly recently discussed the Administration Report for the Bombay State Road Transport Corporation for 1953-54, it is only now that copies of the report have been made available to the public. A satisfactory feature of this report is that it contains the audited financial results for 1952-53 and also the unaudited accounts for 1953-54. This gives a better indication of the progress made by the Corporation, besides bringing the accounts up to date.

Total receipts of the Corporation increased from nearly Rs 6 crores in 1952-53 to Rs 7½ crores in 1953-54. Net revenue, after providing for depreciation, rose to Rs 64 lakhs at the end of 1953-54, from Rs 44 lakhs in the previous year, but what is more important, depreciation provision is now adequately provided at Rs 95 lakhs as against only Rs 40 lakhs in the earlier year. This has enabled the Corporation in 1953-54 to provide for debenture Sinking Fund of Rs 9.73 lakhs and to show a nominal profit of Rs 1 lakh after making other adjustments and after providing interest on capital of State and Union Government at the rate of 4½ per cent.

The Corporation's share capital as on March 31, 1954 amounted to Rs 10.13 crores. Taking debenture capital, borrowing from State Government and Canadian Aid Loan into account, the total capital of the Corporation exceeds Rs 15 crores. Besides land and buildings valued at around Rs 3 crores, the principal assets of the Corporation are in vehicles of the value of Rs 9 crores. Against these assets, a total depreciation of Rs 2.63 crores has been provided. Stock on hand amounts to Rs 2.90 crores and besides sundry assets, the Corporation has nearly Rs 3 crores in cash and Government securities.

The vehicles owned by the Corporation exceeds 2,000 in number. The total strength of the staff has been steadily increasing and at the end of March 1954, it exceeded 12,800 as against 10,000 two years back. The number of routes covered in March 1954 was 1,482, compared to only 800 two years ago and route mileage has risen during this period from 25,000 to 40,000. The total effective mileage during 1953-54 was 5.34 crores as against 4.51 crores in the previous year.

The Corporation's activity now

covers two-thirds of the motorable roads in the Bombay State, as a result of the gradual expansion of passenger service and parcel services. 1953-54 saw the commencement of Goods transport was begun in 1953-54 with the Canadian Aid Trucks received under the Colombo Plan. The original scheme provided for goods operations on a monopoly basis in a limited area of the State but owing to certain difficul-

ties, it was decided to operate the freight service side by side with private operators in all parts of the State. More effort was directed during the year for achieving economy by means of improved maintenance, better utilisation and reduction in the cost of administration. As the mechanical personnel gain experience, the quality of maintenance shows an improvement and the full effect of the measures taken in this direction will be apparent from year to year.

Pakistan's American Aid Budget

BEING in the grip of a constitutional crisis that threatens its survival as an orderly state, Pakistan may not be in a mood to pay adequate attention to the budget proposals, which, in keeping with the extraordinary situation of the Government, was presented over the radio. But the budget papers now available throw searching light on some of the factors which brought about the present denouement. In a section entitled "The Perspective", with which the Economic Survey for the year opens, developments are traced back to the partition. Though the key to the present situation is not put there in so many words, it is not difficult to find it. The explanation of much of the subsequent travails that made the situation so desperate that the Government saw no other solution except to seek American aid, can be traced to the unfortunate decision not to keep in step when other sterling countries, and particularly India, with which the Pakistan economy is so greatly complementary, devalued their currencies. True, at the moment, Pakistan's export position was strong. To make the high exchange rate of the rupee a matter of national prestige, however, when, in reality, the maintenance of the high exchange rate was at best a fortuitous circumstance, was an unfortunate decision; the consequences of which are being reaped today.

Non-devaluation led to an immediate rift in trade relations with India that has never been repaired since. For a time, the Korean boom enabled Pakistan to maintain a show of strength but the strength was more apparent than real. The nemesis came when that boom collapsed, and ever since, the Pakistan economy has been wallowing in stagnation. Though political commitments are dragging Pakistan down an inclined plane, there are welcome signs, of late, of a better appreciation and a more objective assessment of economic realities. Financial papers in Pakistan are now prepared to discuss a revision of the exchange rate; even a year ago, to be willing to do so would have been for any responsible organ of the press to commit political Harakiri, so greatly had feelings been worked up over what is, after all, a purely technical, economic question.

The outbreak of the Korean War in June 1950, served to accelerate

the recovery in exports; it led to an unprecedented boom in Pakistan's commodity markets, further reinforced by the short-fall in the American cotton crop. Demand for stock-pile purchases led to a sharp rise in the prices of both cotton and jute. The average export price of cotton rose from Rs 475.8 per bale in the second quarter of 1950 to a peak of Rs 935.5 in the corresponding quarter of 1951 while jute rose from Rs 151.8 per bale to Rs 238 per bale. A surplus of Rs 51.98 crores was recorded in the balance of payments in 1951. The Central budget recorded a revenue surplus of Rs 28.96 crores in the revised estimates for 1950-51, while the estimates for 1951-52 provided for a surplus of Rs 20.74 crores.

The boom conditions created by the Korean War, however, did not prove an unmixed blessing for the country. Despite a sharp increase in export duties and the 'funding' of the revenue surpluses, inflation,

already present, was aggravated. To counteract growing inflation, import policy was greatly liberalised and as a result, Pakistan was led into something of an "import spree". Moreover, though the financial resources for development were augmented, capital goods from abroad were difficult to obtain.

Toward the end of the year 1951, while the imports continued to increase the situation underwent a radical transformation in the export sector. Commodity markets in general and textile fibres in particular began to weaken perceptibly. Cotton and jute prices started declining and by the end of 1952, cotton fell from its peak level of Rs 1,150 per bale to Rs 503.6 per bale; similarly jute slumped from Rs 210 per bale to Rs 110. While total foreign exchange earnings declined by Rs 96 crores in 1952 to Rs 191.6 crores, payments continued to rise and reached a peak of Rs 276.6 crores, resulting in a heavy deficit in the

balance of payments. Pakistan foreign exchange reserves were reduced in consequence from a peak of Rs 151.3 crores in the middle of 1951 to Rs 60.6 crores by the end of 1952. The balance of payments came under additional pressure as a result of the serious food shortage in that year. Over eight lakh tons of wheat had to be imported in 1952-53 the bulk of which was received as a gift from the USA and Canada. The Open General Licence was curtailed in August, 1952 and was suspended in November of the same year. With a view to restricting imports, credit facilities for imports were also curtailed and the import duty on cotton cloth was enhanced.

The changes brought by foreign aid (which is mainly American aid) on Pakistan's Budget for 1955-56 is, of course, no less important than the relief it affords to that country's balance of payments. As may be seen from the table alongside, capital expenditure in 1955-56 (B.E.) is about Rs 36 crores more than in 1954-55 (R.E.); since a fall of Rs 7 crores is envisaged in defence capital outlay, other expenditure on capital account (mainly developmental) goes up by Rs 43 crores. This the Government is able to finance without an unduly large draft on cash balances or a big increase in floating debt, because an additional credit of nearly Rs 50 crores is taken under foreign aid. Had this not been in sight, the shape of the Pakistan budget for the current year would have been very different. It would have disclosed either a cut in development expenditure from 1954-55 (R.E.) levels, or a very substantial increase in taxation, or a large budget deficit—assuming, all the time, that defence outlay would be left unchanged. One can have one's choice and argue that American aid has enabled Pakistan to enlarge her development outlay or sustain her defence expenditure, according to one's predictions. (For the third alternative of deficit-financing for development is, under the disturbed political conditions, not much of a practical possibility). That is a distinction which politicians might like to stick to, but not economists.

All this is in terms of outlays envisaged for 1955-56. What is in fact likely to happen in the next eleven months or so is a different matter. For, as in India, the revised estimates of development outlay on capital account in 1954-55 are nearly Rs 20 crores less than in the

budget estimates. Could this be an evidence of the Government's inability to spend on account of administrative reasons? If that is so, mere availability of foreign aid will not help directly the development programme. But it might make things easier for the Government, inasmuch as it would enable further tax concessions or relaxation of restrictions on private imports.

Taxation proposals for 1955-56 are (i) increase in the rate of excise duty on cigarettes, (ii) to levy a duty of excise on rayon or artificial silk cloth at the rate of 6½ per cent *ad valorem*, and (iii) reimposition of duty on tea at 0-3-0 per lb. Reliefs offered are as follows: (i) 50 per cent reduction in the duty of excise on coarse cotton cloth, (ii) exemption from export duty for rice, raw hides and skins, and jute rope, (iii) component parts of radios can be

imported free of duty, (iv) date of tax concessions on income from newly constructed houses has been extended up to March 31, 1957, and (v) tax concession on five per cent of the capital of new industrial undertakings has been extended for a further period of 3 years, (vi) double the normal rates of depreciation allowed on plant and machinery installed upto March 31, 1955, has been extended upto March 31, 1957, (vii) initial depreciation allowed at present (15 per cent) will continue upto March 31, 1957, (viii) initial depreciation on plant and machinery which is admissible at 20 per cent has been raised to 25 per cent, and (ix) moneys brought into Pakistan from abroad, which have been exempted from tax since partition, will continue to enjoy this concession for another year, *ie* until March 31, 1956.

There are many who have felt all along uneasy about the danger lurking in the not so distant future, of Hindi coming to replace English as the common medium in the Universities, in the deliberations of the Parliament and in the business of the Central Government. Those provisions for it are incorporated in the Constitution. True, Hindi is not going to replace English here and now. It has to be a graduated process, and to be brought about by well defined stages. For the first fifteen years, English will continue to hold the same place, as it did before; five years after the Constitution comes into force, a Commission is to be appointed to recommend the steps to be taken for the progressive use of Hindi for the official purposes of the Union, restrictions on the use of English for all or some of these purposes, the language to be used in the proceedings of the Supreme Court and High Courts, in the legislatures and for the issue of all orders, rules, regulations and by-laws made by Parliament or State Legislatures. After another ten years, another Commission is to be appointed in furtherance of the same objective.

So to those to whom the eventual adoption of Hindi as the official language is a matter of serious concern, the danger was never very distant. They have now been made to sit up and take notice. A statement was made by the Home Minister in the Lok Sabha that in pursuance of the resolution on the subject passed by the Congress Working Committee a year ago, the first step would now be taken towards progressively replacing English as the language of examinations for the all India services. The Home Minister also announced that a scheme will be prepared for this purpose, "if necessary after consulting the Hindi Commission which is to be appointed shortly" (*italics ours*). The wording of the announcement should be carefully noted. For the changes to be made in the rules of examinations for recruitment to the all India services, the Hindi Commission, the appointment of which under the chairmanship of Shri B G Kher has been announced, subsequently, will be consulted "if necessary"; that is to say, the Home Ministry reserves the right to go ahead in the matter, without waiting for the recommendations of the Commission or consulting the Commission. There has been unfortunate tendency on the part of Government—this comes into evidence whenever politics gets the better of it and the Cabinet finds it difficult to resist pressures—to flout the findings of expert bodies ceremoniously set up to give advice or even to prejudice the issue. This attitude is exhibited in its worst form when the appointment of the Hindi Commission is preceded by a declaration of policy which is deliberately made independent of the findings of this Commission which is being set up so ostentatiously and for which the Government has been able to secure the services of a balanced, sober and liberal minded Chairman who will command the respect of every section of opinion in the country

Spend this Summer
in the Hills!

Cheap concessional return tickets are issued for I, II and III classes from April 1, 1955 at one and half single journey fares for the rail portion plus two single journey fares for the road portion wherever leviable from all stations on the Central & Western Railways to Pathankot (For Kashmir), Simla, Solan, Dharampore (Punjab), Dehra Dun, Kathgodam (For Naini Tal), Darjeeling, Kurseong, Shillong, Abu Road (For Mount Abu), Ootacamund, Coonoor, Kodaikanal Road, Kodaikanal Out-Agency, Kotagiri Out-Agency and Pipariya (For Pachmarhi) stations provided the chargeable distance between the stations is 150 miles or more.

- ★ Tickets will be issued till October 31, 1955.
- ★ Tickets are valid for three months.
- ★ Break of journey allowed on the return trip only.
- ★ Full particulars available at all stations.

CENTRAL & WESTERN RAILWAYS

And how scant is the respect for constitutional propriety? The Constitution provides not only that a Commission should first carefully consider the question, but after the Commission has reported, its recommendations should be examined by a Parliamentary Committee consisting of 30 members, 20 from the Lok Sabha and 10 from the Rajya Sabha. So that this Committee may faithfully reflect the cross section of public opinion, election of its members, it has further been provided, should be "inaccordance with the system of proportional representation by means of single transferable vote." If the Home Minister is in no mood to brook delay, why not at least remove these hurdles by another amendment of the Constitution, in order to lend an air of constitutionality to his actions?

For the Government to proceed in so important a matter as the choice of language to be used in the examinations for the all India services without waiting for the Commission to tender its advice, conveys a mood of impatience which has given rise to serious misgivings in the minds of many who desire the unity of India, as much as the most ardent advocates of Hindi and who are not against the development, as stated in Constitution, of the composite culture of India, but who do not feel that the time has come yet for Hindi to replace English.

Among the latter, the most powerful voice that has been raised is that of Shri Rajagopalachari. No one can question Rajaji's patriotism; it is an irony of fate that the same Rajaji who had gone to absurd lengths to popularise Hindi in the South at one time, has now taken up cudgels against it. How come, then, that this ardent advocate of Hindi has raised his voice to stop this headlong rush? Because he sees in it a danger which, in fact, strikes at the very root of the unity of the Indian people. Rajaji has only counselled patience; he pleads for greater understanding and warns against the danger of forcing the pace and imposing Hindi on non-Hindi speaking people. He does not raise the question whether or not Hindi can fulfil the requirements of a national language. On the contrary, he thinks that it may, given time, patience, understanding and

steady application in raising the standard of the language itself. But before others are asked to qualify in Hindi for all India services, Rajaji first asks Hindi to qualify itself for being chosen as the all-India medium.

Can any one language ever become the national language of India? This is the basic question, the fundamental issue, in this language controversy. An examination of this issue may appear to be academic and too speculative to merit serious consideration in a matter in which the Constitution has made specific provisions. Such an attitude betrays as complete as ignorance of the role of language in the life of a people as of the facts of history. It was not closed when the Constitution was passed. In human affairs no decision is ever irrevocable. Provisions of the Constitution which have been found to be unworkable in practice or against the best interests of the country have been altered, not once, but on as many as four different occasions during the last five years that the Constitution has been in force.

Welcoming Rajaji's courageous and timely stand in the matter, Professor Shrinivas of Baroda University, in a letter to the *Hindu*, has condemned silence on this very vital matter on the part of people who see the danger but do not act. If not arrested in time, the present attempt

South of the 17th Parallel

AT Geneva, Ho Chi Minh made substantial concessions in signing the Agreement. Vietnam abandoned its direct claims to Laos and Cambodia. It accepted, a demarcation line, which temporarily divided Viet Nam in two, for cease-fire in Viet Nam. Military and semi-military terms and conditions of the Geneva Agreement have been implemented according to schedule. Cease-fire conditions have been established in all the three Indo-Chinese States. Vietnam has honoured the obligations undertaken at Geneva. It is admitted by the Indo-China Armistice Commission that the problems relating to cease-fire evacuation of forces and release of war prisoners and civilian internees have been "satisfactorily solved" in all the three States.

But the military terms of the Geneva Agreement had political counterparts. In none of the three Indo-China States have the parties and powers concerned, other than

to force the pace will cause an irreparable breach in the fundamental unity of India and disrupt what has taken generations of struggle to build up. Silence, he thinks, will be to acquiesce. Those who care for sanity and aspire to march together, in accord and in unison of spirit, should protest and protest vigorously. Non-Hindi speaking people should hold meetings for postponement of the constitutional deadline and for going slow with the use of Hindi. MPs should be lobbied, individuals could help by writing letters to the President and the Prime Minister or else the advocates of Hindi, the new *herrenvolk* will ride roughshod over those—and they are the majority of the Indian people—who have, due to no fault of theirs, the misfortune of having some other language as their mother tongue.

But is silence on this issue really as bad as all that? True, one should not be dogmatic about such a matter. History provides many examples of human folly in the matter of language as others. Nevertheless, faith in reason and sanity abides; it is not shaken so easily. People of this country cannot be put into strait jackets in the matter of language. Languages do not develop by dictation; the life and inspiration of a language is the spoken word. Expression is man's prime urge. It will not be stilled or stifled by a diktat from any body.

Vietminh, faithfully implemented the political conditions of the Geneva Agreement. America was not a signatory to the Geneva Agreement, though she promised to abide by the terms of the Agreement. Immediately after the Geneva Agreement, America established SEATO. Laos and Cambodia were specifically mentioned as areas which would be defended and protected in the pursuit of SEATO Powers' policy to contain Communism in South-East Asia. This was an open violation of the spirit and letter of the Geneva Agreement. This is one of the reasons why the Manila Treaty is condemned as a menace to peace in Indo-China and in South-East Asia.

Future developments in Laos and Cambodia may yet worsen the situation in Asia and the Far East. In the meanwhile, events in South Viet Nam are immediate threats to the smooth implementation of the Geneva Agreement. At Geneva, the interests concerned agreed to create

conditions in South Viet Nam under which free and fair elections could be held to decide the future status of Indo-China. France and America assumed the responsibility for establishing a stable and democratic government in South Viet Nam so that elections could be held next year. Developments in South Viet Nam are disturbing reminders of the failure of France and America to discharge the responsibilities undertaken by them. In both its military and political aspects, the situation in South Viet Nam is a direct sequel to the French colonial rule. America's ulterior interests and motives have introduced additional complications to the disquieting situation in South Viet Nam.

To assess the significance of developments in South Viet Nam, it is necessary to appreciate the nature and complexion of the forces in conflict with each other. In South Viet Nam, life, society, politics and the army are dominated by the three sects with their powerful private armies. Of the three sects, Cao Dai is the most powerful. Hoa Hao is the next in importance. Binh Xuyen, the group which has been fighting a losing battle in the Saigon-Cholon sector against the Diem regime's forces, is the least influential. Cao Dai and Hoa Hao are spiritual sects which were encouraged to become politico-military organisations by the French during the colonial war in Indo-China. Both Cao Dai and Hoa Hao were initially sympathisers of Ho Chi Minh. Later, these two sects deserted Ho Chi Minh and entered into an alliance to fight Vietnam. Reasons for this dissension are obscure. But France exploited this dissension to equip the armies of Cao Dai and Hoa Hao with modern weapons to fight her battle against Ho Chi Minh. Binh Xuyen became prominent only recently when it seized control of the Viet Nam police forces through the connivance of Bao Dai.

At the time of last year's Army crisis, Premier Diem succeeded in remaining in power by offering cabinet posts to leaders of Cao Dai and Hoa Hao sects. In March last, all the three sects formed a United Front to demand increased association with the Diem Government. As Premier Diem discerned considerable disunity in the United Front, he started his manoeuvre of playing one sect against another. In this struggle for power between the sects and among the sects and the Diem Government, France and

America are not disinterested observers. Bao Dai has never approved Diem and his government. Bao Dai was a French creation. France still seems to stick to their puppet. This aspect of the alignment has pre-Geneva implications. But it is difficult to appreciate France's support to Binh Xuyen, a sect whom the other two sects are reluctant to recognise because of its association with vice and police. It is possible that Premier Diem, with active American support, has succeeded in upsetting the calculations of the French authorities on the spot. France's antipathy to Diem was, perhaps, influenced by the assumption that the private armies of the three sects would combine to oust Diem. Binh Xuyen and Hoa Hao are opposed to Diem. But he seems to have entered into an alliance with Cao Dai. Latest reports indicate that this formidable alliance between Diem and Cao Dai has convinced America of the policy of

lending full support to Diem. France is opposed to any such policy. Thus the conflicting machinations of France and America intensify political chaos and instability in South Viet Nam.

Diem has played his cards cleverly. In his defiance of Bao Dai, he had the tacit support of America. In his decision to fight the private armies of the sects, he knew that he would have to fight only against the Binh Xuyen army. Developments since last year's Army crisis would seem to suggest that he was always sure of support of the Cao Dai sect. France's alleged support to the Binh Xuyen army is difficult to appreciate unless it be that France expects Hoa Hao to join Binh Xuyen in continuing the civil war in the countryside. Though the situation remains obscure, movements of Ba Cut's army indicate that France may not be wrong in her anticipations. Ba Cut, the head of one of the Hoa Hao groups, is a fanatic military leader who is violently anti-Communist and is vehemently opposed to the Geneva Agreement. It is clear what General Ely was relying on. He was depending on Binh Xuyen's control over the Saigon-Cholon police. He was relying on Ba Cut to fight Diem's forces. Some such assumptions made America hesitate before lending her open support to Diem.

One intriguing aspect of Ruritanian conditions in South Viet Nam needs emphasis. Diem seems to be in control of the Saigon-Cholon sector. But he could not have gained control without the support of Generals Phung and Thinh, two prominent Cao Dai military leaders. Saigon is under the control of a military junta led by these two Cao Dai Generals. It was these two Generals who proclaimed the dismissal of Bao Dai as Head of the State, dismissed the Diem Government and ordered Diem to lead a republican government. These two Generals may have found it expedient to accept the civil authority of Diem. But it is clear that Saigon is now ruled by a military junta led by the two Cao Dai Generals. Diem accepted the offer of these two Generals to head a republican government only after consultations with Mr Kidder, the American Charge d'Affaires in Saigon. It is evident that America is aware of the military complexion of the reorganised Diem Government. America may find it diplomatic to support such a regime. More relevant are the implications of such a military regime in Saigon on the promised elections next year.

Weekly Notes

New Building for Income-tax

NATIONAL income experts may differ whether our income has really gone up from what it was before the war—the use of the plural number is really honorific, for there is only one who claims to know what it was before and what it is after the war, and he says there has been no change. But whether national income has gone up or not, collection of income-tax has enormously increased. In the inter-war period, it fluctuated between Rs 16 and Rs 20 crores, after the record collection of Rs 25 crores in 1921-22. The big rise came with World War II and collections jumped from Rs 27.27 crores in 1940-41 to Rs 143.72 crores in 1943-44 and Rs 210.72 in 1944-45; this is still the highest figure on record. After declining to Rs 164.38 crores in 1953-54, collections slightly improved in the following year, and judging from all indications, an upward trend is not only likely to be maintained, but progressively accentuated.

So whether incomes are going up or not, income-tax has been and will continue to be skyrocketing, from which some draw the dismal inference that inequalities of income are also growing at an alarming rate. This may or may not follow, but it does follow that larger collection require a larger staff, and as the department goes on expanding, it needs more accommodation. Bombay had only one Commissioner of Income-tax before the war; it has now four and the strength of the department in Bombay City alone has increased from 229 in 1922 to 1369 today. The Bombay City and suburban district division is the largest commissioner's charge in the country, accounting for a collection of about Rs 44 crores a year out of a total of about Rs 165 crores. With more than a seven-fold rise in collection, a seventy-storey building to accommodate the Department is in keeping with the pace of development. Long overdue, the Department has now been provided with new building of its own on Queen's Road which was opened by the Chief Minister of Bombay last week.

In keeping with the spirit of the times, the new premises have been provided with an enquiry counter, public telephones, spacious rooms for visitors in each of the seven floors with an extra room on the 1st and 6th floor, a separate foreign section

to deal with income-tax clearance certificates for persons going abroad and a Public Relations Office. The latter is a novel feature; it is still something of a novelty, but in course of time, the income-tax officer will share with the family doctor and the solicitor the privileges of being a friend, philosopher and guide, to advise and help out people from some of the ills that flesh is heir to. He will have to emulate the bed-side manners of the fashionable doctor and apply the methods of painless extraction, perfected by the dentist. The appurtenances for performing his new role have been provided in this new income-tax building, in the shape of a consulting chamber for every officer, in which he would be able to exchange confidences, in a proper setting, and without any fear of interruption, with his assessee, and to prepare him, so to say, in the best approved manner for the eventual extraction, and make it as painless as possible.

Better public relations, of course, have to be established by everyone working in the Department. The job, it is to be hoped, will not be left to be shouldered by the Public Relations Officer alone, though the appointment of a special officer for improving the relationship between the tax-payers and the tax-gatherers and for rendering special assistance in other ways, eg, redressing legitimate grievances, helping assesses to obtain tax clearance certificates and encouraging direct contacts with the department, etc, is to be welcomed, if only for the promise it holds out that the tone of administration and the general atmosphere of the income-tax office will progressively improve. There is reason to believe that evasion and malpractices are on the wane; both are going down, day by day. Here is—wishing for the best.

Pakistan Convention Receding

THE last date for filing of the nominations for Pakistan Constitution Convention has come and gone. The date for the inauguration of the Convention has since been changed twice and now kept in abeyance, pending the Federal Court's final decision. Taking stock of developments from the time it was summoned, it does not appear that even if the Convention finally meets, it will be able to frame a constitution. Opposition from East Bengal was partially overcome by the decision of

the Awami League to file its nominations, but only partially. The other political parties, namely, the Krishak Shramic Party, East Bengal Muslim League, and Congress, following the lead from Fazlul Huq, refrained from submitting nomination papers. Since of the 40 seats allotted to East Bengal, Fazlul Huq now commands 29 against Suhrawardy's 11, what chance has the latter to forge ahead?

The developments in West Pakistan show similar dissensions. The Muslim League which is still supposed to be the leading party has serious conflicts within its own group. While Sind sent its nominations without any hitch, 65 out of the 80 League Assembly members of North-West Frontier Province have decided to keep out until the Federal Court decides on the legal issue. True, the Punjab Legislative Assembly gave a blank cheque to the Central Government to nominate its representatives but in doing this, it transpired later that Daulatana had pulled a fast one on Chief Minister Ferozkhan Noon. The breach between these two groups has been further widened by the resignation of three of the ministers of Noon's Cabinet, and the efforts of Mahommed Ali and Iskander Mirza, who visited Lahore recently, failed to patch up the quarrel, even temporarily.

Even if the Federal Court decides in its favour, the membership of the Convention would be too heterogeneous to allow a Constitution to be pushed through. Moreover, in West Pakistan, all the 30 elected members may be from the Muslim League but with party discipline what it is, it is doubtful if the members can work as a team. The ten nominated members, alone, will follow the line of the ruling block, but which would be that block?

With uncertainty all around, the future of the Prime Minister of Pakistan, Mr Mohammed Ali who, incidentally, also happens to be the President of the League, alone appears to be certain. With only one Leaguer to be elected from the East Bengal Muslim League, he cannot very well expect to get the nomination from his home province. And since the formation of the Convention is on the basis of parity, West Pakistan also cannot nominate him. It looks almost certain that Mohammed Ali will be the first victim of the doctrine of parity that he has himself done so much to establish. So he has

to leave the game to some one else who can play it better. Will it be H S Suhrawardy?

How Socialistic?

AVADI may have speeded up Government action on the Gorwalla Committee report; within five months, its recommendations have been implemented and the State Bank Bill was put on the legislative anvil. But how socialistic is the Bill nationalising the Imperial Bank and other banks in which the State has a stake?

Many countries have nationalised some of their banks; Italy has painfully retraced its steps but France so far has not had any reason to look back. Compared to the hue and cry raised in France when 4 out of 6 big deposit banks were nationalised in 1945, opposition in India has been very lukewarm. Is it a compliment to Congress that it has been able to create such an atmosphere that opposition does not dare to be vocal, or was it the past history of the Imperial Bank that prepared the way for the smooth passage of the Bill?

The State Bank is expected to be run as a commercial bank while the main purpose of nationalisation is to make it the principal channel for supplying agricultural credit. The Deputy Finance Minister took pains to explain the profit making intention and capacity of the State Bank. Apprehension has been expressed about possible loss of deposits and decline in the efficiency of service to be rendered by the State Bank. On the other hand, commercial banks are not so sure that it will not take away their deposits. Only the future can tell, but the experience in other countries where nationalised banks compete with non-nationalised banks, do not warrant any such fears. What may justifiably raise doubts however is the mixed character of its functions. The State Bank is to lend short term except for agricultural credit where it may lend up to 15 months. To saddle it with "underwriting of the issues of any stocks, shares, debentures or other securities in which it is authorised to invest its funds" (Section 33 (xi), or to allow it under Section 35 (xvii) to advance to a company or co-operative society "for the purpose of averting the winding up of the company or society", make its functions heterogeneous.

The above criticisms are met in principle by the power given to the Central Board to make regulations. Well developed practical conventions,

which nationalised banks in other countries have evolved, would be the final answer.

Sui Gas Comes to Karachi

WITH the laying of the 350 miles of pipe line connecting Sui gas fields with Karachi scheduled for completion this week, Pakistan can claim to have gone a long way towards relieving her desperate fuel position which she had to face ever since the inauguration of the State. How desperate the fuel position has been, can be gathered from the fact that despite a vast increase in output from the low grade coal mines in West Pakistan—the only source of domestic coal supply, so far—from 241,000 tons in 1948 to 554,000 tons in 1954, Pakistan has still to import a minimum of 1,400,000 tons of coal annually. Coal has been sought to be economised by replacing steam locomotives on railways by diesel engines and diesel electric engines. Simultaneously the production of oil of the Attock fields—also in West Pakistan—has also been progressively increased from 27.6 million gallons in 1948 to 129 million gallons in 1954. The search for new sources of power has been pursued assiduously and deposits of lignite, estimated at more than 100 million tons, have been located in East Bengal, but utilisation of these deposits is still a long way off which, incidentally, shows that apart from the overall shortage for Pakistan taken as a whole, the eastern wing of the State can hardly look for much relief even in the near distant future. The situation of East Bengal in this respect remains virtually unaffected, even when account is taken of possible hydro-electric developments. For the western zone, considerable progress, it is reported, has also been made in this direction, mostly in Punjab, and North-West Frontier Province. But even if these are developed, there is still a huge gap left in Sind, the industrial potentialities of which, and more particularly, the development of Karachi, have been held up so long by inadequacy of fuel resources. Sui gas will go a long way in meeting just this crippling deficiency.

From Sui fields in Baluchistan, bordering Sind and Punjab, to Karachi, the 350 miles 16" pipeline will have capacity of carrying 70 million cubic feet of gas per day, working on natural gas pressure. The capacity can, in future, be raised to 110 million cubic feet by installing com-

pressor pumps. Sui gas is very rich in heat value, having 900 BTU per cubic feet as compared to 450 BTU of the gas supplied by Bombay and Calcutta Gas Companies. Daily production of 70 or 110 million cubic ft Sui gas will therefore be equivalent in terms of thermal value to about 1.0 or 1.5 million tons of good quality coal per year.

Natural gas can be used directly in some industries while in others it can be used for production of steam, both for power generation or process work. It has also been extensively used in USA and elsewhere for production of heavy chemicals, particularly fertilizers, plastics and explosives. Utilization of the Sui gas will provide immediate relief to the industrial areas around Karachi, by making a readily consumable fuel available to the industries, and by augmenting electric power generation. It will also help in modernising the ginning of cotton in the Sind cotton belt through which the pipe line passes. The canal, road and rail transport developments currently in progress in Katri-Karachi area offer high potentiality in industrial development. The pipe line also passes through the deposits of lime stone where Dalmias and ACC have cement factories and replacement of coal by natural gas will increase the production of these factories as well as open up prospects for setting up others.

The cost to industrial users of Sui gas per 1,000 cu ft works out at about Rs 2.8 in Indian currency compared to Rs 5.4 in Bombay and Calcutta. Taking into consideration the heat value of Sui gas which is nearly double, the cost to industries in Karachi will be 25 to 30 per cent of the cost in Bombay or Calcutta. As a fuel for running steam turbines, however, Sui gas will cost approximately 44.5 as per million BTU which is considerably higher than the cost of approximately 26 as estimated for the waste gas from the refineries that Tatas will buy for their Trombay thermal station. This is understandable. For Trombay, the cost of gas has to be in line with cost of fuel oil. The price difference does not, however, provide a fair comparison. Waste gas from the refineries is only a bye-product and its supply is incidental to the location of the station. Pakistan will be fully justified in working on a higher estimated cost, in view of the national saving Sui gas will effect and the prospect of self-sufficiency in fuel resources that it holds out.

Our Delhi Letter

The Middle West is Here

Thursday, Evening

DELHI has been full of Bandung. The principal actors in the drama, as they arrived at or passed through Delhi, did not fail to emphasise their achievements at the historic gathering of the Asian people. Our Prime Minister did not lag behind in the dramatisation of the Bandung conference. But his is a dual personality, a unique combination of a statesman and a philosopher. Those who read him and his speeches see only the political aspect of his personality, but those who saw him arrive felt that he looked not a little pensive. It appeared as though he was tying up the loose threads of his thought, which must have got a little tangled in that mixed gathering at Bandung. I am somehow inclined to discount the political aspect of his personality and have a suspicion that in the great mind of the political philosopher, a big plan is in the process of gestation. As he has come back from Bandung, there is a renewed awareness that in having him at the helm of affairs, the country has been undeservedly favoured with an unusual bit of luck.

NEHRU ON BANDUNG

For the first time—as far as I can recall, he read out a prepared statement on foreign capital in 1948—he did not deliver an extempore speech on foreign policy, and the speech was, therefore, the less enjoyable for it. The Nehru flourishes were missing. There were no flights to the empyrean heights of social philosophy. In the statement that he read out to the Lok Sabha on the 30th, he traced the history of the conference, and referred to its geographical as against an ideological or racial basis. He was full of fulsome praise for Dr Soekarno and quoted him at some length.

As the political achievements of the Bandung conference yet remain amorphous, the Prime Minister elaborated at some length the economic and cultural issues and saw wisdom in the conference having avoided the setting up of any separate machinery for international co-operation. In his opinion, the Bandung decisions represent a break from the general belief and practice that for technical and other aid, Asia must rely exclusively on the non-Asian world. The detailed recommendations proclaimed the reaching out of the Asian countries to one another and their determination to profit by one

another's experience on the basis of mutual co-operation. The Prime Minister referred to the "alleged conditions in some countries" analogous to colonialism. He emphasised their sovereign status, their independence in terms of international law and practice, their diplomatic relations with ourselves and other countries, including the Big Powers. In his opinion, they can in no way be called colonies; nor could their alleged problems come under the category of colonialism. He really felt sorry that this controversy—a by-product of the cold war confusions—should have been projected into the arena of the Asian African conference. Summing up, he characterised the Bandung conference as a historic event, as a proclamation of the political emergence in the world affairs of over half the world's population. He praised the capacity of the new nations of Asia and Africa for practical idealism.

KRISHNA MENON, FOREIGN MINISTER?

Against the background of the great and epochmaking achievements of the Bandung conference, the Prime Minister expects that we shall take another step in the fulfilment of our historic destiny. While this sort of language is bound to appeal to our hearts, it is really difficult to assess the practical achievements of the Asian African conference. Those, who have come back from Bandung are full of praise for the performance of their individual heroes. All of them are agreed on the unique diplomatic talents of Krishna Menon. It is said that his sincerity, the power and resilience of his mind, his art of draftsmanship, his contacts at all levels saved the conference at many critical points. He is going out to China and might well come back as the Foreign Minister of India, for the Prime Minister is needed to co-ordinate, harmonise and lead on the domestic front. Today, the Prime Minister is too much of a Foreign Minister and too little of a Prime Minister, except when it comes to broad matters of social philosophy.

IN THE THICK OF IT

While we have talked about Bandung, there is evidence enough that we have shifted right into the centre of the tricky politics of the Middle West, that used to be called

the Middle East. The week began with the arrival in the city of Sayed Ismail-el-Azhari, the Prime Minister of Sudan. In fact as Pandit Nehru came back from Bandung, he waited at the aerodrome to receive him. With the look of a Europeanised African. Azhari has a very pleasant way of dealing with persons. He was taken round several places including Kasturba Niketan. He met Pandit Nehru a number of times in private sessions. But the first and perhaps the most conspicuous thing that he did was to join the mass Friday prayers at the Juma Masjid. Whatever we might do or the Big Powers may do, Islamic camaraderie is a factor that we shall have to reckon with. Afghanistan and Pakistan might quarrel. In fact during the week, they threatened to close down each other's consulates with possible severance of diplomatic relations in the offing. Our friend, Col Nasser of Egypt, expressed his preparedness to reconcile them.

As this is being written, we have in our midst another distinguished visitor, His Royal Highness Amir Faizal, the Prime and Foreign Minister of Saudi Arabia. Pandit Nehru well described him as a comrade in the common task of Asian resurgence. The Amir returned the compliment in fulsome terms: "... this great gentleman, the gentleman sitting across the table, His Excellency Mr Nehru ...". Amir Faizal, like Azhari of Sudan, has also gone round, visited the Qutab Minar with its Arabic inscriptions, the Humayun Tomb, the shrine of Hazrat Nizam-ud-Din and the like. What passed in his mind at the sight of these ruins of Islamic glory can only be imagined. Like the Foreign Minister and Deputy Prime Minister of Afghanistan, Amir Faizal also referred to the historic ties between Arabia and India!

I think we better stop here, for if we probe into history, it might prove distressing. We are concerned with the present, and at present, in Delhi, it looks as though the Middle West is divided into two big blocks, one consisting of Turkey, Iraq and Pakistan, backed by the Anglo-American powers, there is the second block, consisting of Egypt, Syria, Saudi Arabia and Afghanistan. Iran is really in the first block, but is afraid of any such formal avowal, lest the Soviet Union swoops down

on it. Israel is sandwiched between the two blocks; if the two were to join, it will be squeezed out. As against the big powers supporting the first block, we are unreservedly supporting the second. India thus enters into the political arena of the Middle West.

PANDITJI AT MAY DAY RALLY

On the domestic fronts, Pandit Nehru achieved his most outstanding triumph in mass contact by addressing on Sunday, the May Day rally at Ramlila grounds which was organized by the Indian National Trade Union Congress. That he was at the rally is more important than what he said. He invited Indian workers to participate fully in the unique experiment of revitalising the country's social and economic life without sacrificing human liberty and democratic institutions. Though he admitted the existence of class struggle, he refused to accept the conclusion of the Marxian hypothesis and warned against the methods and ways of violence. Incidentally, he also warned the country against depending on external aid for reconstructing the country's economic life. As usual, Panditji was full of many things—full particularly of Bandung, "this unique gathering of diverged cultures and nations". Winding up his speech with the hope that the remaining vested interests obstructing the path of the people's progress would be removed, it looked as though Pandit Nehru had in him the capacity to emerge as leader of the working classes alone, instead of leading all the progressive sections of the community that he is doing today.

SPATE OF SOCIAL LEGISLATION

The Parliament has not been dull this week. In fact apart from economic legislation, it has been discussing social legislation of far-reaching importance. The Parliament went rapidly through the three readings on the Untouchability Bill, which seeks to give practical shape to Articles 12 and 17 of the Constitution abolishing untouchability. Pandit Pant's speech really deserved more publicity than it received. One very much wishes that the great Home Minister would direct his wrath against some real social evils instead of flogging the dead horse of untouchability. Of greater importance is the matter of Hindu Marriage which is being discussed in Parliament. Our women parliamentarians (and also that married sanyasi, Acharya Kripalani) were at their very best in discussing the pros and cons of the right of divorce.

MANAGING AGENCY UNDER NOTICE

On Monday last, the Joint Select Committee on the Company's Bill, presented its report to the Lok Sabha. It is a document of extreme importance to the economic life of the community. The Committee has suggested that all existing managing agencies except those renewed with the consent of Government should come to an end on August 15, 1960 and that no managing agency should be heritable or divisible by will. Government will have the power to discontinue managing agencies in certain industries, notifying them from time to time. Where managing agencies are allowed to continue, Government's consent will be given only in the public interest and only in cases where the record of the managing

agents is satisfactory. The remunerations of the managing agents, managing directors and managers of the companies has been fixed at 11 per cent of the net profits as the limit. When there are no profits, it should not exceed Rs 50,000 per annum. The reform of the managing agency system has been long overdue. It now appears to be in sight.

Against this background of economic change, it appears a little trivial to refer to the rather serious trouble at Kanpur, at Tuensang in the north eastern frontier and in Goa, about which the Prime Minister made a statement today in Parliament. One cannot have fair weather all the time but on the whole we seem to be sailing fairly smoothly.

From the London End

Election Manifestoes

THE election manifestoes of the two major political parties have now been issued—that of the Liberal Party is still to be made public. Both documents are ponderous and only the very conscientious will take the trouble to struggle through them. With the advent of the radio and television as the most effective media of electioneering, pamphlets have had their day. And in this situation as the *Times* dared to comment, "election manifestoes are no longer the things they were". But so far as these documents still fulfil their original function, the stage is now set. This is not to say that the issues on which the election will be fought will be any clearer. It is the way of general election campaigns to develop a character of their own, and in the current one, in spite of what each Party professes as such, it seems likely that the hydrogen bomb will loom large over the ballot-box.

The Conservative Party manifesto is wordy and woolly. Its thirty-two pages are liberally peppered with platitudes and high-sounding phrases—it provides, as one responsible journal puts it, "a maximum of rhetoric and a minimum of programme." This is understandable. The Government party always stands on its past records, no matter how unfortunate it has been, and less they commit themselves on matters of future policy, the greater is the flexibility and freedom of manoeuvre they will have when returned. Their programme in these circumstances could not be more aptly entitled than "United for Peace and Progress". The slogans in the programme all attempt to give the impression that Conservatism is really dynamic in content and some commentators have appropriately dubbed the Tories as the "New Conservatives". The disaster which overtook the Conservative Party in 1945 had to be repaired and the 1951-55 era of Tory rule has afforded the opportunity for presenting Conservatism's new look to the nation. As Robert Boothby, one of the intellectually inclined of the Tories, had put it,

"What we have to do is to convince the public that our programme amounts to something more than the dole, the quinquennial vote and the recurrent world war."

The four years of Tory Government

have been good years for the British people—some, particularly the Labour Party, have attributed these good years to pure luck, others to good management at the centre. There is no doubt that the favourable movement in the terms of trade has assisted the Tories but to attribute everything to luck is to take too prejudiced a view.

The Tory programme propounds the need for manufacturing the H-bomb and for the unification of Western Europe while declaring at the same time that the Conservative Government "will continue to strive for world disarmament". It is to be noted that the Labour manifesto "Forward with Labour" subscribes to the very same view except that it qualifies the use of the hydrogen bomb, by the proviso that it "could not be used in the event of minor disturbances". The Tory manifesto speaks of the two-year term of compulsory national service as not being fixed, though it makes no bones about it that "national service is an instrument of our foreign and imperial policy". With regard to the "Empire and Commonwealth", the Tories are to work for greater "cohesion and influence", and to see that "Commonwealth partnership continues to enable us to stave off economic crises". On the Colonies, they say what Gladstone had once said about the Indian Empire, "it is unrealistic to lay down a cut-and-dried time table for the evolution of political maturity". All this is typically Tory and it is difficult to see whether the New Conservatism is so new after all, at least in foreign and imperial relations.

On home economic policy, the aim of the Tories is to double the standard of living in 25 years. To achieve this, there is Mr Butler's slogan "invest in success". As the last Budget showed, greater opportunities will be placed before the owners of wealth to invest in economic expansion—since they are the real savers, their co-operation in the "invest in success" campaign is essential. It is, therefore, necessary to lighten the burden of taxation on them. The disproportionate reduction in the standard rate of income tax compared to the lower rates in the last Budget is justified on these grounds. On foreign trade, "expansion" is forecasted in words which have been heard more than once and which are now beginning to

wear a little thin. The programme is, however, clear on "cotton policy"—

"It will be our constant aim to safeguard the special interests of the cotton textile industry in the important interchanges taking place with other governments particularly concerned."

The Labour programme "Forward with Labour", though less woolly than the Tory manifesto, is largely a rehash of its 1953 "Let's Face the Future" policy statement. Labour can afford to be more specific and even reckless in its commitments. It is specific on its nationalisation policy (chemicals, machine tools, and steel, of course, will be under State control) and while it does not predict a collapse of the Butler boom, it outlines its own practical proposals for expanding production and "ensuring that the increased national wealth is fairly shared". The Labour Party pledges itself to restore guaranteed prices to farmers, reorganise marketing and re-introduce bulk purchase ("where necessary") and price controls of essential foodstuffs.

It is on the enlargement of the Welfare State that Labour programme is most explicit and probably the most far-reaching. The fundamental difference between the policies of the two major parties is about the means of financing Welfare facilities. The Labour programme speaks of the need to mould a fiscal policy which meets the requirements of the Welfare State. The Tories, on the other hand, will finance whatever social security measures are in existence by means of direct contributions from the mass of the people.

Rehabilitation Plans

FROM Sealdah, Pakistan-bound trains start with few passengers. To Sealdah, the trains from India-Pakistan borders come packed to overflowing. Exodus of East Bengal Hindus continues. Karachi has assured that it does not want migration of Hindus from East Bengal. This assurance seems to have assured the Union Minister for Rehabilitation. But East Bengal Hindus do not seem to be assured by Karachi's promises. They are still migrating. And the inflow of East Bengal Hindus into Calcutta remains as heavy as in recent months.

Karachi promised measures to ensure conditions which would end the exodus. These measures have not yet been introduced. Goods traffic has been resumed between the two Bengals. Many Sikhs have visited the Gurudwaras in Western Pakistan, and have come back to Punjab (India). Press reports suggest that the passport and visa system has been liberalised. One has noticed that the queue at the western end of Writers' Building is no longer as long as formerly. But, one gathers, the visa is still a delaying process. May be, liberalisation arrangements have not yet been finalised at the Calcutta end.

Passport and visa delays are not causing inconvenience to many. Only a few want to go to Eastern Pakistan. These delays may be irritating when, if ever, the reverse flow begins. Pakistan not only wants to stop migration. Karachi desires that those who have migrated should return to their homes in Eastern Pakistan. New Delhi seems to share Karachi's hopes. But the people and the Government of West Bengal do not share such hopes. It is doubtful whether even the continued exodus can be stopped. Much more unlikely is that the reverse flow will gather momentum in the near future.

TOP-LEVEL TALKS

By the time these lines appear in print, top-level talks on refugee rehabilitation will have started in Calcutta. For too long, New Delhi has been under the delusion that the problem of East Bengal refugees will vanish as suddenly as it emerged. It is more than time for New Delhi to abandon any such hopes. A couple of months ago, Pandit Nehru made a statement in Parliament on this problem. He was realistic in his

assessment. New Delhi has been more active and energetic in its attitude to East Bengal refugees for about a year now. Shri Meher Chand Khanna has created a favourable impression in Calcutta.

But it becomes increasingly obvious that much more will have to be done by New Delhi. It is unrealistic to hope that the exodus will stop, or that those who have migrated from East Bengal will go back. Once this is fully appreciated, the magnitude of the problem becomes evident. There is a tendency in New Delhi to ignore facts and figures about East Bengal refugees. Since partition about four million East Bengal Hindus have migrated to this country. Many more are coming, and will come.

It is clear that West Bengal cannot absorb, even at the most liberal estimate, more than two million of these refugees. Plans have been prepared for starting some new industries to absorb the displaced persons. Dr B C Roy's Government has sought New Delhi's permission and approval for starting some new industries. There are proposals for establishing three fine-count spinning mills, for expansion of some of the existing cotton mills, for establishment of a calcium carbonate factory and for expansion of a forged steel factory.

Both New Delhi and the West Bengal Government have plans to encourage and to help industrialists to start new industries or to expand existing ones in order to absorb refugees in gainful employment. It would be uncharitable to suggest that no attempt is being made to rehabilitate East Bengal refugees. In the last year, rehabilitation efforts have been speeded-up. Admittedly, the resumed inflow of refugees since October last has aggravated the problem. Even so, it is clear that rehabilitation efforts now being made are inadequate to rehabilitate the displaced persons.

Certain facts are beyond dispute. It is clear that the West Bengal Government's efforts to place the displaced persons have reached the saturation point. Its resources are too limited to deal with the problem. It is equally clear that West Bengal's capacity to provide temporary relief has almost been reached. Two compelling conclusions follow from these facts. This is where New Delhi must step in.

Even on the most conservative estimate, there is already the problem of rehabilitating some two million East Bengal refugees outside West Bengal. It is doubtful whether West Bengal has the space or the Government has the resources to maintain and to rehabilitate even two million refugees. It would, perhaps, be more realistic for New Delhi to assume responsibility to rehabilitate 2½ million East Bengal refugees outside West Bengal.

Experience of refugee colonies outside West Bengal is not encouraging. East Bengal refugee centres outside West Bengal are mostly in Orissa, Bihar and Assam. This aspect of the problem has some relation to the possible recommendation of the Boundary Commission. But it is evident that, even in the event of acceptance of West Bengal's claims for re-adjustment of boundaries, there will be need for establishing refugee towns outside West Bengal. New Delhi, and not the States concerned, must assume full and complete responsibility for creating and maintaining such refugee towns.

REFUGEE TOWNS

Creation of such refugee towns under the direct control and supervision of the Union Government is a necessary first step. But the problem cannot be solved merely by establishing such towns. It is evident that these towns should be planned as satellite industrial centres. Once the Central Government assumes full responsibility for rehabilitating the 2½ million refugees, whom West Bengal cannot possibly absorb, it logically follows that such refugee towns should be built in and around the large-scale industries started, or under contemplation, by the Union Government.

For the people, the Government and Big Business in Calcutta, it is good news that the British steel mission is impressed with Durgapur's claim as the best location for the third steel plant. If Durgapur is ultimately selected as the site for the third steel plant, it should offer opportunities to absorb some of the displaced persons. Jamshedpur shows how Durgapur, with a steel plant, can emerge as a thriving industrial town. As in Jamshedpur, many ancillary industries are likely to be started in and around Durgapur, once it is selected as the site for the third steel plant.

The Why—and Where—of Exports

IN a neatly got up booklet with this catchy title, the Crawford International Service, London, presents a factual study of the changing trends of world export in the last ten years, with particular emphasis on the varying fortunes of the UK export trade.

The lesson is brought home, with the help of very effective charts and diagrams and nicely displayed statistics that "if we would live well, we must sell well abroad". How subtle and persuasive a proper selection of typography can be in selling an idea! Now, a safe export for Britain is capital goods; the export possibilities of consumer goods are not so certain! Nevertheless, "safety first" is all right upto a point, but it is in pushing consumer goods that selling skills and services of publicity experts, incidentally, are called for in the highest degree. Crawford's who are responsible for this publication, are a name to conjure with in this specialised field, but though emphasis is duly placed on rising standards of living providing more room for Britain's highly finished luxury goods—textiles, leather, silver, cutlery and chinaware, for example—the uncertain factor in the situation is not glossed over by any means. "The imponderable here is how far customer countries will go in raising tariffs to protect their own nascent industries". Against tariff walls, selling skills will not avail. Barring this, there is a wide field open to enterprise. Here is a persuasive and factually authenticated exhortation to British export houses to focus their attention on it.

The post-war period has witnessed a marked expansion in the volume of world trade as also a change in its pattern, manufactures now taking a larger share of world trade than primary products, as compared to pre-war. Thus, the value of total world exports rose from \$20.6 billion in 1938 to \$75.3 billion in 1951, though there was a slight decline to \$73.8 billion in 1953. Of the total exports in 1953, the Dollar Area accounted for \$23.8 billion (32 per cent), the Sterling Area for \$17.4 billion (23.5 per cent) and the EPU Area for \$21.8 billion (29 per cent). Trade has expanded, despite marked rise in prices; what is, however, more important is the change in relative prices: compared to pre-war, the price of primary products has risen three fold while that of manufactures has doubled. And this has affected the terms of trade, especially of countries such as the UK which depend on export

of manufactures for imports of food and raw materials.

WEST EUROPEAN TRADE

The second world war brought about a collapse of the system of multilateral trade and payments and the world got divided into rigidly defined monetary areas, such as the Dollar and Sterling Areas, though in recent years considerable progress has been made in lowering these barriers to trade.

Although the dollar problem was there even before, it was the break down of the machinery of payments that created the dollar gap! An important consequence of war was the increased dependence of Europe on the dollar area. Dollar sources of supply became more important during the war, and non-dollar sources lost ground: thus North American production of bread grains, vegetable oils, fats and cotton increased and exports of these from non-dollar sources declined. The main supplies of petroleum and non-ferrous metals also shifted towards dollar sources. In

metals, technical change favoured Canadian aluminium rather than tin and lead from the Sterling Area. Exports of meat, dairy products and hides from Australia and Argentina, too, fell.

The strength of the dollar area was reinforced by political, social and population changes hastened by the war. Political division reduced the trade between Western and Eastern Europe; population increases along with industrialisation in so-called 'empty' countries reduced export surpluses of primary products, and countries with developing economies became less dependent on imports of light consumer goods and began to need capital goods. It was with a view to face a situation of this nature that OEEC (1948) and the EPU (1950) were set up. Considerable progress has been made since and private import trade of the EPU countries has been considerably liberalised. All the EPU countries, except France, have by now freed 75 per cent of their private import trade from restrictions.

EMPIRE'S...

Forward Leap

NEW BUSINESS

1954 (exceeds)	Rs. 3,82,00,000
1953	Rs. 3,22,00,000

This substantial increase is symbolic of the growing confidence of the insuring public in the strong financial position and satisfactory service of the Company.

Applications for Agency invited

THE EMPIRE OF INDIA LIFE ASSURANCE CO., LTD.

(Estd. 1897)

Head Office:

Empire House, 214, D. Naoroji Road, Bombay

BRANCHES ALL OVER INDIA

West European exports to Eastern Europe have sharply fallen to about a quarter of the pre-war volume; thus the value of exports to Eastern Europe including USSR declined from \$1.7 billion in pre-war to \$527 million (current prices) in 1953. And whatever trade there is between Western and Eastern Europe, is now fundamentally bilateral in character.

THE STERLING AREA

The Sterling Area is neither self-sufficient nor self-contained as it is a net importer of important commodities, eg wheat, cotton, etc. Nevertheless the production patterns of the UK and the other Sterling Area countries fit together well; in the period 1948-52, about half of UK's exports went to the sterling countries and about a third of the latter's exports went to the UK, and these two flows of trade made up about a tenth of world exports.

Primary products such as rubber, wool, jute, tea etc are the main exports of the Sterling Area to dollar countries. Of the exports to the dollar area, Gold Coast tops with 30 per cent of her total exports, India comes next with 23 per cent followed by Malaya (20 per cent). Between 1948-52, 85 per cent of the exports of the Sterling Area (except UK) went to the US; 12 per cent to Canada and 3 per cent to other countries. The UK's dollar export trade is less concentrated on the US. Within the Sterling Area as a whole, the UK

provided about 50 per cent of total dollar exports in 1953, but only one-third of the area's exports to the US.

UK EXPORT TRADE

Not only exports, but earnings from services and investments abroad play a vital part in the British foreign trade. It is through earnings from invisible trade that the UK was able not only to cover her trade deficit but also obtain a payments surplus. Even today, the tourist trade is Britain's top dollar earner—whisky is only next best!

Manufactures form the major part of British exports: nearly one half of UK's exports go to other Sterling Area countries which, together with Canada, are increasing in importance among British overseas markets. The UK's share of world trade in manufactures was greater in 1950 than it was before the war but currently, it had fallen below the pre-war level. The revival of German and to some extent, Japanese competition is likely to accentuate this fall further. The three main export markets for Britain are Australia, the US and South Africa. Out of the total British exports in 1954 of £2.7 billion, the Sterling Area accounted for £1.3 billion, the dollar area £375 million, the EPU area £778 million and others £275 million.

During 1948-52, 15 per cent of British exports went to the dollar area, of which the US took 43 per cent, Canada 40 per cent and others

17 per cent. Britain's principal dollar exports include vehicles, machinery and whisky, while her dollar imports consist of items such as cereals, non-ferrous ores and metals, and other raw materials unobtainable elsewhere at competitive prices.

With the emergence of a buyers' market and the appearance of Germany and Japan as exporters, in recent years, British export trade is faced with severe competition, resulting in a reduction of her exports of manufactures. German exports have met with success in her former markets eg South America, Turkey, Belgium, and some Middle Eastern countries. Thus in 1952, 14 per cent of Egypt's imports came from the UK and only 6 per cent from Germany; in 1953, however, these proportions changed to 10 per cent and 11 per cent respectively. Though the recovery of Japanese industry is not of the same order as that of Germany, she has emerged as a world exporter, especially to South-East Asia. Countries that are developing require capital goods and these provide a safe market for the UK with only the US and Germany as competitors. Britain's most obvious advantage is that she has more capital equipment per head than any other country barring the US, thus having a lead over others in products that need a high degree of engineering capacity and advanced engineering skill. Britain has a further advantage, even over the US, being comparatively a 'low wage' country.

Changing Attitudes in a Chinese Village in Malaya

W H Newell

DURING the last nine months, your correspondent has been living in a Teochiu village of vegetable farmers in North Malaya. Up to the present time, very little research work has been done on the Chinese in this country and the people who have written about the Chinese here are exactly like those in their homeland. This is incorrect. To give an illustration of the difference in custom, the woman responsible for the marriage ceremony among Hokkien and Hakka families must always wear a sarong. The adoption of the sarong must clearly come from the Malays, since in China there is no such dress. Yet this is regarded as Chinese custom here. On the other hand, the method by which certain of the gods are worshipped is by the burning of incense and the presentation of pork and chicken; customs derived from China and not adopted from the Indian or Malay residents in this country.

In China, villagers belong to many associations. Every family in Teochiuland has certain ties with those of the same surname as itself, with those of the same village, with those who are neighbours, with traders to whom they regularly sell their products, with the landlord who owns their land and with various other societies, both legal and illegal, which assist them, in their everyday affairs. When he migrates to this country, these ties remain very strong, especially as many of the people who emigrate with him at the same time also respect them. The villagers with whom I stayed in North Malaya still had a real interest in those people whom they had left behind in China, and regularly wrote letters to them. The fact that both the Malayan Government and the Peoples' Government of China had regulations forbidding the sending of mail other than through the Post Office did not seem to affect the courier service in any way. For M\$1, an uncensored letter could be sent to China and a reply received within a fortnight. In the course of my residence in this village, I read many dozens of these letters and it was interesting that every single one I read consisted almost entirely of personal news about the people whom the villagers knew, and requests for remittances of money.

In my opinion, the Teochius in

this village, during the first generation at least, have such strong ties with the friends and relatives in their Chinese village that they can, for all practical purposes, be regarded as members of this village in China, arbitrarily separated by distance and different governments. It is only in the second generation that the standards and values of the villagers may begin to show signs of change. This was demonstrated very clearly in this village by the large number of quarrels between fathers and sons. In old China, the responsibility of a son for his old father was very clear and a dutiful son was in the nature of a life insurance. In this village in North Malaya, there are numerous old men of over sixty years of age who have sons living but receive no money from them. In one instance, there was a son who used to smoke opium twice a day and was continually quarrelling with his father who reprimanded him for wasting his money in this fashion. Eventually, the son forced the father to leave the home to support himself although the old man was over eighty. The old man's wife, however, took her son's part and now lives in her son's house separated from her husband. There is no doubt that one of the main reasons why children no longer feel compelled to support their parents is not so much poverty, as the villagers are certainly not poor, but the changing attitude of the society in which there is little moral or social pressure put on those who infringe the traditional code.

So, on the one hand, we have an attempt by the old people to follow along the customary and moral paths which they have always known. In contrast the younger generation try to escape from obligations forced on them by their elders, the purpose of which they can no longer see. To a certain extent, practical considerations also determine this change. In a house, near me, a young lad of 22 had been married as a child to a girl of another village who had been bought at birth. This girl addressed the father of the family in which she was residing as Dwa Kung, grandfather, thus showing that she regarded him as a father-in-law. The son, at 17 years of age, had left his village and gone into the wide world to earn his fortune. When he returned, he felt he did not wish to have this illiterate country girl as his wife any more. The family took the girl's

part and argued that it was unfilial of the son not to follow his parents' advice. The girl herself wishes the marriage to continue. It seems to me that the net result of this situation will be to drive the son from the house. I enquired of many other people why it was that there were no other cases of this type of child marriage but all replied that it was stupid to marry in this fashion, because, although a certain amount of money might be saved in the marriage expenses, if the son was not prepared to carry out obligations accepted by his father, then the difficulties which would subsequently arise in the family would be insurmountable.

It is not only in exceptional instance like this, however, that there are difficulties between the China-born residents. Within the family, a very great deal of authority rested with the elder son. This authority seemed to derive in part from the fact that if he did not like to stay in his family and work at growing vegetables, there was nothing to prevent his just leaving his family and finding work elsewhere. Instead of the tie between father and son being based upon authority, and on the right to inherit property, it was much more based on love and affection. Where there was no love or affection, then the social ties in themselves were insufficient to hold the family together.

A further instance of the close ties between the first generation of villagers and the villagers in China is shown by the sudden change in the standard of living that occurs between villagers with close relatives in China and others who have no close relatives there. A villager who leaves China and goes abroad, does so for a variety of reasons, the principal one of which appears to be boredom with those people with whom he has been brought up and inability to make a reasonable living. On an analysis of the place in the Chinese family of emigrants to this village, it appears that both elder and younger brothers are represented and that the majority have some land in China; but, even so, once they have reached Malaya and have started to settle down, they find that even as workmen, their standard of living is much higher than it would have been in China. They then remit money home to their fathers, mothers, sons, daughters, wife, and occasionally to their brothers, but very rarely to anyone else. In order to help them

to do this, they peg their standard of living and instead of spending more money on clothes, or on food or wine, they try to save their money. Once a certain amount of money is saved up, they then return to China and flaunt their wealth before the faces of their admiring friends.

In Teochiuland, the returned citizen of the Nan Yang is looked upon as a profligate and a person who wastes his substance. Of course, sooner or later, his money runs out and he is forced to return overseas once again to repair his broken fortune. For these first-generation Chinese overseas, the people whose respect they want and whom they want to emulate are not the Malays or the foreign Europeans, or even those Chinese in the Nan Yang who come from another district, but their own Chinese villages; with the Malaya-born second generation Chinese, however, all is changed. Hearing their fathers and mothers and their family continually talking about their relatives and the glories of China, they are naturally extremely keen to return to see their own country but once back in China, they find that they have little contact with their father's generation and after spending a certain amount of time in travelling, they are glad to return to their village in Malaya. They are not anxious any more to send money orders to relatives with whom they no longer feel very close. Gradually they start to spend money instead of saving it or remitting it, and at this period in the life of the family, there is a prodigal purchasing of watches, bicycles, and wine to drink with their meals. It is, in my opinion, very significant that in this village, gambling on horse-racing is extremely popular. I am informed by the villagers that formerly very little money was spent on it. I have asked many villagers how much they estimate is spent on horse-betting each week. No-one gave me a lower estimate than \$200 a week and many of them estimated it as high as \$800 per week. For a population of 487, this amount is enormous; this is due to the fact that the younger generation no longer know how to spend their money or have no definite ideas how they want to use it. For Chinese-born Chinese, everything is quite clear—the wish to work up in their society, get the respect of their fellows in China, and show how different they were from the poor humble youngsters who left for the Nan Yang so many years ago. But for the Malaya-born second generation Chinese, this aim is no longer sufficient, and they like spending on other things. This peculiarity, of course, is not confined merely to the

Chinese; it is the same with the nouveaux riches everywhere.

The Teochius are not the largest Chinese language group in the Federation but they are extremely interesting, because the districts from which they come have been excluded in many ways from the more luscious Chinese government plums. There are very few Teochius who are really famous in Chinese history. In the Federation, the majority of Teochius are vegetable farmers, but in their districts in China many of them were rice farmers. The districts of Canton Province which speak Teochiu are nearly all along the big river valley which runs inland from Amoy. According to the Teochius themselves, their appearance partly stems from the geographical features of their homeland. They point out that whereas the Hakkas are wild men living on the top of mountains with no proper culture, the Teochius live in the plains and are essentially village people. It must be admitted that, very roughly speaking, in north Malaya, this appears to be so, because, referring only to rural districts, Hakkas do live much more closely to the central mountain backbone than Teochius and Teochius are found nearly always near the sea or

on flat vegetable growing land. They themselves complain that if Teochius work in the mountains, the joints of their legs swell up. There is no alternative for them but to come down to the plains. They also say that when Hakkas come to live near the sea, their skin peels off their hands and bodies; so they move to the mountains. Of course, whether this is true or not is impossible to say, but the existence of such a belief shows the extent to which customary attitudes towards land and towards work persist, impelling people to take up the same occupations and live in the same sort of country as they are used to.

In this particular village, the Teochiu farmers come from three main sub-districts in Po Ling and Chao Yang districts in Canton, but in spite of their coming from the same villages, they did not come over together as a body, as appeared to have occurred very infrequently in the settlement of Malaya. Nearly every family spent three or four years trying to make a living in other parts of north Malaya before coming to this village. To settle down in this village they had to obtain a contact. To obtain this contact—common village residence or a common name

or a common relative, or more infrequently a common friend—was sufficient to give them an opening. Once this was done, then if they found the company of their fellow villagers congenial, they would settle down. Once settled down, it by no means followed that they would remain friendly with the person by whom they were introduced. The point about this is that common kinship or village in China is only the first step in people co-operating together in certain ways. If people want to be friendly, they themselves will soon find an excuse to justify their friendship. In a hostile world these ties are only the reason for finding the first introduction. Lack of fear of the world outside will loosen the ties.

Among these villagers this friendliness takes the form of renovating wells and carrying pigs to the road, repairing houses, repairing public roads, repairing the school building, and carrying sugar cane. All this is unpaid work except the last, for which a small amount of money is paid. You only help those for whom you have friendly feelings. These friendly feelings derive in part from the fact that the villagers trust one another and have a certain amount of affection for the place in which they live.

For a short while, I lived in an adjacent village consisting of Cantonese, Shinling, Kongsai, Hakkas and Hokkien where this friendly feeling was altogether absent and cash had to be paid for all the services mentioned above. Having no common feelings of origin or interest in the village itself, each man was out for himself and none of this type of co-operation could result. It is very interesting to compare these friendly feelings (which are termed "ganching" in Mandarin) with the *birton* system mentioned in the earlier Indian Village Series.* Whereas *birton* was essentially a reciprocal relation which in some respects could be added up like a balance sheet, ganching among these Chinese may be one-sided and the return given may not be equal. In some ways, it may perhaps be more closely compared to the *jajmani* found in the Uttar Pradesh in which it is necessary to pay a Brahman a regular annual amount of grain, whether you use his services or not. The difference between the *jajmani* system and the Teochiu system of ganching is that the sanctions employed to enforce the former were village sanctions whereas in this Teochiu village, the sanctions are

essentially personal, a fear that if one does not help, subsequently the person concerned may do you harm; and conversely a desire to continue contacts with a friend who asks for your help.

Much to my surprise, in this village I found religion to be a very strong force in contrast to my earlier field work in another part of China. What is so surprising about the Teochiu religion is that it is an extremely practical religion. The gods are thought of as providing special services which are paid for cash down. In the larger temples, there is no need to take off one's shoes on entering. One smokes not only cigarettes but even extremely strong cigars in the holiest part of the temple just in front of the altar if one feels like it; there is no reason why one should not shout, dance and scream anywhere inside the temple. In short, there is no sign of a feeling of respect for the gods or reverence for the temple, but one should not be deceived by this apparent lack of feeling, for the villagers genuinely like their gods, some more than others. When I use the word "god" here, I am referring, on the one hand, to *shen* and on the other to *gwei*. *Shen* are more or less official dignitaries. They have definite duties and obligations and they have their own supporters who give them orders how they are to go about their official duties. *Gwei*, on the other hand, have no definite jurisdiction and are very open to appeals from their supporters, provided that they are good *gwei* and not bad *gwei* (such as suicides). During the last four or five years in this village the soil has been becoming gradually exhausted and there is a plague of vegetable-eating insects which have proved impervious to DDT. In an attempt to keep up his income, nearly every villager now raises pigs and chickens but the raising of pigs is a very risky proposition. Pigs seem to have even more psychological problems than their owners and often die for no apparent reason. The supernatural responsibility for raising pigs lies with a certain *gwei* called Good Big Brother. In the event of any small illness developing in the pig, Good Big Brother's advice is immediately sought and the proper remedy given to the pig. When the pig is sold, a small feast is also given to Good Big Brother. Good Big Brother also takes an interest in the rearing of children and in every personal enterprise in which a successful conclusion is not certain. On the other hand, natural disasters such as flood, drought or

blight are thought to be under the control of Grandfather Sky. Grandfather Sky is a very superior god, above all the others and normally he pays no particular attention to the doings of the world below, but when repeatedly presented with vegetarian food, he may give orders to his subordinates to help the poor farmers. Two years ago, there was no shrine to Grandfather Sky in this village although his annual festival was regularly celebrated in the home. As the plague of insects got worse and worse, three villagers took the initiative and raised money to build him a small shrine. Although the reason the villagers gave for the building of this shrine was that Grandfather Sky had no home in this village, the immediate cause for this action was the plague of insects which, incidentally, still remained as bad as ever. This *shen* and this *gwei* are of course by no means the only gods present in the village. They have a god of the soil called Na to kung,* who is an Arab dressed in long white flowing clothes, and who, like all Muslim Malays, will not eat pork under any circumstances. He was called a Malay god.† In addition to the Na to kung, there is an interesting god called the god of the back door. A Chinese person is fully aware that the Nan Yang (the South Seas) have been built up by the sweat and tears of thousands of Chinese who have died without graves and without their relatives being present. Twice a month, many Teochius burn incense before the god of the back door who represents the thousands of Chinese who have died in order to make it possible for the living Chinese to remain in the Nan Yang. There are other gods, too numerous to mention, but all have this in common that once the method of approach is known and sufficient money or other goods are given to them, the results of their efforts will be certain. This principle is even taken into horse-racing, and no gambler, however stupid, would dream of choosing a lucky number for horse-racing without paying \$10 to the medium of a god for information as to which number is likely to win. Failure to obtain the winning horse through

* Malay *Datok*—tutelary spirit of a *Keramat* or wonder working spirit, Wilkinson.

† It is interesting to note that the neighbouring Cantonese community also living on Malayan soil, do not have a Na to kung but have a Chinese god of the soil who does eat pork and every other way behaves like a proper Chinese.

a medium is, of course, not due to the fact that the whole of this system is a forgery, but that money given was insufficient or that the medium was not competent to interpret the god or some other similar reason.

It is extremely important to realise that this whole system of mediums, gods, and the financial control of temples is by no means a fraud and a delusion to those taking part in it, but is based upon a sincere and honest belief that this is the way gods really do work. The very often unscrupulous managers of temples do not need to invent an excuse for making money because the people themselves so sincerely believe in their temple's efficacy that no deceit is necessary. Where deceit is practised, it naturally reflects on the manager's character and not that of the god.

Of course the system of gods and spirits so briefly described above varies from believer to believer. One family laughed heartily at the idea that any of these gods had any influence on the way events actually moved but I discovered that the previous night the head of this family had invited a medium to his house to whom he paid over \$50 for information about the next day's

racers. This was done secretly in order that others would not know which was the lucky horse.

Among the younger Malaya-born generation, there is less change perhaps in matters of religion in this village than in economic organisation and family relationships. This is perhaps not surprising in view of the fact that the villagers still feel themselves very much on the defensive in a hostile world. The memory of the Japanese occupation, when the power of the government was handed over to the Malays who extorted money from the residents by beating them up, is still fresh. Moreover the administration in this district is carried on entirely in English and, due to lack of education and little mixing with the governing class outside, the world of government still appears to them a mystery symbolised by the occasional appearance of a policeman. Although there are one or two families who have been here for three generations, the Chinese school has not yet been established twenty years and no pupil has ever gone to any Middle School. They have just been left to their own devices and accordingly know little about the world outside. Every Chinese peasant is discouraged from going to

school by having to pay up to \$3½ a month for fees while Malays are encouraged to know that Malaya is their country by getting their education free.

My main thesis in this village is that the Teochius here are an extension of the villages in China from which they come and that during the first generation, the sort of things that they want is derived from the values of their homeland and not from those of their Malay and other Chinese neighbours in this country. Since they are treated as aliens from the beginning and little deliberate attempt is made to understand them, they react as one would expect. But their children born in the British colony of Wellesley Province, after returning to China, find that, although they are Chinese in outlook, their interests and friends are in Malaya. As they acquire more authority in their home, displacing their parents from control, the way they organise their affairs and spend their money change considerably. But their beliefs change much more slowly and in this village in north Malaya, their change of attitude towards the organisation of the family and the sort of things they want to buy has gone ahead of the changes in their religious beliefs.

Commercial Agencies and Village Development

Evelyn Wood

THE capacity of Extension Services to change the village world is very great. This has been amply demonstrated in India since 1952. But rural development requires more than change. The capacity of Extension to carry all the services which village people in India will require is not yet proven. Most important of all, can the National Extension Services be organised to cater for the free choice of individual villagers as consumers?

If it be good for a farmer to change to using a steel, mouldboard plough, is it not better for him to choose just what make of that plough he will use? Are village women to buy whatever soap they can get, or should they not have the stimulus of an added interest in the domestic affairs which is afforded by a free choice of the brand?

EXTENSION SERVICES ARE NOT ENOUGH

Up to ten years ago, not every educated person would have heard of Extension. In Great Britain, the word would have called up visions of night-classes, mostly attended by earnest working-class people in the cities. The tree of education first grew its great branches under the name "Extension" in the United States; and so the idea of a teaching and information service for farmers and their families may have been well enough known there as Extension Service.

But Extension as an arm of development for rural people in Asia and Africa is a concept of recent growth. In fact, the service has only been systematically organized on a large scale in India since 1951. At first, Extension in Africa and Asia was a field of work mostly cultivated by missionaries. Where rural hospitals or agricultural colleges were set up as part of the secular work of a Mission, their scientific teaching tended to spread outwards into the countryside.

The YMCA had one of the first Extension services in India, at the south end of the Malabar Coast. The Allahabad Agricultural Institute was famous, by the thirties, as a school which produced distinguished Indian farmers with a scientific bias, and a mission for teaching by Extension all over their own country, and also in Africa.

The Rockefeller Foundation was an early promoter of Extension, par-

ticularly in the fields of Medicine and Public Health. Rockefeller doctors began experiments in rural development in India long before the 1939 war. China of the period between the two wars was a field cultivated by Rockefeller farmers.

It was, however, only after the 1939 war that Extension moved into Africa and Asia in a big way. It arrived at first through the promotion of far sighted individuals like Sir John Boyd Orr, in the international field; and Albert Mayer in India. The United Nations and its Specialized Agencies were the next to take up this technique of rural development, under the general banner of Technical Assistance. FAO treated the technique as Agricultural Extension; UNESCO as Fundamental Education; WHO in its drives against malaria and tuberculosis.

Almost simultaneously, the United States Government entered the field of export Extension, with a generous and visionary programme for Asia in particular. The Ford Foundation was the greatest example of non-official aid in creating Extension Services within Eastern countries. By and large, India came under the American pattern of rural development through Extension. There are now signs that the European countries may contribute more towards future growth.

There is probably a greater variety of Extension schemes in Africa, both within the colonial pattern which lingers on the West coast and in the equatorial centre; but there is also Extension of the newer, national pattern in Egypt. Israel and the Islamic countries of the Levant have also taken up Extension. As regards Asia, from which we must exclude Russia and China for lack of detailed knowledge about what happens in those great countries, there seems to be by far the biggest network of growing Extension Services in India. This is a product of Planning; and it is part of a very broad Government policy which is intended to lead to a socialist Welfare State. It is very encouraging that international specialists who have studied rural development in other countries to which Extension is new all give India the top place for earnestness of endeavour.

Today, probably everyone has a general idea about Extension; but here is a rough definition, which

may clear some of the clouds about the word. Extension is out-of-school education of a special kind. In rural areas, it is directed towards enabling people to improve their lives in every way; to make use of all available knowledge, including modern scientific discoveries; to cultivate better skills; and to re-establish patterns of free choice, instead of living by habit and custom. Extension is mainly, but not entirely, directed towards adults. It works on and for the illiterate as well as for the literate. It forms a two-way channel of communication between rural people and universities or other institutions where exact knowledge is being cultivated. Extension is the new link which has now been forged between the disparate interests and the complementary resources of village people and townspeople.

SUPPLIES AND SERVICES FOR RURAL AREAS

There is probably a snag in the rapid stream of expansion of official Extension Service in India. When such service began in 1952, as the Community Development Projects, the officials in charge of the three-hundred village units were reluctant to regard commercial people as constructive parts of an Indian rural community. Trade, industry, and even professional services working on a profit-margin were regarded as undesirable elements in the new pattern of rural development. This attitude has now somewhat relaxed; but the recent political pronouncements of the Indian National Congress about socialism might mean that it will be increasingly Government policy to squeeze out commercial or private professional people from developing rural areas.

This seems to me a critical point. Everyone will view the possibilities of Welfare Statism differently, and therefore any value-judgment must be personal; but it is surely critical whether or not all the supplies and services needed by a developing rural people can be furnished by Government organizations.

As an old and staunch socialist, I consider that such a belief is self-delusion, of the kind that will lead the believer blindly into totalitarianism. I am also aware that totalitarianism has utterly failed to solve rural problems, and that by the official admission of the USSR, which has had the greatest opportunity for

Mining Equipment

Branches at: NEW DELHI BOMBAY KANPUR

forming rural development by these means. Apart from any personal revulsion against Stalinism, its aim of rural development exclusively through organs of the State has missed its target. It therefore seems wasteful to repeat the same aim in India.

It seems doubly wasteful to exclude commercial supplies and services from planning rural development in India, since the vision of Gandhiji regarded the village-centred renaissance of this country as a practical possibility partly through the commercial abilities at the disposal of rural people. After all, Gandhiji was himself a member of a commercial caste; he was also educated as a professional, in order to earn his own living from the profit-motive.

The whole situation seems to be summarizable in a very simple formula. There are services which the State can best render, and these include the production, even distribution of some articles. A socialist would allocate more services and more articles for manufacture and distribution to the public sector of economic activity. Most people would agree that postal services are best State-run; only a socialist, perhaps, would agree that it is better to produce and distribute steel through State organizations. Few people who have had practical experience of handling major commodities such as foodgrains can see the State as an efficient organization for collection, grading, warehousing and marketing.

The formula is therefore one with variable terms, but the number and order of the terms must always be the same. The formula will allocate the different fields of activity partly to the private sector, working on a profit-margin, and partly to the public sector, working without risk on funds supplied by the taxpayer. Probably the respective allocations cannot be the same all over a huge, varied country like India, and this is where the variables enter the formula.

I come back, then, to a reassertion of my personal opinion that the single point on which all this excusatory turns is a critical one. Decisions of this kind must be taken, consciously and actively, all the time while rural development continues: which services and supplies are the responsibility of commercial agencies, and which are those of the State? Both commercial and official agencies need time, whether it be to organize or to discontinue a particular activity. Neither form of organization can be switched from its agreed fields of operation at a few

days' notice. There must therefore be constant, harmonious, agreed collaboration between the officials running the State services and supply-lines and their commercial counterparts. Writing off for the time being the pronouncements of major political parties about socialism as something rather Olympian and remote from the immediate world of practical action, it does now appear as if the officials who run Extension services in India are willing to work with commercial people.

COMMERCIAL EXPANSION CAN SERVE EXTENSION

There is no dearth of practical examples of what can be done to serve rural development by people working on a profit-margin. Two contrasting instances in my professional experience will indicate possible lines of commercial expansion.

New Service by Villagers. In the area developed by the Extension Project of the Allahabad Agricultural Institute since 1952, District veterinary service is available from stockmen maintained by the Uttar Pradesh Government. Every year, there is an outbreak of haemorrhagic septicaemia among the cattle of the area, at the onset of the Rains. Extension teaching raised the demand from village cattle-owners for prophylactic inoculation far beyond the capacity of the official veterinary services to satisfy it.

In consequence, the Extension Project, with the agreement of the officials concerned, trained and organized villagers as inoculators against this disease. Government supplied free vaccine; the Extension Project furnished syringes and needles, for which the village servicemen are paying in instalments. A small fee per head of cattle inoculated was agreed by farmers, servicemen, and the panchayats; it varied from village to village. In the first year of this development, 15 villagers trained as servicemen inoculated over 10,000 head of cattle from 400 villages.

New Service from Manufacturers. A medicine which is considered by the medical profession to be safe enough for villagers to take without a doctor's supervision has been promoted throughout North India by the methods of Extension teaching. The difference in such operations is that the Extension workers are not residents of the rural areas, but are recurrent travellers through the same areas where the resident Extension services are established. The commercial, travelling Extension workers also cover rural areas where no Ex-

tension services have yet been established.

The results of this promotion are such that the manufacturers are continuing with it. Evidently there is a market for patient, unsensational promotion of consumer goods in rural India.

The former experience with village-inoculators shows that it would be far simpler if the supplier of the vaccine were a commercial distributor, instead of a Government Department. The latter experience shows that when Extension service-personnel who are all Government officials do agree to collaborate with commercial travellers similarly engaged in educational work, the results from village-consumers are much greater.

By quite offhand listing, the same arguments would apply to the distribution of the following products:

- Fertilizers
- Agricultural Implements
- Veterinary Supplies
- Insecticides and Pesticides
- Certified Seed
- Other Proprietary Medicines (restricted to those which medical men will pass as reasonably safe for self-medication by village people).
- Oil and Other Fuel or Illuminant
- Cement
- Water-Lifting Devices.

In the case of some of these articles, technological service-after-sale would be required of the distributor, in addition to the technical aid which is now available to villagers through the Extension Service. Tractors and their implements of course require more service, which might have to guarantee repairs and maintenance of the machinery until enough villagers of the second generation could come up as trained mechanics, able to earn fees for their services from the farmers. Conversely, soap would require no service after sale to the retailer. In between, degrees of service must be considered according to the region and the capacity of the official Extension Service. Each article for distribution must be considered separately, finally with particular regard to the ability of the villager of that region to make the best use of the article.

The above list is by no means exhaustive, even within the subdivisions possible under its broad headings. Extension is already promoting a demand for all the above articles. It does not look as if Government's

distributing mechanisms can make adequate and timely supplies to satisfy that present demand. This situation presents manufacturers with an opportunity which should last for at least two generations, or say 40 years.

WAYS AND MEANS

Any manufacturer who contemplates this situation will immediately see that a considerable long-term investment is required to operate a rural campaign. The expense may rank as sales-promotion costs; but it will rarely be acceptable for the first year or so as a charge against the normal margin on specific annual

turnover. Depending on the particular article, it would be wise to regard the cost of such a rural campaign as an item of capital investment, much on the same footing as the cost of building or equipping a factory.

It will be necessary to balance the investment required against the eventual profits expected from it, in view of the possibility of further socialization of trading by future Governments in India. In this sense only, there is an element of speculation in such an investment. Fortunately, there is no need to launch an expensive all India campaign from the start. It is now possible to

THE ECONOMIC WEEKLY

experiment with a given article in a restricted sample of rural areas served by official Extension, anywhere in India. Suitable controls of other sample areas can be established to give a measure of the effects of such an experiment. The detailed knowledge which is now available within most Extension blocks is enough to enable a sound socio-economic comparison to be made. This experimental procedure of course depends on the collaboration of official Extension services, which is easy enough to secure if the proposals for the pilot rural campaign are shown to contribute to public good as well as to private profit.

THE ECONOMIC WEEKLY

With timely co-operation between tea planters, traders, exporters, shipping and insurance agents and the Government, some of the heavy losses incurred by Indian traders and exporters could have been avoided. Even then, London tea auction prices would have fallen. There were successive increases in export quotas in the last season. Exports were higher. Production was also higher. Today, the seller's market has ended. As the buyer's market develops next season, tea prices will fall further.

Tea—Prince or Pauper

It is clear that there is not much scope for expansion in the world demand for tea. Last season's heavy world demand was mainly due to replenishment purchases of tea by Britain. This influence will no longer be felt in the coming season. Meanwhile, rising tea prices have stimulated output. If production expands while demand is falling, the inevitable consequence is a fall in prices. It is interesting to note that some prominent tea exporting and broking firms in Calcutta are suggesting that the northern Indian tea planters should adhere more strictly to the scheme for voluntary restriction of output.

Tea shares are slumping. They may fall further. Experience in the last few years suggests that tea is a prince or a pauper industry. That the last year's boom in tea prices would not last, was not unknown. Why, then, was such a cornering craze some months ago? Those cornerers who bought Tea shares to acquire controlling interests must now be repenting. Non-Indian tea planters have managed to sell out or to liquidate their interests at higher prices. Many tea gardens are still on auction. But, today, there are no buyers of tea gardens. This is not the first time that some unimaginative and ill-informed Indian capitalists have been coaxed to purchase interests in some industries at inflated prices.

Jute Industry's Problems

This week's fall in equities on the Calcutta Stock Exchange is due partly to the heavy drop in raw jute and jute goods in the last few days. Many stock exchange operators here deal in raw jute and jute goods in the unorganised futures markets. They have suffered losses because of the sharp set-back in the prices of raw jute and of jute goods in the last few days. This is a technical market factor which cannot be ignored, but whose importance should not be emphasised.

This is the time of the year when raw jute prices are influenced by weather and crop reports. Weather and crop reports continue to be favourable. As the time for the movement of the new crop approaches, speculators find it difficult to dictate terms to the market. Stocks of raw jute with the mills are not inadequate. And mills have not been unsuccessful in outmanoeuvring the manipulations of the speculators in *falka*. With more regular supplies in terminal markets, raw jute prices have now developed a sagging tendency.

To some extent, the falling trend in raw jute is a reflection of the set-back in jute goods. April data of production and mill stocks are not

yet available. But it is expected that both will show increases over the month. As the market found that foreign buyers were not interested in purchasing Indian jute goods at the recent high levels, jute goods started falling. Declining raw jute prices contributed partly to the set-back in jute goods. In the latter half of the week, the falling trend in jute goods seemed to have been halted on rumours that the industry may revert to shorter working hours. Such a policy may suit the industry, but it may provoke labour trouble. Perhaps, the slightly steadier trend in jute goods at the time of this writing is due to reports of some foreign orders. But it is of interest to note that the steadier trend in jute goods has checked the fall in raw jute.

Around Calcutta Markets

Drop in Equities

Thursday, Evening

FLUCTUATIONS in equities on the Calcutta Stock Exchange continue to reflect developments in Indian Iron and in Tea shares. Fall in raw jute and jute goods is aggravating the set-back in equities. Provisions of the Company Law (Amendment) Bill, as it has emerged out of the Select Committee, relating to managing agency system have accentuated the "bearish" trend in stock markets. Though equities are falling, the technical position remains weak as "bears" do not seem to be active. Drop in equities is not due to the activities of "bears".

Equities are falling mainly because of liquidation by weak holders. As investors found that the post-budget spurt in shares lacked confidence, they began to sell. This is only to be expected. But it is intriguing that professional "bears" have taken no active part in initiating or in aggravating the recent set-back in equities. Thus it comes about that, though equities are dropping, the outlook does not seem to be as depressing as the fall in share values would seem to indicate.

This week's fall in shares is not directly due to the Company Law (Amendment) Bill's provisions relating to managing agents. But the Bill's provisions are fresh reminders to investors of the Government's attitude to private initiative. This, indeed, is the basic underlying factor responsible for the investors' retreat from the stock markets. Because investors are not sure about the shape of things to come, they are

liquidating their holdings. That is why equities are falling.

Indian Iron Drops Sharply

Set-back in Indian Iron is due partly to some peculiar factors. It started as a prominent speculator began unloading as his efforts to rig the market up did not succeed. But, despite the sharp drop, there is neither replacement buying nor fresh support by investors. Indian Iron dropped further for two successive days after the publication of the Company Law (Amendment) Bill. Yet, the market opinion is almost unanimous that the sharp set-back in Indian Iron in the last two days has no relation to the Bill's provisions relating to the managing agency system.

Drop in Indian Iron in the last few days is partly due to the delay in the Government announcement about steel retention prices for this company. Pending the recommendation of the Tariff Commission, higher retention prices for Tatas have been declared. It is assumed that the provisional retention prices for Indian Iron would also be higher. But as long as the extent of the increase is not definitely known, replacement buying is not likely to make its influence felt. There has been some "short" selling in Indian Iron in recent days. Some "bear" covering is not unlikely as the retention price is announced.

When equities continue to fall, the operators never lack reasons to explain, if not to justify, the market trend. Delay in the announcement of retention prices should not have caused

any worry to holders of Indian Iron, particularly after the announced increase in retention prices for Tatas. That Indian Iron will also have the benefit of higher retention prices, is not denied. But it is argued that, according to the Government's directive, neither Indian Iron nor Tatas may be allowed to raise dividend payments even though higher retention prices should result in increased earnings and profits.

Tea Shares Slump

For the continued drop in Tea shares, the reasons are not far to seek. Tea shares and the industry will be vitally affected by the managing agency clauses of the Company Bill. This week's fall in Tea shares has been aggravated by this influence. But even as regards Tea shares, the slump is not due as much to the Government's bias against the managing agency system as to wider developments relating to the industry. While Tea shares are falling, it is necessary to discuss certain developing events.

Even as the boom in tea auction prices some months ago was due to the London dock strike, the recent fall in London tea auction prices would seem to be partly a belated sequence to that strike. Because of the dock strike, Mincing Lane was starved of supplies for some weeks. London tea auction prices soared. As the dock strike ended, Indian exporters issued orders to their agents to dispose of accumulating stocks. As supplies increased, and as exporters were eager to auction supplies at any price, London tea auction prices fell.

Volume VII—No 20

The Great Endeavour

WAS a new Congress born at the recent Avadi session phoenix-like from the ashes of its old body? It was only five months ago that the organisation met at Avadi and resolved to establish a "socialistic pattern" of society. At Avadi the Congress also drew up a fresh economic policy. The trend of legislation in these few months shows a conscious and deliberate attempt to implement these resolutions. It is not the speed with which the Government, which is charged with the responsibility of carrying out these resolutions, has acted that is so notable as the change in the atmosphere that has been brought about in the past few months. Is it that Pandit Nehru has succeeded in transmitting to this slow-moving, heterogeneous and faction-ridden political organisation his own sense of urgency or is it the other way about? Is it Panditji who has caught the new stir of life which is in the country and which has also penetrated into the Congress and has been acting as leaven within its ranks?

More than the resolution on the economic policy and the adoption of the draft plan frame for the second five-year plan, it is the attempt of this old political organisation to slough off its dead skin and take on a new life that is the most remarkable and significant feature of the latest session of the AICC. For the first time in many years, Acharya Vinoba Bhave attended a session of the AICC. His presence was symbolic of the gathering in of the constructive workers. "The purity and strengthening of the organisation", one of the resolutions passed at the session reads, "are not to be viewed in the light of the interest of the organisation alone, but of preparing the people for shouldering mass scale programmes of village industries, basic education, local works and utilisation of man-power resources to the fullest extent." "Only sustained and continuous efforts in these directions", the resolution concludes, "can enable us to reach the goal of a socialistic pattern of society and to eliminate unemployment within a reasonable time".

The AICC recorded its appreciation of the steps taken by the Government of India for the progressive adoption of measures for establishing a welfare state and a socialistic economy. It put its seal of approval on the fourth amendment of the Constitution, it welcomed the establishment of the State Bank and blessed the social reform legislation that has been passed by Parliament.

The call on constructive workers to join in the great adventure of building up socialism is not to plough a lonely furrow as they have been doing so long, but to enlist their services actively and wholeheartedly in the implementation of the Second Five-Year Plan.

"The AICC trusts that the Pradesh and the subordinate Congress committees will render all assistance possible to the zonal organisers and will themselves, in consultation with the zonal organisers, devise ways and means to create the necessary atmosphere and take steps that would lead to the implementation of the Congress programme of constructive work without any delay whatsoever."

It is in the context of the economic policy resolution and the adoption of the plan frame, provisional though it be, and the formal association of the constructive programme with both—it can mean nothing else than amalgamation—that the presence of Acharya Vinoba Bhave at this session becomes meaningful. Fuller employment, a progressive rise in the standard of living, equality of opportunity, establishment of heavy industry and development of small scale, village and hand industries on a scale never contemplated before—to take up all these in its stride, the Congress needs the country behind it. But the country means the people, and is it not idle to claim or to expect that not this section or that, but the whole people can be behind this or that plan, or for the matter of that, that they are behind the Congress or Pandit Nehru?

It was difficult to be persuaded even then, though a plausible

enough case could be made out for it, that the Congress resolution for a socialistic pattern of society was just an election dodge to forestall opposition against it in Andhra. Commenting on Avadi, it had been remarked in these columns:

"It would be wrong to assume that no change in policy is contemplated by Congress. . . . There is ample evidence that Congress has, under the compulsion of wider political and economic influences, come to a decision that it is necessary to ensure social control of the major means of production. Speculators and gamblers are free to take comfort from Panditji's sausive diplomacy. But those who are aware of the fundamental politico-economic trends may not be wrong in their assumption that acceptance by Congress of a policy more revolutionary than that of a co-operative Commonwealth is inevitable."

What then appeared faint and inchoate has now become clear and

more defined. Not that there are no shadows. The next election—never far in the mind of the politicians—casts its shadow far ahead. Hence the talk of cleansing the organisation and disciplinary action against group formations within the Congress. There is the ugly spectre of linguistic dissensions. But there is also the wider horizon. India no longer stands alone. With the other countries of Asia and Africa, she faces the same task of carrying out a social transformation and brings into it a wealth of experience derived from her own struggles in the past and her traditional technique, perfected through the ages, of effecting social change through acceptance of differences and by non-violent means. To her rich inheritance has been added the fruits of modern knowledge and science. With reason unclouded by ignoble self-seeking, aims unsullied by mean ends, the people are prepared for this great endeavour.

Four Power Talks

CYNICS will be excused in their suspicion that the Western Powers have reluctantly honoured their post-dated cheque. Since the cold war, Russia had always had the diplomatic initiative in proposing four-Power talks to resolve outstanding world issues. These proposals had been repeatedly rejected by the Western Powers. President Eisenhower had always insisted that the Communists must prove, not by words but by deeds, that they desired peace. In their action in Korea, they showed that they were willing to negotiate. At Geneva, they gave unmistakable evidence of their peaceful intentions. Russia repeated her proposal for talks "at the summit". It was turned down by the Western Powers on the argument that no purpose would be served in having four-Power talks before ratification of the Paris and Bonn Agreements. This rejection was accompanied by a promise that they would be ready to consider the proposal for four-Power talks after ratification of the Agreements. These Agreements have been ratified. Western Germany is now a NATO Power as a sovereign State. Some of America's NATO partners thought it prudent to remind her of their joint promise to Russia. With utmost reluctance, America has agreed to join Britain and France in proposing four-Power talks "at the highest level" to Russia.

On the eve of a general election

in Britain, Sir Anthony Eden and his Foreign Minister took the initiative in proposing talks with Russia "at the summit". France responded promptly to Sir Anthony's gesture. America was hesitant. It was only when Washington realised that America's attitude might unduly strain her relations with her allies that she joined Britain and France in proposing four-Power talks "at the summit" to Russia. Cynics will be excused in drawing the inference that Washington has endorsed the Anglo-French move for four-Power talks not because it has any faith in the outcome of such discussions, but because America's acceptance of such a move might help Sir Anthony and his Conservative Party to return to power in Britain. They will recall that Sir Winston Churchill won the last general elections for him and his Party by his dramatic appeal to the people to give him an opportunity to ensure world peace. He promised the British electorate that if he and his Party were voted to power, he would call for four-Power talks "at the summit" to discuss outstanding world issues. Sir Winston could not honour his electoral pledge mainly because of President Eisenhower's obstinate refusal to participate in discussions among Heads of States. Sir Anthony can now face the electorate with a clean conscience. He has succeeded where his illustrious predecessor had failed.

It would be unwise to over-empha-

sise such considerations of national party politics as motivating influences behind the Western Powers' invitation to Russia to join four-Power talks "at the highest level". Deeper influences have prompted the Western Powers to propose four-Power talks at this stage. Through ratification of the Paris and Bonn Agreements, one of their conditions to join in four-Power talks "at the summit" has been fulfilled. Russia's willingness to sign the Austrian Peace Treaty has left Washington with no excuse to delay four-Power talks "at the highest level". While the Western Powers were busy in implementing the Paris and Bonn Agreements, Moscow had stolen a diplomatic march over them. More than Russia's eagerness to sign the Austrian Peace Treaty, Austria's acceptance of the Russian proposal for neutralisation of Austria has upset the Western Powers' plans for Europe. Through this diplomatic triumph, Russia has almost succeeded in neutralising the Western Powers' policy of political and military integration of Western Germany with Western Europe even before the actual implementation of that policy. In Bonn, there are growing doubts whether the price that Western Germany is paying to regain partial sovereignty and to rebuild the German army is not too high. It was widely expected that Russia would offer Germany the same terms as Moscow had offered

to Vienna for a solution of the German problem. Even the Adenauer Government, and certainly the Germans in Western Germany, would find the anticipated Russian offer of a united, sovereign, neutral Germany too tempting to refuse. Such a possibility made a gesture by the Western Powers inevitable. It is as well that they have taken the initiative to invite Russia to four-Power talks "at the summit". That Germany will be the major European problem under discussion at the proposed four-Power Conference, is a foregone conclusion.

Even those who are suspicious of Russia's peaceful intentions will concede Moscow's diplomatic wisdom in relenting in its attitude to Austria. After the plans for neutralisation of Austria are implemented as a sequel to the conclusion of the Peace Treaty, the occupying Powers, including Russia, will have to withdraw their forces from Austria. It will be admitted that Russia has been eager to sign the Austrian Peace Treaty so that Western Germany will realise what she is losing by joining the Western European alliance. There can be no easing of world tension without an agreement on Germany. There can be no solution of the German problem without unification of the two Germans. Russia's policy to Austria indicates that Moscow may suggest neutralisation of a united, sovereign Germany as a solution to the German problem. Irrespective of the problem of neutralisation, it is evident that there can be no agreed solution of the German problem with Western Germany as a NATO Power. It is clear that Russia will be prepared to make concessions to Germany if only to neutralise NATO and the Paris and Bonn Agreements. Any agreed solution of the German problem will mean evacuation of NATO forces from Western Germany as well as withdrawal of Russian forces from Eastern Germany. To neutralise the effects of the Paris and Bonn Agreements, Russia is prepared to accept these consequences. In the meanwhile, Russia is taking actions to counter NATO. At Warsaw, Russia and the Communist States of Eastern Europe are now assembled to create a counter-NATO in retaliation of Western Germany's military integration with Western Europe.

It is not quite clear whether the Western Powers' invitation to Russia

to participate in four-Power talks "at the highest level" is confined to European problems or to the major issues responsible for the continued tension between the two rival power blocs. With an East-West agreement on Austria, Germany is the only unsolved problem in Europe. Without an agreement on Germany, neither European nor world peace can be secured. But even after an agreed solution of the German problem, there will be many world issues which will remain in dispute. There are many issues in dispute in Asia and the Far East. Both European and Asian issues in dispute will, no doubt, be discussed in detail by the Foreign Ministers or their Deputies

after the Conference of the Heads of States. It is right and proper that this Conference should have no fixed or rigid agenda, and that the talks between the Heads of States should be informal. Once the Western Powers and the Communist States reach an understanding on the principle of peaceful co-existence, it will not be difficult to reach agreements on specific issues and problems. It would be idle to pretend that it will be easy for the Heads of States to agree to disagree. But hope lingers that the devastating consequences of an atomic war will compel the two rival power blocs to accept the wisdom of reaching an agreement on peaceful co-existence.

FAMOUS *throughout* **INDIA**

The Fort, Delhi.

"Built to withstand the passage of time, the shocks of violence and extremes of the Indian climate."

Yes, those words describe a fortress—or a 'West End' watch. Their durability and accurate performance have made 'West End' watches famous in India for more than 80 years.

Styles and prices vary, but value-for-money is assured. Look for the name 'West End Watch Co.' on the dial before buying.

JS Aid and Pakistan Economy

is why, indeed, the editorial staff of "The Economic Weekly"

of their own accord—and very rightly, too—called my letter: "German Recovery and the German Worker." The points made regarding other aspects were frankly asides; and were meant to be treated as such—though I do not think this absolves me of certain loose designations for which your London correspondent has rightly taken me to task.

I note that he does not now maintain the position in the strict form regarding the alleged deterioration of the German working population that he took before. But to be honest, even his present treatment leaves many things to be desired, especially from the purely statistical point of view. But I shall leave this as it stands, lest both of us start disputing on statistical methods, and thus sail in uncharted seas.

Finally may I repeat that apart from certain subjective opinions which were very strongly put, particularly at the end of his article, I thought—and still think what I have said—that it was an admirable study by your correspondent. I have had it read by several others and this has been the common judgment. I hope, therefore, that he welcomes my criticism in a sporting and scholarly spirit.

Mandarins and Ministers

WITH reference to his protest in the issue of April 16, against the note on 'Malodorous Indecorum' though the Delhiman deserves credit for the sweet reasonableness with which he stated Dr Keskar's case, it is with deep regret that your correspondent has to record that he is unable to see that spirit of reasonableness in Dr Keskar's speech in question. The undersigned has a well-marked and well-thumbed copy of the PIB hand-out reproducing the full text of the speech which runs to 34 foolscap typed sheets. Almost the whole of it is couched in the same style—14 pages relate to personnel and breathe the same spirit of fury directed against the Director-General of the AIR, whom your correspondent does not have the pleasure of knowing at all. Ten of these pages—not one sentence, as the Delhiman thinks—are about the Director-General; and there are repeated threats held out to him to get out.

On a matter like this where public interest is concerned, it is not proper or honest to mince words.

Only brief extracts from the long passages quoted by your Correspondent from Dr Keskar's speech were published in your note. We would request Delhiman to reflect on the effect on the discipline and efficiency of the staff of the AIR, when the Minister calls the Director-General 'a mandarin'. Since Delhiman has obviously written on behalf of Dr

Keskar, we take it that he reflects his considered judgment about the whole sad affair and we are happy about it.

NEW INDIA STORIES FROM LIFE 1

'My good turn helped me most'

MY FRIEND'S son came to sell me insurance. My business was doing well, and I thought I did not need any. But the boy was so young and enthusiastic, that just to encourage him and please his father, I agreed to take out a policy.

Some years later, business slackened and everything I touched seemed to fail. My business took some hard knocks; and my partner got too ill to share my problems. I had to reorganise, but where was the necessary capital to come from? The only solution was to sell our house—and it was my wife's pride and joy.

Then my young friend dropped in to remind me that my New India Endowment Assurance policy would mature shortly. What a wonderful relief! I would get the money I sorely needed at exactly the right time.

I thought I had
obliged a friend—
actually he had
helped me!

An insurance policy, taken
out now, may one day stand between
you and disaster. For full

Our Delhi Letter

THE week in Delhi began rather badly with an impending threat of a Fourth Afghan war. The news of general mobilisation in Afghanistan was received with consternation; for people have never heard of general mobilisation so near as Kabul. It sounded like an echo of the World War, and there were people here, who believed that recent developments in Pak-Afghan relations might well mean the beginning of a third world war, since Pakistan had USA to back her and Afghanistan had declared her readiness to seek Soviet aid, in case Pakistan applied economic sanctions to that land-locked country. There was, however, general relief that the Khyber was no longer the responsibility of the Government of India and *Dawn's* 'Police Action' would have to be paid for by the unfortunate people of Pakistan. Iskandar Mirza's threat of teaching Afghanistan a lesson for life has created a rather bad impression in diplomatic circles here, as elsewhere, for the feeling is that Pakistan has given away what was possibly a good case in international law. Official circles discount the possibility of armed conflict, for it would be sheer madness for Pakistan to attack Afghanistan, when she has antagonised both her powerful neighbours—India and the Soviet Union—through the acceptance of American military aid. It is further believed that the USA itself is exercising a moderating influence on Pakistan, for any further aggravation might throw Afghanistan completely into the arms of the Soviet Union; and the latter would only be too anxious to blow up Pakistan at the very formative stages of the SEATO. But people can be sometimes mad—otherwise wars would never break out. That Pakistan can be mad is evidenced by the Nekowal incident, in which a party of workers at our mechanized farm, cultivated under military guard, was fired upon last Saturday, killing 12 Indians, including Major Badhwar. India has protested, but what is the use of protest?

The *Dawn* has threatened to teach the Royal Family of Afghanistan a lesson in international law, adding that that family never had a reputation for keeping international obligations. Pakistan never bothers

to inquire into her own record during the last eight years of her existence. As it is, our workers and our jawans are every day of their lives exposed to mortal danger; and there is great feeling in the city, as also in the country, over the matter, of which Pakistan ought to be aware. Delhi is neither Kabul nor Peshawar and Pandit Nehru is not a politician in the Middle East. If war breaks out, its origins will lie in the gross miscalculations of the powers that be in Pakistan. Those whom the gods wish to destroy, they first turn mad. It is rather strange but highly reassuring that in spite of all these, there is great sympathy for the exploited and misguided people of Pakistan.

Amidst these alarums and excursions, we had our meeting of the National Development Council in the security-bound precincts of the South Block. Pandit Nehru feels that he can safely rely on Shri Deshmukh for raising the tempo of economic development from a 3 per cent annual rate of increase in the national income in the First Five-Year Plan to 5 per cent in the Second. He referred to employment, but the phrasing was rather awkward and weak—"We have done well but remember that although we have done well in the last few years, the pace has not been fast enough to catch up with this", meaning thereby the rate of increase of unemployment. Deshmukh followed with the assurance of an annual increase of 5 per cent in national income and 10 to 12 million new jobs! Prof Mahalanobis told the Council that it should be possible for the country to attain the targets laid down in his Plan-frame. Prof Gadgil stated the case modestly that considering the rate of development in other countries, a 5 per cent annual increase in national income did not look like an impossible target.

On the whole, however, the politicians appeared braver than the economists. With the exception of Dr B C Roy of Bengal, to whom I shall return presently, all the other Chief Ministers supported the targets of the Plan-frame. Regionally it looked as though the South (Madras, Mysore and Travancore-Cochin) was for the maintenance of the Plan-frame targets; the west

(Bombay) was for a bolder plan; the north (Rajasthan, UP) was doubtful and the east (Bengal) hostile. Shri Subramaniam, the Planning Minister from Madras, argued strongly that the tempo should be maintained. "We cannot go in reverse gear at the present stage and we shall have to find the necessary resources". Shri Hanumanthayya (Mysore) was for widening of employment opportunities. On the whole, the representatives from the South gave an impression of being realistic and progressive, knowing full well the political consequences of low economic development in a crowded area, in large parts of which population has been increasing at the rate of 20 to 30 per cent in a decade! Of course, the people from the South know which side of their bread is buttered and their demands are based on the conviction that the Centre will foot the bill!

Morarji Desai appeared to be the

"He that leaveth nothing
to Chance will do few
things ill."

Lord Halifax.

soul of radicalism. Weather was a material factor. May is stuffy in Bombay but it was soft and cloudy, as Morarji entered the South Block, unheralded and unnoticed. With vehemence, he pleaded for a bolder plan: "... We would have to go much further than under the Five-Year Plan..." he said. Dr B C Roy (like Prof B R Shenoy among the economists) held that the strain of investment envisaged would be beyond the capacity of the economy. It would mean lop-sided development and would seriously injure the prospects of balanced growth. These arguments come strange from the Chief Minister of West Bengal, which has the most unfavourable land-man ratio, the expansion of which arouses fierce hostility from the surrounding states (eg Goalpara in Assam) and the only prospect of whose survival lies in a much larger industrial investment than is envisaged in the Plan-frame. Nobody, however, bothers about West Bengal's problems here and they are believed to be insoluble any way.

From the Development Council, the scene shifted quickly to the meeting of the AICC at Berhampur. Surprisingly the Congress appears to be re-entering a creative phase. Acharya Vinoba Bhave was present throughout the proceedings and pleaded for *Bhoodan*. Pandit Nehru amidst his old comrades seems to have regained form. In his usual style, he talked of "the high adventure of building up a New India and bringing prosperity to our vast population". The AICC resolved on the establishment of heavy and capital goods industries and a great development of small scale, village and household industries. After all, we have thus arrived at a correct pattern of economic development that broadly corresponds to what Gandhiji advocated in the later phase of his life. The targets, Shri Dhebar suggested to Congressmen, are realistic and are likely to gather mass support for the Congress Party.

In furtherance of the Avadi resolution, he desires the following to be done: (a) Elimination of unemployment within 10 years; (b) Introduction of basic education upto the secondary stage in 10 years; (c) Doubling the *per capita* income within 15 years; and (d) Creating equality of opportunities in all the spheres of the nation's social and economic life. Here, there is no confusion and no camouflage, no mystifying references to capital formation, no dilatoriness.

From the London End

The Last Sitting

THE Parliament of 1951-55 has now passed into history. A quick-look back however does not bring to mind anything in that Parliament which would allow it to occupy a significant place in British constitutional history. Some observers have taken the opportunity to describe the House of 1951-55 as the "Churchill Parliament". This is true but only in one sense. It was in that Parliament that Sir Winston decided to bring to an end his 50-year career as one of the most powerful and controversial of figures in British politics.

In 1951 when Mr Churchill (as he then was) took up the seals of the office of First Lord of the Treasury there were not a few who feared, remembering his "Gestapo" speeches of 1945, his belligerent outpourings on Indian independence and of course his Fulton Speech of 1946, that the greatest of war leaders would fail as a Prime Minister in peace time. He was suspected of being an arch-militarist and thus least equipped to foster international pacification in a dangerously divided world. And yet as the years of peace-time leadership rolled on, it turned out that it was he, and he alone among the leading Western statesmen, who worked for what has since been termed a meeting at the "summit". It was he who proclaimed that "the immense problem of reconciling the security of Russia with the freedom and security of the West is not insoluble". This proclamation is the precursor of the current diplomatic strivings for an early meeting of the Great Powers. This may be another important sense in which the House of 1951-55 was "Churchill's Parliament".

The Parliament now ended is the "Fortieth Parliament of the United Kingdom of Great Britain and Northern Ireland". It has in fact been dissolved though the ancient ceremony customary to the occasion maintains the fiction that Parliament is merely "prorogued". At the final stages of the ceremony, pursued on this occasion with complete decorum, the Lord Chancellor read the Queen's proclamation of prorogation: by virtue of Her Majesty's command under the Great Seal and in Her Majesty's name the prorogation of Parliament "to Tues-

day the 10th day of this instant May." By that date, as everybody knows, Parliament will have been dissolved and the country plunged into the election fray but, of course, "formalities do not heed such mundane things".

THE CAMPAIGN OPENS

As the *Economist* described it, "an election... is a singularly invisible operation". This characteristic is certainly not universal, it is British. The press and most of the politicians have been mildly cautious and so far it is only Mr Bevan who has been employing epithets that indicate that the two major parties are really fighting each other. Even here, the whole weight of press comment so far has been to castigate Mr Bevan for his "vermin", "gaderene swine" etc, speeches, though it is to be noted that Mr Butler, the Chancellor of the Exchequer, has replied that he prefers being "a swine in a happy herd" than an "isolated pig".

In the constituencies, however, things have begun to stir but one gets the impression that of the parties contesting, the Conservatives and the Communists are the best organised. The constituency Labour parties, at the best of times, are mere localised election machines. At the worst they exist only in name. But wherever they are alive, they are overwhelmingly Bevanite. The Labour Party has full-time election agents in about half of the 630 constituencies while the Conservatives boast that they have them everywhere. There is thus "greater smoothness of the hum in Conservative offices and a greater sense of flurry and improvisation in the Labour offices".

Officially, campaigning commences only when the writs for the election of new members to the House of Commons are issued. These have been issued simultaneously with the prorogation of Parliament. The Conservatives have commenced with an election broadcast by the Prime Minister to be followed by a nationwide speech-making tour. Mr Attlee follows suit. Emphasis by Labour is being placed on Lancashire and Mr Attlee is spending more time there than anywhere else. The cotton crisis can be exploited by the Labour Opposition but it is difficult to see what they will be able to do about it, if they are returned to power.

In spite of these plans for extensive campaigns, there is a feeling that the issues at state are ones on which both the major parties are in broad agreement. A trend of some significance is emerging in both the parties. In the Conservative Party, the more right-wing and reactionary elements have been effectively suppressed to the point that the Party as a whole believes to a certain extent in the welfare state—the responsibilities of the Government in providing social and economic amenities to the broad masses; and it is noteworthy that the Tories in the past five years have not dismantled the social framework brought into existence by Labour during their post-war years of office. The Labour Party, too, has gone a long way, in the name of unity, towards suppressing their extremist elements—the Bevanites have been steam-rolled into accepting the outlook of the National Executive and again in the name of unity, have officially dissolved themselves. The Labour Party's official policy accepts the Morrison thesis of the "mixed economy"—of a degree of public ownership married with a "virile" private sector. This broad agreement on political strategy between the two main parties has since been described as "Butskellism"—the agreement of both Mr Butler and Mr Gaitskell on basic economic policy. This trend in British politics is likely to be hidden in the day-to-day skirmishes of the campaign and, of course, the less said about it, the greater the air of realism imparted to the fight between the parties.

Damodar Valley — India's Ruhr

ONE recently had occasion to have a look at wolves in sheep's clothing. Bengal's pre-independence revolutionary workers met in a conference at the old office premises of the largest circulating Bengali daily. As one was listening to the President's address, one remembered that the Government of West Bengal had named the State bus in one of the routes recently taken over by it as Bagha Jatin—in memory of Jatin and his associates who fought a gruelling armed battle against the mighty British Raj in the interior of Balasore.

Bengal's pre-independence revolutionary workers had nothing of the wolfish look in them. Unlike the leopard, they have ostensibly changed their spots. They admitted that they no longer had faith in revolution. They, the revolutionaries, initiated the freedom movement. But Congress won freedom for the country. Congress succeeded because of its policy of evolution. Bengal's revolutionaries now believe in progress through evolution.

Of all the political parties in this country, they seem to prefer Congress. But they accept the Congress creed and Congress policies with certain mental reservations. They concede that co-existence, in its national and international projection, is a democratic principle. They endorse Avadi as a correct economic policy. But they have a feeling that the State in India is becoming a *Ma Bap Sarkar*. They are opposed to a paternal State because it conceals the seeds of a totalitarian State. They want more freedom and rights for the individual.

Bengal's individualistic revolutionaries are political refugees. They cannot fit themselves in the altered circumstances. They wear khaddar or handloom dhoties, but not the khaddar cap. They have been wooed by many political parties. They do not seem to like the Communists or PSP or Hindu Mahasabha, though all these parties have some members from among Bengal's pre-independence revolutionary workers. They have been in political wilderness since Mahatma's entry into Indian politics. They have no longer any political organisation of their own. But they have not lost their political individuality. This is surprising indeed, for they have nothing much to preach now.

As a group, Bengal's revolutionaries

are a spent force. But there are many revolutionaries who are highly respected in all the political circles in this State. They are not of Congress, but they still have some influence in the Congress organisation in this State. Most of them are disillusioned. Most of them feel and look frustrated. Some of them have become bitter. But, then, they cannot deny that Bengal and the Bengalis have always acknowledged their heroic and glorious sacrifice and service in the country's freedom movement.

Like Bengal's revolutionaries, West Bengal's politics is feud-ridden. But the people, the State, the politicians and Big Business are united in their geo-political demands. All are agreed that the Damodar Valley Basin should be converted into the Ruhr of India. This claim is made not only in the interest of West Bengal, but in the wider economic interest of the country as a whole. Hopes have revived in West Bengal that the Damodar Valley may yet become the Ruhr of India.

Experts are aware of the industrial potential of the Damodar Valley Basin. But its geological and mineral potentials are not widely known. Ninety per cent of India's coal raisings are from this Basin. Seventy-five per cent of India's known coal deposits are within the Damodar Valley. Nearby, are those groups of hills which contain the world's richest iron ore deposits. It is not only the fuel-metal base of India. Many rare and strategic minerals have been found in this Basin. As the mineral heart of India, this Basin has an over-riding claim to be the industrial nerve-centre of this country.

This is the geological background to the British Steel Mission's reported selection of Durgapur as the location for India's third steel plant. At the time when the Krupp-Demag Combine chose Rourkela in Orissa in preference to Durgapur in West Bengal as the site for the first steel plant, it was argued that New Delhi was unduly emphasising the problem of dispersal of industries. Probably, the reported selection of Bhilai in Madhya Pradesh as the site for the second steel plant by Russian experts has also been influenced by this question. But in arguing the claim for any of the possible locations within the Damodar Valley Basin, the experts are now echoing the remark, credited to Dr Stone, who was brought to India as Industrial Adviser to the

Prime Minister, that geology is not dispersed.

In the Damodar Valley Basin, there are three possible sites for the third steel plant—Sindri, Bermo and Durgapur. It is no longer a secret that the British Steel Mission is impressed with the claims of Durgapur as the site for the third steel plant. On considerations of cost, proximity to raw materials and easy marketability of the finished product, Durgapur's superior claims are accepted by industrial and geological experts.

Once it is conceded that Damodar Valley Basin is the natural location for an iron and steel plant, Durgapur's claims over Sindri and Bermo logically follow. Besides a possible steel plant, the West Bengal Government has projects for industrialising the Durgapur area. For over a year now, Calcutta and New Delhi have been quarrelling over these projects. When the West Bengal Government discovered that it could not go ahead with its Durgapur plans without the previous sanction of New Delhi, it asked the Union Government to investigate the problem on an expert level. There are reports that the Committee of Enquiry, appointed by the Union Government, has blessed the West Bengal Government's schemes for coke oven and thermal power plants at Durgapur.

Plans outlined by West Bengal's Chief Minister in his budget speech may be too ambitious. It is doubtful whether the West Bengal Government's Durgapur projects can solve the unemployment problem in this State. It is doubtful whether this State's unemployment problem will be solved even if Durgapur is finally selected as the site for the third steel plant. But there is equally no doubt that unless Durgapur becomes the Ruhr of India, the problem of unemployment in West Bengal will be nowhere nearer solution.

Durgapur alone cannot solve West Bengal's industrial and unemployment problems. But the rapid exploitation of the geological and industrial potentials of the Damodar Valley Basin is essential not only for the economic recovery of West Bengal or of the western regions of eastern India, but of the whole of India.

Why Only for the Layman?

Studies in Indian Economic Problems By Nabagopal Das. A. Mukherjee & Co Ltd, Calcutta. 1954. Pages 131. Price Rs 3.

Reviewed by P K Basu

IN reviewing this collection of articles by Dr Nabagopal Das, reproduced from various journals and newspapers, it seems to me that time has come when economists should take more than just a lively interest in the economic problems of the country. The divergence between economic theory and its application has always been great. Reasons are obvious. Not only, economists and policy-makers never co-operated, the policy-makers never even thought of getting help and advice from the theoreticians. But the gulf remains wide even to this day when expert opinion on any other subject is respected and recognised. Preoccupied with the theoretical problems of an advanced economy, the switching over to the real problems of an underdeveloped economy appears to be either too simple or outside the scope of a theoretical economist! Thus there is very little analysis in the mass output of economic writings in this country. And those who attempt to present a theoretical explanation fall in the trap, that being the usual habit of treating the problems of an underdeveloped economy as variations on the model of an advanced economy. The present collection, in spite of the valuable information it contains and the wide ground that it covers, for it practically covers all the problems of a closed economy, has little of economics in it. For example, Dr Das never poses the basic problems of a normative study in planning: Why do we need planning? What are the main criteria of economic progress? Production or distribution of wealth? If production be our goal, should we build up industries or agriculture? If industry, heavy or light industries, capital-intensive or labour-intensive methods of production? So on and so forth. True, whether economics can ever be a normative science or not, is a big question which remains to be answered. But unless we assume that welfare economics can at least set up a model of "efficient" allocation of resources, even if not "equitable", we have to abandon any approach to an applied economics, worth its name. In an economy like India, where resources are under-utilised,

the problem of allocation is of secondary importance. What we need, is utilisation of more and more of unused and under-employed resources. And the answer to economic problems of our country is well-known, that being industrialisation. And this has been adequately emphasised by Dr Das in his third essay 'The Challenge of the Unemployment Problem'.

There is a general criticism, which I think, can be levelled against these collected papers that none of the articles really take up the "demand" side of economic development and visualise the problems from that angle—where a long-term analysis would have been more interesting and useful. While the problems of the availability of mobile labour force, technical know-how, and capital requirements are well-known, we must also remember that given all these, economic development can still be impossible if there are bottlenecks in effective demand owing to maldistribution of income, and defects in the organisation of distributive trading. In a poor country where the bulk of the population live from hand to mouth, one would expect a higher propensity to consume and a larger multiplier effect of an unit of investment. Obviously, there are slips between the cup and the lip. And we can neglect the "demand" side of the picture only at our peril; and the problems of organising markets, localising and planning industries with a view to local or regional demand, where complementarity or tastes as well as processes of production must be viewed with equal importance; and the improved system of transport and communication and the spread of education—must be looked at from the same level of economic priority. It is in this context that we must evaluate our attempts towards the five-year plan *vis-a-vis* other similar plans in South-East Asian countries, specially those belonging to the Colombo Plan.

In particular, while I enjoyed going through the short, snappy and well-written articles and to my surprise, noted a wide field of arguments where we agree, I have how-

ever come across one or two points where a difference between the points of view of an academic economist and a civil servant becomes too obvious. On the question of rationalisation of industries, dilemma of conflicting ends, unemployment due to relative inefficiency and unemployment due to frictions in the process of rationalisation, has been adequately brought out. But one only wishes that perhaps Dr Das could analyse the possibilities of industrial combination in this country in the present structure of Indian industries; no doubt he will have something interesting to write on this subject, perhaps in the near future, with his present experience of a State industries and commerce ministry. Incidentally, his summing up of industrial development in West Bengal makes interesting reading. On the priority of cottage and small-scale industries, I could not agree with him more on the point, that small-scale industries as feeders to the network of heavy industries need an earlier recognition than the cottage industries; also the reason for the survival of small firms, as given in terms of varied type of demand and immobile labour between various pockets spread over the country, seems to be sound. But a policy which aims at giving employment to masses by reviving cottage industries with state aid, merely because they are more labour-intensive, errs on the side of being short-sighted. If a quick pace of industrialisation and a higher rate of growth of national income be the social ends of our economic policy, the development of industries with higher profit-component must get priority. Hence the case for heavy industries, the case for industrial combination and large-scale production. For in the absence of a developed capital market, the importance of undistributed profits, for reinvestment, must be considered in the interests of capital accumulation.

On two other occasions, I felt, that perhaps a further clarification and greater emphasis would have been welcome. Undue emphasis on capital requirements with practically no reference to an even more

acute problem, lack of entrepreneurial ability in the private sector, needs recognition. Once industrialisation gets a start, capital becomes much less a problem than co-ordinating ability and foresight. For saving is generated in the process of income creation. What's more, there is ample savings in the shape of unemployed and under-employed resources. But there is very little of industrial enterprise, as opposed to commercial and financial enterprise, of which there is no scarcity. There is no denying the fact that we have yet to build up an industrial class, which if it join hands with the already existing financier's class in business, can only make industrial revolution in India *fait accompli*. As Dr Das rightly pointed out, that in the absence of comparable institutions like the underwriting firms, investment, banks and issue houses of note, the Managing Agency System filled a very important gap—providing a bridge between shy capital and scarcity of entrepreneurship. The future of such a system is certainly worth investigating instead of abolishing it only because of the stigma attached to this system, or because it marked the beginning of foreign investment in India.

The chapter on Deficit Financing deserves comments. While the descriptive study of unbalanced budgets in various countries was most instructive, I was not sure whether Dr Das discussed the specific problems of inflation in India, which in the past was caused by the inelasticity of food supply operating adversely on the income-elasticity of demand for food. Perhaps we agree that so long as inflation does not become "speculative", purely "demand" inflation and to some extent "monetary" inflation can be a tonic to an otherwise static economy.

The review of the First Five-Year Plan in retrospect is good; and requires a separate set of comments. Although the comparison of actual results to desired targets has been unfortunate—the targets being so many millions of expenditure and results shown in the statistical figures in the index number of total production in particular industries, *eg*, cement, chemicals and engineering—there is little scope for a comparative estimate. But as Dr Das has rightly pointed out, the big question is not to draw up a balance sheet of our efforts to our targets, as to find out whether there is any fundamental and sound analysis

behind all this planning. Whether, what we have planned for, justly distributes the total expenditure between competing priorities. The author casually remarks: "We should analyse it in terms of social cost-accounting so as to bring out the real achievements of the plan". Perhaps he could have clarified the statement a little!

The theoretical framework of the first FYP, as Dr Das has remarked implicitly in his writings, is indeed a very 'rough' canvas on which the super-budget has been imposed. There is no industrial policy as such; private sector has been overlooked all through, although we are supposed to be planning for a 'mixed' economy. But I am tempted to remark that there is very little attempt in these essays to clarify the theoretical issues, responsible for the half-success of the plan and which will provide the basis for the next five-year plan. A detailed analysis in a thin volume of less than 150 pages, however, is perhaps asking for too much. His "panch shila" of economic progress can be summed up thus:

- (i) Physical planning;
- (ii) The second FYP should be conceived as an integral part of a plan of a longer range;
- (iii) To plan investments as to ensure greater employment and productivity as well as better utilisation of unused resources;
- (iv) The role of private enterprise recognised and maintenance of profit motive; and
- (v) Analysis in terms of investment, savings and capital formation.

Unfortunately, this sort of analysis is ineffective, for the layman is puzzled with a long list of platitudes, thrown on the wide level of generality. Our arguments should be specific and mutually exclusive. What we need is a "proper" distribution of investments as between (i) private and public sectors, (ii) heavy and light industries, and between (iii) investments with a long and a short period of gestation. 'Avoidable' compromises should be avoided; but that does not mean, that we ought to avoid compromise of any description. "Mixed" Economy is itself a compromise; and is desirable too.

On the problems of labour relations, productivity and occupational distribution of population, there are a number of very interesting articles in this collection. On the question of wages-structure and its effect

on the mobility and on the possibilities of working out a national wages policy, the author is silent. While it is obvious that "money illusion" does not operate in an economy with a recent experience of inflation, I wonder whether the present supply curve of labour (if such a thing can be conceived) is the inverse projection of the usual backward rising one. The arguments for prohibition emanate from the same set of premises. There is no denying the fact that efficiency of labour can be enhanced more by reaping the fruits of progress in terms of better housing, abolition of child labour, compulsory education and perhaps national insurance scheme of some sort than by giving them more in terms of purchasing power. Here too, as elsewhere, an industry-wise survey would be welcome.

Progress in Many Directions

By Our Correspondent

DURING the quinquennium 1949-53, though it passed through a difficult period, insurance business in India maintained its progress on all fronts. The table below of gross premium incomes of life and non-life insurance business, compiled from the official publications, shows that progress has been somewhat hesitant which is not to be wondered at in view of the unsettled financial and business conditions in the post-war period. A slight recession in business occurred in 1950 when the Insurance Act IV of 1938 was drastically amended. The business showed an upward trend in the following years and when the next issue of the Insurance Year Book comes out, it will show a substantial progress both in life and non-life insurance business made in 1954. Judged from the figures of new life business so far published by Indian insurers, the new sums assured in 1954 will reach a record figure of Rs 250 crores.

Taken all in all, the table reveals the heartening fact that Indian insurance business is gaining ground in the home market, slowly and steadily. The percentages of life, fire, marine and miscellaneous insurance premiums written by Indian insurers during the period under review are respectively 84.6, 56.8, 50.1 and 63.7. Since it is only recently that Indian insurers commenced underwriting hull, machinery and aircraft, it may be confidently expected that general insurance business of Indian insurers will continue to improve in the years to come.

Efficiency of Insurance Offices

Among the papers submitted, read and discussed at the symposium held last month in Madras during the Tenth Insurance Conference, there were no less than four papers on improving the office efficiency and two on accounting system. With the progress of insurance business and the consequent need for closer co-operation among the offices, branches, field workers and insuring public, the need is being felt increasingly for better methods and more up-to-date sys-

tems. Indian offices, however, with a few honourable exceptions, did not believe in office efficiency and until now, they had remained content with antediluvian methods, involving loss of time and money. With changing times, new problems have arisen and old systems must in due course give place to new. It is a hopeful sign that Indian insurance executives have at long last realised this basic truth and are now willing to break away from the old pen and ink method and take to modern mechanical devices in running their offices.

New India Insurance Co Ltd of Bombay, which boasts of a fully mechanised insurance office in India, has started a school of insurance in order to give efficient training to its staff and field workers. In his paper "How to Improve Office Efficiency" Mr R M Desai of New India described at length the functional office machines used to deal faultlessly and expeditiously with the volume of daily work and thereby avoiding "obvious and inobvious" wastes. His paper conveys to the

reader a clear picture of a modern and efficient insurance office. Starting from the location of the office, ventilation, lighting, arrangement of the departments, Mr Desai brings in the mechanical equipment and control of entire work at various stages.

In a shorter paper written with a similar end in view, Mr J A Mansoor of the Bombay Mutual gives practical suggestions how to improve the basic elements of efficiency, viz, service, time and cost. Mr I B Rao of the Andhra Insurance Co Ltd of Masulipatam, in his paper on the subject laid stress on personnel management and staff relationship. No system, however mechanised and modern, can be run without human elements and disgruntled staff can wreck a perfect system in no time. Therefore according to Mr Rao, problems relating to the management of personnel should be given top priority in modernising the office system. Mr N S Parkal of the Canara Mutual Assurance Co Ltd of Mangalore also dealt extensively with maintaining a

healthy and harmonious relation between the management and staff. He stressed in his paper that merits of every worker should be recognised and opportunities for advancement afforded to staff so that the personal dignity of every worker is assured. "Ego-recognition," says Mr Parkal, "is the most difficult task that confronts any management and employee today." Opportunities for the employee to freely discuss with their superiors their feelings and viewpoints are most essential for "ego-recognition". The workers, suggests Mr Parkal, should be made to feel important and given "a pat on the back" at the appropriate moment.

Mr R M Desai of New India and Mr P V S Raju of Andhra Insurance Co also read interesting papers on accounting of agency commissions with a view to improve efficiency of office. Mr Desai laid particular stress on utilising Adrema and Hollerith machines for the purpose.

Mutualisation of Oriental

At long last the Directors of the Oriental Government Security Life Assurance Co Ltd announced their decision of converting the company from a joint stock company to a mutual one. This has put an end to the speculations which had been rife in insurance and business circles.

Incorporated in 1874 with a capital of Rs 6,00,000 made up of 3,000 fully paid up shares of Rs 200 each, the Oriental, the largest life insurance company in Asia, paid in the past very high dividends on the shares which were quoted around Rs 7,450 each in the market. Sir Cowasji Jehangir, Bart, the new chairman of the Board of Directors of the company, while announcing the decision of conversion stated that the existing shareholders would receive a compensation of Rs 8,800 for each share, payable in the form of 4 per cent debentures. The debentures thus issued will be redeemable at the option of the company at the end of 10 years and they will not form a charge on the assets of the company. The debenture-holders will have the right to elect a debenture-holders' director who will retire only after the redemption of the debentures.

To the existing shareholders of the company, the mutualisation scheme appears to be attractive as

on current quotation, each share yields a tax-free dividend of Rs 175 while the debenture given as compensation will guarantee a taxable return of Rs 352. The net return after deduction of taxes will amount to Rs 264 which compares favourably with the present yield. The policy-holders, under the terms of the scheme, will have to give a nominal guarantee of one rupee so long as their policies remain in force.

There is virtually no difference between a joint stock company limited by shares and a mutual company limited by guarantee. Mutualisation has little bearing on the progress of the company as such. It only confers on the policy-holders the privilege of electing the entire Board of Directors from among them and this privilege can be a valuable one, if they take active interest in the affairs of the company. Past experience, however, does not show that policy-holders, as a class, take much interest in the company with which their lives, and incidentally, future securities, are assured. On the contrary, it is the usual experience that a particular group manages to remain in control of the company, year in and year out, by obtaining proxies through its network of branches from unsuspecting policy-holders. This obviously defeats the main object of mutualisation. While shareholders, being a smaller body and alive to their monetary interests, can act as a healthy check on the directors, it is difficult to mobilise the millions of policy-holders who are interested only in the fulfilment of obligations under long-dated policy contracts, against a weak management. In the context of above, it is difficult to envisage the actual reasons for the decision of mutualising the Oriental, unless it is a move to forestall nationalisation of insurance business, which may come some day.

India Enters Reinsurance Business

The Reinsurance Association of India (International) Ltd having obtained from the Controller of Insurance their certificate of registration under Section 3 of the Insurance Act have commenced writing reinsurance Fire business. It is good to find that a concern has got going, though in a modest way, and entered a field hitherto monopolised by foreign concerns. The Reinsurance Association will enter into reciprocal arrangements with foreign

companies in order that transactions may be both ways and not one way only, as has largely been the case all these years.

The Association is mutual and any insurance company in India can become its member with full rights of membership by giving reinsurance business to it. As its retentions are modest to start with, the Association will distribute their excess risks to member companies in order to have a well-balanced portfolio in Fire business. Being a mutual office, all the profits will go to the insurers themselves.

The head office of the Association is in Nagpur, but the controlling office for the present is at 10, Mount Road, Madras.

* Figures in brackets show the percentage of business of Indian companies.

South-East Asia —Each Going its Way

THE *Economic Survey of Asia and the Far East* for 1953 had made two significant observations: (a) First, that because of favourable weather conditions and consequent prospects of better harvests, food supply would show further improvement and surpluses might arise in some of the exporting countries in default of price adjustments. (b) Secondly, that export earnings were not likely to increase appreciably. Both came true. Thanks to favourable weather and continued grow-more food efforts of governments, the ECAFE countries recorded substantial improvement in the production of cereals in 1954 and rice exporting countries had to face the problem of disposing their surpluses. Export earnings also declined a little, compared to the previous year, and there is little prospect of an increase except under conditions of unstable export prices. The immediate problem of many countries is the inadequacy of earnings from exports for the purpose of financing the import requirements of development plans. The lesson was driven home once again that unless domestic savings can be increased or large-scale foreign aid becomes available, the prospects of expediting development will remain dim.

Though all countries in the region, according to the *Survey*,* achieved 'substantial measure of economic progress' during 1954, the *Survey* also notes that disposal of rice surpluses emerged as a new problem for the rice exporting countries, while for the old, chronic ones—the inadequacy of capital for financing development plans and deficit in the balance of payments—the countries in the region have yet to find an answer.

MARKED RISE IN CEREAL PRODUCTION

Production of cereals in general increased from 108.8 million tons in 1952-53 to 117.5 million tons in 1953-54, ie, by 8 per cent and this was a 11 per cent improvement over the 1934-38 level. That of rice

(milled) increased from 68.1 million tons in 1952-53 to 74.3 million tons in 1953-54, ie, by 9.1 per cent. This happened when, as emphasised by the FAO earlier, rice importing countries had curtailed their imports and sought to reduce the gap between their requirements and domestic supplies, by increasing outlays on domestic production *sometimes regardless of costs*. Here is a problem which could probably be solved through closer co-operation among the countries of the region. Other agricultural products, viz, tea, cotton, rubber, jute, fared better during the major part of 1954, though they had to face the long term problem of competition from substitutes or influence of technical progress, etc.

PATTERN OF INDUSTRIAL DEVELOPMENT

Progress on the industrial front has been more rapid due in part to fuller utilisation of existing capacity. The industries that are being developed seem to follow a familiar pattern—light industries (textiles, food processing) are usually taken up first; power generation, cement, simpler chemical industries, and basic industries (iron and steel) come next, and development subsequently fans out towards engineering industries and modern complex chemical plants.

This particular pattern of development has been the result of the fact that most of the countries in the region were until recently under colonial rule and it is only after they attained independence that they could pay any attention to raising standards of living through agricultural and industrial development. The scarcity of capital hinders both the pace and character of their industrial development. It is only in recent years that they have been able to direct their effort towards large scale industries.

India's first Five-Year Plan, the *Survey* points out, laid relatively greater emphasis on increasing food production and on the expansion of consumer goods industries. Though good progress has been made in engineering products, cement and chemical fertilisers, basic industries such as steel, have yet to expand and the Second Five-Year Plan is expected to concentrate more on them. Burma's pattern of development also suggests the same trend; after cotton spinning, sugar and cement, Burma has plans for the establishment of steel (20,000 tons annual capacity), and pharmaceuticals. The Burmese government also contemplates an outlay of 964 million kyats (Rs 96.4 crores) on power generation under their eight-year development programme. In Ceylon, the attention of the public sector so far has been confined to agriculture, transport and power, while production of soap, matches, rubber shoes, cotton towels, etc, have been taken up in the private sector. Of late, greater emphasis is being laid on small scale industries. In Hong Kong development of industries has

THE ECONOMIC WEEKLY

so far been confined to cotton spinning, printing and publishing, electric torch, chemicals (including matches), etc. Indonesia has given highest priority to food production, and power projects next. Though the 1951 urgency industrialisation Plan contemplated the setting up of large industrial plants, it is only since 1954, that the Department of Industry has been able to give any attention to it. In Nepal major emphasis so far has been on irrigation and road construction, though the development of cement and forest resources are contemplated. In Philippines, the Government's plans of development attach great importance to the attainment of food self-sufficiency in all items except milk, dairy products and fruits; the programme for industries which are next in importance, include electric power, coal, iron and steel and chemicals. Thailand is essentially agricultural and electricity is perhaps the only existing industry; but she has proposals to erect a pig iron plant, a cement and a plywood factory. It is to be noted, however, that the relative weightage of large scale factory manufacturing remains extremely low in all these countries, with the single exception of Japan.

PROGRESS OF INDUSTRIES

The production of cotton piece-goods in the ECAFE countries in 1954 totalled 8,100 million metres, compared to 5,900 million metres in 1951, while the estimated consumption increased from 5,600 million metres to 7,500 million during the period, leaving a net exportable surplus. Similarly, the production of steel ingots increased from 4.6 million tons in 1949 to 11 million tons in 1954, while that of cement at 22 million tons recorded an improvement of 15 million tons during the period. Improvement in production is also seen in electric power, and chemical fertilizers, while tangible results have been attained in the development of transport. But inadequacy of capital resources and lack of trained personnel, according to the *Survey*, holds up the pace of development.

PAYMENTS PROBLEM

There has been considerable deterioration in the balance of payments position. The position would have been more serious but for (a) tightening of quantitative and payments restrictions, and (b) certain favourable world developments such as (i) the appreciable improvement in the payments position and in the

balance of trade between the dollar area and the rest of the world, reflecting the rising competitive capacity of Western Europe in relation to the US and an increase in the supplies of dollar competing primary products in the non-dollar world; (ii) the relaxation of payments and trade restrictions by Western Europe, especially the UK; (iii) steady level of economic activity in the advanced countries; and (iv) continued flow of external financial aid, however inadequate its volume.

The total foreign exchange reserves of the ECAFE countries excluding Afghanistan declined from \$4,361 million in 1953 to \$4,137 million at the end of June 1954. The ratio of exports to imports dropped from 1.1 in 1950 to 0.78 in the first half of 1954. Some exports, eg, rice and sugar, had to face a buyers' market, while some others met with uncertainty and difficulties regarding markets and prices owing to strategic, technical and other factors.

While export earnings declined, imports of many countries greatly increased during the year. For the region as a whole, the value of exports and imports amounted to \$1,681 million and \$1,819 millions respectively for the quarter ending July-Sep 1954. The continuing payments problem of the ECAFE region also suggests the scope for co-operative and concrete action in the organisation of foreign trade, etc. The question of the creation of a payments union was discussed at a conference of the ECAFE countries last year, and it is possible that some workable plan can be devised. An effective solution for this problem has got to be found, in view of the inadequacy of foreign exchange resources for financing import requirements of the development plans of all these countries.

Though special efforts are being made to attract foreign private capital, foreign investments in the ECAFE countries has not been

sizeable and funds for development have had to be found from domestic sources, *eg*, current budget surpluses, floatation of loans and small savings, though receipts from loans have been important only in some of the countries. Retained profits of corporations have been important only in Japan and to some extent India and Pakistan, but difficulty is experienced, as in India, for example, in attracting private capital towards risky ventures. A recent and welcome development is the establishment of new financial institutions to cater for the financial needs of agriculture and industry, *eg*, the State Agricultural Bank in Afghanistan (1953-54); State Agricultural and State Commercial Banks in Burma (1953); the Industrial Development Corporation and the Industrial Credit and Investment Corporation in India.

The scope of the *Survey* has been extended to include Afghanistan and China (mainland). A detailed account is given of the Chinese national economy and of its Five-Year Plan (1953) though readers have been cautioned about the reliability and comparability of statistics and estimates used. The various heads under which the review of the 'Regional Situation' is given have also undergone a change, and we now have five major heads, *viz*, (i) Agricultural production; (ii) Industrial production and transport; (iii) International trade and payments; (iv) Monetary and fiscal development; and (v) Progress of development programmes.

The *Survey* notes that the pattern of development in the region has been affected by the scarcity of capital resources, and that owing to the pressure of population, there is need for the use of labour intensive methods of production and the development of cottage and small scale industries. Moreover, most of the countries have concentrated their development programmes on irrigation and flood control meant to increase agricultural output. Since importance is attached to maintaining current consumption, pace of industrialisation has been relatively slow. Further, owing to the lack of or slow growth of an entrepreneurial class in many of the countries of the region, most of them have adopted a system of mixed economy in which the public sector includes basic facilities such as technical training, housing, public utilities, transport, etc, while the remaining industrial field, especially

consumer goods industries, has been left to private enterprise.

An important problem with which countries like Ceylon, Malaya, and Philippines are faced is the need to reduce their dependence on the export of a few crops. Because of the fluctuations in the demand for their products and change in export prices, and consequently in their national income, these countries are prompted to diversify and industrialise their economies.

After going through the *Survey* the impression is difficult to resist that some at least of the problems of the ECAFE countries could be solved by a proper co-ordination of their respective economic policies and programmes of development. Though the economies of these countries are competitive, being

essentially agricultural and having trade relations with countries outside the region, those of Japan and to some extent India, are complementary with the others. These two countries have manufactures to export which all the other countries import. If China is also industrialised, it may also complement the other economies in the same manner. Possibilities of this nature could be explored fruitfully and exploited to the mutual advantage of all, provided the countries in the region do not pursue policies of economic self-sufficiency. Ceylon's efforts to achieve self-sufficiency in rice in the face of accumulation of surpluses in Burma and Thailand, or Burma's attempt at developing the steel industry, though she has neither coal nor iron ore, highlight the possibilities that can be but are not being exploited.

AIR's Monopoly Must End

Som Benegal

THE basic debate whether Broadcasting in India should be a Government monopoly, handed over to private enterprise, or run by a corporation has now been disposed of. Government does not intend, even in principle, to part with its control and monopoly even though it is obviously repugnant to the right of free expression guaranteed under the Constitution. Government's arguments for its retention of monopoly can only be described as unrealistic in view of the fact that the two other great channels of mass communication, the Press and Film, are free and unfettered. Government spokesmen have suggested that there is no other agency which can handle and develop so expensive a project as broadcasting on so dispersed and national a scale. Granting that it is so, why should Government hold a monopoly? Why can there not be smaller systems co-existing with the Government apparatus called All India Radio? Government spokesmen have also argued that the very cost of broadcasting would permit of other monopolies coming into being, commercialism becoming rampant and standards being lowered defeating the very purpose of freeing broadcasting. Now this argument can be applied with as much validity to the daily press and hence logically Government should take over the publication of all newspapers in the country! No rational case, therefore, has been made why broadcasting should continue to be exclusively in the hands of Government to be administered as a part of the bureaucratic machinery without the people's participation. Indeed, in terms of the performance of All India Radio there appears to be every justification for this to be reversed.

Broadcasting in India today is in a very sorry state. The vast and complex apparatus of broadcasting — All India Radio — is the fourth largest in the world. Last year the Ministry of Information and Broadcasting asked for 228 lakhs of rupees to run the organisation. This excluded expenses on capital development. This year Government has asked for some 305 lakhs including 200 lakhs on capital account. For all its dimensions and increasing development, for all the huge sums

of money being poured into it, All India Radio is totally lacking in vitality and arresting power, its programmes are informed by mediocrity and amateurishness, its news service is an apology. What might have been a potent and powerful means of entertainment and education is scattered waste to the four winds. In recent years foreign broadcasting stations have increasingly been compelling the attention of Indian listeners. What is the root cause of the malaise of All India Radio?

I think it lies fundamentally in its organic and operational basis. All India Radio is an inverted cone with a vast, heavyhanded bureaucracy crushing down through several spirals of petty officials upon the ultimate producer who is at the apex. This welter of officialdom which stands between the producer and his product is essentially careerist by virtue of the fact that it is there not to promote broadcasting professionally but as managers of an enterprise in which the individual's self-interest is primary. The word careerist is not necessarily used in the derogatory sense though in the circumstances it must appear so. As officials of a bureaucratic machine this is unavoidable. Most of them faithfully served the previous regime and serve the present one with the same lack of loyalty to any altruistic or ideological cause. Initiative and courage, resourcefulness and imagination are beyond the scope of such a system. The fundamental incentive is to manage efficiently at the marginal level where security of position is least in peril. In the past seven years even the certainty of position and security have vanished leading to utter demoralisation. Vacillations about confirmation, uncertainties of promotion, which in any case are not always based on merit, and inscrutable appointments by the Union Public Service Commission, and frequent interference from every level of Government have brought the organisation to near ruin. These are not vague and general charges but rest solidly on well-known cases.

There are the instances of various officers who have been in broadcasting for well over fifteen to sixteen years who have not been confirmed yet, though they have been promised

time after time that the matter was under immediate resolution. I am personally aware of the instance of an officer who headed one of the sections of All India Radio who, with the inevitability of gradualness, rose to his high status through five promotions and is on the verge of retirement though the substantive post he holds is the original one at the lowest rung of the ladder. Then there is the translator sub-editor in a language unit in the News Services Division who after fourteen years of service has been under notice of dismissal for alleged inefficiency. His case has been dragging on for years. I can think of two historic instances in the Programme Sections of All India Radio where positively brilliant men who had reached the position of Assistant Directors were demoted by the Public Service Commission to lower grades. Their contribution to broadcasting was unquestioned, yet the Commission found it fit to topple them. One of them resigned and has gone away to England, the other leads a frustrated, unhappy life in his new role which is purely administrative and takes no account of his programme abilities. In the News Division last year two brilliant news editors were reduced in rank while three junior editors were elevated. The elevation of one of them by the Commission is incomprehensible to put it at the mildest. Only at grave peril to the Organisation could this editor be put in any responsible job, so he continues to have an easy time while drawing almost twice the salary, while the two news-editors who were demoted are called upon in the name of national service to retain many of their previous responsibilities. In the higher appointments, the theory of the multilateral ability of an individual has led to frequent changes in the topmost post of Director-General. The uncertainty of tenure and the feeling that the post is only a stepping stone has not infused the incumbent with any zeal for broadcasting as such.

As regards interference both from Government and politicians of the ruling party, it is endless and perennial, it pervades every nook and corner of the halls of broadcasting. Of course, after Dr Keskar's recent speech in Parliament, interference

The Tungabhadra project in Andhra State has consumed over 2,20,000 tons of ACC cement

with ACC
cement

has become a virtue, not to be apologetic about but to be triumphed from postures of defiance, and scorn. But its most telling effect is nowhere to be seen as clearly as in the News Services Division. Radio news is the most potent form of communication of information. Its ability to keep the nation well-informed through crisp, quick and intelligible summaries of world happenings is limitless. Yet over the years, instead of gaining in authority and efficiency, it has declined into the most lifeless, uninspired recital of a fraction of the realities of national and international life. The element of distortion, not always by design as by default, suppression and faulty emphasis has increased through its subordination to every wing of Government. Every department of Government holds the Division in contempt and considers it primarily as a mouthpiece of its desired utterances. Rightly the News Division insists that everything it says is first verified. This often means that an authority has to be approached. It has been the experience for such authorities to give gratuitous advice that All India Radio need not worry itself about the item, regardless of its importance or of the fact that elimination would put the Organisation to ridicule and public censure. Argument is futile. The tendency, therefore, is to play for safe news and to abandon the sense of integrity and honesty, because in the last analysis everyone is responsible not to the listener but to the authority above.

Careerist, as the integral core is, the attitude in time approaches more and more devotion to the employer and less and less to news, objectivity and such other intangible commodities. Another fatal blow comes from interference in the judgment and choice of news. Space and other considerations do not permit of a full disclosure of what this means. But I need quote a few items which AIR has broadcast from which the reader can draw his own inferences. Some time ago a news bulletin contained the entire list of names of those who had been successful in the IAS and IFS examinations. Earlier a bulletin over the national network gave a

in Parliament was leaving New Delhi by train for Patna was broadcast although such items of arrival and departure are never broadcast about anyone save the President, Vice-President and Prime Minister. I need not take the reader further back to the time when India decided to refer the Kashmir question to the United Nations when AIR was the only news outlet which held back the news for a week and then splashed it when it was a dead story in all newspapers, only to make a laughing stock of itself. Nor need I recall the manner in which the news of Dr Shyama Prasad Mookherji's death was announced despite the ingenious but entirely misleading explanation given by Dr Keskar in Parliament.

The situation is no better in the programme sections of All India Radio. Some years ago I was asked to write a feature for Independence Day. Many have been the script writers who have had to face deletions and substitutions reflecting the reactionary views and self-generated fears of the bureaucracy, and their

Around Calcutta Markets

Hesitant Trend

Thursday, Evening

FROM the recent behaviour of stock markets, it is evident that investors are not interested in equities at current prices. For more than six months, equities have been falling. There was a temporary spurt in share values after the budget. It could not be sustained. There has been an appreciable set-back in equities in the last six months. In a "bull" market, investment support at set-backs may be reasonably expected.

Lack of investment support, even after such a heavy set-back, is creating doubts whether the "bull" market is a thing of the past. There has been a considerable diminution in the volume of business in the last few months. Investors, it is true, are keeping away from stock markets. Even replacement buying is not making its influence felt. Yet, it is not a little strange that the atmosphere in and around stock markets does

excessive desire to keep on the right side of the political party in power.

Thus in the circumstances initiative is abhorred, resourcefulness is held in distaste and courage looked upon in alarm. Anyone who persists in displaying these perilous tendencies is brought to heel. The sense of purpose and dedication is gradually dulled, professional pride killed, frustration and personal discontent allowed to accumulate bringing the Organisation to an appalling state of unrest.

Broadcasting, to my mind, is the business of professionally competent, disinterested, independent, imaginative and courageous people who are not at the mercy of Government officials or politicians. Either Broadcasting should be turned over to a Corporation, or if Government intends to have a share of it, other systems should be permitted to offer at least some competition and some relief to the long suffering listener. In its present monopolistic state to apportion huge sums of money every year is an unparalleled waste of the nation's money.

Market Realism

Equities may be falling. But both investors and speculators seem agreed that, as the second Five-Year Plan gets going, equities will begin to look up. There are reasons for the different approach of industry and of investors to the economic outlook. Industry is worried about the relative importance of the private and the public sectors in the second Plan. Investors look at it from a different angle. They argue that the economy must improve as the enlarged second Plan is implemented, irrespective of

Edited by Sachin Chaudhuri, printed by him at Western Printers & Publishers, 15 and 23 Hamam St., Bombay 1, and published by him for The Asian New Age Publishers Ltd., from Noble Chambers, Parsee Bazar Street, Bombay 1. Business Manager: A. Fernandes.

Sleep tight, sleep sound, little baby

'But of course, Mr. Weathermaker! My baby gets sound, restful sleep (and so do we!) thanks to the 'Crystal' coolness of the room.'

A good idea for you, too! Install a 'Crystal' room air conditioner in your home, and enjoy hill-station weather throughout the summer. On particularly hot and humid days you get extra cooling — automatically. The 'Crystal' fits into a window and is specially built for quick and easy servicing.

The 'Crystal' room air conditioner is made in India for India by the people who know air conditioning best. 20 years' experience makes the 'Crystal' the most efficient and trouble-free

unit available in the market. 800 units have already been sold and enthusiastically received. Be quick to place your order, if you want to secure a unit out of current production.

New Phase in Steel

DURING the war, Government price policy had the twin objectives of maximisation of the production of essential commodities on the one hand, and keeping down prices proportionately to costs on the other. After the war, this policy was continued in the case of steel till 1951 when on the recommendation of the Tariff Board, Government decided to allow price increase to cover the actual cost of immediate replacement requirements, in excess of the funds available in depreciation account of the companies. In the latest price revisions announced, Government has gone a step further. It appears that it is now the intention to allow price increases to provide the companies with a portion of the capital required for their approved plans of expansion of their plant capacity. In a basic industry like steel, when the private sector gets a boost, it becomes necessary to understand its implications in the light of the much-talked-of Avadi resolution of the Congress.

First let us see what the Government resolution has to say. Government has agreed that the capacity of Tata Iron & Steel Co Ltd should be expanded by about 500,000 tons of finished steel and that of the Indian Iron & Steel Co Ltd by about 100,000 tons. It has also agreed to an increase in the finishing capacity of the mills, over and above the capacity already planned under their respective expansion programmes. The resolution further states that representation was received from the producers that the retention prices fixed for them should be suitably raised to facilitate implementation of these additional expansion programmes partly from their internal savings. After examining this representation, Government has now come to the conclusion that

(1) The major producers of steel should be paid a uniform retention price;

(2) The uniform retention price to be paid to the companies should be fixed at Rs 385 per ton, pending inquiry by the Tariff Commission; and that

(3) Agreements should be obtained from the two producers that the extra profits made by them as a result of the present increase in the retention price would be ear-marked specifically for development and expansion, and not used for any other purpose, except with the express permission of Government.

This introduces three new principles to the price policy of Government; first, the principle of financing development projects from internal resources; second, the principle of uniform prices; and third, direction to the companies for division of profits for expansion plans. The third is, in a way, a corollary to the first. We shall examine these one by one.

There is nothing wrong if, under competitive conditions, the private sector manages to finance its development projects from internal savings. This is how much of industrial development has been financed in advanced countries. The situation was not materially different in this country either. But since the war-time control on prices, the situation has changed. The production, distribution and price of steel have been controlled and only a fixed margin of profit has been allowed

Annual Subscription Rs. 24.
Foreign Rs. 27.

to the producers. This has been done with a purpose. The argument that if there had been no control, the steel companies would have made enormous profits does not fully square with the facts of the situation. Firstly, at world prices, the off-take of steel would have been considerably reduced. Any doubt on this point would have been cleared if Government had allowed 25 per cent of the companies' production to be sold at world prices after ear-marking 75 per cent at controlled prices for essential purposes. Secondly, for producers to think that in a basic industry like steel, they can ordinarily sell at a price disproportionately higher in relation to cost, is to be blind to the fact that the case for nationalisation will only be strengthened thereby. It is no use, therefore, to try to browbeat Government on the count of world prices. It will not pay. On the other hand, if there is reasonable assurance that by expansion of private sector, steel could be produced more quickly and at a cheaper price, no one can have any objection to Government's giving assistance to private sector by way of loans on favourable terms. But the weakness of the present method of allowing price increase in order to provide internal savings is that fresh assets will be created at the expense of the consumer, without any corresponding sacrifice on the part of the shareholder. That means when the expansion programme is completed, the shareholders of steel will be placed in a privileged position. Is this the intention of Government? Or is it the intention of Government to nationalise the industry when the 10 years' respite given to steel under the 1948 Industrial Policy Statement expires? And the question of compensation can now be settled 'amicably' under the Fourth Amendment to the Constitution. In that case, one can understand Government's last minute haste to boost up this basic industry in the private sector.

Now let us come to the second point, *ie*, uniform prices. One could have understood the case for uniform prices better if Government had stated that as the actual production of the Indian Iron is about 75 per cent higher than the output assumed for estimating cost, the cost differential between the two companies has now narrowed down. On the contrary, Government concedes that the cost of

Indian Iron continues to be higher than that of Tatas and has actually directed the Tariff Commission to recommend a uniform price on the basis of the (higher) costs of the Indian Iron. In the light of the Avadi resolution, the policy makers in Delhi appear to have come to the conclusion that uniform prices are essential for speeding up socialism rather than uniform profits. That apart, let us see how it is going to work out in practice. By a uniform price was meant, one would have thought, that there would be the same price for similar products of both the companies. But that is not the intention. In another directive to the Tariff Commission, Government has stated that "the prices fixed for the producers should be uniform on the average and where necessary and possible for each comparable product." In what conceivable manner can such an average be struck? And what is the significance of such an average when the products rolled are not similar?

The third point is the insistence that the extra profits earned by the companies from this price increase should be earmarked for financing the development plans. How will this extra profit be determined? In the case of Tatas, the price increase is estimated at Rs 54 per ton. Will the extra profit—the new 'element' in the price for development—be determined at this rate on the whole tonnage? Or on the product-wise rate increase and the actual quantity of each product sold? For the market to be able to follow these developments, an immediate clarification is necessary; because the amount available for distribution will depend on the basis that is adopted for the determination of extra profits. To talk of an average rate of increase in this context is misleading because the pattern of production is variable, and to the Tariff Commission.

At the Crossroads

THERE is consistency in Russia's diplomacy. She has never denied the possibility of peaceful co-existence. It was, therefore, only to be expected that she would be prompt in her acceptance of the Western Powers' invitation to four-Power talks "at the highest level." In accepting the invitation, she has reiterated her eager desire to co-operate with the Western Powers in ending the "cold war." Simultaneously, she is taking steps which

not fixed, depending as it does, on the 'product-mix'. In fairness to the investor, therefore, Government should announce without delay the price fixed for each product on both the companies and the pattern of production adopted in arriving at the average price per ton of Rs 385.

Another intriguing factor in the situation is the Government's decision to refer the matter to the Tariff Commission for further examination. What the Commission have to examine is a little difficult to understand. They have been told that they should recommend a uniform price, as understood by Government. But in determining this uniform price, the cost of production of Indian Iron is to be taken as the basis. Also, the uniform price should be such as to enable both producers to obtain a portion of the capital requirements of their current and additional expansion programmes from internal resources. A good cost accountant should be able to determine the actual cost of production of the Indian Iron. If this is the only problem, why drag the slow-moving Tariff Commission into it? What portion of the capital requirements for expansion should be met from internal resources, *ie*, by a price increase, is a matter on which perhaps the Commission can give an opinion. They may also recommend the period for which the new prices should be in force. Here, again, there is no knowing whether Government will agree with the Commission, if they do not toe the Government line. This reference can at best have only a nuisance value to the companies. It will mean a little hard work for the Tariff Commission staff and also provide some incentive to stock exchange speculators. But beyond these, there is little point in referring the matter

are indications to the Western Powers of the terms and conditions on which world peace can be attained and maintained. From the Western Powers' confused reaction to the latest international developments, it would seem that either they are not fully aware of the conditions of world peace, or that they are reluctant to accept the necessary conditions for world peace.

Certain facts clearly emerge from recent developments. On the issue

of disarmament alone have the Western Powers always had the initiative. Russia has never denied that an agreement on disarmament is an essential pre-requisite to world peace. But she has always insisted that such an agreement can be reached only after certain prior conditions have been fulfilled. There has been a welcome response to the latest Russian plan for disarmament. But the Western Powers find it both convenient and diplomatic to ignore or to minimise the conditions attached to the latest Russian plan for disarmament. Even as there can be no world peace without disarmament, it is evident that there can be no agreement on disarmament without settlement on certain related issues. In the latest disarmament plan, Russia has indicated what these issues are. These issues will inevitably enter into the proposed four-Power talks. It will not be Russia's fault if the Western Powers then argue that these issues are of no consequence.

Russia has made major concessions in her latest disarmament proposal. These concessions have been widely welcomed by the Western Powers as evidences of Russia's peaceful intentions. A closer examination of the plan discloses the basic conditions under which Russia is willing to enter into an agreement on phased disarmament. One of the conditions is that occupation forces, except "strictly limited police forces" under four-Power control, should be withdrawn from Germany. This aspect of the world disarmament problem is analysed in a subsequent paragraph where the problem of Germany in relation to Europe is discussed. Here, the other conditions may be stressed. Before entering into an agreement on disarmament, Russia expects Far Eastern questions to be "settled." Foreign military bases on the territories of other countries are to be liquidated. "Discrimination in trade relations" is to be eliminated. These are conditions which are essential to world peace as well as to disarmament. Russia is entitled to insist on these conditions.

These issues raise basic problems of world peace. In her latest disarmament proposal, Russia has not only indicated the plan and procedure of phased disarmament, but has also suggested the problems which the forthcoming four-Power Conference will have to settle to ensure world peace. Once these conditions and their implications are accepted, the Foreign Ministers of the four Powers can, then, start detailed discussions on specific issues in dispute.

Opinion will differ whether Russia has been diplomatic in emphasising the conditions of world peace at this stage. But, in laying all her cards on the table, she has indicated her sincere desire to come to an agreement with the Western Powers. More than once, the Western Powers have accused Russia of dilatory and delaying tactics after agreeing to have talks on world issues in dispute. Russia has been wise in stating the conditions to world peace so that the Western Powers now know the basic issues which Russia will raise in the proposed talks among the Heads of State.

If the Western Powers have proposed four-Power talks "at the highest level" only after economic, political and military integration of Western Germany with Western Europe, Russia has been prompt in taking measures so that she, too, can negotiate from "position of strength". At the recent conference at Warsaw, Russia and the Eastern European Communist States have formed a military organisation to counter NATO. But Russia has been diplomatic in not including Eastern Germany into this military alliance. Emergence of a neutral, independent, Austria and the exclusion of Eastern Germany from the military alliance between Russia and the Eastern European Communist States underline Russia's plans for the solution of the German problem. It is clear that Russia will propose a free, united, neutral, Germany as the solution of the German problem. In excluding Eastern Germany from the Warsaw military alliance, Russia will claim that she has, unlike the Western Powers, taken no unilateral action to prejudice the solution of the German problem.

Neither world peace nor world disarmament is possible without an agreement between Russia and the Western Powers on Germany. A free all-German election is an essential preliminary to unification of Germany. There may be differences of opinion on the detailed procedure of the proposed election throughout Germany, but Russia is not likely to oppose the Western Powers' demand for free all-German elections. It is on the future status of a unified Germany that differences are likely to arise. Dr Adenauer may be expected to endorse the anticipated Western Powers' proposal that unified Germany must have the sovereign right to choose her future political, military and economic alliances. It will be argued that the Western Powers are entitled to insist that a sovereign, united, Germany must

have freedom to formulate her future foreign policy. But, in signing the Austrian Peace Treaty under which Austria has emerged as a free, united but neutral State, the Western Powers have accepted, by implication, the possibility of a similar solution to the German problem in the prevailing conditions in Europe. In proposing neutrality for a future united Germany, Russia has the support of Dr Adenauer's political opponents. France may not be unwilling to endorse the Russian plan for Germany. It is undeniable that France shares Russia's and many European States' apprehensions about German re-militarisation.

Disarmament is an essential condition of lasting world peace. Though the latest Russian plan has brightened the prospects for disarmament, it is inevitable that any plan for world disarmament will have to be implemented in gradual stages. Even after an agreement has been reached on disarmament, it will be necessary to ensure certain conditions so that Communist States and the Capitalist Powers can co-exist in peace. There is, on the other hand, the possibility that the forthcoming four-Power Conference may fail to ease the prevailing world tension. Latest diplomatic moves by Russia indicate that she is making preparations for both the eventualities. It is evident that Russia is interested in creating a neutral belt in Europe. Austria is now a sovereign, neutral, State. Russia's solution of the German problem envisages a similar neutral status to a future unified Germany. Moscow's overtures to Belgrade are aimed at ensuring Yugoslavia's neutrality. Russia is willing to talk peace. But if the proposed peace talks fail and the Western Powers go ahead with their plans for political, economic and military integration of Western Germany into Western Europe, Russia has counter-plans ready. Warsaw arrangements will be promptly implemented. Efforts at creating and extending the neutral area in Europe will be energetically pursued. Russia is willing to reach an agreement with the Western Powers on outstanding world issues. But she has made it abundantly evident that she will not enter into any agreement under coercion. Neither on the German nor on any other world issue in dispute, will she accept dictated terms. In the event of failure of the proposed four-Power talks "at the highest level", she will promptly implement her counter-plans. It is evident that the "cold war" has reached a crucial phase. He would be a bold man who would predict what the next phase in the world situation will be.

Weekly Notes

Dockyard Labour

THE condition of dock labour, whether in Bombay or in Calcutta, has been a long standing grievance with the shipping companies. Deliberate adoption of go slow tactics, indiscipline and divided responsibility between stevedores who have to service the ships, while control over labour is left in the hands of a Dock Labour Board and fixation of wages on a time scale unrelated to actual performance—all these have been blamed in turn or in combination, for the scandalous state of affairs that has prevailed ever since decasualisation was introduced to end another kind of chaos that used to prevail before. Dock labour blames Port Trust authorities and stevedores, stevedores blame the other two, while shipping companies suffer from slow clearance of ships, reduced voyage days and total tons of cargo carried, all combining to undermine their freight carrying and earning capacity. Matters have come to a head after the decision of the Overseas Shipping Conferences to impose a surcharge of 25 to 30 per cent on freights to and from Indian ports, if working conditions do not improve. The Dock Labour Enquiry Committee that was appointed by the Government of India to examine the situation has yet to submit its report.

Despite conflicting claims, the basic facts are not hard to come by. To begin with, when the decasualisation scheme was introduced, the average discharge of bagged cargo which varied between 159 to 206 tons per hook before the war, was fixed at about 90 tons by the Chief Labour Commissioner. The actual output, however, falls far short of this datum line, by 30 to 40 per cent. The cost per ton of cargo has gone up correspondingly. Time rates of wages tend to keep down output, and stevedores themselves, it is complained, slacken operations as the datum line is approached, in order to avoid bonus payment. Their supervision, besides, is ineffective and slack. However that may be, surely labour is on firm ground in accusing Port Trust authorities for refusing to instal mechanical devices which could speed up handling of bulk cargo, however surprising it may be for labour to demand introduction of labour saving devices. Customs

examination in the docks, it is further complained, takes much longer time than before, because of the change in the character of imports after import licensing. Some system of pooling of labour and piece rates with a minimum wage appear to be the only solution but how best it can be worked, for that the committee's report will have to be awaited.

Groundnut continues to Perplex

IN the absence of reliable statistics of crops, the market behaviour of oilseeds and oils is dominated by export rumours and speculative manipulations and prices remain out of tune to the supply-demand situations for long periods. Government is no doubt trying to improve the technique of forecasting crop yield through sample crop cutting surveys and the position may improve after a few years. It is, therefore, not very surprising that the groundnut and groundnut oil market behaviour continues to perplex experts. Thus, in the 1953-54 season, despite a forecast of bumper crop, groundnut prices increased by over 20 per cent during the season, that too without any stimulus from exports. The prices began to decline after the season was over under the influence of the decline in other commodity prices. During the 1954-55 season, however, Government has been quite liberal in allowing exports of HPS groundnut and groundnut oil and over 2½ lakh tons of kernels have been exported in the form of oil and seed. The profit margin in the export trade has also been fairly attractive and export quotas of oil still fetch a premium of Rs 75 per ton. Yet groundnut and groundnut oil prices have failed to look up even when the season has nearly ended. The price of groundnut oil stabilising at a level of three to three and half times its pre-war level is in keeping with the price level of other commodities. However, with the season over, it is necessary that Government should consider the policy of further exports very carefully so that wide fluctuations in oil prices are not repeated. A policy of price stability can now succeed with the stability in the world supply of oils and fats brought about by increased production and reduced demand from industrial consumers, mainly manufacturers of soap.

It is a pity that Government,

desiring to encourage cottonseed crushing, is following a rather halting policy in regard to the export of cottonseed oil and cake. The increase in cotton production has substantially increased cottonseed supply. Further, as oil recovery from cotton seed is only about 12 to 18 per cent, the price of cottonseed cake determines the profitability of cottonseed crushing. It is therefore in the larger interest of the country that cottonseed oilcake and cottonseed oil should be freely exported so that in case there is scarcity of edible oils in future, the established cottonseed crushing industry in the country can help augment supplies.

Simla Conference on Dollar Aid

THOUGH the Simla Conference of the Colombo Consultative Committee, from which Ceylon conspicuously absented herself, achieved nothing, it drew attention to some practical difficulties in the utilisation of US aid which it had met to discuss. These arise from the form in which the aid is given, viz, tie-up with the disposal of farm surplus and the stipulation about the manner of its carriage. The first creates difficulties of absorption of a sort not difficult to imagine; the second causes delay when US ships are not available. It is curious, however, that the difficulties of absorption of US aid should be advertised, when nothing is said about the difficulties of utilisation of the aid given by the Commonwealth countries. The tie-up, for example, of particular projects with plant and equipment to be supplied by donor countries which naturally depend on the delivery dates that their manufacturers find convenient.

Japan's active participation in this Conference was a notable feature, particularly its offer of technical assistance at a cheaper cost which, however, could not be discussed as the Conference had been called only to consider US aid. It was only a conference of officials. So let us leave it at that. That Stassen's offer to underwrite a payments union for the ECAFE countries, which has been in the air for some time, should turn out to be such a damp squib is surprising in the extreme. Did he really expect these countries to pool together their military aid for financing a payments union?

Goa — Too Long in Going

PUBLIC opinion in India has been agitated over the manner in which the Portuguese authorities in Goa have treated the venerable freedom fighter of Maharashtra, Senapati Bapat, and his gallant associates in the first batch of satyagrahis to enter that alien-dominated pocket. Those who are a little too much bothered about international niceties to realise the magnitude of the provocation that the Portuguese have been offering may question the propriety of allowing satyagrahis to cross the Indian border into what is to them foreign territory. To distant Delhi, Goa may be no more than a pimple to be scraped off in course of time. But to people living around the pocket, who have their kith and kin and even ancestral homes inside and who have been deeply pained by the happenings there, the problem has assumed an urgency which a merely legalistic approach cannot assuage. This is, however, not to condemn Delhi's high rectitude in this matter, but rather to point out that there is another aspect to it, call it human, emotional or even that of common decency, which can no longer be ignored. If Goa were a sequestered islet far off in the Arabian Sea, it might have been different; but Goa is not only an integral part of India, but one that is in living contact with the rest of the country. What affects it affects other parts too, and in a vital manner. Therefore, to treat it merely as a problem in law or political punctilios is a little unrealistic. Not that Delhi's active intervention is sought; those who seek it tend to take too facile, too short-sighted, a view of things. But for the Government of India to go to the other extreme and prevent the spontaneous forces of freedom from asserting themselves, be it even outside Goa, is to be unduly touchy. After all, the Portuguese are not going to quit Goa gracefully; methods of discussion and negotiation have little appeal to their authoritarian psychology. And grace on our part, though it may no longer be mistaken for weakness, will nevertheless encourage them to persist in their reign of terror, causing untold suffering to the people of Goa. Why should this be allowed to happen, if it can be helped?

The point to remember about Goa is that whatever mistakes the Portuguese authorities might have committed there, they have not been guilty of providing opportunities of

liberal education to the people or allowing them to secure political instruction or training. And if despite this precaution, any sign of political awareness has manifested itself at any time, they have lost no time in suppressing it ruthlessly. They have kept it as a close preserve of Portuguese privilege on the one hand and mass ignorance and servitude on the other—a sort of colonial holiday centre where the few batten on the helplessness and apathy of the majority. Those with spirit or intelligence who could not stand this and who had no great possessions to tie them down, have had to escape from the stuffy atmosphere to seek an honourable livelihood elsewhere in India. In fact, the intellect and heart of Goa reside outside the borders of that little islet of mediævalism; and so also a good part of conscious man-power which might have been expected to assert itself against alien insolence and oppression in keeping with the spirit of the times. The result is that there are few left in Goa to present any serious challenge to Portuguese domination; and it is that and the propaganda potentialities of it as also Delhi's unconcern that have enabled the colonial freebooters to put on such airs. Had it been just a pose before removing themselves bag and baggage, none would have been the worse for it. But it seems as though they take themselves very seriously, and still hope to retain their control over Goa, which is certainly not a matter for amusement.

Blow It Off

BUT what is to be done? To expect a strong movement to develop within Goa is to misread history and misjudge the power of mischief and the capacity for suppression that the Portuguese rulers still possess. It is futile to imagine that the latter have decided to wind up their 400-year-old show and wait for the first ship to transport them home. There might sooner have been a popular rising in Nazi-dominated Germany than in Portuguese-held Goa. It might be well to remember that the machinery of domination and oppression in Goa has been perfected with consummate cunning and cynicism over more than four hundred years of unshaken Portuguese hegemony. Any comparison with pre-Independence India is most inapposite. Nor can there be any reasonable comparison with conditions in the French pockets on the eve of their deliverance. Whether it pleases all of us or not, the

truth, to put it plainly, is that Portuguese authority must be assailed from outside, be it by the most non-violent of methods; and once it is so assailed and there is assurance of strong popular backing from outside, then the crushed spirit of the Goan people may have a chance to revive and give the final kick to the tottering edifice of colonial authority. How is that to come about? Economic measures are not without their value. Indeed, whatever measures have been taken by Delhi to prevent smuggling and restrict remittances to Goa, on which so much of its prosperity depends, have done not a little to stimulate an awakening to realities which Goa had never experienced before. The embarrassing position in which the Portuguese now find themselves is also becoming increasingly evident; but an entrenched power does not yield so easily. Badgered, it becomes even more vicious. So long as it is the people who suffer and not the foreign rulers and again so long as popular discontent does not rise to the point of being able to overthrow its authority, they may not be shaken out of their resolve to cling to the pocket. But if economic measures should be accompanied by convincing tokens of support by people outside Goa, such as Senapati Bapat and his brave band of volunteers have already given, and if these tokens grow in number and intensity, the situation will change—and perhaps sooner than most people expect. The card-house of Portuguese rule has started wobbling. A strong whiff of popular sentiment should bring it crumbling down—the Government of India permitting.

Minimum Wages in Agriculture

THE fixation of minimum wages for agricultural labour has been on the cards for many years. The Minimum Wages Act passed in 1948 provided for it. According to this Act, minimum wages had to be fixed before December 31, 1953, for employments in agriculture. Since some of the States, especially part B States, could not adhere to the time schedule, the Act was amended to extend the last date to December 31, 1954. While efforts have been made to fix minimum rates in industrial employments, no progress has been made on an all-India basis, except where wages had been fixed by the respective State Governments.

The obstacles in the way of introducing a minimum wage for agricultural labour are well known. Cus-

tom and convention govern such a large number of transactions in agriculture, and they differ so widely in different parts of the country that it is difficult to evolve a uniform code of minimum wages. Moreover, most of the agricultural employers are themselves small holders and granting that a minimum can be enforced, they might either do away with the little hired labour they employ or, switch over to 'share cropping', which is neither conducive either to efficient cultivation nor desirable on social grounds.

The tripartite labour conference which met last week in Bombay were quite alive to these difficulties, when they discussed the fixation of minimum wages for agricultural labour. Labour leaders were, no doubt, vehement in their demand for the immediate fixation of a minimum wage on a national level and since the Agricultural Labour Enquiry had shown that agricultural labour finds employment on an average for 189 days in a year, they demanded that a fair wage should be fixed during the season of 189 days, which would enable the workers to carry through for the rest of the year. What could be more simple than that?

The representatives of State Governments, however, some of whom have tried fixing a minimum, expressed their doubt about the success of a wage policy for agriculture—owing to the disorganised state of agricultural workers and changing conditions from area to area. Hyderabad's experience of the Minimum Wages Act was one of complete failure. The representative of Rajasthan Government was of the view that the measure should be confined to farms where more than 20 labour-

ers were engaged. The compromise reached was that there should be a "pilot" implementation of this measure in selected areas, before it could be extended to all farm labour.

Price Support Widens Price Differentials

THE operation of price support in UP in the first two weeks has brought to light some complexities of the problem which could well have been anticipated. This is only the beginning; so there is no need to jump to conclusions, but the facts are sufficiently important and significant to merit attention. Government purchases for the present are confined to fair average quality wheat which normally commands a premium over other qualities. But since Government is buying only this quality and no other, the price difference between different qualities of wheat has widened, and widened so far as to upset the market. While the FAQ (fair average quality) is selling at Rs 10 per maund, the red variety, grown on the banks of Jamuna, has gone down below Rs 6 per maund in the interior. Normally, the price difference between these two qualities does not exceed Rs 1-8; now it is Rs 3-8 or more.

True, there is no *a priori* reason to suspect that the elasticity of substitution among the different qualities would be so low as to enable such high price differentials for long. But experience alone can show how far this assumption is borne out by facts. The situation, it is reported, has been made a great deal worse by lack of adequate publicity with the consequence that villagers, ignorant or sceptical about the price support programme, have resorted to panic selling, thereby further upsetting the market. Of course, relative prices need conform to no set standards. This becomes apparent, when the comparison is extended from different qualities of the same grain, eg, wheat, to other cereals and particularly, to gram, the widening price difference between gram and wheat having been a feature in recent years.

Paradoxically enough, it is because prices had been controlled in the past and the grain market in UP as in other important producing centres had come to depend on a substantial volume of Government purchases, decontrol has left these markets without adequate support. The funds employed in the purchase and carrying of stocks and grain were diverted to other uses, trade capital has not yet returned to the grain market and the tendency to depend

on Government purchases is understandable enough. But this very dependence also retards the flow back of normal trade credits and restoration of arrangements for carrying of stocks.

The more sober opinion in UP as well as elsewhere appears to be that when Government purchases attain substantial proportions, grain markets will regain stability; the implied assumption being, among others, that eventually price support will not be confined to one or two varieties, but will be extended to all the major qualities. It is by no means certain, however, that the same result can be obtained by confining purchases, as at present, to a single quality of wheat. The situation bears more than a passing resemblance to that prevailing in the gilt-edged market when Reserve Bank was supporting only the Conversion Loan. The price difference of other loans widened perceptibly and this disparity remained pretty wide—judged by the standards of the highly integrated money market where rates are adjusted very finely—and persisted throughout the period of Reserve Bank support.

Off the Record

DID the presence of Acharya Vinoba Bhave at the last session of the AICC really symbolise the closing of ranks, so that constructive workers within the Congress, who have hitherto hitched their wagon to the star of Sarvodaya, can present a united front with governmental wing of the Congress who have sponsored a second Five-Year Plan with its accent on heavy industry, though it has given a wide scope for cottage industries also? To put it more pointedly, can Sarvodaya be reconciled with the socialistic pattern of society which the Congress Government hopes to attain through legislation and through the implementation of the second Five-Year Plan? How could they be reconciled, with ends that are poles apart and means so different, one depending for fulfilment on a change of heart and spontaneous response of the people—this has been aptly called Janashakti—and the other on the administrative machinery and its law-making power—which has with equal aptness been described as Rajashakti.

It is only in the highly idealised Hegelian conception of the State that the two are one and the same. This demands a degree of abstraction which offends both common sense and realism; paradoxically enough, the Hegelian conception is upheld today by the followers of the very man who put Hegel upside down. In the Communist States, Janashakti is also Rajashakti, not only as a matter of abstract legal theory—which it is in every political democracy, and even in a successful dictatorship—but also in day-to-day operations, the participation of the people in the execution of State policies being ensured at each stage through the agency of a single all-embracing party. The instrument through which the State acts in Communist countries is not bureaucracy of the administration, but of people's organisations. The Congress had, in the days of its struggle, developed, if not exactly as a mass organisation at least as the skeleton of such an organisation, through which it could get the people behind it effectively for one supreme purpose: to win the country's independence. For that purpose, the organisation proved nearly adequate. This much even the critics of the Congress have to

The Strategic Points

concede, excepting diehard ones who perhaps still maintain, though they do not say so loudly any more, that the Congress did not lead the people finally to victory, and that it was but a favourable combination of circumstances which enabled it to get freedom on a silver plate. Those who think on these lines do not of course regard what India gained on August 15, 1947 as real freedom; but that is a controversy which is now dead and had better be dropped.

The point is that the Congress succeeded in winning freedom and that it did organise the people successfully for this purpose; but can it organise the people successfully for a common economic programme? True, it has all along had a constructive programme, and it actually sponsored organisations like the All-India Village Industries Association and the All-India Spinners Association and trained a number of constructive workers. It has also a programme of Sarvodaya. According to some, this was all that was genuine in the Congress in the past. Vinoba Bhave is not trying to win land for the landless by operating the legislative machinery or through the coercive power of the State. His movement is based on entirely different principles, and it does not stop with Bhoodan. He has a very clear notion of the pattern of society he wants, and that pattern is not of the Avadi type. Philosophical anarchism and an idealistic concept of the State are as poles apart as are Sarvodaya and State Socialism. Did the presence of Vinoba at the last session of the AICC achieve the impossible and reconcile these two completely antithetical ideas?

To those who consider themselves genuinely Congress, indigenous to the soil and wedded to the spirit of Gandhiji's teachings, Pandit Nehru had a reply to give. Panditji traced the history of the Congress, not in terms of its constructive programme, the All-India Spinners Association or the Village Industries Board, but in terms of the resolutions on economic policy passed in various sessions of the Congress in the past. He referred to the principles of economic policy and the fundamental rights laid down at the Karachi session of the Congress in 1931. That was the first formulation by the Congress of certain basic principles in broad out-

lines. After that, he said, the Congress did not formulate any policy except in regard to land, because land was obviously the most important, and no work could be done unless this problem, on which depended the welfare of 75 or 80 per cent of the people, was solved. For a popular and agitational organisation, however, it was enough to concentrate on one aspect of a problem which was "complicated and complex", but for the Government, he implied, rather than said in so many words, it was necessary to think of all the other aspects also. This was a veiled reference to the Congress Agrarian Reforms Committee and its report which he did not mention by name.

Then again, the Congress had thought of economic planning as early as 1938, when the then President, Subhas Bose, appointed the National Planning Committee of which Pandit Nehru had been nominated Chairman. But the war came and with it the pilgrimage to prison. By the time the leaders came out and took over, the findings of the Planning Committee had become out of date; and the Neogi Committee was appointed in 1946 to collect the preliminary data for planning. The rest is recent history, too recent to need recounting.

This brief excursion into history was useful in adding some ballast to Sarvodaya. After all, those who point accusing fingers at the one or the other have to take note of the fact that the Congress had all along been moving in two different ways. One of these finally led to the setting up of the Planning Commission. Did the other lead to Bhoodan? While this is a wholesome revelation in itself to those who are prone to take a one-sided view, it does not help build the bridge between Sarvodaya and State Socialism. That bridge has to be built, and Pandit Nehru was merely thinking aloud, as he is wont to do, when he said that Socialism cannot be established by a decree: it has to grow. It can grow, if Government changes by law the social relationship and ownership and thus prepares the ground for it. There is a certain degree of coercion implicit in State action—in preparing the ground for the eventual coming of Socialism. That is why perhaps he hesitated to use the word Sarvodaya. It was a far

better word, he admitted; but it was, nevertheless, a word which had no "historic context behind it" and again, it was one which "we are not yet worthy of using".

Though Pandit Nehru has a habit of taking his education in public and also of thinking aloud, to get the closest insight into the working of his mind, one has to watch him and listen to him not at official functions or even in Parliament, but in party meetings where he is least assertive.

Addressing his party colleagues in Parliament, Panditji set out his basic ideas; how the socialistic pattern of society can be achieved? His habit of thinking aloud makes him present both sides of the question, but it sometimes leaves the reader guessing which way his own mind is moving. The burden of this speech appears to be that nationalisation is neither the royal road nor the only road to socialism. That it is, a "completely wrong notion". "Do not mix the two things up". Many of the Communist countries have nationalised everything, but they have not succeeded in achieving a balanced economy. Having gone too far towards industrialisation, some of them are painfully retracing their steps and going back to agriculture. China, on the other hand, not only

has a private sector, but Mao Tse-tung has issued an open invitation to Chinese capitalists abroad to bring in their capital and offered it protection. Anyway, even Bernard Shaw was dead against capital levy, "although otherwise he called himself a socialist, even a communist." "Let us not get lost in words."

Now all this is neither here nor there. One may cavil at Shaw, whose mind was made by the stage, being taken as an authority to consult on an issue like capital levy or demur that Mao may not agree that Marx is so outdated after all. But that is not it. Nehru is groping for something, he is breaking away from and coming out of the shell, Fabian one may call it, woven round him by civil servants that no one should earn more than they do, and hand over the control to them and we shall, here and now, be in the best of all possible worlds. "There is really no choice before us between having a private sector and allowing it and encouraging it to function, and not having it at all. It is foolish to have a private sector, and then undermine it and prevent it from functioning. There is no point in it. You simply undermine your own policy that way." "The public sector will always be number one and will, I have no doubt, grow at

a much faster pace than the other sector, and shall gradually really determine the economy of the country. The rest will have to fit in; even now we try to make it fit in, in our plan".

This is something positive, and refreshing, this feeling for life and growth, this counsel for supplementing the private sector rather than wasting resources for supplanting them, is both realistic and constructive. But while holding forth at length on the scope for expansion both of the public and private sector, eg, in the sphere of banking—"There is so much room for state banking to expand, then why should I worry about private banks?"—Nehru also said "I am interested at the right time in acquiring banks, insurance companies and mines. I am interested in these because these are basic things." (italics mine). What is the right time? How basic are they and in what way are they holding up the progress at the moment? Insurance companies pool the savings and invest the bulk of their funds in Government securities; so do the banks. It is yet to be proved that banks cannot be made to toe whatever line the Reserve Bank chooses to set for them. What are the basic things? Panditji has only asked the question, he has not answered it.

Our Delhi Letter

IT has been a Pakistan in Delhi. The Pakistan leaders are past masters in the art of diplomacy. They made us forget completely the sad incident at Nekowal, the memory of which was yet green on Saturday last. When Mahomad Ali and Iskandar Mirza arrived with their Begums at Palam-aerodrome, Pandit Nehru received them with a charm and grace that are peculiarly his. It was obvious that there was no enmity in his mind and he welcomed his Pakistan guests with open arms. Even the appearance of Mohamad Ali's new Begum did not seem to disturb Panditji, normally known for his moral and aesthetic sensitivity. The new Begum was the soul of modesty. From a distance, she looked so typically Indian, with a beautiful sari on, that it was difficult to believe that she had been born in Canada and had Syrian blood in her. Whatever the morals of polygamy, Mohamad Ali surely is a man of taste. Aliya went round and made herself at home wherever she went, and she moved around a good deal.

The Begum had made a little history in the social circles of Karachi. Does the fate of countries hang on such trifles as these? She was in the background, however, while the two Prime Ministers carried on long and secret conversations. I waited right till Wednesday evening to be able to report in a confident way, which way the wind had blown during the Indo-Pak conference on Kashmir. We seemed to be agreeing on almost everything else—including, it was said at one time, the division of the India Office library in London. Gen Mirza, who talks fire at Karachi and Dacca and even attempts to blow it across the Khyber, appeared to be in a most amiable mood and was reported to be agreeable to the Defence Ministry proposals in his anxiety to stop border incidents.

For the time being, we must concentrate on an evaluation of the recent Indo-Pak talks. I must confess, in this connection, to a sense of failure, and that is the major cause of the delay in this despatch. I weighed all the material I could get, including the views of persons called knowledgeable in their rather shifty line. I only seem to have been right in a limited and negative way in as much as I discounted their story about the India Office library, which gave an impression of the reasonableness of the Pakistan attitude. But

Pakistan in Delhi

as a matter of fact no agreed formula has been reached regarding the library and talks will continue, as on Kashmir. The communique is beautifully vague. Fullness and cordiality—the first is characteristic of Pandit Nehru and the second of Mohamad Ali—are certainly new and welcome developments in Indo-Pak relations. That the talks did not break down but will continue, this time in the more salubrious climate of Karachi, are hopeful signs of a possible change in the destiny of the Indo-Pak subcontinent. In fact, during these talks, almost for the first time during the last eight years, one had the feeling of togetherness, of the stupidity, if not the insanity of the Partition, of the insolubility of the political problems of the subcontinent. I know, there are people—almost the whole of Delhi for that matter—who believe that coming together is unthinkable. To me, there are hopes, apart from the mystic prediction ascribed to the late Sri Aurobindo. Pandit Nehru has in him statesmanship of that calibre, which can bind men, hopelessly sundered. I believe, Pakistan is getting down to the acceptance of its present position in Kashmir; and the correspondent of the London Times, who put out this story not long ago, appears to have been well informed, despite the vituperations of Dawn and the supposed official repudiation of such 'treachery'.

In this connection, the developments in Pak-Afghan relations are typical of Muslim politics. The deadline of May 15 is past. The Middle East princes are still going about trying to patch up the breaches in Islamic solidarity. Really there has been a lot of bluff on both sides. These marionettes haven't the will or the strength to fight. The credit for the softening of tension must go deservedly to US diplomats. We, of course, remain the villains of the piece, the reputation of the Soviet Union in that direction having already been established. Americans are in no mood to turn Pakistan into another Korea. American mothers will not risk the lives of their boys in another Korea and the Republican Party is afraid of losing the Presidential election, now not far off. So Pakistan has reverted to the methods of diplomacy, typically British in technique. They are trying to put up his Royal Highness, Shah Mahmood Khan, the uncle of

the present ruler. Pakistanis may be right in terms of international law, but they just don't understand that they haven't the resources of the British Empire to maintain the Durand Line and keep the Russians off the Oxus. Some historian should tell them of the terrific cost in terms of (our) blood and money (the Military Accounts Department just broke down in all the three Afghan wars) that the maintenance of the north-west frontier entailed. It is just common sense that this frontier can only be maintained by the combined resources of the whole subcontinent; and it is equally in our interest to help Pakistan in limiting the line of the Russian advance. We may now fiddle, while the frontier is burning and make fun at the impotent rage of Pakistan. It is not yet sufficiently realised that Pakistan, as a buffer state, is among our strongest defences and we must prepare to take over the responsibility from obviously incompetent and incapable hands. This is the historical basis of my superstitious belief in the prophecy attributed to Sri Aurobindo.

On our own limited frontiers, we seem to be blundering badly. It simply cannot be the policy of Pandit Nehru. Our frontier policies of dealing with the Akalis, the Bengalis and Nagas—they are now our frontier tribes—are not characterized by that farsightedness and magnanimity, for which the Prime Minister is rightly known. It appears fated, as things are developing, that these communities will acquire a Muslim League psychology; and as we had to agree willy nilly to Pakistan, we might later have to agree to some such vicious solution of the problems involved. Reports have been received here during the week of large scale arrests of Akalis and Nagas. Without going into the rights or wrongs of the whole position or the political outlook of certain large groups of people, one can still see that we are not following right policies. I think, it was Pandit Nehru himself, who referred at one time to how the Soviets solved their problem of nationalities. Historians used to describe Tzarist Russia as a babel of tongues, races and creeds. How typical of India it sounds. Yet the Soviet Union is now a unified personality. It is historically wrong to believe that this was achieved by

force of arms. Nothing enduring is accomplished that way. The Soviet Union not only recognised the provincial languages but encouraged them by getting school books published in those languages at the cost of the Central Government! Pandit Nehru's philosophy suggests these methods, not wholesale arrests for shouting silly slogans and the like. The Nagas will not give up their head-hunting except by a sincere and powerful drive in the cultural and economic spheres.

We have been too long with the frontiers. This political gossip has unnecessarily clouded the basic economic issues. We missed an opportunity of building up, of course, in a small way, a regional economic unit for Asia. The Simla Conference came to the agreed conclusion that considering the order of funds required for an Asian Payments Union and a regional aid programme, it was best to continue receiving aid on a bilateral basis. Why did we then hold the conference? Of course, it really had not much of a chance any way. The Colombo Powers were a house divided against itself. The other Asiatic powers do not share a common political philosophy. Those who represented us at Simla were congenitally incapable of appreciating the *malaise* in the troubled soul of Japan. The heart of Japan revolts against the scale and technique of American aid. She is struggling to find a substitute in the economies of Asia. We can certainly find a solution. We don't need a moneylender to finance our coming together. Even as it is, one was ready to put in some small capital, which was not without its marginal significance. We buried the scheme ceremoniously. Though quiet and beautiful, it was a thoroughly useless conference. Once again, wherever the spirit of Pandit Nehru is missing, everything goes wrong or nothing materialises. By the by, what has happened to his proposal of going on a voyage on a cargo steamer to relax? It would be just disastrous for us. Outside his personality, there is a vacuum that is almost terrifying. Gandhiji left behind giants. Pandit has bred only pigmies.

Lot else has happened, which has now to be compressed. The Clutterbucks have left dramatically in the American fashion and we are going to have the son of the late Ramsay MacDonald, representing the UK here. What is Pandit Nehru's reaction, for he had strong

feelings about the MacDonald affair, in which the son was also involved. General Maharaj Rajendra Singhji has vacated his post of Army Chief and General Srinagesh of the Southern Command has taken his place. Pandit Nehru has laid the foundation of a National Museum and we are in for a grand institution. Steel

retention prices have been raised and there is some evidence that the Russians are going ahead with their steel project. The week began with a rumour that Ghulam Mohamed—Gulu, as he is affectionately called here—was dead. We now have evidence that he is quite alive. That is not bad.

NEW BUSINESS IN 1954 EXCEEDS Rs. 30 CRORES

Built and developed all these years as a national institution, the HINDUSTHAN has now gained even greater stature, acquired new laurels and has established a glorious record of teamwork in the service of the country. This has been achieved because of its triple foundation in—

From the Calcutta End

ONE of Stalin's miscalculations, one gathers from Mr Truman, was that America would be plagued by a severe slump after the second world war. Stalin's Marxist faith in the inevitability of a slump in a capitalist country may or may not be shared by Calcutta's economists. But the people of Calcutta seem convinced that epidemics are cyclical phenomena. Every fourth year, it is said, Calcutta is plagued by either smallpox or cholera. This four-year cycle theory seems to be well-established, and widely believed in this disease-ridden, congested, unclean, city.

1955 is the dreaded fourth year. December to March is the season when Calcutta is visited by smallpox. It may be because one had the misfortune to suffer from an attack of chicken-pox, one now notices pock-marked faces more frequently in the streets. The season for smallpox is over. Now the season for cholera has started. It has already been declared epidemic by the Corporation. Hospitals are reported to be full with cholera cases.

Calcutta is, perhaps, the only city in the East which is vaccine-conscious. All the hotels and all the big industrial and office establishments are regularly visited by Corporation doctors for vaccinating people against cholera or smallpox. Calcutta's inhabitants do not share the Shavian dislike of vaccination. Maybe they, though Orientals, are no longer fatalists. Their faith in modern medicine is commendable. So also are the efforts of the Corporation. From all street corners, Corporation vans are warning people through loud-speakers that cholera has this year, the fourth year, appeared in an epidemic form in Calcutta.

TABC

It was the editor of the first Bengali weekly, Iswar Gupta, a considerable poet in his own right, who wrote that doggerel "in Calcutta, one lives with flies during day-time and mosquitoes at night". The doggerel caught on—people have been humming it for nearly a century. Flies and mosquitoes are still there. But now in Calcutta one lives under the constant threat of typhoid, smallpox and cholera. These diseases frequently recur in epidemic form

Inside Pakistan

BATTLE FOR SUCCESSION

Mr Ghulam Mohammed's ability and competence were widely acclaimed. Pakistan's Governor-General is an ailing politician. He is reported to be deeply disturbed over the struggle for power among Pakistani politicians. He is reported to have reached the conclusion that it would be better for Pakistan to align with India instead of associating with the Middle East, as the latter policy may mean that Pakistan will become another Iraq or Iran. There may be doubts about Pakistan's future foreign policy. But there is no doubt about Karachi's desire to be friendly with New Delhi.

One gathered from the discussions that the battle for succession could have been easily solved had Karachi not been suspicious about Mr H S Suhrawardy's intentions and designs. It transpired that General Mirza would prefer to remain as the maker and breaker of kings, rather than be king himself. This leaves the field open for Mr Suhrawardy. Some informed foreign correspondents seemed highly impressed with Mr Mohammed Ali, the present Finance Minister. At this stage, one joined the discussion to suggest that, in that case, it would have been wiser for Mr Ghulam Mohammed to groom the present Finance Minister for the Premiership of Western Pakistan. Then, the Khan Saheb could have been persuaded to be the Premier of Pakistan—a choice which would be in the best interest of Pakistan's solidarity.

PUNJABI DOMINATION

It was at this stage of the discussion that one of the foreign correspondents turned to this writer to answer one of his earlier questions. How to fit in Karachi's reported desire to be friendly with New Delhi with the continued exodus of Hindus from East Bengal? How to explain the seeming contradiction between Karachi's declared assurances to the East Bengal Hindus and the continued exodus from Eastern Pakistan? This was where the problem of Punjabi domination entered into the discussion.

Punjabi domination is the most crucial problem in Pakistani politics. To solve this, as well as the

in this city. So, to attain immunity from them, people in Calcutta now live with TABC and vaccination against smallpox. TABC, in case any reader in any modern, sanitary city is unaware of it, is an injection which is supposed to give immunity against cholera and both the forms of typhoid all at one shot. One has to live as a Roman while in Rome. So, one is trying to discover how painful TABC is.

Disease, unemployment and politics are Calcutta's three major problems. These problems are not unconnected. This is not a dissertation on the co-relation between unemployment, poverty, and disease, or between physical, mental and political ailments. But it cannot be a mere coincidence that Calcutta's politics is as distorted and dirty as the city is. Politics in this city has a tinge and a flavour which one who has lived in more sophisticated surroundings for many years finds nauseating.

HIGH POLITICS

Calcutta's internal or party politics may be morbid. But it is not unimaginative in its treatment of High Politics. It is natural that Bombay is more intimate and familiar with Goa, as Calcutta is with India's northern neighbours or NEFA. Nor is it unnatural that theories are current in Calcutta about Pakistan with which even New Delhi is not yet familiar. After all, the refugee problem is one of Calcutta's major troubles. And, the Union Rehabilitation secretariat in this city is now very active not only in dealing with the refugee problem, but also in propounding theories about Pakistan.

One had occasion recently to have a lively and intriguing informal discussion about refugees and Indo-Pakistani relations with some foreign correspondents and their political friends. All seemed to agree that Pakistan was now eager to establish friendly relations with India. Pakistan's economic and political troubles would seem to indicate some such attitude. No one present was willing to risk his reputation by predicting a solution of the Kashmir problem. But certain deductions emerged out of the discussions, which would be well worth retailing.

issue of Eastern Pakistan's domination over Western Pakistan, the separate provinces of Western Pakistan were merged into one unit. Even so, Eastern Pakistan continues to have numerical superiority over the combined unit of Western Pakistan. To avoid domination of any wing by another, the parity basis of representation to the Constituent Convention has been fixed. Many political parties in Eastern Pakistan oppose this basis of representation. They claim proportional representation.

With Karachi's support and consent, Mr H S Suhrawardy recently visited Dacca to smooth matters over. He succeeded in wooing Maulana Bhashani's support. Maulana Bhashani's associates now claim that they supported the plan in the knowledge that they would have opportunity to include the policies of the United Front in the Pakistani Constitution as the Convention, as it was then called, would

have legislative powers. It is difficult to appreciate how this can be possible on the basis of parity representation. This is where Mr Fazlul Huq holds the trump card. There is, of course, another theory that Mr Suhrawardy secured the tacit support of both Maulana Bhashani and Mr Huq with the assurance that, when he becomes Pakistan's Premier with their support, he will ensure Eastern Pakistan's claims.

ENGINEERED EXODUS?

What has all this to do with the seeming contradictions between Karachi's open assurance to East Bengal Hindus and the continued exodus? Some imaginative foreign correspondents are inclined to the view that the Punjabi element in Pakistani politics is determined to assure its domination. Eastern Pakistan still has a numerical superiority over the merged unit of Western Pakistan. But this advantage Eastern Pakistan will lose if all the Hindus can be driven out of East

Bengal. Eastern Pakistan's administrative set-up is dominated by Punjabi and non-Bengali Muslim elements. These elements have joined in a conspiracy to create conditions in which the Hindus may be forced to leave Eastern Pakistan.

Such an explanation of the continued Hindu exodus, even after Karachi's declared assurance to East Bengal Hindus, is now widely current in Calcutta. Stories told by incoming refugees lend weight to some such assumption. Wider issues relating to the fundamental basis of Pakistan as a future State are involved in these developments. Apart from these wider issues, latest developments in Eastern Pakistan are rude reminders to Mr Suhrawardy, if not to Karachi, that, in winning over Maulana Bhashani, he has won a pyrrhic victory. Fazlul Huq may be old and ageing, but he is still the most popular political figure in Eastern Pakistan. He does not accept the parity basis of representation.

Russians, it is argued, for example, would never have "given in" on the Austrian peace treaty had it not been for the military power of the West (through NATO).

The Labour Party, on the other hand, is not all at one on questions of foreign policy. In the party political broadcast of Mr Griffiths, the question of peace is treated defensively—that, when the Labour Party is returned, it will pursue with "greater vigour" the settlement of

all outstanding questions with the Russians and that efforts will be made to "cut down" on the number of experimental explosions of nuclear weapons. In the constituencies, however, the individual candidates adopt a more offensive and positive attitude to these questions. At one meeting which your correspondent attended, the candidate called for the "banning of all nuclear weapons", pledging himself to strive for it, if returned. Mr

Attlee, however, is content with philosophic generalities, hoping that the electorate will acknowledge his seniority among British politicians. "The problem of the world", he said at one of his major public meetings, "was fear". He offered no solution.

One clear picture emerges from the results of the borough elections in England and Wales held last week (two weeks from polling day of the general election). Conserva-

From the London End

The Election that Fails to Wake Up

IT is generally acknowledged that the current election campaign is unprecedented for its lack of public enthusiasm. The candidates are facing a real struggle—not so much against their opponents in the campaign, but in getting the electorate to the meetings. Had it not been for the radio and the television, the parties would certainly be most unsure whether their positions on the various issues are clear to the people. But even here as a survey of the BBC indicates, the electorate tend to switch off the radio or turn on to another programme whenever a party political broadcast is taking place. Those who have television turn on the political "performances" more from want of entertainment than from real interest. Except for the most blatantly partisan press, the daily newspapers are being unusually "objective" about what is going on and in most cases, their commentaries deal with the more comic aspects of the elections. Some of the newspapers give their "objectivity" so academic a slant—lengthy excursions into the statistical probabilities of the situation—that their real value is lost not so much from the layman's lack of enthusiasm as from his lack of comprehension.

Almost imperceptibly, the political

parties are adjusting themselves to the realities of the situation and are therefore forcing through what may be called "shock" tactics to provoke the electorate to take sides. The people, if at all worried, are worried about one thing—the H-Bomb. It is, therefore, this particular worry that the parties are exploiting and although both Conservative and Labour are agreed on the "manufacture" of the bomb, they vary the theme in such a manner as to give the impression that there exists a basic difference in their attitudes on this question. And so, starting off from this alleged difference, all the problems of foreign policy have been thrown into the election controversy, and they have taken precedence over all other issues.

THE INTERNATIONAL IMPACT

Most people now recognise that the current dramatic forward march of international events in a favourable direction is linked, in one way or another, with the British elections. The *Times* Washington correspondent was unusually emphatic the other day. Reporting the press conference of President Eisenhower on talks at the "summit", he drew the conclusion that the favourable

reaction of the United States to the British proposal for talks with Marshal Bulganin was more the outcome of the State Department's "desire to see a Conservative election victory" than the reduction of international tension through a Big Four meeting. In any event, the speed with which the British initiative for the talks has proceeded must seem unusual if account is taken of what happened in the past.

The favourable way in which international relations are moving is an obvious advantage for the Conservative party. And while it should by no means be implied that the British initiative is being taken solely for election purposes, it is clear from the manner in which the general public are reacting (as shown in the local election results), that Tories are well on the way towards securing the support of the people on questions of "peace through negotiation". With surprising speed, they have welcomed the new Soviet disarmament proposals and they argue convincingly enough to a generally ill-informed public that their past policy of "peace through strength" is bearing fruit, that is, that they have, as one Tory leaflet put it, "frightened the Russians" into negotiating with the West. The

tives and Independents regained control of many of the boroughs which they had lost in the swing to Labour in 1952, and of the seven councils where the Tories have won outright control from Labour this year, four are marginal Parliamentary constituencies. The Tories made a conspicuous advance in Lancashire where the Labour Party had hoped to cash in on the textile slump. In all, Labour lost control of 11 councils, and in three others where they were previously on level terms, the anti-Labour elements have gained control. Measured in terms of council seats, Labour lost 390 seats and the Tories gained 346 seats.

This trend—and it is nothing less than a trend—should be taken into

account in the general arithmetic of the elections, in particular the relation between votes and seats in Parliament. At the last general election Labour won 48.8 per cent of all votes cast, won 295 seats while the Conservatives with 48 per cent of the votes secured 321 seats. Had the two parties shared the votes equally, it is estimated, the Conservatives would nevertheless have won between 40 and 45 seats more than the Labour Party. To secure parity in Parliament, the Labour Party in 1951 needed at least a two per cent margin of votes in its favour. Thus if the Labour Party were to govern effectively, it would need a majority of at least 5 per cent of the votes cast. The handicap for Labour lies

in the greater concentration of the working class in particular areas thus making for "safe" seats and accounting for many "wasted" votes.

In this situation, the opportunities for Labour being returned depends on their fortunes in the marginal constituencies, *ie*, in which the difference of the votes cast for the two parties is no more than 2 per cent. It is precisely in these constituencies that the *News Chronicle* Gallup poll is most frequently held and the weekly published results of the poll show that Conservatives are gaining in support—49 per cent of the poll being for the Tories and 48½ per cent for Labour in last week's survey.

Hock Lee Bus Company and Singapore Riots

(From Our Malayan Correspondent)

THE dispute between the Hock Lee Bus Company and the employees of that company which has resulted in the riots in Singapore during the last few days appear on the surface to be a normal type of dispute over the recognition of two rival unions. One union is called the Hock Lee Bus Employees' Union, the other the Singapore Bus Workers' Union. Although this second union does not cover all the bus workers in Singapore, it certainly has very much more general support than the first. The Hock Lee Company is a Chinese company managed by a fairly recent arrival in the colony. He uses his wealth to run the True Light Church, a self-governing self-propagating branch of the Church of England. The general standard of welfare activities and wages in the company compares favourably with that of other bus companies in the colony. It is only on the issue of membership of the Union that the dispute really turns. Several members of the Bus Employees' Union have given evidence in the courts that they thought that it was a condition of their employment that they joined the tied union.

The newly-elected Singapore government has only just taken office and it is rather a peculiar feature of the whole dispute that it should take place just after the Labour Front has become the government. The Labour Front is a union of left wing parties with very much the same character as the Labour Party in England. To the left of this party is a party known as the Peo-

ples' Action Party, the members of which, although not members of the Communist Party (as it is proscribed in the colony) have a very similar programme. It has been suggested that the Communist Party thought it so unlikely that the left wing parties should take over the control of the government, that all arrangements for this strike had been undertaken before the elections. Whether this is true or not, there is not the slightest doubt that many other people besides the actual bus employees took part in the strike. One of the largest sections of the general community supporting the strikers were the Chinese students of three middle schools, the Chinese High School and the two branches of the Chung Cheng High School. Readers of the *Weekly* will hardly be surprised at the participation of students from the Chinese schools in this dispute in view of my previous remarks about Chinese education (Chung Cheng now has over *four thousand students*, twice the reasonable capacity of the school and many times greater than the pre-war figure). But in the case of this dispute, lorries were provided by a hand unknown to carry the students around, free drinks were offered to them at appropriate intervals and even meals.

There is little sign of the shortage of funds common in industrial disputes. Wherever there is a large crowd there are officials appointed presumably by the strikers (although often non-strikers) to organise traffic and at points in the crowd there are orators from outside,

some of whom play on the theme that the churches and capitalists in combination oppress the workers by forbidding them the right to organise. In addition there is the normal Chinese practice of carrying on a programme of rumours and counter-rumours to confuse the main issues as occurred so successfully with Lin Yu Tang when they wanted his retirement. Just as in China attacks on the churches were supported by photographs and stories of nuns strangling their orphan charges and missionaries secretly murdering members of their congregation for money, so in Singapore we have a charge that the Minister for Labour has received a large sum of money from the Bus Company to get the police to intervene. Up to the present, the number of casualties seems to consist mainly of those outside the ranks of the workers and police. The police have acted with very much more restraint than the organisers of the dispute who seem, in some cases, to have stood by while the mob worked itself up.

I hope I have written enough to show that this dispute is by no means an ordinary one over the recognition of a union. It is of course disgraceful that in a colony as advanced as Singapore, there are still tied unions, but, given that that state of affairs exists, there can be little doubt that there are strong interests in the colony whose aim is to use any dispute to take control of the colony's affairs, irrespective of the sort of government.

Book Review

An Indian Reference Annual

The New Year Book—1955, Edited by P C Sarkar, 12th issue. Published by S C Sarkar & Sons Ltd, 1-C College Square, Calcutta 12. Pp 312; price Rs 3/4.

THE compiler of an year-book has to ask himself, for whom is he compiling? An Indian publication, it may seem, has the course clearly chartered out for it. Either it has to be ambitious and cover the rest of the world as well as India or it may choose to be modest and supplement standard foreign publications concentrating on information relating to India, which they do not cover adequately. The second course would appear to be an obvious one for an India publisher to take. But the choice is not so simple as that, for standard year-books published abroad are expensive and beyond the reach of the ordinary reader. Hence the compromise—a limited coverage of world news and an exhaustive coverage of Indian news. The Indianness of the New Year Book, which enters the twelfth year of publication is not in question, since 277 out of its 392 pages are devoted to India. The world coverage is compact and useful, but in Indian coverage, the editor falls between two stools, width and depth. It is at the range of this excellent compilation, perhaps, that some readers may cavil: Why so much of sports and films, for instance, but so little of literature and nothing of art? Indians abroad is another omission that one detects at a cursory glance.

Otherwise, this handy volume of reference containing useful information, on topical matters including general information such as chronology of world events, geographical information about mountains, lakes, islands, etc, developments in the scientific field, award of prizes and titles, the United Nations, sports and games, and facts and figures about world today. A major portion of the book is devoted to India, and contains a wealth of information about India's historical background, physical features, etc, her new constitution, general elections, political parties, industrial development, public finance, foreign trade, etc. The publication contains a lot of Economic statistics relating to India's agricultural resources and production, a detailed description of the development of Indian indus-

tries, banking, currency, industrial finance, and insurance, and a useful section on India's Five-Year Plan and the progress achieved during the first three plan years. Useful information bearing on community development projects and National Extension Service, foreign aid and loans received by India, Indian labour legislation, transport and communications, public health, and the Indian Press also find a place, though understandably they have had to be dealt with briefly. After providing a lot of useful data relating to events in the world of sports and games, the year book ends with a brief section on who's who in India and Pakistan.

One or two suggestions may be offered: in the section relating to India's new Constitution, the amendments that have been effected so far have not been given, though

it is stated that "certain amendments of fundamental rights regarding freedom of speech and expression, freedom of assembly, etc, have been passed in spite of vehement opposition from a section of the Parliament in 1951". It would be useful to have the text of the amendments passed so far. The section dealing with India's neighbours includes Afghanistan, Burma, Ceylon, Nepal, Tibet, China and Pakistan. In view of the growing interest in the affairs of Afro-Asian countries, it would be useful if the year book includes information about other Afro-Asian countries.

On balance one gets the impression that the year book is heavily weighted in favour of economic facts and statistics relating to India, and it could as well be described as the Indian Economic Year-Book—1955.

Staff Insurance

T Bagchee

INDIAN Insurance Companies introduced a staff insurance scheme some years ago under which the risks on the lives of "persons gainfully employed under a common employer" were covered by issuing separate policies at reduced rates of premium, depending upon the age of the individuals and terms of insurance. The employer did not have to contribute towards the premiums under this scheme, but he had to take the responsibility of collecting the premiums, by instalments if necessary, and of remitting the amount to the company in a lump sum once a year. A reduction in the rates of premium was effected, largely from savings on the commission payable to agents. Though the reduced rates of premium was in itself an attraction, the sale of this class of cover was never very brisk in the past, possibly because insurance agents were not enthusiastic in working this scheme as their remuneration was so much lower. However, when in the middle of last year, two leading insurance companies began to push the scheme aggressively among the big banks and public utility companies, the insurance companies, particularly the small and medium-sized companies, raised a protest against the scheme. The matter finally reached that august body, the Life Insurance Council and its Executive Committee immediately placed certain restrictions on the operation of the scheme and appointed a sub-committee of experts to look into it.

Staff insurance schemes, in force in UK, USA and other countries should have the following basic features:

(a) The policies are issued under a group scheme to the employer;

(b) The premiums are paid by the employer or by the employer and employees jointly;

(c) The amount of assurance on each policy is based on some specific plan to preclude individual selection; and

(d) The reduction in premiums corresponds to the actual savings in cost and not in commission alone. The staff insurance scheme issued by Indian companies does not comply with the basic requirements stated above. This type of insurance is clearly devised to pay additional rebates to a select few at the cost of the other policy holders and

agents. The scheme is therefore discriminatory in character and inimical to the healthy growth of agency force. The Indian Life Assurance Offices Association, in its representation dated March 7, 1955, addressed to the Chairman, Executive Committee of the Life Insurance Council, demanded that the so-called staff insurance schemes, other than those issued under group insurance schemes as defined in section 4 of the Insurance Act 1938, should be abolished.

Insurance companies suffered a considerable reduction in renewal premium incomes on account of general reduction in the premium rates introduced in March 1955. The staff insurance scheme in its present form, according to the representation made by the Association, "is not justifiable as it overestimates the savings in the cost of procurement and servicing of business". The Association is of the view that "offering different rates of premium for the same benefit to the same class of persons, according as they come under the staff insurance schemes or otherwise, is against public interest and such practice should be prohibited by law". While considering the modifications placed on such business by the Executive Committee of the Life Insurance Council, the Association, in its letter dated May 3, 1955, stressed that such modification "in no way touches the fundamental aspects and does not remove the evil underlying the writing of business under the said scheme". Judged from the utterances of the Chairmen, managers and actuaries on the subject, the staff insurance scheme received more condemnation than approbation. The opinion expressed by experts in the symposium on the subject held by *Insurance Underwriter*, a well-known Calcutta contemporary, also supports the above view. The claims of benefits that this class of policies confers, made by its supporters, will not stand scrutiny. It is detrimental to the interest of the general body of policy holders and agents. It does benefit a few salary earners at the cost of the rest of the policy holders and the entire body of insurance agents. The report of the sub-committee set up by the Executive Committee of the Life Insurance Council is expected shortly.

The Story of Bank of America

H T Parekh

WITH the transformation of Imperial Bank, the biggest private commercial institution in the country, into the State Bank of India, commercial banking is on the threshold of a new era. At such a time, a study of the history and working of the Bank of America NT & SA,* the biggest commercial bank in the United States of America and in the world, can throw new and very revealing light on what is regarded as sound commercial banking in other parts of the world outside Great Britain. British banking practice has become so much of a model in India that the study of materially different conception of commercial banking prevailing elsewhere in the world has been totally neglected. One of the consequences of this neglect is that joint stock banking in India, in its present form, can hardly be regarded a living or a growing organism.

The consideration for opening a branch bank in India is primarily to draw deposits from the public, and not to extend material assistance to the residents and small business in the locality concerned. The Italian founder and the soul of the Bank of America, A P Giannini, on the other hand, began aggressively to develop joint stock banking in California fifty years ago on unorthodox lines by being all too ready, as soon as he opened a branch, to lend to the local community for every sound business proposition, before he thought of attracting local deposits. The core of banking, as he understood it, was to be able to offer assistance to "the little fellow", the person of moderate means; that was the surest way to gain public confidence and through it, to expand banking. This is best illustrated from the following advertisement he gave about his Bank of Italy, under which title the bank was first started:

"The Bank of Italy has been, from its inception and is now, ready and anxious to make loans to people owning, or intending to build, their own homes—to the smaller mortgage borrowers who need \$1,000 or less. The Bank of Italy has built up its present reputation, its present enormous resources, largely through catering to the small depositor—the

wage earner, the producer, the small businessman, the man who owns a small home or a piece of improved property, the man who is the bone and sinew of Southern California's progress. This bank has never catered to speculators . . ."

A P Giannini's novel and dynamic approach to banking resulted in most rapid expansion of Bank of Italy's resources in California, even though for a long time he was not able to overcome the prejudice of the established bankers, particularly of New York, who perhaps regarded Giannini's banking ideas as heresy. As Giannini took his banking to every nook and corner of California which was as yet undeveloped, he suffered from no inhibitions about the nature of advances he should make. He was ready to consider formally any proposal for advance however small or unusual, so long as it passed through his astute test as a business proposition.

Apart from normal short-term bank advance against commodities, Giannini willingly advanced against property, fruit farming, poultry farming, forestry and fishing, gave loans for development of agricultural activity, including medium-term loans and even lent to local bodies for water works. For instance in 1919, 15 years after the bank was started, 50 per cent of the bank's loans went to farmers, packers and cannery. In short, he regarded as sound banking financing of any legitimate business or industrial activity so long as it was not of a speculative character and meant economic expansion, because the loan would then be self-liquidating in due course.

As a characteristic visionary banker of this century, Giannini strained every nerve to win support of the small investor, the small depositor or the small borrower, while he was indifferent to gaining support of the big businessman or the rich depositor. He spurned large loans. He preferred to make small advances and whenever he opened a new branch, he began by bringing down his lending rate to reasonable level, if he found the prevailing rates exorbitant. He revolutionised traditional banking. For instance, he pursued actively the idea of savings by school children. His branch managers visited schools regularly to popularise banking by accumulating pennies from school children, even though

such endeavours meant little immediate gain. Likewise, field workers made collections in factories, mining camps, lumber camps as well as on board ships. As a man of the people, Giannini despised the idea of a bank manager cloistering himself in a special cabin. Even in the early days, he advised "that if we would have anything to do with a bank in New York, we would see to it that the managing officers, from the President down, were put out in front and in the open where they would come in contact with and greet the people as they would come in and go out of the bank. This is one thing lacking in most of the New York banking institutions." A more revealing sidelight on Giannini can be had from the fact that more than once when speculative trend took prices of his shares to soaring heights, he was the first to issue open warnings to the public not to fall a prey by buying shares of his bank at too high prices!

BANKING AND AGRICULTURE

Perhaps the most enduring contribution of Giannini to commercial banking was to extend commercial banking wholeheartedly to the farmer. In his scheme of things, rural banking was an integral part of general banking and the banker's function was as much to finance agriculturists as to finance commerce or industry. "The Bank of Italy began putting the borrowing farmer on a budget, a radical departure in that day. The budget ran the whole gamut of farming costs: capital expenditure, such as a team or a tractor; materials and supplies from gasoline to twine; operating costs for crop-plowing, cultivating, irrigating, pruning, harvesting and hauling; an estimate of monthly advances; and crop forecasts." Giannini also promoted separate banking subsidiaries known as "Cow Banks" to finance livestock and land banks. How close agriculture was to Giannini's heart was best disclosed when he refused to take the large commission that was due to him and made it over as an endowment with which began the Giannini Foundation of Agricultural Economics at the University of California costing \$1½ million. By 1930, the Bank of Italy moved into first place as a backer of agriculture in California, its investment in farm mortgages being 9 per cent of

* *Biography of a Bank: The Story of Bank of America NT & SA.* By Marquis and Bessie R James. Harper Bros, York, 1954. Pp 566.

the State's farm-mortgage debt. What is more, 100 branches had loans over 70 per cent of local deposits in the local communities which included many rural branches. "Actually it was city money that went to the country."

GROWTH OF GIANNINI EMPIRE

The book traces at length the growth of the bank from 1904 when Giannini started the Bank of Italy in Southern California and how he expanded its activity by fighting against the concept of unit banking which held the field and for establishing branch banking which was widely opposed in USA. He took over bank after bank so that by 1930 the resources of the Bank of Italy amounted to \$1,000 million. In 1930 he merged the Bank of Italy and the Bank of America of California which also he controlled into the Bank of America National Trust and Savings Association operating in California. Along with the Bank of America in New York, which was also under his control, the total resources under his management exceeded \$1,800 million in 1930.

Giannini exercised his control through the Transamerica Corporation which held the stock of these banks. The slump of 1931-32 and the banking crisis of the time spelled a major catastrophe in the life of the bank; Giannini almost lost control and some activities of the bank were about to be liquidated. But old Giannini could not bear the dream of a lifetime being shattered and by organising a campaign with the support of stockholders he performed the miracle of regaining control. The authors relate how Giannini fought the Federal Reserve authorities and succeeded in his plans for expansion of state-wise branch banking. The bank's progress can be judged from the growth of its resources which were around \$1,800 million in 1940 and rose during the war years to \$5,000 million in 1945, making it the biggest bank in the world. By 1950, these had further grown to over \$6,800 million (over Rs 3,200 crores) with over 4 million deposit accounts.

During the war years, the bank's activities turned to financing of war contracts which included manufacture of aircrafts, ships, etc, and in the post-war years, with greater vigour it financed house construction, power production as well as municipal schemes.

The enterprise and initiative shown by the bank throughout its existence of half a century to pro-

mote agricultural or industrial development of California is perhaps unparalleled in world banking. Giannini left no fortune, when he died in 1949 and well before his death, he had spent half of his small fortune in establishing the Bank of America—Giannini Foundation. His life work is the story of a great private enterprise yielding enormous public good.

MORAL FOR INDIAN BANKING

From this absorbing account of the Bank of America, the moral for Indian banking is clear. It is an axiom of Indian banking that advancing to agriculture, real estate and unsecured, personal loans is unsound banking. In USA such loans are consistent with sound banking and are permitted by law. If joint-stock banking is to play a positive

role in the development of all aspects of Indian economy, the bankers may well ask themselves the validity of their assumptions. It is wrong to follow blindly the British tradition without taking into account the course of commercial banking in other parts of the world. If Indian banking is not made flexible enough to meet the peculiar requirements of the Indian economy, joint-stock banking can have no future in India. Neither vision nor boldness has characterised Indian banking. Now is the time for initiative both by the bankers and by the central banking authorities on whom rests the heavy responsibility of right guidance. Government's approach to this vital question is to alter the form of both co-operative and joint-stock banking while giving little attention to what constitutes substance of banking.

The "Shell" Transport and Trading Company, Ltd.

Greater Operational Activity Results in Increased Sales Volume

Heavy Capital Expenditure Inescapable

Substantially Enlarged World Consumption

Sir Frederick Godber's views on Oil Prices

THE Annual General Meeting of The "Shell" Transport and Trading Company, Limited, will be held on June 1 at The Chartered Insurance Institute, 20, Aldermanbury, London, E.C.

The following is the statement by the Chairman, Sir Frederick Godber, which has been circulated with the report and accounts for the year ended December 31, 1954:—

The Board of Directors

Little more than a year after his resignation from the board owing to ill health, Sir Andrew Agnew, our colleague for so many years, has passed away.

In my statement last year I paid tribute to Sir Andrew's half-century of devoted and untiring service to your company and to the group. I recalled, too, his outstanding work in building up the group's tanker fleet into one of the world's largest and most efficient maritime enterprises. I feel sure you will wish to join in extending sympathy to Lady Agnew and to all the members of his family.

Balance-sheet and Revenue Statement

The financial results of the group are reported elsewhere in this statement. The dividends paid to the parent companies for 1954 amounted to £26,841,299, compared with £22,186,010 for 1953. In consequence the net revenue of your company, which consists mainly of dividends from the group, was £10,527,844, against £8,670,523 in 1953.

After deducting the Preference dividends paid and accrued and the interim Ordinary dividend of 1s. per £1 unit free of income tax, paid on January 18, 1955, there remains available for distribution, including the carry forward from 1953, an amount of £9,538,414.

The directors now recommend a final dividend of 2s. per £1 unit free of income tax which, if approved, will be payable on June 8, 1955, and will absorb £6,541,763.

Reference has already been made in this report to an issue during 1954 of 10,902,939 Ordinary shares

through the capitalization of part of the company's share premiums reserve.

When commenting on this issue in my statement last year, I said that one of its objects was to broaden the basis of the ownership of the company. You may, therefore, be interested to learn that during 1954 registered Ordinary stockholders increased by approximately 10,000, and in December numbered over 142,000. You will appreciate, of course, that the number of individuals who own the equity of the company must exceed this figure by a substantial margin, there being no record of those who prefer to be registered in the name of nominees, or of holders of Ordinary stock in bearer warrant form.

By means of such issues from time to time the shareholder has obtained in concrete form acknowledgment of the growth of the assets which his shares represent, and of the business in which they are used.

The Royal Dutch/Shell Group

The assets of The "Shell" Transport and Trading Company, Limited, are substantially in the form of investments in a large number of companies known collectively as the Royal Dutch/Shell Group. Your company has a 40 per cent interest in these companies and the Royal Dutch Petroleum Company a 60 per cent interest.

The greater part of these investments is held through three principal wholly owned operating companies—The Anglo-Saxon Petroleum Company, Limited, N.V. De Bataafsche Petroleum Maatschappij, and The Shell Petroleum Company Limited. The managing directors of each of these three companies are identical and at present are: The Hon. Sir Francis Hopwood, Jonkheer J H Loudon, H Bloemgarten, J W Platt, F A C Guépin, F J Stephens, L Schepers.

At last year's annual general meeting I mentioned that it was proposed to make available a figure of group income for 1954 on a half-yearly basis. The publication of these results, which was made in Septem-

ber, was widely appreciated and favourably commented upon, as affording an opportunity of following more closely the current trading results of the group. I am glad to say that this year we propose to publish similar results on a quarterly basis, and that figures for the first quarter will be available within a few weeks.

I will now proceed to the report on the group financial results for 1954.

THE ROYAL DUTCH/SHELL GROUP REPORT ON THE YEAR 1954

Financial Position

Net income of the group for 1954, after taxation and elimination of minority interests, was £134,474,218, compared with £130,413,373 in 1953.

Higher activity in all phases of the group's operations resulted in an increase in the volume of sales in 1954 of nearly 10 per cent in world outside North America, and of 4 per cent in North America. This improvement was reflected in an increase in group net income before taxation of £23 million. The greater part of this increase, however, has been offset by higher taxation provisions, to which reference is made later. As a consequence of these larger tax provisions, the net income of the group after taxation increased by only £4 million over the previous year. This is a very significant fact.

Out of the 1954 income, dividends of £26,841,299 have been paid to the parent companies—Royal Dutch Petroleum Company and The "Shell" Transport and Trading Company, Limited.

Sales proceeds and other income, amounting in 1954 to £1,851,039,043, were higher by £150,324,593 than in the previous year. The greater proportion of the more valuable light products achieved in 1953 sales was maintained in 1954, in spite of the fact that the higher demand pressed more heavily on fuel oils. Geographically the improvement was particularly pronounced in Europe, where it is attributable to the record level of economic activity reached

in western European countries during 1954. The increasingly high standard of quality of group companies' products also contributed to the improvement, since it resulted in public preference for them becoming more marked.

In the USA sales and income of Shell Oil Company were higher, in spite of the US oil industry's general experience during 1954 of more difficult conditions, which were reflected in a reduction of allowable production of crude oil, and in one of the smallest annual increases in consumption since the war.

Costs and expenses of the group rose in total at about the same rate as sales. Operating expenses amounted to £1,044 million in 1954, against £977 million in 1953. In addition to those costs directly attributable to the production, manufacturing, transporting and marketing of oil and chemicals, there are other heavy expenses connected with exploration and with research, both of which increased. In 1954 group companies spent more than £50 million on exploration in an intensification of the search for new oil; this, like the expenditure on research, is a cost incurred to safeguard our future position.

Depreciation, depletion and amortisation charges were, at £155 million, higher than in 1953 by £7 million. The upward trend in this item during recent years has thus continued, and is likely to do so in the future in view of the high level of present day capital expenditures.

Larger sales have also meant higher sales taxes, excise duties and similar levies, which rose by £58 million in 1954 to a total of £406 million. The steep increase in this item is in great part attributable to the increase in sales in Europe, where these levies are particularly onerous.

Taxation on income of group companies throughout the world in 1954 was £102 million, and was thus £19 million higher than in 1953. This increase is principally due to the fact that taxable income was substantially higher in 1954 than in 1953. The provision also includes certain charges in respect of extra or new taxation levied during 1954 and relating partly to prior years, as is to be expected in operations so widespread and diversified as those of the group. In some years such charges arise, while in other years amounts may be brought back into the accounts. In 1953 these factors operated on balance in our favour, but in 1954 this was not the case.

It must be remembered that income taxes are levied on group companies by fiscal authorities all over the world, in fact by more than 50 different governments. In the same way the income of £134 million is spread over an equally large number of countries, and while a few of these contribute a very significant proportion, no preponderant part is attributable to activities in any one country.

Assets and Liabilities

Turning now to the statement of assets and liabilities, you will see that some changes in presentation are made, in order that a more detailed and clearer picture of the financial position may be given. Long-term receivables have been separated from current receivables, and a new item, short-term borrowings, appears under current liabilities. This is made up of bank overdrafts, short-term accommodation bills with banks, and long-term borrowings due within one year; the two last items were formerly included in accounts payable. In addition, separate figures have been shown for cash and for short-term marketable securities.

There have again been substantial increases in property, plant, and equipment, the gross investment in which stood at £1,664 million at the end of 1954. The rise in the figure for investments from £85 million to £104 million is due to a number of causes, the chief of which is the group's initial investment in Iran; there were also other substantial investments in joint production, refining, and marketing enterprises.

Stocks of materials have continued to fall—from £102 million to £92 million—despite the higher level of activities and some rising prices. This is due to the development in group companies of the most modern methods of material indenting and stock control, by means of which they have taken full advantage of the easier world markets for materials. The increase in trade has resulted in the value of oil stocks and of accounts receivable rising to £216 million and £199 million respectively.

It is gratifying to note the increase in cash and securities, which at the end of 1954 together amounted to £346 million. Against this improvement, however, must be set very substantial forward capital commitments moreover taxation liabilities have risen to £129 million, and these must be met irrespective of the course of our future generation of funds. It is essential for our cash position to be strong, in order that we may be in a position to meet requirements for funds in nearly every country in the world, in most of which facilities for raising funds are limited or negligible.

Capital Expenditures

Our capital expenditures during 1954 were quite as high as was predicted a year ago. The figures for the past four years in millions of pounds were as shown in the table below.

About two-thirds of these outlays have been met from depreciation and other provisions, and the remainder from the retained earnings of the group.

In the light of information available at present it appears probable that the future levels of capital expenditures will, if anything, be even higher than in the recent past. Since such vast sums are concerned, it is desirable to give an explanation of the factors governing them.

In the survey of activities it is suggested that the rise of world energy demand over the next 25 years may be of the order of 3 per cent annually, in which case demand would double within this period; and that the oil industry will have to contribute an increasing proportion of these great additional requirements. Moreover the capital expenditure necessary for finding, producing, shipping, manufacturing and marketing each extra barrel of oil has risen considerably in recent years. This trend is attributable to higher capital costs in all phases of the industry—to the ever-increasing cost of finding new oil to replace reserves;

Capital Expenditure, 1951-54

	1954	1953	1952	1951	Total	1951-54
	£	£	£	£	£	%
Exploration and production ..	110	101	96	88	395	50
Oil refineries and chemical plants ..	57	72	51	45	225	28
Marketing facilities	28	30	30	24	112	14
Ocean-going fleets	27	13	6	3	49	6
Miscellaneous	4	4	5	4	17	2
Total	226	220	188	164	798	100

to rising costs of capital goods; such as ships; to the public demand for higher quality products, which entails increasing use of expensive plant such as catalytic cracking and reforming units; and to the demand for a higher standard of technical services, which frequently involves the provision of extra equipment.

In this sense, therefore, much of our capital expenditure may be defensive, and consequently does not offer prospects of any great increase of income. The normal test of profit-earning cannot be applied to such investment, which must be treated rather as a cost of maintaining our business than as new investment on which added return can be expected.

ECE Report on Oil Prices

The explanation which I have just given you should afford a good understanding of the financial administration of the group's operations, and for that matter of the business of any of the larger companies in the international oil industry. I have given explanations on similar lines in previous years and I hope, therefore, that you have been adequately informed, and so have obtained an understanding of the financial aspects of the industry.

I stress this because recently there has been considerable publicity concerning oil prices arising out of a document published last March by the United Nations Economic Commission for Europe. This document set forth the results of a study made, on its own initiative, by the Secretariat of that Commission for its Coal Committee, and while there seems to have been a serious effort to elucidate for the committee the basis and machinery of prices at present charged for oil in western Europe, the fact that on the authors' own admission the document had to be based on incomplete knowledge of relevant facts, and that its conclusions, as well as many of its statements, are accordingly erroneous and academic, makes it very questionable whether it ought to have been presented to the committee as a contribution of value.

Furthermore, on the accepted precept that a little learning is a dangerous thing, it is even more questionable whether it should, or even would, have been published in the ordinary course of events. However, the decision to publish it was undoubtedly influenced by the fact that before even the coal committee, for whom it was prepared, had had an opportunity of considering the document, leakages of its contents

appear to have taken place; and the Press here as well as elsewhere gave much publicity to distorted versions, which alleged that the document accused the oil industry of charging extortionate prices through the machinery of an international oil cartel. Such accusations are not included in the report itself, nor is there any foundation for them.

Nevertheless, these distorted "leakages," and the sensational criticism indulged in on the strength of them, engendered a good deal of interest in the subject generally, whereas probably the report itself, if it had not been so heralded, would not have done anything of the kind, either on its merits as a study or as sensational material. In fact since its publication views on its limitations have been widely endorsed in the Press, as well as by spokesmen of HM Government and the US State Department. Nevertheless, in the light of the events which I have described it is appropriate that I should supplement my comments on the finances of the group in relation to certain statements and inferences in the ECE document and the critical expressions which it evoked.

The point, supposedly extracted out of the document, which has been responsible for most publicity is that prices of oil products, such as petrol, in western Europe may be too high. The reasons given for this suggestion are that such prices are linked to prices in the USA, and that the cost of producing crude oil in the Middle East, which is the main source of supply for western Europe, is lower than that in the United States. Actually the document does not contain any such statement in this precise form. This is the interpretation applied by those responsible for the publicity to certain phraseology in it; but since the wording of the document might without too much stretch of imagination carry the implication in question, and since it has been quoted in many quarters as a positive criticism of the industry, it is best that I should deal with it as such.

Prices and Profits

I am sure that all of you must know that, like most other commodities, crude oil and also oil products are sold on the basis of market prices. Market prices in their movements are not necessarily respecters of costs, let alone costs in one particular area or particular phase of the business. What, therefore, is the criterion by which to judge whether or not, a

market price at a given moment is too high?

The total profits of the major oil companies, including our own, represent large sums in terms of money. But the quantity of oil which is sold is also very large, as is the capital required to put it into consumption. I will use our own companies' results in dealing with this question. Our business is primarily financed by our shareholders, who provided the money with the sole object of receiving some reasonable return on it in relation to the circumstances. The profit of the group for the last year was £134 million, and this means a return on capital employed of less than 14 per cent. We sold 26 thousand million gallons of oil and therefore on all operations, that is on producing, shipping, refining, and marketing combined, our profit margin worldwide was about 1½d per imperial gallon. By what standards can either of these results be judged excessive?

Even so, only a small proportion of these profits go to the shareholders in dividends. I explained to you last year in cold terms that, if we are to maintain our business all over the world in strength and in progress, heavy capital expenditure is inescapable; and also that, since the capital requirements of the international oil business have now outgrown the money markets of the world, they can be financed only by retaining in the business an appreciable proportion of earnings. Even in the USA, where capital is much more plentiful, it has been estimated that 90 per cent of gross investment in the oil industry since the war has been financed by funds generated within the industry.

I have already commented on the great increase in energy requirements forecast for the future, and the part which the oil industry is expected to play in filling these. We should be failing in our duty to the public as well as to our shareholders if we did not continue to make whatever provision is possible to enable us to play our part in this expansion. To the extent, therefore, that these future requirements must be financed out of earnings, it is a complete fallacy to regard such earnings as profits in the conventional sense. Moreover, should prices fall to a point where it became impossible for the industry to make adequate provision for financing expansion, there would be a shortage of oil products, with the consequence that economics would eventually prevail. This would inevitably, after a period of dislocation, bring us back to where we are

today, which shows clearly enough what is the influence which must govern prices in the industry.

I would, however, like to put one more test to this question. Are oil prices too high for the economic health of the consumer?

It is impossible to assert seriously that they are since oil products are probably the main victims of taxation all over the world.

You will see from the financial statements that the payments of sales and excise taxes by group companies were three times group net earnings. World-wide they represent over one-fifth of sales proceeds, but in Europe they reach one-third. If petrol in Europe is taken by itself—and its price has been especially criticised—well over half of our realizations represent sales or similar taxes. Such heavy imposts inevitably raise the cost of living since, taking the United Kingdom as an example, four-fifths of petrol used is for industrial and commercial purposes or for public authorities. Therefore, while it might with reason be asserted that the consumer is paying too much, it is not the basic price which is responsible for this, and Governments must hold the view that the basic price of oil is economically so favourable to the consumer that he can afford to pay much more in the form of taxation.

None of the information which I have now reviewed and amplified is new to you. I have given it in more concise terms in previous years, particularly last year, and it is a curious fact that the authors of the ECE document, seeking knowledge as they obviously were, seem to have neglected industry reports. The same must apply to many of the other critics, who could not have seriously raised some of the questions which they did, if they had had the knowledge which has been conveyed to the shareholders of this company in recent years, and which would have been available by reading the reports, had they made any effort to procure them.

World Oil Conditions

Total world oil consumption in 1954 showed a substantial increase over the 1953 level, for which the latter months of the year were mainly responsible. Though the growth in the USA was one of the smallest of the post-war years, in the rest of the world, excluding the Russian sphere, it approached the remarkable figure of 10 per cent.

Contributing to this increase was the rising demand for fuel oil, which continued into the early months of this year, and which during the winter months reached such a level that it stretched available fuel oil supplies world-wide to the limit. In consequence the price of that product rose in February of this year. The world's future energy requirements are likely to make further heavy demands on the oil industry, in particular for fuel oil, until such time as atomic energy becomes a significant factor.

A consequence of the unexpectedly buoyant demand for all products over the winter months was the rapid rise of short-term tanker freight rates, which by February last had more than doubled between the trough of midsummer and the peak of winter. At the height of this activity tankers on short-term charter amounted to as much as one-fifth of the total tonnage employed in moving oil, and consequently this rise in short-term rates was a major factor during the winter months in freighting costs. In contrast, the basis used for establishing the freight rates charged by group companies resulted in variations of less than 10 per cent during the corresponding period.

The world tanker position remains in surplus. Though the winter demand brought tankers out of lay-up, at the period of highest demand, there were still over one million tons idle. Moreover, a record total of $4\frac{1}{2}$ million tons of new buildings became available in 1954 and the building programme still continues at the very high level of 8 million tons, about half of which will come into service this year. The creation of this modern tanker fleet with its lower operating costs must be detrimental to the trading prospects of older tankers in a continuing highly competitive market, and their increased scrapping or conversion to other uses will become still more necessary.

The future requires that supplies of crude oil, the raw material from which the industry's manifold oil products are derived, be at all times available in sufficient quantity to fulfil potential demands. This can only be achieved by continuous exploration for new oil discoveries. It will be appreciated that over the past years those prospects which were most readily accessible have already been tested, with the consequence that reserves for the future must be sought, for the most part, in remote and less accessible regions,

at the greater depths which modern methods enable the drill to reach, or in off-shore waters. The search goes on, but year by year becomes for these reasons more hazardous, more difficult and more costly.

I have made reference earlier to the large capital sums which the industry is called upon to spend; a considerable proportion arises from the increasing demands for refineries in the areas of consumption. I do not propose to go in detail into the arguments for or against this trend, since they vary widely in the differing circumstances of one country as compared with another. It is, however, as well to sound a note of warning that there is a minimum limit of capacity below which a refinery, if it is to produce the high quality of products increasingly in demand, cannot economically be justified. Self-sufficiency, however, appealing it may be from the point of view of national prestige, can in certain circumstances only be at the expense of flexibility, and hampers the replacement and modernization of equipment which is so necessary. Up-to-date quality at the lowest cost can be provided only if the refiner is in a position to keep pace with the rapid developments in refinery techniques.

RECENT GROUP ACTIVITIES

Bombay Refinery

As has become customary, a separate and illustrated survey of activities is being circulated with this report. The achievements of group companies in 1954 follow the pattern of increasing and intensive activity in all phases of the business, which has been the keynote of past reports.

The wide range of these activities includes the considerable developments in marine exploration areas, of which drilling in the off-shore Texas and Louisiana concessions, in Qatar (Persian Gulf) and the Gulf of Paria (Trinidad) are examples. In the Gulf of Paria, where we operate with partners, oil has been found since the end of the year, though the extent and nature of the find have yet to be determined.

Last year I mentioned that oil had been found in Nigeria. Although since then oil indications have been found in a second well also located in the coastal area, much further work will be required before the value of this discovery can be assessed.

In the refining sphere, Geelong (Australia) started operating in mid-1954 and Bombay early this year,

whilst the capacity and scope of our manufacturing facilities are being expanded in many places to meet growing product requirements.

Supplementing the transportation chapter in the survey, a further 19 general purpose tankers of 18,000 tons are expected to be delivered by the builders during 1955, as well as seven of the 31,000-ton ships on order. These deliveries will further improve the efficiency of the fleet.

In February of this year an offer was made by Shell Chemicals Ltd of

Indian Labour Conference

ONE of the blessings conferred by the Second World War was the adoption by the Indian Government of the annual tripartite conference on the model of the International Labour Conference. The exigencies of war necessitated active and willing co-operation of Capital and Labour and this was sought through consultation with these two partners of industry during the annual conferences. The war ended in 1945; but this healthy practice of State consultation with industry and labour has come to stay. Within its limited sphere, the conference has proved useful in varying measure for all the three parties. Industrial democracy under the paternal care of the State is at work here. It is the Parliament where the representatives of three parties discuss past events, present maladies and future legislation. Within a democratic set up, it is convenient for a popular Government to get the views of employers and workers on non-controversial topics. Controversial subjects are kept away from the conference. Here is a forum which provides a common ground to employers and workers to accuse each other in an academic fashion. Once a year, the three parties come together and discuss across the table problems of general as well as topical interest.

Until recently, the sessions of the conference were being held in Delhi. Lately, however, there has been a welcome change. The 12th session was at Nainital (1952), the 13th was at Mysore (1954) and the 14th session was held in Bombay.

The Bombay session was as usual a success, because the subjects chosen for discussion provided little scope for any divergence of opinion. The subjects taken up, however, were important enough to interest all the three parties. Action taken on the decisions of the previous session (Mysore, January 1954) was reviewed. General matters in the field of

£5 million for the acquisition of the entire issued share capital of Petrochemicals Ltd, and in full settlement of the claims upon that company. The terms of the offer were accepted, and Petrochemicals Ltd has consequently become a group company. The acquisition of this interest gives the group an immediate entry into a chemical field in the United Kingdom which is complementary to its present interests; it will also provide rights in certain new and important fields of chemical research.

Industrial relations were very broadly discussed. Various amendments to the Minimum Wages Act, which still awaits full implementation, were suggested. The desirability of extending the provisions of the Employees' Provident Funds Act, 1952, to 16 new industries (employing 10,000 workers or more) and to plantations and mines was stressed. An employers' association suggested the introduction of an unemployment insurance scheme in place of the present prohibitive provision for pay-off and retrenchment compensation. The main findings of the Agricultural Labour Enquiry (1950-51) were summarised for the conference to make any recommendations in the field. The factual findings of a Labour Bureau monograph on "Child Labour in India" were placed before the conference to make suggestions for checking the evil of child labour, which seem to persist in spite of the protective legislation. Details of the proposal for setting up of a wage commission were called for by an all-India workers' organisation. It was proposed to change the name "Working Class Cost of Living Index Numbers" of the Labour Bureau series to "Consumer Price Index Number for Working Class", as the latter was more appropriate.

Both in its structure and contents, the Indian Labour Conference is a miniature model of the International Labour Conference. Naturally, India's relations with the ILO provide important topics for discussion. The Bombay session reviewed the work of the ILO conferences and committees held in 1954 and discussed the various proposals for conventions and recommendations on the agenda of the 38th session of the International Labour Conference being held at Geneva during June 1955. The earlier session of the Indian Labour Conference had set up a tripartite three-man committee to draw up a programme of implementation of the principles, if not

the individual provisions, of ILO conventions. This committee had its second session during the Bombay conference. India has ratified up till now only 22 out of a hundred and odd ILO conventions. The committee on conventions, it is expected, will enable the Government of India to ratify more conventions and thereby confirm India's rightful place as one of most advanced countries of industrial importance, by ILO standards.

What may be considered to be the most important item on the agenda, viz, the Second Five-Year Plan, did not receive adequate attention. In the First Five-Year Plan, Labour had been relegated to the background and was almost neglected. Full details of the Second Five-Year Plan have not yet been made available. However, from the meagre details doled out to the public, the Plan has evoked much interest. The Labour Ministry have already suggested for inclusion: extension of existing social security schemes, workers' education, a fresh agricultural labour enquiry, industrial museums, training for welfare, housing, establishment of a Central Labour Institute and expansion of employment service organisation. The conference was requested to suggest more schemes for further improvement of labour. The progress made in the implementation of the First Plan was also reviewed. Naturally an important and comprehensive item like the Second Five-Year Plan could not be adequately discussed alongwith 16 other items. A special session, preferably the next session of the conference, may be wholly devoted to discuss the role of industry and labour in the implementation of the Second Five-Year Plan. By then, the Planning Commission would have finalised the Second Plan and the Planning Minister who is also a specialist in labour problems should help the deliberations by laying down certain guiding principles for industry and labour.

End of a Phase?

Thursday, Evening

BEHAVIOUR of equities on Calcutta Stock Exchange in the last two days would seem to indicate that the market might be taking a turn for the better. It is yet too early to be dogmatic. But, in recent days, the feeling has spread that the fall in equities has, perhaps, been overdone. Irrespective of the long-term trend, a steadier tendency in equities after the prolonged set-back may reasonably be expected.

One of the reasons for the irregularly lower trend in equities was the erratic behaviour of Indian Iron. Delay in the official announcement of steel retention prices was having a disturbing effect on Indian Iron. During the week, the Government announced provisional steel retention prices. New Delhi's announcement conforms generally to the reports recently current in markets. Since the announcement, there has been a tendency for Indian Iron to steady-up.

Despite the steadiness, it is clear that the market is divided in its assessment of the Government announcement relating to the increase in steel retention prices. According to one view, steadiness in Indian Iron in the last two days is partly due to settlement considerations. There is something in this interpretation. It is also true that those who sold "short" in anticipation of uniform steel retention prices for Tatas and Indian Iron are now covering their sales.

Two Views

Settlement considerations will no longer be in operation for a fortnight. And, if the current steadiness in Indian Iron is mainly due to "bear" covering, it is already apparent that "bear" covering is almost over. Those who emphasise these technical factors argue that, in the absence of investment support, the improvement in Indian Iron cannot be sustained. And, it is a fact that investment support has not been in evidence in recent weeks.

Be that as it may, the pessimistic interpretation of the provisional retention prices does not seem wholly justified. It is clear that the increase in retention prices has been so fixed as to cover adequately the relatively higher production costs at the Burnpur Works. Tatas enjoy an advantage. But that is because

their expansion plans are larger than those of Indian Iron. But it is equally clear that the provisional increase in retention prices will enable Indian Iron to execute the contemplated expansion schemes.

To stock markets, these wider considerations are not entirely irrelevant. But markets are more interested in immediate dividend prospects. Here the outlook is not encouraging. New Delhi has declared an adequate increase in steel retention prices on the condition that the resultant increase in profits should not be utilised for raising dividend payments, but should be spent on financing development projects. This is a long-term "bullish" factor for Iron and Steel shares.

Tea Shares

Sometime, some day, Clive Street was hoping, buyers would re-appear in Tea shares. Yesterday, for the first time since the fall started, there was some fresh buying of Tea shares. Steadiness in Tea shares had a sustaining effect on the whole market. Hopes are now being expressed that improvement in Tea shares may generate recovery in other shares. It remains to be seen whether these hopes will materialise.

Last season's boom levels for Tea shares are not likely to be reached in the near future. But the realisation is growing that the market has been unduly pessimistic about Tea shares. With timely and proper adjustments in output, the tea industry should be able to avert a crisis. Internally, the demand for tea continues. Internal tea auction prices also remain steady. If next season's tea prices do not fall below economic levels, Tea shares should be quoting well above current levels.

Current steadiness in Tea shares is not due to these long-term factors. After such a heavy set-back, replacement buying is easily explained. But some bargain-hunters have now entered the market. June and July are the months when final tea dividends are declared. There are faint indications that speculative investors are getting interested in Tea shares in anticipation of fat dividend disbursements in the coming months.

Jute Parities

Jute shares remain in the doldrums. Mill stocks are mounting.

There does not seem to be any prospect for the industry to succeed in adjusting supply to demand by restricting output. Shorter working hours will create labour trouble.

There has been some foreign buying of Indian Jute goods in the last few days. Argentina is reported to have bought considerable quantities of hessian for deliveries up to December next. Parity prices between raw jute and jute goods are no longer unduly unfavourable to the industry. New crop quotations are now easily available. Raw jute prices are likely to soften.

Despite inactive Jute shares, in spite of the continuous fall in Tea shares, some selected Miscellaneous and Engineering shares continue to be well supported. There was considerable buying activity in BIC this week. Last dividend payment was disappointing. Interested buying of BIC has, therefore, caught the market unawares. There are reports that there is an attempt to corner these shares. From the spurt in BIC in the last few days, it is clear that the floating stock is not unduly large. But, then, the market believes that a considerable percentage of the total volume of shares are firmly held.

Market Trend

Recent behaviour of the Calcutta Stock Exchange suggests that Miscellaneous and Engineering shares are not able to push the whole market up. Efforts of these groups to replace Tea or Jute shares as market leaders have not been very successful. It is, however, not without significance that the fall in these shares has been much less than that in Tea or Jute shares. It is more than a mere coincidence that these shares have started looking up just when Tea shares are experiencing a revival of demand.

Strength in Miscellaneous and Engineering shares cannot, by itself, impart steadiness to the market. But if Indian Iron and Tea shares remain steady or move up, the improvement in Miscellaneous and Engineering shares may have a "bullish" repercussion on Clive Street. In the week under reference, these market tendencies became faintly discernible. Some days must elapse before it can be known whether Clive Street has resumed the upward journey.

Source: Railway Board

expansion prepared in the past might make the over-all canvas a little clearer. As early as in November 1947 a fact finding mission was appointed by the Government of India comprising a committee of three. Fifteen representatives of Indian ship-owners met Dr Bhaba, the then Commerce Minister, and assured the Government of their entire co-operation in any scheme for expansion. The target set before the nation was two million tons of shipping in five to seven years. India had indeed decided on a dynamic policy for the expansion of her Mercantile Marine. Since private enterprise at that stage was certainly not capable of building up such an ambitious fleet, State help was promised. The expansion was to have been effected with "the active co-operation of the State with enlightened private enterprise, in an endeavour to secure for India her rightful place among the maritime nations of the world," and the Government committed itself to floating three corporations with a capital of ten crores for each, of which 51 per cent would be held by the State, 27 per cent by a major shipping concern in each case acting as the Managing Agents, and the remainder of 22 per cent issued to the public.

To meet the demands of an enlarged officer cadre, the Government established a Directorate of Marine Engineering Training at Calcutta and enlarged the scope of the training of executive cadets on the Training Ship *Dufferin* at Bombay. This was to be the actual year of culmination of that plan, the year 1955. Let us therefore look at some of the figures now. We have precisely 4,36,141 tons gross of shipping instead of two million tons as on March 31, 1955. There are only 94 deep sea vessels of over one thousand tons gross, of which a bare 29 are actually engaged in any manner of over-seas trade. There is only one shipping corporation functioning instead of three, with a capital of 5.5 crores instead of 10 crores. What has happened to our plan of expansion?

In fact the plan had miscarried badly from the beginning. With the first words of encouragement uttered in 1947, private enterprise rushed madly into an abundance of mushroom shipping companies, and by the beginning of 1948 the total authorised capital of the shipping

companies had already exceeded 100 crores. Lured by prospects of a quick turn-over, such outmoded tonnage was acquired by the new companies that it could neither stand a healthy competition, nor survive any extensive General Surveys. And although there is a law now in operation preventing ship-owners from indulging in such short term speculations, even last year 13 ships were acquired by Indian shipping interests as against 9 that were sold or scrapped, the effective addition to the fleet being only 4.

Another alarming aspect of this stilted growth is not generally realised by the public. For strictly in accordance with the original plan, the two establishments at Calcutta and Bombay have all along been turning out highly trained officer-personnel, far in excess of any existing or even expected needs of the profession. For instance, to man the 4 vessels added to the fleet last year, a minimum of 12 executive and 8 engineer officers were all that were required. And yet during 1954 no less than 170 executives and 131 engineers obtained their Ministry of Transport Certificates of Competency! In another two years, we shall be burdened with a highly trained cadre of qualified officers for whom there will be no employment. Another batch of the flower of our youth will be condemned to frustration. This bodes no good for a nation, or for the service where personal integrity, professional efficiency and a high standard of discipline make all the difference to the strength of this our second line of defence.

The answer to all this is rapid and immediate expansion. But in facing the problem of expansion, we have sooner or later to face the bogey of Flag Discrimination. Shri S N Haji, President of the Indian Shipowners Association, has rightly pointed out, though not in so many words, that the legitimate aspirations of under-developed countries should not be brought within the compass of Flag Discrimination. What, after all, constitutes 'Flag Discrimination'? If two countries have a bilateral trade agreement whereby each agrees to carry a part of the trade in its own national shipping, then that is labelled as Flag Discrimination. But the International Maritime Conference at Geneva in 1948 fully accepted the principle that the

principle was acceded to in its Charter. But the International Chamber of Commerce would not recognise the Charter. How could it? It is not concerned so much with the violation of maritime etiquettes; long consolidated vested interest is merely looking askance at the new maritime awakening among under-developed nations. It is high time that the International Chamber of Commerce took fresh bearings and recognised the altered scheme of things in the sphere of international trade.

India has gained, on sufferance, membership of a limited number of shipping 'conferences'. The conferences are like cartels that operate to the benefit of an exclusive membership and pursue a blocked door policy to all new shipping. They not only limit the membership, but also stipulate how many steamers a member may ply on a particular trade route, even to the extent of determining their sailing schedules. Participation in inter-national shipping remains restricted to the privileged few who enjoy the membership of a large number of conferences. For example, British shipping companies enjoy the membership of no less than 40 Liners' Conferences. But Indian shipping concerns, although members of the original India-UK-Continent Conference, are debarred from membership even from its sister organisations like the Aden-UK or the Colombo-UK conferences. An American ship may bring cargo from a third foreign port to India, but Indian ships cannot trade between America and another foreign State. So much for the freedom of the seas.

The Indian Merchant Navy needs expansion now, expansion that is long overdue, and needs it badly. Let the Government take a firm attitude in controlling the quality and quantity of our fresh tonnage acquisition, curtailing the danger of unwarranted unemployment by legislation at home, and go ahead with such mutual agreements with nations abroad as will give the necessary stimulus to expanding national shipping. Read in the larger context of monopolies and cartels, the terms Flag Discrimination and Freedom of the Seas would appear devoid of any meaning, and it is futile to expect voluntary accommodation from the few who control that freedom.

Formosa

SINCE Mr Chou En-lai's Bandung offer to negotiate with America on Formosa, Washington has been on the defensive. Mr Dulles, though not the officials of his State Department, was right in refusing the interpretation that the offer was a propaganda device. But, in arguing that America could not be expected to negotiate with Red China under coercion, he was begging all the questions that were involved in the Formosa dispute. Washington had succeeded in creating confusion about the Formosa dispute. America's NATO partners endorsed her demand that negotiations could not start unless there was a cease-fire in the Formosa Straits. This was what Mr Dulles had in mind in his emphasis that America could not agree to negotiate with Red China under duress. This aspect of the problem has a vital relation to Peking's offer to talk direct with Washington. By accepting Peking's stand that Formosa is an issue in dispute between Peking and Washington, America has, by implication, accepted the substance of Red China's basic demands. In his recent reiteration of the Bandung offer to negotiate directly with America, Mr Chou En-lai has explained Peking's diplomatic claims.

"Taiwan is China's territory... and the liberation of Taiwan by the Chinese people," Mr Chou En-lai explains in his report on the Asian-African Conference to the Standing Committee of the Chinese People's Congress, "is a question of China's domestic affairs. The United States' occupation of Taiwan has created tension in the area, and this constitutes an international issue between China and the US. The two questions cannot be mixed up. There is no war between China and the US—so the question of so-called cease-fire does not arise." This explanation should help a proper appreciation of the dispute relating to Formosa. Washington has always been aware of Peking's diplomatic claims. Mr Chou En-lai's statement to Red China's highest executive organisation explains why Peking's repeated offer to negotiate with America "to ease the tension in the Formosa area" is silent on the question of cease-fire in the Straits.

Only those who are unfamiliar with the sequence of developments relating to Formosa will express surprise at Peking's offer to negotiate directly with America. Peking is

logical in its diplomacy. Red China is not a member of the United Nations. She has not succeeded in her efforts to name America as an aggressor in the Formosa Straits. She cannot raise this issue before the United Nations as she is not a member of that international organisation. She does not recognise the Chiang regime in Formosa. Therefore, she has expressed her willingness to negotiate directly with America, the Power directly involved in creating tension in the Formosa area. Peking is emphatic in its implied claim that America cannot deny responsibility for creating tension in the Formosa area on the plea that the intervention of the Seventh Fleet in the Formosa Straits is justified by the mutual security pact between America and the Chiang regime. For any such plea begs the whole question of the future status of Formosa.

By repeating the Bandung offer, Red China has reiterated her peaceful intentions. But Peking is firm on her basic claims to Formosa. Red China is ever ready to negotiate with America to ease the tension in the Formosa area. She is prepared to negotiate, as proposed by Russia, under the auspices of a ten-Power Conference, but "is willing to consider other forms" of negotiation. Red China has, thus, left the door open to America to suggest any alternative procedure for the proposed negotiations. Red China's offer is based on two basic conditions. She is opposed to participation of the Chiang clique in the proposed talks. Her offer to negotiate with America on the Formosa issue does not, in any way, prejudice her sovereign rights over Formosa. In offering to negotiate with America, Red China does not abandon her right to liberate Formosa. Lest this and her attitude to the question of cease-fire be interpreted as war-like policies, Red China hastens to add that she "is willing to renounce war and accept peaceful processes in relation to the Formosa area." In this clear assurance, America has a guarantee of Red China's intentions to solve the Formosa issue through peaceful means. After such an emphatic assurance, it would be dishonest of America to refuse, or to delay, negotiations with Red China on the plea that Peking has not given any undertaking to establish cease-fire conditions in the Formosa Straits.

Confronted with repeated peace gestures from Red China, America

has been forced to shift her ground. She is now reconciled to withdrawal of Chiang's forces from the off-shore islands like Matsu and Quemoy. America has two motives in making this concession. Once she accepts the position that occupation of the off-shore islands is not essential for the defence of Formosa, it becomes easy for her to accept Peking's demand to exclude the Chiang regime from the proposed negotiations. Her main motive in relenting her stand on the off-shore islands is to coax her NATO partners to endorse her policy to Formosa. She has not been unsuccessful in this diplomacy. Neither Britain nor France is happy over America's policy to Formosa. But it is not without significance that the British Labour Party is committed to a Formosa policy which, impliedly, denies Peking's sovereign rights to Taiwan. There are proposals for neutralisation of Formosa, or of placing the island under the trusteeship of the United Nations. Peking is not likely to accept either of these solutions, though there are some Asian-African nations who are hopeful of a compromise plan for deciding the future status of Formosa by holding a plebiscite there under the auspices of the United Nations.

America is reconciled to evacuation of the off-shore islands by Chiang's forces. To maintain her base in Formosa, she may be willing to accept any proposal under which the Chiang regime will renounce its plans to invade the Chinese mainland. But she is in favour of creating a future status for Formosa under which she will be able to fortify her Pacific system of defence. America's Pacific defence system is based on the creation and maintenance of an island chain of defence. This explains American fortifications in the Aleutian Islands, in Japan and Okinawa, in Formosa and the Philippines. This island chain of defence is fortified with American air and naval bases. This defence chain is based on the strategy of atomic warfare. This island chain of defence is being fortified with the dual purpose of defence against aggression and of facilitating offensive military action. This is the sinister strategic background to America's policy to Formosa. Red China has shown her peaceful intentions by her willingness to negotiate on Formosa. But it would be idle to pretend that the Formosa problem can be solved as long as America persists in her policy of fortifying the island chain of defence in the Pacific.

Weekly Notes

The Whiteman's Voodoo

IT has been held by the wise that fear and ignorance are two of the most formidable evils facing mankind: but in organised society these are the weapons wielded with great power, often with apparently virtuous effects. If we are to concede that the internal political consolidation of a state is of essence a virtuous project, irrespective of the means adopted, then apartheid of South Africa should be applauded as commendable, designed to create confidence in a particular group of people.

There is a Ministry of Justice in South Africa, believe it or not, whose helmsman, Mr Charles Swaat, believes that the Nationalist Party has been placed in power in that country "by the will of God", according to Reuter's news-message. This reference to the Divine sanction for the present Government of South Africa was made in regard to the question of removing all coloured voters from the electoral roll. There is a divinity that will shape the coloured voters' ends through the direct agency of the Nationalist Party which now proposes, for the purpose of removing certain lowly, undivine and embarrassing constitutional difficulties which lie in the way of getting an absolute majority for passing the Senate Bill, by the simple procedure of doubling the upper House.

The body politic of South Africa evolves round colour bar. Colour bar is more orthodoxy of thought than the desire for the preservation of a particular culture, and more of economics than of racial discrimination. That there is a large electorate of coloured (ie, of mixed blood) people whose number is ever increasing is in itself a proof that behind the 'bar' of national legislation, individuals of both sexes have no qualms about free mixing, albeit surreptitiously. And the tremendous strides which Indian business men and farmers have made wherever they have found the opportunity in South African soil, damps the soul of the competition-scared West European populace. To rally the people round to an active support of Government a bogey must be raised; if it is 'Kashmir' or 'Islam in danger' in Pakistan, it is 'Anglo-America under the red flags' elsewhere; similarly,

the inability of South Africa to contribute anything constructive or worthwhile towards international progress is also a direct result of her pre-occupation with the racial issue to the point of an obsession.

Since the credulity of the South African people follows a pattern of psychology incomprehensible to most, it is really difficult to say how the business of evoking Divine Wrath by the Minister of Justice in discriminating white from brown will help his case in the final reckoning. On the question of colour bar, of course, the United Party (Opposition) has no different programme from the Government; but it is afraid that this Bill would "lead to a one-party State in South Africa". So Mr Harry Lawrence comes back at the Government with the cry, "In the nostrils of decent people the Bill stinks to High Heaven". This practice of referring all parliamentary matters to High Heaven is probably becoming an obsession with them, too. The Government asserts that H Heaven has decreed it, whereas the Opposition holds that on the contrary H Heaven smells a rat. Mr Lawrence further goes on to say, "The House must realise we are up against two different ways of life in this country—the way of the brigand, the bully and the jackboot, and the way of decency".

What decency?

How much Tea per Head?

THE Tea Board has brought out a monograph of *Tea Statistics* in which for the first time an attempt has been made to estimate the internal consumption of tea in different States of India during 1953-54. The total internal consumption estimated amounts to some 175 million lbs. Indian production in 1953 being estimated at 608 million lbs and exports at 501 million lbs—both calendar year figures—the balance left from the current year's crop would be only 107 million lbs. Against this has to be compared the estimate of internal consumption, which is presumably for the financial year. The production in the previous years being 615 million lbs and 624 million lbs respectively, perhaps the excess of consumption over the net retained supply for the year might be partly explained, but only partly. One does not know, however, which are the firm figures

for production, for the figures given in table II do not tally with the figures given in table I, which being made up from returns supplied by the ITA and UPASI should be regarded as the more reliable ones; but that is quite another story.

Whatever one may say about the total figure of internal consumption, it is the breakdown of consumption by States which takes one's breath away. The estimated *per capita* consumption State-wise varies widely from 126 lbs per thousand people in West Bengal to only 5.6 lbs per thousand people in the Uttar Pradesh. How to explain so wide a variation? Can tea consumption in Uttar Pradesh, with so many large cities and at least one substantial industrial centre in Kanpur, be so low and so much lower than in Orissa, where it works out at 8.5 lbs per thousand. The statistics of internal consumption by States has been reproduced on the statistical pages and they will speak for themselves.

The States where the *per capita* consumption exceeds 1 lb arranged in descending order are West Bengal; Assam; Punjab, Himachal Pradesh and Pepsu; Delhi; and Bombay, Saurashtra and Kutch. Then there is a sharp drop and the next group of States where consumption is just above ½ lb per head are in the south, Madras, Andhra and Travancore-Cochin. There are only two others where consumption is about one-third lb per head, viz, Mysore and Hyderabad. Madhya Pradesh has a consumption of only .24 lb per head, Bihar .19 lb and then there is another sharp fall, none of the remaining States having consumption of more than 10 lbs per thousand population.

In the absence of a clue to the method of estimation employed—the Statistician to the Indian Tea Board does not oblige the casual reader—one can only gape and wonder. But if some day the Tea Board has to turn its attention to promoting internal consumption as the only long term solution for stabilising the tea industry, perhaps these statistics will be looked into more closely and some light would be needed not only on the method of estimation, and the degree of reliability of the estimates, but also on the factors that account for the wide variation in consumption habits.

Burma Wants High Rice Prices to Continue

AN American Rice Mission, headed by Mr Charles Baldwin, Deputy Assistant Secretary of State for Far Eastern Economic Affairs, is touring South East Asia to study the marketing position in rice-producing countries. The US has emerged from the war as a major rice exporting country and is currently loaded with an exportable surplus of half-a-million tons of rice to dispose of. Burma has an exportable surplus of 1½-1¾ million tons of rice from the current crop in addition to another quarter million carried over from the previous year.

Two proposals were discussed by the American Mission to the Burmese Government, namely, the advisability of lowering export prices of rice in order to dispose of all surpluses in Burma and the USA and the promotion of increased consumption of rice. Regarding the first, it was conveyed to the Mission that Burma had already reduced her export prices and therefore she was not in a position to effect any further reductions. On the second proposal, however, Burma had something different to say. She complained that rice consumption had been adversely affected by the liberal distribution of surplus wheat by USA in the world market and therefore the best means of promoting rice consumption would be for USA to revise its policy and sell wheat at 'reasonable' prices.

The Food and Agricultural Organisation has warned that unless the price of rice is allowed to find its natural level, disposal of surplus rice would remain a serious problem for the rice exporting countries. In view of the growing self-sufficiency in rice in the rice importing countries, FAO advises as a long-term solution diversification of production in the rice exporting countries to other crops. In spite of all these, if Burma can still maintain high prices for rice, it is not because the price reduction already effected is very substantial but because Burma has entered into long-term contracts with Ceylon and Japan for the supply of substantial quantities till 1957-58 and therefore she may hope to enjoy the benefits of high prices for 2 or 3 years more. For the US, however, the problem is immediate and pressing.

Indian Industries Fair

THE character of our exports has changed and with it, the methods of export promotion have to be changed too. But advertising

Indian manufactures with an eye to export promotion is not the only object of the Indian Industries Fair which will be held in Delhi later in the year and kept open for six weeks from October 29 onwards. The sponsors, the Federation of Indian Chambers of Commerce and Industry, have a two-way traffic in mind; they are keen that Indian industrialists should also be given an opportunity to learn something about the plants, equivalents and techniques employed in other countries and see for themselves the very latest of each.

The products of Indian industries, large and small, are to be displayed and the attention of the world will be drawn to industrial goods made in India and products of our cottage industries in particular, in view of the international character of the Fair.

The main aims of the Indian Industries Fair are:

- to present a picture of India's economic progress,
- to promote contacts among manufacturers, traders and consumers,
- to promote better economic relations between India and foreign countries by interchange of ideas in the industrial and commercial fields, and
- to afford an opportunity to Indian manufacturers to organise a show-window for Indian industry and at the same time to get acquainted with the design, quality and performance of foreign capital equipment.

In short, the Fair is intended to achieve the twin objectives of displaying Indian industrial goods—mill-made and cottage type—and developing a profitable export market, and also enable Indian industries to learn of foreign technique, design, etc, the latest in each field.

To ensure the international character of the Fair, the organisers have provided special facilities for foreign exhibitors to display their products. Special permits for the import of exhibits will be granted to participants from abroad to their agents in India, and the exhibits to be imported will be exempt from the payment of customs duty, on the condition that they will not be sold except with the special permission of the Government of India. Further, the railways have decided to give a one-way freight concession for the transport of exhibits to the Fair site.

Air Crash Mystery Solved

THE mystery of the Air India International Constellation carrying Chinese delegation to the Bandung Conference has at last been cleared by the official Indonesian Inquiry Committee's report. The verdict is clear that it was a sabotage by placing an 'infernal' machine—in the starboard wheel well of the aircraft which exploded while the plane was nearing its destination.

The infernal machine is no euphemism for time bomb but the technical term for any "disguised apparatus for producing an explosion destructive of life and property," in other words not a weapon of defence. The location of the 'infernal machine' is negatively significant. The bomb could have been planted in a more vital part of the aircraft to ensure certain destruction and leaving nothing to chance. As it is, it actually resulted in puncturing one of the fuel tanks which set fire to the aircraft. Incidentally, the wing is accessible to outsiders who can manage to gain entry into the airfield but getting into the aircraft or into the cockpit is a more difficult matter.

As this was an impartial inquiry by technical experts of a neutral Government, no politics can be suspected in the verdict. Thus the Chinese Peoples' Government's suspicion has come true, though it is far from established that it was engineered by a Government hostile to Red China.

It is now for the Hongkong Government to investigate whether it was a political sabotage carried out at Hongkong airport while the plane was on ground refuelling and picking up the baggage of the passengers or the handiwork of some disgruntled Chinese refugee from the mainland seeking revenge for persecution at the Communist hands. The crash, however, clearly shows that even in the not-so-cold 'cold war' of the Far East, sabotage, common in hot war, is not uncommon and the neutrals cannot but be wary in their dealings in that part of the world.

So far as India is concerned, she can now do nothing except express sympathy for the lost lives as the material cost will be fully borne by Lloyds in London and Air India International is promised a new Super Constellation next year by the manufacturers to replace the old model Constellation.

Big Things...!

They are BIG!

But even your biggest printing problems are not big for us.

For an Indian Press to attain the standards of printing as in the United States of America, England, Germany and countries where most progress is made in this direction, is an achievement. Clientele will testify to our attainments in this direction.

With our photo offset, blocks, letter press, litho and packaging material manufacturing departments and a capacity one of the largest in India and twenty-five years' experience behind us, we can undertake all types of printing.

Let us tackle your printing problems.

Enquiry into Private Sector

FAR from resenting the Finance Minister's suggestion that a committee of enquiry should be set up to examine its claim of efficiency, the private sector would indeed welcome it, provided that the findings of the enquiry are applied equally to the public sector as well. True enough that if the affairs of the private sector were brought before Parliament, it might be found that it was not as efficient as it claimed to be. But the enquiry would also establish that in the private sector, somebody has to shoulder the responsibility for what happens, that losses have to be borne by and large, by those who incur them, barring malpractices of company finances which are exceptional, and that incurring of losses can never go on indefinitely. An end is put to it before it has gone very long. Would the Finance Minister be prepared to apply the same test to the public sector, fix the responsibility for losses incurred on those who are entrusted with management and mete out the much milder punishment of asking them politely to resign? So many things have come into the open about the

public sector that it would invidious to mention any particular case by name. But taking prefabricated housing by way of illustration, would the Finance Minister be prepared to say who was responsible for it and what punishment did he have to take?

Many tests of efficiency have been suggested for the public sector such as that State enterprises should compete with the private enterprise on equal terms, neither under handicap nor enjoying special privileges. But such cases where a fair comparison is possible being rare, considering that profitability cannot be applied as a criterion in view of the special circumstances or conditions under which public enterprise functions, other tests have to be applied by which its performance must be judged. True enough, in the absence of any such criterion public has so long gone solely by the proportion of the sanctioned expenditure incurred on a project or by a department as a measure of performance. Judged even by this criterion, the public sector has not so far come off with flying colours. Things, however, are now improv-

ing, so we are told. The Government cut to the quick by the constant blandishment of Parliament has been trying seriously to mend its ways. The order has gone around to spend, since the public cavils at failure of spending, taking it as a measure of the inefficiency and slackness of the Government machinery. Well, the full target may not be attained, but 85 per cent of the planned expenditure will have been incurred by the time the last plan year comes to an end.

If people wanted spending, they are going to have it. It will be many years before the Public Accounts Committee or the Estimates Committee let us have a look into the manner of this spending, with the impressive figures of which the Finance Minister is now bent on rebutting all criticisms. Surely, this is not the spirit in which criticism should be met. It is high time that Government thought of some better criterion of performance, put it up before the public, and wait for its judgment before boasting in self-righteousness "Let jaded mare wince if it will, our withers are unrun".

Our Delhi Letter

Dynamism in Action

Thursday, Morning

WEATHER and politics (or rather the lack of it) have conspired to make it a rather sleepy week at Delhi. The ceremonious send off to the Pakistanis made one suspect that a political deal was in the offing. In retrospect it appears somewhat strange that there was hardly any immediate public or official reaction to the firing on Satyagrahis at Goa. Subsequently, of course, Pandit Nehru's dynamism got into action and the Portuguese authorities, all their bravado on the international front notwithstanding, do find themselves in the dock. Opinion here is almost equally divided between a showdown and the expectation that the Portuguese, while talking fire, are preparing to quit.

On the Akali front also, there are (or were) signs of greater reasonableness in Punjab politics, though Pandit Nehru's attack, characterising the Akali *marcha* as "vulgar, highly improper, unwarranted, nonsensical, obnoxious and born of parochialism"—what a

combination of adjectives—has somewhat complicated the matter. Obviously the Pandit is no politician. Does he realize what would be the reaction, if this sort of stuff were read out to masses of illiterate Sikhs? I wish, someone read out to him this line from Marshall: "In the conduct of public affairs, it is worse than folly to ignore the baser side of human nature". But Pandit Nehru doesn't care.

INDIA'S STOCK HIGH IN US

On the foreign front, things seem to be going well in accordance with Nehru's heart's desire. There is to be a 'summit' meeting of the Big Powers. "The position of strength" philosophy, though it continues to be talked of, has receded. Our ambassador at large, Krishna Menon, is on his way from Peking to Delhi; or rather from Peking to Washington via Delhi and London. Quite curiously, unconsciously, almost effortlessly, a Delhi-London axis has become an operative factor

in international politics. By the time Menon reaches London, the political atmosphere there would have cleared after the elections, which are being held today. Both official and intellectual circles—people don't even know that the oldest democracy is going to the polls today—would like Labour to return to power, for then Dulles's hunch of a Delhi veto on British foreign policy may mean something. After the Asian Conference, the Pandit has again begun to look for comrades in London. His impending visit to Moscow, which the Russians are going to make much of, has not yet attracted much attention in the West, particularly in the United States. At the moment, attention is focussed on what cards Menon displays to his Chief at Delhi. There is a feeling of subdued optimism in official circles; and the Ministry of External Affairs is looking forward to the visit of the Vice-Premier of China, Mr. Chen Yi, whom Menon has invited with the blessings of Chou.

From the Calcutta End

Make-up of Unemployment

UNEMPLOYMENT is West Bengal's Number One Problem. Both the unemployed and the employment exchanges are making efforts to solve the problem. There is co-operation from all the parties concerned. Employers seek the help of employment exchanges. Those who seek employment get themselves registered with employment exchanges. But the result is not very encouraging. There is not much scope for fresh employment.

There are nine employment exchanges in West Bengal. One has had many occasions to observe the queue at the regional employment exchange in Calcutta. It is a busy and crowded establishment. The queue there is an interesting study in psychology. Each and all the persons in the queue seek employment. Some are young; some are middle-aged. Some are well-dressed; many are not. But, in the mass, this long queue does not seem to be as forlorn or frustrated as one would expect such a queue to be.

Passing that patient, waiting, queue, one has very often wondered at the philosophic courage of the unemployed persons who form the queue. What sustains them? Of course, the most popular explanation is that every Bengali family has some land somewhere to fall back on. Statistics have demolished that myth. But statistics do not disprove the other popular explanation. Though the joint family is decaying, it is not yet dead as an institution.

JOINT HINDU FAMILY

It is the joint family system that has saved Bengal from a bloody revolution, from fascism, from Communism. It has concealed, though not minimised, the rigours of unemployment. What will happen when the Hindu Code Bill becomes an Act? There is a possibility that the individual may lose his family roots long before social insurance becomes a reality. Today, it is fashionable to talk about the menace of unemployment. How sinister that menace is will be evident when society faces unemployment without social insurance or without industry's ability to absorb the surplus at a time when family roots will be withering away.

Against the growing menace of unemployment in West Bengal, the State Government's remedy is to enlarge the boundaries of this partitioned State. At Darjeeling, the cool summer resort of the State Government, Dr B C Roy is having talks with the State Re-organisation Commission about West Bengal's boundary claims on Bihar and Assam. That may or may not solve the linguistic problem. But that will not solve West Bengal's land or unemployment problem.

DEMOCRATIC PLANNING

New Delhi's remedy is simultaneous development of heavy and small-scale industries. Expansion of the latter is expected to provide immediate employment. Development of the former will ensure a lasting solution of the unemployment problem. There is controversy about the draft of the Second Plan. There are statements in the Calcutta Press about Dr B C Roy's views on these outlines. He does not think that the Plan is workable in a democracy. He is for a less ambitious Plan. Dr B C Roy is certainly free to define democracy as he likes. But there is not the least shadow of a doubt that there will be no democracy either in West Bengal or in India if the unemployment problem remains unsolved.

One can assess the problem, its composition and complexion from the working of employment exchanges. In 1954, unemployment was acute in West Bengal. Two factors intensified the problem. There was large-scale retrenchment of workers in the jute industry. This, incidentally, explains the State Government's reported opposition to IJMA's contemplated move to revert to shorter working hours. The State Government's commitment to absorb the surplus staff in the State Food Department also affected the scope of providing employment to the unemployed.

FINDINGS

Findings of the employment exchanges are interesting, but will not be unfamiliar to the reader of fresh page. There is a surplus and engineering graduates, inexperienced neering graduates, ungraduates, and mid-wives and trained nurses. There is shortage of women.

of qualified and skilled men for various types of technical work. There is dearth of women for posts of stenographers, receptionists, sales-assistants, teachers and art-mistresses.

Unemployment in West Bengal is most acute among the educated middle-class. That is why more art, mechanical and engineering graduates are seeking jobs than there are jobs. Those who know the mental make-up of Bengali women will realise why there is shortage of female stenographers, receptionists and sales-assistants. But the shortage of female teachers and art-mistresses is not likely to be felt much longer.

Mahavir Tyagi but came back in time to see off Maulana Azad, who left on Monday last on a multi-purpose tour of Europe (including possibly the Soviet Union) and the Middle East.

THE NEW DYNAMISM

The Congress President, Shri U N Dhebar, has become an active practitioner of the Nehru philosophy. Inaugurating the Delhi State Congress Workers Convention in Jamuna Bazar slum area in the old city, he called upon Congress workers throughout the country to declare war on casteism, unemployment and communalism and to muster all their energy for bringing about a socio-economic revolution in India. In his opinion, the main function of the Congress organization was to establish a just socio-economic order under a democratic set-up. In this connection, it is a pleasure to record that Shri Dhebar has taken his job seriously.

THE CALL OF BHOODAN

Our Rashtrapati has broken silence after a long time. In his address to the Harijan Udyog Shala (Harijan Industrial School) at Kingsway, he deprecated the present system of education as adding to the number of unemployed in the country by making them to forget the use of their hands and feet. He pleaded for the introduction of basic education on a wider scale and said that Government was keen to bring about the change. There is news that Dr Rajendra Prasad has donated 31 out of his 186 acres of land in Champaran district for the *Bhoodan Yagna*. Shri Bipin Bihari Varma, MP, has also donated one-sixth of his holdings, which comes to 45 acres. About 500 acres of *bhoodan* land, including the Rashtrapati's donation, will be distributed next week. The political stock of *bhoodan* seems to have gone up, for it is reported that the Prime Minister is showing keen interest in the movement. The news that the Chief Minister of Orissa is to resign in favour of *Bhoodan* has been received with interest and amusement. It is a subject-matter for research why in the present political atmosphere, the ranks of constructive workers are being strengthened at the cost of real and rare political leaders.

Shri Nandaji has not missed the off-season chance to speak. At the closing function of the First Leader's Training Camp organised by the Bharat Sewak Samaj, Shri Nanda

insisted on the doubling of the *per capita* income as soon as possible, to ensure a minimum living standard to the common man. In his opinion, the machinery and resources of Government could not cope with the task of reconstruction of the country's social and economic life and it was therefore necessary to harness popular support and co-operation in this great venture. These are brave words, but to whom were they addressed? Does the Bharat Sewak Samaj really exist?

Though not in town, Shri Deshmukh has not been idle. He has spoken from Bangalore and threatened an inquiry into the efficiency of the private sector! Speaking on the Second Five-Year Plan, he thought, it was safe to indulge in a 1,000-crore deficit financing, whatever that might really mean. Against this—this is my way of putting it—Government would raise Rs 500 crores by way of additional taxation. As regards the Finance Commission, the prospective candidates must still bide their time, for its appointment must await Government's decision on the report of the States Reorganisation Commission.

It would be unfair to by-pass in this review the heroics of Shri TTK, who had his day at the meetings of the Import and Export Advisory Councils. It is reported that his threat that Indian ports would be declared out of bounds for the ships of discriminating companies had immediate effect. Shri TTK was obliging in every way to private interests, particularly in respect of cotton and newsprint. The most interesting news really was that the Federation of Chambers of Commerce and Industry had four actively functioning standing committees for promoting exports to different regions—South East Asia, the Middle East, Pakistan, and Europe. It would be worthwhile knowing, how these committees have functioned and what have been their achievements in export promotion.

The Muslims of Delhi celebrated their *Id* with great *éclat*. The whole of old Delhi from Juma Masjid to Fatehpur put on a festive air. Dr Syed Mahmud, the temporary successor to Maulana Azad at the Ministry of Education, spoke on *Id* at the International Cultural Forum and regaled the audience with anecdotes from the records of the East India Company to whose urgent calls Nawab Siraj-ud-Daula refused to attend, as he would be busy for a week in the celebration of *Holi*!

The impression is that Menon's stock has gone up. He not only walked arm in arm with Chou and Chen, but had an audience with Mao himself, whose prestige has reached the Stalin heights. In any case, we shall see him here tomorrow. At the moment, he is at Madras with a three-point formula in his brain or bag—a formula that would at once secure peace in the Straits of Formosa, create friendliness in the USA by the much longed for release of airmen and confirm India as a recognized mediator in Big Power disputes. For once, anti-Indian feeling in Washington has abated and the *bona fides* (?), sincerity and international goodwill of Pandit Nehru have been re-established in US political circles. Just prior to the Russian visit, this appears to be a master stroke in diplomacy.

On the domestic front, the Jagat Narain case, which has so much exercised the public mind in recent days, has been amicably settled. There is a strong public feeling that it is a political and not a judicial decision. The best course would be, in such cases, where the Prime Minister is convinced of a *prima facie* case, to hand it over to a special bench of the Supreme Court. We have not yet reached a stage where political corruption, particularly in the Congress Party, can be adequately and fairly dealt with.

NO LONGER 36 CRORES

The Women's department of the AICC has been unusually active. They have been able to hold a fairly big and long conference of Congress women organisers. The conference attracted all the big guns of the Party, including the Prime Minister, who advised the women to cultivate mass contact, to participate with heart and soul in the social revolution and pleaded for uncared-for children. Pandit Nehru referred to 36 crore problems of 36 crore people. It is high time that some one informed the Prime Minister—it should be the periodic duty of the Registrar General of Population to do it every six months—that we are now 38 crores; and when he begins peddling the Second Five-Year Plan, he should refer to the almost immediate prospect of our becoming 40 crores. He repeated the same figure of 36 crores at Hardwar, where also he spoke as usual on his favourite social philosophy. He paid a flying visit tohra Dun in company with Shri

Many unemployment surveys have emphasised the shortage of qualified and skilled men for various types of technical work. On many earlier occasions, the need for expanding facilities for secondary vocational education has been emphasised in this page. Yet, a strange contradiction may be noted. In West Bengal, there are ten centres where the Union Ministry of Labour is imparting technical and vocational training to 72,552 boys. Similar other attempts are being made to extend vocational training. Soon, therefore, there will no longer be any shortage in the supply of secondary technical personnel seeking jobs.

From the London End

A Tunisian Settlement?

UNLIKE Morocco and Algeria, where French direct rule continues with unashamed violence, the Tunisian situation offers at one and the same time, the prospects of certain peace and self-government and, on the other, a steady political degeneration to a situation paralleling that in the neighbouring French territories. The renewed negotiations between the French Government and the Tunisians is apparently proceeding with some speed and, according to the latest reports, the French have promised to complete the negotiations by this week (May 25th). The climax in Franco-Tunisian relations is, therefore, being fast approached, and it is being accompanied by various events which can bode ill for the future of Tunisia.

The current negotiations have their origin in the logic and realism that M. Mendes-France exhibited whilst he was in power. It will be remembered that M. Mendes-France had sent out, as Resident-General, General de Latour, in the hope that the influence of the older trained imperialist officials of the Residency would be reduced and this would contribute towards an easing of the tension between the Tunisian Nationalists and the French Authorities. This appointment was accompanied by the marked relaxation of various security measures and by an amnesty for all those *fellaghas* (the Nationalist guerrillas) who were prepared to surrender their arms. Simultaneously, organisations of the Nationalist movement were allowed to operate and the Bey was invited to a delegation for negotiations on terms with the French Gov-

REHABILITATION

There are additional complications in placing the displaced. Refugees are pouring in from East Bengal. Calcutta's and West Bengal's unemployment problem is being aggravated by the continued exodus of East Bengal Hindus. Despite efforts of the employment exchanges to impress on the employers to give preference to displaced persons, the results are not very encouraging. Of the 42,000 displaced persons registered with the exchanges in 1954, only 3,500 were provided with employment.

There is hope that some other efforts to place the displaced may prove more successful. Both the

THE ECONOMIC WEEKLY

State Government and New Delhi have plans for helping industrialists to expand existing industries or to start new ones on the condition that displaced persons should be given preference in the matter of recruitment. There are indications that some enterprising Bengali industrialists are seeking loans from the Union Rehabilitation Ministry, and not from the Industrial Finance Corporation, to start new industries or to expand existing concerns. Many such industrialists are being promptly helped by the Union Rehabilitation Ministry on their assurance that they will give preference to displaced persons in the matter of recruitment.

ernment.

The negotiations have been protracted and at times appeared to have reached a dead-lock. They have, nevertheless, been continued. These negotiations have, however, all been marked by one feature; no sooner had there appeared some chance of the negotiations taking a successful turn, the French settlers in Tunisia and their "lobby" in the Paris Assembly would become active. These have not proved successful so far, though the current agitation appears to be of an extraordinary and far-reaching character. The announcement that the Franco-Tunisian negotiations would be completed by or before May 15th forced the hand of the representatives of the extremist French-settler organisations in all the three North African Dependencies. They have held a conference which has drawn up a "programme of co-ordinated action against the Paris Government's policy of surrender",

and they are threatening to "carry the battle into the streets unless the claims of the French population in Tunisia are satisfied." The French Parliamentary delegation which recently visited Tunis returned with the announcement that "we are returning to Paris to carry on the struggles against the follies of the Government's policy". These announcements have been accompanied by a number of violent attacks on the members of the Neo-Destour, the premier nationalist party of the country. It has been reported that a number of Tunisian students have been killed as a result of these attacks.

The Government of M. Faure have continued the policy of the Mendes-France Government in regard to Tunisia though they have retreated heavily from the previous policy on Morocco and Algeria. The Faure Government, moreover, have made it clear that France would not abandon its "responsibilities" for the defence of Tunisia, which, as a Government statement recently put it, "is imposed upon her by ineluctable strategic necessities". The current negotiations are, therefore, concerned with the conclusion of seven conventions. In the first place, France is requiring guarantees for the security of the property of the French community in Tunisia, which is to be coupled with the maintenance of the "personal status" of French citizens, of their access to the professions and of their representation in the Tunisian Assembly. Next, there is to be a convention on administrative and technical co-operation, whereby the conditions under which France would supply officials and under

THE ECONOMIC WEEKLY

which French capital would be invested in Tunisia would be determined. The third convention relates to France's rights and prerogatives in the fields of Tunisia's defence and, fourthly, in international relations. There is to be a judicial convention, which will define the powers of French and Tunisian courts in the Regency. The two other conventions relate to cultural matters (the status of French schools, and the French language), and monetary and financial relations between the two countries. All these conventions are to be linked together by a general agreement on relations between France and Tunisia. In particular, they are to lay down the procedure for the settlement of any disputes which might arise in their application.

The Faure Government have acted wisely in these negotiations. They invited the leader of the Neo-Destour to help in the negotiations for Tunisian self-government. M. Habib Bourguiba has been recognised as the *supreme combattant* to almost all Tunisians. Long years in exile have not deprived him of his great influence within the territory. He has been able, it is said, to merge the Arab bourgeois intellectuals and the mass of the *fellaghas* into a single disciplined party, supported at the base by an efficient and united trade union movement. It has been this sense of national solidarity which has been the key factor in Franco-Tunisian relations. Unlike French policy in Morocco and Algeria, where the standard "divide and rule" approach was fully exploited, the French in Tunisia were faced with a coherent national spirit which transcended class differences and petty factionalism among the tribes. In 1953 the Bey was deposed but his successor, whom the French chose, subsequently identified himself with the Nationalist Movement. Similarly, the puppet cabinets of "representative Tunisian leaders" which the French had formed at various times, proved to be too difficult and all of them had to be sacked.

The National solidarity of the Tunisian people is certainly the key factor contributing to the French initiative for negotiations. There are other reasons as well. One is the relative weakness of the French settlers in the territory. Out of a total population of nearly 4 million, only 250,000 are Europeans. Next, there is Tunisia's abject poverty. The average income among the French population of the dependency is nearly 25 per cent lower than in Algeria and "annual investment" per head is 5,500 francs compared to 9,400

francs in Algeria and 8,700 francs in Morocco. Finally, Tunisia's old-established industries, such as phosphates, no longer attract French capital and extensive prospecting has so far failed to reveal workable oil deposits.

The hope of a peaceful settlement in Tunisia can only be realised if, as M. Bourguiba pointed out, "the French Government will apply a sincere spirit to the Agreement". He has pointed out in a recent statement that he is not unmindful of the possibilities that the French "old-timers of 20 to 30 years overseas service" will attempt to undo what is now being done. In this event, he has warned the *fellaghas* would again take to militant action and the whole of Tunisia would quickly fall into the pattern of violent politics which is the mark of

French North Africa today. The Neo-Destour, having emerged from illegality, have been able to instil among the *fellaghas* a greater sense of loyalty and there is little doubt that given French sincerity the *fellaghas* would come out into the open and form themselves into, what the Neo-Destour has recommended, the core of a National Tunisian army. Since the Tunisian negotiators have agreed that matters of defence should be left in French hands, it would follow that the *fellaghas* would come under the control of the French. This, by any measure, must be considered to be a far-reaching concession on the part of the Tunisian Nationalists. It can only be hoped that French sincerity will be maintained in the future and that the ravings of the French settlers will be ignored in the search for a permanent settlement.

Book Reviews

The Bandung Powers

Asia and Africa in the Modern World Edited by S L Poplai, for the Asian Relations Organisation, Asia Publishing House, Bombay and Calcutta. Pp 218., Price Rs 5.

THIS neatly got up handbook, published on the eve of the Bandung Conference, has been a very timely publication—how timely, is proved by the fact that it had to be reprinted within a month. Prepared with the assistance of the Indian Council of World Affairs and the newly set up Department of African Studies of the Delhi University and the Department of Islamic Studies of the Aligarh University, the basic facts about the countries of Africa and Asia which met in the Afro-Asian Conference at Bandung have been set out in this volume very briefly.

Though no attempt is made at political analysis or in tracing the political development of the Afro-Asian group of countries and their efforts to enter the world political arena, some light has been thrown on the genesis and development of the Bandung idea. Developments leading to the establishment of a common forum for the Afro-Asian group of countries, beginning with the non-official Asian relations conference which met at New Delhi in March 1947 to the Conference at Bandung, have been sketched in brief and an

attempt has been made to link together the decisions taken at various conferences. Thus in 1947, all the Asian countries met at New Delhi with a view to exchanging ideas regarding the common problems which they had in the post-war period, and resentment was expressed against domination by Western nations. But the setting up of a Secretariat and holding a conference every two years, contemplated at the conference, did not materialise for various reasons. In January 1949, a conference was convened in New Delhi—it was rather an *ad hoc* affair, but of decisive importance—to protest against the police action of the Dutch Government against Indonesia and to focus world attention on and canvass sympathy for Indonesia's problems. The conference turned the course of history.

The emergence of an Asian-African group in the United Nations, the Baguio Conference in Philippines in May, 1950, the meeting of Colombo powers in April-May, 1954 at Colombo and at Bogor in Indonesia towards the end of 1954 at which the proposal regarding the Bandung conference,

took a final shape—all these have strengthened the bond among Afro-Asian countries.

The Bandung countries have been divided into five major groups as Africa, East Asia, South East Asia, South Asia and West Asia. The publication then deals countrywise with their geographical and historical background, constitutional framework and foreign relations, economic resources and foreign trade etc. The value of the publication is enhanced by the appendices at the end which includes the covenant of the Arab League and details the text of the decisions taken at the Asian Relations Conference, the Delhi Conference on Indonesia, the Baguio Conference, the conference of Colombo Powers at Colombo and at Bogor, and the South East Asia Collective Defence Treaty.

One, however, wishes that the statistical tables at the end, which now give data regarding only four items, viz, population, area, foreign trade and consumption of commercial sources of energy, were a little more exhaustive.

Agricultural Price Policies in Far East

THOUGH the world food and agricultural situation changed in 1953 from one of scarcity to relative abundance and in some cases even surpluses appeared, prices of basic foodstuffs still largely reflected the influence of the long post-war shortage, despite important modifications in the price policies in the Far Eastern countries. This is the conclusion drawn from the joint study undertaken by the ECAFE and FAO, published by the United Nations under the title *Food and Agricultural Price Policies in Far Eastern Countries with Special Reference to Rice*, Part I. Apart from their influence on agricultural production and food consumption, price policies have their impact on the general price level as well as on the prices of export products and export prices, in their turn determining the pattern of international trade and the quantum of import and export of individual countries.

During the war-time and post-war shortages of cereals, governments of the various countries of the region imposed food control and introduced compulsory procurement, rationing, price fixation, control over international trade in cereals, etc, with a view to ensuring minimum supply to consumers at fair prices. The most characteristic feature of the cereal control policy was the more or less complete insulation of domestic prices of rice in both exporting and importing countries against the influence of international prices. Therefore the prices prevailing during war and post-war years were not the result of the natural operation of the economic laws of supply and demand but the controlled prices maintained by governmental intervention. In fact, for the Governments of Burma and Thailand, differentials between the purchase and export prices became the mainstay of government finances. For the importing countries, price control meant a heavy drain on national finance in the form of consumer subsidies to equalise domestic and foreign prices. With the increase in domestic production, the subsidy was either curtailed or abolished. Among the importing countries, while some of the countries like Ceylon and Malaya sharply raised the price of paddy as an incentive to expand production, India permitted only a slow rise in the maximum procurement price for paddy and sought to expand production mainly by development programmes and techni-

cal improvements. Among the exporting countries, while Thailand increased both the area cropped and the level of production, war-time devastation and continued insurgent activities prevented Burma from developing rice production to any large extent.

When the situation changed into one of relative abundance, Burma partly solved its problem by entering into long term contracts with importing countries like Ceylon and Japan. For Thailand, on the other hand, with a reported exportable surplus of 1,000,000 tons on hand from 1953-54 harvest and the expected increase in production, falling demand is a matter of concern. The countries afflicted or threatened with a burdensome surplus may find *ad hoc* measures like price support policies helpful for a time, but as a long-term measure, either they have to permit prices to fall to competitive levels and concentrate attention on the possibility of developing alternative crops, particularly on land marginally suited to rice growing or suffer losses. This holds good not only for Thailand but for all the rice surplus countries of this region. In India lack of storage facilities, among other reasons, has prevented Government from undertaking large scale purchases. But new warehousing schemes are under contemplation and a modified form of price support is now the accepted policy. Building up stocks may ease the problem of surplus production due to favourable seasonal conditions. But if production continues to increase with improved methods of cultivation and increase in acreage, stock building, apart from its impracticability, is no solution. Diversion of acreage under paddy to other crops, especially in view of the reported world surplus of 8,000,000 tons of rice, would become necessary.

During the years 1949-53, in addition to considerations of supply and demand, other important factors like the currency devaluation of 1949, exceptionally high demand as a result of the Korean war during 1950-51 and national price policies influenced the course of prices of jute, cotton, tea, rubber, etc, in this region. But in direct and export crops, despite sale intervention and followed by retail prices, domestic market prices trend of

deficit countries on the other hand had to reconcile between the conflicting aims of increasing domestic production to the utmost through higher prices and of arresting the pressure of inflation. The idea was that prices should not be too high for the consumer and too low for the producer. These are relative concepts, depending on numerous economic factors changing from country to country and from time to time. Therefore, Governments had to regulate their price policies for basic food on the basis of trial and error. In the two main rice surplus countries, Burma and Thailand, the Governments had to pursue the double objective of stabilising producer prices in order to check inflation and of collecting Government revenue from export prices. In both countries, a 'minimum' price for paddy was fixed and it has not been changed since 1949.

High price policies, however, were not always effective in expanding production. In the first place, the opportunities of extending the area under paddy are much less in intensely cultivated countries like Japan than in countries like Burma, Ceylon and Thailand where a considerable expansion of the cultivated area is possible through extension of irrigation facilities. Secondly, the efficacy of a policy of price support depends on several other considerations. First, it depends on the relative prices of other crops such as jute and cotton which are likely to compete with rice. As cash crops generally respond more strongly to price stimuli, though with a time lag, marked fluctuations in the prices of industrial and export crops make it difficult to use price support for either increasing or stabilising supply of food. Further, the fluctuations in the industrial export crops, any level has also to be incentive

sharp rises in prices of the lack of marketing price for agricultural products at the efficiency of a price incentive scheme. Most of the producers are small holders with little financial resources. Their holding power being limited, their produce is usually bought up by intermediaries at very low

prices and the benefits of price support rarely reaches the actual growers. In spite of the improvement in marketing facilities that is taking place in many countries, a large proportion of paddy is sold through one or more intermediaries and in consequence, the cultivator receives substantially less than the official price.

Thirdly, the system of land tenure also works against the policy of price support. Either most of the producers are small holders eg in Thailand and Burma or share-croppers eg in Ceylon, India, Malaya; in either case, the bulk of the cultivators have little or no margin for sales over their own subsistence requirements.

The present price policies and price levels for cereals in Asian countries in the face of abundance and often surplus of cereals on the world market, throws up many problems for both the exporting and importing countries. Exporting countries are troubled first, by the marked trend towards self-sufficiency in some of the deficit countries, eg. India and secondly, by the increasing competition from exporters of wheat and other cereals. Although the improvement in production of the deficit countries was favoured by good weather conditions, it also reflects largely a permanent movement towards higher levels of production. Wheat and other cereals became prominent in the post-war years both because of the inadequacy of imports in rice importing countries and the fall in their prices relatively to pre-war. Nevertheless, the preference of many consumers for rice is still strong, and rice can regain most of the lost ground if it is competitive both in price and quality. But a discouraging tendency is that while the disposal of wheat has been subsidised in some countries, rice exporters have imposed export duties thereby reducing the competitive capacity of rice on the world market. Unless these countries decide upon the extent to which they can forego revenue from export duties, they cannot regain the ground lost.

In many of the rice importing countries, on the other hand, domestic prices have been fixed at a high level in order to stimulate production—in many cases, they are substantially higher than the prices at which cereals could be imported. While a policy of this kind could be followed indefinitely by countries such as Japan, with a more or less permanent deficit, it may be more difficult to maintain in countries which are more or less self-sufficient eg. Indonesia, Philippines. If production in these

countries exceeds requirements, the price level can be maintained either by financing the carry over of stocks or by subsidised exports. If, however, there are continued surpluses, they will then have to examine the possibility of diverting production into other channels, by a downward price adjustment. The scope for such diversion is limited by two considerations, first, diversion of production may prove difficult either because of natural factors, market de-

mand or necessary skill, and secondly, the cultivator may react by curtailing his own consumption and increase the marketable supply. In view of the considerations set out above, it would appear that the maintenance of rice prices above world levels would give rise to many problems in countries which are close to self-sufficiency, and therefore there is need to bring down prices. The case for diversifying production of coarse needs no special pleading.

Skyscraper Sarvodaya-Secretariat

THE new skyscraper home of the Bombay Government, it is claimed, has been built in record time; but oddly enough, the same efficiency and expedition have not been evident in giving it an appropriate label. True, this too may be claimed as a point in favour of Government, indicating, as it may well be supposed to do, a certain august indifference to things of the surface, things that merely embellish but are not of the essence. That the new secretariat has not yet been named and that a search for a name is going on, however, does not suggest august indifference. On the contrary, it betrays an indecision of purpose, if not also a little mental indolence. Meanwhile, however, the public have manfully come forward to shoulder the task, the proof of which may be found in the correspondence columns of local papers. It is a happy sign that when Authority wobbles even in so small a matter as the selection of a name for a building, the public should strive to rise to the occasion; for is not that how democracy should function? To say that, however, is not to suggest that the people, or at least such of them as are moved by a sense of duty to pen letters to the Editor, have been able to make any contribution of much value. No suitable name has yet been found for this impressive structure. The process of arriving at a popular choice is itself torturous and time consuming; and that is why there is something to be said for one or two firm-minded persons in authority taking a decision for good or bad.

'Sarvodayalaya,' 'Sacheevalaya' and 'Kacheri' are some of the names suggested in the correspondence columns; and if there has been any unanimity, it is in discarding the old label of the Secretariat, 'Bom-

bay Castle', not only as being out of date, but also possibly as being too authoritarian in sense and sound. But some may well ask, as the repository of authority, should Government not also spell a certain degree of awe? True, State dignitaries nowadays makes an attempt now and then at rubbing shoulders with the populace—generally to the embarrassment of the latter. But has there been much of a change in Government in this respect? Scratch the meekest of Ministers, the Gandhian veneer will come off and the bureaucrat of old will spring into view, bristling with the trappings of authority. For such folk to take refuge in a 'Sarvodalaya', or even 'Sachivalaya' and prune down their egos to appropriate proportions or stove them away in a self-denying spirit in one of its numerous cubicles would be to suffer a damage to sedulously-built personalities which may leave them politically prostrate. Many irreverent alternatives in nomenclature could be easily suggested, at once apposite and strikingly self-revealing; but humour wilts where solemnity is enthroned in all its heroic magnificence. And indeed, who knows how long it will be before levity and banter is classed as subversive activity, perilous to the smooth progress of the State, and made culpable as such through an appropriate amendment to the Constitution? Indeed, the quest for a name for the Secretariat is unpromising and unrewarding either way; and they may, after all, be the really wise who have desisted from writing letters to the Editor on the subject or giving any thought to it. When all is said and done, a seat of authority will remain a seat of authority and forbidding at that, whether it is called a castle or a hermitage.

ELECTRONIC CONTROL FOR NEPA NEWSPRINT PRODUCTION

India will soon be able to meet one-third of her requirement of newsprint when the Rs. 6-crore Nepa Mills goes into full production in a few months time. The only one of its kind on the mainland of Asia, six electronic controlled drives of Nepa Mills will turn abundantly grown *salai* and bamboo of Madhya Pradesh into useful newsprint playing a very important role in the development of the country's press and literacy.

The quality and production of paper calls for very critical control of the paper machine drive. The G.E. Electronic Amplidyne Control installed at Nepa Mills will enable one operator to co-ordinate all six groups working at the same time. This highly accurate and modern G.E. drive system is being used by leading paper mills in the United States, Canada and Europe.

Using G.E. Electronic Amplidyne drive system, it is estimated that enough paper in a sheet 18 feet wide could be produced in 24 hours to cover the 327 miles from Napanagar to Bombay.

Progress is Our Most Important Person

GENERAL F

INTERNATIONAL GENERAL ELECTRIC

A Stock Market Review

Calcutta Stock Exchange Official Year Book 1955 Calcutta Stock Exchange Association Ltd,
7 Lyons Range, Calcutta 1. Pages 535. Price Rs 12-8.

CALCUTTA is the only stock exchange in India to have an official year book of its own and the latest issue of the year book for 1955 fully keeps up the standard. Official publications of this type are usually compiled with meticulous care and the Committee of the Stock Exchange Association responsible for the year book, point out in their preface that the information presented has been verified and endorsed by the Managing Agents and Secretaries of the companies concerned. The information about the companies is presented in a standard form and net profit has been shown in accordance with the Section 87-C of the Indian Companies Act and after provision for taxation. In addition, for this edition, the manufacturing profits of jute mill companies "have been put on a rigid and correct basis." The companies are classified under the following broad heads:—banks, railways, tea companies with separate sections on sterling and Jalpaiguri tea companies, Malayan rubber companies, cotton mills, coal companies, jute mills, mining companies, engineering companies, electric companies, sugar companies, miscellaneous companies and insurance.

The list indicates the wide range of shares which used to be dealt with on the Calcutta Stock Exchange, including Malayan rubber companies, for instance, of the days before World War II when rubber and tin shares were popular with Calcutta investors. Each section carries a general introduction in which within a brief compass all important developments relating to the industries concerned has been brought together. Significant changes in company affairs in the last one year have been collected in a separate section entitled "Company Intelligence 1954-55". These relate to changes in managing agency, capital structure of the companies and in the registered office etc.

Departing from the austere lines of London Stock Exchange publications, publishers have not maintained in countries which introduce less self-sufficient eg. India, Philippines. If production in these

reviewer, a rapid survey is given of the broad developments. In the course of this survey, naturally some generalisations are made which do not matter much. But in a matter like the price of tea shares and the gains made by the tea shares, the Committee of the Stock Exchange Association observes:

"What created a craze for tea shares from the very beginning of the year was the notion, taken for granted by the investors, that the prosperity of the industry, based as it was on restricted production and remunerative prices, was not to end too soon. That they were right in their notion was proved by the subsequent course of events."

Reading this introduction after the fever has passed, it is easy enough for one to be wise and question this judgment. Even when these lines were written, knowledgeable people may not have endorsed such a judgment, but it does appear somewhat odd for a sober body like the Committee of the Stock Exchange to hazard an opinion and put it down in print when experience must suggest to them how difficult it is to distinguish a passing phase from a long term trend.

The lack of ready availability of dependable statistics must have led the compiler to include the section on economic statistics. In this sec-

tion, as is natural, the Five-Year Plan and the financing of the Plan have been covered under several heads, eg. Investment under the Five-Year Plan, its phasing, sources of finance, irrigation and power projects, results anticipated, distribution of outlays and financial resources. The table of distribution of working force by industries in the Indian Union, which the National Income Committee claim to be no more than a very rough approximation, is likely to mislead the unwary reader.

On the other hand, greater exhaustiveness would have been more welcome in a matter like statistics of joint stock companies for which one would naturally turn to this specialised publication. This is dismissed in a single page out of 17 pages devoted to economic statistics. While information is given of company registration year by year, nothing is said of the companies which go into liquidation. So one does not get the correct measure of net growth. Again, consent of capital issues is tabulated, but not new issues or issue of bonus shares.

Companies in liquidation since 1939, preference dividends in arrears, rights of preference shareholders and full texts of the rules and bye-laws of the Calcutta Stock Exchange are regular special features which are duly maintained.

"A man may, if he knows not how to save as he gets, keep his nose to the grindstone."

Social Welfare Services

(Contributed)

THERE have been developments of considerable significance in the field of social welfare in India in recent years. One is the emergence of a public sector in social welfare work, following increasing participation of the State in that sphere. The other is the growing co-ordination in the activities of the various voluntary social welfare organisations in the country engaged in a specific field of welfare work or among different organisations engaged in a number of allied activities, which could be beneficially co-ordinated.

These two developments are of immense significance for the country as a whole and, in particular, for the needy or socially defenceless groups in the population for whose benefit the activities are designed. Considered in their proper context, they are the first steps in the direction of a Welfare State, which is the goal of India's Constitution. The provision of social security, in the broadest sense of the term, to all the needy, destitute and socially unprotected sections of the community is implicit in the concept of a Welfare State, and so is the obligation that the incidence of preventable unemployment, old age, infirmity, physical handicaps and destitution should be made bearable. We are yet far from that ideal; but the first steps have been taken in that direction in the scheme of Employees State Insurance and the various labour welfare laws. Foundations have also been laid for social welfare work for the needy and the defenceless and for social services in the shape of education, public health, community services, housing and so on.

Social services and social welfare activities of the magnitude and extent demanded in the conditions obtaining in the country are manifestly beyond the scope and ability of the purely voluntary organisations to provide, however well-established the latter may be. The All-India Women's Conference, the All-India Adult Education Council, or any similar voluntary organisation could undoubtedly be regarded as agencies competent to initiate programmes or suggest measures for the furtherance of the interests of women or the cause of adult education. But when the question is

one of providing welfare activities and services in the requisite measure for the large number of women who are the victims of social vice or who need maternity services, it is beyond the All-India Women's Conference, for example, to afford either the funds or the personnel for the purpose. Obviously, it is the State or the public sector, which alone can shoulder and discharge this responsibility. The public sector or the organisation which represents it would undoubtedly seek—and is entitled to obtain—the co-operation and the support of voluntary organisations in implementing the necessary schemes. There is no other method by which the needy sections of the people can be assured of an adequacy of assistance and the requisite efficiency in the administration of the programmes than through such fruitful co-operation between the public and private sectors. That is how social services and welfare activities have developed in a number of other countries—East and West; there is reason to believe that in India too we are walking along the same road to reach the same goal.

CO-ORDINATION AMONG PRIVATE ORGANISATIONS

It has, nevertheless, been found in India, as in other countries, that while co-ordination could be attained comparatively easily as between the public and the private sectors in social welfare work, particularly at the planning and directional level, it is not so easy to ensure co-ordination among the private organisations which are engaged in the same line of welfare activity or in different but inter-related activities. Life has become so complex that different kinds of social welfare work cannot be separated in water tight compartments. Organisations functioning, say, in the field of child welfare can render greater and much better service when they act in co-ordination with one another and pool their resources and efforts. If we look at it from the standpoint of the services they can render, there can understandably be no escape from the conclusion that these can be maximised only when they are prepared to work together, though they may not merge their individual identities in the common pool. Progress of welfare

work therefore depends on the systematic promotion of this co-ordination, where possible through mutual agreement among the organisations themselves and where necessary, under the guidance and with the assistance of the State organisation.

CENTRAL SOCIAL WELFARE BOARD

Voluntary social welfare activity has had a long tradition in India and the number of organisations engaged in it has always been quite considerable. In the course of the past few decades, a number of all-India organisations, interested in one aspect of welfare or concerned with the welfare of one particular section of the population or the other have sprung into existence. There are child welfare organisations, youth welfare organisations, organisations for the welfare of women, organisations interested in the welfare of the physically handicapped like the blind, the deaf and the mentally handicapped, organisations for rehabilitating delinquent children, community welfare organisations and so on. While this doubtless represents a commendable and welcome development, in a number of cases, the financial resources of such organisations are not adequate to enable them to undertake programmes of welfare on any extensive or sustained basis. This deficiency has been sought to be eliminated for the first time through the constitution by the Government of India of the Central Social Welfare Board, in pursuance of a recommendation in the Report of the Planning Commission, and the provision of Rs 4 crores made for the implementation of its assistance and co-ordination programmes during the First Five-Year Plan period.

The Board's activities have lent point to the concept of social welfare in India, invested it with meaning and significance, and demonstrated the need for and the potentialities of purposeful co-operation between the public and the private sectors in that field. The significance of the Board's work consists principally in that it has been given to it to infuse life and vigour into a number of voluntary organisations which, starting with highly laudable intentions, have in course of time

begun to decay due to financial difficulties and become completely or partially defunct. Financial assistance has been given to 1,700 such organisations, many of which are situated in urban centres, to resuscitate themselves and to extend their scope of usefulness. These organisations, representing the private sector in social welfare, may not in all cases have responded to the effort to inject life into them; but, by and large a vast proportion of them, so far given grants to the extent of Rs 35 lakhs, have been helped to extend their social service activities in their respective fields and to that extent, have relieved distress and provided relief to a number of needy persons.

SAFEGUARDS AGAINST ABUSE

That is an aspect of the work of the Central Board, the significance of which can be properly evaluated only in course of time. If the voluntary welfare organisations which have received grants utilize the money to the best advantage, it will have automatically augmented the sum-total of the resources available in this vast country for social welfare work and relief of distress. There is, indeed, need for vigilance against the grants being badly utilised or remaining unutilised. The Central Board's inspectorate system and the supervision of the work of aided institutions by the State Welfare Boards are a safeguard against such mispending or waste of public funds.

That co-ordination in the provision of relief and assistance to the socially down and out sections in the rural as well as urban areas is an essential ingredient in producing satisfactory results is now accepted. While it is attained at the policy-making and directional level at the centre by the Central Social Welfare Board, it is achieved at the implementation and execution level by the State Social Welfare Advisory Boards set up in the various states and by their subordinate bodies. It is no longer so much private charity or endowments, hedged in with conditions on the utilisation of funds provided that sustain voluntary welfare organisations as state grants and assistance from public revenues. Hence co-ordination is all the more necessary. Extravagance on the one hand or dissipation of resources over a widely scattered field on the other can now be avoided by, say, child welfare organisations in a particular area or child welfare and women's

welfare organisation in another area, coming together first to pool and then to share their funds and the personnel they employ in their institutions for the common good.

WELFARE EXTENSION

In the rural areas, where the welfare services are few and far between, the Central Social Welfare Board as is well-known has introduced a scheme for welfare extension projects—one in each district in the country, totalling 352 projects—covering more than 35,000 villages in the First Plan period. The welfare extension projects do not duplicate the work in the national extension service blocks or the community development blocks, in which the accent is mainly on food production, agricultural development, and economic development. They concern themselves at present with provision of welfare services for women, children and the handicapped, which do not trench on the jurisdiction of the national extension service blocks. There is, however, the hope that, as the area covered by the NES expands and as, simultaneously, the area under the welfare extension projects also expands, as it is expected to do during the Second Plan period, the two schemes will become increasingly complementary to each other, despite the different auspices under which they will function. To the extent that the programmes under the two schemes are identical in some respects—such as in the provision of maternity or child welfare services—duplication and overlapping can be avoided by earmarking a specified number of projects for the operation of the programmes of each organisation.

The two principles of co-ordination of the activities of voluntary organisations as well as utilisation of the agency of the private sector in the social welfare field are clearly evident in the execution of the welfare extension projects. In the project implementing committees at the district level, all—or almost all—the private welfare organisations operating in the fields of women's or children's welfare are generally represented and function in a co-ordinated manner in formulating work programmes and implementing them. In the State Welfare Boards themselves, representatives of the State Governments sit side by side with private welfare workers under non-official chairmen appointed by the Central Board in consultation with the different State

ernments. The State Boards screen the institutions within their respective areas for the distribution of the Central Board's grants and formulate the over-all programmes of work in the welfare extension projects, for spending the Rs 25,000 grant made by the Centre to each one of the projects for the First Plan period.

GRANT MAKING BODY

It will be seen that the function of the Central Board, representing the public sector in social welfare is presently more or less restricted to the making of grants to private or voluntary organisations, giving directions to the State Governments or State Boards, drawing up of the over-all plan of schemes of welfare, arranging for the training of personnel like the *grama sevaks* or village level workers and maternity assistants and other health personnel for employment in the project centres, and inspection and auditing of the accounts of the voluntary organisations accorded aid. It is also directly handling the family welfare programmes which at the moment is limited to the establishment of a match factory on a factory-cum-cottage industry basis in Delhi.

It is, however, inherent in the scheme of aiding voluntary organisations that, whenever any particular service provided by these develops into such a magnitude and size that it cannot be effectively executed by such organisations, it will be taken over by the State agency to be executed directly by itself or through a non-official agency competent to carry it out if financially aided by the State. A comprehensive scheme for the provision of after-care and correctional services for a number of needy groups which the Central Board has approved for implementation during the Second Plan period is thus proposed to be put through in co-operation with voluntary agencies.

Though the most important in that field, the Central Board is not the only State agency which provides for social welfare services. A number of such services are either directly sponsored or aided by the Central Ministries of Education and Health, Home Affairs, and Rehabilitation, in the sphere of welfare of industrial workers, the Scheduled Tribes and the Port labour is to be permanent basis, there

these various services is vast and continuously growing, even as the Central Board's field of work is growing, thereby revealing the great leeway that has to be made up before India can develop a sizeable welfare service. These welfare services represent in their cumulative effect the contribution which the public sector is making and will continue to make to social welfare work and invariably they are put through with, wherever possible, the co-operation of voluntary organisations. It is a two-way traffic, and it postulates a readiness on the part of voluntary agencies to extend their co-operation to the State agency.

The field for social welfare work in India is vast, what with the large number of people whose problems call for the demonstration of human sympathy and exhibition of an understanding of human needs, particularly of those sections of the population, who have remained so far unblest by the benefits of education or of healthy life. It is a field in which the State agency should play an increasingly import-

ant part; it is also a field for which the vast reservoir of private funds and voluntary efforts could be tapped to the maximum possible extent. An increasingly fruitful partnership between the public and the private sectors should be developed in this sphere, and it is to be hoped that that is the direction in which things are in fact moving.

There is a growing movement, sponsored by the Indian Conference of Social Work, to secure the establishment of Social Welfare Ministries and departments in the Centre and in the various states, which has borne fruit to the extent that in three states, Departments of Social Welfare have been constituted. Further developments along this line in other states should be welcomed as a concession to the demands of the times and as representing the enlargement of the principles of extension of the scope of welfare services, fruitful co-ordination between the State agency and voluntary welfare agencies and as affording greater scope for private and voluntary effort to enter the field of social service with the

assurance that it can draw on the financial assistance of the Government or a Government sponsored organisation for their programmes. This postulates that substantially larger appropriations should be made in the Second Plan period for these services.

Smooth co-ordination between the public and the private sectors in the field of industry is yet to be attained. The growing importance of the public sector in industry, however, is not regarded by all as a happy augury promising harmonious relations between the two. Fortunately, co-ordination between the two sectors in the field of welfare work does not give rise to such conflicts, it can be and is being pursued with the prospect of extended responsibilities devolving on the public sector in course of time. Nevertheless at no foreseeable time in the near future is there any prospect of the private sector being eliminated from the picture in the social welfare field; rather it is possible to visualise the continued occupation by it of an honoured and honourable place.

The Simla Conference of Asian Nations

B N Ganguli

THE first plenary session of the ten-nation conference of the Asian members of the Colombo Plan Consultative Committee which recently met at Simla gave top priority to a discussion of the utilization of the \$200 million Asian Development Fund allocated by the US Congress for the development of intra-regional trade and setting up of machinery to provide credit to enable Asian countries to tide over short-term balance of payments difficulties.

This new variant of American economic aid deserves more careful examination than it has received so far. It is based on the recognition of the fact that economic aid received on a bilateral basis is not enough. Secondly, it is felt that emphasis on regional needs and interests would tend to counteract frictions and misunderstandings generated by discriminatory aid. Thirdly, the emphasis on regional needs and interests emphasises the need for economic co-operation conducive to intra-regional trade and stable and final settlement of disputes. Finally, it puts on a large volume of intra-regional trade as an aid to

economic development and not as the basis of economic development. It may be pointed out that these basic principles are in accord with what may be called the Colombo Plan approach. President Eisenhower's special fund operating through, or in conjunction with, the Colombo Plan agency is, therefore, calculated to put external aid to Asia on a new and more effective footing.

What broad purposes is the special Fund likely to serve? The purposes mentioned in this context are:

- (1) Development of intra-regional trade, and
- (2) Provision of credit to enable Asian countries to tide over short-term balance of payments difficulties.

Asian economies are said to be competitive, and not complementary, economies and, therefore, the scope for intra-regional trade is naturally small. But the extent of diversity of production which already exists and which can form the basis of a large volume of intra-regional trade should not be underestimated. Before the war South-East Asia had a large volume of intra-regional trade in tropical products, particularly

rice and fish, the total value of which was estimated at \$400 million. There has been a certain degree of primary industrial development in this region over the years. Some countries have also developed their secondary industries. But there is no reason why intra-regional trade should not develop while South-East Asian countries are passing through a process of concurrent economic development. In fact there is every reason why it should be possible to utilise the proceeds of foreign loans or foreign economic aid for the purpose of stimulating sales and purchases, within the Asian region, of essential light capital goods, consumer goods and foodstuffs which Asian countries would need in order to develop their economies without internal inflationary pressures and serious balance of payments difficulties.

Clearly President Eisenhower's special Fund is not meant for financing economic development in Asian countries and thereby raising the volume of intra-regional trade to a high level. What it seeks to achieve is to provide credit by means of which primary producing countries of Asia will be able to meet their

short-term balance of payments deficits which bring about a contraction of markets for one another's exports and thus inhibit intra-regional trade.

It is the balance of payments problem which is held to be the crux of the economic problem in South-east Asia. It is well known that sharp cyclical fluctuations in the export earnings of these countries have been a serious obstacle to economic development on the basis of stability. Export earnings of these countries had been falling since the first half of 1951 and were still declining in the first half of 1953. Most of them have been facing a fall in government revenues as the result of the lower levels of private incomes and foreign earnings. Their tax structure is not adapted to raising resources for development, and since private savings are inadequate, there is recourse to budget deficits unless investment outlay is drastically cut. Since the latter alternative is politically undesirable, there is always a danger of inflation. Clearly the ability of these countries to sustain budget deficits depends partly on foreign currency reserves either accumulated earlier, or received as US aid or as import of private foreign capital. Several countries of South-East Asia are at the dangerous borderline where balance of payments deficits tend to lead to an undesirable kind of dependence on foreign aid. The US Congress seems to recognize now that foreign aid should be what it is: an aid to economic development and not the basis of economic development. What is then the solution? Countries of South-East Asia have been moving in a vicious circle. Economic development is sorely needed to escape from the paralysing effects of violent fluctuations of export earnings. And it is these violent fluctuations of export earnings which, in their turn, create serious balance of payments difficulties and inhibit sound economic growth. How is this vicious circle to be broken?

One way of breaking it is to form a payments union on the lines of the European Payments Union which has solved the payments problem of Western European countries during a very difficult period of inflation. Asian countries could form a Bank of Intra-regional Settlements. If a bank of this kind cannot be started now, a beginning may be made with a bank which can be a lender of the last resort to Central Banks of Asian countries provided that there are proper safeguards against risk of default. It does not appear that the Simla Conference could tackle these problems of organisation in a realistic and co-operative spirit or make a significant contribution to economic development in South-East Asia.

be safeguards against piling of deficits in so far as they are due to heavy uncontrolled internal inflationary pressures. Such an organisation will discourage the tendency for any country to have credits or debits in any particular currency. It will also discourage discriminatory exchange arrangements. It will thus unblock the channels of intra-regional trade without exposing the member countries to the recurrent threat of balance of payments deficits.

Theoretically, an Asian Payments Union is an attractive solution. But several conditions have to be fulfilled if such a union can be regarded as operationally sound in the Asian context. In the first place, \$200 million is clearly inadequate and has to be supplemented, I imagine, by some kind of 'standby credit' to be provided by other agencies like the International Monetary Fund and the Central Banks of Asian and other countries. In the second place, commodity agreements, such as those concluded in 1953 for stabilizing the prices of tin and sugar, must contribute substantially towards preventing extreme fluctuations in export incomes. Otherwise too severe a strain will be imposed on the Payments Union by violent and simultaneous fluctuations in the prices of primary commodities produced in South-East Asian countries and in their export incomes. In the third place, members of such a Payments Union must undertake to pursue rational domestic economic policies to offset, as far as possible, the fluctuations in export earnings which cannot by any means be avoided. Lastly, like the members of the European Payments Union they must agree to liberalise intra-regional trade to the extent that such liberalisation is not inconsistent with the basic domestic and external equilibrium of a particular country.

What is needed, it seems, is an Asian OEEC (Organisation for European Economic Co-operation)—a broadbased organisation built on the foundation of the Colombo Plan machinery. It must eventually turn round the pivotal institution—the Bank of Intra-regional Settlements. If a bank of this kind cannot be started now, a beginning may be made with a bank which can be a lender of the last resort to Central Banks of Asian countries provided that there are proper safeguards against risk of default. It does not appear that the Simla Conference could tackle these problems of organisation in a realistic and co-operative spirit or make a significant contribution to economic development in South-East Asia.

Economics of Dockyard Labour

THAT there has been a marked deterioration in the output of dock labour, both in Bombay and Calcutta, is not disputed. It is about the factors responsible for the present state of affairs that there is, as usual, wide divergence of opinion between labour leaders on the one hand and the spokesmen of shipping companies and stevedores on the other. Dock Labour blames the Port Trust and the stevedores, stevedores blame labour, while shipping companies suffer from slow clearance of ships, reduced voyage days, increase in expenses, etc. This problem assumes special importance in view of the need for and the accepted goal of expanding Indian shipping. And it will remain, when the storm presaged by the threat of foreign shipping companies to impose a surcharge on freights has blown off.

A lasting improvement in the situation can be brought about only when the deep-seated defects in the working of docks—be they on the part of the labourers, stevedores, shipping companies or port authorities—are brought to light and remedied.

The only hard facts that are not open to dispute are those relating to the performance of dock labour. There has been a steep fall in the output of dock labourers; the average rate of discharge of bagged cargo, which varied between 159 and 206 tons per hook during pre-war, was fixed at about 90 tons by the Chief Labour Commissioner, after the introduction of the decasualisation scheme in 1952. But the actual output has fallen short of this low datum line figure by 30 to 40 per cent. On the other hand, the cost per ton of cargo has gone up in the last three years by about 40 per cent; ships are held up at ports much longer than before, their voyage days are reduced, as also the total ton miles of cargo carried—and all these have adversely affected their freight earning capacity. Again, ship held up in port not only means heavy loss to the shipping company concerned, it also means that the capacity of the port is reduced.

How far are all these due to deliberate go-slow tactics practised by dock labour and how far to general labour indiscipline and other factors? Before the decasualisation, conditions of dock labour were wretched in the extreme. Now that their rights are conceded, is labour shouldering its

share of responsibility? The present system of wage payment may not be held against labour, but wages not being related to output, may tend to encourage slackness and lower output. Since a quick turnaround of ships at ports is of the utmost importance, this system of wage payment is obviously not suited to dock labour.

Even more important is the system of employment on the docks. It has several peculiar and unsavoury features. In the first place, there are different types of labour, recruited and controlled by different employers: cranemen are engaged and controlled by the Port Trust authorities, who also employ a large number of casual labour depending on the volume of work; then there are the so-called "pool-gangs" recruited and paid by the Dock Labour Board, but who serve the needs of the

stevedores; and, finally, the stevedores themselves maintain labourers—though small in number—on a monthly basis, known as the "monthly gangs".

The maintenance of the pool-gangs by the Dock Labour Board for serving the stevedores makes for divided responsibility. Since the pool gangs are managed and paid by the Board, they are not as loyal as they should be to the stevedores who have no effective control over them. Hire and fire is the only principle which works in the docks as well as outside. Unless, therefore the system is changed and effective control of labour by the stevedores is ensured, output is not likely to improve.

If the above analysis is correct, labour cannot singly or directly be held responsible for the poor output, not to speak of being accused of delaying tactics. Another factor responsible for slower handling at the docks, though perhaps a minor one, cited by labour, is the longer time now taken for customs examination. The Chairman of the Bombay Port Trust, it is stated, has taken up this matter with the Customs authorities. How far this is due to the change in the pattern of trade and to the issue of numerous licences for small consignments resulting from import control is to this day an indeterminate quantity. But it is doubtful if the delay in customs examination can explain the fall in the output of labour.

Among the negative factors could be cited the reluctance of the Port Trust Commissioners—altogether inexplicable, it would seem—to introduce modern mechanical devices which would make handling of cargo easier and quicker. But this complaint, surprisingly enough comes from the spokesmen of labour who usually oppose the introduction of labour saving machinery. Another contention of labour is that the employment by the Bombay Port Trust of a large number of casual labourers, (whose output is lower than those of permanently employed) makes for delay. This argument, however, does not take account of the fact that the very nature of the work on the docks—the volume of work fluctuates from time to time—makes it necessary for the Port Trust to have a large number of casuals. If all the labour is to be employed in a permanent basis, there

BENGAL WATERPROOF WORKS. (1940) LTD.

377, Hornby Road, Bombay-1.

would be slack periods when many of the labourers would be idle but would have to be paid, whether they worked or not. If all workers are to be placed on a permanent basis, either there should be a reduction in the level of wages or dock administration will have to be heavily subsidised. Moreover, the alleged lower output or efficiency of casual labour has yet to be proved since all dock labour was casual before the war and yet the output was very much better, judged by present standards.

The crux of the problem appears to be the ineffective supervision of stevedores. There is delay in starting work, and stevedores, labour complains, are inclined to slacken as the datum line output is approached in order to avoid payment of bonus. Again the complaint about, lack of basic amenities for labour such as canteens, shower baths, drinking water, etc., are at best negative factors in the situation and cannot explain the present fall in the rate of output. The standard of amenities in the docks could not have deteriorated so seriously as to affect efficiency of labour. On the contrary, the last enquiry conducted by the Ministry of Labour in 1952 regarding the conditions of labour in the dockyards, showed that most authorities provided all reasonable amenities such as canteens, free medical aid, facilities for sports and games, etc.

So all that one can say is that there is an urgent need for concerted effort on the part of all concerned—labour, the Port Trust, the stevedores and the Government as well—to find a workable solution to improve the present 'situation'. The Dock Enquiry Committee is now studying the problem. The committee will have to explain why decasualisation has produced results quite the opposite of what could be expected. As indicated earlier, the present system of labour management makes for divided responsibility. The stevedores who are required to provide quick service to shipowners need an efficient and responsible labour force. This can be ensured when the control of labour passes on from the Dock Labour Board to the stevedores. However, this is to be effected is the problem, for obviously the "pool gangs" employed by the Labour Board cannot be broken up and taken over by the stevedores individually. The 'pool gangs' could be collectively employed and managed by a Stevedores Association, if one could be run suc-

cessfully, which would then allot labourers to their members according to their requirements. A change along these lines can alone combine security of employment with regulated supply of labour to the stevedores according to need. Along with this change in management, the system of wage payment will also have to be modified. A streamlined incentive wage system should replace fixed wages unrelated to output. This is a complex, technical problem and the solution will have to be sought in a reasonable minimum wage related to output up to a datum line, and for results above the line, payment should be made on the basis of fixed schedule of piece-rates. Needless to say, a properly devised incentive wage system would also have as its complement some disincentive against perform-

Insurance Notes

Fire at Limbdi

THE fire which broke out last week in the Fateh Singhji Cotton, Ginning and Pressing Factory at Limbdi, in the State of Saurashtra, caused the loss of 42 lives and completely gutted the factory with the stock of 10,000 bales of cotton. It was one of the most disastrous fires not only in Saurashtra but in the whole of Western India for many years. The fire broke out on the 20th instant and rapidly spread and enveloped the factory and godowns where bales of cotton were stocked. The intensity of the conflagration was such that fire brigades had to be requisitioned from the neighbouring towns to cope with it and the only fire fighting vehicle of Limbdi was totally destroyed in the fire. The military and police were summoned to assist the fire-fighting squad. The Chief Minister of the State rushed to the scene. The fire was finally brought under control on the evening of the 21st instant after it had taken heavy toll of life and property.

The insurance companies who covered the risks of building and contents of the factory and the stocks of cotton deputed their officers and two well-known surveyors to assess the risk. The estimates made by the surveyors place the fire loss at about Rs 22 lakhs, though the total loss was reported in the press at Rs 50 lakhs.

The fire at Limbdi has created a

THE ECONOMIC WEEKLY

ance falling below the minimum.

It has been suggested that the Port Trust authorities themselves should take over both the recruitment of labour and the stevedoring services; this would mean that the Dock Labour Board will be concerned mainly, as it should legitimately be, with the welfare of labour. The problem of stevedore labour relationship will also be eliminated. The suggestion, however, is too impractical to be worth serious consideration. Stevedoring is a technical job which the Port Trust authorities are not equipped to undertake. Moreover, neither shippers nor shipowners would welcome the idea of the Port Trust, a semi-Government agency, being entrusted with this work. Port Trusts are not particularly known for quick despatch of business or satisfactory public relations.

consternation among several insurance companies who are perturbed at the frequent outbreak of fire in the recent months in the cotton growing areas of Saurashtra, Madhya Bharat, Punjab and other States, resulting in heavy losses. Fires in cotton ginning factories are not uncommon and the experience of the insurance companies of this class of risks is not satisfactory.

There are inherent risks of fire in the process of ginning cotton, which is itself highly combustible. Further, most of the ginning factories are ill-managed, and the atmosphere prevailing in them is one of strained relationship between the owners and workers. Therefore the moral hazard of such risks is not good from the underwriter's point of view. Apart from difficulties experienced in probing into the causes of incendiarism or the doubtful origin of fires, the lack of fire-fighting equipments with trained personnel to handle them in the ginning factories and in the localities where such factories are located, is directly responsible for the heavy losses which result in mofussil fires. It is high time that fire prevention measures were taken by the factory owners themselves and municipalities even of small towns maintained up-to-date fire-fighting equipment. But it is not a matter to be left to them alone. The insurance companies have a vital stake in fire prevention

THE ECONOMIC WEEKLY

and they should inaugurate a campaign through the press, lectures and broadcast talks and through distribution of publicity literature to stress the economic factors and to show that even under normal conditions, the amount recovered under insurance policies does not cover the loss sustained from fire. They should arrange for periodical and close inspection of the properties insured and insist on factories taking fire prevention measures.

According to the press reports, the

Around Calcutta Markets

Equities Marking Time

EQUITIES have been marking time throughout the current week. This week's behaviour of the Calcutta Stock Exchange would indicate that last week's spurt in equities was a false start. There has not been any appreciable fall in equities. But the volume of business has diminished considerably. Investors show no interest in stock markets. Even professional speculators are less active. In the absence of activity, share values are gradually sagging.

There has been a gradual change in the stock markets' attitude to the second Plan. Some months ago, investors were apprehensive that, if the second Plan involved a relative enlargement of the public sector, there would not be enough scope for expansion of the organised sector of industry. This was the main factor which initiated the fall in equities, which started last October.

Later, it was being argued that an enlarged Plan must necessarily lead to rapid economic recovery; that, with economic progress, industry must prosper. As the budget did not include any appreciable increase in taxation, equities began to look up. With reduction or abolition of the proposed excise taxes, equities developed further steadiness. From the subsequent re-adjustments in excise duties, stock markets inferred that the Government will try to stimulate consumption.

Stock markets are impressed with industry's demand that, unless measures are taken to expand consumption, industrial production may not be maintained. Employment is the main aim of the second Plan. With more employment, money incomes may be expected to improve. As money incomes expand, consumption may be expected to go up. But industry argues that, as the en-

Union Government, while expressing concern over the extensive loss caused by a fire at Limbdi, has asked the State Government to make a full investigation into the cause of the fire, which is at present unknown, and ascertain if any mischievous elements were responsible for it. While carrying out this investigation, it will be worthwhile for the State Government to go into the question of maintaining adequate fire-fighting equipments in the cotton districts and making suitable provision for preventive measures.

larged money incomes are mopped-up through higher taxation, there will not be enough left for it to expand, or for the community to spend on consumption.

Stock markets are now repeating the arguments advanced by some bank chairmen in their recent annual addresses. Under the second Plan, there will be an undue emphasis on development in the public sector. Though the private sector is allowed to function fully within the limited scope, industry's ability to expand will be curtailed further as funds are diverted through taxation and loans for expenditure in the public sector.

Shri Chintaman Deshmukh's analysis of the financial aspect of the second Plan has only deepened the gloom in stock markets. He had occasion recently to indicate that the second Plan would involve annual deficit financing to the extent of Rs 200 crores and additional annual taxation of Rs 100 crores. Whether these financial targets can be achieved without inflation is an issue on which opinions differ. But the financial implications of the tentative second Plan have had a chilling effect on stock markets in the current week.

Behaviour of Tea shares has disappointed many optimists. Last week's steadiness in Tea shares was widely welcomed. It was hoped that the forthcoming final dividend payments will lead to a gradual improvement in Tea shares. Final dividend payments will start from the middle of next month. So, hopes of buying support in Tea shares in anticipation of dividend payments still persist.

Both the industry and investors in Tea shares are anxiously awaiting the results of the first export auctions in new crop tea. That will be

known next Monday. Current reports are that export auction prices will be appreciably lower. It will not be news to the industry or to the investors that tea prices will fall. But the immediate outlook for Tea shares will depend on the extent of the fall in export auction prices at next Monday's auctions. Meanwhile, Tea shares remain quietly steady at lower levels.

Raw jute and jute goods are behaving according to expectations. Both are falling. Weather and crop reports indicate a satisfactory raw jute supply position in the coming season. Even though prices are falling, mills do not seem to be in a hurry to replenish their stocks of the raw material. Absence of mill buying is accentuating the fall in raw jute prices. As is natural, the downward trend in raw jute is having a sympathetic effect on jute goods.

Jute shares have fallen considerably in the last six months. These shares remain dull and inactive at the current low levels. There is no longer any selling pressure in Jute shares. In recent weeks, speculative investors have more than once shown interest in testing the market. If the falling trend in raw jute and jute goods continues, investors may be tempted to re-enter the market. Whether, and if so when, Jute shares will resume the upward trend, is still a matter for controversy. But the feeling is spreading that it may be risky to sell at the current low levels.

For some weeks now, Miscellaneous and Engineering Shares have been relatively steady. There are special reasons for the current popularity of BIC. But a feature in Engineering shares in recent months has been consistent support of all popular scrips at set-backs. Some of these scrips are sound. In most of them, there have been, or there are, syndicated support. But the steadiness in some Miscellaneous and Engineering shares is not entirely due to cornering activities.

It is now widely realised that the second Five-Year Plan will have a bias towards heavy industries. Whether heavy industries are to be developed within the private or the public sector, is a question which is not without significance. But, whether heavy industries are developed within the private or the public sector, it is clear that expansion of heavy industries will stimulate secondary engineering industries. This explains why some selected Miscellaneous and Engineering shares at the receive investment consumer lative support, 15 and ated. Each publishers Ltd. cottage and

Need of Perspective

DOES the making of bricks and tiles come under the category of village pottery industry? Making of country tiles does, but not the better type of tiles which calls for big kilns, heat control and other technical devices beyond the reach of the potter. Mangalore tiles on the West Coast and Raniganj tiles in Bengal, Bihar, Orissa and Assam are factory industries. Brick-making goes on all over India and surely there must be trained hands in the job who are better than others. But a small man in any part of India cannot afford to have a brick built house, not because the services of brick-makers are expensive or difficult to get but because in order to make bricks one must have coal. And coal is scarce, in out of the way places, besides being terribly expensive. So in the brick cement ratio, which determines the demand for reinforced concrete, the high cost of coal tilts the scale more and more in favour of concrete, which steadily displaces bricks. This is, in the simplest terms, the economics of building construction in the countryside and in the process of its working, cement is pushing out both wood and stone, much to the detriment of local architecture as can be seen in the course of a short walk through the bazaars of Almora or anywhere else in the Himalayas.

It is pretty obvious that techniques can be assimilated and absorbed, if the other conditions for its successful adoption are also present. So the attack has to be on all fronts. Opening of primary schools and teaching children to read when literature that is suitable for the boys and girls who come out, after two or three years of perfunctory schooling, is not being turned out, produces the familiar phenomenon of lapse into illiteracy. True, the social milieu changes and it can be changed more rapidly. But so long as the proper types of reading matter are not being produced, so long as the publishing trade does not create and catch up with the demand, there is inevitably a lot of wastage. It is the same with brick-making or teaching of arts or new techniques.

Since the Government of Bombay has decided to use, as far as possible, only country bricks and tiles for building construction in the community project and national extension service blocks, it may be presumed that making of bricks will not be stopped any longer by the lack of coal. The same applies to the scheme for setting up pilot projects for cottage industries in selected community project areas all over India. It is to be hoped that the co-operant factors will also be made available—skills will be matched with resources, materials will be supplied and finance as well as marketing arrangements provided so that the whole thing might go with a bang. The scheme is for setting up 26 pilot projects in various states. The location of the projects will be selected with due regard to the resources available—raw material, local skill and existence of communications and transport. Further, the Community Projects Administration has suggested that the area selected should be agriculturally advanced, so that consumer demand would be already there and need not be created. Each of the blocks selected for intensive development of cottage and

small scale industries will be divided into 15 groups of every 20 villages and a group committee set up for each of these groups of villages in order to plan and assist the programme of cottage industry development.

As has often been remarked, though the development of cottage industry had been one of the objectives of community development from the very beginning, it has not so far received any systematic attention. The present scheme is, therefore, to be welcomed if only for its educative and exploratory value.

Classification is the first step in knowledge and it had been hoped that when the Ford team of experts examined the question of small scale industries, they would suggest the types of industries that have a reasonable chance of survival and should therefore be supported, what would be the most economic size of the unit, which processes would be the most economical or at least lay down the criterion for separating the chaff from the grain. This was the first reaction but on closer consideration, it became clear that the Ford Team could not have attempted to answer these questions. The Ministry of Commerce and Industry, following the recommendations of the Ford Team, have now invited Dr Eugene Staley as a con-

sultant Industrial Economist to help find the answers; they have also invited Dr Lincoln Clark, to act as Marketing Consultant.

Now let us try to piece together these bits: do they make a complete picture?—the type of industries that should be set up, the economic size of the unit and the economics of the process to be adopted, marketing of the product. Then comes the development of the huge potential market through survey of public opinion, securing orders from wholesalers and retailers and processing of such orders and so on. This is the empirical approach to the problem, feeling one's way and moving forward cautiously on the basis of experience gained.

Thinking in aggregative terms, one may forecast an increased demand for cottage industry products, resulting from the substantial increase in investment that is now being proposed in the next five years. It is also proposed that the bulk of this increased demand should be met through increased output of household and hand industries. On the one hand, to increase substantially the production of these industries raises questions of organisation and administration of a magnitude that has never been faced before. On the other hand—

THE ECONOMIC WEEKLY

and this is probably the crucial point—much more needs to be known about the demand for these types of goods resulting from aggregate spending to be sure that additional production will be absorbed by the consumers. The difficulty of maintaining a balance between supply and demand, not in the case of a particular product, but of a whole range of them, is too great to warrant the comforting assumption that demand, wherever and however generated, will ultimately percolate to the village industries. Equally facile is the assumption that village industries will be able to deliver the goods, until much more is known about their requirements of raw materials, organisation, finance and transport.

It is only when the economic set up within which village industries are to function is clearly discernible that problems of technique, processes to be adopted and of marketing can be seen in their correct perspective. In the absence of such a perspective, we shall be perpetually groping in the dark. There is need for much exploration in this field. While the step now taken by the Community Project Administration is to be welcomed, it is to be welcomed only because it draws attention to the problems and not because of its adequacy as a solution.

India's World Status

PANDIT NEHRU is a statesman. Shri Krishna Menon is a diplomat. At his Press conference in New Delhi, Shri Menon left more things unsaid than said. Pandit Nehru was disarmingly frank in his informal talks with representatives of the Press. Shri Menon has just returned from his mission to Peking. He is on his way to Washington in pursuit of his half-finished mission. Pandit Nehru, too, will be visiting Russia soon. But he made it abundantly clear that he was not on any mission to Moscow. Even as Pandit Nehru expressed satisfaction that, in the world today, "there is less tension and there is a little more hope and a little more understanding", Shri Menon seemed hopeful that the relations between Peking and Washington were likely to improve. But, while Shri Menon created an impression that he had a formula for the solution of the Formosa dispute up his sleeve, Pandit Nehru gave no indication

that he was visiting Moscow to discuss a secret formula for world peace.

Both Pandit Nehru and Shri Menon were at pains to stress a significant aspect of India's foreign policy. Neutrality is an incidental aspect of India's foreign policy of peace through negotiation. But her foreign policy is not passive. She is actively interested in creating conditions under which the parties or Powers concerned are encouraged to enter into negotiations to resolve disputes through peaceful means. That was why Shri Menon visited Peking recently. That is why he is now on his way to Washington. This is also one of the main aims of Pandit Nehru's forthcoming visit to Moscow. He has expressed hopes that his visit to Moscow may be of some help in securing a lowering in world tensions. But it would be wrong to jump to the conclusion that India has any mission or ambition to act as mediator in world

disputes.

Shri Menon was at pains to dispel any impression that, in his efforts to reach a peaceful solution of the Formosa dispute, he was acting as a mediator between Red China and America. He went out of his way to emphasise that the four American airmen, known as the "Fischer group", had been released by Red China out of her own free will and initiative, and not at the instance of India. Pandit Nehru was more emphatic on this aspect of India's role in world affairs. India has no intention to act as a mediator in world disputes. But India is anxious to seize opportunities, whenever they come, in trying to put across one country's ideas to the other. With becoming modesty, Panditji claimed that sometimes such a policy helped to ease world tensions.

This was the role India performed at Geneva. This is precisely the aim of Shri Menon's visit to

THE ECONOMIC WEEKLY

Washington after his talks with Red Chinese leaders in Peking. This is one of the underlying aims of Panditji's visit to Moscow. Such informal talks, Panditji expresses the hope, are likely to weaken the "rigidity" in the parties or Powers concerned, and make them more receptive. It is a tribute to Pandit Nehru and his foreign policy that both the rival power blocs now recognise that India is in a position to perform the role she is trying to perform in world affairs. Britain, some of the Western European Powers and Red China, among the Communist States, have long since shown proper appreciation of India's peaceful foreign policy. Panditji's forthcoming visit to Moscow, at Russia's invitation, emphasises Communist Russia's faith in India's peaceful role in world affairs. America alone has been suspicious of India's foreign policy. Even after Washington was compelled by circumstances to concede that India was not a camp-follower, it remained sceptical of New Delhi. But there are reassuring indications of a change in America's attitude to India. Mr Dulles was wise in sensing India's and the Colombo Powers'

initiative behind Mr Chou En-lai's Bandung offer to negotiate with America on Formosa. He has been gracious in acknowledging India's efforts in creating conditions which are likely to ease the tense relations between Red China and America. It is a welcome development that India's peaceful foreign policy is now better appreciated in America.

It was inevitable that the Prime Minister should discuss the situation in Goa at his Press conference prior to his departure for Russia and some other European countries. It was equally inevitable that he should discuss Goa in the wider context of India's foreign policy. Many would endorse Panditji's guarded assurance that the Goa problem was now nearer solution. There has been strong criticism in some quarters within the country against New Delhi's attitude to the developing situation in Goa. Panditji reminded his critics that India could not, in conformity with her peaceful foreign policy, pursue a militant policy to Goa. Nor could the Government actively support and encourage any movement of mass satyagraha by non-Goan Indians, though it had no objection to individual Indians join-

ing the satyagraha movement. Short of war, India was prepared to enforce all measures to force Portugal to quit her "possessions" in India. But even while Panditji warned Portugal about the implementation of economic sanctions, he assured Lisbon of New Delhi's willingness to enter into negotiations for a peaceful solution of the Goa problem. Goa and the other Portuguese "possessions" belong to India. Portugal's willing consent to integration of these "possessions" with the Indian Union is an essential condition of the settlement of the dispute between India and Portugal. Both Portugal and the Goans have the Prime Minister's assurance that Goa's merger with the Indian Union will not in any way prejudice Goan culture or the existence of Goa as a separate unit and entity. Portugal, like France, would be within her rights in demanding such assurances. Goa, like Pondicherry, has the assurance that India is pledged to preserve Goan culture and individuality. India's claim to Goa is now conceded by most of the member States of the United Nations. Portugal would be wise in learning the lessons of post-war history.

(97 Branches throughout Japan)

To be out on June 18

SPECIAL NUMBER ON SECOND PLAN

Art Cover, 100 Pages, Price Rs. 2

The next issue of *The Economic Weekly* will be expanded into a special number to feature the Draft Plan-frame for the Second Five-Year Plan and it will come out on June 18. In view of this special number, there will be no separate issues on June 11 and 25.

A great deal of confusion has been caused by the premature and partial disclosure of the financial and other targets of the Second Plan. Now that the papers relating to the Second Five-Year Plan have been released, a proper examination of the Plan-frame is obviously called for.

To stimulate informed discussion, the Draft Plan-frame prepared by Prof P C Mahalanobis, which has unfortunately not been made freely available, will be published in this issue in *extenso*.

All important aspects of the Second Plan—its employment potential, internal consistency, heavy industry, demand for and supply of consumer goods, financial provisions, etc, will be treated in separate articles.

A symposium of opinions on the Plan will be an additional attraction.

Please Book Orders for Copies in Advance

Weekly Notes

Freer Exchange Rates

WITH the steady expansion of the transferable sterling area, freeing of gold and commodities exchanges, Britain's graduated convertibility programme for sterling has reached the stage from which one more hop will land her in full convertibility. This final step has caused much headache to Britain. Full convertibility at fixed exchange rate requires a strong foreign exchange reserve. Britain has not built up such a reserve. Even with all the assistance that the sterling countries may conceivably draw from the Monetary Fund, the reserves would not be large enough to withstand three bad years. And the burden of the present not so limited convertibility has to be borne without the compensating advantages that full convertibility may be expected to bring. Hence, the thoughts of those who look before and after, are turning increasingly to the possibility of convertibility with fluctuating exchange rates. Canada has shown the way. The Fund has climbed down from its original position and blessed her fluctuating exchange. With the return of bank rate to its old position as the arbiter of economic condition, the case for fluctuating exchange rates for maintaining internal stability is again gaining support.

Against this background has to be assessed the decision of the Reserve Bank announced this week that exchange rates of all currencies other than sterling, dollars, Canadian dollars and Pakistan rupees will be made free from June 15. It should be noted that the exchange rate will be made free, but control on exchange will remain as before. At present, the exchange rates of various currencies are determined by the Exchange Banks Associations in consultation with the Reserve Bank on the cross rates between sterling and other currencies. From June 15 onward, these rates will no longer be quoted by the Exchange Banks Associations, but each bank will be free to quote its own rates, based on advice received by it from its London office or correspondents.

Many new entrants in exchange banking will now have to make intricate calculation for quoting rates which are currently dished out to

them by the Exchange Banks Associations. The immediate result of the step may be, under the impact of completion, to narrow the spread between selling and buying rates of some of the currencies in which transactions are neither heavy nor frequent.

The long-run consequences, however, may be more far reaching. Though no official estimate is available, it may be presumed that more than 60 per cent of India's foreign trade and 50 per cent of the total international trade outside the iron curtain are transacted through sterling. Continental countries like Germany and Holland are enticing away some foreign trade from its sterling mooring by offering various facilities to it if such trade is transacted through the medium of their national cur-

rencies. If this trend gathers momentum, India may take advantage of such facilities provided the banks in India can afford such direct dealing instead of routing transactions through London. Though the possibility of an increase in trade through continental currencies is very limited, it cannot be entirely ruled out. Such direct relations presuppose the maintenance of a certain amount of exchange reserves at various centres to enable these banks to give ready service to their customers. In their enthusiasm for the new freedom, however, the banks should not lock up their liquid funds abroad at the expense of the local demand for credit.

Mitsui Bank Resumes

THE Mitsui Bank which resumes its operation in Bombay after a gap of 15 years, traces back its history to 1683 when the beginning of what was to develop over the centuries into one of the world's strongest financial institutions was laid by the opening of an Exchange House in Yedo. Mitsui became a private bank with its present name in 1876, and a partnership in 1893. It was finally incorporated as a Joint Stock Bank in 1909.

The Mitsui Bank has a network of 97 branches at home and abroad. The Overseas Branches are at London, Bangkok and now at Bombay and there is a Representative Office at New York. In addition, the bank has correspondents at all centres of the business world. It is therefore well able to attend to foreign exchange business extending to any part of the world.

The Bombay branch of the bank was active for nearly 20 years until the stoppage of trade with Japan brought its activities to an end. But that was some time before Pearl Harbour. Like other exchange banks, in addition to foreign exchange business, the Mitsui Bank intends to enter the field of domestic banking also in due course. For quite some time, before the opening of the branch, a representative of the bank had been functioning from Navsari Chambers, since July 1953, acting as a liason between the traders of Japan and India.

The branch office will take over this work and pursue it with more vigour.

**India's

so little as **TEA****

People's Participation in Kosi Project

KOSI symbolises a new approach to the problem of flood control and river valley development. Here, for the first time, voluntary labour has been enlisted in the execution of a large sized project. Although less than half a year's work has been put in—work commenced only in January this year—official reports confirm not only that the progress made so far has been 'gratifying' but also that this new experiment holds out promise for the future. Whether this hopeful prognosis is based on actual experience and what the experience has been are, however, both matters of controversy at the moment. Conflicting reports have appeared in the press and though in view of the uniqueness of the experiment, one should have thought that Government publicity would have availed of the opportunity to invite as many independent observers and press representatives as possible to see things for themselves, nothing of the kind has been done. While the press may be accused of making a mountain of a mole-hill sometimes, Government publicity has so often tried to turn mole-hills into mountains, so that the case for objective study and independent assessment can hardly be over-emphasised. From the scrappy materials at hand, one can only try to piece together some of the data and struggle valiantly to understand the situation as best as one can.

A big project is not all earth work to be carried out by relays of workers with baskets on their head and spades in hand. The major components of the Kosi project are:

- (i) Construction of a barrage at Hanumannagar in Nepal three miles long, lying partly in Nepal and partly in Bihar;
- (ii) Construction of flood embankments on either side of the river;
- (iii) Diversion of flood waters into the old channels of Kosi; and
- (iv) Construction of a canal system.

It was only in the construction of the embankments, the first stage of which had to be completed before the monsoon set in, that people's participation was feasible and was asked for. Different types of labour have been employed and consider-

able reliance has been placed on voluntary labour supplied by several organisations like the Bharat Sewak Samaj, Auxiliary Cadet Corps, etc. Indeed, judging from the number of hands working from week to week in April and June, the part played by contractors' labour appears to be quite negligible.

Bharat Sewak Samaj has been the guiding spirit behind the formation of Gram Panchayats as well as the labour co-operatives which recruit and supply paid labour. These labour co-operatives are a novel experiment in rural co-operation. Long before Kosi became the watchword for voluntary labour participation, at least one such society had

All the advantages of . . .

AOLLERITH
Electrical PUNCHED CARD
ACCOUNTING

to help
you
when
you're
really
busy

If the size of your business does not justify the installation of HOLLERITH, you can still, at peak periods, have all the advantages of HOLLERITH services and methods.

Submit your accounting problem to a HOLLERITH Service Bureau and it will produce the results—tabulations, invoices, statements or other documents as may be required. Your original documents are returned to you and all the information, which is now on punched cards, is filed and treated with strict confidence, ready for you to call upon at any time.

Alternatively, you may hire or buy Punching and Verifying machines to record your information on Hollerith Cards in your own offices and then use the Bureau to produce the finished result.

Apply to us at any of the offices listed below, and we will send a representative, who, with knowledge and foresight, can help you when you're really busy.

been registered in Bombay, but what happened to it? Only perhaps the Minister for Co-operation has an idea, and for the matter of that, talking about voluntary organisations to be drilled into disciplined bodies, what happened to Morarji's ambitious Home Guards, the formation of which was announced with the usual fan-fare of publicity, but of which little has been heard since? Behind Gram Panchayats sponsored by the Bharat Sewak Samaj are the *mukiyas* who are being officially 'built up' by the Bihar Government. Mukiyas, of course, are traditionally entrenched in the feudal village society of Nepal across the border. To these have been added the Shramdanis who have been enlisted for providing voluntary and unpaid labour, also organised by the Samaj. From the figures released by Shri Gulzarilal Nanda, the Minister for Irrigation, Power and Planning, it would appear that the solid phalanx of labour is supplied by none of these but by the Auxiliary Cadet Corps which forms the second division, or a sort of 'B' team to the National Cadet Corps. The relative strength of all these types of labour was as follows:

Period	Gram Panchayat Worker & Shramdanis	A.C.C. Cadets	Contractors
27-3-55 to 31-3-55	2,622	70	44
1-4-55 to 15-4-55	1,792	5,234	58
16-4-55 to 30-4-55	5,249	9,200	170
1-5-55 to 15-5-55	4,222	5,457	296
16-5-55 to 23-5-55	6,491	5,345	132

Output of Contract and Voluntary Labour

FROM the above figures it is not possible to read straight off the relative costs. For all kinds of labour, the Project Administration provides accommodation, tools and implements as well as such amenities as sanitary, medical and recreation facilities. Ration shops have also been opened at the work sites. To know the relative costs, however, one has to know, for instance, whether or not the expenses of the Cadets working on the project are being met in part by their own organisation, and how the cost of accommodation and amenities compares with the wages of hired labour.

However, obscure the position about relative costs, perhaps one can get some light on the comparison of the different

types of labour employed on the Kosi Project. An idea of the total performance made may be gained from the following table which gives the targets by a fixed date in terms of earth work measured in crores of cubic feet:

(in crores of cu ft)			
Date	(1) Target	(2) Progress	(1) as % of (2)
April 15	3.81	1.90	50
Eastern Embankment			
May 15	5.5	3.25	60
Western Embankment			
May 15	11.7	6.82	58

On the eastern afflux bund, there was some slowing down in the beginning but later things improved. Work on the eastern side of the project in Bihar—this is different from the eastern afflux bund—was delayed, because of difficulties encountered in the recruitment of labour; here work was also started late. On the western embankment, there were no such delays, but the pace has now to be speeded up in view of the fast approaching monsoon. From this general description, not much of an assessment is possible. But from the output *per capita* of different types of labour employed, some inferences appear to be warranted, assuming that the figures of output *per capita* are comparable, conditions of work being more or less similar. On the western embankment, the *per capita* output was 11.3 cubic feet for the Auxiliary Cadet Corps, 49 cubic feet for Gram Panchayat labour, but only 5 cubic feet for Shramdanis. On the western wing, the output for "contract", public co-operation and shramdan sectors

was 45, 40 and 10 cubic feet respectively. The categories under which information has been given, it should be noted, are not the same in the two cases. How are these quantity measures to be modified in order that comparison may be fair? In favour of the Shramdanis, it is remarked that the quality of their work was good. But since digging of earth can have little room for it, quality must apply to something else. For all classes of labour, it is complained that compaction was neglected and everybody was employing "the trick of dressing the side neatly". If by compaction is meant pressing down earth firmly, compaction by hand is not a substitute for mechanical compaction and machines will have to be used for this kind of work. This aspect of the problem, we are told, will be further examined by the Government.

The difficulty experienced in the recruitment of labour was due partly to the fact that labour was highly seasonal—large bodies of labourers went back to their villages for farm work—and partly to the fact that the areas adjoining the project are not populous. From these fragmentary data, however, it would be difficult to say that the experiment in public participation in the work has yielded conclusive results. What it has done instead is to raise a host of questions regarding the availability and supply of, and recruitment policy for, labour which are important and which have to be fully explored as well as successfully tackled, if the more ambitious Second Plan is to be executed with the lowest possible social cost.

THE TATA IRON AND STEEL COMPANY, LIMITED NOTICE

The Transfer Books of the Company will be closed from Friday, the 1st July to Friday, the 29th July, 1955, both days inclusive.

The dividends for the year ended 31st March, 1955, when sanctioned, will be made payable to those shareholders whose names stand on the Share Registers of the Company, on Friday, the 29th July, 1955.

By Order of the Directors,
TATA INDUSTRIES LTD., Managing Agents,

BOMBAY, 27th May, 1955.

J. J. GHANDY,
Director.

East Wind, West Wind

Thursday, Morning

IT has been a Menon week in Delhi. His long shadow began spreading over this place, the moment he left Peking. Even the Prime Minister's voice became somewhat muffled in the expectation of what this magic trickster would bring in his bag from the great land of China. There was hush hush in the atmosphere, which lasted till Nehru's envoy returned. The two great minds of Indian foreign policy met. Krishna Menon gave Panditji his feel of the Chinese situation. He then went round the chancelleries or it may be more true to say that the diplomats of the great powers gathered round him. It is vain to guess what transpired between the Prime Minister and Krishna Menon or between the latter and the representatives of foreign powers. On Monday, our ambassador at large held a press conference. Immaculately dressed, he gave an impression, as though he had acquired the art of statesmanship through generations of experience! If ever there was a consummate politician, it is Krishna Menon. That was the general impression but the more sensitive among us were rather struck by his naivete and effrontery. What Krishna Menon said boiled down to very little in fact, but he said it with such art and skill that an act of clean bargaining—the release of only four US airmen—appeared more than an act of grace and generosity.

NEHRU'S PRESS CONFERENCE

The Prime Minister followed soon after. He held a long press conference on Tuesday, for he wanted to have the last word, before he left for the land of the Soviets. There was little fire in what he said. In fact there was such grace and mellowness about the man that it almost smacked of age. Pandit Nehru referred to the Second Five Year Plan and said that his mind was almost entirely full of it, though he talked of much else. He referred in commendable terms to the Plan-frame drawn up by Prof Mahalanobis and defended it against the charge of authoritarianism. He protested strongly against the ideological approach and was all for taking the good out of all systems. He was determined to combine political democracy with economic planning.

The Prime Minister dealt with the situation in Goa at some length. Despite his dynamism, he seemed to

attach great importance to the success of his basic principles of non-violence and non-involvement and was in fact very positive about it. The use of force or the threat to use it, implied, in his opinion, that we do not feel ourselves sufficiently strong and that in fact we are afraid. He made it clear, it was open to us to adopt any measure, but *within the ambit of peace*.

On Kashmir, however, Pandit Nehru said very little but said it in a manner that was so distinctive that it cannot but appeal to all decent men, in refreshing contrast to the filibustering of the Prime Minister of Pakistan, Mohamed Ali, during the last few days. It was a significant admission, however, that some new ground had been covered in the Kashmir talks and there appeared the hope of a satisfactory and peaceful solution.

A LITTLE MORE UNDERSTANDING

On the whole, the international situation appeared to Pandit Nehru to be less tense and his reading of it was that there was—how moderately he put it—a little more hope and a little more understanding in the world. He said nothing about himself or his contribution to this remarkable achievement.

Naturally Panditji was asked about his visit to the Soviet Union. He said that he was going there to learn, to get an idea of the shape of things in that great country. He added with marked humility *perhaps* to a slight degree his visit might help in the lessening of world tension.

On two matters—the sabotage of the 'Kashmir Princess' and the Akali Morcha—the Prime Minister became somewhat warmer. He paid a high compliment to the crew of the 'Kashmir Princess', particularly to Captain Jathar and the air hostess. His approach to the Akali Morcha was unusually reasonable and if that philosophy prevails, I don't know, why we cannot bring the problem to a satisfactory conclusion. Unfortunately, he will be leaving in a few days, leaving the field clear to men of inferior calibre. Already the whole thing has been thoroughly muddled. Reports vary as to how many Akalis have been locked up for shouting slogans, the estimates ranging from 700 to 1,400. Even the smaller of the two is a large

figure. In politics, there is never a question of right or wrong. What is of paramount interest is to get the matter amicably settled and give the Sikhs a place in the Indian polity that they themselves would consider satisfactory. At present that is not the position and therefore, there is something obviously wrong on the home front.

THE PLAN-FRAME

It is only natural that when two giants—Nehru and Menon—straddle across a limited canvas, people are not likely to notice any other figure emerging from the background. Prof P C Mahalanobis seems to have thoroughly superseded the whole tribe of economists and statisticians. He spoke on Tuesday here on his approach to the Second Five-Year Plan. It must be confessed, there was something distinctive in this approach. He is for re-imposition of the salt tax, thereby bagging some 20 crores for the exchequer. He is also for heavier taxation on luxuries, and is not very particular about prohibition. Government was in his opinion entitled to make profits from its own undertakings. His priorities for Planning are (i) solution of the problem of unemployment and (ii) a steady expansion of the economy. While he had little belief in the philosophy of the handloom and the like as a long-term proposition, he thought—and he brought forward a formidable array of statistics in support of it—that it was possible to increase employment opportunities substantially through cottage industries. He believed that the justification of a socialistic pattern of society lay in the inability of the private sector to carry out, at a sufficiently fast rate, the development of the country. Prof Mahalanobis called it a wholly indigenous approach to Planning; that it will be entirely indigenous by the time the Plan finally emerges from the Planning Commission, no one need have any doubt about it.

DELHI ON RAJAJI

For quite some time, C R has been speaking to Delhi from Madras; and it is time that we took note of it. I will be excused for faithfully recording the actual impression these speeches and letters have created. I flatter myself for being severely objective in saying that these have been rather badly received here. These speeches are too pontifical.

Rajaji is trying to imitate Gandhi. He is lecturing too much to others what they should or should not do. All this is being said fairly widely in intimate, private conversations. Pandit Nehru's references, however, to Rajagopalachari and what he has said, were polite and graceful, but they do not represent the views of the common man in Delhi. The Prime Minister praised the high moral stand of CR, but he thought that it was unwise to mix up a high moral issue with a slightly political one of the acceptance of American aid. So, while he respected CR's opinions and ideas, it was obviously a different matter, when he had to decide issues as the head of the government.

While all this was being said, the officials of Nehru Government were in fact signing agreements for getting US financial assistance amounting to Rs 3.6 crores for four projects for augmenting steel supplies, water resources and irrigation works, assistance to home science, agricultural research and to institutions imparting technical education. Our share of expenditure in these projects would amount to Rs 55 lakhs only. These agreements were signed only yesterday.

An event of importance was the creation of a separate ministry for Iron and Steel, put in charge of the Minister for Commerce and Industry. While entirely right in principle, it would be difficult to justify the manner in which these changes have been made. The selection of Shri T T Krishnamachari for the job, for example, is liable to the interpretation that the battle between the private and the public sectors within the Government has been privately settled in favour of the former. It is being openly said that the expectation of the private interests, present as well as prospective, have gone up: on the other hand, the chances for the Russian Steel Plant visibly dimmed when TTK was put in charge of the Ministry of Iron and Steel set up on the Soviet model. It is, however, in the national interest to emphasise—this is also the universal impression among officials and engineers—that the only party likely to deliver the goods in time and is very serious about it—is the Soviet Government. Not only have they accepted the terms which are internationally the most favourable to us, they have signed the contract on a most tenuous basis. At any time the Government may ask them to walk off. The Indian officials and engineers, meanwhile, are being actually activated by

their Russian comrades who waste no time and insist that others must not. At the moment of writing, a team of Soviet engineers headed by Kratenkov is on its way to Delhi, and for all I know, might well have arrived at Delhi and proceeded to Bhilai.

Government has also set up on the Soviet model a Cabinet Committee on Heavy Industry, and a corresponding Committee of Secretaries to bring about close co-ordination at all levels of Heavy Industry in the public sector. The Cabinet Committee will consist of the Prime Minister and the Ministers for Home Affairs, Finance, Iron and Steel, Production, Railways and Defence. The Steel and Production Committees of the Cabinet have been abolished. There was a time when the Government of India functioned closely on the British model. Not that the technique of administration has changed but some other terminology is now coming into vogue. This practice is likely to gather strength, when the Prime Minister returns from the Soviet Union.

On Saturday last, the clerks of the Government of India met and gave the Government 75 days' notice to satisfy their demands, failing which they would resort to peaceful, direct action. Their basic demand is for a revision of the pay grade from 55-3-120-5-130 to 100-10-300. On the face of it, the figure does not appear unreasonable, but the impression among officers, ministers and the gen-

eral public is that the clerks of the Government of India don't work. It would be too much to lecture to the clerks that their demands would become stronger, if they were to suggest a certain minimum efficiency test. Probably Government would throw at them another Rs 10 and ask them to keep quiet.

Pandit Pant has been making history in his own way. He wants some method to be devised by which the press could be associated with the Government in the sphere of policy-making. Apart from getting information and putting it in the correct perspective, the Government should seek assistance of the press in the solution of difficult problems, which come up from time to time. I am sure that the assembled journalists must have felt grand when Pandit Pant called on them to feel in reality that they were co-adjutors with the ministers in serving and advancing the larger interests of the country! They would, if they functioned in this manner, acquire a more constructive character and help in policy-making at its formative stage, for they have a vast fund of information, opportunities of rubbing shoulders with all classes of people and thus gaining an intimate appreciation of the happenings that mark the progress of events! Pandit Pant paid a tribute to the Indian Press for its high standards. I do not think at his age, he has any ambition to be the next Prime Minister of India. Shri Deshmukh is younger and has better chances, if he plays his cards well.

From the Calcutta End

Portuguese Pimples

AT the Students' Hall, College Square, the all-Parties Parliamentary Committee on Goa held the Second Convention last Saturday. May 26 is observed in Portugal as a day of commemoration for the Salazar regime. Outside Portugal, the Salazar Government is widely suspect for its leanings to fascism. It was in the fitness of things that May 26 was observed in Calcutta as the Goa Liberation Pledge Day. Goa is part of India. Goa and the other Portuguese pockets must be integrated with India.

These were the predominant demands expressed at the Second Convention. There is nothing new in that. But the Second Convention, held in Calcutta, has been wise in presenting the Goa situation in its proper perspective. Bombay and Poona are now reverberating with war cries against Portugal. Bombay's militant mood is provoked by the brutal atrocities perpetrated by the Portuguese authorities on the first batch of satyagrahis to Goa. There will be sympathy with Bombay's militant mood. But it is neither wise nor diplomatic.

There has been a lot of loose talk in Bombay and Poona. Senapati Bapat has issued a call for "home Satyagraha" against New Delhi to

force the Government to take military action against Portugal. Acharya Kripalani has challenged Pandit Nehru to suggest an alternative to war for the solution of the Goa problem. Many leaders are urging the Government to start "police action" against Goa. In the Calcutta Convention, too, many speakers accused New Delhi of inaction. But the Calcutta Convention was wise in not issuing a call for military action.

MASS SATYAGRAHA

India is committed to peaceful solution of disputes among nations. She cannot, therefore, settle her dispute with Portugal through forceful means. India's demand is just. Britain has quitted India. Through protracted negotiations, the future of the French "possessions" in India has been solved satisfactorily. India is willing to enter into negotiations with Portugal on the future of Goa and the other Portuguese pockets. Colonial rule in Goa must go. Portugal must negotiate with India on the question of peaceful transfer of Portuguese pockets to India.

Those who exhort New Delhi to take direct action are unaware of the practices and conventions of international diplomacy. It is not for Pandit Nehru, Prime Minister of the Republic of India, to lead a satya-

graha movement against Goa. But it is right and proper for the all-Parties Parliamentary Committee on Goa to issue a call for mass satyagraha for liberation of Goa and other Portuguese pockets from colonial domination. What the Prime Minister cannot say or do, the people of India can do or say.

So far, the anti-colonial and anti-imperialist freedom struggle has been carried on by the Goans themselves. With this movement, the people of India are in full sympathy. It, therefore, logically follows that the people of India must take the initiative in launching mass satyagraha for liberation of Goa and the other Portuguese pockets. It was wise of the Calcutta Convention to issue such a call for mass satyagraha by the Indian people instead of goading New Delhi to take direct action against Portugal in Goa.

War is a failure of diplomacy. But it is open to New Delhi to take all measures short of war to end Colonial rule in Goa and the other Portuguese pockets. It would be unwise of New Delhi to issue an ultimatum to Lisbon. But New Delhi would be justified in warning Lisbon that, unless Portugal agrees to a negotiated solution of the dispute, India will be within her rights to enforce "suitable sanctions". Many will

INDUSTRIAL FINANCE CORPORATION OF INDIA

Incorporated under the Industrial Finance Corporation Act, 1948 (XV of 1948)

Authorised Capital: Rs. 10,00,00,000/-
Paid-Up Capital: Rs. 5,00,00,000/-
Loans Sanctioned: Rs. 25,21,25,000/-

The Corporation has been established to grant medium and long-term loans to industrial concerns registered in India. Only public limited companies or co-operative societies engaged in (i) manufacture or processing of goods; (ii) mining; (iii) generation or distribution of electricity or any other form of power; and (iv) shipping, are eligible for financial assistance.

Industrial concerns requiring medium and long-term advances over Rs. 10 lakhs for new schemes of expansion or modernization are requested to get in touch with the Head Office of the Corporation or its Branches; as soon as they have prepared their schemes.

endorse the Calcutta Convention's call to New Delhi to pursue such a policy promptly and energetically.

Calcutta must be congratulated in placing the problem of the Portuguese pockets in its proper perspective. Even Communist and PSP leaders who participated in the Convention were less militant in their attitude. There was wider realisation that the solution lay in adopting the Gandhian technique of mass satyagraha. If this technique succeeded in forcing Britain to quit India, it could not possibly fail in compelling Portugal to enter into negotiations with India for a peaceful solution of the problem of the Portuguese pockets.

PRESIDENCY COLLEGE

Presidency College is unique among educational institutions in Calcutta or in West Bengal. Most of Bengal's famous men are from this College. They are proud of Presidency. And Presidency is proud of them. By the middle of this month, this College will be celebrating its centenary. Elaborate arrangements are being made for the centenary celebrations. Many illustrious past students, including Dr Rajendra Prasad, the President, Dr Mookherjee, West Bengal's Governor, and Sir Jadu Nath Sarkar, the famous historian, will attend the centenary celebrations.

One had heard complaints that Presidency College is no longer so august an institution as it was. Many years ago, St Xavier's College came to be patronised more than the Presidency by science students. It may be a mere coincidence, but in this centenary year Presidency College boys seem to have done exceedingly well in IA and ISC examinations. There are more Presidency College students among the first ten in ISC than those from any other institution. There are many Presidency College boys among the first ten in IA. But there are more boys from the Belur Ramkrishna Mission Vidyamandir among the first ten in IA than from any other institution. One gathers that Ramkrishna Vidyamandir has now an established reputation as a first-grade institution.

EDUCATION SYSTEM

Calcutta, its inhabitants claim, is not only a literate but an educated city. In this city, such topics are matters for live discussion among parents who are eager to give their sons and daughters facilities to receive education at the best possible institution. There is much that is wrong with education and with the Calcutta University. There is much that is wrong with West Bengal and

the Bengali. But even those who disapprove of this State and its people concede that Calcutta is, perhaps, the only city in this country where the University dominates the city's life and society.

This writer does not claim any competence to discuss the present system of education in this State. Educationists claim that the present system is far more advanced and scientific. But one may be excused if one has gained the impression that the students these days have to

do a lot of cramming. Does that explain why the average college student seems to lack common sense? One is, all the same, satisfied to discover that the proposed reforms in the system of education conform to theories which one has espoused for many years. There is a strong case for raising the age-limit for the school leaving certificate, for extending the scope of SLC, and utilising this examination for branching-off the less promising students to technical and vocational education.

NEW INDIA STORIES FROM LIFE 2

'My advice saved this boy's future!'

Years ago, I persuaded my good friend and neighbour to take out an insurance policy. He thought I was being fussy, when I brought up the question of his son's education. His son was just six months old then!

Ten years later, my friend was struck down in the prime of life. A sudden heart attack, and he died almost at once. I took over the guardianship of his son.

Today, the boy is studying to be an engineer. The New India Life Assurance Policy his father invested in has paid for his education. And imagine my feelings, for indirectly I had ensured a successful future for the son of my friend.

An insurance policy taken out now may one day stand between you and disaster. For full information, write to

Election Apathy and Strike Fever

AFTER an election campaign notable for the absence of heat and fundamental controversy, the favourite has won "comfortably", and for the first time in some 100 years the voters have sent the same party back to Westminster with an increased majority. The apathy of the electorate to what is supposed to be the supreme event in the democratic process reached almost disgraceful proportions. If these elections indicate any thing, surely they indicate the political disinterestedness in the attitude of the average British citizen. This must certainly be a serious problem for any democracy and more particularly for a democracy which persistently holds up its way of life as an example and, as it is sometimes put, as a "challenge" to the outside world.

The absence of heat and hubbub in a general election (in the context of British history) is not so much a reflection of political maturity on the part of the electors as many apologists are bent on arguing. It reflects rather, the absence of suitable choice for the voter, either between candidates or policies. This was certainly brought out in an alarming manner in the last elections. The virtual identity of views between Tory and Labour on almost every crucial political issue; the lack of any sustained enthusiasm among the Labour leaders to establish to the electorate how different they are from their rivals; the absence of concert and visible purpose in the parties both with regard to ideology and immediate programme—none of these gave the voter any opportunity for working up his political partisanship to fever heat.

This larger problem contains within it a number of smaller though no less important problems. The first is surely that relating to the future of the Labour Party. Almost every result recorded in the elections go to show one thing: the reduced votes cast for the Labour candidates compared with those in 1951. This is not accompanied however by any increase in the votes cast for the Conservative candidates. The number of active Labour supporters dropped by about 1.5 million while that of the Conservative supporters dropped by about 0.4 million compared to 1951. In other words, that section of the electorate which exhibited political indifference or apathy (by not bothering to vote) had in the

1951 elections mainly voted for Labour. The Labour Party is therefore the main victim of the current wave of apathy among the electorate.

The Way the Votes Went (in millions for each party)

	1955	1951
Conservative	13.313	13.718
Labour	12.393	13.949
Liberal	0.711	0.731
Others	0.296	0.199
Electorate: 1955—34,852,469 (76.82 per cent voted).		
1951—34,914,912 (82.3 per cent voted)		

LABOUR'S FUTURE

The first Labour reaction to the

election results came from Mr Morgan Phillips, the general secretary. He said that the situation gave the "Party a chance to revive". This could not have provided much comfort to those countless political workers who from a deep sense of mission gave their whole time to the Party during the elections. But nevertheless the reaction was an honest one—it is now patently clear that if Labour is to remain a force of some consequence in British politics and not slide down the slippery path of political decadence (as appears the fate of the Liberals) it has to regain the sense of purpose and of a mission which in the '30s and early post-war years was its hall-mark. More than

SHALIMAR PAINT, COLOUR & VARNISH COMPANY, LIMITED

Write to Post Box 68, Calcutta, for the latest copy of The Shalimar Standard

that, it must provide an alternative to the policies being pursued by the Tories and close its ranks under a united leadership. The question of leadership in the Labour Party is certainly going to assume considerable importance in the near future. There is little doubt that only because of age, the current Parliament will be the last for both Mr Attlee and Mr Shinwell. Mr Herbert Morrison is fast approaching his seventies and Mr Dalton has already talked of retirement. These old stalwarts have to be replaced sometime in the near future and unless the younger Labourites are given opportunities to come up in a united party with an agreed long-term programme which evokes enthusiasm among the rank and file, the replacements are not likely to enhance the power and influence of the party.

The Labour movement as a whole appears to have come to a parting of ways. The sad lack of enterprise in the Labour leadership, both before and during the elections, resulted in a profound apathy among Labour supporters to exercise the vote. These Labour supporters have however taken to new paths of activity—principally through unofficial action on the industrial front. The past three months have witnessed the growth, at a rapid rate, of general industrial unrest. Official, and as is more often the case, unofficial labour strikes on the docks, in the railways and in the electrical, engineering, mining and newspaper industries persist despite the exhortations of the Labour Party and the Trades Union Congress leadership for industrial peace. The unrest is going to assume wider proportions unless the leadership of the Labour movement as a whole rethink and rework their policies and attitudes. The industrial unrest is already so serious (with a railway strike pending) that the *Times* has called upon the Prime Minister to "invite the Labour leaders to confer with him on this grave matter".

THE STATISTICIANS DELIGHT

The 1955 general elections has proved to be a particularly happy hunting ground for the statistician. On the basis of the Gallup Poll and so-called "Cube Law", electric computers were supposed to show that a 2 per cent swing in the vote meant a majority of 100 seats for the Conservative Party. And each week as the Gallup Poll statistics of the *News Chronicle* was published, the computers went to work. As the swing in the people's loyalty varied from week to week, so did the anticipated "seat-

majority" of the Conservative Party. Before long, even the layman began talking in terms of "swings" in the poll rather than the usual commonsense guess-work—the instinctive feel of the sway in the opinion of the public. In an important sense this reduction of people's views to statistical "laws" is dangerous. It contains within it an element of suggestion—once the statistician works out his lot and has it splashed in all the dailies, the readers tend to conform in their views to the expectations of statistical forecasts. But once again as the *Times* put it, "commonsense has blinded science".

People have a knack of being unpredictable. The refusal of the country to submit to absolute uniformity, local variations, the tough-

ness of so many Labour seats in refusing to yield at least a hundred votes to make the "law" come true, the triumph in certain areas of personality instead of policy—all these will yield various explanations. One thing, however, is clear. The 100 seat majority which the 2 per cent swing in the vote was supposed to yield has not materialised, in spite of the fact that the *News Chronicle* Gallup Poll was only 0.1 per cent out, compared to the actual votes cast for each of the parties.

Book Review

Role of Consumer Credit in US Economy

Studies in Consumer Credit by Clyde William Phelps. (1) *The Role of Sales Finance Companies in the American Economy*. Pages 87; (2) *Instalment Sales Financing: Its Services to the Dealer*. Pages 99; Commercial Credit Company, Baltimore. Prices not mentioned.

THE tremendous and rapid expansion of the American economy since the turn of the century has been traced by some writers to the development, among other things, of the institution of consumer credit. Considerable attention has been devoted by American economists to the part played by fluctuations in credit-financed consumer buying in fluctuations in economic activity but relatively little to the role of consumer credit in stimulating economic growth and in particular, the rapid expansion of the durable consumer goods industries and even less to the organisation and functioning of the system, and to the services it provides to manufacturers, dealers and consumers. The Commercial Credit Company, one of the three largest sales finance companies in the United States, must, therefore, be congratulated on its initiative in publishing these studies in consumer credit specially written by an independent economist.

The two studies under review deal specifically with sales finance companies, a special form of institution to be distinguished on the one hand from small loan or consumer finance companies, which engage primarily in lending money to consumers, and on the other, from banks and other institutions, which perform some of the functions performed by sales finance companies as a small fraction of their total activities. A sales finance company engages in two basic activities:

- (1) The purchase from retail merchants of retail paper (the promissory notes signed by consumer buyers) and the collection of instalment payments due thereon; and
- (2) "The provision of floor planning for retail dealers (the financing of wholesale purchases by dealers from manufacturers)".

These two functions are in fact of very great significance. The first, usually known as retail financing, implies that consumer credit is afforded through the medium of the dealer and yet, the dealer is relieved of the responsibility of collecting the instalments and carrying out other legal formalities that may be involved. But the second function, it is quite clear, does not amount to consumer credit at all. It is really financing the dealer, providing him with the working capital necessary

for the maintenance of a large stock of items, which are by their very nature bound to be fairly expensive. An appreciation of the role of the sales finance companies is not possible without understanding that they provide credit and connected services to facilitate the flow of durable consumer goods from the manufacturer to the ultimate consumer. The sales finance companies have recognised that the provision of credit to consumers is not really enough and that the difficulties of finance faced by dealers in durable consumer goods must also be solved if consumers are ultimately to buy these products in large numbers.

It is the basic feature of the durable consumer good, its relatively high price, that makes it difficult for the ordinary financial institutions to serve the needs of the industries concerned. The consumer is not in a position usually to pay for the commodity in cash, nor is the ordinary consumer credit for a thirty-day period of any use. What the consumer requires is a plan for payment of the price in monthly instalments spread over more than a year. If substantial sales are to be made by any dealer, he must allow a volume of credit to his customers which it is impossible for him to find from his own resources, since he has to pay the manufacturer in cash.

One of the major advantages claimed for the sales finance companies is that they provide a complete service to the dealer as well as the consumer. As has been pointed out above, these companies provide wholesale as well as retail financing. The former is relatively less profitable as such but is provided because it attracts the latter. In retail financing, the companies accept what are described as "marginal" as well as average and high-grade "paper", thus enabling the dealer to sell to the marginal risk buyer as well and in that way to expand total sales substantially. By financing used car dealers also, these companies help the new car dealers who receive used cars in part payment of the new cars they sell.

In addition to this, sales finance companies provide for insurance cover from the moment of purchase, an efficient but sympathetic collection service, advice to dealers on sales promotion and to buyers on adjust-

ment of their family budgets to permit payment of instalments and provision of capital loans to dealers for expansion, renovation, etc.

The author, therefore, considers that sales finance companies have the advantage over their competitors. They have long experience in the field and the technical knowledge required. They enjoy all the advantages of specialisation and have therefore introduced many innovations into the field. They operate on a risk capital base which is much larger proportionately than that of ordinary lending institutions and are, therefore, willing to take greater risks.

It will be seen from this that the sales finance company is a special institution which serves a special need arising out of the manufacture of durable consumer goods, the value of each unit of which is necessarily relatively high. By the provision of its services, large numbers of individuals are able to purchase automobiles, refrigerators and other durable goods which otherwise they would not have been in a position to purchase. The rapid expansion of these industries has been made possible by the existence of these sales finance companies which have tapped a large and expanding market for them. The fact that in 1950, 96 per cent of American homes had radios, 94 per cent electric light, 80 per cent refrigerators, 12 per cent television sets, and 66 per cent had at least one car, is a testimony to the role played by the sales finance companies. The author points out that "... even in the case of families having incomes of less than \$2000 per year, almost half (46 per cent) are car owners."

Consumer credit, through the sales finance companies, played a substantial part in the development of the United States economy. In Europe today, consumer credit is helping to bring about rapid expansion of the durable consumer goods industries, though it has also introduced an unstable element into the economic situation. Could consumer credit be the key to economic development in this country? Many would demur, but it is a question to which it would be worth devoting some attention in the light of the facts contained in the present studies.

Recession Fighter—the US Consumer

(From Our American Correspondent)

WHEN the US economy started "dipping" after the middle of 1953, prognostications about the future were equally divided between the optimistic and the pessimistic. The Administration and the business world believed that the decline was a temporary but necessary adjustment, while economists saw in it the beginnings of a true recession, of even a severe slump if corrective measures were not taken. The former put their faith in built-in stabilisers, while the latter were frightened by the implications of increasing unemployment.

Before the end of 1954 the economy had resisted further fall, and early this year it resumed its upward movement which may take it even above the peak of 1953.

The pessimists have proved wrong in their prognosis; but the optimists can hardly congratulate themselves on their diagnosis. Built-in stabilisers of the economy have played a relatively minor role in stemming recession and promoting recovery, while non-automatic factors like deliberate reversal of hard money

policy, liberalization of dividend payments and mortgage terms, reduction of taxes and personal saving and stimulation of investment in housing and foreign assets have been far more decisive.

But probably the most interesting feature of the recovery has been the role of the American consumer. He has been the hero in the drama of recovery. Built-in stabilisers and action by the Treasury and the money market helped to increase his disposable income at a time when the gross national product was contracting, and unemployment expanding, and he responded to the challenge by spending more than the increment of his disposable income. This is supposed to be the result of high pressure propaganda. If so, the American economy seems to have lifted itself out of a recession by its vocal chord.

What about the future? The consumer is still spending freely the increment of personal income generated by the expansion of the gross national product. During the first three months of this year, the gross

national product ran at a record annual rate of \$370 billion. He has ample supplies of liquid assets; but he is spending as much as 92.5 per cent of his income after taxation, and is faced with the highest level of debt in history. The construction of new homes, however, the most important single factor in the recovery, is likely to run ahead of the rate of family formation, while manufacturers of cars do not expect the demand to measure up to the current rate of production. Moreover, farm income and farm prices have failed to share in the recovery while expenditure on defence is declining. On the other hand, there are indications of a broadening of the recovery. The strong consumer demand is being supplemented by a rise in investment demand, which is expressing itself in increased orders for producers' durable goods, in a high level of construction activity and in a moderate tendency towards inventory expansion. Non-agricultural employment as well as the manufacturers' payroll have risen in recent months, and though defence expenditure is on the decline, state local expenditure is likely to increase.

State Associated Banks

D L Gupta

THE Committee of Direction of the All India Rural Credit Survey suggested in Volume II of their report, Government control over the Imperial Bank of India and the amalgamation of the ten State Associated Banks for the following reasons:

- (1) Integration of financial administration of the country,
- (2) Handling cash work of the Government treasuries throughout India by one bank, and
- (3) Extension of credit facilities in rural areas, particularly to agriculturists.

Although the amalgamation was proposed in the larger interests of the country and it will be a statutory amalgamation, yet it deserves a careful consideration on the part of the higher authorities before implementing these recommendations.

In this country of 5 lakh villages having a population of about 38 crores, the centralisation of banking to such an extent would not be beneficial to rural India as it is hoped. The distant control over the banking affairs of the country has its own disadvantages:

1. First and foremost, contact between the banker and the customer will be less personal and there will be a tendency to fall back on routine which militates against the individual problems of the customer being fully considered.
2. Secondly, the very size of the institution may result in loss of efficiency.
3. Thirdly, the centralisation of resources may work out disadvantageously to the local trade and commerce through a drain of funds to money centres.
4. Fourthly, there is a potential danger that carried to its logical conclusion, the proposed amalgamation must mean the formation of money trust in a few hands under political influence.

On account of the above disadvantages in Great Britain, where a series of important mergers just after the World War I reduced the large number of banks to big five,

further amalgamation without the sanction of the Treasury was stopped. In South Africa also, in the 1942 Banking Act a clause has been included forbidding the amalgamation of banking institutions in the country without the consent of the Minister of Finance.

In a vast country like ours, to meet the needs of small traders, small industry and small agriculturists of small places, the regional banks should be strengthened and both the Government and Reserve Bank should extend to them reasonable support instead of amalgamating them with the State Bank. The managements of regional banks, on account of their close working relationship with the local people, are in a better

position to know the businessmen, small agriculturists, their problems and their aspirations. They, therefore, can accommodate them according to their genuine requirements on sound banking lines.

NECESSITY OF CO-ORDINATION

For this purpose there is necessity of confidence and co-ordination. If the Government, Reserve Bank and the State Bank of India extend their support to the regional banks and a link is established between the State Bank of India and the State Associated Banks, for all purposes, i.e., remittance of funds, issue of drafts, sharing in advances, etc., all the virtual advantages of amalgamation can be secured without the disadvantages of banking centralisation.

In America, this sort of co-ordination exists between Treasury, Federal Reserve Bank and Commercial Banks of the country. Mr Edward F Bartelt, Fiscal Assistant Secretary of the Treasury of United States of America describes it as follows:

"The 12 Federal Reserve Banks are now the principal fiscal agents of the United States Government. Each Reserve Bank maintains an account in the name of the Treasurer of the United States. Into these accounts virtually all Government receipts eventually are credited and from them all payments are made.

"Complementing the Treasurer's accounts at the Federal Reserve Banks is a nationwide network of deposit accounts in commercial banks. Most of the money collected by the Government feeds into the US Treasurer's accounts at the Reserve Banks through the banking system of the country. Any incorporated bank is eligible to qualify as a Government depository.

"Like any large business, the Treasury must maintain bank accounts. The big difference is that it has more of them—many more. It would be utterly impossible for the Treasury to carry on its extensive business efficiently without the use of this vast network of commercial banks throughout the country. Even when the Government's operations were much less extensive

Branches throughout India

than they are today, experience proved that the Independent Treasury System was inadequate. It was fortunate, therefore, and indeed very helpful to the Treasury when it was faced with the great financing burdens of World War I that the country was equipped with a well organised Federal Reserve System consisting of 12 regional Federal Reserve banks and several thousand commercial banks.

"In World War I, and again in World War II, commercial banks played a big part in the War loan drives. They composed the largest single group of sellers of war bonds. Three quarters of the dollar volume of war loan campaign sales were made through commercial banks. They took bond subscriptions, issued savings bonds, delivered securities to purchasers, made payments of interest coupons from Government bonds, and carried on countless other functions in the interest of the Government.

THREE TREASURY PRINCIPLES

"In handling the money and securities of the Government the Treasury is guided by three basic principles—safety of the public funds, efficient service to the public and economy of operation. There is another factor, as important as all three of these combined. It concerns the effect of Treasury operations on the economic stability of the country. This, among other things, includes proper control of the ebb and flow of money from the banking system into the Treasury and back again to channels of trade through Government disbursements. The use of bank accounts helps the Treasury in meeting all these requirements." (*Banking*—November 1953).

Besides the co-ordination between the Treasury and the commercial banks for the transaction of Government business, there is in United States of America a close co-operation between the big city banks and country banks to provide all the banking facilities equally at every place in the country, which has been commended by Mr Robert M Hens, President of Association of Reserve City Bankers as follows:

"Correspondent Banking is the core of the independent banking system. The Banking system of United States is a system only by virtue of the voluntary co-operation of the 15 thousand independently owned and independently managed

banks that supply the banking facilities of this country.

"The Reserve City Banks derive strength and diversification from their country correspondents. Country Banks attain support and flexibility from their city correspondents. Between them they devise means of supplying loans, of guarding deposits, of meeting the constantly shifting demand for financial services of a great and varied economy."

If the Government continue their cash work of the Treasuries with all the State Associated Banks and appoint them as agents to the Reserve Bank as well as the country correspondents of the State Bank of India, the 11 banks would prove more serviceable and useful not only to the Government but to the public also and their services will be comparatively more economical.

PUBLIC DEPOSITS AND STATE BANK

The conversion of the Imperial Bank of India into the State Bank has already created doubts and suspicion in the minds of people and they have begun to think about withdrawing their monies from the Imperial and State Associated banks. The Imperial Bank of India's deposits have fallen from 230½ crores on January 15, 1955 to 211½ crores on May 20, 1955 in other words 19 crores of rupees have been withdrawn by the public after the announcement by the Government of the setting up of the State Bank while the total liabilities (excluding borrowings from banks) of Scheduled Banks increased by 36 crores during the same period.

This indicates that the increase in the deposits of the scheduled banks excluding Imperial Bank of India is over 45 crores, which reflects the opinion of the people against the proposed Government control and the amalgamation of the Banks. In view of the above, it is certain that the Government will not be able to derive all the cherished advantages from a single fiscal agent whatever its size may be.

AGRICULTURAL CREDIT

As regards credit facilities to agriculturists, it has been complained in the Report under reference that the commercial banks could not extend credit facilities to agriculture. It is not the fault of the

commercial banks that they follow the British banking pattern. The Government of India or the State Governments did not like that the commercial banks should extend credit facilities to the agricultural industries. They always preferred the co-operative banks as a suitable agency for the purpose. On the other hand, the co-operative banks in spite of all sorts of patronage and support from the State and Reserve Bank of India could not extend credit to the agricultural industry for more than 3 per cent of its requirements. In my opinion if the same sort of facilities are extended to the commercial banks, they may be able, without depending too much on the Government, to provide more credit to agriculturists than what is done by the co-operative banks and with greater efficiency and security, just as commercial banks in Canada and America are doing. Even today if the State Government and Reserve Bank of India are prepared—(1) to place the necessary funds in a certain proportion at the disposal of the commercial banks to finance agriculture, (2) to grant subsidies for deficit branches, and (3) to guarantee the bad debts to a certain percentage of the total advances, the commercial banks would prove the better agencies for providing finance to agriculture industry. That is why in 1925, Sir Basil Blackett, the then Finance Minister of India, remarked in the course of his address before the Delhi University:

"If banking in rural areas is to be developed to the extent required, it will, I think, have to be by the recognition of the indigenous banking system, and its adaptation, rather than by its supersession by Joint Stock banks managed on western lines. It would be desirable also if some method could be found, as for example, has been done in the American Banking System, for linking up the small rural banks from below with the Imperial Bank System from above." (italics mine).

In these days the general opinion is in favour of institutional credit. So for this purpose, the suggestion regarding indigenous bankers may not be acceptable any longer but the second suggestion of Sir Basil Blackett is a wise one and deserves favourable consideration even today.

In entrusting the cash work of

Government Treasuries to a number of agents, the Rural Banking Enquiry Committee have raised fears and objections, the principal was being (a) the capability and resources of the banks, and (b) the difficulty of reconciliation of accounts. So far as capability of handling the Government work is concerned, the State Associated banks are transacting Government business for a long time and their Governments are well satisfied with their services. The existing arrangements are most advantageous, convenient and economical to them. The State Governments, therefore, were not inclined to appoint Reserve Bank of India as their bankers on the suggestion from the Government of India because the disturbance in the present arrangement is a costly affair to them. The Patiala State Government have refused to appoint the Reserve Bank of India as their bankers as it was not advantageous to them. This shows that the exist-

ing banks are quite capable and possess sufficient resources to handle the work of their Governments as also to meet their requirements.

As regards security, the Rural Banking Enquiry Committee have stated in their report that in America the Government depository banks lodge Government securities with the Federal Reserve Bank to the extent of Government deposits with them. In Canada a prior charge over the assets of the banks has been given to the Government for the recovery of Government dues under the Canada Bank Act.

All this is true but these conditions were imposed on the banks concerned under particular circumstances in which those banks were working there. The US Government required the lodgement of Government securities from depository banks after sustaining considerable losses on account of interference with the depository banks by politicians of the States, before the

Federal Reserve System proposed this precautionary measure. The Canadian Government's prior charge over the assets of the bank is nothing new or peculiar. Every Government has prior charge to recover its dues. In India under the Government Dues Recovery Act, the Government have prior charge under certain circumstances which can be extended to the banks also. It will not affect the banks in any way as it has not affected the Canada Banks.

Again, the above conditions apply to all banks irrespective of the size. Here in India such conditions were imposed neither on the Presidency Banks nor on the Imperial Bank of India, because there is a vast difference between the system of handling Government balances in the abovementioned countries and in India. In USA and Canada, Government balances remain with the banks as banks' deposits, free of interest, which they utilise as their earning assets. Here in India the Government maintain their own separate currency chests and only its control in sub-divisions has been entrusted to banks. Government balances cannot be treated as bank deposits. True, the banks may withdraw money from the currency chests for Government requirements as well as their business requirements, but subject to its telegraphic adjustment by next day positively through Central Accounts. Thus the agent of Reserve Bank at one branch utilises money out of currency chests against the disbursements on Government account or cash deposited in currency chests at the places of its other branches. The para No 71 of the Rural Banking Enquiry Committee report confirms it as under:

"All payments on behalf of the Central and Provincial Governments are initially made by the Imperial Bank from its own cash balance and subsequently adjusted through its Central Accounts Office with the Central Accounts Section of the Reserve Bank at Calcutta where the main accounts of the Central Government and the Provincial Governments are maintained. Similarly all receipts on behalf of the various Governments are initially taken into cash balance of the Imperial Bank and later on adjusted by the Central Accounts Office of the two banks at Calcutta. Payments or Receipts by the Provinces on behalf of the Central Government or by one province on behalf of another are also adjusted through Central Accounts Section of the Reserve Bank at Cal-

cutta, which acts as a Clearing house for all inter-governmental transactions."

"These arrangements for the reconciliation of accounts between the Reserve Bank and the Imperial Bank are highly organised so that the major part of transactions are brought into account and the necessary adjustments made through the Central Accounts Offices of the two banks on the working day immediately following that on which the transactions occur. Nevertheless, there are occasions when transactions remain unadjusted for several days during which the Imperial Bank remains out of pocket to the extent of some crores. Such a position usually arises during the periods when revenue is slow to come in and during the early days of the month when disbursements on account of Government are heavy and the bank is required to carry large amounts in transit."

This system, therefore, requires no lodgement of Government securities or other protection to the Government except the general soundness of the bank to which Treasury work may be entrusted. So far as the class 'B' State Associated banks are concerned, they have been bankers to Government and to the people of their respective states for a long time and both the State Governments and the public have demonstrated their confidence in them. There is no instance of failure of any such bank resulting in a loss to any Government. Today the Reserve Bank of India has sufficient control over all the banks under the Banking Companies Act. The Government of India can entrust their business to these banks without any hesitation as a sound bank deserves confidence from all quarters.

As regards the difficulty of adjustment of transactions, it is not an insurmountable one; it is manageable. In the USA the treasury transactions of 11,000 banks are reconciled with ease and efficiency. So there cannot be any difficulty in reconciling the Government transactions with 11 banks.

The above discussions adequately support the view that:

- (i) The Government treasury work may be entrusted to the existing State Banks by appointing them agents of Reserve Bank of India and by co-ordinating the services of State Bank of India and the other State Banks.

- (ii) The work of providing agricultural credit may also be entrusted to these banks with all the facilities that may be reasonably required.
- (iii) To provide remittance and other facilities, these banks may be appointed correspondents of the State Bank of India where it has no branch but the State Associated Banks have.

DIFFICULTIES OF AMALGAMATION

The Imperial Bank of India had its own tradition and standard. It did not allow interest on current deposits, neither did it accept call deposits. On Savings and Time Deposits it allowed interest at 1 per cent and 1½ per cent respectively while other big scheduled banks allow 1½ per cent to 2 per cent on Savings Bank Deposits and 3 per cent to 3½ per cent on Time Deposits. In spite of such a difference in the rates of interest, the Imperial Bank used to hold 25 per cent of total deposits of scheduled banks.

Similarly the Imperial Bank of India charged interest on advances at 3½ per cent to 5 per cent when the other banks were charging 4½ per cent to 7 per cent.

The State Associated Banks are at present following the big scheduled banks in offering rates on deposits and charging on advances.

After amalgamation of the State Associated Banks with the State Bank of India, the problems of allowing interest to depositors and charging interest from borrowers that will arise may be solved in the following three ways:

- (1) By lowering the present rate of interest of State Associated Banks.
- (2) By continuing the present separate rate.
- (3) By increasing the rate of interest at Imperial Bank of India Branches.

So far as the immediate reduction in rate of deposits is concerned it will unfortunately affect depositors and borrowers alike:

- (i) (i) It will penalise the accumulation of savings and practice of thrift in 'B' Class States.
- (ii) The deposits of the State Bank will decrease in 'B' Class States instead of increasing.

(iii) The lowering of interest on advances will make credit unnecessarily cheaper in view of the risk and labour involved in rural areas and this, in its turn, will create further problems like over-expansion of credit, etc.

(2) The continuance of the present separate rates may not be feasible:

- (i) It will not have a uniformity in the institution.
- (ii) It will be unfair for the same institution and particularly for the nationalised bank to pay or charge differential rates for the same services.
- (iii) It will encourage the shifting of the deposits from the places of low interest rate to the places where higher interest is paid.

(3) The increase in interest rate on deposits and advances will be unthinkable for the State Bank of India. It means deviation from the sound tradition of the Bank. Economically also, it will be a wrong step as the deposits of the Imperial Bank of India are more than twice of the State Associated Banks. If, under any pressure, interest rate on deposits is increased it will create many problems and affect the whole credit structure of the country.

- (i) The Bank then will be obliged to increase rates on its advances to the business concerns which are paying low rates at present. It will increase the cost of production and affect trade and industry adversely.
- (ii) It will further increase undesirable competition among the private banks to retain their present business.
- (iii) It will tend to reduce the volume of bank credit as industry and trade would try to get direct credit from the public.

Moreover there will be other problems like adjustment of salaries of staff and seniority and juniority of the officers, the solution of which will take considerable time and energy. If the Imperial Bank standard is adopted, establishment cost will rise to an unbearable extent.

The varied regional economy and diverse ways of business require different treatment at different places from the bank. At present the local institutions with their local know-

ledge and close association are providing credit facilities suited to the local conditions. After merger, local interests may not get the same sympathetic consideration and so the quality of banking services may deteriorate, affecting the interests of the clientele adversely.

SYSTEM OF SUBSIDIARY COMPANIES

To avoid all these difficulties and inconveniences, there is another alternative—System of Subsidiary Companies.

It is popular in Europe where it has proved quite successful in achieving all the benefits of big bank without amalgamation of the banks.

Some of the English banks own the capital of a few banks in Scotland and run the latter as their subsidiaries. The banking systems of Scotland and England are in many respects very much alike but there are certain differences. On account of this, the English banks prefer to allow their owned Scottish banks to work as separate units in Scotland. For instance, there is a group of three banks, viz, Royal Bank of Scotland, Glyn Mills & Co and William Dea-

cons Bank Ltd. The Royal Bank of Scotland holds all the shares of the other two institutions in exchange for its shares. The former bank preferred to allow the other two to serve their respective areas as separate entities, because the goodwill created with all the local traditions and affections of the people by the latter banks are assets to the parent bank which could not be sacrificed in the best interest of the parent institution. Thus all the three institutions are working separately in their own names and under the management of their independent Board of Directors. Under this arrangement, shareholders have gained and so have the communities served by the three banks in their respective areas with little or no disturbance to the arrangements which have existed over a very long time.

Under this system one bank acts as agent for the other. Generally this is done free of charge although in cases involving exceptional outlays of time and labour, reimbursement is made, if desired.

The transactions and balances of accounts between the three are adjusted usually by transfers on the accounts maintained by each of the

three banks with the Bank of England. This system has proved very useful to the parent bank and the people of Scotland as well. Mr Thomson, General Manager of the Royal Bank of Scotland recognised it in the following words:

"In our case it was decided that the size of the units was well suited to the efficient individual management and then the business of the three units could better be conducted and developed separately; though in close associa-

tions. In practice, the arrangement has been found to work very efficiently and very smoothly."

Here in India also it will be very convenient and suitable. In this way all the advantages of amalgamation and large resources and facilities of a big bank with hundreds of branches can be retained without disturbing the local relationship between the bank and their clients, without disregarding the local sentiment, without loss of efficiency and without sacrificing the benefits of

local knowledge and experience of the management of the respective banks which is the most valuable asset of the parent bank. I believe that the authorities concerned will give their careful and close consideration to this system also. It is the best way to achieve the cherished object without many changes. The purpose of the amalgamation is to provide complete, convenient and courteous banking service in rural areas and it is certain that it can be served better by this system.

Reorganisation of States

N A Shah

"SHOULD this (the linguistic division of India) happen it would mean two things: one, the end of Indian nationalism and two, the end of joint multi-lingual living. It is the greatest deception to declare that we will have linguistic states and there will be no weakening of nationalism nor victimisation of linguistic minorities in linguistic states. Honesty, humanity, justice and equity demand that people should not be subjected to such bluffs," says Prof Mukerji in his book—*Reorganisation of Indian States**—written in collaboration with Mrs Ramaswamy.

The first part of the book deals with the general problems of states reorganisation in about 48 pages. It is the most important part of the book and is the work of Prof Mukerji. In part two Mrs Ramaswamy deals with the special problems of Bombay State in about 32 pages. In an appendix the problems of Hyderabad are discussed by K Satyanarayan.

In another appendix the questionnaire which was used for this study is reproduced. It was sent to some 235 different persons and bodies. Only 15 replies were received. Prof Mukerji draws attention to this fact and says that it gives an indication of a particular attitude among responsible persons namely "of reticence". The replies received were mostly from men of standing and importance such as mayors, officials of Congress Committees, advocates, MLA's, etc. In addition, a number of persons were interviewed which

included MLAs, mayors, officials of Congress Committees, ministers and editors of journals.

The method of handling the subject has come to be known as "communication research" in USA. Such studies reveal social "attitudes" rather than facts and confirm the sociological fact that human nature in politics, in a vast majority of cases, is guided by irrational motives whose importance in a democratic set-up can be ignored by the statesman only at the greatest peril to his career and to the stability of social life.

Statesmanship at the top level must, however, be able to curb the forces of unreason which are disruptive and destructive; and enthuse in the people a spirit of unity based on a sense of fair-play and reason. The most pressing demand with which the country is faced at present is the demand for linguistic division of the country and calls for unrivalled courage and vision on the part of our statesmen.

In the first few pages, Prof Mukerji traces the history of the linguistic movement and shows that the Congress leaders' alternate encouragement and denunciation of linguism is responsible for the present confusion in the minds of many. He then enumerates the views of some of the ardent supporters of the linguistic movement.

It is interesting to note that Lanka Sundaram, one of the crusaders of the movement for linguistic states, has said that the demand for redistribution is predominantly economic . . . that the movement has arisen as a revolt against the prevailing exploitation of one area by another and of one group by people of another.

Dr Ambedkar admits that ultra-linguism may result in political insubordination and administrative confusion. He insists that the official language must be the language of the Central Government and not the local language, so that every unit will have two languages.

Prof Mukerji then turns to consider the 'rationalistic' approach and states that by far the ablest exposition of the rational approach is to be found in the concluding pages of the Dar Report. All this discussion takes up nearly half the portion of Prof Mukerji's writing. The remaining half is devoted to his comments and suggestions.

Replying to the oft-repeated assertion that the Congress is committed to the creation of linguistic states, Prof Mukerji says that it can be an argument only if we accept that Congress has never erred and that it has the divine sanction to determine the destiny of the nation as it pleases.

As regards the second argument, that considerations of national unity should not stand in the way of linguistic states as national unity has no historical sanction, Prof Mukerji jocularly remarks, should we abolish the all-India railway system, the army, the press, the inter-universities board, etc., on the same ground? As a matter of fact, if the philosophy of history has anything to teach us it is this, that the development of the Indian polity of the future should avoid the European pattern of linguistic sovereignties, competition and war.

As regards the third argument that the cause of democracy will be better served by a federal form of government with autonomous linguistic

states as the units, Prof Mukerji replies that the Unitary principle is inherent in the Indian constitution. It is, therefore, futile to try to strengthen the cause of separatism on the basis of federalism.

Then Prof Mukerji goes on to discuss the question whether a federal constitution is essential for success of democracy. "Success of democracy" means success in making the common man aware of the forces that mould social life . . . and the atmosphere of freedom in which the ordinary individual may bring to bear upon public questions his instructed mind. For achieving this kind of success, what is needed is local self-government and devolution of power as far as it is possible to grant these, consistently with national unity and safety. No one has so far shown that the cause of local self-government suffers under a unitary government. And it is quite possible to have most centrally dominated local bodies with no local autonomy under a federal constitution. A federation is no guarantee of the success of democracy or local self-government.

That the demand for linguistic states has no basis in culture, nor is it spontaneous, being trumped up mostly by middle class politicians who are benefited by the establishment of a linguistic state, are some of the other points made by the author. But it is not in these that Prof Mukerji is at his best. Many have stated the case against linguistic division but they have all argued for the retention of the *status quo*. Prof Mukerji certainly does not. He does not agree with those who in the name of a rational approach desire to maintain the *status quo*. For the victimised minority of any state is the most fanatical proponent of a linguistic state. In short the *status quo* is irrational and linguism is fanaticism.

Turning the table on his adversaries, Prof Mukerji argues that rational reorganisation must promote the political unity of India and as Indians, people must learn to live in multi-lingual states which do not permit any political or economic advantage to any language group and which are created with a view to promoting administrative efficiency and economic prosperity of the country as a whole. Bearing these considerations in mind he has divided India into five units only—geometrically—north, south, east, west, and centre. Whatever may be the reaction to such violent

zonal groupings in the other parts of India, the proposal for an eastern state—Purvachal Pradesh—has been anticipated and taken up quite actively though only by a handful of thoughtful people.

Insurance Notes

An Insurance Journal

THE Insurance Press in India has not been able to keep pace with the rapid progress of insurance business of the country, with the result that about half-dozen journals published in English language and a couple of periodicals published in vernacular languages comprises its entire strength. Of these, *Jeeban Beema*, a monthly insurance journal published in Bengali, is perhaps the oldest, having completed its 25 years of publication. The slow and feeble growth of the insurance press is mainly due to lack of encouragement and support by the insurance companies and their workers to these publications. That a well-edited journal devoted to the cause of the industry can be a valuable aid in spreading the gospel among the people and in solving the difficulties of this business for the workers engaged in it, it seems, is not fully appreciated even today. Apart from giving active support, the Indian insurance executives and experts often turn down requests for contribution of articles on the subject. The result is that editors of insurance journals are forced to fill their pages by reprinting articles published in foreign journals, thereby diminishing the usefulness of these publications to a considerable extent. The non-Indian insurance companies as a class consider it *infra-dig* even to advertise in the Indian insurance journals. In spite of this these journals have, during their struggling existence of last 20 years, materially assisted in propagating the cause of insurance in India.

Insurance Underwriter (Editor: Mr Sukumar Lahiri) is comparatively a new-comer in the field. A monthly publication, this well edited journal is somewhat different from the rest in that it regularly publishes useful and informative articles from well-known experts on the problems of life and general insurance. The April 1955 issue of the monthly contains a symposium on Staff Insurance by well known actuaries and managers which may be considered an outstanding contribution on a subject which evoked a lot of criticism in insurance circles. A detailed report of the 10th Indian Insurance Conference held in

The book should rank high among text books for politicians but it should have been published earlier so that it could have made its proper contribution to the discussion on the subject.

Madras in March last, with a brief summary of the technical papers read, has been included in this issue. Mr S S Ali's article "Selling oneself" written in his inimitable style, containing many practical suggestions, will be found useful by the field workers. The lecture delivered by Mr G T Foster FIA at the Insurance Institute, London, on the underwriting of Life Insurance, reprinted in this issue is a valuable contribution on the duties and responsibilities of the underwriter in assessing life insurance risks. In addition to these, there are usual features such as Legal Section, News Reel, etc, which enhance the usefulness of the publication. *Insurance Underwriter* has a distinctive appearance and is neatly produced.

"Chance fights ever on the side of the prudent."

Euripides.

Obituary

NARAYAN MALHAR JOSHI, known to his friends, advisers and co-workers as Nana-saheb Joshi passed away peacefully and suddenly on Monday, 30th May. A noble life devoted and dedicated to labour movement came to an end. An Indian trade unionist of international repute left the world with a record of selfless service for half a century in many a noble cause.

Nanasaheb was born on June 5, 1879 in Goregaon—now a suburb of Bombay—in a Brahmin priest's family. In order to prepare him for the family calling, he was set to study the Samhita, but his elder brother, Mahadevarao persuaded him to have English education in Poona. A similar example, where priesthood was discarded for English education, was that of Shri R P Paranjapye, the noted educationist and politician. India must have lost a good many leaders, because many brilliant persons continued their hereditary professions and thus led a narrow, isolated life. After graduation, Shri Joshi took up teaching as his profession, and spent eight years of his youth in teaching. Another accident led him to join the Servants of India Society which had then been set up recently by Shri G K Gokhale.

Poona of that day was a beehive of intellectuals, social reformers and political agitators. Youths were drawn to leaders and teachers like Ranade, Gokhale, Tilak, Agarkar, Fulay, Bhandarkar and many others. Young Joshi became Gokhale's follower and joined him in 1909. After that, it was a life of uninterrupted service and continuous sacrifice, all for the cause of working classes. The Servants of India Society was a nursery of scholar-workers, well up in their specialised subjects and sincere in their thought and action. After spending the first two years in Poona, in 1911 young Joshi moved to Bombay where his social work brought him in contact with industrial workers. He founded the Social Service League and developed a number of educational, social reform and social welfare activities amongst industrial workers in Bombay.

Social welfare slowly but inevitably

led to labour welfare and labour organisation. Nanasaheb played an important role in the establishment and development of many organisations—the Workingmen's Institute, the International Labour Organisation, the All-India Trade Union Congress, the Indian (now National) Federation of Trade Unions, the Bombay Textile Labour Union, the Mafatlal Gagalbhai Textile Technical School and many other associations for and of labour. He also played an important part in the cause of civil liberties, co-operative movement and social reform. His

work on the Royal Commission on Indian Labour and the Indian Pay Commission is well-known. His public life was marked by his tremendous zest for work, sincerity, integrity, respect for the opponents and deep knowledge of the subjects he had to deal with.

Those who came in personal contact with him found Nanasaheb the man more lovable than Joshi the public worker. His paternal advice was available to all—from ministers to research students. Labour Ministers, Government officers, trade unionists, social workers, students and many others used to seek his advice on a variety of subjects. The last 15 years of his life he spent mostly in a small room, 12' x 12', which served as his bed room, study and conference room. In one corner was his bed, in the other a big shelf piled with blue books, pamphlets and labour literature, in the third a small table full of papers, while in the centre was a stout easy chair for him to recline on and discuss. Every evening he spent an hour at the Social Service League and at the Chowpatty Band Stand. The familiar figure in a long coat, *dhotee* and round brown cap will be missed.

Nanasaheb was an ideal family man; but his integrity did not allow his close relatives to get cushy jobs. His eldest son secured a labour officer's job in the Defence Department, but not without some embarrassment to his father. His other son managed to have an ordinary job in a private firm.

He treated his opponents with fairness and consideration. Though he received rough treatment from the Communists during the 'thirties, his relations with Communist trade unionists remained cordial throughout. He had high regard for leaders like Hariharnath Shastri, who belonged to the other camp.

His mature advice and guidance may not be there now. We may, however, take some inspiration from his noble life and try to achieve some of the goals for which he fought—trade union unity, social security and economic equality.

Uncertain Trend

DULL conditions continue to prevail on stock markets. Investors remain apathetic. Even speculators seem to lack courage either to push up, or hammer down, prices. There has been a considerable decline in the volume of business. In the circumstances, it is not surprising that equities are gradually sagging. Even at the current low prices, there is not much of even replacement buying. On the contrary, whenever equities tend to move up, holders enter the market as sellers.

It is evident that stock markets are disturbed about the developing events on the economic front. Financial implications of the framework of the second Plan are having an adverse effects on stock markets. Irrespective of the scope for expansion in the private sector, it is now being argued that the tentative financial estimates of the second Plan suggest that the private sector may find it difficult to secure the finances for undertaking expansion projects.

Nationalisation Fears

Recently, the Finance Minister indicated that the second Plan would involve additional taxation of Rs 100 crores per year. It is now being argued in market circles that, if such substantial amounts are to be withdrawn annually through increased taxation for expenditure in the public sector, there will not be enough resources left for exploitation by the private sector. Stock markets seem to have jumped to the hasty conclusion that indications are that the organised sector of industry will not have much scope for expansion in the second Plan.

More than the financial implications of the tentative estimates of the second Plan, stock markets are disturbed over inspired reports that ambitious nationalisation plans are under contemplation of the Government. According to recent reports emanating from New Delhi, the Government is considering plans for nationalisation of banks, insurance companies, coal, steel and heavy chemical industries and the trade in jute goods. A prominent firm of brokers here recently expressed the opinion that the existing iron and steel industries would be nationalised after the completion of their expansion projects.

Weakness in Indian Iron is

mainly due to these reports. Other factors are aggravating the downward trend in Indian Iron. As investors will not reap any benefit out of the higher retention prices in the shape of enlarged dividend disbursements, they feel no inclination to lend support to iron and steel shares. Besides, there is the possibility that, due to the expansion projects under execution, this year's iron and steel output may be lower than that of last year.

Lower Steel Output

Investors are, therefore, concerned that, with a lower steel output, the existing iron and steel companies may not even be able to maintain dividend disbursements. No such possibility is widely apprehended, though it is now taken for granted that there is no possibility of any increase in dividend disbursements in the near future. Even so, it may be of interest to note that both TISCO and IISCO are reported to have plans for raising capital through issues of ordinary shares to the existing shareholders. If these reports are true, the downward trend in Iron and Steel shares may be halted.

Cornering in Shares

Though not falling, Tea shares have developed an irregular trend. Both investors and the trade are anxiously awaiting the results of the first export auctions to be held next Monday. Meanwhile, the Government's decision to lower the tea export duty has had a sustaining effect on Tea shares in the last few days. New Delhi has been wise in announcing the cut in the tea export duty prior to the first tea export auctions of the season. This decision is being favourably interpreted in market circles as indicative of the Government's anxiety to maintain tea exports.

Incidentally, an interesting feature in this week's price fluctuations in Tea shares may be noted. Though buying of Tea shares in anticipation of dividend payments has not yet started, there has been a partial revival of interested buying of some selected Tea shares. There is some evidence that cornerers have re-entered the market. If that be so, some speculators are arguing, the prospects of Tea shares

cannot be as gloomy as gloomy prophecies would seem to indicate.

Jute Shares Steady

Jute shares remain inactive. But both raw jute and jute goods continue to fall. There has been a considerable decline in the prices of raw jute and jute goods in the last few weeks. Even so, the price trend remains downward. Mills do not seem interested in buying raw jute even at the current low prices. Nor do foreign buyers seem interested in purchasing Indian jute goods, though the fall in jute goods prices has been heavy in recent days.

Both raw jute and jute goods are being confidently "talked down". It is now evident that the new crop would be heavy. Lower raw jute prices should lead gradually to lower prices for jute goods. Cheaper jute goods may stimulate exports. These are developments which are being anxiously watched by market operators. Jute shares still remain featureless. But the downward trend seems to have been halted. In recent days, there has been occasional buying support for some selected Jute shares.

Irregular Trend

One of the disappointing features of the behaviour of the Calcutta Stock Exchange this week has been the irregular trend in Miscellaneous and Engineering shares. This is a possible disturbing development, but its significance should not be over-emphasised. It is only natural that BIC and Indian Copper should tend to attract occasional liquidation after the recent spurt in these shares. Nor is it unnatural that the irregularly lower trend in equities in general would occasionally have psychological repercussions on these groups.

That apart, there is nothing yet to suggest that investors have revised their views on the prospects for Miscellaneous and Engineering shares. There is growing doubt about the future scope of expansion of heavy industries in the private sector. But investors are inclined to the view that, as the second Plan involves rapid expansion of heavy industries, the future of secondary engineering industries would seem to be moderately "bullish".

Larsen and Toubro

THE impressive and steady performance which has marked the progress of Larsen and Toubro for the last ten years is fully maintained in the accounts for the year ended March 31, 1955. There has been an all round improvement in the working of the company as compared to the previous year. Total sales amounted to the record figure of Rs 314 lakhs showing an increase of Rs 62 lakhs over the previous year. Trading profits are higher at Rs 44 lakhs as against Rs 39 lakhs in the earlier year; the net profits before and after providing for taxation remained more or less steady at Rs 12 and Rs 7 lakhs respectively. Dividend of 10 per cent on ordinary shares is proposed to be maintained for the sixth consecutive year.

Important orders were received for paper making machinery, blast furnace plant, dairy and electrical plant; substantial increases were also recorded in the sale of caterpillar earthmoving machinery and tube well drilling equipment. The firm has obtained a contract for drilling tube wells in North Gujarat from

the Government of Bombay. A large number of orders are on the books of the company to be executed during the current year. The company needs a new factory building without which it cannot cope with the evergrowing demands from customers; it is also needed in order to enable the company to expand its manufacturing activities. The outlook for the year appears to be very bright with a sizeable stock of machines and spare parts and an unprecedentedly large number of orders under execution.

A steady progress has been registered in the volume of sales and manufacturing activity of the offices of the company in Madras, Bangalore, Cochin, Calcutta and New Delhi. Two of the companies for which Larsen and Toubro hold managing agencies, viz, Engineering Construction Corporation Ltd and Alu Capsules Ltd, suffered a drop in turnover during the year while two others, viz, the India Crown Cork Company Limited and Viking Transport Limited maintained an upward trend in sales.

It is to the credit of the company that within a short span of time, it has not only come to occupy an enviable position, but is able to embark successfully upon new manufacturing activities.

Bharat Line

THE Bharat Line maintains steady progress though for the year ending Dec 31, 1954, there was a slight decline in gross profits. During the year under review, the company earned Rs 2.60 lakhs by way of freight and charter hire of ships and a gross profit amounting to Rs 35.2 lakhs as against Rs 2.20 lakhs and Rs 39.6 lakhs respectively in 1954. Delays at loading and discharging ports and high maintenance costs and an all-round reduction in freight rates probably explain the fall in gross profits, despite a sizeable rise in the total earnings of the company.

The company appears to have obtained a fair volume of business on the Persian Gulf—India/Burma Trade line, which it entered recently. It has also been making steady progress with its schemes of expansion, and during the year under review, three cargo ships were added to the company's fleet. One of the company's ships was transferred from the UK Registry, to the Indian Registry during the year. Depreciation set aside during the year amounted

to Rs 29.3 lakhs on ships and Rs 75.115 on other assets of the company. Depreciation Account at the end of 1954 stood at Rs 1.80 lakhs, constituting 40 per cent of the fixed capital, after adjustment for the loss of one of the company's ships. The fleet replacement fund amounted to Rs 16.7 lakhs at the end of 1954. Despite a drop in gross profits, maintenance of dividend at 5 per cent has been recommended by the directors.

The company has two subsidiaries at Bombay and at Calcutta primarily for the servicing of its ships. Of these, the one at Bombay which runs a workshop, incurred a loss of Rs 30,000 during the year and the outstanding loss carried over now stands at Rs. 2.9 lakhs. The subsidiary at Calcutta registered under the name "The Ships Repairers Ltd" will soon have its workshop ready. Construction work on it is proceeding satisfactorily.

Mobilising Savings and Insurance

THE postman versus the milkman argument for socialism has never been put forward in support of nationalisation of insurance, at least never very seriously. Hence the telling figures put out by Shri A. D. Shroff of the comparative performance of postal insurance and insurance business in the private sector, to refute the case for nationalisation, did not really tell so very much. More impressive, however, was his presentation of the magnitude of the problem of insurance, of mobilising the savings of the community. If life insurance in force is to amount to a sizeable percentage of the national income here too, as in the UK or the USA—no reason is given why it should, but that is a different matter—insurance will have to collect some 8000 crores in the next 10 years and this will call for an army of 5 lakhs of agents, field workers, inspectors and so on, all trained for the job and working in disciplined, stream lined organisations. No Government agency that we can now think of could possibly rival the right type of insurance agents who have come up the hard way through a process of natural selection. So, when it is merely a question of the better agency for the job, no Government department will stand a chance, if the choice is on merits.

The case for nationalisation, however, has usually been advanced on an entirely different ground, namely, that of the supposed undesirable alliance between insurance and big business on the one hand and that of banking on the other. A more effective answer, therefore, to this sort of argument will be to establish that there is, in fact, no such unholy alliance in this country, whatever may be the case elsewhere, and that concentration of financial power through insurance companies will not jeopardize whatever programme of development people may have, that, on the contrary, the resources collected through insurance do, as a matter of fact, flow into the most desirable of productive channels and that planned development could be helped much better by insurance companies than by any alternative agency that could be thought of.

That insurance companies mobilise the savings of the community and invest the bulk of their resources in Government and other approved securities and that the pattern of investment of the balance of their funds also conforms to the investment priority laid down for planned development will any day be the stronger argument against nationalisation, if the business is carried on in a manner such that no cause is given for any suspicion such as that of extravagant expenditure or of playing with insurance funds for purposes other than those which are socially desirable.

There is, however, another point. The nationalisation of banking and insurance has been a common demand of all socialist parties, partly in order to break the hold of financial concentration on economic life which these parties do not like, but partly also, the demand arises from the naive belief that once financial control is acquired by the State in this manner, the problem of finding resources for development would be easier. Whether the socialistic pattern of society envisaged in the Avadi resolution implies extension not only of control but also of ownership to financial institutions has been a debatable point. The immediate pro-

Fort, Bombay Phone: 23406
Annual Subscription Rs. 24.

vocation for Shri A. D. Shroff's attack on nationalisation could not be the nationalisation of the Imperial Bank of which he was no great lover in his younger, fighting days. Probably it lies in the following paragraph in Prof. Mahalanobis's Draft Plan:

"The public sector must be expanded rapidly and relatively faster than the private sector for steady advance to a socialist pattern of economy. In order to make available large capital resources for investment and national development and to facilitate the implementation of the Plan, Government will be prepared to enter into such activities as banking, insurance, foreign trade or internal trade in selected commodities."

It cannot be interpreted as a doctrinaire argument for nationalisation for the sake of nationalisation; on the contrary, the language of the paragraph suggests extension of the public sector to the field of banking and insurance as also to that of trade, to supplement rather than to supplant existing institutions. For the present, the question, therefore, need only be treated on merits. And on merits, perhaps State undertakings in some lines of general business would have a fair case.

Writing in these columns a few years ago on the subject of nationalisation of insurance, a contributor had observed: "The question of nationalisation would not have loomed so large, nor would it have cropped up so soon after the achievement of independence, had the business not been invaded by a number of persons who had nothing but selfish interests as their aim. A few such black sheep have spoilt the good name of Indian insurance in such a way and have done such damage to its reputation that the insurance business has lost the confidence of the public as well as that of the Government". This was in the context of the bill then in Parliament, to amend further the Insurance Act, the purpose of which was to extend control on this line of business.

In support of his contention, the contributor strung together some authoritative opinions. One was that of Shri L. S. Valdyanathan, on the "race for the acquisition of the shares of one company with the life funds of another with a view to gaining control." Another was from Sir Purshottamdas Thakurdas: "There is a tendency on the part of Insurance Companies in general to

make illicit gains from insurance business. Can we overlook the cut-throat competition of acquiring business? ... Still worse is the dishonest practice of dressing up of accounts." The third was from Shri A. D. Shroff: "Have we been fair in our dealings with the public and have we tried honestly to reduce the cost of insurance to the public?"

These were the views of men who could speak with authority on the subject. Things have changed quite a lot since then, and as Shri A. D. Shroff's own company has shown, so successfully and so much to its own profit, the cost of insurance could be and has been reduced without the blessings, so to say, of the controlling authorities! It is no longer on this sort of issue alone that the future of insurance is being judged.

With the prospective changes in the structure of incomes and distribution of savings, the mechanism of mobilising savings will also have to be changed. But when the insurance companies are doing their part so well and bringing so much grist to the mill, why hurry? The situation, of course, would be altered and the issue precipitated if, what could be interpreted as forestalling action on the part of the insurance companies lent added strength to the case for nationalisation. This, it is good to find, Shri A. D. Shroff, is determined to resist. Opposing the shareholders' demand for a bonus issue at the annual general meeting of New India Assurance Co. Ltd., he said that the company was not inclined to do so at the cost of the sound policy of building up the necessary reserves, which were ulti-

mately in the interests of the shareholders, merely because of fears of the proposed nationalisation. He pointed out that he would rather leave as legacy a soundly managed industry than frittering away its present strength, even if it was decided ultimately by the Government to nationalise it. In thus presenting his case, Shri A. D. Shroff has also put a challenge to the Government. Vested interests are not supposed to surrender voluntarily, that is the text book case; the type of social transformation we have undertaken commits the Government to devising means of resolving conflict of interests that are different from the text book variety, but that conflict exists has to be established first. It is not yet proven.

But is the difference really so very sharp and clear cut? Think again of the army of agents and field workers "working in disciplined, streamlined organisations". Change the plural into singular, but the picture will not change perceptibly and will not be very different from the usual one, so often conjured up, of flags fluttering and an army on the march to mobilise savings, whenever one hears about organising the enthusiasm of the people. True, selling cover is a tailored job and cannot be made into a slot machine affair, but this is true only of the discriminating clientele who want technical service calling for much skill; but that clientele should be thinning out as the pattern of society goes progressively 'socialistic'. That way, some day, there would be little to choose between the two but that day is not yet.

Four - Power Talks

AMERICA'S Secretary of State has the unenviable distinction of being in the minority of one in his emphatic denial that there has been any change for the better in the international situation. America's NATO allies do not share Mr. Dulles's pessimism. Russia has made repeated gestures in recent weeks to indicate her eagerness to reach an understanding with the Western Powers. Her overtures to Yugoslavia have encouraged hopes in the Western European Communist States that they may have opportunities to pursue policies without undue interference or control from Moscow. Asian statesmen have welcomed the gradual easing of world tension. Russia's recent

contributions to creating a climate of peace have been widely appreciated. She has concluded a treaty with Austria. She has invited the West German Chancellor for talks in Moscow. She has assured Tito of non-interference in Yugoslavia's internal social and political affairs. She has committed herself to basing her relations with the world on Panch Shila. M. Molotov has proposed a seven-point peace plan which has been favourably received by America's allies.

Even as Washington's reaction to Mr. Chou En-lai's Bandung offer was unhelpful, Mr. Dulles's response to Mr. Molotov's seven-point peace plan was unduly aggressive. Mr.

Dulles is suspicious of the designs of international Communism. There is need for caution. But Mr. Dulles reveals the ultimate design of America's foreign policy in mistaking suspicion for caution. If Mr. Dulles is suspicious of Cominform, Moscow is equally suspicious of the American bases in foreign countries. If Mr. Dulles is suspicious of the designs of international Communism, Moscow is equally suspicious of Dulles's foreign policy of "liberation". Activities of the Cominform may not be above suspicion. But many thinking persons are equally convinced that the creation and fortification of American bases in foreign countries are menaces to world peace. It is inevitable that any Russian peace plan, as the latest Molotov proposal envisages, will insist on dismantling of American bases in foreign countries. Few will deny that the mutual security pact between America and the Chiang regime in Formosa is an obstacle to peace in the Far East. Even those who do not accept neutralisation of Germany as the best possible solution admit that withdrawal of troops by all the four Powers is an essential pre-requisite to a solution of the German problem. Many thinking persons will concede that military pacts like NATO and SEATO can only provoke the Communist States to create parallel military organisations.

To these arguments, Mr. Dulles will probably retort that it is Americas', as well as her allies' policy to negotiate from positions of strength. Aggression must be resisted. Even as the Western Powers are entitled to build positions of strength to deter Communist aggression as well as to compel the Communist States to maintain peace, Russia and the Communist States have an equal right to pursue a similar policy for those two identical purposes. This has been the strategy of the "cold war". Experience has taught that peace cannot be ensured through a policy of building positions of strength. If the "cold war" is to be resolved, both the rival power blocs must abandon the race for armaments. On this basic issue, Russia has made progressive amends since her original refusal of the Western Powers' proposal for world disarmament. Sometime ago, Russia relented on her original insistence that any plan for disarmament must be preceded by international control and inspection of atomic weapons. In proposing the

seven-point peace plan to the United Nations, M. Molotov has indicated Russia's willingness to accept the Western Powers' proposal for reduction and international control and inspection of conventional armaments. This fundamental aspect of the world problem, it is not without significance, was also stressed in the Nehru-Bulganin communique.

An agreed plan for phased disarmament is a preliminary condition to world peace. Russia's willingness to accept the Western Powers' disarmament plan, as reflected in M. Molotov's seven-point peace proposal before the United Nations, indicates that Mr. Dulles's fears and suspicions about the militant aspect of international Communism have no longer any basis. Ideological implications of Communism persist. Such associations are inevitable and are implicit in peaceful co-existence. Mr. Dulles has no right to insist that Russia or China should abandon Communism, even as Russia has no right to demand that America should jettison Democracy. Peaceful co-existence involves competition in peace between Democracy and Communism. Only those who lack faith in Democracy can be concerned or perturbed over any such peaceful competition among different ideologies. Developments since the "cold war" lend weight to the suspicion that, unlike India and the small, newly-independent Asian and African Powers, America and the older democracies are apprehensive of any possible ideological competition in peace. India is in favour of peaceful co-existence as a means to world peace in her conviction that, in a peaceful world, she, a democracy, can achieve as much progress and plenty as any Communist country. Mr. Dulles's aggressive retort to M. Molotov's peace plan deepens the suspicion that the American Secretary of State lacks the Indian Prime Minister's robust faith in Democracy.

From Mr. Dulles's reply to the Molotov peace proposal, it is clear that the American Secretary of State has strong mental reservations against verbal Russian commitments to maintain peace. Such an attitude loses much of its relevance with repeated Russian gestures towards disarmament. Besides Russia's willingness to accept a plan for world disarmament, Mr. Dulles has now the assurance that Russia accepts Panch Shila as the basis of relations between nations. At

Belgrade recently, Russia assured Yugoslavia that the development of different forms of social ideologies in the various countries were internal affairs of those countries. In the Nehru-Bulganin communique, Russia pledges herself to non-interference in the internal affairs of any country "for any reasons either of an economic, political and ideological character". Though Cominform has not yet been liquidated, Russia has recently offered repeated assurances that she will not pursue or encourage subversive ideological activities in other countries.

These are welcome indications that Russia is prepared to make concessions in order to come to an understanding with the Western Powers. Her recent gestures have had a good response among America's NATO partners. Britain and France have repeatedly expressed hopes that the forthcoming four-Power talks would hasten world peace. There are many world issues in dispute. It is evident that Russia will have to make concession to reach an agreed solution of the German problem, even as America will have to relent on the Formosa issue to ease the tension in the Far East. But the settlement of the issues in dispute depends mainly on the rival power blocs' acceptance of the principle of peaceful co-existence. Mr. Dulles's latest statement that there has been no basic change in the international outlook raises the question whether America is prepared to accept peaceful co-existence. In his reply to M. Molotov's seven-point peace plan, Mr. Dulles creates the impression that he does not expect anything substantial out of the four-power talks. America's allies owe a heavy responsibility to the world to convince her that the alternative to peaceful co-existence is world destruction through an atomic war.

Weekly Notes

The State Bank Takes Over

THE State Bank of India has been launched quietly and surprisingly, without the fanfare which is usual on such occasions. Though launched quietly, its stewardship is in the firm hands of Dr. John Matthai. The State Bank is to do so many things—it has to reverse the course of history by reversing the flow of resources, from urban to rural areas, meet the needs of agricultural credit to the full, and at the same time carry on extensive commercial banking, the responsibility for which it has inherited and assumed. Then, in due course, it will have to extend credit to small scale and rural industry also and bring about decentralisation of economic power which is demanded by Congress ideology and which has been accepted as a definite policy by the Avadi resolution. Banking nowhere breeds so much inequality as it does in this country; to put all the blame on the British model, which Indian banking is supposed to follow, is not quite fair if one thinks of the earlier traditions of British banking. How many people in this country are entitled to an overdraft? If decentralisation is to be effected by making bank credit easily accessible to all the latent enterprise that is here, the magnitude of the problem will stagger imagination. The State Bank has to do all these and more.

Those who know something of the caste system in our administrative hierarchy and of the prestige that attaches to particular jobs and posts, should pay a humble tribute to the steward who has undertaken to shoulder all these responsibilities. Dr. Matthai has gone through the entire gamut of this hierarchy and gone up to the top. The sense of public duty he has displayed by accepting this position which, neither in emoluments nor in status, is in keeping with the positions he had held and continues to hold, should not go unnoticed. He would not have undertaken all these, had he not been in tune with the spirit of the times and been moved with a high sense of duty.

Goa is Now Indian Territory

WHY did the Portuguese administrators have to do such a mad thing? Goa is Indian soil. It will be Indian territory. No power on earth can blot out facts, facts of

geography and of history. Who can resist nature and man? The outcome of the Goa struggle was not in question at any time; it is the fate of the poor devils who have invited disaster on themselves that gives cause for grave concern.

The sacrifice of Amirchand will not be in vain. But why had the Goa brass hats to condemn themselves to perdition by drawing the blood of the martyr? For India now to step in and take over will be an act of mercy to save those unfortunate, benighted and pitiable wretches who know not what they do. The thought that medieval minds are not capable of living in modern times and tackling the problems of modern times is poor consolation. One has to do something about it and find a home for the mentally afflicted, even if one may not find a ready cure for minds diseased.

Liberalisation: Exports and Imports

SELECTIVE liberalisation remains the key note of import policy to which has been added the new feature of channelling the import of certain essential raw materials through Government approved agencies in order to enable end users to benefit from it. A surprisingly large part of our import now consists not of capital goods but of raw materials of industry, the imports of which rose from Rs. 288 crores in 1953 to Rs. 329 crores in 1954 and is likely to reach Rs. 340 crores during the current year. This compares with imports of plant and machinery of Rs. 80 crores in 1953 and of Rs. 76 crores in 1954. Essential consumer goods come in between, their imports being Rs. 188 crores in 1953 and Rs. 159 crores in 1954. The latter perhaps includes food items and so these figures should not lead to the conclusion that there is wasteful or extravagant consumption of foreign exchange.

The liberalisation of exports announced during the week, however, arises more from changing conditions in international markets than from any perceptible change in policy. As usual, the Government has been tardy in adjusting export duties to changed market conditions abroad, but sooner or later it has to yield. In the case of short staple cotton, the export duty has been reduced

from Rs. 300 to Rs. 250 and the export quota has been raised from 1 to 1½ lakh bales. Trade estimates of exportable surplus being 2 lakh bales, perhaps further extension of quota might be in the offing, if demand responds to the cut in export duty.

Faced with similar resistance in foreign markets for Indian coffee and non-absorption of allotted quota, the Commerce Ministry has removed the export duty altogether.

The coffee crop this year will be much smaller, but unless domestic consumption suddenly shoots up, there will still be a problem of disposal of surplus stock. With the carry over of 3,000 to 4,000 tons, and the estimated production of 24,000 tons this year, export market has to be found for about 5,000 tons. As the bulk of the coffee crop would have been gathered by the end of May 1955, the announcement has come none too soon. There is no immediate prospect of prices shooting up as a result of this announcement for Government retains quota restrictions both for internal releases as well as for exports and T T K can be relied upon to wield the big stick, whenever coffee prices misbehave. A fuller examination of the situation should, however, await the findings of the Plantation Inquiry Commission which is fully aware of the problem.

Draft Plan-Frame

A Correction

In the Draft Plan-frame Number, issue of June 18, 1955 the full text of Professor Mahalanobis's 'Draft Recommendations for The Formulation of The Second Five Year Plan 1956-1961' was reproduced from the printed copy of the text released by the Press Information Bureau, Government of India. In Table VI in the Draft Recommendations, there is a mistake in the figure of percentage increase. This was reproduced faithfully on page 720 in June 18 issue of this paper. The estimated volume of employment in 1960-61 in agriculture and allied pursuits is shown in this table as 41. The correct figure is 1.4.

The same correction should be effected in the table which is also reproduced on page 735 along with the article 'Employment in the Draft Plan'.

Trend and Progress

IN contrast to 1953 which was a quiet year, 1954 proved to be a very active year for the Indian scheduled banks. Over the year, between January and December, their advances increased by Rs. 79 crores. It was only in 1951 that advances recorded such a rise (Rs. 88 crores.) but the achievement is more spectacular in view of the fall in prices that occurred in 1954. The rise in advances in 1951 could be largely explained by the rise in prices in that year.

Between January 1 and May 14, advances rose by Rs. 117 crores. From the busy season high—the highest level ever recorded by Scheduled banks—figure of Rs. 592 crores on May 14, advances declined to the slack season low of Rs. 535 crores by October 15. Despite the decline of Rs. 57 crores, advances were still on the high level for a slack season. By the end of the year, the lost ground was recovered by Rs. 19 crores and advances stood at Rs. 554 crores.

Financing of this enormous increase in advances, however, does not appear to have given the bank managers as severe a headache as in previous years, thanks to the Bill Market Scheme of the Reserve Bank. Between January 1 and May 14, scheduled banks' total borrowings from the Reserve Bank increased by Rs. 51 crores. With the rise of Rs. 15 crores in deposits, banks' total resources increased by Rs. 66 crores. After drawing down their cash and balance with the Reserve Bank by Rs. 7 crores, and their investments in Government Securities by Rs. 5 crores, scheduled banks' liabilities increased by Rs. 105 crores between January 1 and May 14, while their assets showed a rise only of Rs. 66 crores. How is this disparity in the movement of assets and liabilities to be explained, is the puzzle presented to the readers in the **Trend and Progress of Banking in India during 1954**, in the Statement III, to the solution of which a perusal of the report provides no clue. How did scheduled banks bridge the gap of Rs. 39 crores between their assets and liabilities?

The table on the next page brings out the gap between assets and liabilities. This is a continuing situation, though the gap fluctuates erratically, as will be seen from the variations noted, from the previous period. Obviously changes in capital and reserve which are rarely appreciable in short

periods cannot explain either the size of this gap or variations in the gap. Exchange Banks' tapping of resources outside the banking system, like short term capital in-flow from abroad, may throw some light. There must be other factors also at work. But what they are, the Department of Banking Research is not willing to disclose. There is no indication in the explanatory note for the guidance of the layman who may stumble on the statistics in the **Trend and Progress of Banking**. This particular report is in pursuance of Section 36(2) of the Banking Companies Act, 1949 under which the Reserve Bank collects data from the scheduled banks in a particular form. The data, required for a specific purpose, are supplied in a form, under the direction of the Reserve Bank, which does not apparently enable a balance to be struck between assets and liabilities. There is nothing, however, in the Act to prevent the Reserve Bank from straightening out the figures and presenting them in an intelligible form a pre-condition of which is that assets and liabilities should balance. Or is this too big a demand to make on the Department of Banking Research?

Cost of Deposit

A NOTABLE feature of banking in 1954 was the trend of deposits. During the busy season, 'net liabilities' (total deposits plus payable suspense accounts etc.) increased by Rs. 15 crores while during the slack season, they increased by Rs. 46 crores, rising further by Rs. 31 crores between October 15 and December 31. Increased industrial production on the one hand and resumption of trading in food stuff after removal of control may explain the rise of Rs. 77 crores in deposits between May 14 and December 31. The rise in deposits, however, was not an unmixed blessing as it made inroads on the banks' profit earning capacity. The table below will show how banks attracted deposits by offering higher interest rate.

	Deposits at interest between 0 and 1½ %	Deposits at interest over 1½ %
	(Rupees Crores)	
March	539	295
June	542	311
Sept.	539	329
December	562	342

Thus, of the deposits gained totalling Rs. 64 crores between March and December, 23 crores carried interest

at between 0 and 1½ per cent and Rs. 47 crores at above 1½ per cent. As a result, scheduled banks paid Rs. 9 crores as interest in 1954 as against Rs. 7.8 crores in 1953. Interest paid on deposit constituted 29 per cent of the total gross earning in 1954 compared with 27 per cent in 1953. Banks, however, recouped their position as much by charging higher rates on advances and discounts as by increasing the volume of their business. Scheduled banks' earnings from interest and discount amounted to 24 crores in 1954, compared with Rs. 22.2 crores in 1953.

The rise in deposits was not in the same proportion among the different sections of banks. While deposits of the Indian scheduled banks rose from Rs. 674 to Rs. 733 crores, between March and December, in the same period the deposits of the Exchange banks rose from Rs. 160 crores to Rs. 171 crores. Thus the rate of increase was 6.8 per cent for exchange banks and 8.8 per cent for the Indian scheduled banks.

Composition of deposits was also different as between Exchange banks and Indian scheduled banks. For the latter demand deposits constituted 60 per cent of total deposit in 1954 as against 59 per cent in 1953. In the case of Exchange banks, on the other hand, percentage of demand deposits declined from 67 in 1953 to 65 in 1954.

What Size Cash Balances?

THE total volume of cheques cleared, which had dropped during 1953, recovered last year though it was far below the 1951 level. The latter, however, was inflated by post-Korean boom, as the undernoted figures will disclose.

	Cheques cleared (in lakhs of rupees)	Velocity of circulation
1951	7,877.99	13.0
1952	6,853.40	12.3
1953	6,603.25	12.5
1954	7,064.27	13.0

Investment portfolio of the banks showed only a small decline of Rs. 5 crores between January 1 and May 14 compared to the decline of Rs. 20 crores during the same period in 1953. With the assistance given by the Reserve Bank under the Bill Market Scheme, banks did not have to take recourse to liquidating their investment in order to meet the increased demand for bank credit.

During the slack season, the scheduled banks increased investment by Rs. 24 crores. This reflects the banks' participation in the National

Plan Loan made possible because of the increased deposits. Maturity pattern of scheduled banks' holding of Government securities has also undergone a significant change.

While advances were going up rapidly, cash balances remained almost throughout the busy season below 9 per cent of total liabilities. But with the rise in deposits, cash balances stood over 10% almost throughout September to December. For many weeks during November and December, cash balances went above 11 per cent. Excess of cash balances over the statutory minimum amounted to Rs. 13.2 crores on January 1, 1954 but it touched the level of Rs. 31.8 crores at the end of the year—the highest point being reached at Rs. 33.2 crores at the end of October. To many, this is a most distressing feature in our banking statistics—such a large amount lying idle for want of proper scope of utilisation. It supports the demand for developing a bill market which seems to be as far away as ever. While the case for better utilisation of funds will be readily conceded, it may still be pertinent to ask, how much of the excess balance is a real excess in the sense that the banking system could work smoothly enough without it? Surely the statutory minimum is not the reserve that all banks could work on. The operational minimum must be somewhat higher than the statutory minimum but how much higher still remains an undermined quantity.

Small Savings and Prices

"WHEN a farmer buys a Savings Certificate, there is no difficulty; he gives the money and gets a certificate", Lala Shri Ram had written to the Planning Commission in January 1951, "but when the time for

repayment comes, he has to knock from door to door, and also spend some money (which, in fairness he should not be made to spend) on getting his own money back. This justifiably leaves a bitter taste in his mouth. Facilities should be provided for prompt repayment when the time comes. The administrative difficulties in prompt repayment in villages are not insuperable."

Patience and persistence has at last been rewarded. It is not of course Lala Shri Ram alone who found the lack of imagination on the part of civil servants—particularly of the Finance Ministry—shall we say—irksome? Others also doubtless must have in their own humble way tried to bring these difficulties to the knowledge of those who are responsible for drawing up and enforcing the financial procedure and it must be glad news to them that at long last difficulties hitherto found insuperable have been resolved. This has been done through the simple means of allowing payments to be made by money order. Perhaps some day the villager would even have the privilege of having the interests due remitted to him by the same means. Who pays for the money order? We will not go into that here. But even to agree to money orders must have wrenched the hearts of those who have been brought up on the belief that payments should be made through the treasury alone. The treasury system held the British empire together. Will not Free India collapse, if that system is tampered with?

Lala Shri Ram's major crusade for lowering of the price lever however awaits a major encounter when the Industrial Advisory Council meets in the last week of this month. He is sceptical about price support to agri-

culture. It will not help the small peasant—their number is legion—who has to supplement his own production and buy food grain for cash. In the case of cash crops prices support will store up trouble for the future, as it has done in America, or plague both the buyer and the seller, as in the case of sugar. But if agricultural prices are not to be supported, industrial prices must be brought down. Almost alone among industrialists, Lala Shri Ram concedes this.

Now there is an Agricultural Prices Variations Enquiry going on. The terminology both in the naming of the committee and in drawing up its terms of reference is not over-refined, but the purpose is reasonably clear, viz., to do the necessary preparatory work for administering price support by studying inter-state and intra-state price variations and the variations in the same market through the year. Narrowing down the range of these variations will be an object of this committee. Working out a price parity will be another. One may grumble that this is putting the cart before the horse, but in the world of affairs, the sequence of events is not always that of logic. In fact, it is not possible to talk about price support in agriculture without begging a number of questions. As currently viewed, it is an attempt to forestall the future and meet it half way. For the presumption is that declining agricultural prices can only be temporary, pending such time as planned investment on the larger scale gathers momentum. And when it does, things will be different. The high cost economy to which the country would be heading under the Second Plan should provide sufficient provocation to Lala Shri Ram to continue his crusade.

Needed: More Information About Handicrafts Board

THE All-India Handicrafts Board held its seventh meeting in Bombay to consider the second Five Year Plan of the Board where the Chairman, Shrimati Kamaladevi, was very critical about the lack of sympathy of men in key positions regarding handicrafts and observed that if we believed that our country should follow the industrial pattern of the West, it was sheer waste of time and money to bolster up handicrafts.

The Chairman is perhaps right in her indignation at the general callous attitude of the people concerned, but the blame is not entirely of the public at large, if it takes such a view, more so because unlike the Khadi and Village Industries or Small Scale Industries Board, the functions and activities of the Handicrafts Board have not been very clear, nor are they publicised either by books or reports.

The Handicrafts Board was set up in November 1952 in order to bring together unofficial advisers to suggest ways and means of development. The Board enjoys the status of an autonomous body within the Ministry of Commerce and Industry (now the Ministry of Production) which provides funds for the various projects sponsored by it. The Handicrafts Board announced that as a starting programme, it had undertaken the items (1) toy making, (2) mat making, and (3) pottery for intensive development. It held an exhibition of toy, mats and pottery in Delhi in 1953 and also started a museum. In 1954 the Handicrafts Board organised an exhibition of textile printing and a very costly brochure was published.

The public, however, has not learnt anything about how the development project was worked, what the results are, and what the process of this intensifying development is.

If the object of the Handicrafts Board is to absorb more people into the crafts, or increase the income of individuals occupied in this work, it is necessary to make known these facts. Instead, we are told—this is a peculiar feature of all our nation-building activities—how much money has been spent in these projects, but hardly anything about the achievements.

We have inherited a tendency of looking abroad for appreciation. We even claim to have sold goods worth huge amounts in exhibitions held abroad without trying to ascertain at what cost or how much of the expenditure is due to the salary of the officers or their travelling and other expenses, and how much was spent on the purchase of handicrafts products or how much money went to the craftsmen in question. The Minister for Production, Shri K. C. Reddy, remarked about the lack of co-ordination of various agencies concerning handicrafts and rightly so. People should be taken into confidence and it should be explained what the relation is between the Indian Co-operative Union with the Handicrafts Board, and what control the Board has over it, when it granted Rs. 80,000 to the Co-operative Union for a marketing survey or entrusted the union with arranging an exhibition at Kalyani where Rs. 60,000 were spent, and how much money was received by way of sales, thereby showing how far these exhibitions justified its participation, apart from enlightening the people

attending the Congress about the crafts we are capable of producing. The same is the case with the various exhibitions held abroad in America or England or Brussels on which the Government spent Rs. 2.7 lakhs in 1953-54.

The average man also does not know the relation between the Handicrafts Board and the various State Cottage Industries Departments. It will serve a useful purpose to show how many emporiums are opened by the Board directly and how many are State organisations.

In fact, a Hand Book published by the Board giving these details would help a better understanding of the problem of development and organisation, and would remove some of the causes of annoyance both to members of the Board and the outside public. It will help young enthusiastic elements or societies to take more interest in these projects and their activities.

Off the Record

Encouragement to Develop —but not to Electricity

DRAFTING of a bill is a matter of considerable technical complexity. Time and again, in actual working, the effect is found to be different from what was intended when a bill was passed into law. But no Act, however competently drafted, can hope to achieve its purpose if those who have to do the drafting are not fully apprised of and carefully briefed about the variety of cases it has to cover.

Now take the familiar case of capital replacement when the cost of such replacement has gone up as a result of rise in prices of capital goods. However prudently and dutifully the companies might have set aside funds for replacement in the depreciation reserve, the reserves are no longer adequate to pay for the cost of replacement, with prices of capital goods rising substantially as has been the case in recent years. The resulting problem has exercised the Finance Ministry wherever there is a problem of replacement to be met. Much ingenuity has gone into the solution of this problem, which, however, remained intractable in the end. To alleviate the situation, a way out was found in allowing a high rate of initial depreciation on new plant and equipment. It did not need much ingenuity or insight into accountancy however, to realise that this could be at best only a pis aller—an interest free loan from the income-tax. For when companies were allowed higher initial depreciation they could treat the additional allowance as expense, but once an item of capital had been written off—and this could be done as quickly as in 5 years—the company had to pay tax of a higher amount than would be the case if the depreciation had been spread over a longer period. Therefore, to meet this familiar situation the Finance Minister introduced in the last budget a more substantial measure of relief. This was in the form of a developmental rebate the purpose of which was to encourage investment in fixed capital by offering exemption from income-tax of 20% of the capital value of the new assets acquired. That is to say, it was to be an outright gift with no unfavourable projection into the future as was the case with additional initial depreciation.

However different their effects on the ultimate fortunes of an enterprise, the point that needs to be emphasised here is that the intention of both the measures was to encourage capital investment, no matter where capital might be invested. The Act did not say that encouragement was to be given to some undertakings and not to others. In actual working, however, the effect turned out quite differently, e.g. in the case of electricity undertakings. There is a separate Act which prescribes a different rate of depreciation for the purpose of determining the rate to be charged for the supply of electricity on which, needless to say, ultimately depend the returns on their investment. When it was additional initial depreciation, the electricity companies had to take it, whether they wanted it or not. The benefit that was meant to help them to recover the cost of equipment, however, had to be passed on to the consumers! For the Electricity Supply Act laid down that all benefits beyond a certain point were to be passed on to the consumers. What if the Finance Act wanted the electricity companies to retain some of it? The Electricity Companies might have prayed for exemption from this relief! but who listens? The law is an ass. Until the Electricity Act is amended or the Finance Act carries a Special clause extending the relief to Electrical undertakings notwithstanding the provisions of the Electricity Act, whether they wanted it or not, electricity undertakings had to take the allowance given by the Finance Minister in his kindness.

The electricity undertakings are in no better plight now that there is a developmental rebate since the benefit of it, too, goes to the consumers. True, at some future date they may be able to recover the higher charges. But that is not here and now. A bird in hand would be preferable any day and that is clearly the object of the developmental rebate. They are not allowed to retain the rebate to pay for development and yet the country needs development at as fast a rate as it can and nowhere is development more sorely needed than in the supply of electricity, judging from the high priority given to power production in the First Plan,

and the allocations proposed for it in the Second. Despite all these schemes of power generation in the public sector, it need hardly be added here that distribution has still to be handled by the electricity supply companies which buy power in bulk where possible and carry it to the homes and factories.

The fair rate of return is quite another matter. Whether it should be 5 per cent or more, or whether it should be linked in some way to the bank rate, should not be mixed up with the simple and straightforward issue of giving relief which the Finance Act intends to give but of which electric undertakings are deprived, thanks to the Finance Ministry—or is it the Ministry of Irrigation and Power?—not being able to grasp that between the idea and reality there are intervening barriers and these have to be cleared. It is surprising this omission has not been noticed and rectified so far. Could it be because someone tripped somewhere and mixed it up with the question of fair return?

Wage Rates and the Level of Exports

THE once accepted tenet that wage rate increases could only be countenanced in conditions of rising productivity now appears to be under severe attack. A new and somewhat novel doctrine linking wage rates with the international competitiveness of exporting countries is being gradually introduced as an argument against (and for) meeting wage demands in industrial negotiations. It is true that in the standard theoretical models of international trade, relative wage levels in different countries are among the more crucial determinants of the flow of trade and further, there is a strong presumption for believing that wage rates in different trading areas tend towards equality. But to suggest that these abstractions have immediate relevance at the industrial negotiating table is certainly a new development. The Financial Times, taking its cue from the statistics published recently by the Economic Commission for Europe, has come down to stating the new truth in the following terms:

"the truth is, of course, that a rise in industrial output per man-hour creates no more than a prima facie case in favour of a higher wage rate per hour. The issue can only be decided finally by reference to what is happening in wages, productivity and prices in competing industries abroad".

Germans Getting Less, so...

The reason for the introduction of this somewhat new negotiating point arises most certainly from the current economic situation in Britain. The upswing in activity is being rapidly confronted with various inflationary symptoms, but more by a number of crucial bottle-necks in the supply of productive resources, and one of these is the shortage of manpower, particularly skilled manpower. In this situation, labour has a relatively strong bargaining power, but even apart from this, it has a fairly strong claim for a higher share of the output of industry. It is estimated, for example, that between the last quarters of 1953 and 1954 output per man-hour increased by 4.3 per cent (in the metal-using industries) while real hourly earnings rose in the same period (and in the same industries) by only 3 per cent. Between 1950 and 1954 output per man-hour rose by 1.7 per cent while real

hourly earnings for all industries rose by 1.2 per cent. How then are these claims to be rebutted and, more so, how can the share of capital in the form of profits be excluded as a consideration in industrial negotiations? Ingenuity on the employers' side has found a new answer: "the Germans are receiving less in wage rates and are therefore winning more export contracts—in the national interests we have to do the same".

Sweated Labour Argument Reversed

This argument is nothing more than a twisted version of an older argument, which in pre-war years was effectively used to justify the pushing up of tariffs and other barriers against the import of Japanese goods. The "sweated labour" policy which, in those years had given Japan a decided advantage in international trade, was roundly condemned by the Western exporting countries. Now, if these same countries are to remain at all consistent, it would be expected that they would attack the wage policies being pursued in Western Germany, rather than the claims now being made by their own Trade Unions. Of course, the present situation is different from

that prevailing before the war. Then, both national and international economic activity was in the 'doldrums', and mass unemployment was the first among a series of virtually intractable problems. Profit margins were low and in Britain at least, wage rates had reached the irreducible minimum level. Now, however, as the Economic Bulletin for Europe of the E. C. E. puts it "the improved employment situation and the high profits make labour less and less inclined to show restraint in wage demands".

The situation in Western Germany is well worth looking into. As in all other European countries, employment in Western Germany increased between 1953 and 1954. After having a large reserve of unemployed in 1953, the rate of increase in employment was among the highest in Western Europe (6.5 per cent compared to 2.5 per cent in Britain) and while unemployment has not been completely solved, the average working week is long compared to that in Britain and France. In Britain, the working week is three hours shorter and in France four hours shorter than in Western Germany. While it is possibly true that the lengthening

Ask for

INDIA SUPER

Tyres

The finest tyres made

of the working week is partly explained by the shortage of skilled labour, it is likely to be more true that this lengthening in Western Germany has been governed by the need to maintain a reserve of unemployed and so reduce the power of labour to bargain for higher wage rates. In this situation, it is understandable that while the productivity of the West German worker has increased by 6½ per cent between 1953 and 1954, real earnings have risen by only 2 per cent. With the exception of Italy, this increase in real earnings is the lowest for all the West European countries.

It may no doubt have been possible that in these circumstances Western Germany could find itself with a cost structure which gave it a clear advantage in international trade. As the Economic Commission described it, "increases in earnings in West Germany lagged so much behind increases in output that the competitive position must have improved considerably compared to that of the United Kingdom". But to deduce from this a remedy which calls for a reduction in British wage levels to a position which makes them compare favourably with those prevailing in West Germany, can by no means be the answer to the general international trade problem. Apart from the fact that the British Trade Unions

will not accept such a remedy, it is clear that the problem lies not so much in Britain's wage structure, but more in the wage policies prevailing in Western Germany. As long as Western Germany fails to give to the German workers their fair share of the rising output of their labour, so long will European wage differences persist.

Britain's export prices and the level of her exports are not, however, so heavily dependent on relative wage rates as is generally supposed. The E. C. E. report cites a number of arguments which support the contention that international wage differences were not the decisive factor leading to Britain's disadvantage in international trade. When the 1954 boom commenced, unlike her European competitors, Britain had an unusually small amount of unused capacity in industry and very little stock of basic materials. Moreover, British export prices are more dependent on the level of import prices than in any other country in Western Europe. With regard to unused capacity and small stocks, the case of coal is a pertinent one. While Germany was able to cut down her purchase of coal from abroad, Britain had to become a net importer of coal at prices which were some 5 per cent higher than those prevailing in 1953. The position is no less differ-

ent with regard to steel. In Britain, the upswing in engineering industries began with a much smaller margin of spare steel making capacity than that on the Continent of Europe. In other words, Britain did not have the advantage of being able to build up her engineering boom from the same strong basis as the various Continental countries. The pressure on basic materials was therefore more marked in Britain and consequently, led to a necessary upward price movement.

Upward Trend of Profits

Arguments like the one that is now being advanced, i.e., wages have to be steadied to make exports competitive, sound particularly hollow when account is taken of the trend of profits in industry, as well as of the boom on the London Stock Exchange. Profits have been assessed as being some 13 per cent higher in 1954 compared to 1950, and, while it is true that this estimate largely excludes requirements for depreciation reserves, the speculative boom in a number of British industries is associated with quick profits. The profits realised on capital values as a result of the Stock Exchange boom have been so large that it is more likely than not that the current industrial unrest in the country is a direct consequence of it.

From the Calcutta End

An Unseemly Quarrel

ON July 1, Dr. B. C. Roy, West Bengal's Chief Minister became seventy-four. On that day, the West Bengal Pradesh Congress Committee presented him a cheque of Rs. 74,000. It all depends. Some do not like to be reminded that they are growing old. One would presume Dr. Roy falls in this category. Two years ago, there were whispers that he might retire as he was ageing. He could not deny that he was growing old. But he resented the hint that he was getting infirm or unfit for arduous work.

He is alert and agile. He acts as if he has a mission to fulfil. And he behaves as if he will continue to be this problem State's Chief Minister as long as the mission is not achieved. Many will wish him a longer and more fruitful life. But it will take many years before West Bengal ceases to be a problem State. It, therefore, ill becomes the Chief Minister of such a State to behave as if he does not worry or bother much if after him the deluge comes.

Plan-frame

Dr. Roy is now front page news in this State's Press. That is not because he was 74 on July 1, but because of his hostile attitude to the tentative framework of the second Plan. He does not think that the people will willingly bear the sacrifices involved. Cynics are now saying that Dr. Roy is an honest politician: He likes and enjoys the good things of life, and so he does not want the people to stint themselves. Every man has his philosophy of life. But Dr. Roy's economics does not seem to be good.

Something else than Dr. Roy's Philosophy or politics or economics is involved. Can he, Chief Minister of a State, carry out an open controversy with the Union Government's Plan-frame? True, the tentative framework is meant to be discussed and analysed. Dr. Roy is entitled to his opinion. He has already expressed his views to the Planning Commission. But is he entitled to quarrel with New Delhi in public? He questions the magnitude of the Plan-frame. But the plan-frame for his State is much more ambitious. How to explain such inconsistency? There is an explanation. But that would be washing

dirty linen in public.

Karachi Coalition

Mr. Mohammed Ali, Pakistani Prime Minister, has a knack of hitting the headlines. Karachi may resent that he has developed a habit of making policy statements while in Calcutta on his way to and from Dacca. But the Press in Calcutta and the City's foreign correspondents are grateful to the Pakistani Prime Minister for his prolific statements while waiting in Calcutta for planes to fly to Dacca or Karachi.

It was in Calcutta recently that he disclosed the make-up of political parties in Pakistan. In Western Pakistan, the Muslim League is the major political party. United Front is the most influential political organisation in Eastern Pakistan. At the Centre, therefore, the Government will be a coalition between the Muslim League and the United Front. Poor Maulana Bhasani! He must be repenting that he allowed himself to be outwitted by Mr. Suhrawardy. Mr. Suhrawardy, in his turn, has been outmanoeuvred by Mr. Mohammed Ali. And Mr. Fazlul Huq is happy in the knowledge that he remains Eastern Pakistan's most wily and influential politician.

Kashmir

Foreign correspondents were not as much interested in his disclosure of the coming coalition between the Muslim League and the United Front as in his views on Kashmir. Mr. Mohammed Ali likes to talk with pressmen. He is free and informal. He likes to oblige pressmen. In Calcutta recently, he suggested that Pakistan might accept partition on Kashmir as a result of arbitration or mediation. Foreign correspondents rushed to file their stories. When the Pakistan Prime Minister reached Karachi that night, he had to issue a denial that he had ever indicated Pakistan's willingness to accept partition of Kashmir.

Hindu Exodus

It is yet too early to say whether the resumption of the popular Ministry in Eastern Pakistan will end the exodus of East Bengal Hindus. Both Karachi and Dacca are pledged to protect the interests of the Hindu minority in East Bengal. The Abu Sarkar Ministry has begun well. It is popular. Its intentions are not in doubt. And, as the exodus is mainly an administrative problem it

should be possible for the popular Ministry to end harassment of, and discrimination against, the Hindus.

This, however, does not mean that West Bengal's refugee problem is nearer solution. If the Abu Sarkar Ministry means what it says, the exodus may slow down. Those Hindus who are still in East Bengal may decide not to come out to West Bengal. But those who have already come out are not likely to go back. It is good to know that the Rehabilitation Ministry's plans are based on such realistic assumptions.

Rehabilitation

A conference of Rehabilitation Secretaries of five Eastern Region States was held in Calcutta this week. It was inaugurated by the Union Rehabilitation Minister. And the Central Rehabilitation Secretary was present in Calcutta to participate in the deliberations of the Conference. Shri C. N. Chandra, Union Rehabilitation Secretary, disclosed New Delhi's plans to settle the displaced persons from East Bengal in some States outside West Bengal.

Sometime ago, representatives of the Planning Commission, the Union Rehabilitation Ministry and the Government of West Bengal met to discuss plans for dispersal of Bengali refugee families to compact blocs of land in other States outside West Bengal. 700 to 800 Bengali displaced families will be settled in a compact area in Hyderabad by the side of the Godavari river. Similar other refugee colonies will be established in Chota Nagpur, in north Andhra, in south Orissa and in Mysore and Madhya Pradesh.

There are plans for starting industries in these refugee townships. Rs. 10 crores have been provided by the Planning Commission for outlay on these industries. Shri Chandra revealed that the expenditure on such industries will be raised so as to provide employment opportunities to the displaced persons. Housing will be a problem in these refugee colonies. Direct construction of tenements by the displaced persons will be encouraged to solve the housing problem. Bengali-speaking welfare officers will be appointed in such colonies outside this State to help the Bengali refugee families to settle down in areas outside West Bengal.

A Report on Yugoslavia

Tito Lifts the Curtain. By Hallam Tennyson. Rider and Co., London, Pages 240; 15 shillings

Reviewed by Lokesh Ghatak

THERE is an air of something not quite clearly comprehensible to both Eastern and Western minds about Marshal Tito's Yugoslavia. Rather than any attempt at clarification, the tendency of all recent reportage has been either to justify Tito's neutrality or to apologise for the introduction of new Communist experiments in Yugoslavia. This is neither necessarily the result of international distortion of the news, nor so much a faulty evaluation of the news-worthy events; the causes are rather to be found in the difficulty in conveying to a homogenous group of people in other countries the complexities that beset a composite nation, a nation of many tongues and cultures and peoples. Such a nation, for instance, is India, and Hallam Tennyson whose forthcoming book on Vinobha Bhave (*The Saint On The March*) is eagerly awaited in this country, knows India; and knowing the complexity of the national structure here, he is able to give to Yugoslavia that sympathetic attention to the differing groups, religions and cultures which alone can convey, particularly to the western mind, its diversity. This diversity being one of the essential ingredients in the building of the final political edifice, be it communistic or democratic in design, ignorance of it cannot result in good political news reporting.

Hallam Tennyson's new book, *Tito lifts the Curtain*, is certainly the first methodical attempt at presenting to the public a penetrating picture of this country which had, for loyalty of culture, wavered so long between Europe and Asia and now stands trembling on the verge of democracy and totalitarianism. His approach is in itself broad; he does not allow himself to be persuaded by any pre-conceived notions on communism, (he went there to organise an international conference run by the American Quakers), but observes, "Yugoslavia is probably still too deeply divided by religious and regional animosities to be able to stand the strain of parliamentary democracy", and "Freedom of discussion is allowed within the framework of the One Party system and this leads inevitably to the growth of vocal opposition within the One

Party. This opposition cannot now be stamped out by the old ruthless purges, (bold mine), but by a show of reason and an appeal to the due processes of the Law" (Preface).

One Fundamental Difference

This actually constitutes the one real and fundamental difference between methods of implementing communism as done elsewhere and as is attempted in Yugoslavia. But the emergent structure also is different, as Tito shows by lifting the curtain in Hallam Tennyson's book. Indeed this is a very timely publication; more than anything else, here, are indications that may help to clarify the new open-door policy of Tito as well as the psychological reasons for the top Soviet hierarchy openly wooing him now.

As a result of experience gathered in an extensive tour lasting over four months across every region of the country, helped considerably by a knowledge of the language, Mr. Tennyson is able to contend that some 25 per cent of the country's population, composed largely of the intelligentsia were solidly behind the Government, whereas the other 75 per cent were mainly non-interested and quite unpolitical. In order to understand the liberality of Yugoslav communism, he concludes on the other hand, one must understand that "Communism rose to power in Yugoslavia by an act of popular will (bold author's); and this fact alone distinguishes it from the communism of any other country with the possible exception of China".

Break off with Cominform

Actually, however, the twenty-five per cent of Mr. Tennyson's intelligentsia represented the real voice of the people in Yugoslavia; the lethargic are content to be led; whereas in China the common people had for long been ripe for any kind of change from the corrupt regime of Chiang Kai-shek, a very strong negatively motivated support for Mao Tse Tung. No, the popular front of Tito goes back for its support earlier than the results of the last election, means more than what those results can indicate or what a new survey now may bring forth; when in 1937 the Russian trained 'Comrade Wal-

ter' returned to his native land with a forged Canadian passport proclaiming him to be one 'Tito', and took over the Secretary-Generalship of the party, he soon severed all financial connections with Moscow. It was then neither customary for the underground Communist leaders of foreign countries to operate from anywhere but Moscow, nor to work on a basis of an independent source of revenue. The seed of independence sown then grew to the healthy plant that dared to break off with the Cominform later, and now represents the solid tree with its roots deep down into native Yugoslavian soil instead of in portable earthen pots. Things become interestingly clear why the Soviet 'summit' should strike increasingly respectable attitudes in dealing with Yugoslavia than in its dealings with the satellite nations. Tito has certainly lifted the curtain to show this.

I have not tried to show that the independent nature of the birth and the growth of Chinese Communism is to be belittled, but rather that in far less extenuating circumstances, Yugoslavia stands as the only Communist country where the change has come from the people. Again, the conclusions which the reader may derive for himself, and which may not necessarily be those of the author, depend on the observations forcefully presented by the author himself, a brilliant example of systematic coverage.

1948 Controversy

In view of some mildly contradictory statements that have recently emanated from Belgrade from the two country's representatives, it is interesting to recall the letter which the Yugoslavian Vice-President Kardelj had written to the Russian Ambassador in 1945, in which he had urged him to meet the Yugoslavian leaders 'not as representatives of another country, capable of solving questions independently, but as representatives of one of the future Soviet Republics'. This widely sweeping remark was quoted by the U.S.S.R. in 1948 during the controversy, and would tend to show that the mentality of the Yugoslav leaders at that stage was no different from that of the other East Euro-

pean leaders; in fact it might at best have been the official policy of the state then towards Soviet Russia, for the Tennyson narrative brings out vividly how in the strong and independent personality of Marshall Tito, Russia received her first determined rebuff. Tito was the only Communist leader in Europe outside the U.S.S.R. who was of any consequence, and he was not there by the grace of Kremlin. He was the acknowledged leader of his people by virtue of his proven qualities of leadership and had nurtured the growth of communism as a native plant on Yugoslav soil. It was this strength from within which enabled the fifth congress of the Yugoslav Communist Party to resolutely refute the charges of the Cominform in July

1948. And now read in the background of more recent occurrences at Belgrade and the volteface of the top Communist leaders, Mr. Tennyson's account of the country, its people and their politics certainly make interesting reading.

In the main the book is really a travelogue in which the author's instinctive attitude as a writer and the acquired attitude of a reporter with a mission has blended to influence much of his conclusions, on the social as well as the political occurrences in Yugoslavia. There are delightful personal interludes with the men and women and monks of Croatia, Serbia, Dalmatia and Macedonia, and these, apart from being of interest in themselves, serve as a

pointer to the attitude of this multi-regional nation.

As for the economic well being of the people, their material prosperities, religious freedoms and freedom of speech, it will be of little use writing down in simple statements the conclusions of Hallam Tennyson; that can never indicate the relative perspectives from which these must be viewed. To do that one must spend, like the author, four months travelling extensively in every region of that country, with a knowledge of the language and an open mind; or one must read for himself *Tito Lifts the Curtain*.

A good book, pleasantly informative rather than drily instructive; above all, an important book for the time in which we live.

Experiment In Trade Union Education

Asian Trade Union College, ICFTU Asian Trade Union College, New Alipore, Calcutta—33. pp. 54.

Price not mentioned.

He increasing interest of the International Confederation of Free Trade Unions in Asian affairs is in conformity with the growing influence of international communism in Asia. The 'free and democratic' trade unions of the West have the constant fear that the working classes of under-developed countries might fall an easy prey to the wiles of communism. The real remedy lies in raising the social, economic and political status of the population and thereby eliminating the causes which breed communism. ICFTU, however, thinks of a short cut. A band of trade unionists, thoroughly trained and liberally financed, might wean over a large number of their compatriots from communism. The Asian Trade Union College thus came into being on November 5, 1952 in Calcutta as a central institution under the auspices of the ICFTU to help the trade union workers of Asia to train themselves in the principles and practices of democratic trade unionism. These workers "would imbibe from their education at the college the spirit of democracy which believes the individual to be an end in himself, which seeks to develop individual integrity, initiative and responsibility, which bases organisation on co-operation and never on co-ercion and draws nourishment from reason and knowledge instead of from passions and authority." The college aims to equip the workers to carry on the organisational work in their own

countries with a greater consciousness and efficiency and also to train cadres of workers to organise local educational programmes in their respective countries.

The college is in existence for the last 2½ years and an interesting account of its history and activities for the first two years has now been made available by its Director, V. S. Mathur, in brochure. During this period, the college conducted six courses, each of 12 weeks' duration and trained 134 students from eight Asian countries. Of these 134 students, 110 were office bearers of their unions, while the rest were ordinary members. The majority of students came from railways, shipping, bus and tram transport, iron and coal mining, engineering, posts and telegraphs, textiles, clerical services, teaching and plantations. Analysed by age groups, 79 were between 20—30 years, 49 between 31—40 years and only six were between 41—47 years. Women students were only two.

Lectures were given on various aspects of trade unionism—its functions, organisation and administration; collective bargaining; history and legislation. Other subjects taught were general and applied economics; political topics, educational, welfare and community activities; techniques of intellectual work; statistics; industrial psychology and current affairs. The lectures were supplemented by demonstration clas-

ses, educational visits to factories and unions and by the workers' Education Centre—an independent project by itself. The educational activities took various forms like Sunday classes and night classes; preparation of literature in local languages; local and regional trade union short courses; wall newspapers, etc. Ten short refresher courses were held in various countries.

Various difficulties, such as lack of adequate knowledge of English, different food habits and refusal by employers to grant leave were experienced. The most important problem, however, was that of right selection of candidates by trade unions. Curiously enough, the brochure is silent about financial difficulties, which generally come in the way of such projects. It gives the source—a special fund from voluntary subscriptions at the rate of two pence for each member of trade unions affiliated to the ICFTU—but is silent about the actual figures of income and expenditure. It is not clear whether any tuition fees are collected or whether any other charges are levied for lodging and boarding of the students.

On the whole, it has been an interesting experiment in international free trade union education and the brochure brings out the main objects, problems and difficulties in implementing such a project.

This is an advertisement and not a Prospectus. A formal Prospectus dated 28th June 1955 has been prepared and filed with the Registrar of Companies, Bombay.

Consent of the Central Government has been obtained to this issue by an order of which a complete copy is open to public inspection at the Head Office of the Company. It must be distinctly understood that in giving this consent, the Government of India do not take any responsibility for the financial soundness of any schemes or for the correctness of any of the statements made or opinions expressed with regard to them.

A Licence (No. L/11/6/54) has been obtained from the Central Government for effecting a substantial expansion to this industrial undertaking of which a copy is open to public inspection at the Head Office of the Company. It must be distinctly understood that in granting this Licence, the Government of India do not take any responsibility for the financial soundness of this undertaking or for the correctness of any of the statements made or opinions expressed in regard to it.

APPLICATION WILL BE MADE TO THE STOCK EXCHANGES FOR PERMISSION TO DEAL IN THE SHARES.

THE SUBSCRIPTION LIST WILL OPEN ON THE 11TH JULY, 1955, AND, IN ACCORDANCE WITH THE REQUIREMENTS OF THE BOMBAY STOCK EXCHANGE, WILL REMAIN OPEN TILL 13TH JULY, 1955 (INCLUSIVE).

DIVIDED INTO

12,50,000 Ordinary Shares of Rs. 10/- each	Rs. 1,25,00,000/-
25,000 Redeemable Cumulative Preference Shares of Rs. 100/- each	Rs. 25,00,000/-

ISSUED CAPITAL

3,33,618 Ordinary Shares of Rs. 10/- each	Rs. 33,36,180/-
---	-----------------

PRESENT ISSUE

2,16,382 Ordinary Shares of Rs. 10/- each	Rs. 21,63,820/-
25,000 Redeemable Cumulative Preference Shares of Rs. 100/- each	Rs. 25,00,000/-

Out of the above issue the Directors and their friends have agreed to take up 60,000 Ordinary Shares and 12,000 Redeemable Cumulative Preference Shares and the same will be allotted to them against payment in cash. After deducting the abovementioned shares from the said present issue the capital to be offered to the public is:—

1,56,382 Ordinary Shares of Rs. 10/- each	Rs. 15,63,820/-
13,000 Redeemable Cumulative Preference Shares of Rs. 100/- each	Rs. 13,00,000/-
Total	Rs. 28,63,820/-

The Shares to be issued will qualify proportionately for dividends for the year ending 31st October, 1955. The Shares are payable as follows:—

ORDINARY -SHARES

On application	Rs. 2/8/- per share
On allotment	Rs. 7/8/- per share

PREFERENCE SHARES

On application	Rs. 25/- per share
On allotment	Rs. 75/- per share

PREFERENCE SHARES

The Company is advised that the Redeemable Cumulative Preference Shares are Approved Investments within Section 27A of the Insurance Act, 1938.

The Redeemable Cumulative Preference Shares, as provided in the Articles of Association of the Company, carry a fixed cumulative preference dividend at the rate of 6% per annum without deduction of Income-tax on the capital for the time being paid up thereon, and the right in a winding-up to payment of such capital in priority to the Ordinary Shares, but not any further right to participate in profit or assets. The Company shall be entitled on or at any time after the 1st day of November 1965 to redeem the whole or any part of the said Preference Shares for the time being issued and outstanding out of any monies which may lawfully be applied for the purpose at par plus a premium of Rs. 5/- per share upon giving to the holder of the shares to be redeemed not less than three months' previous notice in writing.

TECHNICAL CONSULTANTS

Willys-Overland Export Corporation, Toledo 1, Ohio, (USA).
 John Inglis Co., Toronto, (CANADA).
 Mr. Cecil Johnson, Johnson Associates, Toledo, Ohio, (USA).

MANUFACTURE OF JEEPS IN INDIA.

The Company has acted as the sole representative of the Willys Overland Motors Inc. of Toledo (Ohio), U.S.A. since 1945. Steps were taken early in 1948 to organise an Assembly Plant in Bombay, thereby introducing knowledge of assembly operations as well as affording opportunity for studying progressive manufacturing possibilities. This Assembly Plant located in the Mazagon Dock area is today one of the most efficient and economic Assembly units in the worldwide Willys organisation. After exhaustive investigations ranging over three years by several teams, comprised of engineers from Willys and the Company, a detailed plan was developed for the manufacture of Jeeps in India.

The Company's proposals do not envisage the establishment of a single, self-contained and integrated factory on a large scale. Our technical experts came to the conclusion that by drawing upon spare resources in the engineering industries, a co-ordinated manufacturing organisation can be set up and the Jeep progressively built in India without large capital investment initially.

Willys-Overland Export Corporation have entered into a 10 year licence arrangement providing for the grant of exclusive right to the Company to manufacture and sell in India the 4-wheel drive Jeep and other vehicles, furnishing the requisite technical assistance and also giving the Company full benefit of their research and development.

Willys have further agreed to extend a long term loan to the Company to the extent of \$230,000.00 or 10% of the total subscribed capital of the Company. It is contemplated that in course of time the Company will be able to negotiate the export of Indian-built Jeeps to countries adjoining India.

HISTORY AND BUSINESS

The Company was incorporated at Bombay on the 2nd of October, 1945, as a private company for the purposes set forth in its Memorandum of Association. The main objective before the Company was to participate in the building of a sound industrial and agricultural economy in the country. What has been concretely achieved in these fields is briefly summarised below.

1. **JEEPS**—As sole representatives of the manufacturers, the Company has established a sound reputation for service and sales in respect of this famous vehicle and its allied range of utility models, namely, the Utility Wagon, the 4-wheel drive truck, Cargo Personnel Carrier, Jeep Fire Engine, Jeep Aircrash Tender and ambulance unit.

Hitherto the import quotas have been restricted to about 900/1000 Jeeps a year and it was only in the year 1954, after Government approved the Company's manufacturing plans, that the import quota was liberalised. During the manufacturing period of three years, 1955-58, Government has agreed to permit imports up to 2500 units a year and sanctions for even larger numbers, it is hoped, will be forthcoming on request. In 1953-54 the Company

successfully built about 1650 units. During the six months of the current year (1st November 1954—30th April 1955) the Company has sold over 1100 Jeeps and it is expected that this rate of turnover will be sustained during the following period. The Assembly Plant today has facilities, not only for meeting the requirements of the initial out-turn of 2000/2500 units, but it can handle almost double this number.

As part of the programme of progressive manufacture of Jeeps in India and in the ordinary course of business the Company has recently purchased a factory at Bhandup in Greater Bombay, consisting of Plant, machinery and equipment suitable for manufacture of automobile parts. The owner of the premises has granted a lease of the premises and an option to the Company for an extension of the lease for a further period. The Company has already commenced operations in this factory.

2. **TRACTORS**—The Company has linked up with the famous firm of David Brown of United Kingdom. Experience in the short period of two years has proved both the reliability and suitability of the David Brown range of tractors for most of the soils in India and the Company has arranged with David Brown the question of progressive manufacture of their tractors and implements in India.

3. **TEXTILE MACHINERY**—The Company sponsored the floatation in November 1946 of MACHINERY MANUFACTURERS CORPORATION LIMITED for the specific purpose of manufacturing medium light

industrial equipment, in particular textile machinery. Arrangements were successfully concluded with two American firms of repute for technical collaboration. The Company is the Managing Agent of this Corporation.

The M.M.C. Carding Engine has been very exhaustively tested at a number of critical installations throughout the country and it is a source of gratification that it has proved not only equal in performance and efficiency to any imported product, but that it is being retailed in the market at prices lower than the cost of a British Carding engine of equivalent specifications.

4. **DIESEL ENGINES**—The Company has in collaboration with National Oil & Gas Co., Ltd., of Ashton (U.K.) and Turner, Hoare & Co., Ltd., (a subsidiary of the Company) floated the INDIAN NATIONAL DIESEL ENGINE COMPANY LIMITED (INDEC) with a substantial financial participation of the British Group. INDEC has undertaken to manufacture diesel engines to "National" design and it is hoped that the first Indian made horizontal diesel engine will be on the market by end of July 1955.

5. **TRAILERS**—The Company possesses a separate well-equipped trailer manufacturing shop at Worli (Bombay) where trailers ranging from 10 Cwt. to 10 tons are manufactured, including the well-known Jeep trailer. A close technical collaboration has been agreed upon with the British Trailer Company, one of the leading trailer manufacturers in Europe.

6. **STEEL**—The Company, by virtue of special arrangements with manufacturers, has established a premier position in the import of Steel. The Company represents the renowned British firm of Richard Thomas & Baldwin on an exclusive basis and also holds exclusive representation from VALOR, one of the three French Steel Groups, for Plates, Bars, Sheets and Structural, as well as from SIDELOK for Rails and Sleeper Bars. From Japan the Company has received exclusive offers of Plates and has succeeded in securing large tonnages for the Iron & Steel Controller. The Company has also interested itself in quoting for the steel coming to India under the T.C.A. from America and in such dealings arrangements have been concluded with Tata incorporated in New York to handle our quotations as well as secure,

where possible, offers from U.S. Steel Companies.

7. **GENERAL SALES & SERVICE**—The increasing volume of sales in the many branches of the Company's activity—Jeeps, Tractors, Trailers, Steel—has been achieved by a consistent endeavour to improve the marketing channels and by strengthening the after sales service facilities. In addition to having branch offices in Calcutta, Delhi and Madras the Company has a very efficient chain of distributors, dealers and sub-dealers throughout the country. Regional field officers and inspectors are constantly on tour providing sales and technical guidance as well as check on the distribution efficiency of the area. A mobile tractor school is in operation

throughout the year at various centres; Jeeps service is extensively provided through distributors as well as by direct field inspectors. Stockist arrangements for steel supplies have been completed for Bombay and Calcutta.

FINANCIAL INFORMATION**Auditors' Report**

The following are extracts from the report of the Company's Auditors, A. F. Ferguson & Co.:—

"The profits of the Company for the three years were as set out hereunder and have been arrived at after charging all expenses of working and management and after making such adjustments as are, in our opinion, necessary:—

	Year ended 31st October:		
	1952	1953	1954
Income:			
Sales	1,51,50,411	2,66,99,841	3,61,95,802
Commissions	1,48,276	1,10,044	1,22,583
Managing Agency			
Commission & Allowances	39,406	37,304	36,000
Income from Investments	2,52,011	1,17,282	58,594
Interest	9,584	1,912	534
Miscellaneous	36,102	29,489	67,193
	Rs. 1,56,35,790	2,69,95,872	3,64,80,706
Expenditure:			
Cost of Sales	1,32,55,635	2,37,40,866	3,13,37,359
Salaries & Wages	9,92,423	13,47,347	18,15,422
Expenses	10,03,746	14,56,008	20,07,494
Depn. as charged by the Coy.	92,520	1,04,733	1,03,959
	Rs. 1,53,44,324	2,66,48,954	3,52,64,234
Profit before Taxation	Rs. 2,91,466	3,46,918	12,16,472
Appropriation:			
Provision for taxes	1,00,000	1,30,000	5,30,000
Investment Reserve	2,650	—	—
Special Reserve	23,355	45,281	75,000
General Reserve	—	83,900	1,50,000

"We further report that the dividends paid by Mahindra & Mahindra Limited in respect of the three years ended 31st October, 1954, on its issued share capital were as follows:—

Year Ended.	Share Capital	Dividends.	
		Rate	Amount
			Rs.
31-10-1952	2,400 Ordinary Shares of Rs. 500/- each.	13%	1,56,000
31-10-1953	2,400 Ordinary Shares of Rs. 500/- each.	14%	1,68,000
31-10-1954	3,000 Ordinary Shares of Rs. 500/- each.	28.6%	4,29,000

"The above dividends were paid free of tax and were paid out of current profits.

PROSPECTS

The trading results of Mahindra & Mahindra Ltd., for the last three years ended 31st October, 1954, reflect the increase in the volume of sales, particularly of Jeeps, Steel and Trailers:—

TURNOVER:—

		1951-1952	1952-1953	1953-1954	six months 1-11-1954— 30-4-1955 appr.
Jeeps & Spares	Rs. 99,58,759		1,02,46,712	1,54,63,023	1,43,42,620
Tractors & Spares	—		1,37,759	14,98,110	7,71,714
Trailers	2,27,094		6,23,676	11,09,833	7,54,662
Steel	29,43,087		1,22,55,852	1,20,87,232	84,47,991

On the basis of the Auditors' report the earnings also show a steady increase over the last three years. It should be added that dividend policy in the past has been confined strictly to the declaration of the minimum distribution permissible under Section 23A of the Income Tax Act. Projects for development and expansion now in hand should on completion, prove of benefit to the Company hereafter. While the progressive manufacture of Jeeps to be completed by 1958 is geared to the initial production output of 2500

units annually, it is probable that the market in India will expand to a level demanding more than 2500 units a year. As Government has agreed to issue import licences to the Company up to 2500 units a year during the three-year manufacturing period, it is hoped that the offtake of Jeeps will, from 1955, show an increase every year. Proforma Profit & Loss account for the six months ended 30th April 1955 has been prepared and is summarised as follows:—

"Statement of Profits for 6 months to 30th April, 1955.

INCOME		EXPENDITURE	
Sales	Rs. 2,45,67,317	Cost of Sales	Rs. 2,16,51,524
Commissions	1,50,550	Salaries & Wages	9,47,263
Managing Agency Allowances	18,000	Expenses	10,48,417
From Investment	12,458	Depreciation	51,980
Interest	278		
Miscellaneous	70,813		
Total	Rs. 2,48,19,416	Total	Rs. 2,36,99,184

Profit before taxation Rs. 11,20,232.

During the six months of the current year (November 1954—April 1955) about 1100 Jeeps have been sold as against 1600 units in the whole year (Nov. 1953—31st Oct. 1954). For the year ended 31st October 1954, the net profit amounted to Rs. 6,73,346/- after providing for depreciation and taxation. Allowing for a dividend of Rs. 1,50,000/- on cumulative preference shares of the value of Rs. 25 lakhs, the balance net of Rs. 5,23,346/- from 1953-54 profits without taking into account the results of earnings from sales of larger number of Jeeps and increase in turnover of Trailers, Steel, Tractors, etc., would be sufficient to pay a dividend of over 9% free of tax on the proposed ordinary share capital of Rs. 55 lakhs. The proforma accounts for the six months ended 30th April 1955 reveal even a better position and if the rest of the Company's current year yields similar results there would be sufficient to pay a dividend of more than 10% free of tax on the ordinary share capital for the current year.

It is accordingly anticipated that the Company will be able to distribute a dividend of 10% free of tax on the ordinary share capital of the Company. This rate of return is specifically referred to herein for ready reference and should not be construed as a definite indication that such a dividend will in fact be declared as it is obvious that the Company's dividend paying capacity hereafter must be contingent on the profits actually made which, in their turn, are naturally liable to be affected by conditions ruling at the time.

GENERAL INFORMATION

The minimum amount upon which the Directors will proceed to allotment is Rs. 40 lakhs.

Until the 15th day of June 1955 the Company was a private Company with its issued capital consisting of Ordinary Shares of Rs. 500/- each and employee Ordinary Shares (Series "B") of Rs. 10/- each. The Company had by that date an issued capital of the face value of Rs.

THE ECONOMIC WEEKLY

16,68,090/- all of which had been paid for in cash. On that date the Ordinary Shares of Rs. 500/- each were sub-divided into shares of Rs. 10/- and the entire issued capital was thus made up of shares of Rs. 10/- each. The Company also by then had reserves which were on that date capitalised and 1,66,809 fully paid up Ordinary Shares of Rs. 10/- each of the total value of Rs. 16,68,090 were issued to the then existing shareholders pursuant to the agreement dated 25th April, 1955. The said fully paid up Ordinary Shares were issued as capital distribution and in consideration inter alia of the shareholders agreeing to the conversion into a public company. It is intended to replace a minimum of Rs. 3,50,000/- of the reserves so capitalised out of the profits of the current year. The physical assets and stocks of the Company have been conservatively valued.

COMMISSION AND DISCOUNT

Apart from brokerage hereinafter mentioned, no amount has been paid by the Company at any time or is payable as commission for subscribing or agreeing to subscribe or procuring or agreeing to procure subscription for any shares in or debentures of the Company or as discount in respect of the Shares issued. No amount has at any time been paid by the Company or is intended to be paid by the Company to any promoter.

DIRECTORS AND MANAGEMENT

There are to be no Managing Agents. There is also no contract as to the appointment of Managing Agents. The Company has not issued any founders or management or deferred shares with any special interest in the property or profits of the Company. No restrictions are imposed by the Articles of Association on the Directors' powers of management and the control of the Company's affairs is vested in the Directors.

Hitherto approximately 90% of the issued share capital of the Company has been held by the Directors.

The Chairman of the Company, Mr. K. C. Mahindra, is under an agreement dated 11th day of August 1954 to serve the Company in an honorary capacity for five years during which he is to receive no salary and the Company has only to meet his travelling and other expenses while on business as therein provided. Messrs. Keshub Mahindra, Harish Mahindra and Alope Mitra

THE ECONOMIC WEEKLY

act as executive Directors, under five years service agreement entered into by them with the Company.

The Company has no Manager as defined in the Indian Companies Act.

VOTING RIGHTS

The Redeemable Cumulative Preference Shares confer the right to attend and speak at General Meetings of the Company but not any right to vote except when—

- the Preference Dividends' is passed over in any year or has remained in arrears for more than six months from the date it is declared; or
- any Resolution affecting the rights, privileges or interests of the Preference Shareholders is proposed; or
- any resolution for the winding-up of the Company is proposed.

No member entitled to be present or vote either personally or by proxy or as proxy for another member at any general meeting or upon a poll or to be reckoned in a quorum

whilst any call or other sum is due and payable to the Company in respect of any of the shares of such members.

Upon a show of hands, every member entitled to vote and present in person, or being a Company present by a representative duly authorised as provided in Article 90, has one vote. Upon a poll, every member entitled to vote and present in person (including a Company present by a duly authorised representative) or by proxy has—

- One vote in respect of every Ordinary Share.
- Ten votes in respect of every Redeemable Cumulative Preference Share.

RESTRICTIONS ON RIGHT TO TRANSFER

The Directors, without assigning any reason for such refusal, may decline to register any transfer of shares.

UNDERWRITING

The issue is not being underwritten.

BROKERAGE

A brokerage of 1% on Preference Shares and four annas per share on Ordinary Shares will be paid on receipt of allotment money in respect of applications from the public bearing the stamp of a recognised Stock Broker.

APPLICATION FOR SHARES

Application for shares from the public will only be received on the footing of the formal Prospectus and on forms issued therewith by the Company and these may be obtained from the Registered Office of the Company at Gateway Building, Apollo Bunder, Bombay, or from its branch offices at Calcutta, New Delhi and Madras; or from Batlivala & Karani, New Union Bank Building, Dalal Street, Bombay; Lewis & Jones, Bank of Baroda Building, Apollo Street, Bombay; Place Siddons & Gough, 6, Lyons Range, Calcutta; Dalal & Co., National Insurance Building, P.B. 149, Madras.

Application forms can also be obtained from branches of Lloyds Bank Ltd., at Bombay, Calcutta, Delhi and Madras.

East Africa's Future

(From Our London Correspondent)

THE massive report of the East African Royal Commission will certainly rank high among the standard reference works on colonial economic and social conditions. The document, nearly five hundred pages in length, has an incisiveness and a clarity which make it all the more remarkable when account is taken of the extreme complexity of the problems which fell within its terms of reference. The commission was appointed in January 1953 to examine inter-alia the problems of "tribal land tenure" and the conditions necessary to "achieve an improved standard of living" in the three British territories of Kenya, Uganda and Tanganyika. Its members under the chairmanship of a former Indian provincial governor included two well-known economists, two colonial administrators, a business man and an African member of the Tanganyika Executive Council.

To the Commission the one all-pervading fact which continues to condition life and labour in the three territories and particularly in Kenya is the intense poverty of the people. To remove this poverty it is first necessary to ascertain its causes and hence something like half the report is devoted to a closely reasoned analysis of the problems of economic and social development in a colonial environment. But in doing so, the Commission appears to have got itself ensnared in its own intricate analysis. The prime cause of poverty in the three territories concerned is more marked when the colonies possess an established European settler population who have been able to set themselves up as the ruling community enjoying particular economic and social privileges.

Cause of Poverty—Colonialism

The history of the Union of South Africa and the current developments in the newly established Central African Federation show up this point with tragic clarity. The conditions which prevail in each of the territories covered by the Commission are not uniform. Uganda has been less invaded by European settlers than Kenya, and according to the data compiled by the Commission, Uganda enjoys a per capita income higher than Kenya. The Commission does not recognise this crucial factor though it must be said

that its references to the British policy of deliberate encouragement of European settlement in the matter of distribution of land in Kenya is pregnant with the above implications.

According to the Commission, there are factors which have had the greatest influence in determining the fate of Kenya today. These are the building of the strategic railway through the heart of the territory; the adoption of a deliberate policy to encourage European settlement and the consequent establishment of European and African land reservations; and finally, the influence of the European settler community on the official policy of the Colonial authorities. In Uganda, however, the Commission seems satisfied that among other things, the absence of the European settler and the "development of African grown cash crops" have been the most potent factors affecting the evolution of the Protectorate. Similarly in Tanganyika the absence of "White Highlands" and "tribal land reserves" policy have been contributory factors for the relative tranquillity in that region.

Enlargement of Market Economy

The cause of poverty in the three territories, according to the analysis of the Commission, is the absence, over a wide area, of that type of activity which is conducive to the enlargement of the market economy. Indeed, in many parts of the territories, the African is wholly concerned with a subsistence form of agriculture obtaining, in the course of this, his security from the tolerations afforded in tribal custom and law. In such a situation, the impact of the white settler class was directly towards fostering what economists in a similar context have termed the "demonstration effect"—leading on the one hand to a gradual breaking-up of tribal institutions, and on the other, to the growth of insecurity (particularly in regard to land tenure) in view of the passing away of the protective virtues found in tribal customs. The African's reaction to the shake-up has been two-fold. He has sought to have one foot on the market economy (by selling his labour to the urban trader or to the white plantation owner) and to maintain the other foot in his tribe (by continuing to secure tenancy of

a piece of land in the native reserves). Secondly, the African's "failure" to compete with the white inhabitant of his country in agriculture and in all other economic activities has bred frustration and bitterness leading to violent outbursts for "more land".

Land Need vs. Land Use

The cry for more land—which is the crux of the present problem in Kenya—is examined by the Commission with an academic aloofness which will certainly make it exceedingly difficult for the African to appreciate or to agree with its findings. The difficulty is likely to be greater when account is taken of the climatic conditions and the fertility of the soil of the regions occupied by the African and the European settler respectively. The Commission put the matter as follows:

"The test of land needs must be replaced by a test of land use. The economic security of the society no longer depends on the subsistence which each individual attempts in isolation to wring from the environment...but on the combination of the highly specialized efforts of the community as a whole."

According to this analysis, the African suggestion that the land reserved for them by law, apart from being denuded by continued cultivation over centuries, is incapable of supporting the growing African population, is based on fallacious reasoning. This is certainly the most crucial aspect of the whole report of the Commission.

The meaning of this analysis is clear. It exonerates the encroachment of African lands officially allowed under various land alienation measures in the past. These land alienation measures, in the course of time, have led to the reservation of the whole of the rich and fertile "Highland" region of Kenya for the occupation and ownership of the European settlers. The entry of Africans to these Highlands has been made dependent on the demands of the European planter for cheap unskilled labour and where Africans have squatted on the Highlands as peasant labourers, the Colonial authorities have provided legal means for their eviction at the behest of

the European planter. To this the Commission has lent its support and there can be little doubt that by justifying such a system through the new "test", the Africans in Kenya will have small hope of ever regaining their lands in the Highlands or of improving their standards of living in their own reserved areas where the trend of population growth bids fair to fulfil the Malthusian prophecy in the immediate future.

The application of a new "test" in land distribution must lead to some recommendations—that was the purpose for setting up the Commission. And the Commission has not failed in this purpose. Its recommendation in regard to land follows most logically from the above analysis that the authorities scrap the whole system of "land reservations" for each

of the two races and allow the free purchase and sale of land in the manner and form prevalent in the Western world. Policy should aim at making land ownership individual—private ownership should replace the prevailing system of tribal tenure. In this way, solid economic foundations would be laid for the "role of the African in the territories" concerned. The application of the text-book economic analysis to the African scene thus reaches its climax in the Commission's report. The fact that it is the European who is the main owner of wealth, who by virtue of various privileges granted to him in the past has been able to accumulate capital and finally, the Commission's assertion that the African has risen little above that of being an unskilled

labourer have serious implications for this recommendation. It can mean that the scrapping of tribal land ownership in one fell swoop will reduce the African to the permanent position of a landless labourer. And this is what is taking place in the Union of South Africa.

Your correspondent has not cared to review the other recommendations of the Commission in view of their secondary character. The African land question is the crucial one and the work of the Commission in this regard can hardly be regarded as contributing to a workable solution to what is an intractable problem. On the contrary, the Commission's recommendations are likely to arouse the most serious suspicions of the African people and so worsen racial tension in East Africa.

How banking serves the CASHEW-NUT INDUSTRY

Cashew-nuts were first introduced into India four centuries ago, but the organised industry is of recent growth. Already, however, it is second only to jute as a hard currency earner — exports being valued at 25 million dollars a year.

Seventy per cent of the total supply is grown in South Canara, Malabar, Cochin, Travancore and Goa. There is great scope for further expansion of the industry in South India, and banking will continue to play its part in its development. The facilities and guidance of a good bank, such as the availability of ready funds when needed, and the collection of dues in any part of the country, have become part of efficient organisation in every industry.

We at Palai are proud that so many important cashew-nut producers, and indeed leading firms in every field of business in South India, employ the complete banking service we offer:

Current Accounts — Demand Drafts —
Telegraphic Transfers — Investments —
Letters of Credit — Bill Collection —
Deposits — Loans & Overdrafts —
Confidential Credit Reports, etc.

If you have business interests in the South, it will pay you to open an account with us. Our 25 branches are strategically located, 23 in important South Indian business centres and two in Delhi and New Delhi; and we have correspondents in all important Indian cities. We offer a fully comprehensive banking service at each office.

Our clients can make deposits at any of our correspondent banks, and have the amounts credited to their accounts at any of our branches.

PALAI CENTRAL BANK LTD.

Head Office: PALAI, TRAVANCORE
Branches at: Madras, Cochin, Quilon,
Trivandrum, Madurai, Mangalore, Ban-
galore, etc. Also at: Delhi & New Delhi.

A LEADING BANK IN SOUTH INDIA

The British India General Insurance Company Ltd

Speech of the Chairman Sir Sultan M Chinoy J P

PRESIDING at the Thirtyfifth Annual General meeting of the Company held on June 30, 1955, Sir Sultan M Chinoy J P, chairman said: Gentlemen,

I have pleasure in welcoming you to this Thirtyfifth Annual General Meeting.

1954 was another difficult year for General Insurance as competition continued to be very acute, especially in the Non-tariff section, where the cutting-down of rates persisted during the period.

In the past I strongly advocated tax-free Reserve building in the General Department, and I am happy to note from the Taxation Enquiry Committee's report that the Committee has strongly recommended to the Government to allow the Insurer to build up such tax-free reserve to a certain limit, and, while this concession falls short of our requirements, it is in the interests of the trade that the Government should implement the recommendations made by the Committee.

While the Fire Losses in India, for 1954, continue to be within reasonable limits, the first half of 1955 shows a very steep rise in claims in India, due to numerous fires. With the reduction in premium rates, the Claims Ratio for 1955 will show a very steep rise.

Increased competition by rate-cutting still persisted in the Marine market, with no signs of abating. This is due to the fact that the Marine Insurance market is too large for the limited available business, with the obvious result that many accounts show a loss. War Risk Premium plays an important part in the Marine Account, and if this premium is eliminated from the account, the results will be still worse. With the rising tendency of cutting down the War Rate, the chances of making any profit in this Department are remote. Owing to the delay in the receipt of intimation and the time-lag in the settlement of claims, it is apparent that the Underwriters will be faced with the serious problem of several unprofitable years before an attempt is made to adjust the rates. I, therefore, once again request the Insurer to try and develop this class of business on a heal-

thier line and to see that the Department produces a reasonable profit rather than a loss.

Regarding the Motor Section of the Accident business, it is doubtful whether the rate increase is adequate to produce a reasonable profit; Third Party motor claims having shown a steep rise. However, the other sections of the Accident business show a reasonable return to produce a balanced account, yet it cannot be said that the results are satisfactory.

General Department

The Net Premium increased from Rs. 57,87,466/- to Rs. 61,32,177/-, i.e., Rs. 3,44,711/-.

The Fire Claims Ratio shows an improvement and now stands at 31.59% against 33.70%, but there is an increase in claims in the Marine and Accident Departments. The total claims paid and outstanding in all the three Departments gives a ratio of 37.63% as against 37.57% in the previous year.

The Reserve for Unexpired Risks, together with the additional Reserves created, amounts to Rs. 36,11,160/-, i.e., 58.89%, against Rs. 34,08,148/- last year—a strain of Rs. 2,03,012/-. The Gross Profit shown in the Profit & Loss Account is Rs. 6,06,274/- which works out to 9.89% of the Net Premium Income. The total funds now stand at Rs. 71,89,265/- in all Departments.

Fire Department

The Net Premium Income amounts to Rs. 33,56,350/-, and shows an increase of Rs. 79,779/-. Claims Paid and Outstanding cost us 31.59%, compared with 33.70% last year. The Profit transferred to the Profit & Loss Account was Rs. 3,70,504/-, i.e., 11.04% of the Net Premium Income. The Reserve now stands at Rs. 17,62,084/-, as against Rs. 17,20,200/- a strain of Rs. 41,884/-.

Marine Department

The Net Premium Income is increased by Rs. 73,476/-, and now stands at Rs. 6,87,386/-. With continued caution in underwriting it was possible to maintain the Loss Ratio at 56.74%. After providing a Reserve at Rs. 2,74,955/- (40%), the balance of Rs. 4,46,363/-, i.e., 64.94%, was carried to Additional Reserve.

Accident Department

The working of the Miscellaneous Insurance Department shows an increase in the Premium Income by Rs. 1,91,456/-, which now stands at Rs. 20,88,441/- as compared with Rs. 18,96,985/- last year.

The Claims Ratio in this Department is 41.05% as against 39.02% in 1953.

The Profit transferred to the Profit & Loss Account, after providing Reserve at Rs. 11,27,758/- (a strain of Rs. 84,416/- over last year) is Rs. 88,604/-.

Life Department

The Interest-yield in this Department continues to be satisfactory and now stands at 4.29% in the Closed Account and 3.43% in the Current Account.

Closed Account: This being a running-off account, no comment is necessary.

Current Account: The year 1954 is the eighth year of our working in the Life Current Department and, incidentally, our Valuation year, and I am glad that the results produced are satisfactory. The completed New Life business shows an increase by Rs. 25,81,000/- and now stands at Rs. 97,81,593/- with a consequent increase in the Premium Income of Rs. 2,49,260/-, which now stands at Rs. 12,24,156/-. Our Investments also show a substantial increase by Rs. 5,26,897/-, and stands at Rs. 21,13,953/-. Mortality dropped sharply to a lower level and, during the period under review, amounted to 30%. The Renewal Expense is now 18.93% as compared with 23.20% last year, which is quite satisfactory. The Life Fund stands at a figure of Rs. 24,91,736/-, giving an increase of Rs. 7,62,936/- over the previous year. The actual valuation of liability to Policy-holders is under preparation, but a rough valuation made on the same strict basis of 1951, i.e., at 2½% interest yield, indicates a substantial surplus, and a Bonus higher than that declared last year is expected to be declared when the final valuation is complete.

Profit & Loss Account and Profit & Loss Appropriation Account..

After crediting Rs. 1,75,788/- as interest, and transferring the profits from the Fire and Accident Revenue Accounts, the total account amounts to Rs. 6,58,143/-. After transferring Rs. 9,343/- to the Life (Closed) Account, and debiting Rs. 42,526/- as Expenses not charged to Other Accounts, Rs. 6,06,274/- were transferred to the Profit & Loss Appropriation Account.

Out of this amount, Rs. 2,15,000/- were provided for Taxation Reserve and Rs. 50,000/-, Rs. 25,000/-, Rs. 40,000/- and Rs. 5,000/- were set aside for General Reserve, Reserve for Equalisation of Dividend, Bad & Doubtful Debts Reserve and Exchange Reserve respectively. An amount of Rs. 82,500/- was also transferred to a Reserve called Contingency Reserve.

The balance of the Profit & Loss

Appropriation Account was Rs. 3,07,590/-, out of which your Directors recommend a Dividend of 11¼%, free of Income-tax, absorbing Rs. 2,25,000/- and a carry-forward of Rs. 82,590/-.

My thanks are due to our Agents, Field-workers and to all Officers and members of the staff, for their continued efforts and team-work for The Company.

The New India Assurance Company Limited

Mr Shroff on Nationalisation of Indian Insurance

THE following is the summary of the speech of the Chairman, Mr. A. D. Shroff at the Thirtysixth annual General Meeting of the Company held on June 29, 1955:—

"Insurance business is essentially international in character, and its free development depends on the promotion and maintenance of international peace", observed Mr. A. D. Shroff, addressing the 36th Annual General Meeting of the New India Assurance Co., Ltd. In this context, he referred to the easing of the international tensions, towards which India's Prime Minister had made a significant contribution.

Apprehensions of a major world recession have been fortunately set at rest, by a distinct upturn in the United States business activity. During 1954, the Governments of the U.K., the U.S., West Germany and a number of other countries continued the use of the flexible monetary weapon with a view to stabilising or stimulating activity. In the U.K., the policy of Incentive and Discipline followed by Mr. Butler has struck a responsive chord and the economy has gained a momentum, which, though occasionally hampered by labour troubles like rail and dock strikes, is unprecedented in recent British history.

Economic Policy

The picture of the national economy, in the 4th year of the First Five Year Plan, was generally one of sustained progress and overall stability. Mr. Shroff, however, referred to the shift in Government's economic policy towards a socialistic pattern of society, and deplored a possible further encroachment on the Private Sector, more so, when the Private Sector had fully vindicated itself as evidenced, among others, by a record rise in industrial and agricultural production, respectively, of the order of 40 and 20 per cent, during the First Four years of the Plan. He wished that the Industrial Policy Resolution of 1948 had been allowed to run its allotted span of 10 years.

The pattern of the price picture, as it had developed between pre-Korea and now, was disturbing. Mr. Shroff also referred to the rigidity of Government's monetary and in-

dustrial policies. For example, the money supply with the public had risen by only 6 per cent, during the last 5 years, as against the tremendous increase in industrial and trade activity. The unbalancing of price levels appeared to indicate a fundamental imbalance in the economy, particularly as the price parity between manufactured goods and primary products had been upset. Productivity, in manufactured goods, was the essence of the Problem. In this connection, Mr. Shroff drew Government's attention to the able plea made by Mr. J. R. D. Tata, while addressing the Annual General Meeting of the Tata Iron & Steel Co., in favour of rationalization.

Describing the Report of the Taxation Enquiry Commission as a "patchwork, in parts, which may do more harm than good", Mr. Shroff criticised those recommendations of the Report, which suggested a steep progressive increase in direct taxation and a ceiling on net personal incomes. Referring to a recent study of tax structures in various countries, Mr. Shroff pointed out the undue heavy load of tax on the upper middle income groups in India—the group on whom rests the sole responsibility of motivating the Private Sector. In view of Governmental policies, towards a reduction of taxes in the U.S., the U.K., Germany etc., the need for a more liberal taxation policy in this country stood out in market relief.

Nationalization Issue

The recent references to nationalization of Insurance Industry in India, in Government quarters and elsewhere, Mr. Shroff observed, cannot but harm the cause of Indian Insurance. An objective appraisal of the issues and stakes involved in the proposal to nationalize Insurance would require a consideration of the basic facets of the Industry. These are:

- (i) the social and economic purposes, underlining the proposal to nationalize;
- (ii) the adaptability of the industry to nationalize;
- (iii) the performance of the Indian Insurance Industry;
- (iv) the ability of the industry relatively to a state-owned one to fulfil the national ob-

jective of optimum production, and

- (v) experiences of other countries, in regard to nationalization.

Underlining these vital questions, were the two requisites of successful conduct of insurance business, namely,

- (i) the creation and stimulation of the insurance habit, and
- (ii) the building of a vast field force.

Discussing the two main classes of Insurance, namely, general insurance and life assurance, Mr. Shroff said that general insurance business is highly complex, technical and essentially international in character, and, as such, was the least amenable to nationalization. It was a necessary adjunct of free and active foreign trading. Servicing and prompt settlement of claims were the hallmarks of success of private general Insurance. Indian general insurers have succeeded in planting their flag in as many as 50 countries, earning a net premia of about Rs. 7½ crores in respect of foreign risks, as against Rs. 7 crores in respect of risks situated in India. Nationalization of General Insurance will greatly prejudice the position of Indian Insurers abroad. In this context, Mr. Shroff also referred to the British Labour Party's proposal, in 1949, to nationalize Industrial Assurance, which the party was obliged to revise, possibly because of complexities involved in general insurance.

Life Assurance, although mainly domestic, bristled with problems equally complex and basic. The Life Assurance coverage sold to the public was essentially a personal one; and tailor-made, to fit individual requirements. The product Life Assurance sold was an intangible one future security. Further, in India, Insurers have to combat against negative factors like, ignorance, lack of thrift and lack of insurance habit.

Government's Experience Discouraging

Governmental essays in nationalization, such as the Postal Life Assurance, had a comparatively poor record. For example, in the case of the U. K., the Postal Life Assurance

had to be closed down in 1928 because of poor volume of business. Governmental efforts in numerous other countries, where State Insurance has been tried, have not succeeded, because State enterprises sell only security, and not both security and service.

A further argument against nationalisation of insurance is that it was essentially a co-operative institution, where 92½ per cent of profits were passed on to policyholders. Thus, private insurance came very much close to a nationalized one.

The case against nationalization is strengthened by achievements of Indian Insurers, which were most encouraging. Their business turnover, since the war, compared favourably with that in the U.K., the U.S.A., Canada and other highly developed countries. On the other hand, the Indian Postal Life Assurance had increased its business only by 16 per cent during the decade ended 1952, as against an increase of 214 per cent in the Life Insurance business of Indian Insurers.

Most important of all is the fact that Indian Life Assurance Companies were rapidly expanding their business in foreign countries, their premium income from outside India having increased 3 times during the period 1946-53. No other industry, in the country, possessed as effective technical know-how as the Indian Insurance. The foreign associates of Indian Companies have freely drawn on the technical know-how acquired by Indian Insurers, with the result that a tremendous amount of goodwill exists for Indian Companies abroad.

Private Insurance Sound

In view of such remarkable achievements, the Indian Insurance Companies are well poised for fulfilling bigger objectives, which await them. Our calculations show that a huge life business potential of the order of Rs. 8,000 crores exists in the country. Substantial as our progress is, it is nothing compared to that in more advanced countries. The per capita Life Assurance in India is Rs. 25 against Rs. 8,365 in the United States; Rs. 6,647 in Canada; Rs. 1,840 in the United Kingdom; and Rs. 327 in the United States. The Per Capita Life Assurance in India is Rs. 25 against Rs. 8,365 in the United States; Rs. 6,647 in Canada; Rs. 1,840 in the United Kingdom; and Rs. 2,544 in Australia. The total Life Assurance business in force in India is less than

10 per cent of the national income, as against 95 per cent in the United States; 108 per cent in Canada; 51 per cent in the United Kingdom; and 47 per cent in Australia. The target of Rs. 8,000 crores to be achieved in 10 years' time, would mean only a policy of Rs. 1,000 per family, or a premium of about Rs. 50 per year, per family.

In the light of these facts, Mr. Shroff requested Government to consider, whether they would be in a position to measure up to such potentialities, particularly in view of their commitments under the Five Year Plan.

In spite of the above arguments, Mr. Shroff added, if Government are still of the opinion that State-owned enterprises are necessary for the fulfilment of the national objectives, then a better course for them would be to start new State-owned units. This suggestion was in no way a challenge to the State, but fitted in well with Government's declared policy of not disrupting the existing successful units through nationalization as in the case of the Steel Industry.

New India's Record

Reviewing the results of New India's operation during 1953, Mr. Shroff observed that the total premiums earned by the Company in the General and Life Departments reached a new high level which is a little short of Rs. 10 crores. Out of this, the premiums in the General Department amounted to Rs. 4.37 crores—an increase of Rs. 47 lacs over 1953, and the profit inclusive of interest earnings at Rs. 34.1 lacs were 7.8 per cent of the premium income.

Progress in the Life Department has been phenomenal. Net sums assured during the year amounted to Rs. 43.42 crores showing an increase of Rs. 23.51 crores over the business for 1953. From 1st March 1954 Life Premium rates were reduced by New India which stimulated a large demand for life assurance. The total premium income during the year amounted to Rs. 5.62 crores and the interest income net of tax Rs. 78.5 lacs.

The Triennial Valuation Report ending 31st December 1953 shows a handsome surplus of Rs. 1.57 crores from which Rs. 11.6 lacs has been credited to Shareholders' Account. A bonus of Rs. 14 per thousand on Endowment Assurance and Rs. 16 on Whole Life Assurance was declared during the year. Policyholders can

look forward to still higher bonuses if the present rate of progress continues.

The Life Department celebrated its Silver Jubilee during the year. Sir Benegal Ram Rau presided at the celebration which coincided with the opening of the new Administrative Office Building at Vile Parle.

The Board recommended a dividend of Rs. 2½ per share after making adequate provision for taxation and other reserves. The total funds of the Company now stand at Rs. 30.58 crores. Mr. Shroff expressed the hope that the shareholders will approve the conservative policy of the Directors in order to provide increasing security to the widening clientele.

Since the publication of the Report, he added, the Company has acquired a controlling interest in Bombay Fire and General Insurance Co., Ltd., which is expected to widen our activities and connections.

India's Tea- India's Wealth

EXPORT:
During 1954 India exported 450 million pounds of tea. This is more than 2/3 of her total production. Exports were directed to Great Britain, United States, Eire, Canada, Egypt, Continental ports, Turkey, Sudan, Australia, New Zealand, Iran and other countries.

No other drink refreshes you so much, yet costs so little as TEA

Handicrafts: Not for Export Only

Sankho Chaudhuri

THE problem of artistic handicrafts is to give to the craftsmen better wages and find out how many more people can be absorbed by the existing crafts, what the possibilities are for new crafts to develop to meet our demands and what new uses can be found for those old art forms which have become obsolete due to changing conditions of life.

The first step, then, would be to undertake a survey of these crafts and find out how many persons are employed by each craft and its branches, what their average earnings are etc., who the normal purchasing agents are, whether it is possible to substitute these agencies by Government, or co-operative agencies. This is not an easy task, but I wonder if an attempt has been made along these lines. We have not so far known of any such venture, and our knowledge of crafts is still very much dependent on Birdwood's *Artistic Handicrafts*, or T. N. Banerji's book on the subject.

We should also make up our mind as to whether we want these crafts to be perpetually dependent on foreign export, or whether they should satisfy our needs first. I mean whether we should try to educate the craftsman about our present needs (changed fashion and taste) and educate our people about the right type of thing to purchase and so on.

I do not think any artist can live without getting any response from his own society, always looking outside for inspiration and appreciation. It would be unfair to the artist to put him in this plight and his condition will be pathetic indeed. The Japanese curio export industry or the pseudo-Egyptian stamped leather goods sold in Suez and Port Said are glaring examples of this sordid state of affairs. We have seen partly this very unfortunate thing happen in a more dishonest manner in Kashmir where the cottage industries products exported include negro heads and Javanese boatmen and so on. If the products are normally those that are to be consumed at home, the patterns and designs should be adapted or changed as to suit our changing taste. When I say this, I certainly do not mean the cheap imitation of imported goods as is being done in some parts such as clay copies of Japanese cellu-

loid dolls in Kalighat or plastic goods turned out in Bombay.

This will naturally bring us to the function of the existing crafts and technical schools like those in Jaipur, Lucknow, Trivandrum, Bombay and Calcutta.

The function of these schools should not be to turn out half-baked craftsmen, to lower the standard of skill and beauty, and add to the pressure on these traditional crafts, when already it is a problem for the existing craftsmen to make a living. These crafts centres should provide laboratory facilities to the traditional craftsmen, where a refresher course in drawing, painting, and the elements and principles of designing would improve the general taste of the craftsmen so that they can learn how many of our old art forms are obsolete and how many can be remodelled to suit our taste. Nowadays craftsmen cannot afford to neglect the use of up-to-date implements to turn out better work in a shorter time, so that well finished products can be put up on the market which will not be prohibitive in price. The use of electric tools, wherever power is available, should not be discouraged.

Thus our own traditional craftsman will come back re-orientated from the craft centres better equipped to get adjusted to our society, and will feel less helpless. Today in order to meet the demand for cheaper goods he is compelled to turn out ten articles a day of indifferent quality to be able to make a living.

It is well known that our art pattern is not realistic. It is the quaint abstract quality in our design, which without being purely geometrical (like Arabic or Islamic) portrays all nature such as flowers, birds, animals or human figures in delightful adaptations. It is this quality that is appreciated by our 'cultured' or sophisticated sections and by the foreigners alike. Indian toys thus become unique in quality that is not realistic by any standards.

It was when the British administrators in the old days wanted to send out 'models' of projects etc., that a fashion started in Calcutta, Lucknow and elsewhere to make realistic dolls, and strangely enough, colonies grew up at these places of

craftsmen who drifted to the realistic fashion, who at times spoiled the character of Indian art products. According to us, their work lacks the 'toy quality' as we understand it. If we have centres to utilise their talents—and we teach them elements of architecture—they can be very useful in turning out models of dams, and other constructions, etc., which are nowadays so much in demand. It is in such utility products that their skill may be best employed.

Emporiums can be started in towns and big village centres for two purposes. First to display a collection of good specimens of artistic crafts, so that their function will be that of museums, where the craftsman can get an idea of what his brother artist is doing in other parts, and will be inspired to keep up his own standard. And second, these emporiums can work as purchase centres of the local crafts. It would be ideal if these emporiums could be manned and managed by co-operatives of craftsmen, thus eliminating middlemen who are not art-minded and whose only aim is to make money and sell anything that has a possibility for sale and profit. Why I say this is because in Banaras or Jaipur the craftsmen are just employees of business men, or get advances from them on the promise of supplying any quality and design the business men ask for. If you go and ask them why the colour they use is becoming so loud and cheap, why they are taking to 'filmi' design and abandoning the rich designs of olden days, invariably the reply would be that their 'sheths' want it that way. If you ask the 'sheth', he will tell you that no other design sells these days. I know many customers who have resigned themselves to the debased taste of the age and say, 'one has to be satisfied with whatever one gets'.

There is another aspect of purchase worth taking note of. The purchase organization should avoid buying from one party or individual beyond a certain amount or else these people will either turn middle men, give up their work, collect from others and take their commission, or their tendency will be to recruit some of their own people or raw people, and set up a small pro-

prietary concern. Either way, the purpose of cottage industry, better distribution of money and employment will be defeated. While discussing purchase it will not be out of place to warn about the Government procedure in the matter of purchase or sale. Quite a few craftsmen refuse to sell to Government Emporiums, because of their lack of men and time to turn up at the headquarters at least half-a-dozen times before they realize the money. This may be an exaggerated fear, but is not unlikely to happen.

If a proper survey is carried out and facts gathered about the existing centres of our old crafts, it will be found that many crafts which existed in the late 18th century and which Sir John Bird Wood mentioned, do not exist any more, such as wood carving in Ahmedabad or Gujarat and lacquered work in Surat or leather parchment vases and flasks in Jodhpur or pottery in Ranigunj etc. We can then find out what new centres can be added to supply our present-day need.

But before that, we must divide categories of artistic handicrafts also. There are some which are necessary articles, essentially utilitarian in character, and there is a demand for them. There the question of improving design would mean reaching a new class of people for sale or appreciation.

In this class come woven textiles (the most well known and most advertised Indian handicraft known) and 'mat making', and to a smaller extent, pottery. Mats serve mostly a local demand all over South India and East India but the demand for artistic mats is extremely limited.

Pottery comes next. The demand for pottery is local, as it is not easy to transport; and as the need is very special and elementary, the scope for improving shapes or extending the market is also very limited. If we want more people to be absorbed in pottery, we have to find out articles which can be made in clay, which are not so far made in clay. Making of flower pots, jars and tea pots on a large scale is also not possible, except near big towns where there is a demand for such things.

If we look into old records or the museums, we will find that once there existed centres of artistic pottery which have ceased to produce anything today. This is particularly noticeable in the north, and the place of such pottery is taken by metal

ware, and particularly by aluminium vessels and containers. When a country is industrialized and the use of metal ware is gradually withdrawn from daily life, only pottery can fill its place, but this has to be glazed earthenware or stoneware articles. Therefore, there is a future for this industry near good clay deposits in Gujarat or Moonghyr or Raniganj. Glazed pottery on a cottage industry scale is not feasible in this country because of the huge outlay of money needed for erecting kilns for baking. If co-operative kilns are set up, and more centres like Kharapur in Belgaum are opened, there is scope for more people taking to this ceramic industry, so far most neglected, and almost extinct, excepting on a curio manufacture level at Jaipur or Khurja. Here, however, only artistic pottery can survive; otherwise there will be a clash with commercial factories which produce on a mass scale. High tariff and restriction on imported chinaware will also be necessary.

Toymaking has been a spare-time activity of the potters and carvers. Indian potters do not ply the wheel during the monsoon and their women folk utilize their idle time for making toys. Plastic toys made in imitation are a real enemy of the toymaker and are bound to lower their taste. It is as necessary to control imports as to discourage factory production of toys.

The time has come when the manufacture of gods and goddesses should be substituted by 'playthings' for children and in this direction, the proposal for a 'Dolls' centre' will not be an unworthy experiment.

The success of handicrafts in the last analysis, however, will depend on our ability to combine utility with art and to make art a vital part of our life, something to live with, and not admire from a distance.

Wood carving flourished in Gujarat and Nepal not because there was a great demand for wooden figures, but because wood was used as a building material, and hundreds of carpenters found employment in a city, and some of them in spare time utilized their leisure in work that pleased them. These carvings won the admiration of the persons building the houses, and thus we find beautiful carved grills, doors, balconies etc.

If cast iron railings are used today in cement buildings, we can try and substitute them with wrought

iron railings or grills, thus finding new use for skill and encouraging better taste.

If people only think how many of the daily household articles can be made better and more tastefully than the mass manufactured goods sold in towns, there will be always scope for an artisan to come in and do something, adding variety to the monotony of life and jobs for the needy and deserving.

While on the subject of jobs, it may not perhaps be out of place to stress that the employment potential of handicrafts is about the lowest among the cottage industries. So, if we are to revive handicrafts, attention has to be paid to designs, training and organisation on the lines discussed above, irrespective of the employment opportunities that may result from developmental efforts. This is to say that Shri K. C. Reddy was clearly quite off the rail in talking only of employment, when addressing the Handicrafts Board.

Company Notes

Industrial & Prudential

THE working results of the Industrial and Prudential Assurance Company for the year ending 31st December 1954, show considerable improvement in the business transacted: out of the proposals valued at Rs. 5.28 crores received during the year, proposals amounting to Rs. 4.59 crores resulted into policies, the corresponding value of policies for 1953 being Rs. 3 crores. The aggregate value of life business in force at the end of 1954 was Rs. 23.72 crores, out of which reinsurances accounted for Rs. 1.94 crores.

There has been a slight increase in claims by death paid and outstanding at the end of the year at Rs. 12.18 lakhs against Rs. 11.38 lakhs in 1953; claims by maturity similarly rose from Rs. 31.28 lakhs to Rs. 34.57 lakhs.

Premium income of the company increased from Rs. 108 lakhs in 1953 to Rs. 115 lakhs at the end of the year under review; but the expense ratio has gone up from 25.8 per cent to 28.6 per cent of premium income during the same period.

The total investments of the company valued at cost at the end of 1954 amounted to Rs. 5.18 crores, out of which Government and approved securities accounted for Rs. 3.37 crores. Their value at market price amounted to Rs. 4.93 crores, showing a depreciation of Rs. 25 lakhs. But this is adequately covered by the Reserve for depreciation on Investments which stands at Rs. 35.82 lakhs.

The directors have recommended the payment of a dividend of Rs. 2-4 per share of Rs. 50 (Rs. 6 called up) for 1954, out of the shareholders' dividend reserve fund.

Western India Life

THE Western India Life Insurance has been improving its business from year to year and the new business written by the company during 1954 totalling Rs. 4.06 crores is a remarkable advance on Rs. 2.76 crores in the previous year. Claims paid including outstandings, during the year under report, amounted to Rs. 32 lakhs, the experience of the company in regard to death claims being quite satisfactory. Life assurance Fund at the end of the year is placed at Rs. 6.96 crores. The gross expense ratio of the company for 1954, is estimated at 25.8 per cent of premium income, and is regarded

as satisfactory and compares favourably with the experience of other companies.

The market value of the investments of the company at the end of 1954, amounted to Rs. 5.77 crores as against the book value of Rs. 5.89 crores, showing a depreciation of Rs. 12.8 lakhs, but this has been fully covered by the Investment Reserve Fund which stood at Rs. 16 lakhs at the end of 1953.

The Directors of the Company have recommended the payment of dividend of Rs. 25 per share of Rs. 100 (Rs. 50 called up) free of income tax, out of the Dividend Equalisation Reserve.

Of the two subsidiary concerns in which the company held interest, viz.

UNIVERSAL Fire & General Insurance Co., Ltd.

(Estd. 1919)

H. O.:—Universal Building,
Sir P. Mehta Road,
BOMBAY.

Managing Director:—
I. U. PATEL B.A.

Chairman:—
P. U. PATEL
B.A., B.Com., (Lond.)

Western India Trustee and Executor Company Ltd. and Vima Mudrak and Prakashak Ltd., the latter ceased to be a subsidiary during the year under review. The other subsidiary has been doing good business and has declared a 4 per cent dividend for 1954.

Bombay Co-operative

THE twenty-fifth annual report and balance sheet and accounts of the Bombay Co-operative Insurance society for the year 1954, reveal satisfactory progress in its business. The society has written new business valued at Rs. 1.10 crores compared to Rs. 0.86 crores in the previous year. The total life business in force at the end of the year under review amounted to Rs. 5.64 crores, of which Rs. 20.07 lakhs are re-insurances.

Claims paid, including outstanding, during the year under review amounted to Rs. 7.5 lakhs, as against Rs. 6.73 lakhs in the previous year. Mortality experience has been showing improvement, and of the claims paid out in 1954, claims by death accounted for Rs. 1.8 lakhs as against the previous year's figure of Rs. 2.1 lakhs.

Premium income earned by the society in 1954 amounted to Rs. 29.27 lakhs, net of premium paid on business reinsured by the society. Overall expense ratio has shown a slight increase from 27.01 per cent to 27.14 per cent of net premium income at the end of the year, while the renewal expense ratio is more or less stable at about 13 per cent.

The directors of the society propose to declare bonus at the rate of Rs. 14-8-0 on endowment with profit policies and Rs. 17 on whole life with profit policies, as recommended by their Actuary.

British India General

DESPITE the fact that 1954 was a difficult year for Indian insurers and there was a reduction in the net profit earned by the British India General Insurance Co. Ltd., its working results, on the whole, continued to be satisfactory.

Net premium income of the Fire Department in 1954 amounted to Rs. 33.56 lakhs as against Rs. 32.76 lakhs in the previous year. Net losses paid and outstanding during the year amounted to Rs. 10.6 lakhs and formed about 31.6 per cent of premium income as against Rs. 11 lakhs during 1953. An interesting feature of the

claims experience is that most of the claims related to overseas business. Out of the commission earned by the Department, after meeting all expenses, an amount equal to 40 per cent of net premium was added to the Reserve for unexpired risks and Rs. 4.1 lakhs to additional Reserve. The balance of Rs. 3.7 lakhs was transferred to the company's profit and loss accounts, against about Rs. 3.8 lakhs in 1953.

The company earned Rs. 6.87 lakhs from its marine business in 1954, as against Rs. 6.1 lakhs in the previous year. Claims paid and claims outstanding at the end of the year amounted to Rs. 3.9 lakhs, and formed 56.7 per cent of premium income. After meeting all expenses, a sum equal to 40 per cent of the net premiums was allotted to reserve for unexpired risks, and the balance of Rs. 4.4 lakhs was carried to additional Reserve.

Net premiums in the Accident and General Department amounted to Rs. 20.88 lakhs as compared with Rs. 18.97 lakhs in the previous year. Net losses paid and outstanding amounted to Rs. 8.57 lakhs or 41 per cent of the premium income. After charging all expenses and providing Reserve for unexpired risk and additional Reserve, the balance of Rs. 88,604 is transferred to Profit and Loss Account.

In the Life Department, of the new proposals received during the year, valued at Rs. 1.17 crore, proposals amounting to Rs. 97.8 lakhs resulted in policies. The total Life business in force at the end of 1954 was Rs. 2.51 crores.

Net premium income earned by the Department was Rs. 12.24 lakhs, while net claims paid and outstanding amounted to Rs. 42,462. The life insurance fund at the end of the year under review stood at Rs. 24.92 lakhs, as against Rs. 17.3 lakhs in 1953.

Out of the profits of Rs. 6.06 lakhs earned by the company during the year, a sum of Rs. 2.15 lakhs has been provided for taxation, Rs. 1.82 lakhs has been transferred to Reserve for doubtful debts, Exchange Reserve etc. and Rs. 25,000 to the current account of the Life Department, and the company earned a net profit of Rs. 3.08 lakhs for the year 1954, as against Rs. 3.23 lakhs in the previous year.

The directors have recommended a dividend of 11½ per cent or Rs. 1-2-0 per share of Rs. 50 (Rs. 10 paid up) free of tax, as against 10 per cent in the previous year, which will

absorb Rs. 2.25 lakhs. The balance of Rs. 82,590 will be carried forward.

Indian Trade and General

THE Indian Trade and General Insurance Company Limited maintained its trend of continued progress in 1954 also, and set up a new record in the collection of net premium income in its three lines of business—Fire, Marine and General. The total premium income of the company in the year amounted to Rs. 57.1 lakhs, compared with Rs. 51.5 lakhs in 1953; and the increase in premium was uniformly distributed over the three departments. Earnings from interest and dividends, less tax, amounted to Rs. 1.87 lakhs, and the total income amounted to Rs. 58.99 lakhs. Against this, claims amounted to Rs. 29.03 lakhs, commission, expenses of management and foreign taxes to Rs. 2204 lakhs and other debits to Rs. 1.03 lakhs, leaving a balance of Rs. 6.88 lakhs. With the carry forward from the previous year, the credit balance amounted to Rs. 6.98 lakhs. Out of this amount, Rs. 5.57 lakhs or 97 per cent of premium income have been appropriated to reserve for unexpired risk and Rs. 34,169 to provision for taxation, leaving a balance of Rs. 1,07,211, out of which a sum of Rs. 90,000 is proposed to be paid out in dividend at the same rate of Rs. 1/8 per share of Rs. 100 (Rs. 40 paid up) as in the previous year.

In the working of the departments, particularly notable is the reduction of 6.9 per cent in the Claims Ratio at 39.5 in 1954, as compared

with the previous year, while the net premium income increased from Rs. 25.9 lakhs to Rs. 27.6 lakhs during the same period. The reduction in the loss ratio was due mainly to improvement in claims on the fire business underwritten in India.

The company's experience of marine business brings to light the kind of hazard that underwriting in this field has to face. The loss of three coastal vessels, among others, led to a sharp rise in the loss ratio from 53.6 per cent in the previous year to 60.1 per cent in 1954. This was barely compensated by a 2.5 per cent reduction in commission and expenses ratio, from 29.4 to 26.9 per cent. Considering the underwriting hazards of marine business, the rise in the loss ratio was not of much significance. A significant feature was the increase in the premium income abroad; that the company was able to increase its marine business elsewhere, while it was hard put to it to maintain its business in India, perhaps gives as good a measure as any of the intensity of competition in this field.

In contrast to the marine business, in miscellaneous insurance, foreign claims experience was unfavourable, and the loss ratio rose from 45.3 per cent in 1953 to 63.9 per cent in 1954 owing to heavy claims in certain overseas territories. The expense ratio, however, came down from 42.8 per cent to 39.9 per cent.

The increase in the premium income of all Departments of business has necessitated the strengthening

of reserves against unexpired risks, and the company has accordingly proposed an allocation of Rs. 5.5 lakhs out of the revenue for the year.

In the statement accompanying the accounts of the company, the Managing Director observes that the company has "emerged from a year, which has not been without its difficulties, with strengthened reserves". On this basis one could reasonably expect that the company bids fair to improve upon the current trend of business expansion.

New India

STILL further increases in Fire, Marine and Miscellaneous insurance business and a phenomenal rise in the new sums assured under life insurance policies are revealed in the accounts of the New India Insurance Co. Ltd., of Bombay (General Manager Mr. B. K. Shah, F.I.A.) for the year ended December 31, 1954. The increases are substantial and reflect great credit upon all those responsible for the progress at a time when so many extra difficulties have to be overcome in the quest for new business.

Around Calcutta Markets

JUNE was a good month for the Calcutta Stock Exchange. Throughout the month, equities moved up. Two developments helped the continuous improvement in equity values in the last month: Indian Iron, the most speculative scrip on the stock market here, resumed the upward journey. Strength in selected Engineering shares egged the market on to higher levels.

Cheaper money was contributory factor to the spurt in equities. This is a psychological influence which usually is in operation at this time of the year. Funds tied up in the financing of crops begin to be released at this time of the year. Money begins to flow from the countryside to the towns. Thus, more money becomes available to the money markets in the cities. In this week, there has been a decline in inter-bank money rates in both Calcutta and Bombay.

Even as the spurt in equities throughout June was not unexpected, the Government's loan announcement was also not unanticipated. It is traditional for New Delhi to enter the loan market as the slack season starts. Prospects for the new loan are bright. But the terms and con-

Record Life Business

The new life insurance business during the year reached an all time record figure of Rs. 43.42 crores as against Rs. 19.91 crores in 1953 and the life fund increased by Rs. 3.46 crores to Rs. 23.92 crores. Premium income increased from Rs. 4.74 crores in 1953 to Rs. 5.62 crores in 1954. Claims absorbed Rs. 84.82 lakhs while commission and expenses of management took Rs. 1.77 crores. The over-all expense ratio rose up to 31.9 per cent on account of substantial increase in the new business but renewal expense ratio registered a fall from 14.2 per cent in 1953 to 12.2 per cent in 1954. Total life insurance business in force at the close of the year stood at Rs. 125.29 crores.

General Insurance

There has been an all round increase in the premium income of the fire, miscellaneous and marine insurance business of the company while claims experience of these classes of business have been favourable in 1954. The total premium income from fire, miscellaneous and marine insurance business in 1954

amounted to Rs. 4.36 crores as against Rs. 3.89 crores in 1953. An increase of Rs. 46.9 lakhs under this head is more significant as it is secured in the face of changing economic and trading conditions in a year of falling prices and reductions in the rates of premiums. The table below shows premium incomes and claims ratios respectively of fire, miscellaneous and marine business of the company in the year under review.

	1954	
	Premium Rs. lakhs	Claims ratio ½
Fire Department	250.31	36.1
Miscellaneous Dept.	85.52	49.8
Marine Dept.	100.70	74.1
Total	436.53	

After meeting the expenses and claims and maintaining premium reserves for unexpired risks, a total sum of Rs. 44.72 lakhs was transferred to the Profit and Loss Accounts from general insurance business. A dividend at Rs. 2/8 per share was recommended as against Rs. 2 per share paid in 1953.

Spurt In Equities

Conditions of the new loan indicate that it is the intention of the Government to stabilise medium-term interest rates at assessed 3½ per cent. New Delhi's borrowing programme in the next five years is heavy. Even so, money is not to be made too cheap so as to curb the possible inflationary effects of public expenditure.

In recent years, loan floatations have had an adverse effect on equities. In the last two financial years, the Government's borrowing programme has been heavy due to enlarged deficit financing. Such heavy withdrawals tended to starve stock markets of funds. Due to earlier deficit financing, the resources of the money market and of the banking system have gradually increased. Besides, the net withdrawal of funds through the new cash-cum-conversion loan will be small. That is why, the loan floatation has not had any "bearish" effect on equities. It should not, however, be ignored that the Government's loan programme this year is heavy.

Indian Iron

Spurt in Indian Iron is mainly due to speculative factors. There is a considerable "short" interest in this

scrip. Those who sell "short" are rich speculators. Budla charges, in Calcutta, they call it "satta", are always in favour of sellers. Monied speculators thus find it profitable to sell "short" to earn interest. This operation is, of course, always subject to certain conditions. It cannot be carried on for long against the primary market trend. And if some "bulls" can secure the needed finance, they are able, more often than not, to squeeze "bears" out.

This is what is happening in Indian Iron now. Improvement in Tata Iron is helping the "bulls" to push prices up. "Bulls" are exploiting the situation quite well. Output at the Burnpur Works for the year to March last was higher than that of the previous year. Indian Iron's financial position is strong. There are rumours that the dividend will be raised. That remains to be seen. Last year, the Chairman informed the shareholders that the Company would be able to maintain dividend. From this, the market then concluded that the expected increase in profits would be utilised to service prior charges and to strengthen the reserves, and would not be frittered away in paying higher dividends.

Education Not For All

WHAT is the cost of sending all of India's children to school? To be able to answer this question, one has to know at what age children are to go to school and for how long. Is the school-going age to be 6 to 14 as in Western countries? Or as maturity comes earlier in the tropics, and as the luxury of longer schooling is possible only for the richer and colder countries, could the limit be 5 to 11? Taking the average period children are to be at school, one can work out the number of children in this age group. Assume the average cost per child to be so many rupees per annum—this, again, will depend on many things, among others, on the number of pupils to be put in charge of one teacher, and the salary scale for school teachers. One could work out on this basis the bare recurring cost of schooling. To this has to be added certain incidentals such as text books, if they are to be supplied free, and they have to be supplied free—and other expenses of running a school, besides the salary of school teachers. Add to this the capital cost of school buildings and the minimum of equipment, books, furniture, drawing boards, globes etc. which a school must have, and you get an idea of the cost of compulsory primary education, the attainment of which in 10 years, i.e. within the Second Five-Year Plan period, is one of the directives under the Constitution. The directive may not be mandatory, but it is there in the most precious document cherished by the nation which incorporates the aims and aspirations of a whole people. This directive will not be honoured in the specified time.

The directive, however, goes much beyond this. For it does not leave the school-leaving age to be decided according to convenience or the availability of funds. It expressly lays down that:

"The State shall endeavour to provide, within a period of ten years from the commencement of this Constitution, for free and compulsory education for all children until they complete the age of fourteen years."

So it is not free primary education alone that the State will have to provide, but also secondary education. Even this is not enough. For, another directive enjoins upon the State, "within the limits of its economic capacity and development" to make effective provision for securing, among other things, the right to education". In whatever manner one may interpret this directive, it cannot fall far short of making education free, and free up to the highest stage, for students who show proficiency for it. Free education does not mean free of college fees alone; maintenance of the student and all other expenses are obviously included. Though we are living in the midst of revolution and a professional cricketer has actually been admitted to associate membership of the M C C, some one has yet to come up through the educational ladder entirely at the expense of the State. When that happens perhaps politics and society will begin to have that leavening of the socialistic pattern that has been on everybody's lips. Education today, by and large, is reserved only for the privileged few, and it is becoming more and more expensive day by day. It is one of the striking paradoxes

of the time that despite the right of education granted to all and the directive for making primary education compulsory and free, notwithstanding the progressive adoption of Hindi as a matter of State policy, the queues waiting for admission to English medium schools keep on lengthening, and the demand for the most expensive schools daily grows more insistent while the standards of ordinary schools deteriorate. More of Bombay's school children are English speaking today than was the case 10 years ago. This may not be typical of the whole of India, but the rush for admission into English medium schools is an all India phenomenon.

First things, however, must come first, and we should at least know the cost of primary education, if it is to be made free and compulsory. No one seems to know for certain what it will be, for no round figure has been put up as a target to be attained in successive stages. The Education Ministry's scheme under the Second Five-Year Plan does not aim at more than ensuring that 75 per cent of the children between 6 and 11 may go to school (not putting the 75 per cent to school) as against the present provision for 50 per cent of this age group. In the secondary stage, for the age group of 11 to 14, provision is demanded in the Second Plan for 30 per cent of boys and girls to go to school by 1961 against the present 15 per cent. At this rate, in how many years will the directive be implemented in place of the 10 years time-limit set for it?

True, in putting the question like this, one may be accused of making simple things complex. Was not all this worked out in the Sargent scheme many years ago, even before the British left? But many things have happened since then, and educationists not only in India, but in other underdeveloped countries also have come to realise that on the ground of cost alone, if for no other reason, the type of primary and secondary education so far contemplated cannot be extended to cover even a substantial proportion of children of a particular age group, not to speak of all. Hence, educationists from Asian countries, who met in Bombay under the auspices of the UNESCO some years ago, seriously thought of looking into the alternative system of basic education.

Basic education has also been on everybody's lips. It keeps popping

up time and again in the Education Ministry's Plan. That Plan provides that of the additional elementary schools that will be set up under the Second Plan, 50 per cent will be basic schools.

So there it is, the complete picture. Like hand and household industries and factory production, the two must be reconciled to peaceful co-existence. Threat of displacement calls for a measure of protection for the cottage sector; in the case of basic education, who is to be protected from whom?

It was not the superiority of its educational theory however which commended basic education to other underdeveloped countries, but the mundane economics of it. Not many children can be put to the old type of school. Let them, then, have schooling in a manner which will equip them for life and yet not cost too much. It is finance which in the last analysis keeps down the pace since, as is always the case, there are more pressing demands on it.

Education figures in two ways in the Draft Plan-frame which has been accepted provisionally by Government. Among the general aims and objectives listed in Prof Mahalanobis's paper are the following:

"There must be a rapid increase in literacy, improvement in the pay of teachers and better organisation of education at all levels.

"On the basis of merit, able students, at all levels and in increasing numbers, must be provided with adequate living and educational expense to enable them to receive education up to the highest standard according to capacity without regard to sex, creed, caste, or social status of the parents. Special educational scholarships and facilities must also be provided for women and backward groups and communities."

Here is at long last the promise, if it can be implemented, of that evening which would be symbolic of a socialistic pattern of society. Going through the Education Ministry's Plan, one expects to come up on the same trail somewhere. But though Professor Kabir begins with the preamble that "at present educational opportunities are by and large dependent upon the economic status of the family" and goes on, inevitably, to recount the percentage of students at Oxford and Cambridge who are in receipt of public assistance, he does not seem to follow it up—not

at least in the newspaper reports of the Plan (the Press Information Bureau has not obliged us yet). On the contrary, he breaks off and goes on to the question of "improving the quality of education," for which "better organisation of education at all levels is necessary." Better training and improved conditions of service of teachers is rightly made the main prop for it. For colleges and universities, a three years' degree course to replace the present system of under-graduate teaching is the principal lever. This is going to engage the attention of the Education Ministry during the next Plan, in the course of which some of the existing intermediate colleges will be upgraded and others reduced to higher secondary schools. The promising student who should be able to come up to the top at State expense is forgotten somewhere in the midst of all this.

In the Plan-frame, education comes in in another way, this time not as one of the general aims and objectives, but as an integral part of its working. Much reliance will be placed on social overheads for increasing the purchasing power of the people and for creating additional jobs, and among such overheads, expenditure on education will be a principal item. From the general theory of the Plan-frame, it can be guessed that the magnitude of this expenditure will be large; but how large, it is not possible to say. No estimate has been presented anywhere in money terms, of the target of expenditure intended under this head. So when the Education Ministry comes out with a demand for an allotment of Rs. 1,800 crores, which is about Rs. 350 crores more than in the First Plan, it is not possible to relate this figure to the estimates in the Plan-frame. This applies, of course, to the demands put up by all the Ministries.

A more adequate measure of the cost and the alternative means of attaining it should be presented before the country, if the directive in the Constitution for compulsory primary education is to be realised speedily. What is to be attained has also to be set out clearly and in a forthright manner. For it is high time to free education from the vagaries of State or local finance and to make the same standard of teaching open to all children in India, to whichever State they may belong. This is a minimum demand and it has to be met.

Bombay Clerks Escape Social Insurance

LAST week, the Bombay Employees' Insurance Court, set up under the Employees' State Insurance Act, 1948, gave an important decision, involving a substantial point of law. The court held that clerical employees working in administrative offices of a factory are not covered under the Employees' State Insurance Scheme.

Under the State Insurance Act, an "employee" is defined as a person working for wages and whose work is connected with the work of the factory. The term "work of the factory" is not easy to define, for it is more than somewhat difficult to place the two limits—where the work of the factory begins and where it ends. From a broad point of view, it begins with the purchase of raw materials and ends when the finished goods leave the hands of the management of the factory. If this view is taken, the stores purchasing department, the head office staff (dealing with correspondence relating to purchase, sales, etc.) and the sales department should come under the Act, as all these are connected with the work of the factory. From the narrow point of view, the work of the factory may mean the work relating only to the manufacturing process, i.e., the actual production process. In that case, only the workmen and a few clerks working in the factory will be covered. The Court, it appears, has taken this latter view.

The clerical staff in Bombay have welcomed the decision in no uncertain terms. Their opposition to the insurance scheme can be justified on the ground that they got little in return for their contribution. The scheme makes provision for three risks—maternity, employment injury and sickness. Most of the clerks are males and hence are not concerned with maternity. Being physically away from the manufacturing process, they do not face any industrial hazards and hence do not run the risk of any employment injury. So they have to pay their contributions (at the rate of Rs. 50—60 per year) only for insurance against sickness. With inadequate medical treatment and uncertain cash benefits, the clerical employees prefer to stay out of the scheme.

As the decision involves an important legal point, the Corporation may appeal to the High Court. The legal position remains uncertain in the meanwhile. The clerks may agitate against further recoveries from their salaries, now that such recoveries, which are unauthorised, may be illegal under the Payment of Wages Act. They may also claim the refund of contributions already paid. In short, employees may refuse to pull the chestnuts out of the fire for the Corporation. The Corporation on its part may insist on maintaining the status quo, till it gets the High Court decision. The refund of contributions already paid might not be possible, because of the benefits claimed and received. The resulting picture is one of confusion.

This is rather unfortunate, particularly when the first benefit period has just begun—from 3rd July 1955. The situation may, however, make the Corporation authorities pause and reflect. The State Insurance Scheme is a social Welfare measure and hence should have been widely welcomed, in spite of its compulsory and contributory character. The Scheme should attract insurable persons to its fold and should never be used as a compulsory levy collecting organisation. The finances of the Corporation, collected from employers and employees, can enable the authorities to start measures of medical, social and economic welfare for industrial workers. All insured persons should feel that the scheme is their own and that they would get in return substantial benefits for the contributions they pay. A committee has been recently set up by the Corporation to review its own administration. It is hoped that the Committee will think on these lines and make recommendations to make the scheme attractive to all employees—factory hands as well as clerks.

Weekly Notes

Planning and Printing

PUTTING children to school is not only a matter of finding money for teachers and school buildings. Books and papers are also needed. There is a country-wide scandal today in the matter of production and supply of text-books to schools. Without much planning and advance preparation, many of the States have launched upon the adventure of providing text books for schools. Let us not go into the commercial part of the business—that racket is of hoary antiquity. Here is a case where enlightened public enterprise—who could claim to be more enlightened than publishers of educational books—and intelligent regulation have both failed and come to grief. The solutions suggested range between two extremes. One is to leave it alone, that the Department of Education should neither approve nor prescribe text-books. The choice is to be left to teachers themselves. At best, the Department may publish an exhaustive list of books as a guide, from which a selection may be made, but it will not be obligatory. The solution at the other extreme, to which the States are being driven willy nilly, is for them to take over the job, lock, stock and barrel. Educational officials of State Governments are chasing all around text-book writers, paper manufacturers, railways for wagons and printing presses to get the books out in time. It is not an easy job by any means, what with the text of the books undergoing continuous revision at the hands of many bosses, and books being frequently changed as a result of the authorities not being able to make up their minds on the language issue, for example. Naturally books are not coming out in time. So children attending school are having a gala time of it on the perfectly legitimate excuse that they have no books to read which has the tacit support, it is to be suspected, of teachers who do not know how to teach without books.

For estimating the draft that progress towards attainment of the directive in the Constitution on primary education will make on paper production in the country, there are

no readily available data, but about the capacity of printing presses and the utilisation of this capacity, some statistics may be offered here which, if correct, should give much room for thought. Of the printing capacity in the country some 77.25 per cent. is currently being utilised. So the idle capacity in printing is no worse than in many other industries. But of the capacity that is utilised, some 50 per cent., we are told on good authority, is utilised by Government. This alone should give a fair idea of the volume of printing that the Five-Yea Plan and the bureaucracy that we have built up need to keep them going. We have not entered upon the Second Plan yet. What will happen when we do, with the enormous increase in publicity and propaganda that the Second Plan will call for, is at this stage anybody's guess. All the non-governmental printing that goes by the name of commercial printing, which includes stationery and industrial printing, such as folders, labels, packing material etc. as also newspapers and periodicals which carry advertisements, account for some 22-1/2 per cent. of the present printing. Advertising—this is distinct from commercial printing—takes up another 17 per cent., leaving only 11-1/2 per cent. of the currently utilised printing capacity for educational and other literature.

Paper and Pulp

IT is not surprising, therefore, that paper is one of the industries the expansion of which has been left completely unrestricted in the Draft Plan-frame. The expansion of paper production contemplated in the Second Plan is from 140 thousand to 200 thousand tons, representing an increase of 43 per cent. In view of the magnitudes discussed above, the target appears to be on the low side. With this rate of expansion for paper, there may not be much cause for concern about the future supply of raw materials for the paper industry. But paper mills in India have been relying increasingly on bamboo. And bamboo has so many uses and is needed so extensively for rural housing, fencing and other purposes that if any sizeable rural development programme gets under way, there may

be a bamboo famine in the country. It is good to know, therefore, that the Dehra Dun Forest Institute's Cellulose and Paper Branch has been investigating the possibilities of utilising other indigenous raw materials for the manufacture of paper. Sabai grass is, of course, currently being used by some of the mills. Some other grasses have also been successfully experimented with, if only because of the limited supply of Sabai. Investigations carried out so far seem to suggest sugar cane bagasse as about the best available substitute for bamboo and Sabai. The Institute has developed a method for eliminating non-fibrous pulp from bagasse, but even without this refinement, cheap grade writing and printing paper can be made from bagasse, which more than one paper mill has found a handy raw material. But one wonders what the sugar mills will do for fuel, if all the bagasse goes to paper mills. At this stage, it would be too much to expect the railways to come to the aid of new users or, for that matter, any other potential users of coal—which presumably sugar mills could be, if prices worked out cheaper that way. But the economics of it has so far come in the way of the substitution of bagasse by coal.

Better results may, therefore, be obtained from the utilisation of wood which now goes waste or is burnt as fuel. But, here again, the same problem of transport and substitution of fire wood by coal has to be faced, be it the ubiquitous babul or acacia—whether its bark is used for tanning or not, it supplies fire wood everywhere—or Chir, another of our forest trees, of which not much economic use other than as fuel is being made at present. Chir can be used as raw material for kraft and wrapping papers. At least one paper mill has been started to make paper from it on a commercial scale. It is only the problem of producing rayon pulp that remains to be resolved. Tests have shown that cellulose for paper mills no longer presents an insoluble technical problem.

Education may still get bogged between paper and printing, even if it comes out unscathed from the Finance Ministry's scrutiny.

Higher Steel Prices for Consumers

IN May this year, the retention prices of steel to the main producers were increased by Rs. 54 per ton in the case of Tatas and Rs. 7 per ton in the case of Indian Iron and the prices of both were brought to the uniform rate of Rs. 382 per ton. From the first of this month, the price charged to consumers has been raised by a little over Rs. 20 per ton. This increase, we have been told, is to make available to the Indian consumer larger quantities of imported steel at about Rs. 400 per ton, the price of which, but for this increase, would be about Rs. 200 higher than the Indian price. In other words, it is the intention of Government to subsidise the import of larger quantities of imported steel and to bring the price of such steel on par with domestic price. No one can have any objection to this particularly when a basic material like steel is in short supply. The only doubt is whether this increase will actually be utilised to subsidise the import of steel.

The equalisation fund for subsidising steel import has been in operation for quite some time and crores of rupees have been collected from the surcharge on Indian steel; but there does not appear to have been a corresponding increase in the import of steel. On the contrary, year after year, large amounts have been paid back from the equalisation fund to the domestic producers in periodic adjustments, to meet increases in domestic cost. The Tariff Commission is now examining the case for another revision of prices. The past experience shows that every time the Tariff Commission examined the case of steel, the companies have been able to convince the Commission of their higher cost. If the same thing happens this time also, the present increase in consumers' price is not going to bring in larger imports of steel; for that, consumers will have to wait for another round of increase. The way in which steel prices are going up requires closer examination. The point to be borne in mind is that the lower cost of domestic steel in India to-day is not due to any extra efficiency on the part of the domestic producers. It is due to the natural advantages the country enjoys in regard to essential raw materials like coal and iron ore. The benefits of such advantages cannot be denied to the consumers. About the equalisation fund, Government

should throw more light on how it operates, with particular reference to the amount collected during the last 8 years, the quantity of steel actually imported and the way in which disbursements have been made from this fund. Besides, the steel pool, it is claimed, is a model of successful controlled distribution. People have a right to know how it works.

Investment in Pakistan: U.S. Study

THAT Pakistan has two distinct economies is one of the interesting findings of the US Department of Commerce publication 'Investment in Pakistan.' Another is the firmer entrenchment of British capital in

Pakistan, after the exodus of the Hindus. This hand-book is mainly "designed to bring together in convenient form basic economic and commercial information useful not only to potential investors but also to importers and exporters." A similar handbook about India brought out by the Commerce Department was reviewed in these columns some time ago.

As the report is primarily intended to promote US private investments in Pakistan, it has to deal with almost all aspects of Pakistan's economy and contains a brief survey of its geography, history and people. Among the factors favouring US investment, one is that American

West End **IND** ALARM

you cannot buy a Better Timepiece!

Powerful 30-hour movement.

Heavy brass plates, wheels solid hardened brass, axes and pinions hardened steel cut from the solid.

High tension infallible Alarm, intermittent or continuous by moving shift lever.

Height 6" Width 4 3/4"

CONTINUOUS-INTERMITTENT

Absolutely dependable because of its immensely strong and sound construction, the "IND" Alarm Timepiece, with its 30-hour movement and Continuous Intermittent Alarm, is the finest value obtainable. The "IND" Alarm will give lasting time-keeping satisfaction, while its alarm, which can be continuous or intermittent at will, is absolutely dependable.

Big Things...!

They are BIG!

But even your biggest printing problems are not big for us.

For an Indian Press to attain the standards of printing as in the United States of America, England, Germany and countries where most progress is made in this direction, is an achievement. Clientele will testify to our attainments in this direction.

With our photo offset, blocks, letter press, litho and packaging material manufacturing departments and a capacity one of the largest in India and twenty-five years' experience behind us, we can undertake all types of printing.

Let us tackle your printing problems.

BOMBAY 13

business men get along well with Pakistani business men, and "unlike their reaction from dealings with many people in the Far East they sense a common denominator of outlook," and the other is that "Pakistanis have a definite pro-Western bias and the Americans are welcomed in Pakistan as friends."

Of the present, i.e., pre-American aid state of foreign investment, the report says that new investment in business and industrial enterprises in Pakistan from January 1, 1948 to September 1952 totalled Rs. 3.4 crores which represents only funds brought from abroad. Of this total, Rs. 2.9 crores came from UK, Rs. 1.5 crores from US and Rs. 30 lakhs from other countries. By June 1953, the total had risen to Rs. 4.3 crores. This, however, gives only a partial picture as this amount excludes re-investment or growth of assets already in Pakistan which is likely to be substantial.

Britain Well Entrenched

THE report makes some interesting comments about the dominance of British capital in Pakistan's economy. "With the exodus of Hindus to India after partition, the position of the British has remained relatively strong. British goods are well-known throughout Pakistan; standards and specifications in use in Pakistan are largely of British much existing equipment is of British manufacture, and technical origin. The interests of considerable number of well-established British

firms in Pakistan have been buttressed by an active High Commissioner, by strong representation in the leading Chamber of Commerce, and by the presence of a number of British advisers in the Government. British capital has participated in several industries in Pakistan, and specific industries have been developed to take advantage of 'Imperial Preference' rates on items such as chemicals, drugs, textiles and metal products. British interests have recently received fresh support in the form of £10 million 10-year credit extended to Pakistan by the United Kingdom to be used for the purchase of approved capital goods manufactured in the United Kingdom." American capital, in contrast, occupies a very minor position. It operates in a few insurance companies, Caltex and Standard Vacuum Oil Companies, a branch office of the American Express Co., a General Motors truck and bus assembly plant and Coca Cola plant at Karachi. In view of the under-developed state of the economy and the way things have been going—Pakistan has not yet been able to finalise a five year plan—it should be fairly obvious that the potential rival for US capital is not the ill-equipped and inexperienced Pakistani business men but the well-entrenched, powerful British. And the report makes no secret of it.

Hamlet without the Prince

Curiously enough, the US Department of Commerce study does

not bother to explain why in spite of the advantageous concessions granted to foreign capital and the very friendly relations that have existed between Pakistan and US on a governmental level, no private investment has flowed from US to Pakistan.

There are a number of interesting observations, some more provocative than sound. One who is familiar with the usurious rates of interest extorted by the ubiquitous Pathan money-lenders (who are also Moslems) will find it difficult to accept that credit facilities in Pakistan are not adequate because "Moslems are prohibited by the Koran from interest-taking." If that is really so, how on earth is this idyllic state ever going to solve its problem of supplying adequate credit?

More than anything else, an investor is primarily concerned with the safety and security of his investment. Scope of profitability and other favourable factors come next. The conditions, past and present, in Pakistan and the rapid succession of weak unstable Governments is not likely to inspire confidence in the mind of the investor either in Ohio or Noakhali. Absence of any mention of this not unimportant issue in the whole report is rather a significant omission when the specific object of the publication is to attract the US private investor.

From the London End

Monopoly Practices and the Public

RECENTLY the London County Council called for tenders for the supply of steel-frames for a block of flats to be erected. Tenders were received from ten firms each identical to the penny—£50,283-19s.-3d. The Glasgow City Council had a similar experience. The City Council of Wellington in New Zealand received identical tenders from several British companies for the supply of electric cable, and the eight British tenders for electrical equipment to the Australian Snowy Mountain authority were all the same. It was clear to these public authorities that their established system of open competitive tender was being undermined by the existence of price rings in various British industries. The ordinary consumers however do not have the same opportunity of witnessing

price rings at work as the public authorities, and yet it is a vast body of ordinary consumers who are virtually held at ransom in their daily endeavour to get value for their money.

The Monopolies Commission has now issued its first general report, *Collective Discrimination* (Cmd. 9504), on the general subject matter of collective agreements among traders at various stages in the distribution process. The eleven previous reports of the Commission have each been concerned with restrictive monopoly practices in a particular trade. The current report covers a wide range of collective practices all of which involve discrimination in favour of or against certain customers and suppliers. The

Commission was not asked to consider trading methods as such; what it had to advise on was whether collective agreements among traders operate in the public interest or not. By a majority of seven to three, the Commission came down firmly against these restrictive trade practices.

Types of Discrimination

Out of the "bewildering" variety of restrictive agreements encountered, the Commission was able to identify some six clear types for purposes of analysis. More than that, it was also able to list over 80 goods of varying importance, each of which was affected by such agreements. In some of the trades, entry of new firms was restricted by requiring new entrants to comply with

rules and regulations which placed the older members of the trade in a somewhat entrenched and monopolistic position.

Of the six types of collective trade discrimination encountered by the Commission, those practised by the sellers were the most important. These take two principal forms: preferential prices and exclusive selling. By resort to "trade terms" and "wholesale terms", sellers were able to establish what the Commission calls a "favoured class of buyers". These favoured buyers are selected carefully by the trade organisations adopting these practices. The criteria for treating some distributors as the favoured ones often include some restriction on the stage of distribution, in which a distributor may engage. There are other pernicious criteria. Dealers in dental goods were required to have a minimum capital of £3,500 (unless they had five years' experience in which case a minimum capital of £1,000 was prescribed) before they could obtain supplies of dental goods. In the wall-paper trade, a minimum turnover is required (this virtually prohibits new-comers) and the newspaper trade prescribes a "distance limit". Until January 1955, the Proprietary Articles Trade Association had a rule which took into consideration "the number of wholesalers already existing either in general or in a particular district". The Commission's finding and conclusion in this regard was that "the most restrictive agreements are those in which favoured buyers are listed and sellers agree to sell exclusively to them or give them preferential margins... We conclude that in general they operate against the public interest".

Exclusive Buying

Another important category of discrimination is where buyers are obliged to make exclusive purchases from sellers discriminating in their favour. The agreements are made between sellers and buyers or between sellers as a group and buyers as a group. In these reciprocal agreements there is normally provision both in the form of discrimination and of selection of the favoured buyers. Where the suppliers' discrimination takes the form of a price concession to distributors, the concession is always given by way of a fixed discount, usually from the common prices agreed to by the manufacturers. The main argument against these collective agreements

in the words of the Commission is that "they create excessive rigidity and go far to eliminate possible competition from traders outside the group". And here again the conclusion is that these collective agreements operate against the public interest.

Re-sale Price Maintenance

The widely practised agreement among manufacturers to establish wholesale and retail prices for their products, more usually termed "re-sale price maintenance," is analysed in great detail in the Commission's report. The Commission found that under resale price maintenance agreements, the resale prices frequently included both the retail price to be paid by the consumer and the wholesale price paid by the retailer. Whatever its advantages, resale price maintenance by individual manufacturers acting independently of one another restricts the ability of the distributors to compete with one another in price. It, therefore, also restricts the consumer in his freedom to choose between different methods of distribution. Both these restrictive effects are intensified by agreements between manufacturers which oblige the parties to the agreement to fix the resale price of their goods; and they usually have the further restrictive effect of compelling manufacturers, who might otherwise not prefer to sell their goods in this way, to fall in line with the majority. The Commission saw considerable disadvantages in all these restrictions and came down heavily against such agreements as being against the public interest.

Exceptional Circumstances

While the practices of collective agreement to discriminate in trade were generally condemned, the Commission conceived of certain "exceptional circumstances" when these practices might be justified. These circumstances were essentially concerned with the ability of consumers to judge standards of service and to assess whether particular practices were being worked in their favour. There were two other exceptional circumstances: as a means of protection against imports and where the agreements sought to protect small firms against large manufacturing concerns.

It was on the issue of what should be done about the restrictive practices that the Commission's members differed. There were two possible courses open for legislative action. The first was the compul-

sory registration and publication of agreements (with subsequent prohibition of those found, after investigation, to be against the public interest) and the second, a general prohibition of restrictive practices, with provision for exceptions in particular cases. The majority of the Commission preferred the second course. They suggest that the exceptions be made by Statutory Order, on the advice of an independent body, which should assess the merits of each application for exception.

Following US Footsteps

The majority recommendation of the Commission is fully in line with monopoly legislation in Sweden and the United States. Indeed the exceptions which are made to the recommendations make them highly feasible for public policy if for only one reason—it avoids the inflexibility which American administrators have experienced in implementing the Sherman Act. The crucial question is, of course, whether the British Government would go the whole hog as is suggested by the Commission. Already comment from business circles has been in an adverse direction and this will, no doubt, force Government to adopt a cautious policy. But the overwhelming view of the country is decidedly for the banning of these restrictive practices in trade.

A Post-Script on Sterling

Rumour was rife earlier in the week that sterling would be "devalued" and even the date when this would take place had also been mentioned. Of course, the British Government has denied the rumour, what else could it do? According to your correspondent's understanding of the situation, there is unlikely to be an outright devaluation, if at all. What is likely, however, is a widening of the exchange rates, coupled with convertibility and thus something like a 5 or 6 per cent depreciation in sterling. There is already a discount of this magnitude on transferable sterling on the Continental free market, and taking into account the recent decision of the Bank of England to intervene in the free market, it is not unlikely that the current free market rate would be used as the basis for determining what can be considered the equilibrium exchange rate. The whole position will be covered in the next despatch together with some examination of the strains being caused by the current inflationary boom.

Export Prospects in East Africa

P M Shah

THE Indian population in East Africa, comprising Tanganyika, Kenya and Uganda, is about 1,70,000, out of a total population of some 18 millions. It is remarkable that this small population in the territories mentioned above controls nearly 70 to 80 per cent of the trade there. The wholesale and the retail trade are mainly in the hands of Indians. Of course there are a few European houses holding agencies for continental and British manufacturing firms, but the share of trade handled by them is not as great as that handled by Indians. Banking and Insurance are, however, in the hands of Europeans. Viewed then in relation to the predominant position which Indians occupy in the trade and commerce of the country, the share of India's export to East Africa is hardly 6 to 7 per cent, with the exception of Uganda, where export of cotton forms 29 per cent of the total trade and is in the hands of Indians. This position of a negligible export to East Africa from India should give us food for thought. The bulk of imports of East Africa is from European countries, Japan and Hongkong which forms nearly 92 per cent of the total trade. The reasons for this state of affairs are not far to seek. To put down the main obstacles, which hamper our trade but which admit of solution, if a little study of market conditions is made on this issue, they are:

Cotton Textiles

So far as exports of Indian textiles to East Africa are concerned, there is a common complaint

(i) That our packing is most defective. Loose packing in transit spoils the quality of goods and some consignments of bales are found to get damaged. I had myself seen pieces of cloth in damaged conditions during my visit to customs houses and godowns. Compared to packings seen on goods imported from Japan and the continent, our packing needs a lot of care on the part of manufacturers. The hessian and other pieces of cloth used for packing are not wrapped properly to withstand transshipment.

(ii) Length in pieces in many cases is shorter than what is actually mentioned on the cloth or the invoices. That is, if a piece is marked 40 yards, the experience of quite a few importers has been that it is less

by a yard or so. This does not happen in the case of textiles imported from Japan or Britain. Instead, therefore, of making complaints and not getting redress to their grievances, importers there prefer not to do business with us and suffer losses.

(iii) Quality of goods is in many cases not according to samples.

(iv) Colour of pieces is not uniform and fast.

(v) Indian textile manufacturers do not register designs like the Japanese or the British do.

(vi) There is no uniformity in weights and sizes in our cloth, both mill-made and handloom.

(vii) Samples are too small to be shown to retailers.

(viii) Shipment samples are not made available in advance of the goods actually shipped.

(ix) Delivery of goods in many cases is made not according to contracts, but according to convenience and market trends.

(x) Some of the manufacturers write on Indian Textiles as "Made as Japan". This carries a bad impression with the importers and I heard people telling me that even Indian manufacturers do not value their quality as much as they do of Japanese make, otherwise they would not write the way they do.

Details in the invoice are not proper and importers have to deposit double the amount of duty with the customs till the correct invoices are received. In many cases, the totals in the invoices were not correct.

As regards yarn the complaints are more or less on the same lines as for cotton textiles. A black ribbon is tied round the bundle, but the quality is not as is supposed to be for yarn where black ribbon is used. The length and sets marked 20 x 10 x 7 are not found so on actual measurement, with the result that Italian yarn is given preference. Tickets and designs on yarn packings are not registered. This is most essential according to buyers in E. Africa and Asmara.

In the case of hosiery, wrong sizes are sent. It is rarely that importers get correct sizes.

(xi) Lack of real interest in export. It was brought to my notice that hardly a manufacturer from India ever visited these territories to

study on the spot and finalise designs to meet the tastes of textile consumers in E. Africa. In the case of Japanese and British manufacturing houses, on the other hand, the heads of mills come to study the nature of colours, designs, tastes, etc. Business could be booked more if India followed the practices which other countries are following.

(xii) Lack of confirming houses. Continental and British manufactures sell goods through confirming houses. Apart from the credit advantages which buyers derive from these houses, buyers can lodge complaints regarding quality and damage to goods on the spot. Thus, confirming houses serve a double purpose in the interests of buyers who deal with European countries.

It is interesting to note that our Trade Commissioner in Mombasa, more or less makes similar observations in his report submitted to the Textile Export Promotion Council.

Leather & Leather Goods

In the case of leather too, I had to listen to the same complaints regarding packing and measurement. It was pointed out that many Calcutta firms who send leather, do not send it according to the invoiced measure. The pieces are often found less by a foot or two. Indian leather is found better in quality, but because of this defect in measurement, buyers hesitate to place orders with Indian shippers. Even in the case of grade, if it is A grade in the invoice, the grade actually received by the buyers is either C or D grade.

Indian leather prices are below world prices. But what buyers hope to gain in prices, they lose in measurement and quality, and therefore hesitate to place orders with India.

As regards articles of leather manufactures, packing is not up to the standard. Leather suit cases are often found with scratches. The locks do not open easily. Screws are not tight and they come off with the result that buyers have to pay for repairing charges before the cases are sold.

In the case of footwear too, we have not been able to establish ourselves, because of lack of interest on the part of manufacturers and exporters. Our prices in every respect are competitive.

There is tremendous scope for all these. For one thing India can deliver the goods earlier than continental countries, and secondly in many cases, though not in all, our prices are also competitive. There is complete lack of publicity for our hardware. No catalogues are supplied nor are representatives sent to canvas orders.

Cement

In the case of cement, the stipulation of our steamship companies that they would not lift cement cargo if it is less than 1400 tons and that on their return journey, they must be assured of cargo, works as a great deterrent to our export trade in cement. Although our prices are a little higher than Egyptian, Swedish, German, or Tripoli prices, buyers are keen on having Indian cement because of the possibility of quicker delivery.

There is, as usual, lack of publicity, although one could say that there is good scope for steel furniture, cupboards etc. Packing again is not sound. Locks sometimes do not work. People from this end do not attend to correspondence.

Curios and Handicrafts

These articles have a wide demand. During ceremonial occasions, European customers and others buy in large quantities articles made of brass, wood or plaster of paris and several other varieties. The difficulty of the traders is that these products do not bear a registration number. Suppose for example, a wooden box from Kashmir is sold out and if that particular size has a demand, the importers must be able to get from India the exact size. This they are not in a position to do, because there is no registration number from the source of origin. The Cottage Industries and Handicraft Board will do well to bear this in mind and give registration numbers, not only to boxes but to all such articles, so that the buyers at the other end can quote the particular number. Literature regarding handicrafts is not at all available in any town or city and whatever orders we receive here, are from those who have personally visited India, or write to individuals or relatives interested in this trade. There is great lack of publicity. Exhibitions and window cases would go a long way in popularising our handicrafts in these territories.

Electrical & Engineering
East Africa and other territories

are absolutely unaware of the fact that India manufactures a good many items of spare parts required in the automobile line. The Government and those engaged in this line, have practically done nothing to publicise the manufacturing capacity of India in the matter of spare parts of automobiles. In India, we are facing a keen internal competition in many lines, while we are not bothering to explore obvious possibilities of marketing products in these territories.

Much the same can be said about electrical equipment. Some firms in East Africa do, however, import certain items of electrical equipment and engineering products. There is scope for establishing a market.

The patent and other medicines are mainly imported from Great Britain, Germany and other continental countries. India has not done much to popularise her products. Maybe, the manufacturers are not keen on export trade.

Consumer and Household Goods

Umbrellas, toilet soaps, biscuits, bicycles, plastic goods, leather belts, hair oils, household utensils, wire-

gauzes, buckets, agricultural implements, and many more articles of daily use have a real demand. For lack of publicity and door to door canvassing, India has not been able to push these products appreciably. It is true that a majority of Indians are engaged mainly in textiles, but that is not to say that these products are not handled by Indian firms. What is wanted is a vigorous publicity campaign and expert canvassing.

Ethiopia, Asmara & Aden

Although much of the information given above relates to East Africa, conditions in Ethiopia, Eritrea and Aden do not much differ. Barring Aden, and Asmara where the Arabs and Jews and Italians also control trade along with Indians, in Ethiopia and Eritrea, trade is still in the hands of Indians. The Indian population in Ethiopia, Eritrea is not as large as it is in East Africa, but in so far as trade and commerce are concerned, it could safely be said that Indians have a voice, and export and manufacturing houses from this country can cash in on their countrymen abroad.

Plan-Frame and Communists

ONE has heard that in America it is no longer McCarthyism but McCarthyism. Senator McCarthy over-played his hand. In his hunt to unearth "un-American" activities, he collided with the Army. That finished him. Pentagon showed him the place he belonged to. After Pandit Nehru's discovery that there is nothing much ironish in the "iron curtain", it would have been a bad advertisement for Democracy if it continued to tolerate McCarthyism. It is good to know that in that land of milk and honey, where even a cabin boy can become President. McCarthyism is no longer tolerated.

Justice Douglas in Calcutta

It is better still to know that America is moving towards acceptance of the principle of co-existence. This is the opinion of Mr Justice Douglas of the Supreme Court of the United States. He is now in Calcutta, at the invitation of the Calcutta University, to deliver a series of twelve lectures as this year's Tagore Law Lecturer. That Mr Justice Douglas has expressed this view to pressmen on his arrival at Dum Dum will be accepted by those who are familiar with "cold war" America as convincing proof that McCarthyism is dead. Could it, then, be that the American Secretary of State is still unaware of this political development in his own country? One has, recently, noticed certain glaring contradictions between the opinions expressed by the State Secretary and his President. But that is a different story about the GOP.

Communists

To non-Communists, McCarthyism has certain affiliation with Communism. One had heard much about Communist cells and activities in Calcutta. Labour troubles and strikes were, and are, more frequent in Calcutta. But this does not necessarily mean or prove the existence of Communist influence. Dr B C Roy claims that he has exorcised Communism from this city. There was almost a witch-hunt against Communists some years ago. Unemployment is more acute now. But one does not notice much of Communist influence in this city at present. Was the Communist influence invented? Or was the witch-hunt successful?

Unlike in Bombay, it is not the custom in Calcutta for the sons, daughters or nieces of multi-millionaire mill-owners to pose and behave as Communists. In this city, the rich are rich and the poor are poor. And the rich and the poor behave as the rich and the poor should. This sharp class distinction should provoke a bitter class conflict. But one must express one's surprise at the growing impression that Calcutta, like London, seems to be reconciled to the inevitability of class distinctions.

Communist influence may not be spreading. But there are many who are suspect as fellow-travellers. In newspaper offices, one very often hears that A or B is a Communist or has Communistic leanings. There is not the least trace of Communism in Calcutta's newspapers. One gathers the impression that it is a handicap to reveal even Leftist inclinations. All progressive writers, artists, actors and thinkers are suspect. When a particular theatre group gives a performance of one of Rabindranath's plays, one is told by even serious literary critics that there is much "Red" but little "Oleanders" in that theatre group's interpretation of Oleanders.

PSP

There is a bewildering look among Calcutta's alleged Communists. They are happy about the spontaneous popular reception of the Russian people to Pandit Nehru. They are less happy over Panditji's flirtations with Marshal Tito. Some of them seem to accept that Congress is becoming Socialist. Some others endorse CPI's verdict that Congress's economic and foreign policy is bourgeois camouflage. From loud and heated conversations in cafes and coffee houses, one gathers the impression that Calcutta's alleged Communists are rather perplexed at the turn of events.

PSP shares CPI's conviction that Congress is incapable of ensuring a socialistic pattern of society. West Bengal's PSP held a conference recently. It accepted Avadi as the economic goal. But this State's PSP members were unanimous that neither Congress nor CPI but PSP alone could implement a socialistic pattern of society in this country. There is nothing new in this. But

during that conference, it became known that Dr P C Ghosh, the Secretary of PSP in West Bengal, had rejected the national executive's request to him to withdraw his resignation.

Dr P C Ghosh is an enigma in West Bengal's politics. He was the first Chief Minister of West Bengal after independence. He established a reputation within a short time. But, then, he was ousted from Congress politics in this State. He joined the Praja Party. He continued to be a member of the merged PSP. But his recent performance has lagged deplorably behind his earlier promise. He is no longer the Secretary of PSP, West Bengal. But he remains a PSP member. Dr Ghosh has left his Congress moorings. But he has not yet found his political anchor.

Economists Support Dr Roy

Dr B C Roy's hostility to the Plan frame is well-known. One had heard whispers before. But it is now being loudly talked about. Professor P C Mahalanobis and his Statistical Institute at Barrackpore are suspected to have Communist leanings. This is what the people and a section of the Press are now saying. But Dr B C Roy and his advisers are diplomatic in not waging the battle on this political plane. Dr B C Roy and his Development Commissioner can now rely on the solid support of Calcutta's economists and business experts in their opposition to the Plan-frame.

Under the auspices of the Shyamaprasad Birthday Celebrations Committee, a symposium on the second plan was held at the Ashutosh College last Sunday. Many of Calcutta's economists participated in the discussion. Most of them argued that the Mahalanobis Plan-frame was "unpractical and too statistical". Many of the economists who took part in the symposium endorsed Dr Roy's approach to the framing of the Second Plan. Calcutta's leading economists will soon meet the Chief Minister to discuss their memorandum on the Plan-frame. Shri Sushil Dey, West Bengal's Development Commissioner, was present at the symposium. West Bengal's Chief Minister and his Development Commissioner seem to be conscious of the value of organised propaganda.

National Income—A Symbol

For a Whole Complex of Socio-Economic Conditions

Economic Change. By Simon Kuznets. William Heinemann Ltd., London 1954, Pages 333.

Reviewed by Hannan Ezekiel

AMONG the leading economists of our time, Prof Simon Kuznets has an assured place. His work on various aspects of the national income of the United States spread over so many different articles, papers and books, has itself been of a quality and volume that would have been adequate to earn such a place for many another writer. His latest work in this field is his paper on "Long term changes in the National Product of the United States of America since 1870" which has been published jointly with a paper by Raymond W Goldsmith as the second volume in the series on *Income and Wealth of the International Association for Research in Income and Wealth*. Many readers have in fact laboured under the misconception that Prof Kuznets has confined himself to this narrow field. Given the relatively free availability of statistics about various sectors of the United States economy, the inference has sometimes been drawn that very little could be learnt from his writings even by those who were interested in national income studies but were devoting themselves to countries for which statistics were scarce and the features of the economy raised special problems of imputation that were considered to have no parallel in the advanced countries.

Even in his studies of US national income, however, Prof Kuznets has never confined himself to the traditional ground. In every study, there is a search for underlying principles, an attempt to pose the basic problems arising out of the material studied and to suggest solutions. Reflecting this interest in the wider issues, his writings on national income are not really confined to the United States. Strwn among them are articles and papers that are specifically devoted to the wider issues. If anything, these probably show better even than his classic studies of US national income, the acuteness of his mind, the range of his knowledge and the independence of his spirit. Besides, Prof Kuznets has also written on subjects other

than national income. The wide range of his interests is indicated by the sub-title of the present volume, 'Selected Essays in Business Cycles, National Income and Economic Growth.' In a significant passage in his essay, "Economic Tendencies, Past and Present", Prof Kuznets points out how statisticians "are all too prone to deal with special problems on the easy assumption of the persistence of the wider framework." He goes on to say,

"There is no one as revolutionary as a scientist within the narrow field of his speciality In the social sciences we have need of a new group of workers who combine the mastery of detail and careful procedures essential to the specialized research scientist with the wider horizon of the historian and the social philosopher, and we have need on the part of our specialist groups of greater awareness of the variety of historical experience and the mutability of the social framework within which lie the more narrowly defined phenomena that they study."

The essays in this book prove beyond doubt that Prof Kuznets himself forms a pioneering member of the new group which he suggests is necessary and that he is constantly aware of the need not to proceed "on the easy assumption of the persistence of the wider framework."

Of the eleven essays in the volume written over a twenty-year period, nine have been previously published (two in Spanish) while two are manuscripts of lectures that were read but have never been published before. In selecting the papers, Prof Kuznets has been concerned "to include only essays dealing with wider problems, . . . no matter how fragmentary the effort, slender the empirical base, or venturesome the hypotheses." The more technical and methodological papers have been deliberately excluded. The order in which the papers are arranged represents also the historical pattern of Prof Kuznets' interest in different subjects from business cycles to national income and national growth.

The first five essays deal with different aspects of business cycles. Though most of these have been written many years ago, they bear the imprint of the masterful analysis for which Kuznets has become famous. Even today, they are worth reading, not merely as the product of a great mind at one stage of its development, but also as making a contribution to the field and stimulating even today new thoughts and ideas. But others have written on this subject too, with varying success. It is the other six essays, therefore, which form the more interesting group for they make bold incursions into untrodden fields. Here in these essays is a standing invitation to the economist to join in the adventure of ideas. These essays provide, as nothing else can, a measure of the man.

One must be grateful to Prof Kuznets for including in this volume his paper on "National Income and Industrial Structure", presented to the International Statistical Conference at Calcutta in 1951. The importance of this paper can be judged from the fact that it evoked three papers at the Royaumont Conference of the International Association for Research in Income and Wealth. Prof S Herbert Frankel accepting its conclusions, elucidated them further and examined their philosophical implications. Prof F Benham rejected the conclusions of Prof Frankel, but on relatively flimsy grounds. Dr. V K R V Rao made a detailed examination of the questions raised by Prof Kuznets' paper and finally accepted some but rejected its other implications.

The main problem posed by Prof Kuznets is that of the comparability of the national income estimates of countries where industrial structure differs markedly, the contrast obviously being between market-oriented economies on the one hand and semi-subsistence economies on the other. He suggests that apart from the existence of possible deficiencies in measuring the output of pre-industrial countries, the whole complex of goods produced and consumed is so different in these coun-

tries that no comparison is possible on the existing basis. That the deficiencies, if any, in the present national income of the underdeveloped countries should be made good need hardly be argued but there may be disagreement about specific suggestions made in this connection. It is difficult to agree, for instance, that "once the products are eventually consumed by the individuals and households of a pre-industrial economy, they must have attained the same satisfactory state of 'finishedness' as the final products of an industrial economy." The main controversy, however, must revolve around the statement that several categories of goods flowing to ultimate consumers "are fully represented in estimates for industrial countries and yet are costs rather than final products, in the sense that they serve merely to offset some of the disadvantages of industrial organisation." Among these Prof Kuznets includes the additional fabrication, packaging and transportation in industrial countries that form "merely an offset to the disadvantages of the concentration of manufacturing in centres distant from the centres of raw materials and of consumption." Though I myself find it difficult to accept this line of thought, it is undoubtedly highly thought-provoking. Only a careful study of revolutionary suggestions made can show how far one can go in accepting them.

The subsequent essay, "National Income and Economic Welfare", reprinted from the 'Boletin del Banco Central de Venezuela', follows up this line of thought with special reference to the concept of economic welfare. It brings out clearly Prof Kuznets' own view that national income provides a "measure closest to a comprehensive estimate of national income". Prof Kuznets feels that productivity cannot be measured in any sense apart from economic welfare, a point that needs to be kept in mind in discussing his views. Dr V K R V Rao in his paper at the Royaumont Conference says at one point that his arguments apply to economic welfare but not to the question of productivity. The premise that these two concepts are separable, would not be acceptable to Prof Kuznets.

Prof Kuznets wants "to know the individuals' choices under conditions freed from the pure calculation of job needs". He speaks of the "costs of urban civilization at large." He wishes to deduct that (increasing) portion of Government activity "that

may not be adding to, but at best may be just preserving the welfare of individual members of society." He asks whether some account should not be taken of the possible changes over time or differences in space, in the input of labour by individuals who are the active members of the economy viewed as a system of production." These are the type

of questions raised by Prof Kuznets. Can one deny after these questions, whether one accepts their implications or not, that he is a provocative thinker?

Prof Kuznets' analysis of the causes of international differences in income levels provides even more striking evidence of the broad approach which he makes to any sub-

'NEW INDIA STORIES FROM LIFE 1

'My good turn helped me most'

MY FRIEND'S son came to sell me insurance. My business was doing well, and I thought I did not need any. But the boy was so young and enthusiastic, that just to encourage him and please his father, I agreed to take out a policy.

Some years later, business slackened and everything I touched seemed to fail. My business took some hard knocks; and my partner got too ill to share my problems. I had to reorganise, but where was the necessary capital to come from? The only solution was to sell our house—and it was my wife's pride and joy.

Then my young friend dropped in to remind me that my New India Endowment Assurance policy would mature shortly. What a wonderful relief! I would get the money I sorely needed at exactly the right time.

I thought I had obliged a friend—actually he had helped me!

An insurance policy, taken out now, may one day stand between you and disaster. For full information write to

THE NEW INDIA ASSURANCE CO. LTD.,

Mahatma Gandhi Road, Bombay 1.

ject which he studies. He is emphatic that statistical association between income levels and other characteristics is no basis for assuming that these characteristics are causative factors. He argues, therefore, that "the realization of the extent to which per capita income level is only a symbol of a whole socio-economic complex of conditions is important as well as for analysis of causes." Prof Kuznets makes a careful examination of the physical factors and the factor of size and finds that though these may assist or create difficulties in various ways, they cannot be considered to be of primary importance as causative factors. It is when he

takes an historical view of developments that he is able to come nearer to an understanding of the problem. His conclusion that private enterprise on the one hand and a democratic political system on the other are the factors in association with the industrial system which must be given primary importance is significant, though it may not find acceptance from all. He insists that it is "dangerous to assume that the association of rapid growth in income levels with free enterprise and political democracy was an historical accident". Prof Kuznets stresses the sociological implications of industrialization and urges the economist and the statistician to widen

his horizon, if he is to make a valid contribution in this field of study.

The other essays in the volume discuss "Retardation of Industrial Growth", "Economic Tendencies, Past and Present" and "Foreign Economic Relations of the United States and their Impact upon the Domestic Economy". They all bear the imprint of the searching analysis and deep thought which are so obviously characteristic of Prof Kuznets. That is what makes this book eminently readable and makes one hope that Prof Kuznets will bring together in book form other essays of this type he may have written to enable the general reader to benefit from his work.

Goa's Changed Economy

(contributed)

A YEAR ago Goa's economy was firm and confidently based on a steady, increasing export of iron and manganese ore and other local produce, a substantial tourist traffic and, not the least in importance, a considerable trade in the illegal export of gold and luxury goods to India. The picture of Goa's economy is, today, radically different. The situation has changed to one of uncertainty, a lack of export demand and markets, serious handicaps in the import of essential items, increasing costs and a drastic fall in contraband trade with India. Goa's balance of trade has shown a heavy deficit in the past years; its imports being almost three times the value of its exports. But the difference represented the demand of the tourist and contraband trades. The balance of trade still continues to show a heavy deficit but without the resources to make up the deficit.

Pattern of Trade Disrupted

Goa was mainly dependent on India; though a customs barrier existed, Goa was part of India's economy. Its surplus found a ready market in India. The normal export channel from Goa for such commodities as salt, fish, betelnut, coconut and mangoes lay across the hats or by sea to India. Goa's principal import requirements, such as, textiles, paper products, tea, coffee, vegetable oils, fresh fruit, vegetables etc. were also met from India. The political strife in Goa is brought in its wake economic measures leading to a complete des-

truction of this pattern of trade. With a virtual ban on import into India from Goa, there has been a feverish search for other export markets—Middle East, Pakistan and Ceylon have been explored but with little success or if some demand has been discovered, it is at prices below economic levels. To take an example: Some export of coconut has taken place to the Middle East areas at prices ranging from Rs. 60 to Rs. 70 per thousand against prices in Goa, a year ago, of Rs. 140 a thousand. Agricultural prices have slumped drastically and the purchasing power of the labour and lower agricultural classes severely reduced. The last crop of betelnut is rotting in godowns in Goa for want of an export market. Two years' production of salt continues to be held by producers who because of orders by the Portuguese Government of Goa were unable to curtail production. The mango crop this season has been sold within Goa at one-third its normal export price.

Starved of Essential Imports

The pattern of import trade has also changed. Though India has stopped trading with Goa, she has not applied sanctions yet as in the case of South Africa. So Goa can still get Indian goods, and it gets them, but only by re-export from Ceylon, Pakistan and such ports as Aden and Singapore. This, however, is a costly process. Prices have, as a result of transshipment costs and middlemen's charges, increased by a further 20 per cent. Compared

with Indian prices, prices in Goa are 150 to 160 per cent higher. But there is another point to note: Supplies from alternative sources are uncertain and only available when those countries have surpluses in relation to their own demand. Transshipment is dependent on a cargo steamship, the M. V. Luabo, a Portuguese commercial liner of 1400 tons, which runs every fortnight between Goa and Karachi, or, on an occasional tramp from Aden or Colombo.

Luxury Goods: No Buyers

Paradoxically, as it may seem, Goa's markets continue to be stocked with ample supplies of luxury goods, silk and art-silk fabrics, watches, confectionery, wines and liqueurs, perfumes and a variety of other goods which were in heavy demand from tourists and visitors from India. Merchants, alternating between hopes of a return to the former freedom of trade between India and Goa with a solution of the political conflict and fears of reducing their imports lest the local Government consider it a sign of political non-co-operation, have continued to place demands for imports from abroad despite higher interest rates on loans. Prices of such luxury goods have slumped by 10 to 15 per cent, and stocks continue to depreciate. The earlier expectation that a large number of troops (there are almost 12,000 troops in the tiny colony) would fill in the void caused by absent tourists has hardly materialised. The Portuguese troops, who walk through the shopping centres in

Panjim and Margao gazing at the windows, are not accustomed to luxury nor have they the money to buy these luxury goods.

No More Tourists or Contraband

The lack of tourists and visitors resulting from travel restrictions on both sides of the frontier and the complexities of a passport system have been felt in other directions also. House-rents on the sea-side are a fourth of what they used to be in past seasons. Calangute, Goa's most popular sea-side resort, was particularly affected by the absence of visitors from India and its beaches, usually crowded, were deserted and its restaurants had no customers. Taxis were not in demand and harbour and railway coolies remained idle. A more stringent customs control on the Indian side than hitherto has greatly reduced smuggling and though some goods still find their way to India by sea, the demand from organised traffickers is probably reduced to a tenth of the former level. Gold, one of the principal items in the contraband trade, remains at a heavy discount, indicating a lack of demand.

A sense of uncertainty and a fear of further deterioration in the economic situation in Goa haunt the business and merchant community.

The only steady feature in the economic life of this tiny foreign possession has been the continued export of iron ore at more or less the same level as before. Manganese ore exports have fallen substantially owing to a lack of world demand. However, mining costs have gone up due to heavier transport charges and Government taxes. Uneconomic mines have gradually closed down and the entire export trade lies in the hands of half-a-dozen owners who have the necessary capital equipment and finance. The shortage of labour has led to higher wages, further affecting profits from exploitation. Investment in the mining industry is hardly as attractive today as it was a couple of years ago when veritable boom conditions existed.

Quixotic Reaction

The Portuguese administration in Goa has reacted to the situation with Quixotic valour. Two high-powered technical missions have come out from Lisbon, within the past six months, to survey the agricultural situation and the mining industry in Goa, Daman and Diu; but apart from expensive suggestions, they have produced no concrete improvement. The Goa Government created, with much publicity, an

"Agricultural Front" and appointed a special committee headed by a European Director of Agriculture. This committee, too, apart from propaganda and grandiose speeches on the desirability of attaining self-sufficiency, has achieved little of practical value. There was some local production of vegetables at a price, but it served only to meet the requirements of the troops. The Portuguese Government also embarked on the creation of cold storage—one at Vasco-da Gama has already come into use—but again it meets only the requirements of the army stationed there.

Economic conditions in Goa, dismal and gloomy as they appear, serve only to accentuate the political situation and the inability of the Portuguese administration to see things from the point of view of the genuine interest of the country. This is really its principal fault—namely, the subordination of the welfare of the Goans to its own interests, arising solely from false considerations of prestige. The fear grows that there can be no real change in the situation except for the worse unless the political problem finds a solution and that is, indeed, what is agitating many minds.

Land Problem in Travancore-Cochin-I

D S Chauhan

THE present state of Travancore-Cochin, which lies at the south-west corner of India between the Western Ghats and the Arabian Sea, was formed on July 1, 1949, by the integration of the two states of Travancore and Cochin, which for centuries had remained separate political units, though they were linked together by common geographical features and cultural heritage. It has an area of 9,143.9 sq. miles and a population of 9.28 millions (1951), which come to 0.72 per cent and 2.6 per cent respectively of those of the Indian Union. Of the total population 84 per cent being rural, and of the latter, 60.6 per cent being agricultural, the state is essentially rural and agricultural in character. But the most disquieting feature is the enormously high rural density and a very great degree of congestion in several localities, the most serious being the congestion in the lowlands. The result is that the pressure of population on land has become a very serious problem here. It should be of general interest to examine the nature of problems arising out of a tremendously heavy pressure of population.

I Most Thickly Populated

The average density per sq. mile is 1,015 in Travancore-Cochin, the density varying from 604 in Kottayam district to 1,444 in Trivandrum. The urban density is 4,991 and rural 881. Excluding 2,456 sq. miles of reserve forest, the average rural density comes to 1,219. This average, however, does not fully convey the idea of pressure on land for a proper appreciation of which the study of the distribution of population in relation to the geographical conditions is necessary.

Natural Divisions

The state is divided into three natural regions: highland, midland, and lowland, all the three running north to south almost parallel to one another. Each of these has a distinct soil, rainfall and vegetation which in turn reflect in different agricultural situations in the three regions.

Highland

The highland, covering the eastern portion and containing most of the reserve forests, occupies 45 per

cent of the total area of the state. Annual rainfall in this area varies from 100" in the south to 200" in the north. The climate is cool. And despite the inadequacy of communications, plantation crops like rubber, tea and cardamom are grown.

Midland

The midland, running almost parallel to the highland towards its west, covers 37 per cent of the total area, and consists of uplands of varying elevation through which rivers have carved out long narrow valleys. The rainfall here varies from 55" in the south to 140" in the north. Rice is grown in the valleys, while tapioca, coconut, pepper, ginger and rubber are cultivated on hill slopes. Road facilities are fairly well developed.

Lowland

The lowland lies in the western plain; it is narrow and irregular in shape and consists mainly of sand and alluvium deposits, and covers only 18 per cent of the total area of the state. At places it is swampy. The most picturesque feature of this area is an almost continuous line of lagoons or backwaters lying parallel to the coast. The lagoons or backwaters are connected with the sea at several places and many rivers drain into them. The rain fall in the lowland varies from 35" in the south to 110" in the north. The soil is peculiarly suitable for rice and coconut cultivation. Fisheries, both inland and marine, constitute an important source of food and income. Almost all the cultivable area in the lowlands has been brought under cultivation.

The spatial distribution of population* is rather unequal. Taking the state as a whole about 80 per cent of the population is confined to 47 per cent of the area where the average density is over 750. A better idea of the pressure of population may be obtained by taking into ac-

*Census of India, Vol. XIII, T.C., Part IA—Report.

Natural Regions	% of Total Area	Total %	Population Density per sq. m.	Rural Population %	Density per sq. m.
Highland	45	6.5	147	7	136
Midland	37	50.0	1,381	54	1,279
Lowland	18	43.5	2,448	39	2,021

count the different natural regions.

Density	% of Area	% of Population
Below 300	22.4	4.7
300—750	30.6	16.3
Above 750	47.0	79.0

The pressure is alarming in the lowland and also very heavy in the midland. Besides, within the natural regions themselves, the pressure is not uniform. The lowland in Trivandrum district has a density of 2,930 while the corresponding densities for Quilon, Trichur and Kottayam are 2,424, 2,347 and 1,646 respectively. In the midland, Quilon district with a density of 1,583 ranks first, followed by Trichur 1,379, Trivandrum 1,308 and Kottayam 1,215. In the highland, Trichur has a density of 191 per sq. mile, Kottayam 171, Trivandrum 157 and Quilon 81. The severity of the pressure is conveyed still more clearly by calculating the density in relation to the occupied land.

Density	% of Total Occupied Area	% of Population
0—500	4.5	0.9
500—1,000	1.4	1.0
1,000—2,500	38.1	62.1
2,500—4,000	8.1	23.2
4,000—6,000	1.8	8.8
above 6,000	0.6	4.0

Only 2 per cent of the population live in areas having less than 1,000 density, and 62 per cent live where the density is between 1,000—2,500, and another 23 per cent is confined to areas where the density is between 2,500—4,000, while 9 per cent of it is in areas where the density is between 4,000—6,000, and 4 per cent in areas of above 6,000 density. What a swarming of human beings! A terribly grim picture. Travancore-Cochin is the most thickly populated state not only in India but among the agricultural countries in the whole world.

II Acute Scarcity of Land

The existing land-use pattern is as follows: net area sown 48.2 per cent, current fallow 1.2 per cent, forests 26.9 per cent, area not available for cultivation 8.4 per cent, other uncultivated land excluding current fallow 6.7 per cent, and area for which village papers are not available 8.6 per cent. The total land per capita was 210 cents in 1875. It declined to 157 in 1901, and to 64 cents in 1951. Of the latter, only 33 cents are cultivable. The net cultivated area per capita has declined from 49 cents in 1921 to 30.4 in 1951. The comparable all-India average is 84 cents. Taking the double-cropped area into account, the total cultivated land per capita comes to 11 cents of wet and 21.7 cents of garden land i.e., 32.7 cents. In 1955 the net cultivated area per capita will be hardly 29 cents and by 1961, it will be further reduced to a meagre 25—26 cents.¹ A limited geographical area and a quick growth of population² have brought about an acute land scarcity. Even assuming that the land is exceptionally fertile (which is not the case) the pressure on land is so great and the availability of cultivable and cultivated land is so inadequate that even with the best agricultural returns from land, the standard of living is bound to remain very low.

III Consequences of Heavy Population Pressure

(i) Smallest size of holding. From the land—man ratio, and considering the net cultivated area, the family holding comes to 167 cents only; and taking into account the double cropped area, it comes to 180 cents, consisting of 61 cents of wet and 119 cents of garden land. The average size of plots is as follows—lowland 77 cents, midland 93 cents

¹ Population estimate for 1955 is 9.98 millions, and for 1961, 11.13 millions; 19.97 % increase during 1951-1961.

² The total population has increased from 3.72 millions to 9.28 millions, i.e., by 149.4 per cent, or on an average by 3 per cent per year, during the last half century; and during the last decade, it has increased by 23.7 per cent, the highest rate of increase in any state in the Indian Union.

and highland 179 cents.¹ The distribution of holdings² and of the cultivated area held shows that half of the holdings are upto 1 acre in or less. The proportion of holdings between 5—10 acres is 3.4 per cent,

Size of Holdings (acres)	% of holding	% of area held
0—1	50.3	7.83
0—5	94.1	44
5—10	3.4	13
10—15	1.3	9
15—25	0.7	7
25—50	0.3	5
50—100	0.1	4
Over 100	0.1	18

and of those above 10 acres 2.5 per cent only. The average size of holdings works out to 2.4 acres, the smallest in the country.³ For the agricultural families, the average holdings are 4.1 acres, and for non-agricultural families 1.2 acres. Amongst the agricultural families, (See table on next page)

it is 4.0 acres for land-owners, 5.5 acres for tenants, and 0.8 acre for agricultural labours with land. It

¹ Taking the different districts into account the size is highest in Kottayam district in the case of all the natural regions and lowest in Trivandrum and Quilon districts. In Kottayam the maximum area is under plantation crops. On the whole situation seems to be slightly better in Trichur district, which is mostly low-lying, and the area under paddy is maximum.

² First Five Year Plan, Annexure p. 201.

³ All India Agricultural Labour Enquiry, 1954.

Generally plantations occupy larger holdings; and they are in the hilly tracts. Tea and rubber plantations are bigger in size than those of coffee, pepper and cardamom. Most of the former are owned by companies, the majority of which are foreign concerns. Most of the latter are owned by individuals. Of the total number of 5,446 plantations, 48.4 per cent are of cardamom, 27.8 per cent of rubber, 19.7 of pepper, 2.6 of tea, and 1.5 of coffee. Most of the pepper plantations are small (5—10 acres), and most of the tea are big (50—100 acres), while most of those of rubber, coffee and cardamom are small (5—10 acres) or medium sized (10—50 acres).

is strange to find that the average size is greater in the case of tenants than in that of landowners.¹

The tiny size of holdings is again indicated by the study of the land revenue assessment (basic tax).² About 60 per cent of the land-holders pay upto Re. 1 and 90 per cent of them pay upto Rs. 5; further 9.4 per cent pay between Rs. 5—50, and only 0.5 per cent pay more than Rs. 50.³ (Table on next page)

(ii) Disproportionate Land Distribution. Tables in the previous section show that 50.3 per cent of the land-holders whose holdings are below 1 acre own only 7.8 per cent of the cultivated area. Of the total, 94.1 per cent (whose holdings are below 5 acres) subsist on 44 per cent of the cultivated area; next 3.4 per cent landholders whose holdings are between 5—10 acres occupy 13 per cent, and the remaining 2.5 per cent possess 33 per cent of the area. Out of this, 0.1 per cent having holdings above 100 acres in size occupy 18 per cent of the cultivated area. Analysing the situation in respect of the various livelihood classes, it is seen that the agricultural families which have 74 per cent of the holdings, possess 86.6 per cent, and the non-agricultural families who have 26 per cent of the holdings, possess 13.4 per cent of the cultivated area. The land owners who own 28.7 per cent of the holdings have 47.3 per cent of the area; tenants who have 12.5 per cent of the holdings cultivate 28.5 per cent of the area while agricultural labourers with land who have 32.8 per cent of the holdings scratch only 10.8 per cent of the cultivated land.

The situation is slightly better in Trichur and Kottayam districts in comparison to that in Trivand-

¹ All India Agricultural Labour Enquiry, 1954.

² The land revenue assessment in force in Travancore-Cochin is a nominal basic tax at a flat rate of Re. 1-9 per acre. In order to equalize the burden of tax on land in relation to soil fertility and agricultural incomes, the state levies an agricultural income tax on a slab system: 1st 1500—nil; next 3500—9 ples per rupee; next 5000—Re. 0-1-6; next 5000—Re. 0-2-6, next 5,000—Re. 0-3-6, balance Re. 0-4-0, the exemption limit being Rs. 3,000, and in some types of families, Rs. 6,000.

³ Report of the Land Policy Committee, T.C., 1949-50.

rum and Quilon. But the problem of the concentration of land exists throughout the state. And such a disproportionate distribution of land particularly in an area of acute land scarcity and heavy pressure of population is socially unjust, and cannot be tolerated for long. The signs of intolerance are already noticeable in the popular cry for fixing a ceiling on holdings and for redistribution of land.

(iii) **High Proportion of Non-agricultural Population.** The enormous pressure of population on land has resulted in a very high proportion of non-agricultural population. The average figure for the Indian Union is: agricultural 70 per cent, and non-agricultural 30 per cent, while for Travancore-Cochin state the average comes to 55 and 45 respectively. For the rural population, the average is 60 and 40 respectively. The pattern of livelihood classes* among the rural population is similar to that of the general population. But the remarkable fact is that the percentage of agricultural class is much smaller and that of the non-agricultural class is very much higher than in the Indian Union or in any other state. There are some very significant features to be noted in this connection:

(a) The high proportion of non-agricultural population is no index of the degree of urbanization and industrialization in the state. On the other hand it shows that the heavy pressure on land resulted in a very low agricultural income, and further that agriculture has reached a stage where it can hardly provide livelihood for any more, even at the current low standard of living.

(b) Another peculiar feature is that the percentage of agricultural class is the lowest and that of the non-agricultural class highest in lowland as compared to the midland and the highland. This is, again, an outcome of land-man ratio in the respective regions. In the lowland, high density and a very small extent of cultivated land per capita have pushed cultivation far beyond the optimum level, where it has ceased to be economic, and hence a large section of the population is compelled to seek means of livelihood other than agriculture, particularly fishing and coir industry which afford greater income, and which are made possible by the sea

*Census of India, 1951, Vol. XIII, T.C., Part IA—Report.

coast and backwaters. On the other hand, in the midland and the highland, cultivated land per capita is greater, and in the latter population being only 6.5 per cent of the total, possibilities of agriculture are relatively greater. This explains the differences between the proportion of agricultural and non-agricultural classes in the three natural regions.

In the case of the non-agricultural section of the population, the highest percentage is in the lowland because of the industries in this region. Fishing and coir are important cottage industries in the lowland and factory industries like tiles, cashew and oil are also here. The high percentage of non-agricultural producers in the highland is due to the plantations which pull up the non-agricultural ratio in highland to 46 per cent. The higher percentage under commerce, transport and miscellaneous livelihood classes in the lowland is due to the concentration of population, better communications

and greater degree of urbanization.

(c) The occupational pattern further shows that the cultivation of own land forms the major means of livelihood for only 29.5 per cent of the rural population and 26.3 per cent of the total population. And for other owners of land, agricultural returns, because of the small size of the unit of cultivation, are so low that cultivation has ceased to be their main occupation.*

*The proportion of owner cultivators is different in different natural regions: 22.2 per cent in lowland; 35.6 in midland; and 21.9 per cent in highland. It is smaller in lowland because of excessive pressure and lower returns from land; and lower in the highland because of greater capital requirements particularly for the plantation crops. It is highest in midland because of greater land per capita, and the availability of garden land where cash crops are grown.

(To be continued)

Livelihood classes	% of holdings held	% of area held	Average size of holding

Balance of Payment and the Plan

(Contributed)

SINCE India is neither a closed economy nor a completely controlled one, the need for a separate study of balance of payments in relation to the Plan is obvious. In this note, an attempt will be made to set out the various lines of study necessary. The relations between balance of payments factors and the Plan will, of course, vary with the type and extent of planning. If the Plan covered the whole economy and were worked in physical terms, some estimates of foreign demand in terms of volume would have to be made for each export industry. The demand for imports should be derived after all the other factors had been fixed, and the size of the estimated balance of payments surplus or deficit would be one check on the feasibility of the Plan.

Even if the Plan were confined to the Government sector and was formulated in financial terms, some estimate of the net balance of payments deficits on Government and private account would be necessary in order to check that the assumptions underlying the Plan in regard to prices, the volume of deficit-financing, etc. were not self-contradictory. In order that the operation of the Plan should not give rise to price movements, disposable income with the public should be equal to gross domestic output plus net imports minus Government off-take of goods and services.

Factors Affecting Balance of Payments

The various factors affecting India's balance of payments can be sub-divided thus:

(a) Exogenous economic factors such as the elasticities in foreign supply of and demand for goods entering India's foreign trade, level of incomes abroad and the supply of private foreign capital.

(b) Food supply: Because of the very large part food imports play in India's balance of payments, and because these imports are governed mainly by natural factors, they should be classified separately.

(c) Government policy: This can again be sub-divided into (i) policy affecting direct governmental imports, e.g., imports for Plan projects, and (ii) Government policy affecting the trade of the private

sector, mainly the degree of deficit-financing and commercial policy.

(d) Foreign official grants and loans: These have been classified separately from exogenous factors listed under (a) above, because the initiative and control over the size of foreign grants and loans is at least partially that of the Government of India.

(e) The level of India's net foreign assets at the beginning of the Plan.

Receipts and Payments

Given these factors, one can break up the balance of payments thus (i.e., in effect using a modified version of the Fund's Compensatory Financing Concept):

Given the first four sets of factors described above, the net balance can be calculated. If the balance is a negative one and involves a larger drain on the foreign exchange assets than was planned for, some of the components of the balance of payments must be altered. These changes can be brought about mainly by manipulating (C), i.e., Government policy, and to a lesser extent by (D) foreign aid and loans. If the deficit is much less than planned for, there is equally some need to revise the other factors, e.g., by including further projects under the Plan.

There are, therefore, two main lines of research: (a) to work out values for the factors affecting components of balance of payments, and (b) to work out the extent to which Government policy can alter these magnitudes, taking into account the major subsidiary effects of each policy.

The fact that (a) cannot be estimated accurately, especially for the foreign factors, is not an insuperable obstacle to planning because (b) can be set out as a series of alternatives, which can be called into

action. At this stage, even if (a) is estimated very roughly, some implications for policy can be deduced. The extent to which it can be estimated or controlled will vary with each item of balance of payments.

I. Exports

Both the volume and value will depend on domestic supply (which can be controlled) and foreign demand. The problem is to what extent foreign demand can even be estimated, and whether it is worthwhile to try to estimate foreign income and price elasticities so that given assumptions regarding the level of foreign incomes and export prices, the value of exports can be determined, or whether rough guesses based on a general forecast of foreign incomes together with the knowledge of the specialised market conditions for each commodity are sufficient. Clearly this depends on the length of time for which forecasts are required: the longer the period, the more unnecessary it is to try elaborate analyses of supply and demand conditions. If the period were as short as three or six months, exports could be regarded as a function of export letters of credit. These short period forecasts would be of no use in formulating the plan but they could be used as a guide, together with other information, to immediate policy e.g. whether export duties should be raised or not.

Since exports can only be very imperfectly controlled or estimated, it is necessary to study analytically the various methods by which Government can and does influence them—e.g. export duties and subsidies, subsidies to competing goods (e.g. the encouragement of foodgrain production at the expense of raw cotton or jute; encouragement of handlooms); export quotas, etc. There are two broad lines of enquiry: firstly, the extent to which existing

Receipts		Payments	
A. Exports.		A. Imports.	
		(i) Needed for exports,	
B. Invisibles, mainly derived, insurance and freight, and migrants, Government's investment income.		(ii) Other private,	
		(iii) Government, and	
C. Private capital.		(iv) Food.	
		B. Invisibles, mainly investment income, travel.	
D. Foreign Aid and loans.		C. Private capital, including A.D.'s balances.	
		D. Net drain on foreign reserves.	

Government policies are inconsistent with assumptions made in the Plan, and the extent to which Government can offset foreign factors which are expected to bring about unplanned changes in exports.

2. Imports

These can be broken up into imports needed for exports, Government imports, private imports and imports of food, i.e. Total Imports = $I_e + I_g + I_p + I_f$, e, g, p and f being the components given above in that order. A value of λ such that $I_e = \lambda$ Exports can probably be worked out, both I_e and λE being given in physical terms, particularly for raw cotton and raw jute (domestic production provided for in the Plan will have to be taken into account).

I_g can be derived directly from the Plan.

I_p is determined by the level of income, Government commercial policy and the domestic demand schedule. The level of income will follow from the assumptions made in the Plan, and commercial policy can be changed by Government which will be determined by two possibly conflicting factors, the need to avert inflation and the need for protection. Although it is unlikely that elasticities of domestic demand can be worked out, the experience of the past few years can yield conclusions useful in determining policy, e.g. it may be found that given a certain protective policy, the elasticity of demand both in terms of income and to a lesser extent of the ratio of foreign to domestic prices, is limited—i.e. since net imports cannot be raised above a certain level, given protection, the scope for deficit financing is limited.

To what extent food imports can be forecast i.e. to what extent good harvests follow a known pattern, is not a matter for economists to decide.

Although, apart from food, the physical quantities of other imports may be estimated in the ways described above, foreign prices can only be guessed at. (For raw jute, at least, the effect of our Plan on foreign prices must also be taken into account). The is another major element of uncertainty in the Plan, whether it is drawn up in solely financial terms or not.

3. Invisibles

These items can clearly be forecast, if at all, only by empirical methods. The projection of past

trends (e.g. for profits) and use of special knowledge for each item (e.g. of exchange control regulations in other countries for emigrants remittances) must be used here.

4. Private Capital

Here again, past trends will have to be roughly projected, supplemented with knowledge of specially large projects forthcoming, such as the steel projects and the oil refineries which have to be planned some time in advance. Since foreign capital is mostly repatriable, the total volume of foreign capital invested in the country should be borne in mind when calculating the minimum level of resources necessary. Of course, the estimates of net inflow of private

capital and of net private investment income payments should also be considered.

5. Foreign Reserves

The minimum level of foreign reserves required must be determined, bearing in mind the following considerations—

- (a) the need to cover seasonal movements in the foreign balances of exchange banks, firms etc.;
- (b) the need to provide for a certain amount of repatriation of foreign capital; and
- (c) a possible rise in domestic demand for imports when the tempo of development and money supply have increased.

Hyderabad State Bank

(Constituted under the Hyderabad State Bank Act with Liability of Members Limited)

Paid-up Capital :	O.S. Rs.	75,00,000/-
Reserve Fund	"	76,00,000/-
Deposits as on 30-9-1954	"	16,48,35,000/-

Dhoti Topi Jamuna Par

—Demand for a Punjabi Suba

Sadhuram Sharma

IMMEDIATELY after independence, the Congress Government appointed a Linguistic Provinces Commission in conformity with the earlier commitments of the Congress for the reorganisation of provinces on a linguistic basis. The Commission, which reported in December 1948, recognised the strong demand for the creation of such provinces. But as a state of emergency existed then, the Commission recommended that when former princely states were integrated and the country was fully stabilised, some of the provinces should be re-formed on a linguistic basis. Subsequent developments, however, brought out the dangers inherent in the linguistic re-organisation of states and it is important in this context to note that the States Reorganisation Commission (Dec. 1953) was specifically asked to bear in mind the preservation and strengthening of the unity of India, in addition to the financial, economic and administrative problems affecting the whole country while making its recommendations.

One such alarming development which presumably led the Government to caution the State Reorganisation Commission in this manner was the belligerent demand for a 'Punjabi Suba' by the Akali Party in Punjab and PEPSU. The demand is for the amalgamation of the seven Punjabi-speaking districts of Punjab with PEPSU, for forming a Punjabi-speaking State along the border. The merits of the proposal need not detain us here as the question of linguistic reorganisation is being examined by the Commission. The majority of the people in Punjab however have strong apprehensions about the formation of a Punjabi Suba. The motive behind the demand is distrusted by the Hindu majority community as the demand comes from a party which as far back as 1937 is alleged to have negotiated with Jinnah for an Azad Punjab as a buffer state between India and Pakistan. Strange as it may seem, Jinnah refused to oblige and was not prepared to regard Sikhs as more than a sub-nation. How far the story is true, few can say. Nevertheless, it is believed by a substantial number of Sikhs themselves and Akalis, with all their

bravado, have never dared to refute the charge of conspiring with Jinnah, a charge that has been levelled against them by responsible leaders, both Hindu and Sikh.

Fear of what happened after the partition still lurks in the minds of the Hindus who are naturally averse to any change of the type demanded. The attitude of the Hindus to the agitation for a Punjabi Suba, however, has till recently been passive and Akalis have been able to overcome what little resistance there was on the specious plea that such fears were groundless. They have themselves to blame for the militant manner in which they have been pushing forward their demand.

Main Aim

No doubt Master Tara Singh, the Akali leader, has been telling the Hindus that Punjabi Suba was to ensure the free growth of Punjabi culture and Punjabi language, neither of which, however, is a private property of the Sikhs and also that the proposed State was no different from the one established for the Andhras. None was assured, for in the same breath, though almost in an undertone, Master Tarasingh had been urging the Sikhs to be prepared to fight for the Panth's progress. The difference between Tara Singh's Punjabi Suba, and Andhra is not difficult to see. He himself made the difference still clearer, when he divulged in an interview with Shri Bhimsen Sachar, the Punjab Chief Minister, that he did not merely want a State where Punjabi culture and language could develop fully and freely but a State where Sikhs would be in a position to look after Hindus (or Banias, as they are derisively called in the face.) That was sufficient to confirm the suspicions long held by the Hindus that the main aim of Akalis was to gain a political advantage over them.

It may be relevant here to recall that after the Sachar Formula was accepted, Punjab has become a bilingual State. According to this formula, the medium of instruction for preliminary education is either Hindi or Punjabi, depending on the region. In the secondary stage, however, students are required to learn both the languages. This has been

accepted by all eminent Sikh leaders, but it has not satisfied the Akalis who must have a State where they are in majority. Hindu fanatics, too, could not get reconciled to Sachar's synthesis. Now as the Akali Morcha against the ban on shouting of slogans went on, there was a deputation of prominent Sikh leaders to complain that most of the schools being in Hindu hands, Punjabi was not being taught in these schools. The complaint to some extent is genuine and the Prime Minister has assured the Sikhs the full implementation of the Sachar formula, along with the removal of other grievances of discrimination against and ill-treatment of Sikh public servants.

Counter Agitation

Against this background is to be viewed the present tension. The proposal for a Punjabi Suba has become a purely communal question. A counter move has also been recently started by some Hindu leaders for the creation of a Maha Punjab. Maha Punjab or Greater Punjab is to embrace the Punjab, Pepsu, Himachal Pradesh and parts of Northern Rajasthan and Delhi State where the majority of the population is Punjabi. There is not much positive response to the appeal, but as a counterblast to the Akali demand, the new front gathers crowd around it and has now become the rallying point for opposing the shouting of linguistic and political slogans by the Akalis while taking out religious processions which Akalis started after getting control of Gurudwaras last year. Thus the move and counter-move for Punjab Suba carry the risk of communal clashes of the type witnessed in Ludhiana and Amritsar. In Ludhiana, complete anarchy prevailed for a few hours in the big bazars of the city in December last following an Akali religious procession in which the processionists shouted political slogans. Counter-clogans were raised by the Maha Punjab front people. One of the slogans Akali processionists were heard shouting was "Khanda Karbhogu, Nehru Bhaju Gu" which means that when swords clash, Nehru will fly away. Stones were thrown on the processionists in Hindu Bazars; there was an open

clash and some policemen were also injured along with Hindus and Sikhs. Some miscreants tried to loot shops also. It is because of these unhappy incidents that the Punjab Government banned the shouting of linguistic slogans in processions and demonstrations in order to "control the uncontrollable elements which generally collect in a crowd". Incidentally, it is the first strong step which the weak and internally divided Punjab Government has taken against unruly elements. Akalis have come out with a Morcha to save democracy and civil liberties. They have found their sympathisers throughout India among champions of civil liberty and the more ardent advocates of linguistic question, including the executives of the All-India Linguistic States Conference. No doubt the civil liberties of the people must be safeguarded and too much recourse to Section 144 must also be avoided. But for that very reason, wilful defiance of law and breach of peace has to be thwarted. Civil liberties and democracy are not just slogans to be shouted for undermining civil liberties and democracy.

Khalsa Dal's Opposition

According to a recent statement of the Akali Dal, about 8000 Akalis have been arrested in connection with the two-month-old Morcha. The Morcha, however, is limited to cities like Amritsar, Jullundur and Ludhiana and there has been little response from rural areas. But the number of arrests made so far suggests that Akalis have been able to work up the feelings of sizeable sections of Sikhs in the cities. There is, however, the other side of the picture too. Pepsu has not responded to the Morcha, contrary to all expectations. Some days after the Morcha, Khalsa Dal, a body of Sikh nationalists with a significant following among Sikhs, decided to offer a counter Morcha to stop Akalis from 'sacrilegious' activities in Gurudwaras. Such a Morcha would have made the situation worse. But nationalist Sikhs have been prevailed upon by the other parties not to take such a step. Akalis, too, were alarmed and gave adequate assurance that they would desist from using Gurudwaras for their political activities. The Sikh Convention at Amritsar condemned the Morcha as ill-conceived and harmful to Sikhs who have equal opportunities and are occupying important positions in Government and business and industry.

As already mentioned, the question has become communal, and is fraught with danger. Thus when the Prime Minister calls the Akali Morcha "vulgar, highly improper, unwarranted, nonsensical, obnoxious and born of parochialism", he knows what he means, being the uncompromising fighter against communalism in any shape. It is however an eminent Sikh leader, Sardar Sant Singh, ex-Indian Ambassador to Ethiopia, who challenged that the 'Akali Morcha' was Pakistan inspired, to which Akalis have taken a strong exception. The basis for Sardar Sant Singh's attack is not sufficient to warrant any such judgment. He bases his charge on the circumstances preceding the Morcha, like the visit of Giani Kartar Singh, the man behind Master Tara Singh to Lahore. Any such conjectures must be discounted. But the sudden goodwill the Pakistani press started demonstrating towards the Sikhs, and the invitation extended

to Akali leaders to visit Pakistan may not be without significance. It was interesting to find an extreme anti-Sikh Urdu daily from Karachi extolling the common traits between Muslims and Sikhs. Both the communities, the paper goes on to say, are brave and hate 'bania' crookedness and hypocrisy and of course both hate to be ruled over by the cowardly 'bania'. It may be noted here that 'bania' is not used here for shop-keepers but for all the Hindus. Whether there is really anything common between Muslims and Sikhs or not, certainly there is a lot in common between Akalis and the Muslim League in their communal and parochial outlook. However much Akalis may be able to convince others about their nationalism, they cannot convince their Punjabi brethren about the sincerity of their demand so long as they continue to hum among themselves 'Dhoti, Topi Jamunapar', maybe in their sadistic humour.

Around Bombay Markets

Bullish Fervour

Thursday, morning

THE stock market is active. The lead was given by Madras where plantation shares advanced sharply. Calcutta, which was favourably influenced by enhanced dividends followed suit and at the end, Bombay also joined. Dalal Street which had been obsessed with Government policy, shook off its lethargy and the professional bear operators who held the field in the last three months had to stage a retreat. With the favourable economic outlook and hopes for higher dividends in steel, bulls have returned to the fray and prices of all leading industrial counters have advanced rather sharply. The oversold position of the market accentuated the rise and T T K added further impetus by his latest views on nationalisation and rationalisation. The performance of the market has been encouraging, though operators are inclined to wait and see what new ideas Pandit Jawaharlal Nehru brings with him from the Soviet Union.

The New Plan Loan

The new 3½ per cent Plan Loan 1965 for Rs. 100 crores has been quite a success. Total subscription amounted to Rs. 103.65 crores out of which Rs. 57.87 crores were against conversion. The State Governments will now be coming to the market for borrowing to the tune of about Rs. 30 crores.

The gilt edged market has been ruling quiet while the new loan is placed at Rs. 98-7-6 to Rs. 98-8-0. Bank shares have been featureless but there have been occasional enquiries about insurance counters. Electricity shares were ruling steady.

Textiles and Steel

In textiles, selective support was forthcoming. Kohinoor were in demand while Century as well as Dyeing shaped well. The Chairman of Simplex Mills has assured the shareholders that the dividend would be maintained, besides building up adequate reserves.

Dividend on the steel ordinaries is to be decided in a few days. Expectations are for Rs. 10-8 to Rs. 11 and there are optimists who feel that the directors would step up the dividend to Rs. 11. Bull operators in Indian Iron have become some-

what aggressive, and raised the scrip to Rs. 35-12.

Other Counters

In the miscellaneous section, Bombay Burma Old had a sharp spurt to Rs. 507-8 on the interim dividend being raised to Rs. 11-4, Rs. 6-4 last year. A C C have been firm part and it looks as if they are going to move up further. Scindia Steams have again slumped, on rumours that the dividend will be passed over this year. Tata Chemicals have gained from extension of protection for a further period of three years. Sugar shares have been ruling steady.

Cotton Responds

The cotton market is in good shape following the recent Government announcements of reduction in export duty, fresh export quota and the maintaining of status quo in the matter of floor and ceiling prices during the next cotton season and the abolition of the quota system of distribution to the mills. Futures as well as spot prices have strengthened considerably. As against the low level of Rs. 553-8 recorded in the second week of April, I C C August was bid up as high as Rs. 609 this week. In view of the dearth of tenderable varieties, the undertone continues firm, while scarcity of rains reported from several cotton growing tracts provided additional support. The new crop contract which will be for 13½" staple length is reported at a premium of Rs. 13 to 15 over the August contract.

The reduction in export duty on raw cotton from Rs. 150 per bale to Rs. 125 bale has been welcomed in trade circles. However it was hoped that the same special treatment would be meted out to Saurashtra cotton but these expectations have not been fulfilled so far. With the further release of 1½ lakh bales, the export quota for this season now comes to 4½ lakh bales, out of which a little over 2 lakh bales have already been shipped. Out of the new quota, one lakh bales will be from Dollera, Mathla, Kala, Deshi, C P I & C P 2 Deshi and C I Deshi, the maximum staple length of which shall not exceed 3¼". Remaining 50,000 bales will be from varieties of India cotton, except Bengal Deshi, up to and inclusive of 25½" staple length. The previous stipulation that 35,000 bales out of the export quota of one lakh bales released in the month of April, should be of Saurashtra cotton, to be shipped from the Saurashtra ports only, has now been removed. Any variety can now be exported against this licence except, of course, Bengal Deshi. Following the above announcement, fairly good export business has passed while mills have also been active on the buying side.

The New York cotton market has been fluctuating narrowly for some time past. The export policy for the next season is awaited. Though no decision regarding subsidy has been taken, it is believed that the U S

Price Range in 1955—Market Leaders

	High	Low	July 7
	Rs. as.	Rs. as.	Rs. as.
Tata Steel Ordinary	246 0	225 12	241 8
Indian Iron	36 4	32 1	35 6
Bombay Dyeing	493 2	452 8	486 4
Kohinoor	337 8	307 0	336 8
Century	397 8	354 0	395 0
A C C	188 0	167 0	187 4
Belapur	325 8	299 0	312 0
Bombay Burma	507 8	436 4	506 4
National Rayon	216 0	189 0	202 0
Premier Construction	165 8	143 12	152 0
Scindia	16 9	14 8	14 11
Tata Chemicals	17 8	13 0	14 12

Government will not take any special measures to boost up exports which this season have reached 3½ lakhs bales.

Burst of Activity in Oil Seeds

A month ago, buyers had gone on strike in almost all the commodity markets as well as on the stock market. The bullion market was the only exception. Markets were in an oversold position and prices bumped along the bottom. All of a sudden, the situation changed. There was a burst of activity and the first signal for the upswing in oilseeds was the postponement of the threatened increase of 35 per cent surcharge on shipping freight, following the strong attitude adopted by the Government of India towards the policy of foreign shipping concerns.

In the meanwhile, large export business in castor oil passed with USA and some of the bear operators were caught unawares. Castor seeds, September delivery, as a result, recorded a steep rise of Rs. 25 per candy within a short period of fortnight. Groundnuts which till recently displayed a vacillating tendency, despite brisk exports of groundnut oil and H. P. S. groundnuts, followed suit and prices touched a new high, after several months. Linseed also made considerable headway on covering by shippers against their overseas commitments in oil but later reacted by a rupee, due to somewhat discouraging foreign advices. Of late, America has been a keen buyer of castor oil in view of the crop failure in Brazil this year and this has provided the main drive for the price rise.

Near Distant Prospects

Kardiseeds and nigerseeds have also recorded fair increases while gingellyseeds have received considerable encouragement from the recent export quota for oil as well as seeds. Cottonseeds which had no buyers some time back have also looked up. It is to be noted that the unsatisfactory state of the monsoon this year so far has also been instrumental in reviving bullish tempo in the market, in view of the fact that the bulk of the floating stocks has been already depleted as a result of heavy exports this year.

Shri Ramdas Kilachand, President of the Bombay Oilseeds Exchange, has objected that the target of 67 lakh tons for oilseeds in the Second Five Year Plan would not be adequate in view of the increase in population as well as the need for

increasing export earnings of the country. He feels that the target should be raised to 75 lakh tons and has suggested several measures to overcome shipping as well as transport difficulties while pleading for a long term export policy.

Prices Rebound

Groundnuts bold spot which were sold as low as Rs. 19-12 per cwt. in May, have been taken up to Rs. 24-8 while the August-September position, after touching Rs. 25, has reacted to Rs. 24-8. Groundnut Oil August delivery is quoting around Rs. 13-6

Around Calcutta Markets

Irregular Trend

Wednesday, evening

AFTER the spurt in equity prices in the last few weeks, the Calcutta Stock Exchange seemed to be consolidating its recent gains during the current week. Equity prices have not declined appreciably. Despite occasional profit-taking, the prices have been well maintained. There is no selling pressure. But, in the absence of fresh buying support, equities have developed an irregularly lower tendency. That the market should pause in its upward journey to consolidate the ground recently gained, is not surprising.

Success of the new loan was not unexpected. But the stock market's attitude to the Government's borrowing programme has changed. It is now realised that the Government may have to re-enter the market later. There is, for one thing, the need to pay off shareholders of the Imperial Bank. And, it is now being emphasised that the enlarged deficit financing must lead to an increase in the volume of borrowings through treasury bills. That does not necessarily mean that stock markets may be adversely affected through increased governmental borrowings.

Factors For Rise

Bank deposits are swelling. Due to deficit financing, the volume of money supply will gradually increase. At present, money market resources have improved substantially to absorb higher treasury bill borrowings without any strain. Long-term loans by the Centre and by the States raise different problems. But informed opinion is inclined to the view that last year's experience is not likely to be repeated. On current indications, there is no reason

per quarter after touching Rs. 13-8. Linseed spot continued firm at Rs. 26-8 while August-September position, after rising to Rs. 26-12 has receded to Rs. 25-12. Castorseeds Madras quality have been lifted up to Rs. 20-8 from the low level of Rs. 16-10, this year, while commercial quality oil has moved up to Rs. 11-4 per quarter from the bottom touched at Rs. 8-6. Castorseeds September delivery which were sold as low as Rs. 73 have rebounded to Rs. 105.

The outlook for the oilseeds market mainly depends on the monsoon.

to apprehend that enlarged governmental borrowings will lead to a shortage of inevitable funds for employment on stock markets.

Equities have developed an irregular tendency not because of such fears, but because of possible developments relating to certain industries. Spurt in equities in the last few weeks was due mainly to the improvement in Indian Iron and in Tea shares. Indian Iron remain steady. Nor are Tea shares much lower. But, throughout the week, there has been lack of fresh buying support for Tea shares.

Export auctions for tea continue to be encouraging. Even prophets of gloom are now conceding that their pessimistic predictions seem exaggerated. Average export auction prices are well below last year's boom levels. But it became evident some months ago that this season's prices would be lower. Investors, therefore, were prepared for a fall in tea prices, and hence in the industry's earnings and profits. In the circumstances, the fact that export auction prices are well above expectations should have a "bullish" effect on Tea shares.

Tea Prospects

Such expectations have not yet been falsified. Recent spurt in Tea shares was partly due to this factor. Final dividend payments for 1954 helped the rise in Tea shares. Some companies have yet to announce final dividends. But this influence will be gradually losing its impact on Tea shares. This explains why the rise in Tea shares has been halted in the current week.

At the moment, the market is arguing whether the current levels

for Tea shares can be considered as safe. There are some who argue that, as this season's export auction prices have not fallen as much as formerly apprehended, undue pessimism is not warranted. There is something in this argument. But it ignores the psychological repercussions of falling prices on investors. Undue pessimism may not be warranted. But it is difficult to appreciate how current quotations for Tea shares can be maintained.

It will not be denied that this season's profits will be lower. Nor will it be denied that the industry's burdens will increase. Last year's fat dividend disbursements are provoking labour demands for bonus and higher wages. Tea workers in the Darjeeling districts have already been promised higher wages. By September, the effects of final dividend payments will be over. By then also, when the second flush of tea becomes available, auction prices may decline. These are possible de-

velopments which may not justify a "bullish" outlook for Tea shares.

Indian Iron

It would be wrong to presume that last week's spurt in Indian Iron was due to Government's announcement relating to an increase in the selling prices of iron and steel. This increase does not affect the iron and steel companies' earnings favourably. Last week's improvement was due to rumours of a higher dividend. It was accelerated by active "bear" covering. As doubts developed about higher dividend payments, weak holders sold out. As a result, Indian Iron developed an irregularly lower trend this week.

Output at the Burnpur Works during the year to March, 1955, were higher than that of the previous year. This does not necessarily mean that dividend payments will be higher. This Company has substantial prior charges to meet. For the first quarter of this current year, the output is lower. Sometime ago, New Delhi let it be known that this year's output of the existing iron and steel companies may be lower due to technical adjustments involved in the plans for expanding production. But the lower output for the quarter to June last has not had the effect of halting the upward trend in Indian Iron.

Jute Dividend

Though five of the Bird-Hellgers group of jute companies have increased dividend payments for the half-year to March last, Jute shares are not moving up. During that period, the mills worked longer hours. Output was, therefore, higher. But the mills had to buy raw jute at rising prices during January to March of this year. This factor was in operation for the first half of the current half-year also. This partly explains the hesitant trend in Jute shares.

In the last few weeks, both raw jute and jute goods have fallen sharply. Fall in raw jute is easily explained. Arrivals of new crop jute in terminal markets have been rising. Current estimates are that this season's total supply of raw jute will be more than comfortable. This season's crop is quite satisfactory. But a tentative estimate of the prospective demand position does not corroborate current fears that there will be such a glut in raw jute this year that prices will fall to unduly low levels.

It is only to be expected that jute goods will fall along with a decline

in the prices of raw jute. There was a sharp recession in jute goods prices last week. There has since been a slight recovery. But the price trend remains "bearish" because of growing fears that mill stocks of jute goods at the end of June may show an appreciable increase. Data relating to jute goods will be released by the time these lines appear in print. Immediate fluctuations in the prices of jute goods will depend on the data relating to stocks with the mills.

Some of the shares in the Miscellaneous and Engineering groups have been rising either on issues of bonus shares or on expectations of such issues. There are two reasons for the recent strength in Texmaco. It has been decided by the Stock Exchange authorities to add this scrip to the forward list. There are rumours that Texmaco may expand the capital structure by issuing bonus shares.

After Russia...

WHAT did Pandit Nehru find in Soviet Russia and Yugoslavia?

What impressions did he carry with him from his triumphal tour? Every item of news is being scanned carefully for possible clues that might give an inkling of the Prime Minister's thoughts. In due course, of course, it may be expected, Pandit Nehru will report his tour impressions to the public. Meanwhile, one must wait and watch and make out whatever one can from hints dropped or scraps of talks. The Stock Exchange has taken courage from Pandit Nehru's observation that food is plentiful and cheap in Soviet Russia, but consumer goods are expensive and not so easy to come by. From this, imaginative operators concluded that there was no reason to fear any drastic change in the Government's industrial policy; whether from the same premise the conclusion is warranted or not that collective farming should be a model for India's agriculture does not, of course, interest the Stock Exchange operator.

But the relief of the speculators has not been so long lived. On the following day came reports of his talk with the Planning Commission in the course of which Pandit Nehru spoke enthusiastically, as is his wont, of workers' participation in the management of industry which he had observed both in Soviet Russia and Yugoslavia. Now Panditji is in the habit of taking his lessons in public; his soliloquy today may become public policy tomorrow. Giving a graphic account of all that he had seen and studied during his tour, Pandit Nehru spoke admiringly of the great discipline among the workers in Russia and of the Workers' Councils having their due share in running the Yugoslav industry.

Another point was made by the Prime Minister, viz., that the Russians, while keeping the five year perspective fully in view, concentrated on the current year's plan and sought to fulfil it.

Since it was Comrade Saburov, the Chief of the Gosplan, who told him so, we will hear more of it and indeed more of Russian ideas of planning. But it may not be out of place to mention here in passing that with the Draft Plan-frame before the country, many of its recommendations, which have been provisionally accepted and are being discussed, would be unmeaning unless the long term perspective were also kept clearly in view, such for instance as making the country go in for inefficient methods of production, pending such time as we can have resources to organise them better. The emphasis on heavy industry, at this stage, is also unmeaning except in the light of the long term perspective we have in view. The question keeps on being asked and cropping up now and again, what are we going to do with the products of heavy industry and with capital goods generally, if we have no programme of mechanisation and are going to stick on to hand and household industries and low efficiency production? Of course, no long term perspective can condone or justify any slackness or indifference in the performance of the tasks on hand, not doing what has to be done here and now, which means concentrating on the job at hand and achieving what we have set ourselves to achieve in the immediate future, namely, the programme for the current year. So there is not much in it that

is not fairly obvious and unexceptionable.

Workers' participation, however, is quite a different matter, for it involves a sea-change in attitudes, and in the relation between industrial workers and employers. The Industrial Advisory Committee which is meeting at the end of this month has no such proposal on its agenda. This Committee has yet to tackle problems which should have been resolved long ago such as improving customs classification and rationalisation of import policy. This is of course only one of the problems that the Committee will have to consider. But it gives an idea of the sort of difficulty which industrialists have still to contend with. From frequently reiterated statements of policy, there is a general impression among the outside public that Government is at least duly aware of the necessity of

helping industry to get its raw materials and that import policies and tariffs are attuned to this purpose. They are not. Import duties on raw materials are high, sometimes fantastically high, while imports of finished products made from them are allowed duty free or have to pay only a nominal duty. This is only one of the many problems that industry has to face today. Shortage of various types of steel, and the failure to provide industry with these basic materials is a factor inhibiting development in engineering industries which persists despite the pool arrangement and the higher price now charged to consumers. Much of the steel imports are for special purposes, most of it under American Aid Programmes, which does not help our engineering industries. High import duty on such steel is a matter of justifiable grouse on the part of industry. Government purchase policy is yet another, but this is a hardy perennial which crops up invariably whenever problems of industry are discussed and so is the price preference claim for domestic suppliers. Industry is also worried about transport and is fully convinced that railways will prove a serious bottleneck unless there is a totally new outlook in planning transport in the Second Five Year Plan. There is also the problem of replacement of machine tools which are "very old and antiquated", calling for a nation-wide inventory to be taken immediately so that both Government and industry may be aware of the magnitude of the problem of replacement.

But while industry still complains of over-legislation in matters affecting labour-management relationship, and the Prime Minister talks about workers' participation in management, Shri Giri's minimum demand that the present system of compulsory adjudication should be replaced by collective bargaining receives scant attention.

The six points laid down by Shri Giri for labour in the Second Five Year Plan are:

1) The employer should recognise that the trade union movement not only had come to stay but also was a highly essential and useful instrument for securing harmonious relations between the two partners in industry.

2) Without implications and limitations, there must be an attempt on the part of the employer and the workers to secure one union for one industry.

3) Standing orders for each industry must be drafted with the approval of both parties.

4) A joint standing machinery must be formed for each industry to iron out differences and disputes that may arise in industry.

5) The workers and the employers should resort to conciliation, and if it failed, mutually agree to arbitration. Arbitration should be at the level of industry without the interference of extraneous authorities, Government or Judiciary.

6) There might be an industrial court on the basis of the United Kingdom Industrial Courts Act of 1919.

Labour's association with industry can be brought about in two ways—one is that of voluntary agreements. Surely when Pandit Nehru talks about it, first things should come first, and determined effort should be made to break away from statutory regulation of these relations to one of voluntary agreement and mutual understanding.

"One has no protecting
power save prudence."

Juvenal.

Four Good Omens

PEACE-LOVING peoples throughout the world will welcome the growing realisation that peaceful co-existence is the only alternative to total annihilation in an atomic war. Ever since the "cold war", Russia has always had the diplomatic initiative in offering peaceful co-existence as a basis for easing world tension. Opinion in France has always been in favour of an understanding with Russia. With the vivid realisation of the devastating, destructive potentialities of the hydrogen bomb, Britain has been urging America to join in a final attempt to discover the possibilities of reaching an agreement with Communist Russia. After prolonged hesitation, America agreed to participate in such an attempt to explore the prospects of an understanding with Russia to ensure world peace.

That was how the Big Powers agreed to have talks "at the summit" later this month. Tribute is due to President Eisenhower for dispelling doubts about America's negative approach to the forthcoming Geneva discussions. America has been insistent in her demand that Russia must prove her peaceful intentions by deeds, and not merely by words. Acceptance of a peace treaty with Austria was the most recent of a series of Russian gestures in response to America's demands. Yet, even after the Western Powers' invitation to Russia to join in talks "at the summit", the American Secretary of State has repeatedly reminded the world of America's mental reservations in participating in the Geneva talks. Such a negative attitude on the part of America provoked the First Secretary of the Soviet Communist Party to indicate that Russia was anxious to reach an honest agreement with the Western Powers on outstanding world issues. President Eisenhower's prompt reciprocal assurance that America was participating in the Geneva talks "in a conciliatory and friendly attitude" will be welcomed by the common man in all parts of the world.

President Eisenhower's recent statements disclose a realistic assessment of the changed post-war world situation. Implied acceptance by the Head of State in America of Communist Russia's post-war world status and the annihilating consequences of an atomic war encourage the hope that the principle of co-existence will be the basis of Geneva discussions for an agreement among

the Big Powers. Peaceful co-existence means and implies simultaneous existence of Democracy and Communism in peaceful competition with each other. In seeking peaceful co-existence, Communist Russia does not reject the fundamental Marxist faith in world Communism. What she undertakes is an obligation to ensure such a state of world affairs in and through peace, and without the use of force. It is reassuring to know that the Head of State in America, the dominant NATO partner, is prepared to accept this challenge in competitive co-existence.

To reach an understanding on these conditions and circumstances, there must be an agreed arrangement on disarmament. It is inevitable that, on the eve of the Geneva talks "at the summit", the question of disarmament will monopolise attention in both Russia and in the Western countries. President Eisenhower has made it clear that disarmament will receive topmost priority in the agenda for the talks "at the summit". In anticipation of such an agenda, Russia has already let it be known that she accepts the Western Powers' proposal for reduction, control and inspection of conventional armaments. Their proposal relating to atomic weapons has already been accepted by Russia. It will not be easy to reach an agreement on disarmament. But there will be hope that the realisation that peaceful co-existence is not possible without a prior agreement on disarmament will be the urge to both sides to be accommodative and conciliatory.

Once an agreement on disarmament is reached, the problem of what Mr. Dulles calls the menace of international Communism loses much of its menacing significance. Here, Prime Minister Nehru's efforts have not been unsuccessful. In joint statements recently issued in Moscow, Warsaw and Belgrade, the principle of non-interference in the internal affairs of sovereign nations—one of the major principles of Panch Shila—has been repeatedly stressed. In his speeches in Russia, Poland and Yugoslavia, Pandit Nehru has emphasised over and over again that non-interference in the internal affairs of nations is an essential condition of peaceful co-existence. Russia has undertaken a solemn obligation not to interfere in the internal affairs of any country for any social, political, economic or ideological reasons.

Pandit Nehru has assured the world that he is convinced of Russia's intentions to honour this pledge. Those who doubt Russia's intentions on this aspect of the world problem need the reminder that Russia has undertaken an obligation not to interfere in the internal affairs of other countries without a reciprocal assurance by the Western Powers, and particularly by America, that they will dismantle their elaborate propaganda machinery and arrangements aimed at wooing the Eastern European States away from Communism.

There will, or can, be no quarrel with the decision to give the topmost priority to disarmament in the forthcoming talks at Geneva. It is equally inevitable that Germany will be the second most important problem under discussion at Geneva. But there are indications that the Western Powers would like to restrict the talks "at the summit" to Europe to the neglect of Far Eastern issues. There can be no world peace without peace in Europe. Peace will elude Europe, and hence the world, as long as the German problem is not solved. But it is equally true that there can be no world peace without a settlement of Far Eastern issues. Formosa, the situation in South Vietnam and Korea are some of the specific Far-Eastern issues which must be settled in the wider interest of world peace. There is, above all these specific problems, the fundamental issue of Red China's admission to the United Nations with all its logical implications. And yet these are the problems which the American Secretary of State has, by implication, excluded from the agenda of the Geneva talks. Admittedly, the talks "at the summit" should be mainly about the fundamental causes which are creating world tension. But to exclude the problem of Red China's admission to the comity of nations or the various Far Eastern issues in dispute from discussions at Geneva is a wrong approach to any attempt at reaching an agreement between the Western Powers and Communist States. Signs are not lacking that the Western Powers are sincere in their efforts to come to an understanding with Communist Russia. There is, however, no indication yet that America is prepared to discuss all the relevant issues in Europe as well as in the Far East which perpetuate the "cold war".

Weekly Notes

Quitting Coastal Trade

INCREASE in efficiency of a machine, a ship or a mill—the acquisition of any of these also—helps everyone else except their competing agents. Now we have been made familiar with the case of increasing efficiency where it injures others, e.g., mills displacing hand-looms; but who is displaced or who suffers as a consequence when a high powered ship, an oil-burner, which is good for the overseas trade is shifted from the coastal trade in which a not so modern coal burner will do just as well, and would in fact be cheaper to run? The question has been raised in a highly provocative manner by the reported decision of Great Eastern Shipping to quit the coastal conference.

This step the Great Eastern has been provoked to take because a Committee of the Ship-owners decided that (1) no Indian flag vessel should be time-chartered to foreign shipping companies; (2) there should be no 'poaching' into foreign runs where Indian companies were members of the conference and (3) chartered vessels not carrying Indian flag should not be allowed to be substituted for 'owned' vessel on the coastal run. The charge of poaching is most amusing since tramp shipping is by no means an Indian monopoly and Indian members get only a microscopic fraction of the freight carried by the Conference lines. Great Eastern will have done something, if it succeeds in provoking others, including the Transport Ministry of the Government of India, to do some thinking on this vital question of resource utilisation.

Kolar Gold Mines

THE decision of the Mysore Government to take over the Kolar Gold Mines, which are at present under the management of a British Company, John Taylor and Sons Ltd., before the expiry of the Agreement (which is to run upto 1970) does not imply any change in economic policy. The State Government complains that the assets of the company were unduly inflated when the present management took over and also feels that it is not getting as much from the gold mines as it should and has plumped for nationalisation as a means of augmenting its revenues. And it has

been encouraged by favourable circumstances too: in the first place, the decision does not involve any constitutional difficulties.

The facts: the State Government came to an Agreement with the present management in 1935, renewing the lease for a period of thirty years from 1940. In 1949, the Government abolished the gold duty imposed in 1940, and it was agreed that the company should pay to the Mysore Government 75 per cent of the net surplus, in addition to royalty. Some time back, the State Government alleged that the company had violated the provisions of the Agreement; and therefore a committee consisting of officials of the Government—no representation being given to the company—was appointed in 1954, for reviewing the working of the Agreement. The Committee reported in February 1955, that the company had "honoured the Agreement more in the breach than in the observance", and among the deficiencies pointed out were: (a) working costs had been unduly inflated; (b) progress of Indianisation of staff had not been satisfactory (c) adequate provision had not been made towards depreciation etc. etc. More than all these, perhaps the greater grievance was that while shareholders had received as dividends about Rs 34 crores from 1881 to 1953, the Government had got only Rs 16 crores. In order to raise the latter's share, the Committee recommended that the proportion of profits to sale proceeds should be increased from 5 to 10 per cent.

The Company's case was that 90 per cent of the increase in working costs was beyond its control, that it had made considerable progress towards Indianisation, 137 out of 229 covenanted posts being held by Indians, and if the Government had not got more by way of royalty, it was because the price of gold had gone down from Rs 300 per ounce at the time of the Agreement to Rs 228 in 1953. Mysore was getting less for another reason—income-tax on the profits of the company which was formerly payable to it was now being paid to the Government of India.

Though gold mining is a highly complex and technical undertaking, the issues raised, however, are not technical. They are the usual ones which arise whenever parties to an

agreement fall out. In such circumstances, the usual procedure is to submit the dispute to a third party. That the State of Mysore happens to be one of the parties to the dispute, does not necessarily call for a different procedure. Mysore has a lot of experience in State enterprises, but that is not relevant either. It may not want to renew the Agreement in which case the present Agreement should be allowed to run out but it is difficult to see how one-sided abrogation could be justified.

Night Air Service—A Lament

SOMEONE should sing a dirge for the night air mail service or rather the spirit of it which dies on the day when night air fares will be off the tariff and made equal to the fares of day services. With it dies the challenge which gave India her 'all-up' and all weather air mail. The night air service ceased to be what it was when it passed on to the Deccan Airways and thus came under State management, long before the other airlines were nationalised. The service deteriorated, frequent accidents scared away would-be passengers, but strangely enough, instead of trying to get more people to travel by night, the management became increasingly reluctant to provide passage to passengers. It could well afford to do so—after all, the mail traffic was there and there was no pressing necessity to pay its way. When the Indian Airlines Corporation took over, only the pretence of a night passenger service was kept up. Even that pretence has now been dropped.

This paper which had fought for cheaper air travel has special reason to regret this decision. The stages by which this remarkably bold and imaginative venture to bring air travel within the reach of people other than business magnates, film stars and Government officials was sabotaged does not bear recounting. The air transport companies could not run the air services successfully. They provided service, but did not earn enough. They complained that the rate of fares was uneconomic, but who would listen? Now by a stroke of pen fares can be raised and the quality of service deteriorates, but no one even says a word in protest. The miraculous air age has come, cheaper air travel is gone.

Hand Pounding for Nutrition or Employment?

FOOD control treated wheat and rice differently. Ration shops did not usually sell flour; if flour was sold at all, it was only on those rare occasions when Government received a consignment of flour instead of wheat. But in the case of rice, it was not paddy which was distributed through the ration shops but milled rice, whether milled in the exporting countries or in India. In fact, rice mills were sometimes employed as procuring agents and were licensed to purchase paddy and de-husk it on the express condition that all the rice milled would be sold to the Supply Department. That way, the Khadi and Village Industries Board has a case against Government and rationing for favouring the rice mills. But the employment angle is being carried too far when a moral issue is being made of it and an All India Committee set up by the Government of India seriously proposes that the Essential Commodities Act should be taken advantage of in order to help hand pounding of rice and that, with its aid, not only licence should be refused for new rice mills but existing mills should neither be allowed to exceed their capacity nor to work for more than 6 hours a day, or that small rice huller machines should be stopped from milling any rice at all by the end of 1956.

Though two official committees—one appointed by the Bombay Government and the other by the Government of India—have been blessed hand pounding and gone all out against rice mills, with due respect to the learned members of these committees it may be submitted that hand pounding of rice is not an industry. It is part of the domestic chore in most village homes done by womenfolk. It is not normally a whole-time job for adult male labour. In view of the wide variety of conditions existing in the country, one cannot, however, be dogmatic about it or challenge, in the absence of adequate evidence, the figure given out as the number of those engaged in hand pounding, which is 2 lakhs according to the 1951 Census. Nevertheless, it would be wrong or misleading to accept any such figure and to ignore the character of employment provided by hand pounding.

Milled rice sells because so many people like it and also because

some village homes find it irksome to pound their own rice. True enough, hand pounding provides supplementary income to some village women. If such deserving cases suffer it is because the trade in rice, as in other things, is getting more and more organised and supplies are being drawn from longer distances. There is no particular fun or social gain in carrying a lot of husk over long distances and subjecting the transport system to undue strain. A certain measure of displacement of a particular type of labour, in this case, that of village women, becomes unavoidable in the process. There is no much help for it, for it is not a straight question of relative efficiency.

How does mill rice push out hand pounded rice? Though even on the ground of efficiency viz., percentage of recovery, hand pounding has been claimed to be superior, the explanation must be sought in the slow changes in the organisation of rice trade and of the pattern of distribution when the supplies are being drawn from longer and longer distances. There is one point in favour of hand pounding, however, which is not so easily disposed of. Viz., that milling reduces the nutritive value of rice but hand pounding does not. If this is the case, it should come more appropriately under food laws, if we are to have any, which should set out nutritional standards and regulate all food processing industries. If this is done, either rice mills will have to improve their system of milling so that the full nutritional properties in rice may be preserved or leave the field to hand pounding. By mixing up nutrition with efficiency and employment potentialities, the case for hand pounding is not helped but hindered.

One Man Trade Mission

LONG before the Commerce Ministry decided to send a Trade Delegation to study the scope for Indian textile exports in South East Asia, Shri P M Shah, the enterprising editor of *The Indian Exporter*, entirely on his own, had led and completed his one-man mission to Aden, Abyssinia and East Africa for the study of export prospects, not only of Indian textiles but for other prospective lines also in which we are having some exports now but can do very much better. Besides Kenya, Tanganyika and Uganda, Shri Shah covered Zanzibar and Pemba, and also explored Ethiopia,

Asmara and Aden, which are all alike so far as trading conditions go and in all of which the Indian business community is well established in trade. Now the fact that Indians control the trade in so many of these territories was a temptation and a snare. It must be said to the credit of Shri Shah that he did not allow his patriotism to get the better of his judgment and he does not mince his words while telling us what exactly he thinks of our business practices in all these territories.

Wherever Shri Shah went, he found that the fair name of India was besmirched by our inefficient and unfair trading methods. There is in every country some measure of shady dealings which are difficult to eradicate. But much of the complaint was also against the sloppiness, indifference and lack of enterprise on the part of our business men in their homeland and, worse still, against similar failings on the part of Government agencies. This will come as a rude shock to many, but not the commonest of complaints, viz. that letters are not replied to and trade enquiries go unattended. People not used to Indian ways are apt to mistake what is at worst indifference for something much worse.

It is not necessary to elaborate the point; it would be enough to draw attention to Shri Shah's report, extracts from which were published in the last issue of this paper. On the positive side, Shri Shah's recommendations deserve careful examination, particularly in respect of the measures he suggests by way of remedial action. Packing, grading and maintenance of proper standards have been and still are crying needs. There is nothing much to add here but since India is going in more and more for manufactured exports, the character of the problem and the appropriate organisation necessary for export promotion are also changing. Lack of real interest in export markets is probably at the root of all the deficiencies that Shri Shah has pointed out. The situation may get a great deal worse rather than better in the next few years if, as is likely, the consequence of large scale investments turn out to be higher money incomes, and keen as well as sustained demand for all sorts of goods which will enable production to be maintained with little or no attention paid to cost or quality. And if there is a thriving home market, who will bother about exports?

The most important single recommendation on the organisational side next only to proper grading, standards and better business methods is the establishment of confirming houses which should serve the interest both of buyers and sellers. Apart from the credit advantages which buyers derive from these houses, they can also lodge complaints regarding quality and damage to goods on the spot.

Despite all these deficiencies and shortcomings, the main impression one gets from this one-man survey is the wide scope East Africa, Ethiopia and Aden offer to all sorts of Indian exports of manufactured goods ranging from cotton textiles, cement and leather goods to handicrafts and a variety of consumer goods like utensils, toilet soaps, biscuits, bicycles, plastic, handicraft products as well as wire gauzes, buckets and agricultural implements. How far are these present

Off the Record

Behind the Purdah—NEFA

BIG game shooting and study of aboriginal tribes which in the old days used to attract English members of the ICS to Assam, does not appear to have exercised the same fascination over their Indian colleagues. Or it may be that there was veiled discrimination and Indians were not trusted for such political assignments and never posted to frontier districts. But whatever the reason, few among senior Indian officials could speak the dialects of the Naga or other hill tribes or knew anything about their social customs and practices to be able to take over the administration of the tribal areas and establish that democratic touch with the people which was necessary, after India became independent. There were many other factors, of course,—the war itself was one—but the present troubles in the North Eastern Frontier Agency can also be partly traced to this source. For the first time it was the north-east and not the north-west frontier which had become a theatre of war. The tribal areas spread-eagling Assam and Burma were churned up. The people suffered and also benefited. The turmoil of jungle warfare left a ferment in its wake. It was not a question of ammunition dumps left behind in this case, or of disarming

prospects likely to endure? Will these markets continue to offer ready sales to Indian exporters? An assessment of long-term factors will also be necessary if we are to set out in a big way to establish trade in these territories. Some of the factors necessary for such an assessment have been presented by Shri Shah, but not all. It can be safely inferred from his report that local production of the goods the export prospects of which he surveyed is not a likely possibility today nor is it likely to come up in a big way in the near future. But what about the prospective competition? Since nature abhors a vacuum and prospects are so bright for Indian exports, the reason must also be that the old time exporters are unable to attend to these markets, in which case the outlook may change overnight when Japan, continental countries and Britain will be in a position to turn their at-

unruly people who had got hold of arms.

The erstwhile head-hunters are a proud people. The dignified bearing of their men and women folk must leave a deep impression on the casual visitor who has occasion to pass through the frontier agency which is a veritable paradise for social anthropologists. But few Indians have done much field work among these tribes and the understanding of their problems is not informed by the light of social sciences. Administrators are still apt to be a little impatient rather than forbearing when they see no rationale in a pattern of behaviour which is so different from their own or from what they consider to be rational. The refusal to use the plough and the persistence of hoe cultivation, for instance, annoys the agricultural expert who will tell you that it is impossible to make these obstinate hill folk change their ways.

Around the settled Naga villages, however, the terraced hillsides appear to be tended carefully enough. They have their indigenous system of irrigation. From a nearby waterfall, through a long line of split bamboos, water is made to flow and when the top terrace has been watered, sluices are opened so that it may pass on to the next

tention to the exploitation of what had once been their established markets. True, meanwhile the aggregate demand in these territories must also have gone up which by itself should leave scope for fresh entrants. But Shri Shah also makes the presence of Indian traders and their established position in trade one of the principal planks in the propaganda platform and rightly so. For distribution and trade are slowly built up and the comparative advantage which had enabled the Indian trader to push out his European competitor is not likely to diminish with the passage of time. On the other hand, control over trade also implies better knowledge of markets and of the requirements of the consumers which the Indian trader should be in a position to transmit to producers and exporters at home, to the definite advantage of both. Surely this is fairly firm ground to build upon.

terrace and so on. One can commit the worst crime and get away with it, be guilty of all manner of misdemeanour and be still forgiven, but if a tribesman neglects to pass on the water to the terrace below when his own plot has been wetted, God help him! He will be hounded out of the tribe. Such simple rules of conduct, which custom has congealed into conscience, sanctify the social pattern of the tribesman. In putting it like this, one may be accused of trying to oversimplify, of talking like missionaries to cannibals. But it is the missionary who has gone into this forbidden or uninviting terrain, set up schools, converted the tribes to Christianity and done what little had been done until recently by way of tribal welfare. How could missionaries who everywhere break up tribal life and destroy tribal values win the hearts of the people—if they have won it at all—is a question which our social anthropologists will have to answer. What hits us in the eye is the fact that it is the converted Nagas who lead the separatist movement and that the Naga National Council is all Christian.

The correspondent who writes bitterly about the failure of our policy in the North Eastern Frontier agency in an article appearing

in this issue does not say what India has been trying to do for the welfare of the tribal people. The roads built, the large funds spent on introducing handicrafts, efforts to make the NEFA self-sufficient in food supply and to associate the tribal people, for the first time, in planning their own development—this is going to be a feature, we have been told, of the Second Five Year Plan for the North Eastern Frontier Agency—do not figure at all in this correspondent's account. But suppose all this was made good and it was conceded that the Naga hills and the whole of NEFA were being converted into a land of milk and honey, would it make such a lot of difference? Think of the sneer, the knowing, cynical smile with which we used to greet British claims to have done this or that for India; how we jeered at such 'trumpeted' claims. Even if we had not doubted these claims, would we have accepted good government as a substitute for self-government?

Some of the correspondent's objections can easily be answered but not all. It is easy enough to see why foreigners may not be welcomed, nor is there any reason to allow a free hand to traders to open up these areas to their economic exploitation. But though it is a fact that little news travels outside, the case for allowing freer access to press correspondents may also appear somewhat paradoxical in the light of the correspondent's own assertion that the press does not seem to protest, as it finds no difficulty in explaining the developments behind the purdah as the doings alternately of the missionaries and of the communists. Surely, the correspondent could not have it both ways.

The full light and searching light of publicity, however, is to be welcomed without any reservation whatsoever. India is strong enough to admit mistakes and rectify them; she needs no excuse to suppress facts nor does she lack courage to face facts. Our Prime Minister has just returned from a triumphal tour of the West where he had the satisfaction of seeing some of the principles that India stands for slowly being put into action, largely as a result of his own initiative in the matter. His own ministry which is in charge of NEFA should not shy at applying the same principles at home. It is mean and unworthy to suggest that because Nehru met his only rebuff from the

Naga tribesmen, his administration fails to stand by the same high principles in the North Eastern Frontier Agency or wants a separate standard to apply there from the one which India holds out to the world outside.

India's case can perhaps be put best as follows:—A country of high mountains, forests, rivers and vast wilderness, the North-East Frontier Agency covers an area larger than West Bengal. But it has a population of 6½ lakhs only, composed of many tribes who may be virile and all that but who had been totally and carefully excluded from all intercourse with the Indian people throughout the British regime. Well, some Englishmen with a flair for such a thing might have written beautiful monographs about the tribes but Britain did not use social scientists to administer the tribes. She did not administer the tribal areas at all, beyond leading occasional expeditions to teach the tribals a lesson for doing something wrong, in order to put fear in their minds and to make them respect the British Flag. Not only was all intercourse with the Indian people prevented, the tribal people were made to believe that Indians were hostile to them and wanted to absorb them completely. There was a theory current at the time about Hinduism gradually assimilating the tribal people by offering to take into its fold such of the mlecchhas as would forswear eating of beef and other unclean foods. Tolerant and catholic, the Hindu pantheon could always make some room for the tribal deities.

Be that as it may, free India was faced with the problem of tackling this neglected area, which did not have the skeleton of an administration even. And the Government of India had to establish for the first time contacts with the people who had been completely kept apart for over a century. There were no roads connecting the tribal areas with the rest of Assam. Economically the tribes were backward in the extreme as there was hardly any trade with the rest of India. Socially, well, despite all talk of an idyllic, satisfying pattern of behaviour, head-hunting still survived and so did slavery. Free India gave to the North-East Frontier Agency a special place in the Constitution. It is now administered by the Governor of Assam as the Agent of the President through the Ministry of External Affairs which

exercises administrative control. The Government of India has advanced the administration almost to the border and connected it by road with the headquarters. The Assam Rifles which is a "Civil police force run on military lines" has established a number of outposts in this agency. Under the 3 crore first five year plan, a great deal of development has been in progress, roads have been built, agricultural farms and seed stores etc. established, training is given in agriculture, and animal husbandry, schools and dispensaries are also being opened and so on.

A P I B hand-out issued some time ago, went to the extent of admitting that owing to other pressing problems, the Government of India had not been able to pay full attention to these areas. But this has been remedied through two visits by the Prime Minister followed by visits of administrative and other experts. What the Prime Minister's visit led to, is, however, quite a different story and it has been told elsewhere.

Administration had to be organised from scratch. It began with the appointment of political officers who were carefully selected from the services as well as from outside, with an eye to their broad understanding of and sympathy with the tribal people, physical energy, drive and initiative. The policy was that the tribes should not be looked upon as museum pieces but should be treated with understanding, sympathy and fairness as citizens of India—there's the rub, they have yet to feel Indian—that they should no longer be isolated from the rest of the country, the aim being eventually to absorb them into the normal pattern of so-

ciety. In order to break down their isolation, contacts with outsiders are being encouraged, though not within the tribal areas. While their economic conditions are being improved, they have still to be protected from exploitation and have to grow and develop in their own way. Leadership is not to be thrust on them; it should rather develop from within the tribes. That is why religious missions and missionaries, Hindu, Muslim or Christian, are being discouraged from going to these areas.

About tribal people in the North Eastern Frontier Pandit Nehru once said that 'they are an extremely disciplined people, often much more

democratic than most others of India, without a constitution and the rest; they function democratically and carry out the decisions made by the leaders or their own representatives almost without exception. Above all they are people who sing and dance and try to enjoy life. The approach to the tribal people should be one of learning from them and having learnt, to try to help and co-operate."

Pandit Nehru sees the same spirit of democracy in the Indian people also. Indeed in a contribution to the journal of Parliamentary Information, he goes much further, and actually claims that in a vague sort

of way, we had also been practising or groping towards the Parliamentary system. The particular variant of it, which is Anglo-saxon, we are told on good authority, is not an export product; but we have been nevertheless working it in a way. Its extension to various groups of people in this wide land, some of whom are isolated from the rest, is not an easy task; but the Prime Minister's high principles and abiding faith in democracy obviously fails to be transmitted through his own Ministry to the NEFA. Between the idea and the reality falls a shadow; it is for him to dispel that shadow.

From the Calcutta End

Dalhousie Square

CLIVE Street seems to have forgotten that New Delhi is committed to implement a socialistic pattern of economy. Stock markets are enjoying near-boom conditions. There are reasons why speculative investors, if not investors, are not much worried about Avadi or Berhampore. After all, Shri Chintaman Deshmukh had to disown the Matthal Commission's directive to raise more resources through taxation after accepting it. Recently, the Finance Minister has assured industry that there is nothing much ultra-socialistic about Avadi.

There is, again, Shri T. T. Krishnamachari, Union Minister for Commerce and Industry and Minister in charge of the newly created ministry of iron and steel, whom stock markets and industry regard as their most sympathetic friend. Last week, TTK deemed it proper to repeat his assurances that the existing iron and steel industries would not be nationalised. Ignorant persons like the present writer may not have known that any such thing was under contemplation by New Delhi. But the stock markets' favourable reaction to TTK's assurances would seem to suggest that investors were apprehensive of some such development. Apparently, TTK believes that economics is nine-tenths psychology. Many others share his belief.

Nationalisation

Nationalisation fears have revived. When the Imperial Bank was nationalised, it was feared that the Government would nationalise banks. This apprehension was confined

mostly to the City Editors of dailies. Bankers were, and are, less troubled with such fears. But insurers seem to have taken this nationalisation business too seriously. Some official spokesmen have admittedly been indiscreet. Pandit Nehru's philosophic comment that every thing has its time and place has been construed to mean that the Government has plans to nationalise insurance sometime before the next elections.

Almost without exception, chairmen of insurance companies have discussed the problem of nationalisation of insurance. Shri A D Shroff, chairman of New India, has advanced formidable arguments against nationalisation. He is objective in his approach to the problem. He is original in his suggestion that, even if the Government decides to nationalise insurance, those among the existing concerns which have stood the test of time should be allowed to co-exist. New Delhi is committed to mixed economy. That is why the Government has no plans to nationalise the existing iron and steel industries, though it has decided to start new ones within the public sector. Shri Shroff demands similar rights and privileges for insurance.

Here, the controversial question of nationalisation of insurance is not under discussion. There is an interesting side-light to this conflict between the public and the private sectors. Spokesmen of private enterprise miss no opportunity to refer to the inefficiency of State enterprises. It is conventional for advocates of nationalisation to retort that service, and not efficiency or economy, is the main aim of nationalisation.

Some time ago, the Finance Minister took a different line on this issue. He deplored that the case of State enterprises was going by default. He expressed the opinion that, if private enterprises were as much or as often subjected to public scrutiny, the former might prove to be no more efficient than the latter. It was amusing to find that the Finance Minister was taken to task for projecting class war to the industrial sphere.

Postal Life Insurance

One of Shri Shroff's arguments against nationalisation of insurance is that the record of private insurance companies compares favourably with that of Postal Life Insurance. Shri S C Jain, Director, Postal Life Insurance, Calcutta, does not accept this verdict. In a letter to a local daily, he argues that, in the last four years, the new business of PLI has increased by over 109 per cent, compared with an increase of only 10 per cent in the new business of Indian life insurance companies. This alone does not disprove Shri Shroff's thesis. But there is much to be said in favour of Shri Jain's action in replying to Shri Shroff's arguments. It is, after all, an elementary principle of jurisprudence that the accused must be allowed to have his say.

Dalhousie Square

To revert to the main theme under discussion, Clive Street is not to Calcutta what Dalal Street is to Bombay. Clive Street may have got over its blues. But Dalhousie Square believes that it can't be fooled so easily. Nationalisation of the Imperial Bank is disapproved by Dalhousie Square. It has noted with satisfaction that

basis of compensation to Imperial Bank shareholders is fair and equitable. But it has not missed the gross Parliamentary Party's hostile attitude to this basis of compensation, and the Finance Minister's logic that such a basis of compensation will not be repeated in the future.

Dalhousie Square is the home of managing agents. Within Dalhousie Square are firms which manage more companies than one can count. Most every floor of every building in Dalhousie Square has more than one impressive and overcrowded name-plate. There has been a change in the complexion of managing agents with head offices in and out of Dalhousie Square. But both Indian and non-Indian managing agents are agreed that the Companies Bill, 1955, will strangle private initiative.

Associated Chambers

Dalhousie Square can no longer associate itself with the Associated Chambers of Commerce of India. But the Chambers, the representative organisation for British business interests, are still an influential organisation. On this side of India, British business interests still continue to be large. That is what makes the Chambers influential. New Delhi uses the Chambers' views and opinions. On major economic policy legislation, New Delhi seeks the opinion of the Chambers, and the Chambers inform New Delhi of their views—just as New Delhi seeks the opinion of the Federation of Indian Chambers of Commerce and Industry, the official organ of Indian private industry.

Spokesmen of Indian private industry were inclined to the view that the proposed institution of secretaries and treasurers would offer opportunities to the existing managing agents to survive in different names and capacities. They are, on second thoughts, doubtful. This explains their revised, and more hostile, attitude to the Companies Bill. Though the Chambers do not endorse the argument that the present Congress Government has no mandate to introduce such revolutionary changes in the form and system of joint-stock enterprise in India, they are peculiarly British in their understatement that the Companies Bill, 1955, confirms their worst apprehensions.

Finance Houses?

It is not the intention here to discuss the Chambers' complicated arguments against the complex pro-

visions of the Companies Bill. But the summary report of the Chambers' representation to the Government, published in Calcutta's dailies, is revealed in some of its emphatic inferences. Managing agents have rendered useful services in the past. One should have expected that the Chambers would emphasise the skill and expert technical knowledge that the managing agency system provides to industry. This aspect of the problem has not been ignored. But the Chambers seem to have emphasised the financial aspect of the managing agency system.

There is an oblique reference in the Chambers' representation to some of the harmful effects of restricting the companies that managing agents

can manage to ten. This will encourage speculative cornering efforts. It has had this effect. But the Chambers are emphatic that managing agents have a useful function to perform as long as the capital market remains undeveloped and the issuing and underwriting houses are not established. That managing agents finance companies, is an argument which is, perhaps, not a good defence for the managing agency system. Industry needs finance. But it is more in need of expert technical and managerial personnel. If managing agents cannot provide these requirements, they should cease to be managing agents and convert themselves into private finance houses.

Balances in the Plan

D Ghosh

IN this note I have raised what seems to me some basic issues. The essence of planning is (a) to establish targets which are consistent with the fullest use of resources, and (b) harmony or balance between different aspects of the plan by which the targets are to be reached. I have said nothing on the first issue; I do not know whether the Second Five Year Plan is bolder than the First. I have confined my remarks to the issues that belong to the second category. I have, moreover, said little about the financing of the Plan and nothing about its physical balances.

1. Balance between increase of consumers' income and increase of consumable goods and services

The net national income is expected to rise by Rs. 2,900 crores or 25 per cent during the Second Five Year Plan. As savings are expected to increase from 7 per cent to 11 per cent, the increase of national income available for expenditure on consumption would be Rs. 2,249 crores. The Plan-frame unfortunately does not tell us whether the supply of consumers' goods and services would increase by an equal amount or not. It would seem from the data on the rate of growth of the latter that there would be an appreciable gap which must be covered by taxation and/or by inflation. The problem is treated indirectly in the section on Investment and Savings. A direct treatment of this item would, however, have been more helpful.

2. Balance between increases of output of producers' and consumers' goods

The same problem appears in a different garb in connection with the relative increments of producers' and consumers' goods. Where saving is made largely in the expectation of a return in the near future as most private savings are made, any increment of the producers' goods must be matched sooner or later by a corresponding increment of consumers' goods. This can be avoided only by inflation of consumers' goods prices and/or by the State undertaking to finance investment in producers' goods without immediate reference to the profits derivable from their

use in producing consumer goods. The Soviet economy has all along relied on compulsory savings through turnover taxes to finance the relatively higher rate of development of its heavy industry. What is the Indian substitute for this compulsory saving?

3. Relative development of factory industry and small enterprises

Within the field of industry, greater emphasis is placed on the relative development of small enterprises, as a means of reducing the problems created by scarce capital and abundant labour. To achieve this objective, capital issues for competitive factory industries would be restricted and discriminatory duties imposed on their products.

However, the extent to which these measures can succeed without defeating the basic objective of the plan, viz., larger output and increased employment, depends upon the relative efficiency (or rather inefficiency) of the small enterprises. A large rise in the price of industrial goods in India caused by greater reliance upon less efficient modes of production may choke off total demand too early in the process of development. Moreover, factory industries will not expand their output to full capacity unless the aggregate demand for factory goods continues to increase absolutely.

I would suggest that in the field of small industries preference should be given to those whose relative disadvantage is the least, and that it may be better to reserve completely certain fields of production selected on this basis for small enterprises rather than try and divide the same field between factory industry and small enterprise by means of invidious measures. An increased and cheaper supply of power should facilitate the adoption of this alternative.

4. Availability of agricultural goods in exchange for the industrial

There is, fourthly, the problem of exchange of agricultural goods for the industrial. The output of agriculture will increase by 20 per cent in the five years of the Second Plan, food grains increasing by 15% and other foodstuffs and commercial

crops by 25%. The working population outside agriculture will increase by 9.5 million over 42.5 millions in 1955-56 or by 22.2 per cent, and non-agricultural production much more than agricultural. This will require that more than half the increase of food production and the largest part of the increase of commercial goods are transferred to the non-agricultural sector of the economy. Whether this will happen through the operation of market forces, depends upon the elasticity of demand for each other's products on the part of the agriculturist and the non-agriculturist. Even if the former is willing to spend an increasing part of his rising income on non-agricultural goods and services, the prices of these in relation to those of his own products being given, he would be inclined to consume his own products more and more, if non-agricultural prices were to rise relatively to the agricultural. This may happen as a result of emphasis on the employment rather than the productivity aspect of industrial expansion.

5. Adjustment of increased output to aggregate demand

Finally, the Plan Frame does not indicate the manner in which the composition of the increased national output is adjusted to changes in the pattern of aggregate demand that will almost certainly accompany the growth of total income. The problem can, of course, be solved by making consumers buy various goods and services in the quantities in which they are produced by arbitrary marking up and marking down of their prices. But such a method would be hardly consistent with democratic planning under which the prices of different goods and services must approximate to their marginal costs of production. In any event, since a large proportion of the total output would be turned out by the private sector, the scope for manipulating the selling prices of individual goods and services by taxes and subsidies must be limited. Indeed, there is in the Plan-frame an altogether insufficient consideration of the delicate and complex problems that attempts to regulate the private sector in the interest of the total Plan would give birth to.

The P E O's Second Year Report

A Noble Document

Reviewed by Evelyn Wood

THE report of the Programme Evaluation Organisation on the First Year's working of Community Projects was startlingly frank for a Government paper. This shock of pleasure cannot therefore be repeated by the Second Year's Report, though its frank manner is perfectly consistent with the first document. Yet there are signs that the writer of the second year's report has become imbued to some extent with the pale tinge of Delhi thought: "All is for the best in the best of all possible . . . offices." But not quite; there are plenty of acute criticisms of both official policy and performance in this later document.

The P E O's protective Delhi colouration is of course an unavoidable concomitant of its function, and it would be churlish to object to it. The Olympian manner is expected of the Union Government and all its officials, and we mere mortals must learn to like it, or else. But it was not necessary for the P E O's report-writer to imply at points in his Report his quite subjective dislike of "the private sector." After all, the Evaluation Report should be as objective as possible. The P E O has no facilities for making the complex investigations needed to weigh the merits of commercial distribution against Government's distribution, and therefore the sneers at private distribution of, e.g., fertilizers are quite out of order in this otherwise excellent document.

Value Judgments Inadmissible

This is just one of the weaknesses of the official mind with which we others have to bear. One consolation is that it must be far worse in the Ukraine. The P E O in this Report makes no effort whatever to prove that the commercial distributor of, say, fertilizers is less "efficient" (blessed, blanket term!) than Government blundering on the same job. Your reviewer is therefore at greater liberty to state his own view, which is in diametric opposition to the P E O's and probably much less subjective. Your reviewer has inside experience of both patterns of distribution. It seems doubtful if any of the P E O's staff can claim that experience; otherwise this sort

of uninformed value-judgment would hardly be made by so responsible an author as the writer of this Report.

This reviewer and the P E O's report-writer enjoy one more major difference of views, which must be confessed at the outset of this comment. The P E O's writer is evidently sold on the Rural Credit proposals which have emerged at long last from the Reserve Bank's enquiry. This reviewer, from the viewpoint of an old village-resident, and a knowledge of where official credits get to in the villages (to the smart boys who please the Authorities), considers that the mountain of the Reserve Bank plus its distinguished Committee have brought forth a mouse of pitiful pusillanimity. So there had better be no comment in further passages of this review on this distressing subject.

Polemics for Co-operatives

But it is not possible to leave the PEO's report altogether alone on this subject. For its writer wraps up the bitter pill of no credit for the small, unpolitical villager (which he would not admit to be the threat) in the supposed sugar of Co-operatives. It is quite out of place for the writer of an Evaluation Report to propagandize as he has done on the subject of Co-operatives,—which, as he must know, the majority of villagers distrust. In retaliation this reviewer will also step far outside the function of a pure review.

In far too many pages of this excellent Report, polemics for co-operatives as the royal road to all rural collective action are rammed down our throats. This is not good enough. Co-operatives, statutory panchayats, (with their golden chance for the village politicians to make hay), and all the rest of the mummery worked out by non-villagers for village-improvement will certainly not do as evaluation. The P E O's writer actually accepts the principle of the paramount need for villagers to work out on their own plans; but these three foreign ideas are his pet recommendations, and he will drag them, in despite his own sound reasons elsewhere.

It is the reasoned bulk of this Report which makes this reviewer enthusiastic. It is a great thing that Government can publish such acute criticism of itself, and that a man is found who is of a stature to make the official self-criticism so clearly. This reviewer could pray with some passion that both the Union and the State Governments which are responsible for the Extension Services as a whole, including the Community Projects, would really study and use the advice contained in this Report. Some of the advice is implicit, not explicit, so that study would be required. Perhaps if we were all to pray with passion . . . or perhaps if that democracy which we are told we have in this country was worked in a more realistic manner, then there might be no need for prayer. But there is need of passion.

Co-operation: So far as a Government paper can be passionate, the P E O's Report is quite often intense on that level. Let me quote:

page 62 section 141 "... if for nothing else at least for having opened out an opportunity for local leadership and constructive local co-operation, community projects should be welcomed and kept going."

The P E O's Report-writer says this in a paragraph which asks for more emphasis on collective action. He follows this paragraph by a distinct reference to "more institutionalized forms of co-operation, e.g., co-operative societies. . ." But his heart must be in the right place, even if he does love the legalism of the de-tested co-operatives.

Incidentally, this reviewer would like to state that he is personally not at all against co-operative societies; but only against the very peculiar form of co-operation which has always been officially tolerated (one can hardly say encouraged) for many years in India. If, in fact, we were to model our efforts to nurse the Co-operative movement on the French or Canadian practical pattern instead of according to the theories of Fabians and Sarvodaya do-

gooders, the co-op would doubtless become loved. It can be done in India and it has been done where both Fabians and do-good 'Sarvodayans' were absent from the rural scene.

People's Participation: Writing of the people's participation the P E O says:

page 63 section 144. "... impossible to get away from physical limitations, but the people's enthusiasm has in some places even achieved that (skilled labour), leaving the leaders in no doubt as to the extent to which the people are prepared to go in realizing collective welfare by collective effort."

In this passage he is particularly thinking of the construction of school-buildings and wells for drinking water; and this reviewer, too, has seen the miracle of skilled labour conjured up where none existed before.

Another, and perhaps the most powerful quotation of all:

page 58, section 132. "... the rate of progress in most of the community project areas has latterly risen, thus creating a hope that by the end of the period of four years or so almost every village, will have been brought under the influence of the developmental process. . . . Creation of local leadership and activation of local institutional life as sharers in the national effort of planning for welfare, and as the normal means of promoting development, should, therefore, never be lost sight of. If this truth was not clear to everybody at any earlier stage, now that we know how the transition constitutes a challenge to the designers of the whole effort, we ought to be more than ever convinced that nothing will last which the people have not done for themselves."

The italics are your reviewer's. It will be noted however that the PEO has no opinion whatever of planning from outside them for rural areas. Yet he still wants to force ideas of official credit, co-operatives and statutory panchayats on to the necks of unwilling rural folk.

Of course, the reader has only this reviewer's word that the village-folk are unwilling. Well, if the reviewer and the P E O's report-writer are at variance on these matters, isn't it an opportunity for that which seems to scare Governments worse than anything: a full-dress sociological study of the changing attitudes of villagers? Here are those admi-

nable points on which to focus a specific study.

Sociological Studies: It should be emphasised that this sort of study cannot be made under Government auspices. To take one prominent example, the National Sample Survey would be a wholly unsuitable body to make such a study. Such an attitude-enquiry is for independent university people to undertake. Yet, when they do so, as happened in the UP with Cornell University's unit, for example, what a howl there is from India's indigenous and inactive sociological faculties! In this sort of study, of course, nationals cannot do the whole job; they must for objectivity's sake, be brigaded with foreign academic types, who have had plenty of field-experience outside their own countries before coming to India. Then again, the foreigners cannot undertake much in the way of study till they have grown into the feel of rural India, and two years would be a reasonable time for that mental acclimatisation, assuming that the foreign scientists are very sensitive and humble persons.

Extension Not Grasped? The P E O does not have a really clear idea of what is actually meant by Extension. Just following the passage above quoted, the Report says: "Extension... express(es) a two-way process of reformation". This is either very clumsy writing, since the word sought for is "regeneration"; or else the writer does not at all understand the nature of the two-way channel of Extension. Yet his criticisms of those "researchers", as he calls them, who are supposed to provide solutions to villagers' problems are acute, and very much deserved. It would appear that the PEO does not value the Community Projects Administration very highly; or it may be the subject experts who are considered notably weak and disinclined to accept guidance and criticism from the field. These are unhappily true impressions.

This sort of hard-hitting comment enlivens this excellent paper, and it is such criticism that makes it worthy of use as a working manual by the relevant Extension authorities. But... this reviewer will continue to pray and to doubt.

Ethnology of 'Bench March Surveys': For the satisfaction of the scientific mind, more explanation should have been given in this Report as to the manner in which the Bench March Surveys were conducted.

ed. It is anyway a mercy that they were not started till the Extension Service (or CP) programme was well under way.

From the reviewer's fairly extensive personal observation of Extension service patterns as actually worked by the various States, it does not look as if the P E O's samples are otherwise very sound. This is just a pattern of ill-luck; or it could be due to some cover-up on the part of the States' Development Departments. For instance, this reviewer has recently been in a rural area known intimately to him for many years. A particular Gram Sevak, in this area, has 18 villages to service, on an area-diameter of 14 miles. He has no transportation whatever other than the rather exiguous State Transport service in that famine area. This does not square very well with the "ample coverage" report by the P E O.

In justice to the P E O and in further criticism of the State which operates such an unrealistic design of field work, it may be said that the P E O's Report is quite savage about this particular State's method of loading the Gram Sevak with all its village-work, including revenue responsibilities. This, of course, makes that particular State's scattered, casual manner of dealing with Extension all the sillier. The State is incidentally one in which the Chief Minister fancies himself as a huzar administrator, and consequently interferes in every detail imaginable, and in many details which are not normally imaginable. No prizes are offered for the name of this State.

Extension Administratively Negatived: In this apology for a system, the Gram Sevak is naturally regarded by the villagers as the official stooge and excuse maker; hence he gets just nowhere with any Extension teaching. But the villagers in his beat are old hands at self-development, and they manage very nicely without reference to their supposed Extension guide. The poor fellow could, of course, learn from the villagers, if his superiors would let him!

As a matter of fact, the first few pages of the P E O's Report, which are nowhere contra-indicated later on, suggest that the P E O has faith in Community Development as such; but that he has precious little time for Extension and its educational pattern. This is prejudice; for Extension, without any thought of community or collective action, has produced great results in other coun-

tries. Then why not in India, if the village-folk really want it? And this reviewer's clear impression is that they do want it, whereas it is not as all so clear that they want to be developed as "communities". The P E O's writer is quite in error when he says, at the top of p. 15, that "Agricultural Assistants were doing Extension work before the introduction of community projects." They were not. This again suggests no knowledge of what Extension work actually is.

There is in the P E O's Report rather a dim realization of the fact that there have to be both the satisfactions of learning something new and of achieving something new on the two sides of the rural development screen. It is not only the villagers who have to learn and to achieve, in order to get a stimulus to further progress. No, it is not only the villagers; officials, and even the most obdurate and dictatorial ministers, also need to learn and to survey positive achievements which can outweigh the frustration of their interminable failures.

Culture Bias: It seems rather as if the P E O's writer gets pulled away from objective, towards the great majority of rigid intellectuals in India. Moralizing and ethic-devising for other people are grim pleasures which seem to grow on those who work in or with Governments here. Perhaps it is like the drug habit? The impartial attitude which can wait for the people to produce an ethic of their own seems to be unattainable by such "sacrificial" types as Congress approves. For instance, starting from section 50 on page 22, the P E O's report-writer speaks of "orientation... in the basic moral and social value..." This is with reference, if you please, to democracy and the Welfare State! This reference betrays the wishful operation of a culture bias; possibly also a Brahmanical determination to teach ethics—or morals, as they would today be miscalled in India. This is a totalitarian danger. It is in any case not suitable for an Evaluation body to state such principles of value-judgement. The P E O's writer is clearly not concerned (as he should be) with logically posited values, which are challengeable; but with Arthashastric, Vedantic (perhaps) or Harijan-periodical disseminated theoretical values which bear no necessary relationship to the practical, day-to-day living values of people, in villages or elsewhere.

This will not do, more especially if there is to be acculturation in rural India, which your reviewer sees as already irrevocably begun. The P E O's writer terms this process as "culture-change" which is unfairly euphemistic, for this phrase nullifies the conflict and tension in the subjects of subject.

Acculturation

Real Acculturation: The point missed for jubilation by the P E O's

writer—probably because of his own adopted system of moralized "values"—is that a real acculturation is inevitably taking place. It began even before the war. In this, the best of the urbanized Extension workers in contact with villagers for the first time of intimacy for hundreds of years, are now learning in the hard way about the tranquil, yet potentially explosive life of the villages. The villager, on the other hand, is

learning with ease of that world which he had before feared as something menacing and quite alien to him. It therefore appears to this reviewer as if a real exchange is proceeding, at the end of which the middle-class, urbanized official and the villager will share a common culture with the rest of us. Probably, this state of affairs may not arrive for a couple of generations. If so, the glorious possibility exists that Ministers and other politicians may also be touched, if not transmogrified by the new forms of acculturation. This is taking a very hopeful view indeed; but why not? This reviewer does not, by the way, suppose that all the features of the fresh, common culture which is developing in rural India are going to be very pleasant for non-villagers.

The P E O refers to the need for "orientation" of officials. This word really should be re-examined outside its American matrix. To have the freedom which rises from a culture in which all persons in a society, at all its educational and economic levels, are imbedded, orientation is certainly a prerequisite; but orientation to a constellation of values which are preconceived even by a Planning Commission will not serve this transcendental purpose. No; the orientation needed in this case is a cosmic re-orientation, of the kind which men and their national plans should be humble enough to eschew attempting.

Extension is certainly required to reach this happy state; or to aim at it, if possible, Gita-fashion, without any personal concern as to whether it be reached or not reached. Extension in this sense will be the proper aim of the new Service: to implant in every villager who is able to feel the need for it a desire to collect and weigh evidence so as to make choices therefrom. In other words, Extension would offer to village-people precisely that education which it is now the function of the world's finest Universities to give their undergraduates—and for that matter, their dons as well.

This level of Extension work is a very practical possibility in India, which already has the right educational tradition, still vital in the villages. The students in such Extension universities-of-the-countryside could be not only the villagers, but also others, Sarvodaya or scientific types whose vocation is truly to work with and for the villagers. It is certainly most essential that the Sarvodaya type of rural worker should be uplifted. Just at present, this

useful type, though apparently less numerous and less vocal than he used to be, thanks to systematic Extension work, is sunk in his morass of "moral values", which bear no true relation—but only a false relationship soaked in hypocrisy—to the lives of anyone, rural or urban. Extension can raise the ethical level of moralizing Sarvodaya do-gooders, as no other pattern of service could.

For all these reasons, any persons, Extension officials and others, who really mean to work with villagers as a life-time-career will do well to learn Extension methods and philosophy. These techniques can reconstruct their own value-systems along with the change-desirous villagers. The specifically Extension techniques of education are right, because they do not try to impose any kind of value upon village-people.

Fluidity of Real Values: Social values are, after all, factors which are every whit as fluid in their application as the improved seeds of today's agriculture which will be out of date for crop quality ten years hence. Just as therapeutic methods in medicine change from one generation to another, so social values which work with the fathers of today may quite well cease to have meaning for their sons. Expressed values must be kept fluid in any scientific endeavour. This is true whether we think of the mensuration science of which westerners are so enamoured today; or of the intuitive scientific systems of thought out of which the Upanishads were constructed.

Therefore, in our own time—now—as we work with village-people at their own chosen targets of self-development, we can feel that they know these fundamental things, as we do not. They cannot reason about them and express themselves as we can; they know. At all costs and for the good of all mankind, Extension must preserve this profound knowledge. Let village folk determine the way they will go and the speed at which they will move; and let Extension be their systematic vehicle. That is all and plenty! And now this has ceased to be a sober review of a fine Government document; it has become that passionate kind of prayer at which your reviewer jibed in the earlier pages of his own work!

One Last Dig At 'Community': It is still necessary to debunk this Community fallacy, because it recurs again and again in all Government

pronouncements; and even in this, on the whole very objective Report. Communities or collective and co-operative action cannot be created from the outside in social groups which have the vitality that Indian villagers possess. The villagers will form their own kind of cohesive action; it will, please all Powers, be nothing like the nightmare of sol-disant democracy from which all the rest of the world, including India—and Russia—suffers.

In village India there is the hope of smashing this pretence of people's rule through ballot boxes. There is no hope elsewhere. Extension which is education can bring this hope to fruition, if any system can do so. The escape from the whole world's vicious circle of mass-politics lies in rural India and the continuance of Extension for three or four generations, with the official foot taken off the 'democracy' loud-pedal.

It should be recalled that what Extension can elicit from the villages of India in this way is not a new culture. The traditional Indian way has always been democratic in the Greek sense—and eclectic besides. The villagers can return by way of the education which Extension offers—by a door which again opens to the surrounding world—to a possibility of reasserting realistically that democratic and eclectic spirit. Most Indian villagers are not yet sunk in a morass of moral values; they have merely custom and not the false assurances of rationalizing to hold them to their standards, such as they are. And choice can destroy custom, when custom is not good. It is to destroy false, rationalised 'values'.

With new standards, worked out by themselves, and a free choice, once again the potentialities of Indian villagers for regeneration appear far greater than any which now exist anywhere else in the world. To your reviewer, it seems as if the PEO's writer has personally seen all this; but in his capacity as a (temporary) Government servant, he had to tone his vision down in favour of the official values and the official 'morality'.

When real freedom of choice, with free access to a world full of constantly new information is opened to hundreds of millions of Indian villagers, then will come the justification of Extension. Rural India can yet rise from its vast plains and its rocky hills with a social structure as noble as Notre Dame, and as imaginative as the soaring towers of Kajoraho in its heyday.

The Metal Box Company of India Limited

Review by the Chairman H Chiswell Jones

Sales

THE general improvement I anticipated over the unsettled conditions in 1953-54 materialised. Notwithstanding the time lag between the country's increased economic activity and its translation into demand for our products, we were able to achieve an expansion of 10% on the previous year's sales volume. This increase was in no small part due to a vigorous effort to expand our sales and we took full advantage of the opportunities offered by the improved demand for packaged consumer goods.

Our fortunes are intimately linked with those of the middle classes and measures which by design or effect reduce their purchasing power will adversely affect all the consumer goods industries we serve. As you know, we have been the pioneers of the small branded consumer package for foodstuffs, the increasing use of which is highly important if India is to make the most efficient use of her food resources. Of the total fruit and vegetable crop, amounting to several million tons, a considerable portion goes to waste. If a substantial fraction of this was canned, India's requirements of processed food containers could be raised from 6 million (compared with Japan's figure of 700 million) to as much as 1,000 million cans per annum; a fact that emphasises what tremendous savings could be achieved by a well-organised canning industry. It is gratifying to know that the development of this important industry is being considered for the Second Five Year Plan. But, even a small reduction of consumer purchasing power would block progress and mean continued wastage of food. More generally, since the small pilferproof consumer-package must of necessity be slightly more expensive, it could lead to a return to the old insanitary bulk pack, undermining those efforts which must relentlessly be applied if the quality of consumer goods and their hygienic presentation is to be improved.

The purchasing power of the public shows signs of remaining steady and, provided no serious economic crisis arises, I consider the prospect for the year is a continued expansion of sales.

Profit

The increase in sales, forecast at the time of my last Review, together with the strict maintenance throughout the year of the operational economies introduced earlier, resulted, as expected, in a better trading profit.

Although competition is keen, I have confidence that the upward trend of sales can be maintained and a reasonable profit level sustained.

Finance

The dividend on the Ordinary Shares has been maintained at 10% since 1951; the year in which the Indian public acquired an interest in the equity capital.

Fixed Assets during the four periods ended 31st March, 1955, have increased by approximately Rs. 70 lacs, i.e. nearly 70%, and this substantial increase has been largely financed from profits retained in the business.

The Directors feel that it is reasonable for shareholders to expect some return on the additional finance they have thus provided for the Company's modernisation and expansion programme. With this in mind the Directors are recommending a final dividend of 7½% on the Ordinary Shares, making a total of 12½% for the year.

Raw Materials

In June last year we were informed that a crisis in tinplate supplies was likely to develop later in the year following a temporary shortage of steel bars and a considerable over-booking of orders by many consumers in anticipation of a scarcity. In consultation with the authorities, it was deemed necessary to import tinplate from America in order to safeguard our customers' supplies. With the help of our Associates abroad early delivery was obtained and the crisis averted.

Indigenous tinplate production is presently running below demand, but expansion plans are well advanced and early next year, a substantial additional tonnage should be available. The present shortfall is being met by importation.

There has been no change in the

price of Indian tinplate during the year.

As a result of continued expansion of local manufacture and packing of previously imported goods, our consumption of aluminium is increasing. For collapsible tubes we obtain satisfactory indigenous material and, though at one time last year there was a temporary shortage of supply, this has since been remedied.

However, the special aluminium sheet required for the production of pilferproof seals, screw caps, penicillin phials and general containers is not at present produced in the country to the required standard and finish and, from time to time, delay in obtaining import licences, coupled with a steadily increasing demand, has kept us on a hand-to-mouth basis. There appears to be a good case for either an increase in the quotas granted to established importers or placing the material on Open General Licence; representations have been made to Government.

Generally, costs of other raw materials remain steady but the new Excise duty will increase the cost of coatings, lacquers and varnishes, paper for packing purposes and board for the manufacture of composite containers.

Industrial Relations

In Bombay and Madras relationships with our workers have been excellent throughout the year. In Bombay our Works' Committee has rendered most valuable service, acting as the vital link between Management and the main body of the workers on day to day matters, whilst in Madras the position exemplifies the fact that excellent labour relations can be maintained given sound Union leadership and a responsible Works' Committee.

In Calcutta, I am distressed to report a deterioration which, shortly after the end of the financial year, resulted in the temporary closure of the factory.

Towards the end of 1954 the Union leadership passed into the hands of extremists—a dismissed employee was elected as Secretary of the Union and, through his instigation, a series of acts of indiscipline were staged including assaults on supervisory personnel for which the as-

sailants were dismissed. A stay-in strike took place on March 30th and, notwithstanding that Conciliation proceedings were in progress, a further strike was called and took place on April 20th. It being clear that normal work could not proceed without an assurance that these acts of indiscipline would cease, the Company decided, for security reasons, not to resume work until a satisfactory undertaking of good behaviour was obtained.

The closure lasted for 18 days with consequent loss to the Company, its workers and its many important customers in the Calcutta area, whose patience and understanding is gratefully acknowledged.

We have always been willing to sit down with our employees and discuss their reasonable aspirations and representations, but, when attempts are made to coerce Management by threats, by restraint and by attacks on the staff, we have no alternative than to take such action as will ensure the safety of our employees and the protection of our property.

It is impossible for a large industrial undertaking to function in an atmosphere of worker indiscipline; yet, in the majority of cases those responsible are a mere handful of the total labour force. These irresponsible elements—themselves with little to lose for they are often paid by outside sources—lead the main body on with extravagant promises. Such situations rarely, if ever, lead to any lasting benefits for the workers, and more often than not, to suffering and hardship.

The situation in the Calcutta factory is now much happier and I hope will remain so for a long time to come.

Developments and New Projects

Having successfully overcome the inevitable teething troubles inseparable from a new undertaking, full scale production of aluminium pilfer-proof seats for glass bottles commenced in Bombay in the latter half of 1954. This new development has been well received by bottlers throughout the country; a substantial demand is forecast and we now plan to manufacture in Calcutta as well.

The Technical Development Section are manufacturing the special machines required to apply these caps.

Owing to unforeseen difficulties over the lease, now settled, the open-

ing of the small scale factory at Delhi was delayed; production has since commenced.

The Technical Research Laboratory at Calcutta has been completed and is expected to make a valuable contribution to the development of improved surface finishing materials. The Laboratory will work in close co-operation with indigenous manufacturers of printing inks, coatings, varnishes and lacquers, to attain agreed standards on an all-India basis, which should ultimately result in operational economies.

We have recently extended the agreement with our Technical Consultants, The Metal Box Company Limited, London, to cover all aspects of Flexible Packaging—a generic term covering bags, pouches, pockets, satchels or wrappers made from viscose or thermoplastic films such as polyethylene, or laminated combinations of these with paper or cardboard. Through our Consultants we will receive the benefit of technical knowledge and research in this promising new field, but so many varied developments are currently taking place in Europe and America that we are proceeding cautiously in order that we may obtain the benefits of the latest techniques and equipment.

The Mangalore factory has completed its first full year of operation and is working smoothly and successfully.

I referred in my last Review to the start we had made on the production of Industrial components. From the trade response it is clear that we are providing a valuable service, making it unnecessary for manufacturers to set-up specialised equipment for limited production of component parts which, in themselves, are merely ancillary to their main production. We expect a steady expansion of demand in this promising new field.

Until recently collapsible tubes greater than one inch diameter had to be imported, but further extrusion and printing equipment covering a larger size range has been installed and we are now making all sizes of tubes presently required. The same equipment enables us to make larger sizes of rigid aluminium tubes. Machinery has also been installed to provide internal lacquering for products which react with aluminium and need this additional protection.

The new prifiting factory at Cal-

cutta has been completed and is in operation.

Staff

Once again it is my pleasure to thank all the staff for their fine effort throughout the year. Their keenness, enthusiasm and loyalty to the Company has contributed in no small measure to the satisfactory results attained.

Not So Quiet on the North-Eastern Front

(From a Correspondent)

WHILE the liberation movement in Goa is filling the front pages of all Indian newspapers, the North East of India is modestly shaded by its old purdah, inherited from the British period, and civil war continues quietly but without interruption behind this closed door—a door closed to outsiders of any kind. If you are a business man, you are not welcome to the Naga Hills and NEFA, because you might exploit the innocent hill people. If you happen to be just a curious tourist, you obviously have no business there and therefore your interest is highly suspicious. If you belong to an opposition party (in this particular case the PSP) you cannot get a permit to enter Kohima even when your wife's brother is a high officer there, and your wife has to face the trouble of a journey with small children quite alone. If you are a foreigner, you are bound to be either an American or a communist spy, inciting the ferocious headhunters to anti-Government activities.

Nagas Turn Back

Few heard about the Naga National Council before their famous public meeting at Kohima, where their leaders were not allowed to read out their address to the Prime Minister, and so all the fifteen thousand of them walked out before the Prime Minister could start his speech. This was perhaps the only experience in Pandit Nehru's life, that some people could resist his personal charm, and this fact rather than anybody's interest in the Nagas themselves, brought the matter into the press. Since that time two or three other reports leaked out, from which it appeared, that the North Eastern Frontier, in spite of its excellent climate, was not the most ideal holiday place for the Indian Forces, but they were cited as rare incidents caused by the wild uncivilized head-hunters, excited by foreign agents. Unfortunately, it is not so simple and the incidents are more frequent than it seems from the press reports—not so long ago about fifty Assam Rifle men died after they had drunk water from a poisoned stream in NEFA. Their mothers and wives might be interested why such accidents go on happening and who is responsible for the mishandling of the situation in this large area.

However it seems that the other side also has got some genuine grievances and here are some examples of the protection which the Government agencies offer to the Naga people:

The Assam Rifles succeeded in burning the following villages in NEFA: Tsungmi, Imbang, Kokhir, Khodir, Jumer, Juthokor, Samir, and some villages in the Phom and Kaliukenyu areas. In the Naga Hills they are mostly satisfied with driving the villagers from their houses into the jungle, so that they cannot cultivate their fields. This was the fate of several villages in the Mokokchung subdivision, namely: Lungkhum, Mangmetong, Mokongtsu, Kensa, Lakhoni and Diboya.

In some other villages in this area, the Armed Forces took to a different kind of recreational activity: they invaded at night and did things to make the villagers more obedient which Nagas find it difficult to forget. The tale of atrocities is too nauseating to be recorded in detail. And it goes on and on. The police force is accused of taking away from time to time domestic animals without the permission of the owners; and the list of charges does not stop there.

How it began

But how did it all begin? According to some persons from the Naga Hills, an Assam Rifle party once was sent to a village, but the villagers refused entry to them. The officer started negotiation and meanwhile ordered his men to be prepared, but not to fire. Yet some of them opened fire and two Nagas were killed. This unfortunate incident was explained and amends were made, but it was only the spark needed to start a chain of mutual vengeance between the two parties who never had too much affection for each other.

Who are the Nagas and why do they not consider themselves to be Indians? Geographically, they are today divided between India and Burma and of those three lakhs inside India, the majority stay in the NEFA and the Naga Hills, some in Manipur State and some in Assam east of Silchar. Racially they are Mongoloids like all the tribes in that area, linguistically they belong to the Tibeto-Burman group, though they

speak innumerable dialects and there exists no one common Naga language. Yet culturally they feel one.

Their arguments for an independent Naga State appear to be identical with those used by other hill people of Assam in favour of a Hill State. They all feel to be culturally different from the Hindus and other people in the plains in that they know no caste or class differences; they possess a decentralised democratic administration of their own and they wish to develop their own languages instead of being forced to learn the Assamese or Manipuri language from the primary school up. Finally, they state that the hills never belonged to India and that they were defeated only by the British who occupied portions of Naga territory from 1879 till 1947 and that they hoped to be independent again since the British had left India. This is as far as the official addresses, pamphlets and memoranda go. If you talk to the Nagas, you will soon find that the most painful spot lies not so much in history or language, but in their respect for woman. No woman was ever kidnapped or molested by a Naga—as far as I could find out—while many Naga girls and women were very badly treated by the Indian Armed Forces. To this must be added the psychology of newly converted Christians—and all the Naga leaders are Christians. They don't like any Hindu influence and they deeply resent the expulsion of all American missionaries from the hills. Since the Naga movement did not stop with the departure of the missionaries (though some hospitals had to be closed), the Press comfortably transferred the blame for it on the communists. But it is ridiculous to try to cure internal troubles by transferring the responsibility for them to any popular outside agency which is at hand.

Naga Leaders all Underground

The present leaders of the Naga National Council went underground three years ago and have remained underground ever since. Though some of the previous leaders accepted attractive Government jobs and gave up their political activities, this process of combating the claim for independence would take probably a few centuries. At the same time the atrocities continue on the usual scale with the same intensity and

frequency and this is really moving some of the younger generation into a conciliatory mood. Not that this would speak highly of the means used by the Government and their application of Gandhian ideals, all the same, it appears that this is what somehow works. Openly the Naga National Council policy is still "rather to be wiped out than to submit," but many would prefer a compromise.

The problem which remains is how to give opportunity to those elements among the Nagas who would be willing to accept autonomy, a complete autonomy of all the Naga territories united into a single State. The present leadership is not likely to agree even to this much; it cannot go easily back. So the only hope lies in the creation of a new political party in the hills, but as long as terror rules, the Nagas will pre-

fer unity even against their own political convictions. So, little can be hoped for if peace and decency are not restored. An impartial inquiry into the happenings in the Naga Hills and NEFA should be the first step to start with. And in the future public opinion should be more trusted and full information and free access to all places at least to the Press should be assured.

Land Problem in Travancore-Cochin - II

D S Chauhan

IN the first part of the article, some of the consequences of heavy population pressure in Travancore-Cochin have been examined. The consequences discussed so far are under the following heads: (i) Smallest size of holdings, (ii) disproportionate land distribution, and (iii) high proportion of non-agricultural population. Some further consequences of population pressure are discussed below.

(iv) Highest Proportion of Agricultural Labour Class. The All India Agricultural Labour Enquiry Committee reported that the agricultural labour class in T.C. was 39.5 per cent of the total families, the highest in the Indian Union.

Livelihood Classes	% of families
Land owners	19.0
Tenants	8.1
Agricultural labour	
with land	20.8
without land	18.7
Non-agricultural families	33.4

Of this, 20.8 per cent of the families had 32.8 per cent of the holdings and held 10.8 per cent of the cultivated area having 0.8 acres as the average size of holding; the remaining 18.7 per cent families had no land. The Census of India 1951, in the tables relating to livelihood classes (mentioned in the previous section) records that 20.2 per cent of the general population and 22.1 per cent of the rural population derives the major share of its income from agricultural labour.¹ Amongst the agricultural class, the proportion of the agricultural labour is 36.8 per cent. In the different districts, the proportions are—Quilon 32.3 per cent, Kottayam 34.9 per cent, Trivandrum 36.3 per cent, and Trichur 46.4 per cent.

Besides, recently there has been a considerable switch over among the working class from non-agricultural occupations to agriculture, as is in-

¹ The class "agricultural labour" in the two reports mentioned above is not identical. In the former it refers to the percentage of agricultural labour families to total families, and in the latter it refers to the percentage of population deriving the major part of its family income from agricultural labour.

dicated by the change in the ratio²

Livelihood Classes	Proportion of Principal Earners	1931	1951
1. Owner cultivators	24	21	
2. Tenant cultivators	5	6	
3. Agricultural labour	18	24	
4. Rent receivers	1	1	
Total agricultural class	48	52	
5. Producers other than agricultural	25	24	
6. Commerce	9	6	
7. Transport	2	3	
8. Miscellaneous	16	15	
Total non-agricultural class	52	48	

of agricultural and non-agricultural 'principal earners' from 48:52 in 1931 to 52:48 in 1951, which is mainly due to the increase in the proportion of agricultural labour from 18 per cent in 1931 to 24 per cent in 1951³

Such a high proportion of agricultural labour is a sign of growing agrarian distress, and it shows the emergence of a substantial section of population without stable economic base.

(v) High Degree of Unemployment. There has been a considerable dec-

	1931	1941	1951
	%	%	%
Principal earners	30.9	27.1	28.5
Earning dependents	17.1	9.5	7.6
	48.0		36.1

	Average days per year			
	All	Men	Casual	Women
			Attached	
1. Employment				
Agricultural Labour	185	185	298	133
Non-agr. Labour	30	31	—	14
2. Self employment	42	41	67	—
3. Unemployment	108	108	—	—

Agricultural Classes	Trivandrum	Quilon	Kottayam	Trichur	TC State
Owner cultivators	52.2	58.2	53.2	21.6	48.0
Tenant cultivators	9.3	7.5	10.3	28.2	13.0
Agricultural Labourers	36.3	32.3	34.9	46.4	36.8
Rent receivers	2.2	1.7	1.6	3.8	2.2

line in the proportion of workers (principal earners plus earning dependents) to total population from 48 per cent in 1931 to 36.1 per cent in 1951. This is definitely an index of increasing unemployment since 1931. The All India Agricultural Labour Enquiry revealed that there were 108 days of unemployment per year on an average for all male workers and for casual workers in agriculture. Further, it is estimated that the maximum period for which agriculturists in T.C. are actively at work is roughly 8 months. And only 19 per cent or about one-fifth of the agriculturists derive any additional income from secondary sources. Therefore, nearly four-fifths of the agriculturists are idle for about 4 months in the year. Thus, there is huge underemployment in agriculture mainly due to the small size of holdings which fail to provide enough work to the men and their families. Unemployment and underemployment are also indicated by the fact that though non-agricultural occupations have developed to a higher level in T.C. (45 per cent of the total population depends on non-agricultural occupations), the distribution of this class between rural and urban areas is very much different from that in other states, where

³ During the previous period low agricultural prices and incomes, and meagre wages were responsible for turning working class to industrial or non-agricultural pursuits; and during the last decade the rise in agricultural prices, in farm incomes, and in wage levels combined with the non-availability and shortage of food, were responsible for switching the labouring class to agriculture.

it is almost equally divided between rural and urban areas. But here, out of 4.19 millions, 3.07 millions (or 73.2 per cent) are in the countryside and only 1.12 millions (or 26.8 per cent) are in urban areas. And further, considering the urban population only, while in other states it is predominantly non-agricultural, in this state, 25 per cent of it is agricultural. Such a high percentage of non-agricultural population in rural areas and the dependence of so large a proportion of urban population on agricultural occupations must conceal a considerable degree of underemployment.¹

(vi) **Movement of Population Towards Hilly Tracts.** The acute land scarcity has given rise to a movement of population to hilly tracts in search of land for cultivation for some decades.² During the last decade, this tendency has become more pronounced; and there is an agitation for allotment of reserve forest land in the highland. But these forests being a boon to the state, any large-scale allotment of forest land for cultivation will be a short-sighted policy, since large-scale deforestation will adversely affect cultivation and will accelerate soil erosion. The results may be disastrous in the long run.

(vii) **Adaptation of Cropping Pattern to Population Pressure.** Cropping pattern is basically influenced by soil and climate; but the pressure of population has exercised a decisive influence on it, within the range of crops determined by the basic factors. Trichur is essentially a low-lying area where 72.6 per cent of the total cultivated land is devoted to paddy, while Kottayam is mainly hilly, where most of the plantation crops are localized.

Rice is the staple food of the people. Paddy is by far the most important crop in the low-lying areas; and the whole of the wet land is devoted to it (which can support the maximum number of persons in comparison to other food

¹Unemployment and under-employment are not peculiar to agriculture alone, but are common to industrial occupations also. It is mostly in the case of unskilled workers; and the period is irregular. Besides, there is educated unemployment also.

²Percentage of increase in total population 1891-1951:—
Lowland 44
Midland 84
Highland 355

crops) though the soil and climatic conditions are suitable for growing other crops. These are clear signs of agricultural adaptation to population pressure. Further, the fact that mixed cropping is the characteristic feature of garden land, is again an index of land-use and cropping system evolving in response to the same influence.

The difference in density of population in the different districts reflects itself remarkably, in the proportion of areas devoted to food and plantation crops. Kottayam with a density of 604, has only 31.5 per cent of its total cultivated area under paddy and tapioca, and 41.3 per cent under plantation crops. On the other hand, the other three districts where the density is more than 1,100, the percentage of area under paddy and tapioca is 58-80 and that under plantation only 3-8. Quilon which has a higher density than Kottayam, but lower than that of Trichur and Trivandrum has 58 per cent under paddy and tapioca (i.e. a lower percentage than in Trichur and Trivandrum which have 80 per cent and 66 per cent); and it has also a larger proportion of its area under plantations than the other two. This shows the relative pressure of population, reflected in the varying proportion of the cultivated areas devoted to food and plantation crops.

Analysing the distribution of the total area under each crop it is found that food crops on the whole are fairly well distributed over all the districts, while commercial crops are concentrated. Again, plantation crops are mainly concentrated in Kottayam which has the lowest density and is also the richest district; paddy and tapioca are grown

THE ECONOMIC WEEKLY

only in small quantities. Quilon which has the next higher density has a lower proportion of plantation crops. On the other hand, Trivandrum and Trichur, which have still greater densities, have the smallest proportion of plantation crops, and a considerably larger proportion of food crops.

(viii) **Deterioration in the standard of cultivation and of living.** During the past few decades, in spite of fresh land being brought under cultivation,¹ cultivated area per capita has gone down from ½ acre in 1921 to about 0.29 acre in 1955. There is likewise a reduction in the irrigated area per capita. On the other hand, the agricultural class has increased during the last decade,

Agricultural class	% of growth	
	1931-40	1941-50
Owner cultivators	—9	18.0
Tenant cultivators	25.8	37.8
Agri. Labourers	—10.1	98.6
Rent receivers	9.0	29.0
All	—1.6	48.4

by 48.4 per cent while the general population has risen by 23.7 per cent. The average annual income per family of 5-6 persons is estimated to be Rs. 600 only and food deficit is estimated to the extent of 50 per cent. The table below taken from the Report of the All India Agricultural Labour Enquiry, 1954 gives an idea of the standard of living of the people in general.

The returns from land are very low. An average family invariably

¹Population has been growing continuously, but during the last 4 decades the unirrigated area per capita has remained almost the same. This shows an addition of the new land under the plough in each decade.

THE ECONOMIC WEEKLY

runs into debt. The standard of cultivation has gone down. Cultivators do not have enough to buy good seed and manure and maintenance of livestock is proving beyond their resources. The result is that many cultivators are compelled to neglect cultivation, as is clear from the previous analysis of the livelihood pattern. In a heavily populated state, this is really a very serious situation.

Again, a decline in the proportion of workers (principal earners and earning dependents) and an increase in that of non-earning dependents, as shown previously, indicate the growing burden on earners. The capacity of the earners to shoulder the burden of dependents not increasing proportionately, there must be a corresponding fall in the standard of living. Further evidence of a fall in living standards in the agricultural section can be found in a strange situation which has developed in this state. The proportion

Agricultural Classes	Effective earners	Dependents
Owner cultivators	28	72
Tenant cultivator	31	69
Rent receivers	36	64
Agri. Labourers	40	69

of effective workers is lower in the principal agricultural classes (and the proportion of dependents correspondingly greater) than in the class of agricultural labour. This indicates the extent of burden an earner carries in different classes. The greater the burden, the greater are the chances of a lower standard.

IV Signs of Growing Distress

More than 92 per cent of the cultivable land has already been brought under cultivation. The limits of agricultural extension having been almost reached, there is little chance of bringing fresh land under the plough. The return from land is already very low, and a decline in the price level will bring distress. Population is increasing very fast. Though the volume of immigration is steadily falling and that of emigration rising, it is strange to find that in such a heavily populated state there has been for long considerable net immigration and it still continues to some extent.¹ Poverty and unemployment face a large number of educated youths. Naturally the future is gloomy; it may become dangerous. Unless they are directed to new channels of economic activity the educated unemployed youths may become

vocal, and the voice will not be ineffective.

V Some Suggestions

The scarcity of land is acute, and the pressure of population tremendous. The remedial measures should broadly aim at increasing production on the one hand and population planning on the other. The percentage of literacy being very high, the measures of population control should prove more effective and quick than in other parts of the country. Besides, the T.C. government should explore the possibilities of planned emigration to the thinly populated central states. This would relieve the pressure in the problem areas of T.C. and would be helpful in stepping up the rate of progress in the latter.

In respect of production planning, it should be recognised that this state cannot be self-sufficient in food supply. Hence that should not be the aim. Secondly, it is equally important to realise that for the major problems of agriculture the real solutions lie outside the field of agriculture, i.e., in general industrialization and the creation of non-agricultural occupations, to provide a source of wealth and to absorb the surplus working population.³ Coir, fishing, poultry and dairying have to be organized as subsidiary occupations for farmers, and the development of other cottage industries should be given an important place in the state's Second Five Year Plan.

Of late, public lands have been protected against encroachment, and the reserve forests have been free for occupation. There should not, however, be any large-scale clearing of these forests, since rivers and streams flowing from them are the important means of communications and sources of hydro-electric power; besides, forests are, and can further be developed into a valuable source of wealth. The state may reconsider its policy regarding public lands.

Subsidiary sources of food, particularly fishing, should be organized more extensively. Besides, in respect of the cultivated area, irrigation and manure are the two major requirements. Of the net area sown one-fourth is wet and three-fourths is dry; and if the irrigation targets in the First Five Year Plan are fully achieved, there will be an increase of 4.9 per cent over 1949-50, and the extent of irrigation by 1955-56 will be 34.3 per cent of the total area sown. Though the annual rainfall is quite heavy, and is also fairly

regular and uniform, the need for irrigation is nevertheless very great, for increasing the double-cropped area, and for enhancing crop yields. The form of irrigation will, however, depend on the local conditions. Regarding the choice of crops, the state can profitably extend cultivation of spices.

There is a popular cry for putting a ceiling on land holdings. Sometimes doubts are expressed that larger estates being plantation estates, it may not be advisable from the view-point of their operational efficiency to break them up. In the case of others, the number of rent receivers is rather small, and even the redistribution of bigger holdings may not very much improve the lot of the surplus population. The concentration of land holding, however, is there; and in such a heavily burdened area ceiling has to be fixed from the view-point of public

Years	Immigration (mils.)	Emigration (mils.)	Balance (mils.)
1901	2.18	.43	1.75
1911	1.91	.60	1.31
1921	1.78	.58	1.20
1931	2.61	.77	1.84
1951	2.23	2.22	.01

The bulk of the immigrants comes to work in plantations in highlands. Nearly 91% immigration is from Madras and 83% of emigration is also to Madras.

²The extent of literacy is 45.8 per cent (Males 54.8 per cent and females 37.0 per cent for general population, and 53.8 (males 64.5 and females 43.2) for population over 5 years of age.

³There are no heavy industries in T.C., and scarcity of capital is quite obvious. Factory industries relate to cashewnut, coir, cement, aluminium, glass, fertilizers, rayon, cotton textile, plywood, tiles, ceramics, paper, oil and soap, etc. But except in the cashewnut factories in Quilon and coir factories in and around Alleppey, very small number of labourers is employed. By far the major part of the non-agricultural labour is employed in cottage industries, the most important of which are handloom weaving, coir and fishing; others are jaggery making, bell metal work, making of screwpin mats, baskets, articles of furniture from cane, pottery, etc. In highlands, plantations absorb practically the whole population.

Hind Cycles has a New Unit

peace and social justice. Under a democratic frame-work, the popular cries are usually effective. The limits for ceiling suggested by the Land Policy Committee, Travancore-Cochin (1949-50), were—double crop (wet-lands) 50 acres; single crop 75 acres; dry lands other than coconut gardens 75 acres; coconut gardens 50 acres. The limits suggested by the Socialist Party in 1954 were double crop lands and coconut gardens 15 acres; single crop lands 22½ acres; and dry lands 30 acres. For such a heavily populated area these limits are too high. In order to make the idea of ceiling effective in reducing social distress, the limit should closely conform to the optimum size of family holding, so long as individual farming remains the common pattern of agriculture. The limit should not exceed 10 acres. The case of plantations, however, has to be treated separately, both in regard to ceiling and to other ameliorative measures. Proper land-use and operational efficiency should not be sacrificed. And for improving the conditions of labour one may think of the measures which are generally adopted in industries, i.e., enhanced wages, bonus and profit sharing, etc.

THE balance sheet and other accounts of the Hind Cycles Ltd. for the year ending December 31, 1954, indicate improvement in performance over the previous year. During the year under report, the company's Establishment No. 2 at Kandivlee started production of cycle chains. Sales and manufacturing expenses on the one hand and establishment expenses on the other, both went up from 13.09 lakhs and Rs. 1.38 lakhs in 1953 to Rs. 16.10 lakhs and Rs. 1.62 lakhs respectively in 1954. Nevertheless net profits were also higher by Rs. 1.07 lakh, and amounted to Rs. 4.40 lakhs in 1954. This improvement was due to the noticeable increase both in production and in the value of sales; thus the number of cycles manufactured increased from 120,232 to 130,232, while the net value of sales rose from Rs. 1.42 crores to Rs. 1.55 crores. The company's contribution to provident fund and Employees State Insurance increased to Rs. 2.60 lakhs during the year from Rs. 2.34 lakhs in 1953. The allocation to depreciation was slightly higher by Rs. 0.19 lakh, at Rs. 6.28 lakhs, bringing up the Depreciation Reserve

Fund at the end of 1954 to Rs. 53.6 lakhs against a gross block value Rs. 73.31 lakhs.

The company has always regarded its well "looked after" and satisfied labour force as an invaluable asset. Hind Cycles pays its workers handsomely: thus, during the year 1954, wages per head per annum averaged about Rs. 2,625. This would be found to compare very favourably with the standard of wages in the engineering and other comparable industries. The wage level in Hind Cycles has been going up steadily since 1950, and the company is very proud of the fact that it has on its rolls highly paid 'daily' workers, some of whom pay income tax.

The company has plans to install additional plant and machinery. Orders have been placed for machinery worth Rs. 15 lakhs and expansion of factory building has been taken up. For financing the expansion programme, the directors are considering expansion of capital of the company.

The directors have recommended that the dividend should be raised from Rs. 8 to Rs. 10 per share of Rs. 100 each.

Revived Spurt

Wednesday, evening

FIRM in the latter half of last week, the Calcutta Stock Exchange developed an irregularly lower trend in the last few days. Fluctuations in Indian Iron have tended to dominate price movements in equities in general in the last two weeks. An uncertain trend in Tea shares has been partly responsible for halting the upward trend in equities. Jute shares remain irregularly steady, while raw jute and jute goods have tended to be erratic in their up-and-down movements.

Three factors have helped the spurt in Indian Iron in the last three weeks. There was a considerable "bear" position in this scrip. Technically, the position in Indian Iron was such as to enable bold speculators to rig the market up in the event of the least favourable development. Some real and some imaginary factors have helped "bulls" to squeeze "bears" out. Improvement in Tata Steel has helped this process.

Iron Dividend

Basically, Indian Iron are moving up because of better dividend expectations. Last year's output and profits were higher. On balance, the output for the first quarter of the current year is also higher. There is no doubt that the Company's earnings were higher last year. From this, it does not necessarily follow that dividend disbursements will be higher. In the Chairman's speech last year, nothing more was promised than the maintenance of dividend. It was implied that higher profits will have to be earmarked for servicing the loans and for gradual elimination of prior rights.

Though Indian Iron have been stagnant until recently, it has been evident since the release of 1953-54 accounts last year that the financial position of the Company is sound. With higher output and profits in the year to March, 1955, the Company can distribute higher dividends. Whether it should, is a different matter. There are some who argue that payment of any higher dividend requires prior sanction of the Government. Whether this is the correct state of affairs for the year to March, 1955, is not quite clear. There is, however, no doubt that the prior sanction of the Government

will be necessary for raising dividend payments for the current year.

There is another reason why Indian Iron are going up. Expansion projects are under contemplation. To implement these plans, the Company will need finance. There is also something in the argument that the Company's capital structure justifies an increase. There are hopes that the Company may decide to raise capital through bonus issues. This will also require New Delhi's prior sanction. But this request is likely to be granted more easily than any request for stepping up dividend payments.

Coal Shares

When equities are, or any particular equity is, moving up, the market does not lack reasons to justify the rise. One of the factors responsible for the recent spurt in Indian Iron seems to be Sri T. T. Krishnamachari's assurance that the existing industries will not be nationalised. Twice last week, TTK gave such assurances in his statements in Madras and Coimbatore. On both occasions, Indian Iron improved on the argument that such explicit assurances may encourage the Company to hasten its plans for expansion.

It could not have been a mere coincidence that, for the first time in recent months, selective coal shares met with active support last week. In the 1953-54 boom, Coal shares were neglected. There were reasons why Coal shares did not participate in the boom. For one thing, the industry was suffering from over-production and falling exports. Fears of rising labour costs and of nationalisation hang heavily over Coal shares.

For some time now, it has been apparent that the position of Coal industry is not as gloomy as pessimists would have the market and the Government believe. Dividend payments may not have been raised, but the disbursements have been maintained. But nationalisation fears persisted. For more than a year, the market has been anxiously awaiting the report of the Committee appointed to investigate the industry's problems. Meanwhile, TTK's assurance that the existing industries will not be nationalised seems

to have emboldened some speculative investors to test the market.

Tea Shares

Throughout last week, the local market has tended to be dull and inactive on the days when Indian Iron has been stagnant or irregularly lower. That is because the other influences which have a sustaining effect on the Calcutta Stock Exchange have not been in operation. Neither Tea nor Engineering nor Miscellaneous shares have been consistently moving up. Most of the days, these groups experienced occasional profit-taking. There were not many dividend announcements last week to bolster Tea shares up. This factor will not have as much sustaining influence on Tea shares hereafter as it has been hitherto.

Stock markets thrive on anticipation. Because the belief is widely held that tea prices and profits will be lower this year, Tea shares remain irregularly lower. But current developments are not unencouraging.

THE CENTRAL BANK OF INDIA LIMITED

(Established December, 1911)

Head Office: Mahatma Gandhi Road, Fort, Bombay I.

Authorised Capital	6,30,00,000

Average export auction prices remain well above expectations. Floods in Assam are causing delay in arrivals of tea because of disruption of communication. Statistics confirm that the scheme for voluntary restriction of output is being more rigidly implemented. These are arguments not for a rise in Tea shares, but for a more realistic appraisal of the nearby outlook.

Jute Shares Irregular

Jute dividends for the last half-year may not be unpromising. Developments for the current half-year may not be less adverse than those in the preceding six months. Despite expectations that last half-year's dividend payments will, at least, be

maintained, Jute shares remain neglected. This is the only group which refuses to look up either on dividend buying or on selective support to sound scrips within this group. This is an ugly feature of recent price movements on the local stock market. If Jute, Coal and Tea Shares remain depressed, can Clive Street experience any sustained spurt?

As in Jute shares, so in raw jute and jute goods. With the realisation that there may not be any glut in raw jute this season, the prices have ceased to fall. But raw jute is not moving up. Neither are jute goods. Data relating to stocks at the end

of June showed a sizable decrease in the stocks of sackings and almost a proportionate increase in the stocks of hessian. But the improvement in B. Twills has not been sustained, though hessian prices are not appreciably lower. These movements in parities may not be favourable to Jute shares. But there is reason to believe that the demand for sackings is consistent. Hessian stocks also may be lifted as and when shipments to Argentina against that country's orders are made according to schedule. These are possible developments which do not seem to justify any unduly "bearish" outlook on Jute shares.

Around Bombay Markets

Dalal Street in High Spirit

Thursday, morning

THE stock market remained in high spirits. Prices made further headway on bull operations and covering on behalf of shorts. Fears, doubts and suspicions engendered by various official policies and pronouncements have given way, for the time being, to a feeling of optimism. That the Government's policy with regard to nationalisation is likely to undergo a change or that economic policy would be more practical, ensuring accelerated industrial production, is also mentioned as a cause for this marked change in sentiment. But the real reason is different—brighter dividend prospects. The fear that Government may tax bonus share issues has induced many concerns to follow a somewhat liberal dividend policy. And this has given a fillip to the stock markets.

Hopes that Tatas as well as Martin Burns would fall in line with the rest have brought support to Tata Steel and Indian Iron. After the recent steep and sensational gains, Dalal Street is likely to pause on its onward march and naturally there is also an inclination to await the Prime Minister's impressions of Russia. Market commentators consider it significant that on his return to Delhi, Pandit Nehru made the observation that foodgrains in Russia were cheap but clothes and other consumer goods were rather costly. This is regarded by some as a hopeful pointer.

In view of the fact that cloth prices are relatively high and have not reflected the decline in raw cotton prices, the impression is gaining ground that the cotton textile industry would fare well during the current year. That is why textile shares have been up. Mention may be made particularly of Kohinoor and Century. Central India, however, is subdued in view of the unfavourable dividend prospects for the year just ended.

Tata Steel as well as Indian Iron forged ahead to new high levels. Profit taking sales have been well absorbed. The market has now an eye on Tata dividend which is to be announced next week. The majority expectation is for a dividend of Rs 11 as against Rs 10-8 last year.

Bombay Burmah has boomed on expectations that the final dividend may come to Rs 25 as against the interim one of Rs 11-4. A C C met with resistance at the higher level. Belapur Sugar has received fair support in view of the fact that the Dacca factories are able to realise a better price in view of the booking difficulties from UP and Bihar. National Rayon met with fair inquiry but as some of the holders were inclined to realise profits, the upward trend did not proceed much further.

Scindias continued to be in doldrums, and in sympathy, Premier

Construction has lagged behind. There was no business in Great Eastern Shipping.

Among engineerings, Alcock advanced by Rs 25 on some influential buying. Tata Locomotive moved up to Rs 140 while Hindustan Motors at Rs 10-1 and Premier Automobiles at Rs 82-8 have remained steady.

The gilt-edged market is ruling quiet, while in Banks, Insurance and Electrics, business has been sporadic with the undertone slightly easier.

Trading in Bullion Suspended

TRADING on the bullion market has been officially suspended in view of the recurrent squeezes in silver attempted by the bull operators. A move is already well advanced for declaration of an emergency so that outstanding business in Shravan delivery can be either squared up by fixing rates or within the limits that may be determined by the Board in concurrence with the Government. The contract is to be amended so that sellers may have to pay minimum penalty for non-delivery in future. It will take some days before the scheme is finalised.

The nominal rates for silver and gold are reported at Rs 160-14 and Rs 92-9 respectively.

Cotton Reacts

COTTON prices have reacted sharply from the highest level recorded during the previous week. This decline is mainly to be attributed to large-scale unloading by prominent bull operators as well as the nearness of the commencement of business in the new crop contract which is based on fine Jerilla of 13/16" staple length. There will be only one contract and delivery months as usual will be February, May and August. Some changes, however, have been made with regard to deliveries. All tenderable varieties under the new contract will be tenderable only up to 2/32" 'on' and 1/32" 'off' for staple. As 3/4" Jarilla will also be tenderable as at present, it has been decided to split Jarilla into two categories 'A' and 'B'. Under 'B', 3/4" Jarilla would be tenderable without tolerance and without any 'on' balance for staple.

I C C August which was recently taken up to Rs 613 declined to Rs 591 to be placed at Rs 593. Several cotton growing areas are still in need of rains. The market outlook is not bearish in view of the dearth of tenderable varieties. But the uncertainty of the fixation of tenderable differences and tenders has undermined confidence. Moreover, business against fresh export quotas has been moderate and this has failed to sustain bullish fervour.

Oilseeds Slightly Lower

AFTER the recent rise the oilseeds market was in a subdued mood as buyers were reserved at higher levels. The Government of India is not expected to issue any fresh export quota in groundnut oil in the very near future, at least not until the monsoon has progressed. This has led to some selling in groundnut oil. Reports of rains in Saurashtra have also been a contributory factor.

Castorseeds fluctuated irregularly. With the commencement of business in new crop for 1956 May delivery, the bullish fervour was dampened in September delivery which came down to Rs 97 from Rs 105, to recover to Rs 102 and to be placed finally at Rs 99 while May delivery was at a discount of Rs 10 to Rs 8. Castor oil commercial has reacted to Rs 10-12 from Rs. 11-2 per quarter.

Groundnuts bold ready were sold down to Rs 23-10 from Rs 24-12 while August delivery came down to Rs 23-8 from Rs 24-14. The new crop December-January delivery opening at Rs. 21-15 improved to Rs. 23-8, finally closing around Rs 22-12. Groundnut oil prices have receded to Rs 12-11 from Rs 13-4.

In the absence of fresh business in linseed oil, linseed was quiet. Bold ready turned lower at Rs 26 while August-September eased off to Rs 25-10 from Rs 26-4. Business in linseed oil was done at Rs 16-2 to Rs 15-13.

HANDLOOM FABRICS MAKE NEWS

ALTHOUGH handloom fabrics enjoy official encouragement, they make news on account of the marketing difficulties they encounter. However handloom products hope to survive mill competition, provided necessary marketing facilities are assured to them.

The All-India Handloom Board is now actively handling marketing of

handloom products both in India and abroad. It has set up show rooms and emporia and grants rebate on retail and wholesale sales, as well as on sales for export. There is already a Central Marketing organisation and an All-India Handloom Fabrics Marketing Co-operative Society has been proposed to be set up.

The Board's external marketing Scheme looks after sales for exports, under which four marketing officers

TWO facts emerge clearly out of the Geneva talks to date among the Heads of State. Their sincere intention to make an honest effort to reach an agreement is beyond doubt. Both Marshal Bulganin and President Eisenhower emphasise that the Heads of State have not assembled at Geneva "merely to catalogue our differences". There is a reassuring admission in President Eisenhower's opening address that the "talks at the summit" reflect the eager hope of the people throughout the world that their Governments should have the wisdom and the diplomacy to arrive at an understanding to ensure peace. Each of the Heads of State has been at pains to be conciliatory and cordial in his opening speech. If President Eisenhower has paid a compliment to Marshal Bulganin for the latter's emphatic realisation that world peace is the most fervent desire of the common man, Marshal Bulganin has promptly responded by making yet another significant gesture towards peace. In his opening address, he announced Russia's decision to contribute her share of atomic materials to the International Atomic Energy Agency as and when this international organisation was created to implement President Eisenhower's plan for an international pool of atomic resources.

From the prompt acceptance of the agenda, as well as from the conciliatory tone of the opening speeches of the Heads of State, it is clear that both sides are sincere in their attempts to reach an understanding. This does not necessarily mean that either side is prepared to accommodate the other beyond certain well-defined limits. If President Eisenhower was deliberate, in his opening address, in excluding Far Eastern problems from the purview of the "summit" talks, Marshal Bulganin was frank in stressing the importance of Formosa and of the Far East in any arrangement for attaining world peace. If President Eisenhower was equally deliberate in his reference to post-war developments in Eastern Europe and to the activities of the Cominform, Marshal Bulganin made it clear in his opening address, that these were topics which were outside the agenda for the Geneva talks. Even so, the agreed agenda leaves scope for each side to introduce issues which the other may be reluctant to discuss. Though the agenda excludes Far Eastern issues, the flexible arrangement under which the Heads of State can agree on "any additional items" offers scope to Russia to discuss Far Eastern issues. Again, as development of East-West contacts is an item on the agreed agenda, nothing prevents America from raising the problem of the "iron curtain" during the Geneva talks.

It would be idle to pretend that no dispute would ever arise among the nations of the world. Differences are inevitable. "Such is life", as Marshal Bulganin, in his philosophic mood, explained to journalists during the first Press Conference ever held at the Kremlin on the eve of his departure for Geneva. But the fundamental thing is to agree to reconcile such differences through negotiation. From the agenda, as also from its order of priority, it is evident that this basic principle is now better appreciated by both sides. Britain, France and America are agreed that Germany is the most important problem under discussion at Geneva. Russia is more logical in her insistence on a European

Prohibition—Final Round?

THOUGH advertised as the final round, it is unlikely that the prohibition controversy will be settled for good when the Planning Committee of the National Development Council meets this week to consider the interim report submitted by the Prohibition Enquiry Committee to the Planning Commission. From the manner in which the latter committee has been packed with prohibitionists and in view of the known predilections of the National Development Council, the outcome is not left in doubt; but the pace and timing of it cannot be laid down in advance so confidently in view of the state of State finances and also the administrative capacity of the different States to enforce prohibition.

It was the latter consideration, viz., the administrative capacity of the States to enforce prohibition, which half of the members of the Taxation Commission considered to be of primary importance and not the fiscal aspect of it, which they admitted to be secondary. The other half of the Commission, however, rejected the idea wholesale that progressive reduction in consumption of intoxicants could ever be brought about by an excise policy which aimed at maximisation of revenue. The members being divided equally on the issue, the Taxation Commission was not in a position to make any recommendation on the subject at all.

Whatever be the findings of the present committee—one of the members has protested that press reports on the subject are wrong and misleading—The Andhra Enquiry clearly established that prohibition had failed in that State. Present policies in different States differ widely in the matter of intoxicants other than opium; the consumption of opium alone is regulated at the instance of the Government of India in a uniform manner in all the States. The picture is a variegated one, and has been summed up as follows in the Taxation Enquiry Report.

1. Complete Prohibition — Bombay, Madras, Andhra and Saurashtra.
2. Partial Prohibition — Uttar Pradesh, Madhya Pradesh, Mysore, Orissa, Travancore - Cochin and Coorg.

Others:
(a) States with some dry areas—Assam and Punjab.

(b) States observing a temperance policy—Bihar, West Bengal and Madhya Bharat.

(c) In the remaining States—Hyderabad, PEPSU, Rajasthan, Himachal Pradesh, Ajmer, Bhopal, Delhi and Vindhya Pradesh—there is neither a policy of partial prohibition nor even of temperance.

While the importance of this source of revenue is not to be minimised, excise being second in importance for a majority of the States, All-India prohibition will not cause a loss of revenue of Rs. 150 crores per year, as has been erroneously reported. The total collections under this head were estimated at only Rs. 44 crores in the 1954-55 budget; on the other hand, if prohibition is abandoned, the increase in revenue could hardly exceed Rs. 20 crores on present showing and the maximum increase will not in any case exceed Rs. 30 crores.

Progressive introduction of prohibition is among the directives of the Constitution but it is only one of several such directives. It is unfortunate that the issue has been discussed so long almost exclusively as a financial one on the one side and as a purely moral or ethical one on the other. Social policy cannot ignore either, but it has to steer between the two and keep within the administrative competence of the State. Above all, it has to meet the test of a realistic appraisal of the existing situation.

Focussing on Change—Tin Cans

ATIN can may be simple enough to look at and even the collapsible tube from which you squeeze out tooth paste or shaving soap every morning may not appear to be such a marvel of science or industrial engineering. Appearances, however, are deceptive in both cases. Most advanced techniques—the latest and the best—the fruits of industrial research of a high order go into the making of both. And behind it is one of the world's best streamlined organisations, for Metal Box makes the tin cans, whether it is in UK or USA or in this under-developed country of ours where canned foods are still somewhat foreign, food processing is in its infancy and enormous quantities of perishable stuff, fruits and vegetables, go to waste every year.

So Metal Box is focussing on a process of change which will, some

day, revolutionise agricultural production and marketing. Judging from the company's balance sheet, the job of helping this process of change is not unremunerative. The undertaking used to be a 'sealed unit' so far as the technique and even a large part of the organisation were concerned. Even in the worst days of scarcity of metals, during the Korean boom, Metal Box had no problems or if it had any, it did not care to talk about them. The company is more disposed to talk now. It is developing its research organisation in India and the difficulty experienced last year in getting its raw materials such as tin plates and aluminium was solved "in consultation with the authorities," and by timely imports.

The increase in the value of its sales from Rs. 321 lakhs in 1953-54 to Rs. 348.6 lakhs in 1954-55 is an index of the growing popularity of the company's consumer package products and the vigorous efforts made to push their sales. As a result, profits, after providing for depreciation and taxation, rose from Rs. 16.5 lakhs to Rs. 22 lakhs in the year ending March 31, 1955. During the year, the company undertook production of aluminium pilfer-proof seals for glass bottles. The new product has been well received. The company's Technical Research Laboratory at Calcutta is working on the development of improved surface finishing materials. Besides, as a result of the extension of the Agreement with its Technical Consultants, Metal Box of Great Britain, the company expects to receive the benefits of advanced research and technical knowledge in developing Flexible Packaging—covering bags, pouches, pockets, satchels etc. The manufacture of industrial components has met with encouraging response from industrialists. The printing factory at Calcutta has started operation.

The dividend on ordinary shares maintained at 10 per cent since 1951, is proposed to be raised in view of the shareholders' contribution towards the expansion programme of the company through the investment of retained profits. The directors have recommended a higher dividend of 12½ per cent (5 per cent interim and 7½ per cent final) per share of Rs. 10.

Wind Mills for Low Power

THERE are high-powered ministries and ministries which are not so high-powered. The Ministry of Natural Resources, therefore, appropriately enough, concerns itself with such things as cooking by sun's rays—frigidaires from surals is not, however, on its cards—and power from windmills. When the question of introducing windmills in India was first mooted three years ago and a sub-committee was set up by the Council of Scientific and Industrial Research to investigate their possibilities, the question that naturally occurred was why this country which is believed to have given the wheel to the world had never gone on to windmills? The wide-scale diffusion of simpler and inexpensive techniques, inventions and designs, is a subject worth closer exploration. Some devices catch on in some parts of the country but not in others.

But someone has to make a beginning somewhere and the Natural Resources Ministry has drawn up a 7-crore project for the installation of 20,000 to 30,000 windmills in the

course of the Second Five-Year Plan. The Wind Power Sub-Committee of the C S I R has designed a low-cost wind mill which can be constructed from local materials like bamboo and wood, and which will cost about Rs 800 to Rs 1000. Maintenance and repair would be inexpensive and should not cost more than Rs 50 per year. The unstated assumptions, of course, are that the village carpenter or the blacksmith should be able to fix a windmill, if it went out of order and do the necessary repairs.

Needless to say, wind mills would be of no use unless adequate wind power is available for the better part of the year. An earlier investigation suggested that the Western Coast had favourable wind conditions. A British expert who surveyed the country for the purpose recommended extended wind velocity surveys and experiments with a 10 kw. wind-driven electric generator plant. It is not clear from newspaper reports whether wind conditions have been adequately surveyed or not, but at the moment it should not be a crippling handicap, because the project now under consideration

is not very ambitious. One of these windmills should be adequate for supplying power for irrigation to a 5-acre farm. This is only for mechanical power, but the cost data and the performance claimed are interesting. Such a windmill can drive a pump to lift 12,000 gallons of water a day on the average, while a man working with a pair of bullocks, under similar conditions, can lift only 5000 gallons of water a day, and that at a cost of Rs 2/8.

Windmills for generating electricity, however, have to be much bigger and they would prove more costly. Together with generator, one will cost about Rs 20,000 and should be able to generate 8 to 10 kw. power which will be sufficient for the needs of a small village. But such mills will need stronger and steadier wind power. Of course, the idea can be infinitely expanded, such as using a windmill to pump water into a dam, when wind conditions are favourable and later using the stored-up water for irrigation or for power generation. At present experiments are being carried on in a small way in Rajasthan and

Saurashtra. Equipment for recording wind velocity is still to be supplied by the Meteorological Institute at Poona for installation at different places in Saurashtra, Bombay and Madras, for a more extensive study of wind conditions.

Central Control Board?

WHEN a Cabinet Minister speaks on the radio, does he give out his own ideas or does he outline the policy of the Government? The question is raised pointedly when so soon after Pandit Nehru's eulogy of workers' participation in industry in the Soviet Union and in Yugoslavia, his Labour Minister, Shri Khandubhai Desai, suggests that "an effective and compact Central Control Board should be set up for all the major industries with statutory power to administer and implement Government's declared policy." The Board, the Minister goes on to say, "should be advised by a tripartite Committee representative of all concerned interests. Besides exercising powers of licensing, regulation and control, the Board will be responsible for dealing with the various special problems that arise from time to time, such as rationalisation. While Government should lay down the policy in regard to all such important matters, it should be the responsibility of the Board to give effect to the policy, especially when there is any difference between employers and workers."

At the time of his predecessor, it was well-known that the views held by the Labour Minister were his own; they did not represent the accepted policy of the Government or of the Cabinet. Is Shri Khandubhai Desai following the same precedent, or is there more to it? If it is his own views that the Labour Minister is airing, it would be better for him to convince the Cabinet first and then to address the public on the subject. Ministers, like workers, have their responsibilities; surely it is not too much to expect that they would explain and clarify Government policy, instead of confounding the public.

Not By the Acres of Land...

THE progress of Bhoodan is no longer being advertised by periodical publication of the target set and the collections made by a certain date. Not that the impact of the movement on the minds of men can be or should be judged by the number of acres of land donated or

any other numerical measure. But since at one time a kind of inter-State competition was sought to be encouraged and the number of acres collected and the target set were publicized in order to enthuse the workers, it may be noted in passing that the official figures just released show that all-India collections till the end of May this year totalled 3.8 million acres as against a target of 6 million intended to have been achieved a year ago, i.e., by April 1954. Bihar as usual led with a donation of 2.3 million acres. But Bihar had set itself a quota of 2½ million acres to be achieved by April last year before the Sarvodaya Sammelan met in Bodha Gaya. When this target was announced, it seemed fantastically optimistic but it was nearly achieved. Judged by the number of acres donated, the rate of progress of Bhoodan since then seems to have slowed down. By 1957, Bhoodan workers promised to collect 50 million acres.

More than donations of land promised or collected, the success of the movement and its strength depend on the success achieved in distributing the land among the landless in such a manner that instead of adding to the evils of fragmentation, which is already bad enough, a process of land utilisation is set in motion which will change the face of the countryside. Writing a year ago in these columns, Hallam Tennyson whose book on Vinoba Bhave entitled "Saint on the March" has become a best seller on both sides of the Atlantic had correctly pointed out that the real test of Bhoodan would be whether it satisfied the first vital need of the agricultural revolution which was for the peasant himself to participate actively in its achievements.

Water Rates and Socialism

SO well has Lohia done his job that party directive or no party directive, Congressmen everywhere will back out from enhancement of water-rates. Andhra provides an excellent illustration. In the debate in the Andhra Legislative Assembly, on the Gopala Reddy Ministry's proposal to enhance water rates by 25 per cent, increase the wet assessment—a composite levy including water rates on certain categories of land—by 18 per cent, and to levy a surcharge on land revenue, not a single member appeared to favour the enhancement. The main argument put forward was that it

affected the poor cultivators who were unable to bear the higher rates, and also that the enhancement of rates would bring only Rs. 40 lakhs. So, it was unsocialistic!

The Taxation Commission has clearly shown how bad the situation is. Not only the cost of new irrigation works—both minor and major works—but also that of maintenance of old works has gone up. An analysis of the financial results of certain works (taken at random) shows that the average running expenditure on major systems has varied between 54 to 77 per cent of gross receipts during the year 1948-49 to 1950-51 as compared to 40 per cent in 1938-39. The accumulation of interest charges and the cost of extension and renovation of small scale schemes have further added to the irrigation expenditure of state Governments. Thus in 1953-54 (R.E.) total receipts of all Part 'A' and 'B' States, under irrigation, amounted to Rs. 10.62 crores, while interest and other charges under the same head amounted to Rs. 18.66 crores. It is only natural under the circumstances that the States should find it necessary to impose additional charges or increase existing rates the scope for which has been provided by the rise in prices of agricultural produce during the war and post-war years.

It is true that water rates should not be made to yield profit. Ordinarily, the principle to be observed is no profit no loss, but exceptions will have to be allowed. In the case of an irrigation work for a scarcity area which is being developed, it may be necessary to adopt the no profit and some loss principle, while a policy of some profit and no loss would be justified where an irrigation work is provided in an economically developed area and where, consequently, the users of irrigation facilities derive substantial benefit.

The members of the Congress party in the Andhra legislature, who are supposed to interpret the Government's tax measures to the people at large, themselves spearheaded the opposition. Outside the legislature, they were actively supported by the Pradesh Congress Chief. At a time, when all possible efforts have to be made by the 'popular' Congress leaders to convince the people of the need for taxation, if party 'bosses' begin thwarting the tax-efforts of the Government, from where will it be salted, if the salt should lose savour?

From the Calcutta End

Assam is West Bengal's Younger Brother

MUCH is being heard, and written, about the controversy between Dr B C Roy, West Bengal's Chief Minister, and Prof Mahalanobis, Statistical Adviser to the Union Cabinet. One curious fact seems to have escaped those who have now joined the controversy. There is much that is common between the Mahalanobis Plan and the West Bengal Development Commissioner's emphasis on the village and on small-scale industries. As both Barrackpore and Raj Bhavan (West Bengal's Development Department is housed in Raj Bhavan) are agreed on fundamentals, one should have expected enthusiastic support of Writers' Buildings to the Draft of a Draft Plan-frame.

West Bengal's Statistical Bureau has issued some brochures which show an implied bias to small-scale industries. Its Development Commissioner is the most enthusiastic supporter of small-scale industries and of resuscitation of village economy. One had occasion to eavesdrop to discussions of these problems by some top-level officials connected with community projects—cum national service extension-cum refugee rehabilitation work. They seemed to agree that Fulia, in West Bengal, and not Nilokheri or Fariabad, is now the most successful centre for these combined experiments and activities.

Barter Economy

One may have some mental reservations in accepting the West Bengal Government's plans for encouraging the barter system in village economy. But its Development Department takes pride and pleasure in showing the results of its efforts to inquisitive newspapermen. A colleague, whose views this writer appreciates, had recently an occasion to see for himself the way how this barter experiment is working at Habra. He was very well impressed with the achievements to date. Many competent observers have recently expressed agreeable surprise at the enthusiastic response of villagers to national extension service and community projects.

This is building up from below. To this, as well as to the Plan-frame's emphasis on small-scale village industries, neither Dr B C

Roy nor his Development Commissioner can have any objection. Dr B C Roy's objection that the Plan-frame will experience administrative bottle-necks has been anticipated by the author of the Plan-frame. To the criticism that it minimises the importance of consumption, the author will probably reply that re-vitalised small-scale industries will supply consumer goods.

In conclusion, an interesting incident in this controversy may be noted. Calcutta University's University Professor of Economics was one of the twelve economists who met the Chief Minister to discuss the Plan-frame. He is a member of the Panel of Economists. To explain his contradictory behaviour, he is now suggesting that the Memorandum submitted by the Panel of Economists is not the same thing as the Draft Plan-frame.

Common Issues

Assam's Chief Minister was in Calcutta last week. He met West Bengal's Chief Minister to discuss "matters of common interest to the two States". During the talks between the two Chief Ministers, the Presidents of the Pradesh Congress Committees of Assam and West Bengal were present. These talks ended on a cordial note. Assam's Chief Minister expressed the hope that West Bengal, which was like an elder brother to Assam, should treat Assam like a younger brother. Dr B C Roy reciprocated by assuring Sri Bishnuram Medhi, Assam's Chief Minister, that Assam was entitled to elder-brotherly treatment from West Bengal. These talks will be resumed when Sri Medhi returns from New Delhi.

Since last year's "incidents" in Goalpara, it has been suggested that the two Chief Ministers of these two neighbouring States should meet to ensure better understanding between Assam and West Bengal. Dr B C Roy was to have gone to Gauhati. But, somehow, that visit was postponed. It is right and proper that the Chief Minister of Assam, which, Sri Medhi emphasises, is like a younger brother to West Bengal, should pay a visit to the Chief Minister of West Bengal, Assam's elder brother. For decades, Assam, Bihar and

Orissa have been treated by West Bengal in a manner which these States have complained as being aggressive, selfish. This is the main psychological problem behind the respective boundary claims of these States.

Role of Congress

This was the main problem under discussion between the two Chief Ministers and the Presidents of the Pradesh Congress Committees of these two States. Measures for promoting good neighbourliness between the States were discussed. From the presence of the Pradesh

Congress Committee Presidents of the two States, it would seem that the role of Congress as the unifying force was stressed. This aspect of strained relations between West Bengal and Assam, Bihar and Orissa has been emphasised on more than one occasion by the Congress President. Talks between the Chief Ministers of Assam and West Bengal will be resumed soon. Only after the end of the final talks will it be known what precise measures are to be taken to avoid repetition of Goalpara.

Industrialisation

Shri Medhi was more formal in his speech at the luncheon arranged by Shri Tushar Kanti Ghosh, Editor of Amrita Bazar Patrika. Assam's Chief Minister appealed to industrialists, and particularly to West Bengal's industrialists, to start industries in Assam in order to make that State self-sufficient. Assam is rich in mineral resources. She has a well-developed tea plantation industry. But she is not an industrial State. In recent years, Assam has experienced floods every year. For four or five months of the year, she is cut off from the rest of the

country as a result of flood damage to communications. This is the main reason furnished by Assam's Chief Minister for his plea to outside industrialists to help Assam's industrialisation.

Shri Medhi's main argument for Assam's industrialisation is that it will help that State to avoid the consequence of poor communication facilities. Assam's industrialisation is desirable on more relevant grounds. Industrialisation will expand employment opportunities. This is the main problem of Assam. Relations between Assam and West Bengal have not been cordial. Assam resents the presence of Bengali refugees within her borders. These refugees aggravate the unemployment problem. Industrialisation will serve the double purpose of absorbing the refugees and expanding scope for employment to the people of Assam. There are historical reasons why the industrial development of Calcutta has hampered the growth of industry not only in other parts of West Bengal, but also in the neighbouring States of Assam, Bihar and Orissa.

Assam Link

Industrialisation is necessary. But it will not solve the problem of Assam's communication difficulties. To-day, the recurrent flood-damage to communications cuts Assam off from the rest of the country for four to five months every year. As long as the Bhutan and Sikkim rivers are not tamed and trained, the floods will continue. Even industrialised Assam will have communication problems. Shri Medhi's efforts to industrialise Assam will have the support of that State's well-wishers. But there is need for simultaneous improvement in communication facilities within that State and between that State and the rest of the country. Partition has aggravated the problem. There has been a welcome revival of river-borne traffic to Assam via Pakistan. Such traffic arrangements need to be encouraged. Even then, there is need for improvement of rail communication facilities within Assam and between Assam and the rest of the country. This will not be denied. Whether the aim can be achieved, as Shri Medhi suggests, by creating a new railway zone for Assam, is another matter.

From the London End

Floating Pound?

THE European Continental money market persist in their belief that the depreciation of sterling is imminent, and this continues in spite of the strenuous denials issued by the British Government. The background to this belief is partly found in what transpired at the June Meeting of the O E E C Council of Ministers and partly in the almost continuous relapse of sterling in the overseas exchange markets since July, 1954. The latter of these two factors has been explained by a British Government spokesman in terms of "heavy inward shipments of tobacco and grain", or "the periodic dock workers' strikes in British ports". Such factors cannot explain the year-old slump in sterling.

In fact, sterling's persistent limp at the lower limit of the official exchange rate and at a discount of some 3 per cent on the free markets, is nothing less than a symptom of the strain resulting from the investment boom in Britain. What is interesting about the current relapse in sterling is that the foreign exchange markets continue to be sellers rather than buyers of sterling, in spite of the sharp increases in money rates and the credit stringency that is prevailing in Britain. There can be little doubt that the dear money policy of the Conservative Government is not restraining to any sizable extent the overall boom conditions in the economy, nor is it attracting foreign capital funds to strengthen sterling's international position.

E P U Agreement Modified

The June Meeting of the O E E C Council of Ministers was possibly more important in provoking the type of rumours that are now so rife on the Continental markets. That meeting was concerned with the problems that would arise when the convertibility of sterling was restored. The decisions of the Council were indicative of the way the British Government was thinking. In the first place, the European Payments Union was renewed for a further year. The system of settlement between the countries through the Union was, however, hardened to the extent that henceforth all debtors were to pay their

monthly accounts on a 75:25 ratio between gold and credit respectively. Secondly, the Ministerial Council agreed to set up a European Fund whose resources would come from the E P U (when liquidated) and whose purpose would be to provide financial assistance to those countries which are planning to restore the convertibility of their currencies.

That such decisions should have been taken was all the more remarkable in view of the serious differences that arose between Britain on the one hand and the Continental European countries on the other. It was the British view that when the convertibility of currencies was restored, there would be no place for a multilateral system of payments as that provided by the E P U. Behind this notion was the belief that when sterling became convertible, London's pre-eminent position in international trade and finance would be restored and that if any multilateral offsetting of accounts between countries was to take place, then London would provide the venue by virtue of its experience and its numerous financial institutions. There may have been another reason why the British Government was not prepared to countenance a continuance of the E P U, or of some other supra-national settlement agency, when convertibility of sterling was restored. It is possible that in British thinking the continuance of supra-national European institutions involving the UK in a particular field would tend to foster European economic integration to the point of reducing Britain's importance in Europe, and, in the present case, of reducing the importance of sterling in international trade and payments.

Britain and the Continent

The "Europeans" were of the opposite view on this matter. They argued, and argued very strongly, that a clean break with the E P U system would endanger the balance of payment stability of many European countries. They argued that the psychological advantages were all on the side of maintaining a proven instrument of European co-operation like that of the E P U

and that in the uncertain period ahead, not all European currencies could become convertible. In view of all this, some multilateral compensation mechanism was necessary. The "Europeans" were even prepared to accept a multilateral system of payments involving a 100 per cent gold settlement.

Directly attached to this controversy was the question of the system of exchange rates to be adopted with convertible currencies. As it was apparently decided at the 1952 Commonwealth Finance Ministers' Conference, the British pressed for agreement on flexible exchange rates rather than what is currently in practice. Here the 'Europeans' were as sticky as on the first question. They believed that flexible exchange rates would be a fore-runner to competitive currency depreciation and to economic war. It would foster "beggar-my-neighbour" policies and so lead to a worsening of international economic relations and to a reduction of world trade and, more important, to that of Europe's place in world trade.

Compromise—Flexible Convertibility

On both points compromise positions were reached. The compromise in each case suggested an early restoration of sterling convertibility. While agreeing to the renewal of the E P U for a further year, a sub-committee of the Ministerial Council was set up to examine the forms which multilateral compensation between European countries can take in conditions of currency convertibility. The sub-committee was given a month to complete its work and its report is now eagerly awaited. On the question of flexible exchange rates, the United Kingdom accepted the Dutch compromise proposal which required the UK to state each month the particular exchange rate at which it would be prepared to clear its balances through the E P U mechanism.

The Dutch solution is suggestive of an early change in Britain's sterling policy. It strongly implies that during the currency of the present E P U Agreement (and dependent on the recommendations of the Ministerial Council's sub-committee) the UK will possibly abandon the fixed parity rate and the current

Post Script to Draft Plan-frame II

Large Enterprise Versus Small

D Ghosh

I AM assuming that the large enterprise is, generally speaking, more efficient than the small. If the supply of capital were adequate, there would be no case, in purely economic terms, for the small industry; we could achieve maximum output and maximum employment through the development of large industry alone. The supply of capital is, in fact, however, inadequate, and we are required to choose between maximum production (by way of large industry) and maximum employment (by way of small industry). The argument for small industry also assumes that it requires smaller investment not only per worker but also per unit of output than the large industry.

Suppose S = total savings (or Investment) of the community; L = total labour force (number of workers). Assume that if the large industry method is employed, only '1' workers out of 'L' would be employed, $L-1$ workers finding no employment whatsoever. If p_1 and p_L represent productivity per wor-

ker by the large and the small industry methods, then for the former method to be justified, not only

$p_1 > p_L$, but $1.p_1 > L.p_L$ or—

$L > \frac{1}{p_1/p_L}$ or productivity of the large

industry must be more than proportionately higher than the decrease in the labour force employed. e.g. (If $L=100$, and $1=60$ then $p_1 > 10$ —>—).

$p_L > 6$

We should now take into consideration two other factors, one economic and the other social-economic-political. The large industry method implies a deepening of the capital, i.e. tying up of investment for a longer period than the small industry method. The rate of return on capital expected in the former must be therefore greater than that in the latter. If we indicate these by i_1 and i_L respectively, $i_1 > i_L$ so that for the former to be chosen $1.p_1 - i_1.S > L.p_L - i_L.S$

Secondly, the unemployed working force (rather they and their families) have to be maintained. Assume a tax "t" required for this purpose. Then the large industry method is justified if $1.p_L - i_1$ (S-t) $> L.p_L - i_L.S$.

The possible adverse effect of the imposition of "t" on savings and productivity would have to be taken into consideration. Two other factors should be, finally, taken note of. First, the investment in either method of production includes investments in the ancillary processes of transport and distribution; these are decidedly greater for the large scale method with higher degrees of localisation (concentration) than for the decentralised small scale method. Secondly, the difficulties and costs of distributing investment and of securing enough enterprise even though of a lower grade, may be much greater for the decentralised small industry method.

(I have assumed throughout that employment as such is not an economic good).

buying and selling official rates. The new exchange rate system in this case can either be that of a complete fluctuating one (which the I M F will regard with some disfavour) or the maintenance of a fixed parity rate with the corresponding official buying and selling rates widened by a margin of some 3 per cent, thus bringing the present unofficial dealings in sterling into line with the new variable exchange rates system. The monthly compensation of balances, that is, those balances which remain uncleared between authorised commercial banks, would then be put through the EPU mechanism (or some substitute) at an exchange rate which the Bank of England would determine in consultation with the central banks of the other EPU member countries. There is little doubt that such an exchange rate would be the average of the daily ruling rates in each month.

Decisions of Great Moment

The decisions taken so far are of considerable moment—those being reached at technical level will equally be decisive for the future of sterling. While there can now be little doubt that some important change in sterling's status is imminent, there is some perceptible confusion in British policy or as the *Financial Times* puts it, "Britain continues to speak with two voices". On the one hand there is the voice of the vast financial institutions in the City and of the Bank of England, who believe, in all justification, that the foregoing changes, when introduced, will not be accompanied by any catastrophic consequences for sterling, or for Britain's foreign trade. Already, non-resident sterling is fully convertible into gold or dollars—at a price—on the unofficial exchange markets of Zurich and New York and the Bank of England is now struggling to reduce, as far as is possible, the gap between the rates of exchange in the unofficial and official markets respectively, even at the cost of losing some of its reserves of gold and dollars. The other voice emanates from the portals of the Treasury—it is a hesitant, academic voice, reflecting full concern over the political controversies which the suggested change in policy would provoke, and more than that, indicating that it is very much alive to the longer-term problems of international economic co-operation and internal economic balance, which are necessarily involved.

Continued Payments Problem

What, then, are the longer-term problems which convertibility and flexible exchange rates will create? In essence, flexible exchange rates assume the existence, or the possible future existence, of balance of payments difficulties. If this were not the case, there would in fact be no difference between fixed and variable exchange rates. A permanent condition of balance of payment equilibrium will involve an unchanged rate of exchange, whether the policy pursued is one based on fixed or on flexible exchange rates. The standard remedies for balance of payments problems under a policy of fixed rates are principally three in number. There is, first, the remedy through the pursuance of an internal deflationary policy as the gold standard rules have required. Second, balance of payments difficulties can be met by quantitative restrictions and exchange controls. Finally, there is the remedy of a straight devaluation as is provided for in the 'fundamental disequilibrium' clause of the International Monetary Fund rules. All these remedies have been applied in one form or another in the post-war period, but in spite of the considerable improvements that have taken place in the financial conditions of almost all the West European countries since 1949, there can be little doubt that the improvements experienced were not the result of the application of these remedies. The improvements have largely been the result, either of a sharp increase in national production or in the sustained outflow of dollars, either under the Marshall Aid, or, as is now the case, under military aid for Western Europe.

The remedies suggested have, in each case, serious weaknesses. A deflationary internal policy possesses potentialities of creating mass unemployment, a sharp fall in output and in standards of living. Such a solution is utterly repugnant in the current climate of social and economic opinion. In any event, the Conservative Government have employed a severe deflationary monetary policy with little success in restraining the boom or the impact of the boom on the balance of payments. With regard to quantitative restrictions and exchange controls, the whole movement of European trade liberalisation suggests that no country will dare to invoke this remedy at the present

time. As for devaluation, the consequent strain arising from speculative capital movements will only bring back the same difficulties in the balance of payments which devaluation is supposed to remedy.

Merit of a Variable System

The merit for a variable system of exchange rate lies in its claim that a country pursuing such a policy can both avoid quantitative import controls and follow, at least within certain limits, an independent monetary policy, i.e., a policy not accompanied by deficits and surpluses in the balance of payments. In stating this merit, your correspondent is aware of the many assumptions that are necessarily implied here, but it is, nonetheless, pertinent to note that the British policy of flexible rates in the 30's was highly successful and, so too, has the Canadian policy been in the post-war years.

In the current situation, the case for (or against) flexible exchange rates is only an aspect of sterling's international problem. Sir Oscar Hobson, the *News Chronicle's* financial editor, taking his cue from the recent experience of the outflow of short-term capital from London, has suggested that "a floating pound will lead to a sinking pound" and, thus, to a further loss of confidence in sterling. This is certainly a strong possibility. The factors making for the flow of capital one way or the other in times of peace are largely psychological and, being psychological, are not easily susceptible to rational analysis. Once sterling's international value is associated with notions of depreciation, strong cumulative forces are likely to operate in such a way as to make the depreciation a reality.

Standardising Statistics

Principles for a Vital Statistics System, Series M/No. 19, Pages 28, Price 2 sh.

Sample Surveys of Current Interest (Fifth Report), Series C/No. 6, Pages 45, Price 3 sh.

List of Statistical Series Collected by International Organizations, Series M/No. 11, Pages 78, Price 6 sh.

Directory of International Standards for Statistics, Series M/No. 22, Pages 19, Price 1 sh. 6d.

All published by the Statistical Office of the United Nations, New York. Available from Oxford Book & Stationery Co., Scindia House, New Delhi.

THE papers published by the Statistical Office of the United Nations form a class by themselves. Through them have emerged uniform procedures and standards which have either been adopted in most countries or are in the process of introduction.

The absence of an adequate and efficient organisation for the collection of vital statistics has probably been the largest single weakness in the statistical organisation of the backward countries. Even amongst the advanced countries, differences in principles or procedures have vitiated comparison, apart from reducing the utility of the data collected even for the more limited purpose of economic analysis of the country concerned. The study on *Principles for a Vital Statistics System* sets out standard forms and procedures together with principles of analysis with a view to remedying these deficiencies.

Among the recommendations made in the report is one suggesting that all countries should try to collect and report certain data as a minimum. A list of basic items whose collection is desirable is given under five heads—live birth, death, foetal death, marriage and divorce. Under each head, the items suggested are arranged in alphabetical order but priority items are indicated. To ensure accuracy in collection and also international comparability, the report provides definitions of the terms used in the study or that should be used in the statistical compilations of different countries.

In general terms the goals which such compilations should set before themselves are

(1) The provision of total monthly or quarterly summary counts of live births and deaths (and of foetal deaths, marriages and divorces if these are included in the collection programme) on a time schedule prompt enough to provide information for administrative or other needs; and

(2) The production of detailed annual tabulations of such type and

on such time schedule as will make possible their effective use for the scientific analysis of the interrelationship between demographic, economic and social factors, for planning, operating and evaluating public health programmes, and for other purposes as required.

The place of sampling in a vital statistics system has also been commented upon in the report. While this cannot be expected to replace legal registration or the tabulation of data obtained by legal registration, it has obvious applications where detailed data are not available through normal methods or for the detailed analysis of census data. In fact, sampling surveys, whether on national basis or for limited purposes, have become a recognised procedure for the filling in of gaps in existing data on all aspects of economic and social activity. The Statistical Office of the United Nations has been drawing attention to the main features of each of these sample surveys in its publication *Sample Surveys of Current Interest* the fifth issue of which is now available. Of special interest to the demographer will be the report on the "Sample Tabulation of the 1950 Population Census" carried out in Japan. The object of this tabulation was two-fold:

(1) To obtain information in advance of the complete tabulation about basic characteristics under study in the census for the country as a whole as well as for each prefecture and large city, and

(2) To broaden the scope for the tabulations by obtaining samples of some population characteristics which were not to be studied on a hundred per cent basis.

Another survey of interest reported in the present volume is the "Master Population Sample Survey" of the Ryukyu Islands designed to facilitate the conduct of major sample surveys of economic, sociological and demographic characteristics. The report is of interest because it shows how sampling methods can

be useful in the earliest stages of the collection of statistical data in relation to a region where no previous work had been done at all.

Of special interest to India where a large-scale programme of community development projects is under way is the "Survey of Social Participation in the Rural Community" in Puerto, whose object was to obtain information which would provide (i) a benchmark against which it would be possible to measure the progress due to the community education programme, (ii) details on the level of people's thinking and behaviour in respect of community problems, and (iii) specific information on the number and type of people who read the materials and see the motion pictures produced by the Division and on the reaction of the people to the mass media employed by the Division. The three sample surveys referred to above are of course only illustrative of the type of material contained in the present issue and show how useful this little publication is. It should be found in all libraries of any importance.

The *List of Statistical Series collected by International Organizations* is in the fact a list, its utility being obviously as a reference work for tracing sources. Statistical series published by the United Nations, the regional Economic Commissions (principally for the areas covered by them), the specialized agencies and certain inter-governmental organizations are included. Having been revised and brought up to date, it represents a comprehensive catalogue. The list has been classified by subject, and the frequency of appearance and the names of the publishing organisation and the publication are mentioned for each series. The use of a code for the names of organisations and publications has made it possible to present the list neatly and in a short space without reducing its readability.

The *Directory of International Standards for Statistics* is another

useful little publication which lists "statistical concepts, definitions, methods and classifications established by international conventions, or regulations resulting from the final action of the competent body of an international organisation." The various decisions are presented in a

summary, except where the length of the original official statement permits reproduction in full. In each case, however, the source or sources containing the full authoritative text are given and in addition, the sources from which the publications can be obtained are given in an appendix.

The Board of Economic Enquiry Punjab (India)

THE publications Nos. 21 to 24, namely (1) Family Budgets, 1950-51, of twenty-six cultivators in the Punjab, (2) Farm Accounts in the Punjab 1951-52, (3) Family Budgets 1951-52 of eleven cultivators in the Punjab and (4) Oilseeds Crushing Industry in the Punjab, confirm the popular impression about the high standards maintained by the Punjab Board of Economic Enquiry. Though, perhaps, the reader may not find the last up to his expectations, the other three publications giving first-hand data will be of interest to any student of agricultural economics.

The family budgets series, it may be noted, were started in the year 1932, with a study of four tenants of a Government farm. In 1951-52, budgets of 11 families were studied. This is one of the few cases in which comparable data for a period of 20 years or more are available. One may well ask whether a study of only 11 families is of much use in view of the small size of the sample. But in answer, one may point out that it is perhaps better to get exact data from a small number of cultivators than spread oneself thin over a large population and get inexact and questionable data and then arrive at some quantitative estimates whose accuracy is subject to grave doubt. It is the paucity of reliable data which makes these unassuming publications so valuable.

The family budgets give statistical data only for one year, there being no attempt to compare the data for the different years. In the absence of details regarding the variations in coverage from year to year, a reader is apt to find it difficult to interpret the data. Further, the Farm Accounts 1951-52 give data which do not appear to be comparable to those given in Family Budgets 1951-52. If in a combined publication both the data

relating to Farm Accounts and Family Budgets had been given and if these were analysed together, the utility of these publications could have been considerably enhanced.

The study of family budgets for 1951-52 is of particular interest; some noteworthy figures and statements of facts are given below:

(1) During the year 1951-52, nine out of the eleven peasant-proprietor families showed a deficit; in 1950-51 on the other hand, only four out of the twelve peasant-proprietor families showed a deficit.

(2) About 60 per cent of the total expenditure was in kind, that is to say, the value of goods produced on the farm and utilised by the cultivator constituted 60 per cent of the total expenditure, the corresponding proportion being 86 per cent in the case of food, 96 per cent in fuel and 11 per cent in clothing.

(3) A peasant-proprietor family spent 62 per cent of its total expenditure on food, the proportion being 12 per cent in the case of clothing, 5 per cent each for housing and fuel, 4 per cent on education, 3 per cent on social activities, 2 per cent each on travelling, religion and amusements and luxuries and one per cent each on lighting and medicine.

(4) For the group of the eleven families as a whole, there was a net deficit for the year 1951-52 as can be seen from the table given alongside:

The other publications also contain valuable first-hand data. One would have liked to see in the publication on Oilseeds Crushing Industry some data relating to relative efficiency of village ghanis vis-a-vis mechanical oil expellers with reference to input-output ratios; in the absence of such data, the conclusions given towards the end of the study appear to hang rather loose, all by themselves.

The list is complete up to September 1, 1954 and it is proposed to keep the Director up to date by issuing supplements from time to time. Slowly but steadily, the task of making one's way through the mass of available material is being rendered easier.

	Total in Rs. for the eleven families
1. INCOME	
1.1 Farm cultivation:	
Gross income	4,810.79
minus expenditure	2,913.15
Net income	1,897.61
1.2 Milk Production	
Gross income	836.19
minus expenditure	818.22
Net income	17.97
1.3 Wages of labour	242.98
1.4 Interest on Capital	207.34
1.5 Miscellaneous	196.51
Total Income	2,562.41
2. EXPENDITURE	
2.1 Food	
Furnished by farm	1,501.66
Purchased	236.78
Total food	1,738.44
2.2 Fuel	
Furnished by farm	155.74
Purchased	6.82
Total fuel	162.56
2.3 Clothing	
Furnished by farm	38.09
Purchased	322.71
Total clothing	360.80
2.4 Housing	147.92
2.5 Travelling, lighting, medicine, education, religion, social amusement and luxury and miscellaneous	406.20
Total expenditure	2,815.92
Net Surplus or Deficit	-235.51

This table, therefore, indicates that the financial position of the peasant-proprietor in the Punjab in 1951-52 was far from satisfactory.

Indian Tradition and Social Change

D P Mukerji

Presidential address delivered at the First Indian Sociological Conference held at Dehra Dun on April 17, 1955, under the auspices of the Agra University

ALLOW me to express my gratitude to the sponsors and the conveners of the First Indian Sociological Conference for kindly inviting me to be its general President. One of the principles of modern democracy is the superiority of general acceptability to the electors over considerations of merit known only to the elite of the community. Shall I be wrong if I suggest that the position in which I find myself today has been determined by some such democratic principles? There are others who are better, and better known, sociologists and more devoted to their field of study than I am. Sociology was not my first love, nor have I been its constant lover. I had come to it because, being interested in developing my personality through knowledge, I realised that none of the social or the natural sciences I had to study in my earlier days could give me, at one and the same time, the synoptic view, the large vision and the understanding of the milieu of knowledge which were necessary for the fulfilment of my being. It has all been a personal affair, not a matter of sociology for the sake of sociology. Not only that: soon after I began to think for myself it was also borne in upon me that I was an Indian, that I could not but be an Indian, that I could develop my personality only by understanding Indian culture. And Indian culture I found to be essentially social. I also felt that the Indian History I knew was merely political history, that the Indian economics and politics I studied were detached from the context of Indian institutions, and further, that the Western metaphysics in which I became interested in the process of my social studies, did not suit my modes of thinking, feeling and being. My mind worked in this way: India might or might not have had history in the Western sense of the term; of politics, again in that sense, India had had little experience—she was becoming political only recently; her economics had been 'unproductive' and subsistent; and her metaphysics, again in the Western sense, was poor. Positively, my conviction grew that India had had society, and very little else. In fact, she had too much of

it. Her history, her economics and even her philosophy, I realised, had always centred in social groups, and at best, in socialised persons. Yet, this elementary fact was missing from the books I read. The scholars were competent in their own fields, but because of the indifference to that solar fact of Indian culture, viz., its rootedness in the social realities which made up India's social system of action, their work appeared to be narrow, circumscribed, fragmented and partial in outlook and treatment. I could not appreciate this type of closed scholarship, its unrealism and its complacency. At the same time, their profession was mine, and with my limited talents, I could not do anything about it.

Sociology showed me the way out. This does not mean that for me sociology is the final science. Perhaps, some day I shall realise that sociology too is not enough for me, unless it is differently orientated. Please pardon me for this personal note. My main purpose is to tell you frankly that I am not a sociologist as sociologists would like me to be. So I guess that deep below my acceptability to the conveners of the Conference flows the common feeling that knowing is more important than knowledge, that living comprehends knowing, that for an Indian, this business of living, despite India's increasing involvement in the world, is primarily Indian living which, in its turn, is essentially social living, that is, living in groups through stages of growth until one is to be so socialised that freedom will have become co-terminous with existence and institutions turned into agencies of growth.

Many Social Disciplines

This autobiographical beginning lays down certain basic postulates of sociology as I have been growing to understand it, and naturally, as I would like to see it develop in India. Sociology has a floor and a ceiling, like any other science; but its speciality consists in its floor being the ground-floor of all types of social disciplines, and in its ceiling remaining open to the sky. Neglect of the social base often leads to arid

abstractions, as in recent economics. On the other hand, much of empirical research in anthropology and in psychology has been rendered futile because its fields have so far been kept covered. Yet within this mansion of sociology the different social disciplines live. In so far as they live on the same floor they are bound to come into conflict with each other in the name of autonomy. To pursue the analogy, they seek to divide the house and close the door against each other. But a stage comes when exclusiveness ceases to pay. Such a stage seems to have been reached by nearly all the social sciences. So the restless spirits among the social scientists are trying to discover inter-relations, and the bolder ones among them are building up systems. Much heart-searching is going on among them today to attain to some form of unity in diversity. I do not mean that the barriers have been demolished, or that the unity has been established. But the dissatisfaction is divine. This development in the social sciences is illustrated by the search for: (a) some basic, neutral and lowest common multiple concepts, e.g. human group, status, mobility, solidarity or cohesion, sympathy, conflict, co-operation, community, etc., in sociology; propensity, welfare, preference, indifference in economics; power and again welfare, in politics; (b) some common methodological principles derived from modern refinements of logic; (c) re-orientations and ways of inter-relations, or cross-breeds; and (d) a philosophical approach. Each type of search has its own merits and demerits, and it is the duty of a trained mind to avoid the pitfalls associated with the method adopted. The popularity of a method is often dependent on academic fashion.

Flight from Philosophy

The philosophical approach is at present out of court. The large sale of Toynbee's works is indicative of religious frustration rather than of a mounting philosophical temper. In certain American universities, and also under the auspices of the UNESCO, a genuine effort is being made towards discovering the inter-relations of the social sciences. Even

there, the logical approach as such is not much cultivated, because it is generally considered to be futile. It seems that the debate between the logic of the natural and the logic of the social sciences continues without coming to any conclusion which could be useful either for research or policy. The effort is thus mainly directed towards bringing the experiences and techniques of different social disciplines to bear upon relatively small, concrete, specific problems. Recently, the India Government, through its Education Ministry, has drawn our attention to this aspect of the matter. There are numerous difficulties in the way of making the effort a success at once. All social disciplines are not of the same level; experts are not always used to team work; and each discipline is apt to build vested interests round a department inside a Faculty. Requisite personnel who can rise above specialist interests are also rare. But, in my opinion, the real difficulty comes from the growing indifference to theory. When I say theory I do not mean "an isolated proposition, summarising observed uniformities of relationships between two or more variables" howsoever useful and precise the establishment of such a proposition may be. I mean by theory another type of generalisation which logically hangs together, from which 'statements of invariance' can be derived, and into which the type of isolated propositions mentioned above can be logically fitted. Most modern sociologists are averse to such theory and are content with isolated propositions between two or more variables. In this they find the statistical apparatus very handy. The exceptions, like Max Weber, Von Wiese, Karl Mannheim, Becker, T. Parsons, and Merton, are not content with isolated propositions. One could, of course, dismiss them as Teutonic.

But I must confess that an Indian sociologist finds 'theory' congenial to his temperament and traditions. I also suspect that in the course of its flight from 'philosophy' which is almost always used pejoratively in these days, scientific social research has been hopelessly dispersed. As an Indian I find it impossible to discover any life-meaning in the jungle of the so-called empirical social research monographs. While statistics seek to give some sort of precision in trends, precision becomes non-significant in the absence of any theory and direction. In India, the danger arising out of the aversion

from 'philosophy' is much less than in Europe or the U S A, though I am not sure how long it will remain so under the high-powered pressure of modern academic fashion. Therefore, I would like to think that if Indian sociologists really tried, they could materially contribute to this vexed question of inter-relationships of the social sciences. Indian sociologists would not be true to their temperament in feeling apologetic for their pre-disposition to theory, or, philosophy, as it is loosely called. If they are sure of their ground, which is offered by social traditions in the main, and if they still retain the traditional gift of logic and theory, they may soon be doing things to which the restless and the bold spirits among the Western sociologists are aspiring today. In the social disciplines at least, the knowledge of traditions shows the way even to break them with the least social cost, if that is necessary or inevitable. We Indians have the advantage of being pre-scientific in our thought, just as we have that of backwardness in our economy. We need not traverse the whole path of Western evolution, step by step, of knowledge and economy. It is uneconomical to reject theory in the name of science and then come back to it when science has failed to produce a synoptic view and generate understanding.

Social Traditions

The first task for us, therefore, is to study the social traditions to which we have been born and in which we have had our being. This task includes the study of the changes in traditions by internal and external pressures. The latter are mostly economic, and we know what they are. But the way in which the economic pressures work is not that of a mechanical force moving dead matter. Traditions have great powers of resistance and absorption. Unless the economic force is extraordinarily strong—and it is that strong only when the modes of production are altered, traditions survive by adjustments. The capacity for adjustment is the measure of the vitality of traditions. One can have a full measure of this vitality only by immediate experience. Thus it is that I give top priority to the understanding (in Dilthey's sense) of traditions even for the study of their changes. In other words, the study of Indian traditions, which, in my view, is the first and immediate duty of the Indian sociologist, should precede the socialist interpretations of

changes in the Indian traditions in terms of economic forces. It has been held that participation, not to speak of life-long participation, is the enemy of 'scientific detachment.' I know how our scholars are taken in by that mysterious phrase. Nishkam will not do for them, oh, no! But weighing the two in the balance, viz. the advantage of insight that comes from participation and that of being in the swing and being internationally recognised as scholars in accordance with a supposedly common standard of 'scientific' technique, I find it tilting on behalf of insight. In any case, participation by long conditioning, which is the first requisite of understanding, should make it less possible to pass on the most jejune and vapid generalisations about Indian problems with which we are being familiarised today in the name of scientific research. I do not in the least suggest that foreign scholars should be barred out of Indian problems, but I am only referring to the greater ease of insight and understanding that can be secured by the sociologist when he is saturated in his own traditions. His capacity to judge is a matter of acquired discipline, but in the matter of understanding, empathy precedes sympathy.

Thus it is that it is not enough for the Indian sociologist to be a sociologist. He must be an Indian first, that is, he is to share in the folkways, mores, customs and traditions, for the purpose of understanding his social system and what lies beneath it and beyond it. He should be steeped in the Indian lore, both high and low. For the high ones Sanskrit is essential, and for the low ones the local dialects. Anthropologists and ethnologists try to pick up the latter, and sometimes succeed in doing so. Yet the spirit is often missing and the letters alone abide. I do not think that many social scientists operating on Indian problems today know Sanskrit; and none care for Persian or Arabic. This state of affairs is deplorable. Unless sociological training in India is grounded on Sanskrit, or any such language in which the traditions have been embodied as symbols, social research in India will be a pale imitation of what others are doing. It pains me to observe how our Indian scholars succumb to the lure of modern 'scientific' techniques imported from outside as a part of technical aid and 'know how', without resistance and dignity. In the

intellectual transactions which are taking place, it seems that we have no terms to offer, no ground to stand upon.

A System of Culture

You will pardon me if I unfold my mind a little more on this vital matter. I am not equating sociology with the cultural anthropology of the modern man. So long as the generalised relationship between culture and social structure is not more clearly understood, that equation does not hold. With Parsons I maintain that "a 'system of culture' is a different order of abstraction from a 'social system' though it is to a large degree abstraction from the same concrete phenomena." My interest is merely to bring to the urgent notice of fellow sociologists only two major points: (a) the common concrete phenomena of which both the social system and the culture are 'abstractions' are the subject matter of sociology; and (b) in so far as the Indian society is concerned, those common concrete phenomena had best be studied through group-action and group-traditions. This is not the occasion for an elaborate thesis. I can only offer a few hints of the way my mind has been moving towards that conclusion. I have a feeling that the frame of reference, which is the first requisite of a theory, is not the 'actor-situation', as Parsons would have it, for the simple reason that the unit of the Indian social system is not "the individual as actor, as an entity which has the basic characteristics of striving toward the attainment of 'goals', of 'reacting' emotionally or affectively toward objects and events and of, to a greater or less degree, cognitively knowing or understanding his situation, his goals and himself."

Action for the Indian is not individualistic in that sense; it is "inherently structured on a normative, teleological", but not on a "voluntaristic system of co-ordinates or axes", with the result that the failure to attain it does not lead to "frustration." The Indian has no such fear of loneliness. We too have our axes in "purushartha", but the operational system seldom permits any "voluntarism" on the ground of individual desires. The individual, if such a term is permissible in the Indian context, no doubt, desires, except probably when he is a Buddhist monk; but not even when he has renounced the world for sannyas, or when he is solely dedicated to moksha or salvation, does

he act in protest against the system of action traditionally prescribed for the attainment of his desires. The common Indian 'individual's' pattern of desires is more or less rigidly fixed by his socio-cultural group-pattern and he hardly deviates from it except under severe economic duress. Protestants there have been many in our history, but very, very few of them have abjured the wider group-traditions. Every saint has sought to prove that he is in the line of great masters — purvasuri, acharya. This accounts for the curious fact, that each one of the thousand and one sects has dissented only to come back to the fold within about three generations contributing its own special technique of normative, teleological, goal-seeking patterns of behaviour to the broad, general stream of the Indian design. In this sense, India's religion is the traditional way of living; so is her culture. Hence her social system is basically a normative orientation of group, sect, or caste-action, but not of 'voluntaristic' individual action. So there is no escape from traditions if you are an Indian, and additionally, an Indian sociologist. I make little difference between the Hindu and the Muslim, the Christian and the Buddhist in this matter.

Voluntarism

Of course, 'voluntarism' is coming up, particularly among the middle classes in the cities, towns and their fringes. But they form an interesting special study for the Indian sociologist. They are vocally important, but if you watch their behaviour closely, you will find that their anti-traditional individualism is also developing a tradition of its own, a tradition of revolt which tends to become a little boring. In my view, the real reason why we have not done more than what we have done through planning—and we have done none too badly—is the yet unresolved conflict between the traditions which are the principle of *dhruti*, that is, *dharma*, that which holds, maintains and continues, and the new traditions which the urban middle class have been trying to build up in the last hundred years or so. Bureaucracy is not the villain of the piece. The sociologist would look at it from the point of view of the growth of traditions through conflict. Be that as it may, the absence of voluntaristic action has done Indian society one good at least. Excluding the middle classes, if you will, the absence of frustration that leads to all manner of psychoses is a remark-

able phenomenon of Indian life. The poise of the Indian peasant and the head of the family is there for all to see. Perhaps it is on the low 'level of aspirations,' as the psychologist would call it, but the point is that level is still being governed by traditions which set the level of culture and values for most Indians. This should not be missed in our urge for uplifting the level of wants.

Indian Concept of Freedom

One point I want to make here in passing. It will be said that if the group is still the unit of action, aspiration and orientation, normative, affective and cognitive alike, then the Indian social life is the life of bees and beavers, regimented, totalitarian, in fact, almost communistic. I almost accept that argument. We are a very regimented people, but the beauty of it is that barring a stratum of people who repeat 'individual values,' 'freedom,' 'cultural freedom,' like parrots, or who have become morbid by their very un-Indianness, the majority of us do not feel regimented. In fact, quite a number of honest and true men have felt free, and they are not fellow-travellers either. They are men like Sri Aurobindo, Ramana Maharshi, Ramakrishna, Dayanand, not to go further back. And not all Indian women either—and it is they who count most—feel, as an eminent politician put it, 'oppressed, suppressed, repressed and depressed.' Our conception of freedom is different, because our conception of man is 'purusha' and not the individual, or *vyakti*. I wonder how many times the word 'vyakti' occurs in our religious texts, or in the sayings of the saints. This, however, would be a small point if the whole paraphernalia of modern communications were not trained on us to make us belong to a 'free' society of individuals each exercising his right of choice despite advertisements, press-chains, chain stores, and empty purse too, which, you must admit, does not leave much scope for 'consumer's sovereignty.'

The Indian sociologist thus, I am afraid, will have to accept the group as his unit and reject the individual. He should, however, launch on his career with open eyes. If science deals with facts and with nothing else, then he cannot be a 'scientist'; if, similarly, history is the study of facts and hardly anything else, then he cannot be a historian of social change either. In other words, he will have to brave the brave new scientific world and be unpopular.

Tradition, which will be his central theme, is not a fact; it is a forgotten fact. As it has been aptly said, "In fact it is generally when the tradition is no longer a description of an actual fact and when it has become somewhat evanescent as a rule of conduct that it most clearly justifies its name and performs its real functions. Strictly speaking, the study of traditions need not be unscientific, at least, in the modern sense of science, which has trade and traffic with quite a number of 'somewhat evanescent' things. In the mid-passage of this century, it is a little out of date to dismiss that rather vague world of fact and values, norms and symbols, as outside the pale of closely logical scrutiny, which, after all, is all that matters. About the study of traditions being non-historical, it should be enough to remember that tradition comes from the root 'tradere,' which means to transmit. The Samskrit equivalent of tradition is either parampara, that is succession, or alihya, which has the same root as itihās, or history. Traditions are supposed to have emanated from a source, which may be scriptures, sages (apta vakya), mythical heroes with or without names. Whatever may be the source, the 'historicity' of traditions is recognised by most people. They are quoted, re-called, esteemed; in fact, their age-long succession becomes an assurance of value which has already accrued in the process of its instrumental functioning as a constituent of social cohesion or social solidarity. In Roman law, 'traders' also signifies safe keeping and deposit of something precious; and so it involves confidence-worthy persons whose normal and legal duty is to preserve the precious thing in tact. The Samskrit equivalents of each term used above will at once occur to us all. The persons are either the Brahmins, or the sampradaya, which is the corporate custodian; the succession is by birth, or initiation; the preciousness is of the order of sacredness; and the methods of keeping the traditions intact are correct speech, or pronunciation of sacred texts, psychological fixations to maintain the social structure and vice versa, mainly by the caste-system with the custodians on top.

Chain of Traditions

In short, the chain of traditions. sampradaya parampara has been the true historicity of the Indian social system so far. Through the normative system thus evolved has the con-

tinuity of the Indian social system been maintained so long. As I have no time to go further into this question, I can only mention that both sound and sight have been harnessed for this work of tradition-conservation. The role of sound is best manifest in Om, and nama japa, while that of sight is in the images, or deva-rupa. The two are combined in the idea that the sage is the seer of mantram, which is to be repeated for one's own hearing and imparted only to the initiate. In India the highest value has been given to rectitude, which is correct pronunciation, correct technique, correct initiation, correct conduct and correct meditation. The overtone of the word *riti* is rectitude. No wonder that the style of writing and the style of behaviour are both called *riti*.

One easy conclusion from the above is likely to be the idea that tradition is nothing but the act of conserving, hence conservative. But that conclusion will be wrong, as I have hinted before. Traditions do change. I am excluding the external factors of change in this address. Among the endogenous ones also, I am not taking into account the class-relations, and for two reasons; (a) in our society class-conflict has so long been smoothed and covered by caste-traditions and the new class-relations have not yet sharply emerged; and (b) we are more or less ignorant of the socio-economic history of India. (Here lies a fertile field of study in the inter-relations of social sciences.) In India a full account of the subtle methods of the internal, non-economic changes would thus be the immediate occupation of dynamic sociology. I guess that it would probably be an object-lesson to those who are legitimately proud of having produced revolutions by consent and without much bloodshed, by the democratic procedure of parliamentary government. So far as I have been able to find out, three principles of change are recognised in our traditions, *sruti*, *smriti* and *anubhava*. It is *anubhava* or personal experience, which is the revolutionary principle. Certain *upani-shads* are almost entirely based on it. But the matter did not end there.

Collective Experience

Personal experience was no doubt the root, but it soon flowered into collective experience. The entire history of collective dissent throughout the middle ages down to modern times proclaims the supremacy of generalised *anubhava* as the principle of change. If we care to know

the origins of the numerous sects, *panths*, we find that their saint-founders started with their own experience, had little or no account with rituals, temples and priests, spoke in dialects, and not in Samskrit, to the lower classes and castes, gave an equal status to the women and preached the doctrine of love, *prem* and *sahaj*, spontaneity, which came like a tidal wave flooding the soil and leaving a rich deposit on the banks of time and tradition. The high traditions were predominantly intellectual and centred in *smriti* and *sruti* where the principle of change was supplied by dialectical exegesis. We find more or less the same process among the Indian Muslims. The *sufis* among them have always laid great stress on love and experience. I think, reason in the western sense, has not been the highest category with us. *Nyaya*, or dialectical skill was no doubt exercised with extraordinary subtlety, but it will not be far from right to say that discursive reason, *buddhi-bhāra*, has been historically inferior to *anubhava*, experience, or love, *prem*, as an agency of change of traditions.

Rationality has not had much chance in our social system except through philosophical speculation and the rules of exegesis. Interpretations have sometimes sabotaged traditions, but in almost every case, the interpreters seem to have fought shy of the implications of their deeds. Even Samkar, whose philosophy dismisses life and the social system once and for all, puts it within the ambit of Vedic traditions. So when the high and the low intellectual traditions, to use Turner's phrase, had a chance of coming into conflict, they were comprehended and brought together within some abstract modes of thought and feeling. Here the well-established elite-group re-asserted its power and all the revolutionary experimental urges were sucked into its orbit of influence. Tradition was victorious once again. Indian social action has so far proceeded in that fashion. It has given latitude to rebel within the limits of the Constitution. An excellent example of squaring tradition with experimental ardour indeed! The result has been a caste-society, a society that has prevented the formation of classes and burked all forms of class-consciousness without the religion of 'free enterprise.' You may like it or dislike it, but there it is. My information is that in most

Indian elections class-consciousness is often submerged by caste-feeling.

Depth Analysis of Social Reality

I have so far followed Turner's simple classification of traditions into high and low. But one could, on the basis of the argument carried thus far, come close to what Gurvitch has called the 'depth analysis' of social reality. This analysis starts from the surface, goes down the various levels of traditions and traditional lore to the deepest level of spiritual values and their collective, immediate and integral experience, involving spiritual and sense data alike. Even on the surface of human geography and demographic pattern, traditions have a role to play in the transfiguration of physical adjustments and biological urges. In India, for example, things like city-planning and family-planning are so bound up with traditions that the architect and the social reformer can ignore them only at the peril of their pet schemes. Lower down are the organised and the unorganised superstructures operating through rituals, achar, kria, which consolidate collective behaviour and give it style. Here, usually, the dynamic element of traditions stops for most Indians. But if the social symbols, which are really and truly 'presences,' hiding and seeking, revealing by concealing and concealing by revealing both the spiritual and the social reality, render these rituals active—and in my experience they do it for many Indians—then the dynamics may proceed. Now begins the creative aspect of symbols. Symbols are neither signs, nor expressions, nor appearances of certain things. They are the things themselves. Symbols have no syntax; they have no subject, object, predicate, and no preposition. Of course, there are symbols and symbols, some of them social and others not so social:

"Social symbols are inadequate expressions of the spiritual realm adapted to concrete social situations, to typical social structures, and to definite collective mentalities, in which different aspects of the spirit realize themselves and by which it is grasped. Social symbols are thus simultaneously conditioned by social reality and the spirit which realises itself therein: they vary in function to this reality, as well as in function to this spirit. That is why symbols are to at one and the same time products and producers of social reality and why they are the principal object of the sociology of the human spirit."

Most of you, like me, will react sharply against this kind of mystical jargon and say that sociology came out of this mumbo-jumbo long ago. And you will be right. But we will be very wrong if we miss the meaning of it in our dislike of the terms. That meaning is simple: the study of sociology is principally the study of traditions; the study of traditions, in the ultimate analysis, involves that of symbols which, under certain conditions and on particular levels, are explosively creative and dynamic; and, therefore, the values and norms retain and enrich their noetic connection with specific social structures and concrete historical situations. All this is very relevant to Indian conditions.

Group Action

In my view, the genuine relation of the social sciences to each other is ultimately established through the understanding of the different levels and layers of the way the person works in, through, and out of society. Gurvitch, as you know, calls it depth-sociology on the lines of depth-psychology. An Indian who thinks of patal down below would like to give it another name. Whatever that name is, the descent to the deeps and the ascent to the heights are relative activities. The point is this: sociology should ultimately show the way out of the social system by analysing the processes of transformation. And, I think, the Indian society and the Indian sociology—all our shastras are sociological—both do it excellently, but in the limited sphere of non-economic endogenous group-action. As a corollary, I may state that as different philosophical systems of India mark the different stages of the spiritual growth of people and men, so the different social disciplines appear to the Indian person as rings of the tree of life, which for him, has its roots up above, with no Ygdrasil to burrow from below. Sciences have begun to disagree since the Western society began to disintegrate. The Indian society too is changing, but without much disintegration. This is an advantage for the Indian sociologist. So, naturally, Indian sociology, for yet some more time to come, cannot but be interpretative with greater dependence upon the method of insight that comes from active participation in the Indian system of social action than was permitted by nineteenth century science. Investigation will always be there, but it will have to be investigation "into the spirit of

things observed, that is to say, symbols. Other investigations are necessary, but subsidiary.

Study of Traditions

If this address were to be delivered a few years ago my emphasis on the need of the study of traditions would have been much less sharp. Meanwhile, I have seen how our progressive groups have failed in the field of intellect, and hence also in economic and political action, chiefly on account of their ignorance of and unrootedness in India's social reality. Besides, the study of traditions by dependent people could degenerate into an argument for traditionalism via the need for self-respect and national vanity. For a free young people who are apt to get groggy with the fumes of progress, however, study of their own traditions may be a guarantee of steady and balanced growth. Revolution is often a leap but after every leap one must stand steady and sane. And there is plenty of room for sanity in this mad world. Even if one chooses to take sanity on the stride, is it not true that the deeper down you go to the roots the more radical you become? That saying of Marx is good enough for me in this context. And if Marx is considered backdatish along with Marxism, I shall go further back in history to be up-to-date, to Cato, whose approval was for all lost causes. But is the cause of spirit, which functions in the context of traditions, really a lost cause? Is the method of insight an altogether decadent, futile method? Is interpretation useless in modern human knowledge? I do not quite know. If it is not, then Indian sociologists should take courage in both hands and openly say that the study of the Indian social system, in so far as it has been functioning till now, requires a different approach to sociology because of its special traditions, its special symbols and its special patterns of culture and social actions. The impact of economic and technological changes on Indian traditions, culture and symbol follows thereafter. In my view, the thing changing is more real and objective than change per se.

I thank you sincerely for giving a patient hearing to an un-scientific, or perhaps, a pre-scientific address. In any case, I hope and trust that my plea for the study of Indian traditions by the Indian sociologist will not be confused with, and exploited in the name of, traditionalism and reactionary revivalism.

Tribal Welfare: A New Approach

Sankho Chaudhuri

A SUBJECT which has attracted much attention of late is tribal welfare. We often use the term 'uplift' in this connection, thereby implying wrongly that we belong to a better class than they and that we are going to salvage them. If that is the attitude we have, I do not think we can do better than tinker with their lot, take away their only 'asset' which is their pride in their pattern of life and leave them with an inferiority complex.

We blame the missionaries for what they have been doing, sowing dissatisfaction among the tribal people; but have we asked ourselves if we are doing any better? I had occasion to meet some responsible persons working among them. One obsession they very often suffer from is to judge a person or tribe by food habits. For example, as staunch vegetarians, they look upon the tribal people who eat meat or fish as inferior; their innocent drinking habit is decried as sinful and their dances are dubbed immoral. Even smoking is looked upon as an unwholesome habit.

Interesting Toys

In Gujarat some very interesting toys are found among the tribal population. When asked why no attempt was made to collect and preserve these specimens in a village museum, the answer was: to irresponsible artists these may be symbols of beauty or of the creative faculty, but to us these are things we would like the people to forget, because they are symbols of savage habits, of animal sacrifice, of communal dance and drinking and such other practices we want to save them from. I was told that an attempt was being made now to substitute these dances by healthy 'keertans' or 'bhajans' and that people were being asked to refrain even from smoking.

I do not understand how this attitude is in any way different from that of the notorious missionary, Dubois, who found in Hinduism only horrible orgies of sacrifice and sex. I am even sceptical about the preaching of prohibition among people in tribal areas, because we must not mix up the excesses indulged in by industrial labour in the slums of an industrial town where people

take to drink partly to escape the drudgery of factory life with the innocent, normal drinking habits of tribal people especially when they are associated with religious practices, after vouchsafing non-interference in personal faith and practice in our Constitution.

If one visits the tribal areas, it is not rare to find that these 'converted' people mention that they have become 'pure' now. Apart from the ethics of such an attitude and coercion turning into conversion, there is the question of health involved. It is known that most of these tribes are not agricultural, most of them do not possess lands and the majority are not favourably disposed towards tilling etc.

A river and what it gives and a few wild birds and animals supplement their food to a considerable extent. When we slowly poison the minds of these people about the evil effects of this food or impress on them the superiority of vegetarianism, what have we got to offer them by way of substitute, unless we want them to become labourers or beggars flocking to cities!

Then again, after alienating these people from the core of their tribe, where do we leave them? We are not prepared to admit them into our society and give them equal status. The Government of India continues to dub these people—how-

ever educated and qualified they may be—as 'Backward Classes, and with the noble intention of encouraging more people to get thus educated, reserves seats and employment as 'Backward Classes' and 'Scheduled Castes', terms which would make any sensitive person revolt against the system or the social justice thus shown.

Those wedded to the sanatani or 'bhakt' way of life—people who, by their hard labour, want to save the untouchables—may well realise that this small, but very important, factor of our attitude to food habits and so on might have turned large sections of these people to Christianity or Islam, wherein whoever is once admitted is never grudged equal status, and never segregated. On the contrary, these creeds give more importance to converts by favouring them with priority in job etc. I think this attitude brings us to the problem of untouchability, because what is untouchability but the outcome of this policy of segregating people because of their origin or position which is a little different from ours?

If we want to undo the wrong done by missionaries, we must decide what we want these people to be. Certainly it is not proper to make anybody feel that he is small

on account of his origin. We should find out what the qualities are which should enable any person to be a proud citizen of India, irrespective of social customs, food habits, religion or belief.

Elements of Injustice

Apart from anything else, Government or the party in power has to view this problem from the election angle too. With adult franchise in force, proper steps should be taken to see that these elements of injustice, social and economic, are not exploited by political parties for securing seats or capturing power. It seems as though the Congress and other parties have not given this problem the attention it deserves.

One of the main problems of resettling the tribal people is to find out better means of subsistence for them. Dr Verrier Elwyn and Mr Archer have written about tribal art. The tribal people are very often found to be deft with their hands. They also procure lac and cocoons and collect hides and skins, bones and horns. If we open small craft centres to teach them silk spinning and weaving and lac laboratories to train them in various uses of lac, and promote centres for handicrafts, we can encourage the production of fascinating articles of beauty and utility.

Similarly, tannery centres to teach better techniques of tanning leather and making utility leather products will be useful in preventing these tribes from becoming landless labourers to flock factories or mining centres and copying the worst habits of a large town, and also in enabling them to lead a healthy life in their own locality, bringing in more spirit and zest into these desolate places.

Towards Self-sufficiency

Most of the tribes wear peculiar costumes of their own taste (very often of admirable design and colour); but it is a peculiarity that except in Assam, the tribes never weave their own cloth. Invariably they are procured from traders in nearby towns. Introduction of weaving will be a step towards self-sufficiency in this respect, which will, incidentally give them more employment and perhaps add to the variety of a city emporium. Merely opening a night class or school is not of much use, because education will not provide employment. It is combining education with a craft that can make their life richer and happier, incidentally saving them from the outside glamour of big cities and descent to a sordid life therein.

Europe's Atom for Peace Programme

(From Our London Correspondent)

THE United Nations Conference of Scientists to be held in Geneva next month marks the first serious attempt among nations to discuss the peaceful uses to which atomic energy may be put. In some quarters the forthcoming Conference has already been described as a "turning point in twentieth-century affairs". The Conference will have the task of blue-printing the application of nuclear engineering on a world scale and this, by itself, is sufficient to make the Conference of unprecedented significance. Depending on how far the Big Four will be able to agree on disarmament and, more than that, on M. Faure's proposal to devote the consequent savings (from disarmament) towards assisting the underdeveloped countries, the meetings of the world scientists may very well lead to something real and substantial. What is likely to be more noteworthy about the meeting is the certainty that the late Professor Einstein's warning about the horrors of nuclear warfare will re-echo with an authority and an impact which will force the pace towards world disarmament.

While it is certain that the forthcoming Conference will present the new horizons which nuclear engineering has in store for mankind, sight will not be lost of what has been done in some countries already. And here the programming that is being very seriously, though silently, thought out in Western Europe will be highly pertinent to the discussions.

Primarily for Fuel Needs

In Western Europe, as probably in most other countries, the peaceful application of atomic energy is primarily being considered in terms of "fuel needs". The economy of Europe is essentially based on coal. It has not been able to derive very much of the benefit, like the United States, of those economic (and social) transformations commonly associated with the discovery of oil. Of the total primary energy consumed in Western Europe, crude oil represents less than 16 per cent compared to about 40 per cent in the United States. With the advent of atomic energy, as a recent United Kingdom White Paper put it, "a turning point" in economic relations, bordering on, if not similar in magnitude to, the revolution which the

steam engine wrought, is in prospect. Similarly, an OEEC study describes this prospect as "another critical stage in the development of energy resources for Europe".

The large-scale use of nuclear fission for generating power in the two atomic reactor research stations in Britain is cogently described in the U.K. White Paper of February this year. It says that nuclear fuel is represented by three fissionable materials, uranium 235, plutonium 239 and uranium 233. Only the first is found in natural form (as part of natural uranium), while the other two can be produced in atomic piles or reactors. When these three materials are introduced into a reactor under particular conditions, the customary splitting process takes place, accompanied by a chain reaction (as that in an atomic explosion) but which is now controllable. The enormous release of heat in this controlled chain reaction is recoverable. More than that, a type of reactor is being constructed (the breeder reactor) which would at the same time produce further nuclear fuel, thus reducing the intake of the three basic materials referred to above over a period of time.

Cost of Nuclear Energy Falling

Until recently, one of the larger problems concerned with the manufacture of atomic fuel was its cost. The world reserves of fissionable material was unknown, and, more than that, the capital cost in building a reactor was considered to be prohibitive. The U.K. plans for the development of nuclear energy in the next ten years appear, however, to reduce the complexity of this problem. Similarly, statistics published in the United States show that the cost of producing nuclear energy is now within the realms of competitiveness with other fuels. The U.K. White Paper estimates that the cost per Kwh should be about 6d. or \$0.07 which is somewhat lower than the average cost of generating thermal power. Other cost estimates of nuclear power per Kwh have been of the following order:—

\$0.075 by Messrs. Isard and Whitney in Atomic Power 1952.
\$0.077 by the Manhattan Project in 1947.
\$0.065 by the Cowles Commission for Economic Research.

\$0.8 by Gordon Dean in Report on the Atom 1954.
\$0.09 by the N.Y. Consolidated

Edison Company.

It is believed that the advent of the breeder reactor may considerably reduce these estimates.

Capital Cost Less Certain

The probable investment in monetary terms is less certain. It is believed that the cost of building nuclear power stations ranges between \$300 and \$400 per Kw of installed capacity. Some recent projects in the United States cost on an average about \$250 per Kw. It is interesting to compare these figures with the cost of producing the traditional type of plant in Europe. For thermal power, the cost averages about \$180 per Kw while that for hydro-electric power about \$270. Although the cost of nuclear plant would appear to be higher than that of the traditional plant, there is, as the OEEC's study puts it "every likelihood that they will settle down in the near future somewhere between thermal and hydro costs".

From an economic standpoint, one of the most important features of atomic energy is that it enables power to be produced wherever it is wanted, and at a cost largely independent of its location. In this sense, the development of atomic energy may profoundly alter economic geography. No longer is it necessary to concentrate large industrial concerns around particular natural sites—coalfields and large-scale hydro-electric stations.

European Organisation for Nuclear Research

The action already taken in Western Europe to obtain advantage of nuclear energy has not proceeded beyond the planning stage. The United Kingdom is, however, the exception. The February, 1955 White Paper was bold enough to state that while the reactor station may take a long while to build and may cost more as work proceeds, "Her Majesty's Government consider that these risks must be accepted". The European Organisation for Nuclear Research has been set up for the whole of Western Europe. The Convention setting up the Organisation in July, 1953 was signed by twelve West European Governments, each

undertaking to contribute towards the cost of the research. The programme of this organisation includes the construction of a laboratory (at Meyrin, Geneva) for research on high energy particles and the sponsoring of co-operation on nuclear research among nations. A staff of over 300 has already been recruited.

More than this, the OEEC Council of Ministers have agreed to consider the recommendations of an expert Committee on European co-operation

for the dissemination of information concerning research into atomic energy and the co-ordination of member countries' policies regarding the generation of nuclear energy. The Committee describes the import of its suggestions in the following terms:—

"If all this were done, Europe's prospects in nuclear energy would be as favourable as those of the United States, as all other conditions are substantially the same in both continents."

The need for co-operation was equally stressed in the UK White Paper—only with the "greatest possible co-operation in the peaceful uses of nuclear energy" can full use be made of "this great new scientific development for the benefit of the world". While the principal aim of these protestations remains confined to Western Europe (and, of course, the USA), there can be little doubt that the movement for co-operation is fast becoming a global one.

Around Bombay Markets

Easy Trend in Equities

THE stock market on the whole reflected an easy trend during the week with the closing quotations in almost all sections showing a distinct loss over the week. Sentiment has been affected by conflicting reports about Tata Steel dividend. Early in the week, there were reports that the dividend would be stepped up by at least half-a-rupee to Rs. 11 per share on Tata Ordinary. Towards the close of the week, however, it was rumoured that the status quo would be maintained and hence there was a decline in steel shares. When longs in Indian Iron liquidated their holdings partially, price of Indian Iron was also depressed.

Exports of cotton textiles having been on the decline and rise in mill shares being sudden and steep, operators preferred to liquidate with a view to booking profits which resulted in a general lowering of prices in the textile section. However, there were exceptions—Simplex, Gokak and Standard each showed fair improvement.

In the miscellaneous section, Digvijay Cement, Premier Construction and Tata Chemicals were spotlighted in that order. National Rayon also were slightly better.

Tata Ordinary opened around Rs. 249 which was the highest for the week. They declined to Rs. 243-8, but closed at Rs. 244-12, with a net loss of Rs. 4-8. Indian Iron also declined from the highest level of Rs. 36-13 to Rs. 36-4 on liquidation by Calcutta longs. The closing was fractionally higher than the lowest for the week, but lower by 5½ as. from the previous week's closing.

Bombay Dyeing for want of fresh incentives suffered a loss of more

than Rs. 12 to close at Rs. 493-2, the highest and lowest levels being Rs. 503-12 and Rs. 486-4, respectively. Century lost Rs. 4-12 and closed at Rs. 409-12, the lowest touched during the week being Rs. 404-8, Kohinoors came down from Rs. 349 to Rs. 337 to close fractionally higher at Rs. 338-8. But Simplex closed higher by 2½ points over the previous week's closing at Rs. 164-8, the lowest for the week being Rs. 161. Swadeshi moved between Rs. 217 and 207 and closed at Rs. 210.

In the insurance section, conditions remained more or less the same as in the previous week with New India closing at Rs. 46, the same as last week.

Amongst bank shares, Bank of India and Central Bank remained steady at Rs. 147-8 and Rs. 47, respectively.

In the miscellaneous section, Digvijay led with a gain of more than 12 points to close at Rs. 200, on reports of better working results and prospects of higher dividend. ACC closed Rs. 3-12 lower at Rs. 185-12, the highest being Rs. 190-12. In the sugar section, Belapur declined from a high level of Rs. 321-8 to close weak at Rs. 316. But Phalton Sugar, after being quoted as high as Rs. 132, closed firm at Rs. 131. Bombay Burmah Old lost Rs. 6-4-0 from the highest of the week to close at Rs. 547-8, the lowest during the week being Rs. 543-12. National Rayon closed more than 2 points higher at Rs. 213-12. Premier Construction and Scindias looked up on considerable speculative support to close at Rs. 158 and Rs. 14-15-6 respectively from the low levels of Rs. 153 and Rs. 14-13. Tata Chemicals finished 5 as. higher at Rs. 15-15-6.

Thursday, Morning

COTTON FUTURES DECLINE

THERE has been a steadily declining trend in the cotton futures market during the week under review. Prices have been adversely affected for more than one reason. In the first place, there were continued reports of imminent announcement of American export subsidy. As a result, there was a sharp break in prices in the Liverpool cotton markets which lost more than 50d. in a single day. Besides, reports of better rains in the cotton tracts and option dealers' selling also adversely affected sentiment in the local market. Longs in the August contract were reported to be unwilling to take cotton on the docket and speculators were reported to have switched over to the new contract by selling the current contract and buying the unofficial new crop contract, February 1956. All these had the cumulative effect of bringing down cotton prices. ICC August which quoted as high as Rs. 596-8 on the opening day of the week came down to Rs. 585, registering a net loss of Rs. 11-8. The closing was Rs. 585-4.

In the spot section, quietly steady conditions prevailed during the week. Local mills were interested in Vijay and Khandesh varieties. A leading group of mills is reported to have bought about 1000 bales of Khandesh cotton at around Rs. 30 off. The basis for Wagad, Morvi and Kalyan remained around the lowest levels.

OILS AND OILSEEDS DULL

WITH no prospects of export business in groundnut oil or castor oil and due to rains in the interior, the oilseeds market presented a dull appearance. There was also straddle business in castor futures. The gap between the September and May

contracts which was as wide as Rs. 7-8 at the opening of the week narrowed down to Rs. 1-8 at the close, indicating greater selling pressure in Castor September. Operators were evidently unwilling to take deliveries against their purchases. In the event, Castor September which was quoted at Rs. 110-8 only last week, after improving to Rs. 102, lost Rs. 10 per candy to close the week at Rs. 92. The May contract registered a loss of Rs. 2-4 over the week to close at Rs. 90-8.

In the groundnut section also, there was a distinctly bearish trend and quotations were generally lower than in the previous week. Groundnut August-September closed at Rs. 23-4 as against Rs. 23-9 while groundnut oil shed five annas to close at Rs. 12-7.

Linseed, however, remained steady at Rs. 25-10 for August-September but Kardi lost about 12 as. and was depressed at Rs. 14-10. Niger seed remained quiet at Rs. 23-10 with a loss of 2 as. Linseed oil showed a loss of 10 as. over the week because of lack of overseas enquiries and sales by shippers.

EMERGENCY CLOSURE IN BULLION

THE bullion market remained closed throughout the week. An emergency was declared and the Board of the Bombay Bullion Association is to meet to decide what measures they should take to curb unhealthy speculation.

Meanwhile, both gold and silver declined (unofficially) to Rs. 92 and Rs. 158-8, respectively as against Rs. 92-6 and Rs. 161-8 in the previous week.

Around Calcutta Markets

Is "Bull" Phase Over?

IF equities were firm in the last fortnight partly because of TTK's assurances that the Government had no intention to nationalise existing private industries, the Calcutta Stock Exchange developed an irregularly lower trend this week as Pandit Nehru praised the system of worker-management partnership in industry in Yugoslavia, giving his impressions of his tour of Russia and other European countries. Something like this, the stock markets were expecting. Markets were anticipating that Panditji might say something on his return to India

which might affect equities.

This is one of the ways of explaining recent market movements. There are other ways of explaining fluctuations in equities in the last few days. By the middle of last week, it became evident that Indian Iron's behaviour was contrary to that of equities in general. Indian Iron were moving up, but equities were either stagnant or slightly lower. It was, therefore, not surprising that equities developed a downward trend as Indian Iron experienced a setback. At the moment, both Indian

Wednesday, Evening

Iron and equities in general remain inactive.

Price Parities

Equities have been rising in the last few weeks. A temporary pause after the recent spurt is neither unnatural nor unexpected. It is clear that the market has paused in its upward journey so as, among other things, to consolidate the ground recently gained. If this is a correct interpretation of the present phase of the market, there is, then, nothing much to worry about. But prophets of gloom are predicting that

the "bull" phase of the market has come to an end. Such gloomy forecasts lack any dependable basis. But certain recent developments cannot be ignored.

There is more than one way of looking at the contradictory behaviour of agricultural and industrial prices. But it cannot be denied that the comparatively lower farm prices have helped industrial production and profits in the last eighteen months. Recent price indices suggest that farm prices are slowly rising. Wholesale prices are also rising. So, it is not quite arguable that rising farm prices will affect industrial costs and profits. If the disparity remains, though both agricultural and industrial prices may be rising, industry will continue to reap the benefit of lower production costs.

But there are other developing factors which may combine to have a depressing effect on equities on the Calcutta Stock Exchange. Tea shares have had a sustaining effect on the market in the last few months. This group has developed a hesitant trend. The season for payment of final dividend is almost over. Though export auction prices remain steady, these may develop easiness in the near future. Export auction prices are likely to be lower by the beginning of September, when the second flush of tea will become available to the market.

Market Factors

There were hopes that, even though Tea shares might not remain steady, Jute shares would develop strength. Though market analysts remain optimistic about Jute shares, the market does not seem to be enthusiastic about this group of shares. In recent weeks, there has been more than one attempt to push Jute shares up. But all these attempts have failed. But, on current indications, it does not seem that Jute shares can develop sufficient strength in the immediate future to act as a sustaining influence on the market.

If neither Tea nor Jute shares can be relied on to act as props to the Calcutta Stock Exchange, Miscellaneous and Engineering shares are not likely to sustain the market. One of the gloomy features of recent market movements has been the uncertain behaviour of Miscellaneous and Engineering shares. These groups are not appreciably lower. But buying support has been lacking for these groups in the last few weeks. Those who apprehend that the "bull" phase of the market may

be coming to an end emphasise these conjunctural market factors. There is something in this line of reasoning.

Steel Dividends

Strength in Iron and Steel shares has egged stock markets in both Bombay and Calcutta to higher levels in recent weeks. Improvement in Tata Steel, as in Indian Iron, was mainly due to expectations of higher dividend. Reasons for expecting higher dividend for Tata Steel are not the same as those for anticipating better dividend payments by Indian Iron. But some of the reasons are common. Both Tata Steel and Indian Iron have made higher profits last year. But, as explained in these columns in the last three weeks, that does not necessarily mean that both, or either, will pay higher dividends.

Tata steel have considerable expansion projects. This company will have to raise capital. Before it enters the new issue market, it is argued, it may be wise policy to pay a slightly higher dividend so as to induce investors to take up the expected capital issue. This is one of the most plausible arguments advanced by those who expect higher dividend payments by Tata Steel. Unlike Tata Steel, Indian Iron are not likely to enter the new issue market. But this company has also expan-

sion projects. It may raise capital by issuing bonus shares. That is how the argument runs.

As a variation, it is argued that both Tata Steel and Indian Iron may maintain the dividend, but may decide to pay bonus. Last year's higher production is not likely to be repeated this year. There is, on the contrary, a possibility that this year's iron and steel output may be lower because of incidental consequences of implementing expansion projects. Hence this bonus argument. Be that as it may, this week's behaviour of both Tata Steel and Indian Iron indicates that the market is not very hopeful about higher dividend payments by the existing iron and steel companies. Tata Steel began to drop first. Indian Iron followed suit.

Wider Issues

As the market revises its dividend expectations for Tata Steel and Indian Iron, both those shares are likely to develop a drooping tendency. And the prophets of gloom are now emphasising that such a possibility, coupled with stagnant conditions in Tea and Jute shares, may exert a definite "bearish" influence on the stock markets. These are formidable technical and conjunctural factors whose importance cannot be minimised or ignored. Even so, there are other wider issues which should not be forgotten.

The Pioneers of Progress!

From the time of Edison's invention of the first incandescent lamp, the G. E. Scientists have continued to contribute to the world of science, new facts, new discoveries and new theories. The list of their many and diverse contributions is long—hundreds of scientific and technical papers include the works of Charles P. Steinmetz, William D. Coolidge, C. G. Suits, Willis R. Whitney, and Irving Langmuir, regarded the world over as being among

the greatest authorities in their respective fields.

Under the leadership of these great scientists, the products of General Electric have grown in quality and their wide diversification.

The work of G. E. Scientists never ends. From their future work will come new discoveries... new developments to benefit the expanding electrical age and the infant atomic age... to enrich the modern civilization with new and better products.

Dr. Charles P. Steinmetz

Dr. Irving Langmuir

Dr. Willis R. Whitney

Dr. William D. Coolidge

Dr. C. G. Suits

Tea Toddles...

THE world changes and with it the Calcutta Burra Sahibs are prepared to change too, judging from their public statements. Some may interpret it as a sign of weakness, lack of guts, but that is a matter of opinion. The marketing of tea, however, stands where it was before and the Ministry of Commerce and Industries has to keep on running all the time just to keep Calcutta tea auctions from falling behind. This is the impression one gathers from a hurried reading of the Report of the Committee on Tea Auctions which has just been released and comparing it with the Report of the Ad Hoc Committee in 1950. The Tea Auction Committee Report is breezy and debonair; but it is a political document though among its signatories, who produced a unanimous report, are the big three of the world of tea, Sir Percival Griffiths, Mr. R. E. Culvarhouse and Mr. Mackay Talak, the present Chairman of the India Tea Association. The Auction Committee has fallen into the trap of phasing, into which the Government led itself in 1950, knowingly and willingly enough. Then the situation was different. Have not things changed in these five years?

The earlier Committee was much concerned about the limitations of the Calcutta market and its ability to handle a large volume of tea. There were physical limitations—crippling shortage of warehouse accommodation, inadequacy of the mechanical devices for handling tea. There were equally crippling shortages of the highly specialised services that go with the marketing of tea—broking houses, tea tasters and financial arrangements. The year was 1950. The tea trade was in the hands of highly specialised and experienced people, who happened to be Europeans and the Chairman of the then Central Tea Board was one who had to be acceptable to the Trade and the choice was deliberate and correct. The Ad Hoc Committee recommended a short-term programme for expanding warehouse facilities and removing, as fast as possible, the physical difficulties of handling a larger volume of tea. Though the expansion of Calcutta auctions and the marketing of a larger proportion of the crop in Calcutta was the long-term objective, the immediate and pressing problem how best Calcutta could face the change-over from bulk purchases by the British Food Ministry to normal marketing, when the bulk purchase contract due to expire in March 1951 came to an end. The long-term proposals were dependent on the question of expanding the facilities of the Port of Calcutta which the Government was understood to have had under consideration at the time.

While in principle this Ad Hoc Committee was in full agreement—so they said—with the Government's desire to see the increasing growth of the Calcutta market, the Committee thought that it would take anything from 5 to 10 years, perhaps longer to achieve the expansion of this market to the extent envisaged by Government. Hence the counsel of caution. The Committee paid equal attention to the development of the technical services associated with the marketing of tea, such as the training of tea tasters, inspection, sampling, and blending etc. and it recommended that the broking facilities available in Calcutta should be adequately enlarged, if the entire North Indian crop was ever to be marketed

here. And it considered that "the immediate association of Indians in a larger measure with the technical side of the trade" was most "appropriate."

From a cursory reading of the Report of the Auctions Committee, it is not clear how far the difficulties pointed out earlier have been removed and what progress has been made in the matter of warehousing and other facilities. Perhaps the Committee was right in refusing to allow shortage of warehousing to affect its decision of expanding Calcutta auctions by putting a ceiling on consignments shipped for London auctions. It did try to estimate the shortage of ware-house space, but the figures arrived at are far from firm, for much would depend on the period for which the chests of tea would have to be stored in the warehouses and that, in turn, would depend on a number of factors and the manner in which the mechanism of re-distribution of exportable tea between auctions held in Calcutta and in London changed over a period of time, assuming that the Committee's recommendations have the intended effect. It will not be enough to expand warehousing; preservation of tea, if it is to be stocked for any length of time and in the wrong seasons of the year, will require effective protection from the humidity of the Calcutta climate. So long the trade has gone on on the assumption that there was nothing like six weeks of seasoning in a ship's hold for maturing Indian tea and giving it the right flavour. About the other expert services vital for the proper marketing of tea, the Auction Committee appears to be equally casual. Perhaps they are right in fixing their gaze firmly on the goal and taking a calculated risk, while not underestimating that risk.

But when the Committee mentions "larger considerations of a national as well as economic character" which in its opinion justify these steps, perhaps it could have been a little more explicit about what the economic considerations are. In fact, on all questions of facts and figures the Committee is more than a little casual. After complaining about the initial difficulty of studying the problems of tea, because of "the somewhat bewildering variety of statistics that are available"—this is rather a damaging confession from a Committee which has as its chairman the Chairman of

the Tea Board—it goes on to outline the general pattern of the tea trade in a series of four tables in which the years are not the same—in one case it is the financial, agricultural or the tea year and in another it is the calendar year and the figures do not tally—and in the table of arrivals, the quantities are sometimes shown in chests and sometimes in lbs. If the Committee finds it bewildering, why impose it on others?

These are not of the essence, however; one can with a little patience try to straighten out the statistics, but what about the categorical statement in the report that "By a natural process, the auctions in India have been increasing in size during the past few years and the trend would almost certainly continue even without any external acceleration"? From the figures of auctions given in the tables referred to above, this statement is not borne out. In the three years for which the statistics of tea sold through Calcutta auctions are given in the table, the volume of sales show a fall, not a rise. If the figures for Cochin auctions are added, the trend remains unchanged. It is not on the natural process, therefore, but on "external acceleration" that the Committee relies for the trend of auctions in India to go up.

The Ministry of Commerce and Industry in its wisdom has not been prepared to go as far; instead of fixing a ceiling on consignments for London auctions as a percentage of crops recommended by the Committee, it has accepted a modest reduction in the absolute quantity to be shipped this year. But neither the Committee nor the Ministry has worked out the economics of it. To point this out is not to suggest that Calcutta auctions should not expand. They should. It is desirable that more of India's tea be marketed through auctions held in India and that these auctions be so popular and attractive as to bring all the buyers from across the seas right to our doors. But what about all those delicate complexities in the marketing of tea which have so far stood in the way of this desirable consummation? Even the President of the Indian Tea Association appears to have written them off. But only five years ago his Association, pleading for the unrestricted freedom of the producer to market his tea wherever it would fetch the best price, was absolutely definite that blending could never be carried out

in Calcutta and that "in this sense Calcutta could never be the centre of the world tea trade" and hence any interference with the "natural supply of Indian tea to London" would be disastrous. The reasons were that no one wanted a straight Indian tea and since other teas such as from Java and Ceylon with which Indian tea is blended would not be marketed here, the result would be a considerable fall in the demand for Indian tea. Further that small and medium buyers would be excluded. The Auctions Committee has, however, gone into this question of small and medium purchasers being eliminated and the market being left in the hands of a few big buyers, but not into all those questions that had been raised earlier about the delicacies of blending and so on.

How is the ceiling to operate? The Committee recommended that this should be entrusted to producers' associations under the supervision of an official agency to be nominated by Government. The Ministry mentions no official agency and is prepared to leave enforcement, "by voluntary action if practicable", to the producers' associations of North India, who have offered to work it out and has accepted this arrangement for the current year.

As important as the ceiling, however, is the other recommendation, namely, that quality grades should not exceed half the ceiling fixed for the London auction consignment. This recommendation of the Committee, the Government has accepted in toto. The ceiling fixed for the current year is 140 million lbs. as against actual consignments of 209 million lbs. in 1953 and 167 million lbs. in 1954. This is only for North India; for the South no ceiling is considered necessary. It is an important step that the Government has decided to take but not a plunge in the dark. Ceylon took it long ago and has not regretted it. Why not we?

After Geneva

FROM reactions to the Geneva Conference of Heads of States, it would seem that many commentators on international affairs and the Right-wing of the Republican Party in America have acquired a vested interest in the "cold war". Throughout the world, the people hunger for peace. President Eisenhower was right in his repeated emphasis at Geneva that the talks between the four Heads of Government were a reflection of the common man's desire for peace. At Geneva, all the four Heads of State have emphatically endorsed the common man's urgent wishes for world peace. Each has admitted the other's sincerity in expressions of peaceful intention. It is a permissible deduction that expressions of peaceful intention of the four Heads of State reflect their grim awareness of the horrors of an atomic war. It is, therefore, a legitimate inference that the military experts and advisers of the four Heads of State have made it palpably evident to their respective Governments that the alternative to co-existence is co-destruction.

Far more significant is the expert assessment of the relative military strength and potential of the rival power blocs. Some of the statements at Geneva of President Eisenhower, himself a distinguished soldier, can only be interpreted to mean that, in his considered opinion, the two rival sides have reached a delicate balance of strength. It was this conviction that impelled President Eisenhower, an expert strategist, to issue repeated warnings about the ominous possibility of a surprise attack. This explains his dramatic proposal for mutual inspection of war installations from the air. Many commentators on foreign affairs do not yet seem to have appreciated the significance of this proposal. There is evidence that the U. S. President's proposal has spread consternation among some of America's allies. There may be more than one motive in Sir Anthony Eden's disclosure at Geneva that Britain is now capable of manufacturing both atomic and hydrogen bombs. But it is not without significance that Russia, as much afraid of a surprise attack as America, has had the diplomatic wisdom to announce her willingness to consider the Eisenhower plan in all its relevant aspects.

Much is being talked about the tough hurdles that the Foreign

Ministers will have to cross when they meet at Geneva in October. Far more relevant are the possible intervening developments in America. There are abundant indications that the Right-wing of the Republican Party is suspicious of events and developments at Geneva. President Eisenhower has, on his return to Washington, taken care and pains to explain to his Party and the Congress that no secret agreements or pacts have been signed or concluded during the Geneva Conference. It is welcome news that this authoritative assurance has partly assured some of America's suspicious Republican Senators. But there is a lurking danger that President Eisenhower, who, alone among his colleagues at Geneva, is the combined head of the State, the Government and the Army, may be disavowed by the Party which he leads and which has made it possible for him to assume triune power and responsibility. This has happened before in history. It has had disastrous consequences on world affairs. At Geneva, Marshal Bulganin had the support and consent of his Party and Army Chief. What the world would like to know is whether the Right-wing of President Eisenhower's Republican Party accepts the principle of co-existence. This is far more relevant and significant than the obstacles which the four Foreign Ministers will have to surmount when they meet at Geneva in October to ensure lasting peace.

Only those who ignore the basic objective of the "summit" talks at Geneva will be disappointed with the Geneva Conference. It was not the purpose of the Geneva Conference to reach agreements on all the world issues in dispute. At Geneva, the four Heads of State met to offer and to receive assurances about their intentions to reconcile differences through conciliatory negotiation. In their statements at the end of the "summit" talks, each has expressed faith in the other's peaceful motives and designs. Without exception, all the three leaders of the Western Powers have assured the world that they are convinced of Russia's peaceful intentions and of her willingness to solve disputes through mediation. From the directives of the four Heads of Government to their Foreign Ministers, it is clear that both sides have made concessions to render the Geneva Conference successful. Despite the difference in

approach to the German problem, the directive makes it clear that the Western Powers have accepted Russia's stand that the problem of overall security for Europe should have precedence over the question of reunification of Germany. In return for this concession, Russia has willingly agreed to discuss the proposals relating to disarmament under the auspices of the United Nations, though she had earlier demanded that such discussions should be held at the meeting of the Foreign Ministers. It would be foolish to pretend that the four Foreign Ministers will experience no difficulty in reaching agreements on the issues they are to discuss in October. But Geneva has established the principle that international disputes are to be settled through negotiation, and not through forceful means. This is no mean achievement.

Of the Geneva Conference, the most valid criticism is that the Western Powers, though not Russia, would seem to ignore that peace is indivisible. Russia alone among the four Powers represented at the Geneva Conference has expressed dissatisfaction that the "summit" talks have excluded the problems of Formosa, Far East and China. Subsequent developments are hopeful. On Monday next, the Chinese and American Ambassadors will meet at Geneva to discuss the problems of detention of citizens and repatriation of nationals. Mr. Dulles's observations at a Press Conference after his return from Geneva indicate America's willingness to have talks with Communist China on issues directly affecting the two countries in order to reach a peaceful settlement. Mr. Dulles wants an assurance from Red China of her acceptance of the principle of non-recourse to force to solve disputes. It should not be difficult for Mr. Chou En-lai to offer Mr. Dulles the assurance he wants. Peking has more than once invited Washington to have talks on issues of common interest. There are indications that the talks between the Ambassadors at Geneva may be followed by discussions at a higher level. By enunciating the principle of solution of differences through mediation, the four Heads of State have created an atmosphere in which Far Eastern problems can be discussed calmly and dispassionately. This is another incidental achievement of the talks "at the summit" at Geneva.

Weekly Notes

State Government Loans

THE experiment tried out last year of pooling all borrowing by the Centre by the floatation of the National Plan Loan obviously did not prove so a great success. So the Government has reverted to the earlier system of allowing the States to try their luck. There may be something in local patriotism and in the initiative of the State Governments. Moreover, variety has its own attraction, why not let the States try? Ten of the State Governments are going to enter the market with a borrowing programme of Rs. 35.75 crores in all. Bombay has a programme for Rs. 6 crores, Madras Rs. 7 crores, Hyderabad Rs. 2 crores, Andhra Rs. 2.5 crores, West Bengal Rs. 5 crores and Uttar Pradesh Rs. 6 crores. All the loans will carry interest at 4 per cent and be redeemable at par in 1967.

There is nothing exceptional in the timing up of the loan either, the slack season has always been the one for borrowing. About the technique also, it is only a return to form but on the question of propriety, perhaps a word may not be out of place. Premature disclosure by a member of the Andhra Cabinet of the borrowing programme of his State would have created quite a stir, had money market conditions been somewhat different from what they are. It largely passed unnoticed but it should not. A feature of the present programme is the long notice given. This is however not to help the investor to make up his mind and to give him sufficient time to arrange his affairs accordingly, but to enable the States to do their best in the matter of whipping up enthusiasm and rigging up their respective markets.

Though the other terms and conditions of the loans are the same, issue prices differ according to the State. These differences are not really a measure of credit rating but the money market's assessment of the ready marketability of the different State Government loans. Bombay has always enjoyed the highest credit and its issue price has been fixed at par. West Bengal gets the same high rating, thanks to the energetic personality of its Chief Minister who can be relied upon to arrange for the proper placing of the loan. Other States are to issue their loans at varying rates of discount,

ranging from Rs. 0-4-0 to a rupee per 100 rupees.

Apart from the fact that pooled borrowing tried out last year did not prove a success, another consideration may have led the Centre to revert to the old practice viz. the difficulty of apportioning loans to the different State Governments and reconciling their competing claims. Now the States are at least free to try to get as much as they can.

Corruption in Railways

THE decision arrived at the meeting of the six Zonal Railway Commercial Superintendents and members of the Railway Board, to implement all important recommendations concerning Commercial Departments, would suggest that the Government is keen on paying immediate attention to the problem of corruption on the railways. The recommendations relating to the operating departments are likewise to be discussed at a meeting of the Operating Superintendents of Zonal Railways next month. Among the recommendations made by the Enquiry Committee, with which the Commercial Departments are directly concerned, are the following:

- Adequate publicity should be given to facilities available to the public on the one hand and to employees of railways on the other. There should also be constant propaganda for bringing home the evils of corruption;
- The jurisdiction of the inspectors, which is in many cases excessive, should be revised;
- Efficiency Bureau should analyse the quantum of work performed by gazetted officers and suggest measures for reducing desk work and increasing supervisory work;
- In making selection for key posts, utmost care should be exercised and due consideration given to the reputation for honesty or otherwise of the officers concerned;
- Greater degree of uniformity should be introduced by the different zonal Railways in the procedure for indent,

allotment and supply of wagons;

- A speedy drive should be launched for improving the wagon position, eliminating ambiguities in the classification of goods, advance planning and adequate arrangements for the clearance of traffic in perishables etc;
- A claims prevention officer should be appointed for each zone.

If the eradication of corruption is essentially a staff problem, it should be tackled by strong action. It is good to know that the Board has assured full support to the railways in this matter and that the Railway Administration is "determined to root out this evil". A psychological approach to the problem has been suggested, greater stress being laid on the 'corrective' rather than 'punitive' aspect of the matter. Emphasis has also been laid on improving the supervisory work of the inspecting staff and also on the need for greater attention to claims prevention and expeditious disposal of claims. It is encouraging to know that the Railway Board is convinced of the need for strong action; the member of the Board for Staff, for instance, has rightly suggested that in proved cases of corruption, the minimum punishment should be dismissal, for unless such deterrent action is taken, the evil cannot be eliminated.

In the absence of fuller details, it is difficult to say why the meeting has not considered some of the other important points raised by the Enquiry Committee such as the need to strengthen the gazetted staff, disparity in the emoluments of the lowest and the highest paid staff, problem of staff welfare, shortage of wagons, corruption in the police and anti-corruption establishments of the railways etc. Probably these will be taken up at a subsequent meeting. Meanwhile, it must be pointed out, that the main factors which encourage corruption in the railways are the inadequacy of emoluments to the low-paid staff, ineffective supervision, slow wagon movement and shortage of wagon capacity. If any lasting impact is to be made on the problem of corruption, the Railways will have to tackle these first.

All About Money and Prices

THE currency report for 1954-55 has slimmed a little, not so much from a reduction in the number of pages, though even these have dropped slightly from the peak of 1952-53, but from use of thinner paper. And it has become more cautious and circumspect. The currency authorities seem to pat themselves on the back for their splendid performance during the year. There was a record increase in industrial production, an unusually good crop for the third consecutive year and a substantial addition to the money supply under the impact of a larger budget deficit, and yet there was no sign of inflationary pressure. On this bright picture, falling prices cast a shadow. It was more than a little perplexing, particularly the widening disparity between agricultural and industrial prices. While the general index of wholesale prices fell over the year by 10.2 per cent, the index of food fell by 20 per cent, and that of industrial raw materials by 10.8 per cent, while the index of manufacturers did not fall at all; in fact, it rose by 0.6 per cent. The disparate movements of sectional price levels are brought out even more sharply when the average level of prices for the year is compared with that of the previous year. The average of the general price index for 1954-55 was 5.1 per cent below that of 1953-54; that of food articles and industrial raw materials was lower by 11.6 per cent and 6.7 per cent respectively, while the average index of manufacturers was 2.7 per cent higher.

The report does not offer any explanation for these disparate movements though it seems to suggest at places that in addition to bumper crops, de-control of food grains brought about heavy liquidation ("dishoarding of supplies was encouraged by the elimination of food control by July 1954") and was thus responsible, at least partially, for the sharp fall in agricultural prices. So one is almost led to believe that instead of countering hoarding, control actually leads to hoarding! Another factor responsible for the sharp decline in agricultural prices is the perverse elasticity of supply—lower the price, the farmer has to sell more of his grain in order to maintain his (money) income. "Once the fall in prices had started", says the report, "it was fed by the stream of supplies coming on to the market from small cultivators who had to reduce their stocks for personal consumption in order to maintain their income". No

better case could be made out for price support, but if this convenient instrument of augmenting the marketable surplus is so readily thrown away, how is the fall in food prices going to provide "a base for rapid development" as expected in the report?

How Big is the Deficit?

AGAIN, how to reconcile the fall in prices with the large increase in money supply and bank credit which took place during the year? "Despite this increase", says the report, "prices have declined; it would thus appear that the increase in money supply took place primarily in response to the growth in econo-

mic activity." The connection between the two may not be as clear to the readers as it is to the authors of the report. The passage quoted may mean one of two things. It may mean that currency was expanded in response to the demands of trade and industry (to finance a larger volume of production and commodity transactions) but not adequately; the expansion failed to meet the demand—otherwise why should prices fall, except inversely to productivity? Or it may mean that currency was expanded to finance development, but the circulation of the new money created remained confined to certain focal points and the secondary movements were slow and subject to in-

West End 'IND' ALARM

you cannot buy a Better Timepiece!

Powerful 30-hour movement.
Heavy brass plates, wheels solid hardened brass, axles and pinions hardened steel cut from the solid.
High tension infallible Alarm, intermittent or continuous by moving shift lever.

Height 6" Width 4 3/4"

CONTINUOUS-INTERMITTENT

Absolutely dependable because of its immensely strong and sound construction, the "IND" Alarm Timepiece, with its 30-hour movement and Continuous Intermittent Alarm, is the finest value obtainable. The "IND" Alarm will give lasting time-keeping satisfaction, while its alarm, which can be continuous or intermittent at will, is absolutely dependable.

definite and indeterminate time-lags. In fact, this raises doubts about the operation of deficit financing as a price stabilizer which had been discussed earlier in this paper when the Finance Minister enunciated his magic assurance ('Deficit Financing—Price Stabilizer'—April 2, 1955.) There is evidence, however, that the secondary movements, referred to above, have commenced and therefore the general tenor of the report that a new phase of expansion under the impetus of development expenditure and deficit financing is now on, will be generally accepted.

Since budget deficit is now the most potent factor influencing currency supply and the tempo of economic activity, what about the exact size of the deficit? For information on this point, one usually looks forward to the publication of the currency report which, appearing some months after the budget, is in a position to present a complete picture of the state of public finances at the end of the year. According to the Finance Minister's budget speech in the Lok Sabha, the year should have closed with a deficit of Rs. 220 crores (revised estimates). What happens between February 28 and March 31 is always a matter of considerable speculation. In the section on public debt, it is stated that during 1954-55 outstanding treasury bills showed a rise of Rs. 137 crores. This, it is mentioned, is the "actual increase based on Reserve Bank data". The net deficit, however, works out at around Rs. 110 crores. This is quite a different figure from the one given out by the Finance Minister in his budget speech. Since the Reserve Bank takes all the trouble to rehash the budget figures, obviously for the benefit of the lay public, perhaps a little more light could be thrown on these statistical complexities, particularly when public attention has been made to focus so sharply on budget deficits.

Currency Part of the Report

IT is the currency part of the report which had to do all the reducing and in the course of the last few years, it has shrunk. Even so, what is left is interesting reading for a holiday afternoon. Since the more serious part of the report has been summarised and widely commented upon, only the humbler task of highlighting this 'backward' part of the report is undertaken here, on the belief that currency statistics can also throw some light on the econo-

mic trends and the spending habits of the people.

The first striking thing to note about currency is that despite its substantial increase, small coins continue to show a decline. Thus in 1954-55 while circulation of notes increased by Rs. 90 crores, that of small coins recorded a decline of over Rs. 1 crore, the total decline in the last five to six years being about Rs. 17 crores. This would mean either that the wartime hoarding of small coins was so large that the process of withdrawal is justified or that because of the general rise in prices, transactions are rounded off more and more to the nearest rupee. The surprising exception, however, is the quarter-anna. The circulation of single pice coins continues to increase. Is the humble pice serving other than monetary purposes as it did during the war years? The single pice pieces with a circular hole have had many uses and they have not, obviously, lost their popularity.

Another interesting feature brought out by the currency statistics is the remarkable stability of the proportion in which notes of different denominations circulate. Thus 10-rupee and 100-rupee notes account for more or less the same proportion, namely, 40 per cent, which is not very much different from the pre-war pattern. The reintroduction of high denomination notes from April 1954 seems to have made a good beginning; during 1954-55 nearly Rs. 40 crores of these notes went into circulation.

In view of the return of coinage from circulation, the mints appear to be working very much below capacity; the total value of coinage minted in India during 1954-55 was only Rs. 2.63 crores, although this is substantially higher than the figure of only Rs. 55 lakhs in 1953-54 and Rs. 39 lakhs in 1952-53. One wonders whether the proposal for the introduction of decimal coinage is partly with a view to keeping our mints fully occupied!

The year 1954-55 was conspicuous for a 50 per cent increase in the number of note forgeries, the bulk of the increase occurring in regard to 100-rupee notes, from 46 in 1953-54 to 2,177 in 1954-55. Like the planners, forgers also are stepping up their targets, though in their own humble way, for the total amount involved is small, being only Rs. 2.5 lakhs.

Mayors Confer

THE Mayors of Ahmedabad, Bangalore, Bombay, Calcutta, Madras and Poona who met to confer, highlighted two important problems. Panditji has made the problem of slum clearance pretty acute for them and overcrowding in the cities just as (or even more?) acute. But while the responsibilities of local bodies, especially those of the bigger city Corporations are growing, owing both to increase in population and in urbanisation, their resources are deplorably inadequate, so that only a few of them are able to provide even the minimum amenities to the rate-payers.

The Taxation Commission thought that the answer to the financial problems of the bigger municipalities and corporations lay in a transfer of additional tax powers to these bodies. But there is a limit up to which taxation can go and anything beyond it, will have to be met by other methods such as borrowing and subsidies from the Government. There is a vicious circle here. The City Fathers can increase the taxable capacity of rate-payers by clearing slums, developing new residential areas and carrying out city improvement in other ways by laying out parks, widening roads etc. All these mean capital investment which even the biggest municipalities are unable to undertake. The City Corporations find it difficult to raise loan capital. The Taxation Commission recognised this and recommended that a part of the assistance for development would have to be in the form of graded subsidies, from the Government, of course, and assumed that funds for the purpose would be made available in the Second Plan.

Viewed against this background, the Memorandum presented by the Mayors to the Planning Commission for financial assistance under the Second Five-Year Plan, does not appear to be unreasonable. Assistance is asked for Rs 135 crores in all, Rs 57 crores in subsidy and the balance as loan. Experience has shown that the initiative for housing and slum clearance has to come from official agencies and local bodies. And of these two, while official schemes have achieved some limited success, the efforts of municipal bodies have been held up for want of finance. Thus, out of the total funds of Rs 13 crores sanctioned by the Government of India

under its housing schemes, at least about Rs 5 crores had been utilised by the State Governments, employers and co-operatives till January 20, 1955. But municipalities have been hardly able to undertake any scheme of slum clearance, housing or even water supply and drainage in the last fifteen years, during which the population of cities has grown enormously, and out of all proportion to the expansion of civic amenities. All this is in the Mayors' Memorandum, but facts are hard to come by, for none of the corporations publish data of new houses built or of licences given for construction.

Export-Import Loan to India

IT had been presumed so long that if the Tata deal went through, it would be the first time that the Export-Import Bank would be extending credit to India. But National Rayons have stolen a march over the Tatas, and have come out first. Now every bank must make sure of the credit-worthiness of the borrower before it agrees to lend. It does not follow, however, that the Tata proposition that the Export-Import Bank has under consideration is vitally dependent on the rupee capital that the Tatas may or may plan to raise for financing their second steel unit. In any case, of the Rs 60 crores required to finance the expansion, fresh capital issue is not likely to exceed Rs 10 crores; even this may be spread over a period of years, the calls being timed accordingly. Some Rs 20 crores may come from retained profits from the Rs 50 per ton increase in price given to meet the cost of expansion and development. So the amount to be borrowed, if the above figures are not wide of the mark, is not likely to exceed Rs 40 crores or \$20 million.

Certain things can be taken for granted, in this particular case, the credit-worthiness of the Tatas. The relevant point for consideration, however, is quite different, viz., the dollar component of the Tata Scheme that is not yet definitely known, and it will not be known until the global tenders are issued and a final decision is taken about the choice of plant and equipment. If the purchase is to be effected from different currency areas, as may still be the case, the World Bank and not the Export-Import Bank will be the appropriate institution to provide the accommodation. For, while the World Bank

loans are available in different currencies, the Export-Import Bank normally confines itself to dollar loans and dollar loans that are specifically required for, if not tied up with, export sales of American equipments. The Export-Import Bank supplements and sometimes supplants the dollar credits that may be necessary to effect export sales of US manufacturers. Export credits necessary to effect sales are sometimes shared between the Export-Import Bank and American suppliers of equipment. The question of finalisation of the deal therefore will not arise until the results of the global tenders are known and selection of equipment has been completed. When that is done, the Tata Mission may have to be back in New York to finalise the deal but it will be some months before it in a position to do so.

Going, Going, Gone

GOA is an integral part of India. Culturally and socially, Goans are no different from the people of India. Of the total population of 6,38,000 in the Portuguese enclave in 1951, all but 1438 persons were purely of Indian origin. They are hardly distinguishable in language, customs and manners from the people across the border. True a large proportion of them, but not the majority, are Catholics but there are many Catholics in India also and they are no less Indian because of their religion. The issue is not one of religion. Goans have not been taken in by the propaganda that integration with India will mean that they would be swallowed up by the neighbouring State where Morarjibhai will impose his morals on them. For Goans have been assured repeatedly by the Government of India that their religion, customs and language will be respected and protected. They do not doubt these assurances.

But who will bring about this integration, the Goans themselves, the people of India or the Government of India? Of course, all three. To pose the question in this form is to suggest deliberately a division into a water-tight compartment that is not only unreal and irrational but positively mischievous. The resolution passed by the Congress Working Committee last week which says that "while everyone in India is naturally and deeply interested in the freedom of Goa from foreign control, it is principally for the Goans themselves to carry on the struggle

through peaceful methods," is therefore to be interpreted only as a counsel for moderation. That the Working Committee had to pass such a resolution shows how strong is the feeling in India on this issue. It has not been possible for the Government of India to ignore this feeling altogether. Hence, as Pandit Nehru explained so lucidly in the Lok Sabha, Government was forced to relent.

The movement inside Goa has been helped and the hold of the Portuguese authorities steadily undermined, by the repercussions of the folly of the Portuguese rulers. Readers may be referred to the article "Goa's Changed Economy" which appeared in this paper in the issue of July 9, in which the changed economic situation was described in some detail. Entirely dependent on India for its essential imports, Goa is now trying to get these imports, after the stoppage of trade with India by re-export from Ceylon and Pakistan and such ports as Aden and Singapore. This is a costly process. Goans themselves, however, are determined that India's neighbours should not be parties to the perpetuation of colonialism on Asian soil and the National Congress (Goa) has planned to send delegations to Ceylon and Pakistan shortly to seek the co-operation of the Governments of these countries and make them withdraw their indirect support to continued Portuguese occupation of Goa. The contraband trade with India which had once been a major source of income, shrank drastically after the tightening up of the customs barrier, though Goans still complain that the check on the Indian side is not as effective as it could be.

Since Portugal refuses even to discuss the Goa situation, the Government of India has decided that the continued existence of the Portuguese Legation in Delhi no longer serves any useful purpose and has finally intimated that the Legation should be closed by the 8th of August. The railway link with Goa has also been stopped, because the Portuguese authorities did not respond to the request made by the Government of India either to remove interference to the track or give an assurance that there was no danger to traffic between India and Mormugao. Meanwhile, reports of Portuguese atrocities keep pouring in and attempts by the Government of India to make the people listen to its counsel of moderation become increasingly difficult.

Atomic Energy Now Open To All

THE International Conference on Peaceful Uses of Atomic Energy which is to be held in August under the auspices of the United Nations will be a unique gathering in many ways. It will be for the first time that atomic scientists from USA and USSR will discuss common problems and inter-change opinion and technical data on so vital a subject as the utilisation of atomic energy. The principal countries represented at this Conference will be besides USA and USSR, Britain, France, Norway, Sweden, Denmark, Czechoslovakia, Canada, Brazil, Israel and India. A large number of papers will be presented, and the maximum number will come of course from USA and USSR. India is also sending a big delegation to this Conference. Her contribution has been mainly in the field of chemical research on the utilisation and enrichment of low grade fissionable material as also in improvement on standard methods in these spheres, but not in the applied field.

The preliminary arrangements for the Conference were worked out at a preparatory meeting of representatives of US, Canada, UK, France, India, Russia and Brazil which was held in New York on January 17 early this year. The activities of the Conference will fall into three principal sections. The first section will deal with the general problems on Reactor Technology, which is of crucial importance for the development of nuclear power. The second section will cover the vast field of application of atomic energy in medicine, biology, agriculture and industry. The third will deal with the fundamental problems in atomic energy research. In short, this conference will embrace every aspect of application of atomic energy for peaceful purposes.

Exchange of Information

An outcome of the conference will be sharing of valuable information regarding the technological difficulties involved in utilizing power from a power reactor. Though fifty or more atomic reactors have been set up in different countries, until now no hopeful results have been obtained in extracting power from them. The most difficult technological problem to be overcome for proper utilization of power from a reactor is the effective rate of heat removal by the cooling system i.e.

the efficiency of the reactor. For power production to be economic, higher the temperature at which heat can be generated the better. But in case of nuclear power, the temperature one encounters is of the order of a million degrees: this is far above the melting point for any cooling system we can use in the heat-exchanger!

The Calder Hall atomic power station in Cumberland, England, now nearing completion, is probably the first successful attempt to utilize atomic energy on a large scale for the production of electrical power. At present most of the information regarding high-powered reactors is "classified" i.e., top secret; it is only in the case of low-power research reactors that publication of data is somewhat free. Although the majority of the scientists attending this conference will be interested in the various fields in which atomic energy is successfully utilized, there is little doubt that the main interest will be in the power reactor.

Wide Field of Application

Though the maximum use of nuclear energy will be as a source of energy, it is worthwhile mentioning the various fields in which atomic energy has been found to have tremendous potentialities:

- Biology: the influence of ionizing radiations on animal organism.
- The new field of Radiation Ecology.
- Application of radio-active isotopes in technology and industries.
- Use of radio-isotopes as tracers to the study of the mechanism of chemical reactions.
- Localization of tumors by radio-active isotopes.
- Utilization of radio-isotopes for therapy of hyper-thyroidism.
- Neutron capture therapy of cancer.
- Studies of the metabolism of different bacilli of communicable diseases.
- Utilization of radio-isotope in metallurgy; study of steel production process.

Nuclear Exhibition

A full-fledged Nuclear Exhibition covering almost the entire field will

be sponsored at the library wing of the Palais de Nations where the conference will be held. An operating research reactor will be demonstrated by the US. Over 60 US firms have indicated that they will have exhibits of equipment and services at the conference. The main idea of building this reactor by the US is to show what other countries can accomplish, if the fuel is supplied from the general international pool of atomic resources. The highly technical exhibits will not be limited only to small-scale models. About two-thirds of the Palais de Nations exhibition will be devoted to reactor technology: the rest will be divided up into instrumentations and isotope applications. In each case, it is expected, the actual operation will be demonstrated, and not just depicted.

Progress in Britain

The holding of the conference provides an occasion for a survey of atomic development in different countries. The Economist has done just that, in a supplement from which some of the important findings are given below.

Britain has made substantial progress in both directions of production of atomic fuels with an eye to future exports and the utilization of atomic energy for industrial and other purposes. Prospects of Britain emerging as a substantial exporter of atomic fuels, however, are remote, if United States seriously wants to enter the field, since American investment in atom piles has been enormous and if it comes to that, she can export at give-away prices. In the development of commercial atomic power, Britain is now entering the first stage of providing atomic power stations of comparative low thermal efficiency. These low power plants will be able to sell electricity at a price comparable with that of power from coal fired stations. There is, however, an arbitrary element in their costs, for the reactors from which these stations will draw their heat will also produce plutonium as a by-product and much will depend on the price that this by-product will fetch. Atomic power stations of high thermal efficiency which would be producing electricity at a cost that is expected to be truly competitive with the cost of power from coal-fired stations is still far away, though recent research has brought this second stage

several years closer to realisation. For the present, only low power stations being within the realm of possibility, the economic criterion is one of the comparative cost of getting additional marginal supplies of conventional fuels to meet the rising demand for energy and that of producing power in atomic plants. Because the marginal cost of coal is rising in Britain as well as other countries of Western Europe, cost considerations also favour atomic development.

That is why the power station at Calder Hall, now nearing completion, has been attracting so much attention. Its efficiency will be low, because of the unsolved problem of heat utilisation. The station consists of two reactors fuelled by chain-reaction process. The reactors will be cooled by gases which will raise steam in boilers of conventional designs and the steam will drive turbines of 60,000 kw. capacity. Commercial versions of this type of atomic power stations will be of 100,000 to 200,000 kw. capacity; eventually it will be possible to build plants of 500,000 kw. capacity, equivalent to that of modern coal-fired stations.

In the initial stage capital cost of atom generated electrically is likely to approach £200 per kw but the operating cost has been estimated at 0.6d. a unit, the same as in the case of coal-fired stations, after crediting the station with the value of plutonium produced in it as a by-product. For the present, the Central Electric Authority will get from the Atomic Energy Authority in Britain a fantastic price for this by-product in the power stations that the CEA intends to build. The cost of generation will fall as efficiency improves. Disposal of plutonium, therefore, and the price it is likely to fetch, are of crucial importance to the economics of atomic development in UK.

The growing difficulty and the increasing cost of getting more coal have influenced the Government to sanction a 10 year investment programme for atomic power in Britain which was announced early this year. A sum of £300 million is to be spent on 12 atomic power stations which will provide between 1½ and 2 million kw of capacity; installed electricity capacity, to put this figure in perspective, is 21 million kw. Construction of the first two stations is to start in 1957, and of the second pair in 1958-59. These four stations will be of the early

"thermal" type with a combined capacity of 400,000 to 800,000 kw. Later reactors will be built to later designs, although none of them is likely to be a "breeder." When they are built, the atomic stations should be producing electricity equivalent to the output of power stations using 5 to 6 million tons of coal. In the following ten years it is hoped to instal between 10 million and 15 million kw of atomic power capacity out of a probable total installed capacity of 55 to 60 million kw, bringing atomic power output to an annual equivalent of 40 million tons of coal.

France Foremost in West Europe

Among the countries of Western Europe, France has gone further in atomic research than any other. A research reactor was built at Chatillon in 1948, and a second pile followed at Saclay. During the same period France set up a chemical factory for the production of uranium metal and for the specially pure graphite needed for the construction of reactors. France, incidentally, has extended the closest co-operation to India in the matter of atomic studies. A Five Year Plan was launched in 1952, but this was found too modest and has been replaced by a new plan that will run to the end of 1957. Large sums had been set aside to finance this plan; a third is to be used for the extraction and preparation of uranium and thorium metals and heavy water; one-fifth for a prototype for submarine propulsion; and another third for a new atomic centre at Marcoule, near Avignon. The construction of Marcoule marks a turning point. It will be France's first full-sized atom plant, and will have two reactors producing between them about 100 kilos of plutonium, and generating about 55,000 kw of electricity. The first reactor should be completed by mid-1956. Its capacity will be only 5,000 kw, but when the second pile is finished in 1957, two 25,000 kw generators will be installed.

The plutonium from Marcoule is of greater immediate importance to France than the marginal amounts of electricity. France is a heavy importer of coal, and is therefore anxious to develop atomic energy as a supplementary source of fuel, especially in districts that are heavily populated and under industrialised. Thus without regard to any eventual decision to produce atomic weapons, France must have a concentrated

fuel like plutonium to develop improved types of reactors.

Economic Incentives for Soviet Atomic Development

Apart from any strategic considerations, Soviet Russia has also an economic incentive to develop atomic power. Distances are vast and costs high; this has prevented industrial development in areas without local fuel resources. The demands of South Eastern Europe and of China must also be an important consideration. Figures of investment in atomic development, however, are not obtainable though lately the secrecy so far observed in regard to the technical problems of development is being slowly lifted and it will not be surprising if Soviet scientists present a very large number of papers at the Geneva Conference. For the first time at a recent session of the Soviet Academy of Sciences several papers were read on reactor design, as well as on the use of radium isotopes and the progress of pure research.

The Soviet authorities announced last year that the first atomic power station with a net capacity of 5,000 kW had been commissioned. This is of course on a laboratory scale, but stations with a capacity of 50,000 to 100,000 kW are now reported to be under construction. Earlier this year, Soviet Russia signed technical aid agreements with the East European countries and with China by which it is to supply these countries with experimental atomic piles and research equipments, to provide free technical information and to supply the necessary fissile material for reactors and radio-active isotopes. At Geneva last week, Marshall Bulganin promised to contribute atomic fuel to the international pool proposed by President Eisenhower. It was also officially announced in China that an atomic power station would be built there with Soviet help.

West Bengal's Second Plan

Dr B C Roy, West Bengal's Chief Minister, has produced his Plan-frame for his State. It is, Dr B C Roy emphasises, different from the Mahalanobis Plan-frame. He has not said so, but he implies that the only thing common to the two Plan-frames is the magnitude involved. Figures show that his Plan-frame is as ambitious as the Mahalanobis Plan-frame. But this is an aspect which Dr B C Roy is not interested in emphasising. He is more interested in stressing the differences between West Bengal's second Five-Year Plan and the Mahalanobis Plan-frame.

At a Press Conference, Dr B C Roy discussed his Plan-frame. He was provocative in his marginal comments on his Plan-frame. He is not in disagreement with the fundamental assumption of the Mahalanobis Plan-frame that employment should be the main objective of the Second Five-Year Plan. His main argument is that the Mahalanobis Plan-frame, with its exaggerated emphasis on small-scale village industries, cannot attain the objective, but his Plan-frame can. This is the major issue in dispute between Dr B C Roy and Prof. Mahalanobis.

Medium-sized Industries

Dr B C Roy argues that small-scale and household industries may give additional employment to the under-employed, but cannot create new jobs. This is an over-simplification of the Mahalanobis Plan-frame. But there is something in this argument. Dr B C Roy is a realist. So, to ensure employment, he envisages development of new medium-sized industries. West Bengal's expenditure in the public sector in the next five years is estimated to provide employment to 450,000 persons. Dr B C Roy's Plan-frame does not ignore small-scale industries. But it lays emphasis on the expansion and creation of new medium-sized industries to provide employment.

Employment is the main, but not the only, consideration for stressing the importance of medium-sized industries. Dr B C Roy is in favour of encouraging these industries to maintain as well as to improve the level of consumption. This raises another issue in dispute be-

tween Dr B C Roy and Prof Mahalanobis. Both the Mahalanobis Plan-frame and the tentative frame-work for the second Plan rely on small-scale industries to provide supplies of consumer goods. Dr B C Roy's criticism that the Mahalanobis Plan-frame ignores consumption is not correct. But he is on firmer ground in his criticism that small-scale industries are not capable of supplying the various kinds of consumer goods which the people, under conditions of full employment, as envisaged in the Plan-frame, are likely to demand.

There is another point on which Dr Roy differs from Prof Mahalanobis. In common with the Mathai Commission, Prof Mahalanobis assumes that resources can be mobilised further through taxation. Both are agreed that there is scope for further taxation of many essential goods and commodities. Even those who favour a substantial increase in indirect taxation of luxury goods will endorse Dr B C Roy's objections to any increase in taxation of essential commodities and consumer goods.

This is a dilemma which the Planning Commission will have to solve somehow. One need not have to endorse Dr B C Roy's uncharitable comment on the "statistical-mechanical" approach to the problem of resources to accept the West Bengal Chief Minister's stand against any undue reliance on indirect taxation of essential goods. It was Shri Chintaman Deshmukh who popularised the idea of indirect taxation in an under-developed economy like India. But it is a concept which has certain obvious limitations. If, for instance, it is a question of reimposing the salt tax or abolishing prohibition, one would unhesitatingly vote for the latter, with substantial increases in both import and excise duties on spirits, as a better alternative to taxing the poor man's salt in a tropical country like India.

Voluntary Contribution

One of the criticisms of Dr B C Roy against the Mahalanobis Plan-frame is that it does not indicate the sources from which money will flow to finance the targets. There are gaps in the resources budget in Dr B C Roy's Plan-frame, though it is not altogether silent on the

sources of finance. An interesting item on the receipts side is that of voluntary contribution in cash or kind. Such contributions are estimated at Rs 30 crores. Dr B C Roy explains that the experience during the First Five-Year Plan justifies his estimate of voluntary contributions for the second Plan. He admits that voluntary contribution means and involves self-inflicted taxation.

Some of the new features of the second Plan for this State explain partly the Chief Minister's estimated target for voluntary contribution. Housing and township, community development projects and national extension service will receive priorities under the second Plan. These projects will be executed mostly in rural areas. For such local works and projects, Dr B C Roy expects that voluntary contribution in cash or kind will be forthcoming. Informed opinion is inclined to the view that he may not be far wrong in his estimate of voluntary contributions for the second Plan.

Dr B C Roy is critical of the Mahalanobis Plan-frame. But West Bengal's Chief Minister emphasised more than once that his Plan-frame has a pronounced rural bias. This is what he calls planning from below. In his detailed explanation of his estimate for voluntary contributions, he adds that, under the State's second Plan, the amount to be spent on works in rural areas would be as much as Rs 124 crores. This State's second Plan is estimated to cost Rs 265 crores. Aid from the Centre is estimated at Rs 115 crores. Internal resources of the State are estimated at Rs. 148 crores. Excluding the budget deficits during the second Plan, the net internal resources come up to Rs 90 crores. Thus, the Plan-frame assumes a gap of Rs. 60 crores.

In order to implement the second Plan, West Bengal will need 780,000 tons of cement, 44,000 tons of steel, 353,000 tons of coal, Rs 2.48 crores' worth of tools and plant and 128,000 wagons. Dr B C Roy's Plan-frame, estimated to cost Rs 265 crores, does not include expenditure on relief and rehabilitation estimated at Rs 113 crores. It also excludes

Asian Trade Union College

I HAVE read with very great interest the review of the Report of the College in your issue of 2nd July. While I am grateful to you for the interest you have taken in the Report, I feel that one or two paragraphs of the review are likely to create wrong impressions in the minds of your readers about the work of the ICFTU in Asia.

The review starts with the words "the increasing interest of the ICFTU in Asian affairs is in conformity with the growing influence of international communism in Asia". The reviewer goes further and suggests that the main reason for the interest of the ICFTU and Western Trade Unions in Asia is to check trade unions in this region from falling a prey to communism. It is, of course, true that ICFTU rejects all forms of totalitarianism—whether of the right or of the left. But its aims are really positive viz. to help the workers to develop and strengthen their own organisations and to secure decent standards of living and better conditions of work. The ICFTU as a free international trade union movement has always emphasised the imperative need for co-ordinated international action designed to assist economically underdeveloped countries in their economic and social development. And, therefore, while presenting the point of view of the free trade union movement in its statements before the specialised agencies of the UN e.g. ECOSOC, UNESCO, ILO, ECAFE etc., it has repeatedly stressed the above stand-point. The ICFTU has also been urging the creation of a Special United Nations Fund for Economic Development.

Mere economic development, however, is not enough. The economic development of a totalitarian variety may not raise with it the living standards of the people to the desirable extent. To ensure that the fruits of economic development would be shared by the mass of the people and reflected in their living standards, it is essential that strong and democratic organisations like trade unions should exist. You would, therefore, appreciate that when the ICFTU starts a programme of trade union education to help develop and strengthen the democratic trade unions in Asia it is not thinking of any "short cuts". It is trying to

create conditions under which alone a healthy economic development is possible.

The ICFTU Mission to Asia which visited fourteen countries in this region in 1950 was pressed by the trade union movement of nearly every Asian country it visited, to make provision of adequate facilities for trade union education and the College was founded in response to the need expressed by these movements. As your reviewer himself says the aim of the College is "to equip the workers to carry on the organisational work in their own countries with a greater consciousness and efficiency and also to train cadres of workers to organise local educational programmes in their respective countries". Hardly anyone would say that this is a "short cut". In fact the criticism is that this would take a very long time. However, that need not be discussed here.

Your reviewer has also mentioned towards the end of his note that no statement of income and expenditure has been given in the Report. However, the source of funds has been clearly stated on page 4 of the Re-

port. The statements of income and expenditure of the College are incorporated in the accounts of the ICFTU which are published and supplied to its affiliates at the time of its world congress. The College is being financed out of the contributions of the trade unions of the world to the special fund raised by the ICFTU for regional activities. To this fund every member of the affiliated organisations of the ICFTU has contributed an equivalent of Annas -[2]-. The Asian Trade Union College is thus a truly democratic project of the workers, for the workers and by the workers. At the same time it is symbolic of the international solidarity of the free trade union movement, since through it the workers of the West register their solidarity in a common struggle with the workers of the East.

I would be grateful if you could publish this letter in your esteemed weekly.

Commercialization of African Tribals

East Africa Royal Commission 1953-55 Report: Her Majesty's Stationery Office, London. Pages 482—Price 17/6.

Reviewed by G Raghava Rao

THE Report of the Royal Commission on East Africa is of great interest not only to the people of East Africa but also to others in other underdeveloped countries and tribal regions. It is of special interest to India because of the large number of Indians who have settled in East Africa. The Commission criticises reservation of land on racial basis, recommends planning of economic development in pastoral regions, advocates individual as against communal ownership and stresses the necessity of non-Africans in developing Africa. With an ex-Governor from India, Sir Hugh Dow as its Chairman, the Commission had on it a number of economists. Prof. S. H. Frankel, Prof. D. T. Jack, Mr. A. Gaitskell, Mr. R. S. Hudson, Chief Kidaha Makwaia and Mr. F. Sykes were the members of the Commission.

The Commission was asked to "examine the measures necessary to be taken to achieve an improved standard of living, including the introduction of capital to enable peasant farming to develop and expand production, and frame recommendations thereon with particular reference to:

"(1) the economic development of the land already in occupation by the introduction of better farming methods;

"(2) the adaptation of modifications in traditional tribal systems of tenure necessary for the full development of the land;

"(3) the opening for cultivation and settlement of land at present not fully used;

"(4) the development and siting of industrial activities;

"(5) Conditions of employment in industry, commerce, mining and plantation agriculture with special reference to social conditions and the growth of large urban populations; and

"(6) the social problems which arise from the growth of permanent urban and industrial populations".

Before examining the report, it is necessary to explain the background. East Africa has an area of 646,476 sq. miles and is made up of Kenya Colony and Protectorate, Uganda Protectorate and Tanganyika Trust Territory. According to the latest census, its population was 117.6 million Africans, 222,215 Asians and 43,756 Europeans. The net geographical product of East Africa was £313.8 millions in 1951 (Kenya £104.6 millions, Uganda £107.2 millions and Tanganyika £102 millions). The per capita income of the Africans is much less than is suggested by these figures. Their capacity to save and invest in productive enterprises is practically nil as Africans have only a sort of subsistence economy. Some are in a pastoral stage, while some are in an agricultural stage. For their religious and social functions, a large number of cattle is essential. Till recently, Africans counted their wealth in terms of cattle.

Most of them own land not as individuals but as tribes. Every member of the tribe is assured a piece of land and therefore no one is a landless agricultural labourer. There was also no such thing as agricultural indebtedness. But African agriculture is primitive. Certain areas are reserved for the Africans and land cannot be cultivated extensively in such reserves for many years. Africans have begun to feel keenly that some more land should be made available to them. Europeans also are engaged in agriculture. Their technique of agricultural production is up to date. Their farming is commercialised as far as possible. Areas reserved for them are too extensive to cultivate. The conditions of the Asians, most of whom are of Indian origin, are quite different. Many of them are engaged in trade and professions, but few carry on agriculture. Those who do, have large farms and cultivate them efficiently. It can be said that most of the area under sugar cane is owned by Indians. There are also some

Indians who want to purchase agricultural land, but suitable land is not available to them. The most pressing problem of East Africa is effective use and distribution of land. The situation is aggravated by racial and political differences.

The report begins with an exposition of basic factors like natural resources, population, poverty and security. The popular notion that the African population has been increasing at 2% per annum, the Commission finds, cannot be established from statistical data. Land hunger of the Africans has, therefore, to be attributed chiefly to an awakening among them for improving their economic condition and to their old ideas of ownership of extensive lands. The Commission, however, did not go deep into the natural growth of the Indian population. Accepting Mr. C. J. Martin's estimates of the rate of natural increase, it presumes that the Indian population would double itself in 28 years. The presumption, however, is questionable since a large number of births among Indians is not registered even within one year of their occurrence and no sample survey of Indian fertility has been conducted. When the data are so inadequate, the Commission should have refrained from making any such statement. It is emphatic, however, in its belief that "a growing population will be an advantage, and may well be a prerequisite for the full use of its resources on modern lines" (p. 40) and yet, the Commission recommends that advise on birth control based on modern medical knowledge should be made available to Africans who desire it! To those who have some knowledge of the difficulties in popularising contraception even among educated persons in India will find it amusing that contraceptives should be recommended for people who are still in a tribal stage and in a subsistence economy.

The report then goes on to the conditions for economic and social development—marketing and distributive system, capital, investment

and financial policy, credit for Africans, manufacturing industries, mining, transport, water development, immigration, African Labour, health, education, statistics, and social and economic co-operation. The keynote is that "even now the African populations possess neither the resources nor the knowledge which could replace the capital and the knowledge which have been responsible for the economic development of recent years, and it is still true that the maintenance of that development and indeed the promotion of new development will depend upon the continued availability of external capital and enterprises". (p. 78) Europeans and Indians played a significant role in the economic development of East Africa. In spite of their political fears, suspicions and differences with non-Africans, Africans would do well to bear in mind that without foreign capital and technical advice, whether Asian, European, or American, they cannot progress rapidly. The real income of the Africans is barely sufficient for physical subsistence and a drive for compulsory savings will not yield any significant part of the capital required to develop the country. The Commission feels that the present policy of Government does not encourage immigration and, therefore, recommends a review of immigration ordinances and regulations. It suggests African enterprises engaging non-Africans either on a temporary contract or on a more permanent basis. Chastened by the experience of the East African Groundnut Scheme, the economists hasten back to Adam Smith. "We think it important that the resources which these Governments can command, should be concentrated on the provision of basic services and not dissipated in the promotion of speculative enterprises which would not otherwise be undertaken". (p. 110). The Commission is also against creating monopolies. The report, however, does not estimate the amount of capital required for industrialising the territories and to bring them to a certain stage of development.

A part of the report is devoted to the conditions for urban development—development of towns, housing, administration and finance.

Indians are not allotted adequate space in urban areas to construct houses with spacious enclosures. The Commission recommends that

all urban plots should be disposed of by public auction. If this recommendation is accepted, some Indians will be able to build houses with a spacious compound. Africans build some residential structures on the outskirts of towns on customary tenure. They have no security, and are evicted when the township is extended. Hence they are debarred from raising good buildings. They have little say in the administration of urban areas. The Commission recommends that Africans should be given clear and negotiable titles to their residential lands. In respect of the Africans who cannot afford to raise buildings according to the prescribed high standards and in respect of those who have no experience of urban life, the Commission recommends that "the urban areas should be divided into a number of zones and that building standards in the lowest zones should be virtually unregulated." (p. 249)

The most important part of the report, however, is the one which deals with the conditions for the development of land. Rainfall which is essential for agriculture has been studied in great detail. All areas with more than 30 inches rainfall have been separated from others with lower rainfall. After assessing the extent of land which can be irrigated, the interests of the pastoral communities are examined. Overstocking in places adjoining water holes leads to a loss of grazing cover and to springs drying up. The result is soil erosion. The Masai tribesmen cut and destroy vegetation. The situation is aggravated by excessive increase in livestock. Destocking, despite the hardships it may cause, is the obvious solution. Cattle ranching on commercial lines is possible in areas of adequate water supply. The advantages of individual grazing rights over communal grazing rights are discussed. A listed quota of cattle for each member of a tribe, the Commission thinks, will be preferable to a quota for the entire tribe. In areas where bush is cleared and tsetsefly eradicated, individual ranches may be profitable and it is suggested that African cattle ranching can be developed without much capital "out of income from animal reproduction and human work," if it is "ploughed back into the ranch gradually to increase the fencing and water and

improve the quality of stock" (p. 300). This was how European ranches were developed, without much capital. Surplus stock can be disposed of by encouraging consumption of meat and increasing marketing facilities. Pastoral tribes should be made to work upon an increase of their livestock as a bumper cash crop. In this connection the veterinary department can play a significant role by improving the health and breed of livestock.

The next topic of interest is that of cultivating communities. These communities, it is emphasised, should concentrate on "land use" instead of "land owning". For raising commercial crops with a long term programme, African peasants should have stability of ownership of land, which is absent under tribal tenure. In suitable areas adjoining those where Europeans grow tea, Africans should be encouraged to grow tea and to sell the leaf to European factories to start with and eventually to establish their own tea processing factories on co-operative basis.

Individualization is the panacea suggested by the Royal Commission for all the ills arising from the defects in the present agricultural system. The community has to be persuaded, says the report, that "the continuation of traditions designed to preserve a clan or tribal security are now leading to a dangerous dead-end and that the road to a higher standard of living for all lies in giving security to the individual stable unit". (p.323) Individualism develops a sense of responsibility. Indebtedness of an unproductive type, of course, arises out of individualism. Individualism is not free from defects. The tribe as a unit also can incur unproductive debts in cash or kind. The efficiency of the tribal organisation depends upon the intelligence and behaviour of the tribal chief and his descendants. But no bank lends money to tribes and there has been no such thing as indebtedness. The Commission suggests certain safeguards in respect of mortgaging land and recovery of debts from African peasants, but it has not explored the possibilities of developing a co-operative organisation out of the tribal organisation. The end of the tribal system is spelt thus: "There is, however, the great human difficulty that nobody may care for the common property, and a com-

munal system which permits the individual to run an unlimited number of stock on the common ground, and treats individual cultivation areas as common grazing ground when the crops have been removed, runs counter to these technical requirements and is agriculturally unproductive" (p. 324). Limitations of mechanization in crowded areas with small plots of individuals are discussed. Among tribes living in wider open spaces, mechanization is possible if individuals are persuaded to adjust the layouts of their farms.

The final part of the report deals with race relations. It is recommended that Africans should be admitted into non-African societies and that they should be taken up on the management of non-African industrial and commercial establishments. Multi-racial commercial concerns are advocated and Europeans are asked to take African tenants and pupil farmers. No thought, however, is given to the development of small scale and cottage industries, which can keep the African peasant busy in slack seasons. In no country peasants raising cereal crops are busy throughout the year and they need some additional employment. The most serious omission in the report, however, is that of the Mau Mau movement. True, it was outside the terms of reference of the Commission, but no progress in East Africa is conceivable as long as the Mau Mau movement continues.

To an Indian reader, the report is disappointing in that it gives no indication of the lines along which Indians in East Africa can better their economic conditions and contribute towards the development of the country of their adoption. The report, however, is silent about the Europeans also, in so far as these problems are concerned. The reason is that the Commission does not believe in a racial treatment of the problem of development. The Indians in East Africa do not want concessions, facilities and privileges which are not available to the Africans and the Europeans. What the Indians want is equal opportunities which they do not have to-day. The Commission did not assure the Indians unambiguously on this point, nor did it say what incentives there should be for the participation of Indians in the development of East Africa.

Hind Cycles Limited

Speech of the Chairman Shri R D Birla

THE following is the text of the speech delivered by Shri R D Birla, Chairman, at the Fifteenth Annual General Meeting of the company held on Monday, July 25, 1955:—Gentlemen,

The Directors' Report and the Statement of Accounts for the year ended December, 1954, has been with you.

The results of the last year's working are satisfactory. Production increased to 1,30,000 bicycles. As mentioned in the report, your Directors have decided to increase the production capacity of the factory. Machinery has been ordered and is in the course of shipment. Extension of the building necessary for increased production is nearly completed. The additional plant includes a Semi-Automatic Conveyor Plating Equipment and a very modern Polishing Plant. Both these plants are due to arrive here by October, 1955, and your Directors hope to complete the erection of all the new machinery and start production on increased basis early next year. When the new plants thus come into operation, the production capacity of the Factory will be raised to little more than two lakhs bicycles per year. Looking to the shipment position of various plants and machinery ordered, your Directors feel confident of achieving production of two lakhs bicycles by the end of the year 1956.

Production of Chains

Production of chains is well in hand, and we are now operating the plant fully. Our chains have been marketed. Your Directors will consider the question of expanding production of chains in future in light of the circumstances, such as, expansion of the consuming market, its reaction and the shape of the Government policy with regard to important questions, like imports, etc.

Progress in the Bicycle Industry

Our country is on the eve of entering the second five-year plan. Progress in the Cycle Industry during the first five-year plan is striking. As against the production of a little more than a lakh of bicycles in 1949-50, production in 1954 was 3,72,000 bicycles and is expected to

be around five lakhs in 1955. This increase in production was mainly due to increased production by your Factory by about 40% and establishment of factories in India by well-known British firms, like Hercules and Raleigh in our country. The other notable feature of the progress in the Bicycle Industry is that India now manufactures all the parts and components in the country, including chains, freewheels, rims, hubs, etc. and even steel tubes to a certain extent. Thus, except for some special raw material, India is self-sufficient so far as the type and number of components are concerned.

Plan Targets for Bicycles

In the Second Five-Year Plan, the target of production in 1961 for bicycles is understood to be in the neighbourhood of twelve lakhs bicycles. The consumption of bicycles till 1955 has been estimated by the Tariff Commission as five lakhs, and compared to this figure, the target for the next Five-Year period is increased by 2½ times. I feel that if the road construction programme of the Government of India is implemented, the programme for bicycle production and consumption may be fulfilled.

Labour Relations and Wage Level

Your Directors are glad to report that so far the relations of labour and management are happy. System of Works Committee composed of representatives of workers freely elected has worked successfully and most of the questions are settled amicably. Average earning of daily paid labour in your Factory is one of the highest in the country, and the Management is proud of it; but this high wage level combined with the fact that we have to manufacture almost all the parts under one roof, unlike any other Factory either in the West or in India, result in a comparatively high cost of production, and I hope that the labour would realise that this state of affairs can only continue till the time we can stand in competition with other Manufacturers, and that labour will also appreciate that our method of production on self-sufficiency puts us to a disadvantage compared to other units who have varying quantity of imported parts in their bicycle.

Pak Afghan Differences

S R Tikekar

IN spite of serious and sincere efforts by other Islamic powers, the Pak-Afghan differences have not yet been amicably settled. Without waiting for a final decision, the Pakistan Government has annexed the Tribal Territory and thus added more fuel to the already burning fire of mutual discontent.

Those familiar with the problems of the North-Western Frontier of India of old know full well the significance of the Tribal Territory and they alone can appreciate the risk involved in thus annexing this territory to Pakistan. For decades past, the hilly tract between the Durand Line and the Indian frontier on the Afghan side, was a sort of No Man's Land. The Pathan tribesmen who inhabited it were independent in more senses than one and neither the Afghan nor the Indian Government had any legal right over them. When by a stroke of pen, the Pakistan Governor-General annexes this territory, one can only admire his boldness and wish for the best.

Pakistan as Successor to British Government.

When Pakistan was ushered into existence and the British power withdrew from India in 1947, the relations of the newly-born state with Afghanistan had not been clearly defined. A change in government naturally allows room for redrawing the mutual boundaries or for affirming old relations. India's relations with Tibet, Nepal, Bhutan and Burma are instances in point. In every case, the matter had to be considered afresh and without harping on the old order, a realistic view was taken of the conditions prevailing. In the case of Pakistan and Afghanistan, nothing of the sort was done. As successor to the British Government in India, Pakistan insists that her relations with Afghanistan should continue to be what they had been under the old regime. Even for maintaining the status quo, mutual agreement is necessary. No relationship can be imposed against the wish of either party. What Pakistan wants to assert is, that she is the successor to all the rights and privileges enjoyed by the previous British Indian Government.

As a matter of fact, the British

had hardly any rights which could be passed on to the legal and rightful successor. Fresh negotiations had been made with every new ruler who came to the throne of Kabul and the mutual relations were affirmed, always in the personal capacity of the Amir on the one hand and the British Government on the other. What rights could the British then have when so much water has flowed down the Kabul river all these years?

Moreover, the Afghan War of Independence (= the third Anglo-Afghan War of 1919) freed Afghanistan from the British control. The resulting treaty could not satisfy King Amanullah, probably because the latter was not well versed in diplomatic parlance. Amanullah wrote to the British Plenipotentiary, who was negotiating, seeking clarification. Sir Hamilton Grant, being the perfect gentleman that he was, gave an assurance that the treaty left "Afghanistan officially free and independent in its internal and external affairs," adding that the third Afghan War had cancelled all previous treaties.

On the Afghan Side

This is not all. There were abdications and regicides on the Afghan side and a complete change of administration on the Indian-Pakistan side. Amanullah could not remain on the throne for long to enjoy the freedom he had won for his country and his people. He had to abdicate and the son of a water-carrier soon succeeded him. The wheel of the Afghan fortune was moving so swiftly that Bachha too had to pay the penalty with his life and Nadir Shah became the founder of a new ruling family. His son is now occupying the Afghan throne in Kabul. With so many revolutions in Afghanistan and a unique peaceful revolution in India, what remains of the transferable rights and privileges enjoyed by the British once upon a time?

Much is said of the Durand Line as an international frontier. It was agreed to by Amir Abdur Rahman not willingly but under duress, in 1893. Even to this day, it is undefined in places. For reaffirming it, mutual willingness is necessary. If after 60 years, the Afghan Government expresses a desire to reconsider it, it is fully within its

right. That it was accepted for 60 long years is in itself a sound reason why it should be reconsidered. The rapid progress of Afghanistan from a protectorate of the British to an independent kingdom and the full growth of its nationalism make it all the more necessary that the frontier should be redrawn.

No Man's Land

Afghan demand for reconsideration of the Pak-Afghan relations is expressed in a nutshell, by only one word—Pakhtoonistan. It means a Pushtu (= Pukhtu) speaking State. The tribes of the No Man's Land will thus be given an opportunity of joining a government after their own liking. There is, therefore, more than meets the eye in this tabloid demand for establishing a Pushtu speaking State. Like an iceberg, the major portion of that demand is unseen. Between Afghan boundary on the Pakistan side (i.e. the Durand Line) and the Pak frontier on Afghan side, there is a large Tribal Territory, which has been used as a buffer between the two neighbouring countries. The tribes are all independent and yet for purposes of administration, they are to be considered as within the sphere of influence of either of the two neighbours. As long as Afghanistan was not free, it was the British who were administering that No Man's Land as much or as little as they could. Now that was a mutual understanding imposed on an unwilling Amir and the diary of Sir M. Durand who negotiated with the Afghan ruler on behalf of the British Government makes the Amir's unwillingness, bordering on resistance, quite clear.

The problem of handling the tribes of this No Man's Land has a long and painful history. British attitude wavered between two extremes. One was the Close Border policy of wanting to confine attention to India's natural frontier i.e., the Indus and the other, Forward Policy, of ultimately reaching the outskirts of Kabul and Kandahar. Those were the days of Russophobia and many a blunder had been committed by British diplomats under that fear. A buffer between Russia and India was Afghanistan and between Afghanistan and India, the Tribal Territory was a similar though smaller buffer.

Various devices were used by the British administrators to keep the Tribes constantly disunited and that under the British thumb. Now the Afghans think that the tribes should naturally be handled by them and by no other power. The demand for Pakhtoonistan includes the right to deal with the tribes. Afghanistan therefore wants first an opportunity to redraw her boundaries and secondly to unite the tribes and

bring them under Afghan adminis-side of Afghanistan. There is no justification for a status quo as the

Boundaries between nations, likedifferences have persisted for quite all other boundaries, must be mu-a long time. In the interests of tually agreed upon. The Durandpeace, fair play and justice, it is Line was accepted by Afghanistannecessary that these points be re-under duress at a time when theconsidered and mutually settled. All Afghan nation had not been born.other attempts, howsoever sincere Tribal relations, too, were exploitedand well intentioned, will fail to by the British taking advantage oftouch the fringe of the main trouble. the weakness of the Arghan Amir. Afghanistan alone knows where the Time therefore seems to be on the Pakistan shoe is pinching her.

4% STATE GOVERNMENTS LOANS 1967

(1) Government of Andhra	Rs. 250 lakhs Issue price Rs. 99- 8-0 per cent
(2) Government of Bihar	Rs. 150 lakhs Issue price Rs. 99- 0-0 per cent
(3) Government of Bombay	Rs. 600 lakhs Issue price Rs. 100- 0-0 per cent
(4) Government of Hyderabad	Rs. 200 lakhs Issue price Rs. 99- 0-0 per cent
(5) Government of Madhya Pradesh	Rs. 100 lakhs Issue price Rs. 99- 8-0 per cent
(6) Government of Madras	Rs. 700 lakhs Issue price Rs. 99-12-0 per cent
(7) Government of Mysore	Rs. 275 lakhs Issue price Rs. 99- 0-0 per cent
(8) Government of Saurashtra	Rs. 200 lakhs Issue price Rs. 99- 0-0 per cent
(9) Government of Uttar Pradesh	Rs. 600 lakhs Issue price Rs. 99- 8-0 per cent
(10) Government of West Bengal	Rs. 500 lakhs Issue price Rs. 100- 0-0 per cent

THE LOANS WILL OPEN FOR SUBSCRIPTION ON 16TH AUGUST 1955 AND CLOSE ON 31ST AUGUST 1955 OR EARLIER WITHOUT NOTICE AS SOON AS SUBSCRIPTIONS APPROXIMATE TO THE AMOUNT OF EACH ISSUE.

Each loan will bear interest from 1st September, 1955. Interest from the date of application to the 31st August, 1955, inclusive, will be paid to the applicants at the time of issue of new securities at the rate of 4 per cent. per annum on the nominal value of the loan applied for and accepted.

Subscriptions will be in the form of cash/cheque in respect of all the loans.

3% Bombay Government Loan, 1955, 3% Madras Government Loan, 1955 and 3% Madhya Pradesh Loan, 1955 will be accepted at par and 5% Mysore Government Loan, 1955 at Rs. 100-8-0% for conversion into the new loan of the Government concerned; interest on the securities of the respective loan tendered for conversion will be paid upto and including the 15th August, 1955.

Applications for all the loans will be received at the offices of the Reserve Bank of India, Bombay, Calcutta, Delhi, Madras and Bangalore.

Applications for any particular loan other than Hyderabad and Mysore Government loans will also be received at branches of the State Bank of India and at Government Treasuries and Sub-treasuries within the State issuing the loan as indicated in the relevant loan notifications. Applications for West Bengal Government loan will not be received at Government Treasuries and Sub-treasuries.

In the case of Hyderabad Government loan applications will be received at branches of the Hyderabad State Bank and at Government Treasuries and Sub-treasuries in the Hyderabad State. For Mysore Government loan applications will be received at branches of the Bank of Mysore Ltd., and at Government Treasuries and Sub-treasuries in the Mysore State.

N.B.—Copies of Notifications and Application Forms may be obtained at any Receiving Office.

Extension—Out-Of-School Education

Evelyn Wood

THE term Extension is a convenient one. Though it has only been in general use three years in India, it has already acquired wider connotations here, which make it a more useful term, and a more powerful instrument of rural development.

Oddly enough, the one form of Adult Education which in India has so far refused to be blanketed under the term "Extension" is the primal ancestor of Extension as it is known to Western countries. We call this "Social Education" in India. What is to-day known as "Extension" began in the West when politics and social principles had to be taught to the new possessors of power, mainly peasants, after the French Revolution.

Of course there isn't anything new about educating adults—or children, for that matter—out-of-school. Family education, which gives German that useful word *wohlerzogen* meaning "well taught in social practices within the family", is the primitive ancestor of all education, in all countries. India has a very great tradition of family education, and not only in this German sense. Shri C. Rajagopalachari tried, with some ill-advised precipitance, to revive technological education in rural families of the South. He was probably right in estimating the effectiveness of technical training within the families of farmers, weavers, potters and the like. He was certainly right in valuing the family's training as superior to anything that 'basic' education can yet provide. But he wanted to go too far and too fast for the general atmosphere of his State.

Adult Education

Now Extension, in the breadth with which it is understood in India, must always aim to use and improve just that family education of which Rajaji was thinking. In fact, Extension had already shown remarkable results in this direction, long before the last war, at Martandam in Kerala.

Adult Education, as the term is used, for example, in Mysore, is definitely not Extension. That particular Vidyapith system takes an adolescent from his village, and returns him, after some months, much as if he were a speck of yeast to leaven the whole life of his village.

This leavening process has its limits. If one pursues the analogy in the world of enzyme action, it will be realized that yeast itself gets smothered unless there is enough of it in the lump of dough. Further, the capacity of the yeast to regenerate itself is not indefinite. Every baker of bread knows that he has to renew his yeast with fresh strains from time to time. Herein lies the probable superiority and the unquestionable extra cost of the Extension system.

Fundamental Education, the UNESCO term for education which may be either after-school, like our example of the Mysore Vidyapith, or out-of-school, like Extension, is too new to India to have established any particular value here yet.

Literacy not Essential

Adult Literacy figures chiefly within Social Education programmes in India; but it is sometimes found where there is only an Extension programme for teaching adults, and no Social Education. The whole subject of Adult Literacy teaching remains controversial; but one channel of certainty flows from considering its practice by any method. In order to pursue a highly active and effective extension programme of teaching and research, it is not necessary to have literate adults in the villages.

Extension is half-baked without research; unless the learners in the villages are able to communicate their problems right the way back to the scientific institutions and the administrators who are equipped to find solutions, Extension must lack essential momentum. General Adult Literacy is, however, not at all necessary either to the outgoing stream of Extension teaching, or to the incoming stream of villagers' desires, needs and unsolved problems.

Cost Higher

The cost of Extension service will, however, be much higher when, as now, it is mainly directed to illiterates. This added cost does not rise solely from the newer media of communication which are used for Extension teaching. These media of course include the full range of audio-visual aids. One is tempted to say that the new media are a necessary adjunct of Extension teaching; but this is not yet scientifically proven.

It is, however, certain that the new media do speed up the process of learning enormously; and there is good evidence that the lessons are better retained when teaching is supported by the new media. Just how much faster learning is possible and how much better the lesson is retained are factors which remain to be measured.

The additional cost of Extension teaching to illiterate adults does not rise even mainly from the more elaborate media of communication. The chief cost-component lies in personnel. The target of two and one third lakhs of Extension workers, to cover the villages of the whole country by 1961 is, it seems fairly obvious, an underestimation of village-folk's necessities. This scant provision of Extension workers is perhaps obvious only to one, who like the writer, has lived for many months as a village resident in India. The official estimate allows between two and three Extension workers per village: or one for every 1300 to 1500 villagers of all ages.

Technological Gaps

Yet the number of Extension workers could not have been set higher, in view of the known difficulties of training them to teach, and perform their other functions of organization in such a huge, widespread service. One may question whether the plan for training Extension workers is really adequate. It could very well be that many more suitable workers would be found tested for vocation, and better trained, if a more realistic, less hurried development were chosen for this new arm of Education.

As a particular criticism, there are some bad technological gaps showing among the Extension workers proposed to be provided for this new education service.

One of these gaps is, as one would expect, in Health. Nearly 5000 Extension workers in the field of Health were scheduled for assignment by March 1956, the end of the First Five Year Plan. By 31st. July 1954, less than 150 were in sight.

Shortage of Engineering Staff

Even more serious is the shortage of Engineering staff in the Extension field. This lacuna is now heavily underscored by the further plans of the Union Government, and the

doubtful implementation of these plans by the State Governments, to establish Small Scale Industries, mainly in rural areas. A 'Statesman' leader of 12th May commented on such economic aspects of these schemes. But in fact it is far more urgent to tackle the problems of technical personnel than the problems of profitability, and the consequent desired devolution of the small scale industries from official hands to those of commercial entrepreneurs.

These urgent problems of small scale industries are basically the same as the parallel problems of Extension teaching. The teachers of simple engineering techniques in the villages, and the similar, educated personnel required to operate the factories must be drawn from the same sources, and should be trained at the same schools. Where are these schools? The question is properly rhetorical!

Here again, doubtless because of these training-schools which exist only so far in a rhetorical sense, the assignments of Engineering personnel (including 'overseers') to Extension service, are pitifully small. The First Five Year Plan provides for

less than 2000 persons to cover 1200 blocks, each of roughly 100 villages. It is believed that less than ten per cent of these Engineers and Overseers together have been assigned to the Extension field. The Second Five Year Plan allows for a total of less than 6500 Engineering personnel to handle all aspects of Extension service for every village in India.

Teaching Small Scale Industry

Now small scale industry will not be planted in every village; but where it is to be planted, there is an obvious need for engineers of higher calibre than are required for the rough-and-ready sort of technical improvements that are to be carried by the Extension services.

For Extension teaching, it will suffice firstly if village masons, potters, carpenters and blacksmiths are enabled to work more efficiently, and thus to earn more while serving their fellow-villagers more thoroughly. Secondly, the new techniques which must be taught to villagers by Extension are also fairly simple: such as road-making, well-sinking, use of untraditional materials as well as skills in building, irrigation and drai-

nage (including that for sanitation as well as for agriculture).

Production of Personnel

The engineers for small scale industries will need all these skills, both at their own command, and as subject-matter for teaching. They will also need further knowledge and skills to maintain and operate the factories. Mercifully, not all of these additional skills and knowledge will have to be taught to villagers for a generation or so.

The writer sees no insuperable difficulty in finding and training the total number of engineers required to work in the rural areas, both in the Extension services and for the Small Scale Industries. Equally, he sees no prospect of the job being tackled—or not as an engineer would tackle it. Yet it is simple enough, to an engineer with a good working knowledge of Extension methods.

Even if the total number be put at 20,000, the job of producing the engineers can be done. It is the time-scale of such operations in the production of personnel which needs revision, in terms of realism.

Nepal's First Census

Y P Pant

NEPAL had no official census until 1952 and in the absence of reliable data of population over a period of years, it is not possible to study the dynamics of the country's population growth. On the basis of the data in the "Interim Census Report"* just published, an attempt has been made below to give a factual account of Nepal's population. For purposes of comparison, data from earlier censuses are mentioned, but the latter have to be treated with great caution.

Earlier Census Efforts

Though the earliest attempt to take a census is believed to have been made by Shri Jung Bahadur, the first Rana Prime Minister, a century ago, it was not until 1910, that even a rough estimate of the population could be attempted. The so-called Census of 1920 which estimated the population at about 5.5 millions was not much better. In 1941, the Nepal Durbar set up a Census Department which estimated the population of Nepal at 6 millions. Subsequently in 1950, when the Department of Statistics was established it was expected to take an official census on a scientific basis; but political troubles in the country led to the suspension of its work temporarily. It was only after the formation of the Matrika Cabinet, that the Government decided to take a census. For administrative convenience, the country was divided into two parts—East and West Nepal. The census of East Nepal was taken in 1952 and that of West Nepal in 1954. The results obtained may be said to be more reliable than in any of the previous attempts inasmuch as it was more systematically organised under Government direction. As in the case of the 1951 Census of India, enumeration was spread over 20 days to obtain accurate results. East Nepal was divided into four census zones, while West Nepal was divided into five, and one of the latter was the Kathmandu Valley. The Census was confined merely to an enumeration of the people and no attempt was made to classify the

* Interim Census Report, Government of Nepal (Department of Statistics) 1955.

population on the basis of age, occupation, literacy, religion and so on and vital statistics have also not been given. The Second Census Report, to be released two years later, is, however, expected to throw light on all these aspects.

Census Estimates

Previous estimates have placed Nepal's population at about 5 millions; it is, however, difficult to say how reliable the estimates are. The Census puts it at 8.43 millions. While no dependable comparison can be made by relating the latest figures to the earlier ones, broadly speaking, even after allowing for increase due to improved coverage, the growth of population between 1941 and 1954, appears to have been rapid, as may be seen from Table I, given at the end of this article.

The total area of Nepal, according to the Census, is 54,045 square miles. The country may be broadly divided into two parts, viz., the mountainous region, containing intractable forests and glaciers, and the Tarai region consisting mainly of grass land and bare rock.

The Census discloses that East Nepal is more thickly populated than West Nepal. The former, with an area of 17,041 sq. miles, has a population of 3.76 millions, while the latter, with more than double this area (37,004 sq. miles), has a population of 4.67 millions.

People of diverse races and castes live in Nepal and migration from Afghanistan, Tibet and India would appear to have been unrestricted in the past. Any effort at improving the living standards of the people is rendered difficult owing to several reasons: in the first place, the population is heterogeneous and contains Tibetan Buddhists and some Lepchas who are animists; secondly, the immigrants have developed a certain aloofness among themselves; and lastly, though the majority of the population is Hindu, there are caste differences in the community.

Population Growth

The Census does not attempt a division of the population by livelihood classes; but the structure of Nepal's economy shows that over 90 per cent of the population must be depending on agriculture. Most of the land produces only one crop

in a year. In view of the absence of transport of any sort in most parts of Nepal, an unusually large part of the population is engaged in portering of staple commodities. There are also marked seasonal movements of population. The people have a tendency to move from the mountainous regions to the Tarai plains and northern India during the market season; throughout the Tarai, there are markets which are active from November to March during the period of crop movements but which have little activity during the rest of the year.

Table I gives the estimates of Nepal's population, over a period of years.

It shows that the rate of growth between 1941 and 1954 is much higher than that between 1920 and 1941. Population increased by 22 millions in the last 13 years ending 1954, indicating a 34.2 per cent growth over the 1941 level. The main reasons for the faster growth of population after 1941 could be three: first, after the thirties, a more liberal policy was adopted by the Government towards immigrants. Secondly, the deforestation policy, especially in the Tarai region, led to the immigration of Indians from the adjacent districts of Bihar, Bengal and U P. Thus, most of the tenants in the Western Tarai are generally migrants from Gorakhpur, Basti, Bharaich and Gonda districts of U P who do not sever their link with their homes and move out seasonally from Butawal, Berdia and Banke districts of Western Tarai. Lastly, the return of the Gorkhali soldiers from the British Army in India and other places after the end of the last War might have possibly added to the country's population.

Density of Population

In the Census year, the average density of population in Nepal was 155 persons per square mile. Since figures for earlier years are not available, only differences in inter-regional density can be noted and some of the factors which account for these differences may be examined. The following figures give an idea of the density of population in the different regions of Nepal:—

Table II—Density of Population (Selected Regions)

Region	Land Area (Sq. miles)	Density per Sq. mile
Kathmandu Valley	208	1993.77
Mahottari (Tarai)	819	512.77
West No. 4 (Bhojpur Mountains)	734	468.92
Rautahat (Tarai)	416	455.52
East No. 1 (Mountains)	1493	250.74
Udayapur (Mid-Tarai)	927	97.66
Nawapur	282	58.12
Kanchanpur (Tarai)	611	29.11

The fact that Kathmandu Valley has the highest density (1993) with only 208 sq. miles indicates the influence of locational factors on density. Not only is the capital situated in the valley, but also two other towns, Lalitpur and Bhaktapur—the only towns that Nepal has outside the Tarai plains. On the other hand extensive plains with fertile land and adequate rainfall are also conducive to high density as in the case of Mahottari (512) and Rautahat (455) in Eastern Tarai. Sometimes, although a particular region may have good rainfall and fertile soil, these advantages may be negated by unfavourable climatic factors. Nawalpur (58) Mid-Tarai in West

Nepal and Kanchanpur (29) are low density areas as they are malarial and have frequent epidemics. Sometimes, the disparity is also due to the stay-at-home habit of the people and difficulties in inter-regional migration. This is particularly true of the hilly parts. West No. 4 (468) and East No. 1 (250) illustrate this. These very factors are responsible for a higher density in some of the hilly parts of Tarai.

If agriculture, under favourable conditions, can maintain about 250 people per square mile, Nepal's average density, which is only 155 per square mile, need not cause any concern. On the contrary the present average suggests that the problem is not one of high density but of under-utilisation of existing resources.

Sex Composition

The breakdown by sexes given in the Census, is 42,25,347 males and 42,03,190 females. In East Nepal the proportion of males to females is 23,58,804 to 23,07,976 while it is 18,70,543 to 18,94,214 in the western part. Thus in the eastern part, the number of males exceeds that of females by 50,828, while in the western part, the number of females exceeds that of males by 23,671. Taking Nepal as a whole, there is an excess of 23,157 males. On an average, there are 994 females per 1,000 males. The popular belief in Nepal

that there is an excess of females over males, therefore, lacks confirmation. Yet to this supposed excess has been attributed many of the social evils, e.g. polygamy, particularly in the hilly regions.

Food Resources and Population

The problem of population in relation to food, does not appear to be so serious in Nepal as in some of the heavily populated countries in Asia, though the standard of living may be very low. The extent of food shortage in terms of quantitative and qualitative dietetic deficiencies, the size of underfed population etc, cannot be estimated owing to lack of statistics. Some rough idea of the country's food resources can, however, be given with reference to land use and the general pattern of production. Sixty per cent of the total area is under forests, one fourth is cultivable and the balance is either Alpine meadows or under perpetual snows. Although cultivated area amounts to 10 per cent of the whole, it includes land which should appropriately be under grass or forests. On the other hand, vast tracts of land in the Tarai plains are left uncultivated for climatic reasons, though they are otherwise suitable for cultivation. Excepting in a few cases in the Tarai, the land is cultivated by small peasant families

and as two-thirds of the land belongs to big land-owners, most cultivators are tenants.* Subsistence farming is the rule, especially in the hilly regions. Ordinarily, the difficulties of transport do not allow the transport of food grains to different parts of Nepal. On the other hand, the Tarai exports to India quantities of jute, rice, peas and wood. From the hills also there are some exports, though much more limited, both to other parts of Nepal and to India, but these are only products which have large value in small bulk, e.g. ghee, wax, wool, etc.

From the substantial exports of food grains to India from the Tarai belt it is generally inferred that Nepal is surplus in food. Parts of Nepal, however, suffer from food shortage. For instance, Kathmandu and certain adjoining hilly regions suffer from acute food scarcity and prices are high, while Tarai region is able to export food grains to India, because of plentiful supplies. The problem is: how to match the surplus of the Tarai with the deficits of the hilly tracts? Lack of transport is a hindrance to the interregional movement of food grains. The problem is essentially one of maldistribution. This emphasises the need for improvement in transport and communications.

Economic Development and Population

Although the pressure of population on arable land is not so serious as compared to many other countries, the disturbing fact about Nepal is that of occupational imbalance, viz that so large a proportion of the population should depend for their living on agriculture, and that, too, single cropping while the yield per acre is among the lowest in the world.

As the cultivated area amounts only to 10 per cent of the total area, and as at present there is a single crop system, there is scope for increase in production both by extensive and intensive cultivation. There should be a strong drive both for improving the technique of cultivation and for bringing more land under cultivation. Agricultural reconstruction should be associated with land reform, which should include measures for preventing excessive subdivision and fragmentation.

* Though 80 per cent of the cultivated land is under tenancy, the problem of land reform has come to the fore recently.

Around Bombay Markets

ALTHOUGH the opening of the week witnessed an irregular movement of prices on the Stock Exchange, mainly occasioned by conflicting rumours about Tata Dividend, there was a perceptible improvement all round, especially after mid-week, with the highest levels in most cases being reached on the last day of the week.

While the bearish trend at the outset was partly brought about by unfavourable reports of Tata Dividends, the discussion at the National Development Council in respect of mobilisation of resources through additional taxation was yet another factor adversely affecting the sentiment in the market. Recovery was initiated after mid-week by reports of better working results of some companies tangibly evidenced by stepping up of their dividend. Among the companies which recently raised their dividend were Western India Spinning and Weaving Co., Indian Manufacturing Co. and the Hindustan Spinning and Weaving Co. On the top of this, there were also strong rumours in the market that Bombay Dyeing would raise their dividend in view of their expansion programme following the introduction of automatic looms, for which they were reported to have already got Government's permission. Century and Kohinoor also shared the general rise in view of their proposed expansion programme.

The maintenance of status quo in Tata dividend, which was announced on Thursday, did not cause any serious setback for operators were still attracted to Tata Steel on yield consideration. This apart, there were strong Calcutta advices which lent support to the bullish trend which saw its climax on the last day of the week when prices recorded the highest levels for the period under review.

Tata Steel Ordinary after experiencing an initial bearish trend resulting in the lowest level for the week at Rs 241-12 steadily improved towards the close to Rs. 250-10, the highest for the week. The actual closing quotation, however, was Rs. 248-8.

Indian Iron lost 10 as. during the early part of the week but rebound-

ed to Rs. 38-3-6 to close firm at Rs. 38.

In the textile section, all the leading scrips recorded good gains. Bombay Dyeing moved from the lowest level of the week to the highest, gaining in the process more than thirty points at Rs. 516-4. Century, Kohinoor, Simplex and Swadeshi shared in the bullish enthusiasm, the highest levels reached being Rs. 418, Rs. 347-8, Rs. 166 and Rs. 213-8, respectively.

In the miscellaneous section, excepting Bombay Burma, National Rayon and Tata Chemicals, all the others ruled distinctly firm. Associated Cement gained Rs. 5 from the lowest touched during the week to Rs. 189-8. Digvijay were well backed by influential buying and touched Rs. 208-8. The weakness

in Bombay Burma, National Rayon and Tata Chemicals was due to heavy bull position built up in these shares, necessitating eventual liquidation by speculators. In the case of Bombay Burma, the down trend was further accentuated by the heavy backwardisation charges that bulls were obliged to pay. Hence the steep fall in this scrip from Rs. 556-4 to Rs. 546-4.

Banks and insurance shares were more or less neglected. Investors were unwilling to extend support to bank shares though they are quoted cum-dividend. Fears of nationalisation would appear to be the main hurdle in these scrips. For the same reason, insurance shares also continued to decline steadily.

Electric and Public Utility shares were more or less quiet for want of genuine investment support.

Cotton

February Contract Opens

THE notable events in the cotton futures market were the opening of the New February contract and the fixation of room rates for the old crop. Although on the eve of the commencement of trading in the February contract, there was a perceptible improvement in the August contract resulting from straddle business, trading in both the contracts at the close of the week, on balance, remained distinctly bearish. This is to be explained by the fact that traders expect heavy tenders in the August contract following the fixation of room rates which were generally considered to be favourable to sellers. There were also continued reports of favourable weather in the cotton belts, indicating better prospects for the new crop. It must be noted, however, that on the penultimate day of the week, there was once again a firm trend in the August contract which was attributable to strong rumours current in the market that leading cotton-cum-mill magnates were interested in buying cotton on docket. When these reports proved false, as they did on the last day of the week, it was but natural for prices to retrace their steps.

ICC August opened the week at Rs. 583 and after improving to Rs. 590-8, sagged to Rs. 581, closing at Rs. 582-12. New contract February started on Monday (July 21) at Rs. 615-4 and after being taken up to Rs. 618 declined towards the close to be placed at the lowest level of Rs. 606-12.

In the absence of any fresh development with regard to the US cotton export policy, shippers were chary of entering into fresh commitments and therefore activity in the spot market was confined to limited lots of shippers' and mills' immediate needs. Short staple varieties continued to be neglected.

Oilseeds

Smaller Crop Feared

ON apprehensions of a smaller crop due to lack of rains, there was a steady trend in the oilseeds market in the early part of the week. Sectionwise, groundnuts were well supported by Vanaspathi interests while linseed remained steady for two reasons. In the first place, floating stocks are small and secondly, the main importer of linseed oil,

namely USA, is facing the prospects of a smaller linseed crop in the coming season. When, in addition to these two factors, overseas enquiries continued to flow, there was naturally an upward trend in prices in this section, and linseeds maintained a distinctly steady trend throughout the week.

The only exception to this general upward trend in oilseeds was the castor section. With scarcely any overseas demand of note and with speculators inclined to sell short, prices of Castor September contract registered a sharp decline of over Rs. 6 from the highest level of the week to close at Rs. 88-12. May contract, which was quoted as high as at Rs. 92 at one time during the week, closed lower at Rs. 86-4.

Groundnut August-September showed a gain of 6 as, at the close at Rs. 23-10 while groundnut oil R/R was placed at Rs. 12-10 as against Rs. 12-7 at the opening.

Linseed August-September opening at Rs. 25-10 declined a little at the outset but steadily improved to close at Rs. 26-2. Linseed oil gained 8 as. and closed at Rs. 15-12.

Both Kardi and Niger showed declines over the week at Rs. 14-6 and Rs. 23-6 respectively.

Bullion

Gold Remains Firm

THE bullion impasse has officially ended but dealers continue to be jittery. Despite the fixation by the Board, of floor and ceiling prices for Shravan delivery, normalcy has not been restored in the market. The market has been officially open for the past four days but in view of the strong hold of the bulls, thanks to their commanding position in respect of stocks, fluctuation in prices has been severely restricted. Gold Shravan remained firm at around Rs. 92-2 while Shravan Silver moved narrowly within a range of 2 as. around Rs. 159-1, throughout the period under review.

Company Notes

Bird-Heilgers Jute Mills

JUTE shares remain stagnant. But the half-yearly reports of jute companies, published recently, are not discouraging. Dividends so far announced are, in most cases, higher for the half-year to March last. For instance, five of the Bird-Heilgers group of jute mills have raised their

THE ECONOMIC WEEKLY

dividend. With the exception of Union, all other mills in this group earned higher profits.

From a perusal of half-yearly reports published so far, it would seem that three problems confront the jute industry at the moment. In the latter half of the half-year to March last, many jute mills had to buy raw jute at higher prices. This affected their earnings and profits. This problem has been present during the major part of the current half-year. There is, however, hope that the problem may be less acute in the next half-year.

Directors emphasise in their reports for the half-year to March last that wide fluctuations in prices of jute goods due to the activities of speculators in "fatka" market created difficulties in trading conditions. This problem is under investigation by the Forward Markets Commission. Unofficial forward trading is having an unhealthy effect on the prices of jute goods. Many are inclined to the view that it is better to have regular, legalised futures trading than unofficial "fatka" business.

Continued from page 901

expenditure on projects like the Durgapur coke oven plant or the Ganga Barrage scheme. These projects are estimated to cost Rs. 62 crores. Expenditure on relief and rehabilitation to the extent of Rs. 113 crores will be met by the Union Government. For the projects not included in the main Plan, separate development corporations will be created.

Revised target of first Plan	77
Special projects, during second Plan, not included in the main Plan	62
Expenditure on refugee relief and rehabilitation not included in the main Plan	113

Resources

Internal Resources (including voluntary contribution at Rs. 36 crores)	148
Estimated Central Aid	115
Net amount available, deducting estimated revenue deficits of Rs. 58 crores in the next five years	205
Resources fall short of the main Plan's targets by Rs. 60 crores.	

THE ECONOMIC WEEKLY

Around Calcutta Markets

Uncertain Trend

Wednesday, Evening

FOR the third week in succession, fluctuations in Indian Iron have been contrary to movements in equities in general. This contradictory movement assumes significance as the strength in Indian Iron has been the only redeeming feature of market movements in recent weeks. Tea shares have developed a drooping trend. Jute shares remain stagnant. Even Miscellaneous and Engineering shares are not moving up. Experience in the last few days suggests that firmness in Indian Iron alone cannot push prices up. It would be unwise to ignore this market factor.

Announcement of new State loans has partly contributed to the uncertain trend in equities on the Calcutta Stock Exchange. State loans were not unexpected. Ten States will be entering the long-term loan market for Rs. 35.75 crores. Some of the State loans are cash-cum-conversion loans. Excluding the total amount of maturing loans, the net withdrawals by the States will amount to about Rs. 29½ crores. From the terms and conditions of the loans, it is clear that the Reserve Bank is aware of the varying status of the various States.

Loans and Equities

Money market conditions are not discouraging. There has been a substantial increase in bank deposits in the first half of the current year. Despite the simultaneous increase in advances, it is evident that the money market is not short of funds. Quotations for existing State loans indicate that the new loans are likely to be successful. Stock markets are more intrigued about the Government loans yet to be floated. There is a possibility of the Central Government re-entering the market at a later stage.

Even so, current indications are that the market will not experience difficulties in absorbing the loans. Massive withdrawals of funds through National Bonds had a depressing effect on stock markets last year. This year's net withdrawals through Government loans will be much smaller. At the same time, money market conditions are far more comfortable now. Apprehensions about the effects of loans on equities may, therefore, be regarded as unduly exaggerated.

Lower Tea Prices

It would be wrong to emphasise

this factor in explaining the irregularly lower trend in equities. Reasons for the set-back in Tea shares are not far to seek. That dividend stimulus is no longer present. So, bargain hunters are no longer interested in Tea shares. Nor are genuine investors willing to buy Tea shares as the belief is widespread that tea prices and profits will be lower this season. This is the main reason why Tea shares have been inactive in the last few days.

This week's tea auctions have had a further depressing effect on Tea shares. For both export and internal auctions, offerings were the heaviest to date. Increased offerings had the inevitable effect of a set-back in prices. As the volume on offer increased, buyers became hesitant. Whether decreased demand or increased offerings led to a fall in tea prices is not as important as the fall in prices. Informed circles are inclined to the view that this is the beginning of the trend towards falling tea prices. This explains why Tea shares have been so inactive in the last few days.

Jute Shares Steady

After remaining stagnant for weeks, Jute shares started moving up a few days ago. Though the upward trend in Jute shares has not yet been firmly established, it is evident that investors are moderately optimistic about the outlook for Jute shares. For one thing, recent dividend payments for the half-year to March last have been satisfactory. Indications are that this half-year's dividend payments will not be lower than those of the previous half-year.

Immediate behaviour of Jute shares will depend on the relative price movements of raw jute and jute goods. Data relating to stocks indicate the highly satisfactory demand for sackings. Demand for hessian will depend on the Argentine offtake. Trade circles are more worried about the future behaviour of raw jute. Contrary to expectations, raw jute prices not only remain steady, but are moving up slowly because of the temporary shortage of raw jute for immediate delivery.

Steel Dividend

For weeks, Tata Steel and Indian Iron were moving up in anticipation of higher dividend payments. There

is still time for the announcement of Indian Iron dividend. But Tata Steel dividend has been announced. Contrary to expectations, it is not higher. Yet, both Tata Steel and Indian Iron are moving up. There are reasons why these Iron and Steel shares are moving up. It is now argued that, like Tata Steel, Indian Iron may not raise dividend payments. But both Tata Steel and Indian Iron will issue right shares in the near future.

Bombay reports indicate that the possibility that the Company may issue right shares is one of the factors which has influenced the directors in their decision not to step-up dividend. This is a policy which is only to be expected of responsible management. For, in the event of issues of right shares, it would have been unwise to raise dividend now as it might not be possible for the Company to maintain the higher dividend on an enlarged capital structure.

Right Shares

There is a strong case for issuing right shares by Tata Steel. It is only to be expected that Tata Steel would be moving up on this expectation, even though the dividend has only been maintained. There are some who argue that, as there is not a strong case for issues of right shares by Indian Iron, this Company may decide to step-up dividend payments for the year to March last.

This is one of the reasons why Indian Iron are moving up. But informed circles believe that Indian Iron will also issue right shares. Gossip is that Tata Steel will issue right shares at Rs. 75 and Indian Iron will issue right shares at Rs. 10. If these expectations materialise, both Tata Steel and Indian Iron are likely to move up higher still.

Engineering Shares

There is no valid reason why the trend in Indian Iron should be reflected in fluctuations in Tea or Jute or Coal or Paper shares. But it is not difficult to appreciate how and why gyrations in Indian Iron have a sympathetic effect on Engineering and Miscellaneous shares. That is why the continued strength in Indian Iron and the absence of any sympathetic movement in Engineering shares are causing anxiety to speculative investors.

Big Things....!

They are BIG!

But even your biggest printing problems are not big for us.

For an Indian Press to attain the standards of printing as in the United States of America, England, Germany and countries where most progress is made in this direction, is an achievement. Clientele will testify to our attainments in this direction.

With our photo offset, blocks, letter press, litho and packaging material manufacturing departments and a capacity one of the largest in India and twenty-five years' experience behind us, we can undertake all types of printing.

Let us tackle your printing problems.

Pakistan Devalues

RELATIVE prices and balance of payments, the two tests of the external valuation of a currency, have so manifestly testified to the over-valuation of the Pakistan rupee that it is needless to argue the point. No one knows it better than the wearer where exactly the shoe pinches and the Finance Minister of Pakistan has mentioned some of the losses from over-valuation though understandably his account of it is not as exhaustive as it could be. The decision to stay put when the sterling area devalued in September 1949 was unfortunate. The folly of it would have been brought home to Pakistan almost immediately but for the chance intervention of the Korean boom which kept things going for a time. But the boom soon passed and recession came in its wake. With it came Pakistan's woes which have continued uninterrupted ever since.

In a matter like the fixing of the right exchange value of a currency, it is not wise to be dogmatic. There is enough evidence to suggest, however, that Pakistan's decision to keep out, was not taken on economic grounds. The Indo-Pakistan Agreement provided for consultations in such an eventuality. The circumstances under which India had to decide and act were hardly propitious for consultation and the relation between the two at the time were such as to ensure agreement. Anyway, the die had been cast. It is not so much the wrong decision taken in a hurry but the refusal to retrace, the persistence in sticking to too high a rate of exchange over all these years, when the consequences were no longer open to doubt, that need to be explained. Economic considerations cannot explain it; that explanation has to be sought in the politics of Pakistan of those days.

The high value of the Pakistan rupee had been played up as a measure of Pakistan's strength, and not only vis-a-vis India, but in international reckoning. Whatever might have been the economic consequences, politically it was not possible, it was not decent, patriotic or proper even to discuss the question. The impact was felt soon after the Korean boom receded. Exchange earnings began to fall, the budget was adversely affected, imports had to be drastically cut, resulting in turn in falling money incomes and rising prices of essential consumer goods. It was a self-reinforcing and accelerated process. The greater the fall in export earnings, the sharper the cut in imports and higher the prices of essential consumers. To this was added the misfortune of food grains shortage in 1952-53. Though the latter was largely met by food gifts from US and Canada, and the additional pressure on balance of payments caused by food shortage passed, the situation did not improve.

Instead of trying to retrace her steps which would have meant turning the direction of trade towards rather than away from India, Pakistan sought American aid to support for tottering economy. The economic viability of Pakistan had been deliberately over-rated by her political advisers when Pakistan had been in the making. An economy depending on two main export products, jute and cotton, may be more viable than an economy which has to depend on only one, but a diversified economy alone can count on steady and stable export earnings, if at all. Hence Pakistan's understandable aspiration for diversification which was

The Economic Weekly

Noble Chambers, Parsi Bazar St.,

Fort, Bombay. Phone: 23406

Annual Subscription Rs. 24.

pursued by Pakistan, in complete disregard of the conditional certificate of viability given to her by her foreign advisers. Viability had been vouchsafed only if Pakistan pursued a free economy. Indeed, making a virtue of necessity, Pakistan set out to develop industries. The scope for it had been created by virtual stoppage of imports. Finance for industry was available because capital normally locked up in trade had been released by the imposition of controls. Capital goods needed by industry were made available by giving high priority to such goods in the licensing of imports.

Pakistan's Finance Minister would have us believe that the pattern of development outlined above had gone on so well that it has now made a change necessary so that Pakistan might compete successfully with other countries in the export of manufac-

tures and that devaluation of the Pakistan Rupee was necessary not to avert a crisis but to augment her gains. What spoils this pretty picture is the continuous fall in export earnings which may be still adequate to pay for a limited quantity of capital goods for her limited industrial development programmes but are wholly inadequate to ensure adequate imports of consumers' goods which Pakistan's industry is obviously unable to supply.

The major adjustment was US aid—which could do little to rectify the defects of the Pakistan economy, particularly when such aid was to come in the form of surplus agricultural products in which Pakistan is interested both as a producer and exporter.

It is not without significance, therefore, that the turn of the tide

was heralded by US aid in more than one way. After it had grasped the economic consequences of such aid, the Pakistan financial Press began to talk about devaluation, at first haltingly and with a great deal of hesitation and later more openly and frankly.

Better late than never, does this welcome decision on the part of Pakistan, which must have needed rare political courage on the part of her financial guardians, signify greater changes to come in her economic policies? Does it indicate a new direction in her economic aspirations, away from that which led her to look for succour in foreign aid rather than in her own inherent strength? It would be, in any case, too early to say, and prediction is made doubly difficult by the political developments that accompanied this important decision.

Formosa and Far East

AMERICA'S Secretary of State has acquired an undiplomatic habit of saying the wrong thing at the wrong moment. At the moment, Communist China and America are having talks at Geneva at the ambassadorial level. On the eve of these talks, Peking has made a gesture in releasing eleven American airmen. President Eisenhower has expressed "relief and joy" over Peking's action. Throughout the world, hopes are entertained that the present Geneva talks will be the prelude to further negotiations between China and America. In a major policy statement before the start of the Geneva talks, Mr. Chou En-lai, China's Premier and Foreign Minister, announced Peking's desire and intention to start negotiations for the "peaceful liberation" of Formosa. And yet, Mr. Dulles insists that he will not negotiate with China with a pistol pointed to his head. Despite Peking's repeated peaceful gestures, Mr. Dulles issues a threat that China must renounce the use of force, or else there will be a war, "the limits of which will not be defined in advance".

Even the most charitable interpretation of Mr. Dulles's undiplomatic behaviour is that his statements during Press conferences in Washington are meant for home consumption. His observations during his Press Conference last Tuesday may please the Republican Party in America, but the world outside will deplore his undiplomatic utterances. It is obvious that Mr. Dulles has not

the stature of President Eisenhower. Though Mr. Eisenhower has shown wisdom and statesmanship in ignoring national party politics in the wider interests of world peace, Mr. Dulles remains a prisoner of his Party. So far as Europe is concerned, President Eisenhower has shown that he has the courage to soar above national party politics. America's involvements in the Far East fall in a different category. There is a danger that even President Eisenhower may not have the courage to withstand the pressure of the "China Lobby". There are ominous indications of President Eisenhower falling a victim to the Republican party's policy to the Far East.

According to Washington, Formosa is the major issue in dispute between America and China. Peking does not accept this version of the source of tense relations between the two countries. Here, the Republican Party's policy to the Far East becomes significant. To begin from the beginning, it was with the aid of the American Navy that Chiang migrated to Formosa. Though the Korean war had the incidental effect of initiating the present American policy to Formosa, the Republican Party cannot escape responsibility for giving that policy an ominous shape. Some of the assumptions of Mr. Dulles's Party's policy to Formosa are that the Communist regime in the Chinese mainland will gradually disintegrate owing to mounting popular disaffection; that, in the circumstances, it is necessary to fortify

the Chiang regime in Formosa as an alternative Government. Washington's Formosa policy is based on this policy of "liberation". It has been pursued with vigour because of the assumed importance of Formosa as a strategic base in America's system of Pacific defences. This strategic assessment of Formosa is now conceded to be wrong as well as irrelevant in an atomic age. This explains the twist in America's policy. Washington is inclined to foster the conception of two Chinas with Formosa and the Chinese mainland as two separate, sovereign States.

Peking has repeatedly rejected this theory of two Chinas. In his major policy statement on the eve of the Sino-American talks at Geneva, Mr. Chou En-lai has reiterated Peking's stand that it will not tolerate the existence of the Chiang regime in Formosa as a separate, sovereign, political entity. Peking regards Formosa as an internal affair of Communist China. Peking is eager and willing to negotiate with America. But Communist China denies that Formosa is an issue in dispute between Peking and Washington. Mr. Dulles's recent statements indicate that Washington now concedes the logic of Peking's stand. But Washington insists that America, a member of the United Nations, has a responsibility to ensure peaceful settlement of disputes among parties or Powers in any part of the world. Once it is conceded that Formosa is an internal affair of Communist China, such an attitude may

lack logic. But even those who disagree with America's Far Eastern policy will hope that the Formosa issue will be settled through peaceful means.

Mr. Chou En-lai's latest statement to the National People's Congress marks a significant departure from Peking's attitude to Formosa so far. It underlines Communist China's desire to settle issues through peaceful means, and will be widely welcomed for its deeper implications relating to Formosa. Peking has so far refused to negotiate with the regime in Formosa to settle the Formosa issue. In his latest statement, Mr. Chou En-lai announces Peking's willingness "to enter into negotiations with responsible local authorities of Formosa to map out concrete steps for Formosa's peaceful liberation". It is not without significance that Mr. Dulles, speaking after Mr. Chou En-lai's statement, has maintained a diplomatic silence on the Chinese Premier's announcement relating to Formosa. Peking still insists that Formosa is a part of China. Mr. Chou En-lai is emphatic that the proposed talks will have to be between the Central (Peking) Government and "responsible local authorities" of Formosa. But Peking has made an important concession in declaring its readiness to negotiate with "responsible local authorities" of Formosa. Some of the interpretations of this announcement underline Peking's conciliatory attitude. Mr. Chou En-lai's announcement has been interpreted to mean that Peking is not unwilling to recognise a status for "the responsible local authorities" of Formosa similar to that of those in Tibet, Sikiang and Inner Mongolia. If this interpretation is correct, Mr. Chou En-lai's announcement means that Peking is willing, under certain circumstances, to grant Formosa the status of an "autonomous region".

Does Mr. Dulles's deliberate silence on this aspect of Mr. Chou En-lai's major policy statement indicate that America is not prepared to accept even such a reasonable solution of the Formosa issue? Mr. Dulles repeatedly insists that America will not negotiate with Communist China unless the latter renounces the use of force in settling disputes. In his policy statement after the "summit" talks at Geneva among the four Heads of State, Mr. Chou En-lai proposed such a "summit" conference for Asia and the Far East. He announced Peking's willingness to sign a pact of collective peace

with the countries of Asia and the Pacific, including America. He has declared Peking's readiness to negotiate with "responsible local authorities" of Formosa. How often will Peking have to assure Washington of Communist China's acceptance of the principle of settling disputes through peaceful negotiation? Tension in the Far East cannot be eased

without a settlement of the Formosa problem. Without America's consent and acceptance, there can be solution of the Formosa issue. Mr. Dulles is entitled to demand from China a declaration renouncing the use of force. What the world would like to know is whether Washington accepts Mr. Chou En-lai's proposed solution of the Formosa problem.

NEW INDIA STORIES FROM LIFE

'My good turn helped me most'

MY FRIEND'S son came to sell me insurance. My business was doing well, and I thought I did not need any. But the boy was so young and enthusiastic, that just to encourage him and please his father, I agreed to take out a policy.

Some years later, business slackened and everything I touched seemed to fail. My business took some hard knocks; and my partner got too ill to share my problems. I had to reorganise, but where was the necessary capital to come from? The only solution was to sell our house—and it was my wife's pride and joy.

Then my young friend dropped in to remind me that my New India Endowment Assurance policy would mature shortly. What a wonderful relief! I would get the money I sorely needed at exactly the right time.

I thought I had obliged a friend—actually he had helped me!

An insurance policy, taken out now, may one day stand between you and disaster. For full information write to

Weekly Notes

Minimum Wages — No deadline

THE time-limit within which the Minimum Wages Act is to be enforced has been extended from time to time, and the due date expires by the end of this year. The Act, passed in 1948, was intended to apply to some of the sweated trades; but these were minor ones: its main aim was agricultural labour. The wages of agricultural labour, however, could not be tackled until the basic facts were known. Hence the Agricultural Labour Enquiry which was completed some time ago. Meanwhile the date of implementation of the Act was being pushed back, while land reforms as well as the pressure of the landless have been pushing the size of the model farm to the limit where it ceases to pay to employ any labour at all! And now the deadline is to be dropped altogether.

The idea of fixing a time-limit in the past was to ensure expeditious enforcement of the Act. The draft amendment Bill which is likely to be taken up during the current session of Parliament proposes to delete the time-limit altogether, and leave the State Governments free to enforce the Act as and when convenient. The representatives of the State Governments had made this demand at the last Labour Conference and the demand has been conceded.

Minimum wages in agriculture, however, have been fixed in some of the States but mostly in the smaller ones, e.g., Coorg, Delhi, Himachal-Pradesh, Kutch, PEPSU, Punjab and Rajasthan. In the States of Assam, Bihar, Bombay, West Bengal, Mysore, Uttar Pradesh and Vindhya Pradesh, minimum wages under the Act have been fixed in certain specified areas. Enquiries are in progress in Madras to ascertain the low wages pockets. By the end of 1953, the number of agricultural and plantation workers all over India covered by this Act was 1,08,87,000. But about how well minimum wages in agriculture have operated, little is known.

Many States have implemented the provisions of the Act with regard to the unorganised industrial workers of bidi factories, carpet weaving establishments, stone quarries, tanneries, building workers, etc.

Second Pay Commission

THE non-official resolution introduced in the Lok Sabha last week, urging the appointment of a Second Pay Commission to go into the question of the country's pay structure could not have been more timely. It is about a decade since the first Pay Commission was appointed and the country's economy has undergone many changes since then. A revision of pay scales has been overdue if only for straightening out anomalies and settling the uncertain position of dearness allowances. To all this, a fresh point and new urgency have been added by the adoption of a socialistic pattern of society as our goal.

The first Pay Commission was appointed in 1945 for revision of scales. It proceeded on the assumption that the cost of living index would be brought down and would settle around a certain level. This assumption, however, has proved unreal and many Government servants of the lower cadre, and those in the middle income groups, have had to put up with higher living costs. The industrial workers have been relatively well off inasmuch as their wages have been linked to the cost of living indices. They can also, in addition, bargain with their employers through their trade unions. Government servants, on the other hand, however justifiable their cause may be, are unable to make themselves vocal and perhaps the only way their lot can be improved is by official initiative, viz., by the appointment of an impartial commission.

Merely cutting down the higher salaries does not solve the problem of pay scales. The main question is one of fixing a basic minimum below. This is necessary not only from the standpoint of social justice but also from the point of view of efficiency. What the ceiling and the floor should be will have to be carefully examined by an impartial commission. Indiscriminate slashing down of higher scales of pay may create fresh problems. Thus, unattractive scales of pay may discourage really competent men from entering Government service. This is particularly to be avoided since, consequent on the extension of the public sector, the Government needs talented and capable administrative personnel.

Then, there is the question of regional disparities in the remuneration of identical services. Although the first Pay Commission emphasised the need of uniform scales of pay all over the country, the disparity between the Central and State pay scales, for instance, persists, and cannot be removed all at once without upsetting many things, including morale. All these add to the urgency for an inquiry.

A Crack in the Zonal System?

THE Ministry of Railways carried through the regrouping of Indian Railways into six huge zones of nearly 6,000 miles each in the face of stiff opposition from the knowledgeable quarters. It is no secret now that even the then Chief Commissioner of Railways, Shri K. C. Bakhle, and many other experts of the Railway Board opposed the zonal system. But the high-up advocates of the zonal system talked then of economy in the cost of administration, particularly on the side of management. They had probably closed their minds to the question of efficient working of the railways. But the hopes of economy in the cost of management seem to have been belied. True, the regrouping of railways into a smaller number of larger units, has resulted in the reduction of a few posts of heads of departments. But this has been practically offset by an increase many times in the number of posts of various deputy heads and officers on special duty.

Indian Railways had been divided into six zones on geographical and political considerations, with the arithmetical yard-stick of 6,000 miles for a zone. The question of traffic requirements and operational efficiency had been ignored. It had to be faced after all. The Railway Ministry has now announced the formation of a seventh zone, namely the South Eastern Zone, consisting of the old B.N.Rly from August 1, 1955. There is more of it in the offing. The Railway Minister said that "certain adjustments within the existing organisational set-up of some of these zones would be carried out gradually." Once the Railway grows out of its concept of geographical unit, the entire system may be re-organised on the more rational basis of operational efficiency and traffic requirements.

Emergency in Calcutta Port

DOCK labour in the Calcutta Port has gone out of control of both the Dock Labour Board and the dock labour unions. It had gone so slow and as a result, clearance of cargo had slowed down so much that the Port Authorities were compelled to declare an emergency under the Dock Workers' (Regulation of Employment) Act, from Monday last. The go-slow movement had been planned well ahead, and it has brought down the volume of work on the docks by fifty per cent. This would affect Indian shipping and Government is naturally perturbed, whether the threat of imposing a surcharge held out sometime ago by foreign shipping lines is justified or not. But authorities are still in favour of restraint and reluctant to use the special powers granted by the Act, such as suspension from work or dismissal from service, after a summary enquiry. They are seeking, instead, the good offices of the labour unions to restore normal working. And with this end in view, time has been given for labour leaders to explain the situation to workers, though the emergency came into effect forthwith along with the declaration.

Complaints of go-slow tactics, on the part of dock labour whether in Calcutta or Bombay are not new. The surprising feature this time is that labour unions are not supporting dock labour. On the contrary, according to the Chairman of the Calcutta Dock Labour Board, two of the unions have not only openly disapproved of the go-slow methods but have gone to the extent of recommending strong measures against the offenders. A third union has denied responsibility for sponsoring the movement and has disowned it. Go-slow by dock labour under these circumstances can mean one of two things; either the labour unions have lost control over their members, in which case they can no longer represent the labourers or the unions are secretly supporting the 'movement' while denying in public all complicity with it. In either event, it would be futile for the Port Authorities to seek the good offices of the labour leaders to persuade the workers to give up their go-slow methods. For, if the former is true, their influence will be limited; if the latter, there is no point in taking them into confidence. Therefore, as a short-term measure, declaration of an emergency may serve the immediate purpose in view; but it would be

necessary to uncover the real organisers and leaders of this 'movement' which threatens to paralyse shipping in the face not only of lack of support but positive opposition from the so-called representative labour unions.

Economic Frame-work of Social Security

AT a crucial stage of its growth, industrial labour shapes its links with land. Though Indian industry has now got a stable labour force and absenteeism or seasonal migration is no longer a seriously disturbing problem for management, industrial labour still retains its link with laws and its social ties—family organisation, relationships and caste affiliations—though subjected increasingly to varying pressures, have not changed basically. The economic aspects of these relationships are not known as clearly as one imagines or one would desire.

The surplus hand in the family not needed for cultivating the peasant holding leaves the village to earn wages in town. He sends remittances home to supplement the meagre family income and provides the much needed cash to meet the obligations that have to be discharged in cash—land revenue, cesses and debts incurred in money. Industrial wages, to this extent, 'subsidise' deficit peasant farming. But the story does not end here. The earning member of the rural family working in industry may fall sick, become disabled and is eventually dismissed or retired. Then he has nothing else to fall back upon, has to return to his village and has to be supported by his family. At this stage it is peasant farming that subsidises industrial labour. This is one type of relation, over-simplified. There are others. In the 'bustees' and 'chawls' are also families who are completely uprooted from land and have no longer any roots left in the village. To what extent industrial labour is drawn from landless agricultural labour families is yet an undetermined quantity.

For this real industrial proletariat to grow into a healthy, stable labour force, industry must not only have to pay a living wage but provide all those other minimum of requisites necessary—deceptively called benefits—for such labouring families to survive and develop. To the extent industrial labour is thrown on its own resources, social security becomes an unavoidable necessity. Labour that industry needs has to be supported

by it. In the last analysis, the problem is one of costs, of hard accountability. How much of this cost is paid in the form of wages and how much in benefits, how the costs of these benefits are shared between Government and employers—these are matters of detail. Benevolence, philanthropy and benefits beg the question, do not answer it. Slowly, under the pressure of hard facts, the concept of social security is taking shape in this country also and in that process, shedding the aura of benevolence which so long obscured it. Not Beveridge at one remove, but 'chawls' and 'bustees' are giving shape to it. Against this background has to be viewed the slow development of social security measures.

The First Step

THE development of anything like social security in the modern sense in India is very

REVENUE :

The Indian Tea Industry contributed to the National Exchequer Rs. 19 crores as export duty, and over Rs. 3 crores as central excise duty in 1954-55. Besides, it contributed large sums by way of State income tax, agricultural tax, road tax and certain imposts.

recent. It was only in 1927 that the Government of India first thought of the problem but it was not until 1943 that some kind of a scheme was actually taken up for consideration. Prof B P Adarkar submitted a scheme of sickness insurance to the Government in 1944. On the basis of this scheme, a Bill was drafted in 1946, and this emerged in 1948 in the form of the Employees State Insurance Act. Although it was intended to introduce the scheme in 1950 according to a phased programme, beginning with Kanpur, opposition from Kanpur employers put off its implementation until 1952; in that year, the scheme was inaugurated at Kanpur by the Prime Minister. This was the first step towards social security not only in India, but in the whole of South-East Asia.

The Act provides five types of benefits viz., medical, disablement, dependents, sickness and maternity. It is applicable to all perennial factories employing 20 or more persons and using power, and covers all workers, including clerical staff, (the legality of this provision is now in dispute) whose total emoluments do not exceed Rs 400 per month. To the contributions by employees and employers, the Central Government adds as its share two-thirds of the cost of administration of the scheme, while the State Governments meet a part of the cost of medical benefits provided in their jurisdiction. The Scheme now covers about 7 lakhs persons and is in operation in industrial centres in Punjab, Bombay, Madhya Bharat, Madras, Madhya Pradesh, Uttar Pradesh and Hyderabad States. It is expected to be brought into force in all industrial centres in the country having two thousand or more factory workers, by the end of 1955-56.

The Employees Provident Fund Scheme, which came into force in November 1952, concerns the employees of factories which employ 50 or more persons in six principal industries viz. cement; cigarettes; electrical, mechanical or engineering products; iron and steel; paper and textiles. Government factories or factories belonging to local bodies and factories that have not completed three years, are excluded from its operation. This scheme is also run on contributions from employers and employees and a part of the cost of administration, here too, is borne by the Government. It has so far covered some 15 lakhs of employees in 1900 factories.

Unemployment Insurance

THE Government of India has now under contemplation an unemployment insurance scheme which will complete the frame-work of social insurance in India. The Working Group on Unemployment Insurance, which has prepared this scheme, has suggested that it should be integrated with the existing State Insurance and Provident Fund Schemes and that all the three should be under one unified Central Administration. This Scheme is modelled more or less on the two existing schemes, and is to run on contributions from employers and employees; the contribution of the Government being restricted to the cost of the administration of cash benefits. Being a contributory scheme, only those who are employed come under its purview, and not those who seek employment. It is to apply, in the first instance, to those drawing monthly salary not exceeding Rs 400, and employed in factories using power and employing 20 or more persons, mines and shops and commercial establishments covered by the Shops and Commercial Establishments Acts. It is to

be subsequently extended to plantations and other categories of workers, but will exclude those in seasonal factories, apprentices, domestic servants, casual workers and agricultural labourers.

The cash benefits to be given under the scheme would be about 50 per cent of the wages (including dearness and overtime allowances) for a period of 13 weeks in a year, subject to certain conditions.

The cost of the scheme is estimated at about 3 per cent of the wage bill. Taking the total wage bill in 1953 of factories under the Factories Act, viz., about Rs 266 crores, it would amount to Rs. 7.9 crores. Of this, employers have to meet 2/3 i.e. about Rs. 5.3 crores and employees the balance of Rs. 2.6 crores. The contribution per worker will amount to about Rs 11 per annum.

To complete the picture, one should also bring in housing but provision of housing for factory hands has not made sufficient progress to fill up an appreciable part of the gap.

Company Law Administration

THE Joint Select Committee on the Companies Bill has recommended in its report to Parliament, that Government should set up a separate Secretariat Department, functioning within the Ministry of Finance, to administer Joint Stock Companies and other related subjects.

The volume and importance of the work relating to the administration of companies consequent upon the passage of the Companies Bill, will be such as to require the setting up of a fairly large organisation. The Government of India has decided to accept the recommendation of the Joint Select Committee to create a new Department within the Ministry of Finance, which will be known as the Department of Company Law Administration.

The responsibilities of the new Department will be as follows:—

- (i) Joint Stock Companies including
 - (a) Company Law and Investment Administration;
 - (b) Capital Issues Control; and
 - (c) Chartered Accountants.
- (ii) Stock Exchanges
- (iii) Finance Corporations including
 - (a) the Industrial Finance Corporation;
 - (b) the Industrial Credit and Investment Corporation; and
 - (c) the Rehabilitation Finance Administration.

Suburban Electric Supply

IT is interesting to find at least one Chairman of a company not complaining either about the amendment to the Constitution or the proposed amendments to the Companies Act. We have it on the assurance of K G Milne, Chairman of the Bombay Suburban Electric Supply Ltd., that at least so far as distribution of electricity is concerned, neither of the two hold any threat to the operation of such companies.

Mr Milne's main points are upgrading of the "standard" rate of return and the eminently reasonable one that companies such as his should be allowed to create a deferred taxation reserve, in the absence of which the tax benefit intended to be given in the form of developmental rebate to all companies, irrespective of the nature of their undertakings, is largely frustrated in the case of electricity undertakings. From what Mr Milne says, it appears that both these claims of electricity undertakings (or is it only the latter, the one about the deferred taxation reserve?) have been accepted by the Government in principle and it is now only a matter of drafting the Bill and putting it before Parliament.

Apart from the light it throws on the financial side of electricity operations, the experience of the Bombay Suburban Electric Supply provides as good a measure as one could expect—and as bad a condemnation of the policy decisions responsible for it as one could think of—of the shortage of electricity that has withheld development. Sales of energy by the Suburban Company went up by nearly 24% last year and the sales the year before were 23% higher than in the last year. This substantial increase was made possible by a limited relaxation of certain restrictions, even though stringent controls are still applicable to demands for new connections. These figures also suggest the magnitude of the pent-up and as yet unsatisfied demand for electricity in Greater Bombay and the arresting effect of power shortage during all these years on the industrial growth of the city and suburbs.

While welcoming the relief expected from the decision to permit Tatas to instal a second plant at their Trombay station, Mr. Milne, however, is doubtful about supplies to be expected from the commissioning of all the three sets at the Government Power Station at Chola. More power, it had been expected, would

be available to industries, both new and old, from this source, but it does not appear likely that the supply can be drawn from this and made available to consumers except during special hours, at least for the time being, that is, until the Chola power station begins to work to full capacity and satisfactorily.

Low Morale of General Insurance

CAN men be made good by laws, or only by inner regeneration? Opinions have sharply differed through the ages and men have trudged along somehow driven by the twin goads of love of God or moral precepts on the one hand and law-courts and prisons on the other. So there is nothing surprising that even from the Chair should come weighty pronouncements on the folly of trying to improve the morale of general insurance business by enforcing a Code of Conduct. Speaking at the last Annual General Meeting of the Universal Fire and General Insurance Co. Ltd., Shri P. U. Patel said:

"Mere framing of rules cannot help any one. In fact, the remedy appears to have proved worse than the disease itself and it is time that the Code should be scrapped altogether. Tightening the machinery still further or promulgating more restrictive measures, can never lead us nearer to our goal. While I am readily prepared to concede that 'rebating' is one of those great evils which should be eradicated, I am afraid that no satisfactory results can be achieved unless the morale of the trade as a whole improves to the desired extent. And since you cannot possibly improve people's morals by merely passing laws or enacting pseudo-legislative measures, it is best to think of other ways and means of achieving the objective everyone has in view".

Now what are the other ways and means, in the particular case of rebating for which the big bad wolf is to be blamed? Competition for general business is keen but it is a competition between unequals, the big insurers and the small insurers. It is the big ones who break the rules of the game and the smaller ones, fighting with their back to the wall for their very existence, have to yield in sheer self-defence. So the moral of it is the need for restraint, to be voluntarily exercised, on the part of the big insurers who have huge reserves and powerful connec-

tions. But Shri Patel tempers his philosophy with common sense and does not spurn experience. The solution he has to offer is not an appeal to the moral sense of the strong alone; he would buttress it by reducing the prescribed "slabs" as to cost (in the General Department) in a downward direction. He feels that if the slabs are reduced by anything up to 10 per cent, companies will show a marked improvement before long and the financial position of Indian insurers will be considerably strengthened. "The reduction in the slabs will automatically lead to reduction in the cost of procurement of business. The evil of rebating will also receive a definite check and if it cannot be eliminated altogether, it will at least be less rampant than before". The suggestion appears to be sensible. It should provoke discussion even though it may not win immediate and universal acceptance.

In the Brave New World

THE quick passage of the Indian Coinage (Amendment) Bill seeking to introduce the decimal system of coinage in the country by the Lok Sabha and the manner in which it was debated would suggest that the measure was brought to the Legislature merely as a formality to comply with the procedure of legislation. There was little opposition to the Bill, and the little that there was, melted away after the Prime Minister's spirited defence of the measure. If, as the Prime Minister said, there is no question of eliciting the views of the people with regard to scientific and technical matters, one wonders why the Ministry of Finance should take the trouble of framing a Bill and undertaking the laborious process of piloting it through both the Houses of Parliament. The Finance Department or the Reserve Bank could have just issued a circular announcing a changeover to the decimal system of coinage.

The Prime Minister very easily disposed of the question with the statement: "One does not consult the country about mathematical formulae or the theory of relativity". Is the issue so axiomatic or is it one whose

validity is unaffected, whether people like or not. A scientific theory is not a value judgment, the choice of the decimal system is. If people think that it is not to their advantage, they may reject it, by the power of votes, even if it is in fact advantageous. However, to point out these deficiencies about the manner in which the Bill was hustled through Parliament, is not to dispute the merits of the decimal system.

The need for a standard, scientific and internationally recognised system of coinage as well as weights and measures is accepted and widely recognised, and the adoption of the decimal system as a first step in this direction is to be welcomed. Apart from the sentimental consideration that the decimal system was India's gift to the world, its adoption will be particularly timely in view of our development plans and it may speed up the country's progress. Accounting would be simplified by the adoption of the decimal system. An expert committee examined the issue and reported in favour of the system. It had also been proposed at an earlier stage to introduce the metric system of weights and measures first and then follow it up with

decimal coinage; but in accordance with the recommendations of the Indian Standards Institution, change in coinage was taken up first.

The rupee will continue to be the standard coin but how centimes are to be named, remains to be decided. The pice may retain its name and undergo a change in value from $1/64$ th to one-hundredth of a rupee. Half-rupee and quarter rupee would be respectively equivalent to fifty and twenty-five units of the rupee. There would be no change in the value of the half rupee and quarter rupee; the changes would be in respect of the coins of lower denominations.

During the period of transition, there will be many difficulties and a great deal of confusion created by the circulation side by side of both the old and new coins; the two systems of accounting also will not come to an end so soon. Except that the new accounting will be simpler, the heroic effort of being scientific and keeping pace with the times is bound to prove arduous. Habits are hard to change, particularly currency habits, and to unlearn the method of counting one learned at school is the hardest of all.

From the Calcutta End**Sex and Education**

SOME TIME, some day, somebody would do for India what experts have done for America, and are now doing for Britain. Only then, the behaviour pattern of the Indian male and the Indian female will be known. Findings of the elaborate census reports must necessarily be the primary raw material for such an investigation. Information based on these data will have to be supplemented by detailed personal investigation on the Kinsey model. Any such study will require the co-operation of sociologists, anthropologists, psychologists and psychiatrists.

Such investigations made so far in some countries have invariably stressed the sexual aspect of human behaviour. This raises a fundamental social problem. Is sex or hunger the most urgent human urge and instinct? Some of the findings of the Department of Anthropology of the Calcutta University on the Great Famine of 1943 would seem to deepen doubts as to whether hunger or sex is the most primordial human instinct.

Sex And Hunger

It is customary to bypass this basic sociological issue by drawing a close co-relation between these two instincts. Some of the Bengali short stories and novels on the Great Famine reflect this theory. Irresponsible, and mostly unconfirmable, gossip about the social behaviour of the refugee population emphasises this theory. Learned treatises have been written to establish a close co-relation between poverty and the world's oldest profession. But one may be excused in having one's doubts about this economic interpretation of the male's or the female's social or sexual behaviour.

It is neither the purpose nor the intention of the All-India Institute of Hygiene and Public Health, Calcutta, to prove or to disprove the existence of any relation between hunger and sex. Some of its findings may throw interesting side-lights on this problem. But in a recent study made by the Institute, it is mainly concerned with the relative responses and resistances to diseases of the Bengali male and the Bengali female. This study also reveals interesting details about some aspects of the sexual behaviour of the Bengali male and the Bengali female.

Though the Institute's investigation has a close bearing on West

Bengal's population problem, some of its findings reveal interesting differences in the behaviour pattern of rural and urban Bengal, and of Bengalis classified into caste, creed, religion and sex. Its inquiry into the productive pattern of the Bengali female shows that female fertility is higher in rural than in urban areas. But caste differences, which are reflected either in late marriages or in differences in age between the husband and the wife, "have little influence" on the reproductive pattern of the Bengali female.

Pattern of Reproduction

From the Institute's investigation, it appears that the average number of pregnancies a Bengali woman has by the time she reaches the end of her reproductive period is 7.9 in the rural group and it varies from 5.7 to 6.3 in the urban group. Findings of the Institute show intriguing differences in the pattern of reproduction between rural and urban groups, as also between Hindus and Muslims in West Bengal.

It is only to be expected that economic factors have an appreciable influence on female fertility. Nor is it surprising to know that education has a close inverse relation to fertility. But the Institute's study indicates that these influences do not affect the Muslim community as much as the Hindus.

For investigations on the pattern of reproduction, 8,510 women were selected for examination from three areas in Calcutta and a rural area near the city. For the Institute's public opinion survey on the attitude of men to planned parenthood, 4,075 men representing different social groups were examined. Detailed findings of the Institute's investigation will be discussed on a future occasion.

Education System

During British Raj, education in India was based on the British model. Every district had a Zillah School. Every Presidency had a Government College. Almost all important district towns had missionary schools. Almost all Presidency towns had missionary colleges which used to specialise in the teaching of science. Gradually, many private schools came into existence. Later, many private colleges were established.

Zillah Schools and Presidency Colleges were patronised and financed

by the Government. Private schools and colleges had to fend for themselves. Much later, a system of grants was introduced. Many private schools and colleges received financial aid by way of grants. Though the institutional pattern of education in independent India remains as it was during British Raj, there has been some improvement in the last few years.

Zillah Schools remain. But almost all private schools now receive more liberal Government aid. School teachers are now as militant as any other militant trade union. Last year, Calcutta's and Bengal's school teachers staged demonstrations which were as determined as those organised by trade unions. Most of their demands were conceded by the West Bengal Government. In theory, the State now accepts responsibility for primary, secondary and post-graduate education. In practice, it pleads lack of finance for not doing more than it does.

Private Colleges

At Naihati, during the last week-end, West Bengal College and University Teachers' Association held a Conference to formulate demands on the State. Its demand is that collegiate education (Intermediate and under-graduate) must be as much a State responsibility as primary, secondary and post-graduate education. At present, dearness allowances of teachers of private colleges are paid by the State. These institutions receive some Government aid for improving library and laboratory facilities. Private colleges depend mainly on students' fees. Their demand is that they should receive more financial aid from the State.

In 1949, the University Education Commission recommended that the "National Government has to ensure the maintenance of these institutions (private colleges), which are now wholly dependent on students' fees, on a proper financial basis". In demanding that the State should assume full financial responsibility for running private colleges, the West Bengal College and University Teachers' Association relies on this recommendation by the Commission. It accepts the responsibility of the colleges to re-organise themselves according to a plan agreed to by the Government and the University before the State assumes full financial obligation to run these institutions.

From the London End

Mr Butler's Gentle Axe

ONE of the main features of the programme announced by the Chancellor of the Exchequer this week for combating the menace of inflation internally and for strengthening the sterling is monetary discipline on orthodox lines. The aim is to damp down the internal demand for goods and services by a tightening of monetary controls. One of the measures was the raising of the deposit required from purchasers in instalment payment transactions over a wide range of consumer goods, with the purpose of reducing the credit element in such deals. This part of the Government's programme, however, reflects in an important sense lack of confidence in that type of monetary control which the Conservative Government had first used in 1951. The new measures rely very much on direct compulsion instead of allowing great stringency to seep into the body economic, through change in interest rates.

The Government's programme has the aim of bringing down internal demand to within the limits set by the supply of resources. This is to be accomplished by curbing Government spending and the spending of local authorities, nationalized industries, private industry and commerce and of the general public. It is in the implementation of this curb that the difference between a pure monetary policy of the 1951 variety and the new departure can be seen. The cut in Government spending is to be brought about by a Treasury instruction to Government Departments to restrict expenditure on both capital and current account. Appeals are being issued to the local authorities "to hold back their schemes for capital expenditure as far as they can". Nationalized industries are being instructed to postpone expenditure on capital projects "as far as possible" and to finance some of their capital requirements from internal resources i.e. by raising the prices of their products and services. In order to restrain spending by industry, Bank of England is issuing an appeal to all commercial banks to curtail their credit facilities by a "positive and significant reduction in the total of loans outstanding."

These measures are to be compared with those adopted in the first half of this year. When symptoms of inflation began to appear at the turn

of the year, the Government's first reaction was to turn to its bank rate weapon and accordingly in two bold strokes the whole complex of interest rates was pushed up. The Government attempted to correct the economy by raising the cost of money through the adjustment of bank rate and through an official squeeze of the credit base to bring the banking system under pressure to restrict its lendings to the public. Now, however, Mr Butler has come to recognize that these monetary controls (through the bank rate) have been slow in restoring equilibrium in the economy and there can be little doubt that Whitehall has come to recognize that informal control through the banking system is no longer sufficient to stem the tide, either of inflation or deflation, in an environment increasingly insensitive to the cost of money.

Apart from this, there are other reasons why the authorities have come to realise the need for a change in their system of controls over the economy. The rapid economic recovery which followed the application of the new monetary policy in 1951 had certainly deceived the Government. They thought that the orthodox credit controls could always be counted on to cure economic problems at short notice. In fact, however, the new monetary policy was only partly responsible for the 1951 recovery. The improvement in the country's economic position, then, was helped by a marked turn for the better in the terms of trade and by the inauguration of a series of quantitative import restrictions by the overseas sterling countries. In the current year none of those features have been present to assist Mr. Butler's monetary policy.

It cannot be questioned that monetary policy could produce bigger results if the Government were prepared to carry it very much further than it has up to now, but it had to be very much further; maybe it would have required an increase of bank rate up to 7% coupled with a sustained credit squeeze at the very base of the British banking system. The costs of such a policy are, however, unlikely to be small and maybe the alternative now being tried out is a recognition by the Government that the cost of a 4½% bank rate is already too large for the country to bear.

Mr. Butler's denial that he is contemplating any widening of the exchange rate for sterling, however, appears in retrospect a bit hypocritical. The expert committee of the OEEC has reported on the new form which the European Payments Union should take when those countries possessing 15% of the quotas in the Union decide to restore the convertibility in their currencies. A plan for the European Monetary Agreement (which replaces EPU) clearly provides for what the British had explicitly demanded throughout the tortuous negotiations in Paris last month. Floating exchange rates up to about 3 or 4 per cent either way of the parity will be permitted, subject to the IMF's approval. If this does not suggest that the United Kingdom was thinking in terms of floating exchange rates, then it is difficult to see why British demands were so militantly fought for on the OEEC Council of Ministers. Every foreign exchange dealer on the continent was able to take a logical and justified cue from the OEEC discussions and not even Mr Butler can question their actions after reports of what he said and what he demanded from his European colleagues at the fateful June gathering of the OEEC Council of Ministers.

dence of the people at the bottom in it that it may dissolve into a group of warring sectional interests with subsequent chaos.

Small Constituencies

To an Indian, the number of people voting in each constituency must seem absurdly small. The largest number of people voting in any constituency was only 30,000 and in some places there were only 8,000 voters who would have had to be approached by candidates. In a situation such as this, it should by no means be impossible for the Government to be really democratic with each member knowing every voter. Whether this will give rise to a genuine Greek polis or to opportunities for bribery and corruption remain to be seen. The final test of a democracy anywhere is, after all, the moral attitude of the individual elector towards certain practices. Even Greece at the time of Socrates, could not restrain the selfishness of its own citizens. Perhaps Malaya will be more successful.

Alliance Wins Malayan Elections

(From Our Singapore Correspondent)

THE UMNO in the Federation of Malaya has just won a resounding victory. It has gained all the elected seats in the Malayan Legislative Council except one. The Council consists of 99 members, of whom one is the speaker, 46 are nominated and 52 elected. This was more than was expected by any of the electoral prophets. The UMNO or Alliance, as it is called, consists of representatives from the Malay National Congress, the Malayan Chinese Association and the Malayan Indian Congress. The principal opponents of the Alliance were the National Party (Negara) whose president Datok Onn bin Ja'afar was soundly defeated in the Johore Bahru constituency. In fact, not a single candidate of Negara party was elected anywhere in the Federation. The only successful candidate not belonging to the Alliance was a member of the Pan-Malayan Islamic Party. His success may almost certainly be ascribed to his high prestige among his constituents and his long residence in Krian as a teacher.

Of the successful candidates 15 were Chinese and one Indian. The remainder were Malays. This is a higher proportion than the proportion of voters would lead one to expect—88% of the voters are Malays and 12% other races. When one considers that there are about an equal number of Chinese and Malays in the Federation, those entitled to vote under the present constitution cannot be more than half of those who would be entitled to vote under a residence qualification alone. It thus shows the good sense of the Malay leaders of the Alliance that they recognise that this discrimination against half the population cannot last indefinitely. The acknowledgement that there are Chinese and Indian Malayan citizens is thus recognised in the number of elected candidates chosen from other races.

Party Programmes Not Communal

Shortly before the elections, the "Economist" had remarked that the programmes of the various parties in the elections was one entirely of a communal character. In my opinion this was not by any means the case. The British Government laid down as one of the conditions for independence of Malaya that all races should work together in harmony. Consequently if the Malays really

wanted independence they had no alternative but to work together with the Chinese and Indians. Since the smaller parties did not adopt this plank in their platform, the Malays could not vote for them if they wanted independence, no matter how much their sympathies might lie with such a cry as the defence of Islam. The overwhelming victory for the Alliance is thus partly a result of the systematic plugging of racial amity as a theme by the British Government. But there is also a real sense in which the Malays are just sick of the colonial government. They are perfectly willing to admit that the British are good engineers and road builders and that they have done a lot for the country. But the enormous bureaucratic machine with the rapid turnover of expatriates and continual pressure on the Malays to do this and do that without anything ever being completed properly, make them feel that they want to do things in their own way for a while. Also one cannot overestimate the enormous influence Indonesia has on the Malays of this country. They are not especially interested in the alleged inefficiency and economic disorder in Indonesia but they do admire the general progressive and go-ahead attitude of the Indonesians who come over to this country and settle down. They wish to model their country partly on this Indonesian model. This admiration for Indonesia and the lack of desire to become little Englishmen explain the UMNO victory.

Strong Discipline

Yet to attain this aim, each party allying itself to UMNO has had to tighten up its discipline. A few weeks before the election, the leader of UMNO, Tunjku Abdul Rahman, had to reprimand his supporters for asking for Indian and Chinese candidates in the same proportion as the number of voters. One party organiser in Kuala Lumpur was expelled for calling on electors to vote only for Malay Alliance candidates instead of for Alliance candidates. A member of the Malayan Indian Congress had to be expelled. He claimed that the whole of the Federation had learnt democracy from India and that it was unreasonable that the inventors of the system should have only one candidate standing. As the real inventors of Asian democracy, they should have

many more. These stirrings have been quashed by expulsion or internal discipline. Adul Rahman stated before the elections that he intended to abolish the various racial associations after the elections and to unite all together into one political organisation. This may be more difficult than he thinks.

Demand for Complete Independence

The new constitution for Malaya was designed in such a way that if there were two parties in the Council, whichever one was the opposition could combine together with appointed members to defeat the Government. The overwhelming success of the UMNO means that this "safeguard" will not work. If UMNO so wished they could now push forward their view against all opposition. But to date they have been noticeably silent about their future policy. It seems certain however that, at the beginning, they will go slowly. They have given as their aim complete independence within four years but, even within this time, it is possible that certain decisions may have to be taken which will evoke wide differences within the party. In the case of the Malayan Chinese Association and the Malayan Indian Congress, it seems by no means certain that they will be able to carry the majority of Chinese and Indians with them. In the case of both these bodies, the organisers are Chinese and Indians who have been long established here as wealthy merchants and traders in Malaya and they see participation in UMNO as a chance to extend their influence even further. They are very largely out of touch with the poorer sections of their own communities (who are very numerous) and with more recent immigrants.

Paradoxical as it may seem, the real future of UMNO as a government really depends on the ability of these two bodies to democratise themselves so that they really do represent the people they claim to represent. Otherwise the more recent Chinese immigrants (represented by the Communists), the nationalistic Malays (represented by Party Negara), and the poorer Indians (represented by Plantations Workers' Unions and certain Trade Unions) may, by systematic sniping at the Government, so undermine the confi-

(Continued on previous page)

U S Peace Economy Booms

(From an American Correspondent)

THE gradually diminishing intensity of the 'cold war' augurs well for the American economy. The auto-makers have been expanding their production for quite some time and are now planning to increase their productive capacity. General Motors announced a 500 million dollar expansion program; it brings the company's postwar expansion program to \$4 billion. Ford and Chrysler are also spending \$625 million each for expansion this year. According to Time Magazine, Oldsmobile will expand its engine plant capacity 50%. Buick will boost annual capacity from 750,000 cars to one million cars.

These trends are evidence of the great confidence American auto-makers have in the US economy and their own industry. Living standards are gradually rising and more and more people are buying cars, better cars. Therefore, the automobile industry feels that it should increase its capacity to meet rising consumer needs.

In the steel sector operations have been pushed almost to capacity, so that additional increases are a physical impossibility. There is a good chance that the steel output can be maintained at this high level in the near future. In several instances export orders have not been filled because commitments at home have been very heavy.

The third of the 'big three' in American industry is the building industry. Here too the situation is excellent. The volume of plant investments in business is increasing and consequently bringing good business to the building sector. Greater investments and expansions, particularly in the chemical industry, will undoubtedly affect building favorably.

The over-all picture of the American economy is bright. However, there are a few black spots. These include declining farm incomes, the rapid expansion in consumer debt and the failure of employment to keep pace with rising production. Some people say that there are monetary trends which might be interpreted as symptoms of inflationary developments; however, these are very small in their impact and overshadowed by other more important factors.

Agriculture has not responded with improvements in other fields of the

economy. The net receipts from farming this year might be about 5 per cent lower than last year. But each year the farm income is spread around a smaller number of farmers.

The farming problem has come more and more to the limelight of politics in the USA. It may even become the central domestic problem in next year's election campaign, particularly if general business activities remain favorable and agriculture is the only sector of the economy where the opposition has cause for grumbling.

High price supports have led to a huge accumulation of farm surpluses in Government hands. The Commodity Credit Corporation investment in farm products is expected to reach an all-time peak after the harvest. The losses incurred by the Corporation are rising continually. Storage charges rise sharply as the Corporation takes title to defaulted commodities; they are now running approximately \$1 million dollars per day. The Corporation has to sell products below their cost of acquisition. Stocks are deteriorating and charges for processing items to be sold or given away run heavily. Selling and buying costs are also considerable.

There has been some criticism about the piling up of surpluses and costly supports. The opposition came mainly from consumer groups and tax payers. They point out that the farm population of the United States comprises only about 1/8 of the total population.

According to law farm surplus products cannot be sold domestically for less than 5 per cent above their current support prices plus reasonable carrying charges. Current production is more than enough for immediate needs. Consequently, there is little chance for sales in the domestic US market.

It was natural for Parliament and the Government to look for markets abroad. In January this year the United States offered to sell butter for export on a competitive bid basis. This, of course, led to concern, and several nations felt that their markets would be upset. What followed the attempts to develop markets for 'butter oil' (ghee) in India, Pakistan, Burma and other Far Eastern countries must be too well known to the readers to need recounting here.

In the United States labor market conditions have undergone a definite improvement; a serious work stoppage has been averted in the automobile industry. However, it must not be forgotten that the demands for a decisive improvement in working conditions which were raised by the automobile workers will soon be echoed in other industries. The general trend points toward strides in social improvement. The establishment of a higher minimum wage is only one of the steps in that direction. The extended coverage of social security payments to groups which so far have not benefited from this system is another measure. There is no doubt that demands for social advancement will continue to be voiced and that American industry will have to take them into account.

Forecasting Failure of Effective Rainfall

Rainfall and Famine: A Study of Rainfall in the Bombay Deccan 1865 to 1938

by Harold H. Mann: Indian Society of Agricultural Economics, Bombay, 1955—Pages 49—Rs 2.

DR. MANN is one of those few Britishers who made an effective but silent contribution towards the development of Indian economy during the British days. His pioneering studies in the socio-economic aspects of rural life are too well known to need any mention. In the field of applied agriculture he has publications like 'The salt lands of Nira valley' (1910) to his credit. And now at this advanced age of 85 it is remarkable indeed that he had the tenacity, intellectual curiosity and the zeal for undertaking such a comprehensive and painstaking research project as the one, the results of which are embodied in this monograph.

In his preface Dr. Mann relates the genesis of this study. His attention was first attracted to the relationship between rainfall and famine in India by his experiences in 1918 when Deccan districts experienced the worst famine since 1899. During June and July of that year, the usual monsoon rain held off. Anxiety grew greater and greater, but the authorities were helpless. All hoped for the best, and no serious preparations were made for a serious failure beyond those which were normally in operation. By September it was evident that a severe famine was imminent. It came, and the ensuing months were a nightmare.

Dr. Mann was at that time in charge of the Department of Agriculture. He could not forget the horror of those months and wondered again and again whether it would not be possible to forecast, with reasonable probability, such a failure of rain as was likely to lead to a famine. If so, much could be done to mitigate its effects so far as the cultivating classes were concerned. All this was emphasised by the occurrence of a second serious famine two years later.

These events set him on to study the rainfall records ever since they were taken, along with a measure which he had devised to assess the "goodness of the rainfall" from the agricultural point of view. The study proved much more difficult than Dr. Mann had originally imagined, but he worked out "views

as to the figures that really mattered" and finally put the whole together on the basis of data up to the year 1926. He did not, however, publish the results at that time. After retiring to England in 1927, he collected the data between then and 1938 in order to check against them how far the conclusions he had drawn could be co-related with what happened in the next 10 or 12 years. One can only be amazed at his devotion and grit and offer him the solace, if one may,—but a practising Yogi like him may not need it—that research consists more of detection of our own errors than of successful trials, for Dr. Mann did not get the results by which famine could be forecast with reasonable probability and which could give the authorities the clear lead that he had hoped for. He finds the results disappointing in many respects. But they indicate the times when famines are most likely, the character of the rainfall which will lead to scarcity (which will not always be when the rainfall appears very short), and the conditions when shortage of rain is most likely to lead to failure of crops.

The basis of much of his argument, notably the calculation of that portion of the rainfall which is likely to be effective, is empirical. But the author can justify it by saying that it is based on many years' experience in studying the agriculture of Bombay Deccan.

The analysis of the data relating to rainfall attempted in this monograph was originally intended for ascertaining whether "it would not be possible to forecast, with reasonable probability, such a failure of rain as was likely to lead to a famine"; the author concludes that "it is not possible . . . to forecast at any time of the season, with a reasonable amount of probability, the further course of the agricultural season". There are, however, other very useful and revealing conclusions, which are arrived at by the author; these are given below:

1. There was no general tendency for the rainfall to increase or diminish during the seventy years from 1869 to 1938. There

have certainly been cyclic changes, though the cycle is evidently not a simple one. The periodicity is almost the same at all the stations whose records have been studied.

2. There appears to be a definite cyclic change in the amount of effective rain during the period, and the cycles seem to be getting shorter in the more recent years. Serious famines have always occurred when the five-year moving average shows a tendency to decline.

3. The date of the opening of the rainy season shows neither regular nor cyclic change.

4. There is no tendency for an early start of the monsoon to be correlated with a small effective rainfall for the whole season. If anything, the tendency is in the opposite direction.

5. The number of 'growing days' in the season shows periodic changes which correspond roughly with those for the total effective rainfall for the season.

6. As regards the end of the rains, there is strong evidence that a high total rainfall will probably be a late rainfall, and that as the effective rainfall for the whole year shows signs of being of a cyclic type, so the lateness of the rainfall seems to be also of a similar cyclic type.

After a study of this monograph, the present reviewer is left with the impression that perhaps more useful results could have been obtained if Dr. Mann had not formulated the "problem" for the study in the way he did. Instead of studying the available statistical evidence with a view to forecasting "famines", if the data had been studied from the point of view of understanding the true nature of variation from year to year, perhaps more fruitful conclusions could have been arrived at. In this publication, the author tries to use refined statistical techniques for establishing co-relationship between

(1) total rainfall.

(2) maximum effective rainfall, and

(3) "standard condition (of rainfall) for fully vigorous growth" on the one hand with the "goodness of the season" on the other.

The study is restricted to four districts Poona, Bijapur, Ahmednagar and Sholapur. The primary data—unprocessed—consists only of (i) rainfall as recorded in Poona, Ahmednagar, Sholapur and Bijapur, and (ii) the area and yield of crops as estimated by the Government on the basis of the reports received from the Revenue Department. The coverage of the sample, in the case of the former, was inadequate; in the case of the latter, the quality of the estimates, for the purpose of the refined techniques to which the data are subjected, is questionable. Further, various assumptions in regard to (1) the critical period during the growth period of crops and (2) the ability of the soil to absorb the maximum amount of rainfall are made while arriving at an estimate of "maximum effective rainfall". Similarly, while assessing the "standard conditions (of rainfall) for fully vigorous growth" various assumptions are made regarding (i) the amount of water drawn up by plants—although based on some experimental evidence—and (ii) the depth at which the sub-stratum of 'murum' or 'kanker' lies. To make the methodological basis still more vulnerable, the "goodness of the season" is assumed to be measured by the product of the total area under staple crops and the relative yield of these crops, as estimated on the basis of the report of the Revenue Department.

The data which have been subjected to such refined measures as "co-efficient of co-relation", are thus themselves in the nature of estimates, and they are inherently subject to a magnitude of error which itself needs to be measured in the first instance. Under these circumstances, it is not surprising to note that no useful conclusion could be arrived at after analysing the data. Though this is the major problem posed for the study, absence of any definite conclusion in regard to this problem does not, in the least, detract from the value of this very useful and pioneering study by Dr. Mann. It is to be hoped that Dr. Mann's publication will enthrust others to work on this number one problem of Indian agriculture.

From the Chair

Bombay Suburban Electric Supply Limited

Speech of the Chairman K G Milne

THE following is the full text of the speech of the Chairman, K G Milne, delivered at the Twenty-sixth Annual General Meeting held on July 29, 1955 at the registered office of the Company, Killick Building, Home Street, Fort, Bombay:—

Gentlemen,

Sales of energy have gone up by nearly 24% in the year under review. Last year the increase was almost 23%. When it is considered that this substantial increase has been made possible by a limited relaxation of certain types of restrictions, even though stringent controls are still applicable to demands for New Industrial Power supplies, which in the main are not yet sanctioned, one cannot help but ponder on how much greater your Company's growth would have been had an unrestricted supply of power been available for distribution. Further these figures of increase reveal the magnitude of the pent up, and as yet unsatisfied demand for electricity in the Bombay Region, and consequent on this, the arresting effect which has been imposed during recent years, on the economic growth of the area. I make these remarks in no spirit of destructive criticism, and even less in that of the "I told you so" attitude. My purpose is to stress again the vital necessity of adequate power supplies being made ready for economic development always in advance and never in arrear of needs, if our cherished hopes of rapidly raising the standard of living are to be realised. I also want to emphasise the importance of drawing the correct conclusions for the future from past experiences.

Trombay A Momentous Relief

The news which came just after your last Annual General Meeting that Government had finally decided to permit Tatas to instal a further 50 MW of power plant at their projected Trombay Thermal power station, came as a momentous relief to the worst of our anxieties for the future; but of course the earliest that this Station could go into production to relieve the present shortages would be about October 1956.

Meantime it has been suggested recently that with the commissioning

of all three sets at the Government owned Chola Power Station, more power would be available to industries both new and existing. I fear however that at the most such extra releases would have to be confined to special hours for the time being, as it is understood that the working of certain parts of this Power Station continues to be unsatisfactory.

On the 6th November 1954 we welcomed the formation of the Bombay State Electricity Board, with Mr. N. H. Hasham Premji, an experienced and successful business man, as its Chairman. I feel this to have been a notable, though too long delayed, step forward.

Company's Six-Year Development Plan

We do not think that we can be accused of any narrow vision with regard to our own arrangements to perform and extend the work we have to do, namely, to provide steady and reliable distribution of all the power which our customers would like to have, to the extent we can procure it for them. The effect of our Six-Year 1948-54 Development Plan is now being very beneficially felt. We are in a position to cater for load much in excess of that which can at present be released by the authorities, and furthermore to take on additional consumers with a relatively lower rate of annual capital expenditure on the Transmission system. The Distribution system continues to be expanded concomitantly. During the year under review, 25 new Sub-Stations were added and the transformer capacity of 12 existing Sub-Stations was reorganised. Further capacitors were added, as those installed last year brought about a considerable improvement in the overall power factor of the System, with a corresponding saving in costs.

Continues its Contribution

The Company thus continues its contribution to the progress and development of the Suburbs, now even reaching out as far North as the village of Bhayander. Unfortunately the standard of Municipal street lighting in most parts of the Suburbs still leaves a good deal to be desired, and this has been the subject of

adverse comment in the Press from time to time. We have no doubt that the Greater Bombay Municipality and the other authorities whom the Company is privileged to serve are well aware of the position, and will in the near future provide the necessary funds in their Annual Budgets to enable the street lights to be improved into line with modern standards. It will be of interest here to mention that a Technical Officer of your Company has been deputed to make a special study of street lighting developments abroad, so that we may make available the very best possible advice at all times.

Wider Issues

Looking towards wider issues, I would like to repeat to you what I have already said elsewhere, namely that I myself see no reason to think that either the recent amendment to the Constitution or the projected new Companies Bill holds out any special threat to Electricity Undertakings such as yours, subject however, I must now add, to there being no more drastic changes introduced into the Companies Bill by the Parliament which is about to begin debating it.

There is I think still reason to hope that the "standard rate" of return will soon be upgraded, though I have yet to see the Bill which we were told was to be introduced at the present Session of Parliament. The question of our being allowed to create a Deferred Taxation Reserve is, I understand, also part of the considerations before Government in connection with this Bill.

Share Capital Indian

There are some facts about this Company which I have been urged by shareholders to disclose, in order to assist in removing misconceptions. In the first place 91.7% of the share capital of your Company is held by Indian Nationals, as are the majority of seats on the Board of Directors. Over 80% of the share capital of the Agency Company is held by Indian Nationals, and again the majority of Directors are Indian gentlemen widely known and highly respected.

In the second place I would say that of the total number of share-

holders of the Company, 23% own between Rs. 100 and Rs. 500 of the share capital, and 45% hold from Rs. 600 to Rs. 2,500. Only 7% own over Rs. 10,000, and, of these, institutional investors (that is to say other companies also having many small holders) comprise almost the whole. I would commend the serious study of these figures by those concerned with the formation of new legislation and controls, in respect of joint stock enterprises and organised industry within the private sector, for they are true not only of our own Company, but of the general pattern of large concerns operating under free enterprise. What would be revealed by such a study is that far from there being an undue concentration of economic power, the truth is that the weapons of production are owned by a large and continuously increasing cross section of society, which is exactly as it should be in a democratic country poised for a vigorous advance of industrial expansion.

Labour Relations

Seven demands were made on the Company during the year by the Union, including those for enhanced wages, and bonus for the 3 years 1950-51, 1951-52 and 1952-53. As no settlement could be reached, these questions have been referred to the Industrial Court for arbitration. The subject is now sub judice, so I will not dwell any further on it. The Union have more lately also made a claim for enhancement of dearness allowance.

The Staff has continued to work for the maintenance of a high standard of service, and our thanks are as usual due to them for their efforts. I am pleased to report that it has been possible to give them a bonus this year amounting to a little over one month's basic salary.

During the year the scope of application of the Employees' State Insurance Act to your Company has been enlarged. Facilities afforded to the staff under the Act appear to be as yet somewhat unsatisfactory, but it is hoped that they will improve.

I have to report with deep regret the death of the Company's Doctor, Dr. Joseph D'Lima, who had been associated with the Company for many years.

Surcharge Not Passed on to Consumers

Coming now to the Accounts which are before the meeting, you will be glad to know that the results have

been obtained without passing on to our consumers any part of the additional 15% surcharge on the cost of power which was introduced by our Bulk Suppliers from 1st April 1954. With regard to Additional Income Tax we are hopeful of settling the issue in the Courts before very long, but I fear that any settlement of the question of shareholders' gross-up of dividends may still be a lengthy matter. The Matthal Commission commented and recommended on both these problems in their Report, which you have doubtless read.

Amendment of Electricity Act Needed

The statutory necessity to make allocations to the Consumers Benefit

Reserve and the Tariffs and Dividends Control Reserve this year, amounting to Rs. 69,933 each, has made it necessary to withdraw Rs. 19,500 from the Equalisation of Dividend Reserve in order to maintain the dividend this year. This kind of position could only be remedied if the Electricity (Supply) Act were suitably amended to increase the rate of return permissible to the Company, and it is somewhat too early yet to draw final conclusions about the future in that respect. I trust therefore that you are satisfied with the Directors having recommended a final dividend of Rs. 4 per share, making 7% for the year, which is the same as that of last year.

Agricultural Labour

I—Pattern of Occupation and Employment

ALTHOUGH the existence of idle man-power in agriculture has been discussed 'ad nauseum', and has all along been acknowledged to be our problem No. 1, no serious attempt had been made to size up the problem or to study its various aspects with any degree of precision. Is there chronic unemployment in agriculture? If so, what is its volume? Could the surplus labour be withdrawn, without any loss of production? What subsidiary occupations are followed by agricultural labourers? What is the extent of self-employment? What is the level of wages in agriculture? Is the fixation of a minimum wage possible? To these and similar questions, it had not been possible hitherto to give satisfactory answers. The All India Agricultural Labour Enquiry, 1950-51 was instituted by the Central Ministry of Labour to find out the answers to some of these questions and it would be interesting to examine the findings of the Enquiry to see how many of these questions can be answered and how reliable are the answers.

The Agricultural Labour Enquiry was to collect data on rural occupational pattern, employment, wages and income, cost and level of living and indebtedness of agricultural labourers, with a view to considering what protective and ameliorative measures, including fixation of minimum wages, should be taken to improve the conditions of agricultural labourers.

The method and purposes of the Enquiry as outlined in the Preface are as follows: The Enquiry was conducted during the year 1950-51 in three stages through three different schedules and covered 800 villages selected on the basis of stratified random sampling distributed through all the 27 States of the Indian Union. In the General Village Schedule broad data were collected on the economy of the village available either from the village records or from local inquiries and the results were published under the title "Agricultural Wages in India", Vols. I & II. The General Family Survey covered all the rural families in the selected villages totalling about 104,000 and information collected related to the size of the family, earning strength, occupational structure, size of holdings, implements and housing. The

results of this second stage of the enquiry have already been published in the volume entitled "Rural Man Power and Occupational Structure".

The third and the most important report now out deals with the Intensive Family Survey of agricultural labour families. Agricultural families are defined as those whose principal source of income is agricultural labour. Roughly, half of the families coming under this definition in the sample villages, numbering about 11,000 in all, were studied and information was collected for the period from March 1950 to February 1951, relating to employment, wages, income, cost of living, standard of living and indebtedness. The data were collected month by month for a period of 12 months and the annual figures were derived from the monthly data. The present report is the first of a series; the subsequent volumes will be devoted to the six population zones into which India was divided for purposes of the last Census.

Agricultural Labourers and Other Rural Families

According to the 1951 Census, the all-India total of rural families was 58 million, of which about 80 per cent were agricultural families. Unlike the population Census, the Agricultural Labour Enquiry takes as the unit the family and not the individual, and the rural families surveyed are divided into four broad categories, viz., land owners, tenants, agricultural labourers and non-agriculturists. The percentage distribution of the rural families, both all-India and Zone-wise, are given in Table I.

In the sample villages covered, agricultural labour families accounted for 30.4 per cent of the rural families: if the same proportion holds good for all India, the total of such

families would come to 17.6 millions. Agricultural labourers being defined as those who derive the principal portion of their income from wage employment in agriculture, they include families who may own a small plot of land or cultivate land on lease.

Casual and Attached

Of the agricultural labourers, again, some are casual labourers, who get employment from time to time according to the demand for such labour. Others are attached workers' families who are more or less in continuous employment, being under some sort of contract with their employers. Most of the agricultural labour is casual, rather than attached; for all India 84.6 per cent of agricultural labour families being casual and only 15.4 per cent 'attached.'

While half of the agricultural families holds some land, the percentage of those holding land among casual labourers is much greater than among the attached agricultural labour families. Casual agricultural labourers who hold land form 13.4 per cent of total rural families, while attached labourers with some land form only 1.8 per cent of the latter total. It will be seen later that the fact that an appreciable percentage of casual labourers holds some land also partially explains why some of these labourers prefer casual employment to the more regular employment obtainable by attached agricultural labour families.

The percentage of both agricultural families and agricultural labour families is lowest in North-West India (77 per cent and 9.8 per cent respectively); while the former category was highest in Central India (83.7 per cent) the proportion of

Table I
Percentage Distribution of Agricultural Families

Zones	Land owners	Tenants	Agricultural labourers		Total	Non-agriculturists
			with land	Without land		
North India	7.7	56.1	5.7	8.6	14.3	21.9
East India	16.3	29.9	19.0	13.7	32.7	21.1
South India	23.0	6.1	27.3	22.8	50.1	20.8
West India	44.8	18.4	8.8	11.6	20.4	16.4
Central India	25.0	22.0	14.6	22.1	36.7	16.3
North-West India	42.2	25.0	2.7	7.1	9.8	23.0
All-India	22.2	27.2	15.2	15.2	30.4	20.2

agricultural labour families is the highest in South India (50.1 per cent). And of the 6.2 million agricultural labour families in the Southern Zone, as many as 5.1 million are in the State of Madras alone. For all India, the proportions of agricultural labour families with land and without land, to total agricultural labour families are equally divided, whereas in East and South India those with land out-number those without land (See Table II).

The main reason for this uneven distribution would appear to be that in Bihar and Orissa in the East Zone and Madras and Travancore-Cochin in the South Zone, there is a relatively large proportion of small sized holdings with the result that there are numerous marginal cultivators whose principal activity is agricultural labour. It is also found that the proportion of attached labour families is very high in North and North-West India. The chief reasons for this seem to be first, that the proportion of agricultural labour families itself is relatively low being 14.3 per cent in North India and 9.8 per cent in North West India as against an all India average of 30.4 per cent. And in North West India, the proportion of land owners is also high at 42 per cent, while in North India agricultural tenants predominate (56.1 per cent). Secondly, in North India, particularly in Punjab and PEPSU, the size of holdings is comparatively large and the productivity of soil high. Hence the cultivators of larger holdings employ the available labour force as attached workers. In the East Zone also, attached labourers form a high proportion of agricultural labour. In the rest of the country, casual labourers predominate and in Travancore-Cochin, their incidence is the highest because of rapid growth of population, the extreme smallness of the average size of holdings and the glaring inequality of distribution of cultivators' holdings in the State.

The average size of the rural family is estimated at five, the average showing only a slight variation among the different zones of the country. Some members of the family are earners, while others are helpers and dependents, only the first two contributing to the family income. The number of earners and helpers is almost the same in the different categories of agricultural families; viz. 2.6 per family. However, while helpers are more important in the case of owner and tenant families (1.5), earners are

more important in agricultural labour families (2.4). Another significant feature revealed by the Enquiry is that the number of women is greater in the latter category of families than in others. Again, the size of the agricultural labour family is smaller than that of others, and dependents average only 1.96 as against about 2.80 in the owner and tenant families. Another notable finding is that in rural families, the earners other than the head of the family do not always pursue the family occupation, and the dependence of agricultural labourers on non-agricultural work is greater than in the case of others. Also, more workers in agricultural labour families take to other occupations than workers in the other types of families take to agricultural labour.

Excessive pressure of population on land has forced the earners in the rural families to take to subsidiary occupations; of the total earners in different occupations, 26 per cent have subsidiary occupations. Of the various categories of rural families, 21 per cent of the agricultural labour families have taken to subsidiary occupations. Of total earners, about a third have subsidiary occupations outside agriculture, one-sixth have agricultural labour as the subsidiary occupation and the remaining have cultivation of owned or leased land. For almost all the agricultural earners, the subsidiary occupation is agriculture. This shows the excessive pressure on land. Of the agricultural

labourers having subsidiary occupations, cultivation is the subsidiary occupation of more than 50 per cent while the rest engage themselves in non-agricultural work such as house building and repairs, road construction, carting, selling vegetables etc.

Pattern of Employment

Wage-paid employment forms the bulk of the total employment of agricultural labourers, and its volume depends on such factors as the employment status of the labourer—casual or attached—extent of self-employable resources, periodicity of labour needs in self-employed occupations, and the age and sex of the labourer. As attached workers are mostly employed on contract basis for a year or so, their wage-employment is more continuous than those of the casual labourers in whose case seasonal need is the determining factor. Again, while labourers who have a small strip of holding of their own are restricted from taking wage employment, women workers are not free to take up wage-employment on account of the pressure of house-hold duties and in some cases owing to some local social customs.

Number of Days Employed

Taking all agricultural labourers, on an average, an adult male earner is employed on wages for 189 days in agriculture and for 29 days in non-agricultural work or in all for about seven months in a year. (See Table III).

Table II

Different Categories of Agricultural Labour Families

Census Zones	Agricultural labour families as % of total rural families	With land % of total	Without land % of total	Casual % of total	Attached % of total
North India	14.3	40.6	59.4	78.3	21.7
East India	32.7	58.0	42.0	76.1	23.9
South India	50.1	54.4	45.6	95.0	5.0
West India	20.4	43.2	56.8	90.2	9.8
Central India	36.7	39.9	60.1	81.6	18.4
North-West India	9.8	28.5	71.5	69.0	31.0
All-India	30.4	50.0	50.0	84.6	15.4

Table III

Extent of Annual Employment of Men Agricultural Labourers (All-India)			
Category of Family	Agricultural employment (days)	Non-Agricultural employment (days)	Total employment (days)
Casual Labourers	176	31	207
With land	162	28	190
Without land	191	34	225
Attached Labourers	299	13	312
With land	280	16	296
Without land	309	11	320
All Agr. Labourers	189	29	218

The employment of an earner in an attached labourer's family is naturally greater than in the case of an earner in the casual labourer's family, by about 3½ months, and as the casual worker is more free to seek employment elsewhere, his employment in non-agricultural work is greater. The zonal differences in the average number of days on which agricultural labourer is employed on

Casual Labour

It will be seen from this table that male agricultural workers are employed for the largest number of days (289) in North India and for the least number of days (181) in South India. The quantum of employment for casual workers is generally low, and it is lowest in the case of North West India (141), while that of attached workers is uniformly high in all the zones, and ranges from 10 to 11 months in the year. It may be relevant to indicate in passing some of the factors responsible for regional disparity in employment. The higher average in the North Zone may be attributed mainly to the fact that this zone has the highest percentage of area sown more than once and also of the area irrigated. Besides, land is comparatively fertile and productive. Secondly, agricultural labourers are fewer than elsewhere and also the number of women workers is smaller with the result that male workers get higher average employment. The low level of wage employment in West India is due to factors which are almost exactly the opposite of those prevalent in the North. South India shows the lowest average, and this is due to factors such as (a) the availability of land per capita is the lowest, (b) the size of holdings is small and (c) the proportion of agricultural labour families to total agricultural families is the highest. Owing to all these, there is a surplus

or abundance of agricultural labour. What has made average employment for male workers worse still is the fact that the proportion of women workers in the South is almost equal to that of men. Amongst the states in this Zone, Mysore's position is found to be the worst.

Non-Agricultural Work

As regards non-agricultural employment, casual labourers have more of it than attached workers in all the zones. The all-India average for non-agricultural work is 29 days, the duration generally being uncertain. The average is highest in East India (42 days) and lowest in West India (20 days).

Women Labour

Most of the women workers are casual, the impelling reason for seeking work being need of additional income. Women are found to be particularly suitable for operations such as weeding, transplanting and harvesting. Their average employment in a year is 120 days in agriculture and 14 days outside it. There is, however, considerable variation, both in the number of women labourers and their average period of employment among the different zones. Taking agricultural labour only for consideration, South India shows the highest average (132) days and in South and Central India, women figured more prominently among agricultural labourers than elsewhere. The main reason would appear to be that the wage level is lower than in any other part of India.

Different Agricultural Operations

An idea of the nature of employment in terms of the different agricultural operations performed by both men and women workers may be gained from Table V.

(To be continued)

EMPLOYMENT OF ADULT MALE AGRICULTURAL LABOURERS

Average number of days worked on wages during the year (All Labourers)

Zones	Total days employed	Agricultural labour	Non-Agricultural labour	Casual workers	Attached workers

Around Bombay Markets

Rise Well Maintained

Thursday, Morning.

WELL sustaining the improvement witnessed at the close of last week, the Stock Exchange maintained its buoyancy, and the closing quotations recorded for the second week in succession the highest levels for the period under review. Under the leadership of steels, all the leading industrial counters attracted uninterrupted speculative activity which in the case of Tata Ordinary was further strengthened by good working results of the company. Indian Iron were well supported by Calcutta bulls on prospects of a bright future for the company.

Either actual reports or expected satisfactory working results of mills accounted for the steady trend in almost all textile scrips. Thus, while Bombay Dyeing, Century and Kohinoor were highly favoured by speculators on prospects of higher interim dividends, Simplex moved up on good working results and on suggestions of a possible upward revision of dividend next year. About 2500 Simplex shares changed hands in a single day towards the close of the week.

The miscellaneous section also reflected the buoyant conditions of the market in general with Phaltan Sugar making phenomenal strides on reports that have been persistently circulating in the ring that the company would very likely raise its dividend from Rs. 8 to Rs. 10. Tata Chemicals and British India Corporation enjoyed consistent speculative backing. ACC were favourably influenced by reports of expansion programme, following the company's joint venture with Vickers Ltd. Bombay Burma Old drew sustenance from reported reorientation of the company and satisfactory working results.

Tata Steel Ordinary maintained a steady trend throughout the week and registered towards the close of the week the 1954 peak level of Rs 254, influenced by the twin factors of the satisfactory TISCO report and encouraging advices from Calcutta. In the event, the scrip gained, over eight points to close a shade lower than the week's highest at Rs. 253-8.

Indian Iron gained Rs. 1-9-0 over the week to close at Rs. 38-8, an anna lower than the highest touched during the week. In kerb trading

Indian Iron were taken up higher to Rs 38-12.

There were further gains in the textile section. Kohinoor, Century, Swadeshi and Nagpur closed at the week's highest levels while Bombay Dyeings, which moved from Rs 510 to Rs. 516-4, closed a trifle lower at Rs. 515. Simplex rose from Rs. 163 to Rs 175 and finished the week at Rs 173.

Bombay Burma, National Rayon and Tata Chemicals, which remained subdued at the close of the previous week, joining in the fray, the miscellaneous section ruled steady throughout the week. Bombay Burma Old reached the peak of the week at Rs 564 while National Rayon successfully penetrated its reactionary level at Rs. 218-4 to close, however, a shade lower at Rs. 217-8. Sentiment in this scrip was favourably influenced by export prospects

to Pakistan. On firm speculative support Tata Chemicals closed steady at Rs. 16, the highest level for the week being Rs. 16-4. ACC, Scindia and Premier Construction were well maintained at around the highest levels of the week. On anticipations of higher dividend, Phaltan Sugar rose from Rs 134-12 to Rs 140 but closed at Rs 139.

Cotton

Reacts to Devaluation

THE cotton futures market displayed a mixed trend. In the first half of the week, it presented a more or less firm front but in the latter half, particularly at the close, it developed distinct signs of weakness. Although even at the outset the undertone was subdued on reports of favourable weather in some parts of Saurashtra cotton belts, with consequent fears that cotton

may not be taken on docket, sentiment changed for the better on the opening day. The improvement was initiated, in the first place, by reports suggesting that prominent cotton-cum-mill magnates were assiduously campaigning for buying cotton on the docket.

On the following day, however, a reversal in trend was noticed when the foregoing reports proved to be without foundation. Evidence of this was provided by a leading bull operator who started liquidating his August position. This was immediately followed by other bulls transferring their purchases to the new crop. In the event, there was a drop of nearly six points in the maturing contract.

In the middle of the week, there was a smart rally in prices in both the old and the new contracts in view of the reported shelving of US cotton export subsidy. This trend, however, could not be maintained for long as a leading cotton merchant-cum-speculator, who had bought August futures recently on a large scale, started liquidating his holdings. As a result, the earlier gains were wiped out and the rates slipped back to their old level.

On Saturday there was only a brief session of two hours during which the market reacted to the reference at the Indian Central Cotton Committee that the cotton crop had already reached the target a year ahead of schedule and that the acreage and production of cotton for the Second Five-Year Plan had been fixed provisionally at 20.42 million acres and 55.86 lakh bales respectively. On Monday and Wednesday, there was no trading.

Tuesday's performance reflected the reaction of the trade to the Pakistan devaluation move. The August contract slumped by 10 points. The issuance of relatively small delivery orders for about 2,250 bales failed to check the declining trend. On balance, the August contract suffered a fall of 21 points from the week's highest while the new February contract slid from Rs. 619-12 to Rs 603-12.

Oilseeds

Mixed Trend

THERE was a mixed trend in the oilseeds market also. On the first two days of the week, speculative selling brought about a recession in prices all round. Trading in the following two days presented a mark-

ed contrast, with prices shooting up particularly in groundnut and castor. Sentiment was favourably influenced by persistent support extended by Vanaspati manufacturers and besides, there was also heavy bull buying and frantic bear covering. During the rest of the week, the trend was erratic. At the close of the week, the weakness in the cotton market also had its bearish effect on oilseeds and there was a general decline all round.

Castor September opened the week at Rs 91-8 and after touching Rs. 93-4, closed at Rs 89-14, the lowest for the whole week being Rs 88-8.

Groundnut ready bold closed at Rs 23-8 after going up at one time to as high as Rs 25-8. Groundnut August-September came down from Rs 24-9 to Rs 23-8 at the close.

Other sections remained easy more or less in sympathy with the declining trend in castor and groundnut, the closing quotations in all showing a moderate loss over the week.

Bullion

At a Standstill

Trading in the Bullion Market was practically at a standstill throughout the period under review.

Tuesday was the settlement day for Gold Shravan delivery. But the Board sought shelter under its by-law 35 (2) and postponed the settlement indefinitely.

Despite the attendance of the bulls at Tuesday's meeting of the Board of Directors, there appears to be no lessening of the tension and the stalemate continues.

Around Calcutta Markets

Effects of Lower Pak Rupee

Wednesday, Evening

FROM the immediate impact of devaluation of the Pakistani rupee on the Calcutta Stock Exchange and on the raw jute and gunny markets, it would seem that Calcutta's commodity markets are wiser than Clive Street. Clive Street was, perhaps, not wrong in marking Coal shares up. But its enthusiasm for Jute shares on Monday morning was rather surprising, as it neither knew nor did it anticipate New Delhi's decision to abolish export duties on jute manufactures.

At first sight, steadiness in Coal shares as a sequel to devaluation of the Pakistani rupee may seem surprising. With the devaluation of the Pakistani currency, it should, theoretically, be more difficult for India to export coal to Pakistan. Under the Indo-Pakistani Trade Agreement, India's coal exports to Pakistan have some relation to India's imports of raw jute from Pakistan. But the trade in coal or in raw jute has not been anywhere near the permissible limit. How, then, to explain the steadiness in Coal shares?

Coal Shares

This raises the question why devaluation of the Pakistani currency has had a mixed reception in Calcutta. Coal shares have steadied up on the argument that, with the devaluation of the Pakistani currency, trade between India and Pakistan will improve. This is one of the avowed aims of Karachi's decision to devalue. Traders in Calcutta hope that it will now be possible to extend the scope and volume of the Indo-Pakistani Trade Agreement. This is a reasonable presumption, and it justifies the halt to the downward trend in Coal shares.

But some industrialists in Calcutta are doubtful whether trade between India and Pakistan will improve even after devaluation of the Pakistani currency. Trade controls and restrictions in Pakistan continue. Pakistan, it is argued, has an acute balance-of-payments problem. She may be interested in raising exports, but will have to keep a strict watch on imports. This, of course, may mean that India may have a deficit trade balance with Pakistan in the near future. This may or may not be a "bear" argument for Coal

shares. But it does not necessarily mean that devaluation of the Pakistani rupee will not stimulate trade between India and Pakistan.

Tea Shares Unaffected

Devaluation has not had any effect on Tea shares. That is rather surprising. With the currency devalued, it should be possible for Pakistan to sell more tea at the London auctions. As exports of Pakistani tea tend to improve, exports of Indian tea may, to that extent, be affected. There is no doubt that Pakistan will now be able to compete on equal terms with India in the London market.

This raises the problem of the export duty on Indian tea. It is widely expected that, as in the case of jute goods, the export duty on tea, as also on raw cotton and on cotton textiles, may be lowered. It was an unlucky coincidence that, when the market opened on Monday, it had to cope simultaneously with the possible effects of devaluation of the Pakistani rupee and an increase in the export duty on tea. Even so, it was rather strange that Tea shares did not fall on Monday.

Tea Export Duty

Incidence of the export duty on tea can be over-emphasised. As the duty is now based on a slab system and is directly related to London auction prices, its effect on exports is no longer so rigid, as the duty automatically varies with fluctuations in London auction prices. To stress this direct relation between the export duty, under the slab system, and London auction prices, is not to minimise the possible repercussions of devaluation of the Pakistani currency on the Indian tea industry.

Temporary factors like dissuption of communications due to floods in northern West Bengal and Assam may have a steadying effect on Calcutta tea auction prices. But the recent behaviour of tea auction prices indicates that Calcutta tea auction prices may fall hereafter. That was why Tea shares became inactive a few days ago. Suitable adjustments in the export duty may offset the possible disadvantages arising out of devaluation of Pakis-

tani currency. But an examination of the relevant factors suggests that the immediate outlook for Tea shares is not very promising.

Jute Shares Up

On Monday morning, when shares were going up, many were surprised at Clive Street's reaction to devaluation of the Pakistani rupee. For, a lower Pakistani rupee was, and is, a serious threat to the Indian jute industry. Therefore, as a result of devaluation of the Pakistani rupee, Jute shares should have gone down. Indeed, New Delhi's prompt action in abolishing all export duties on jute manufactures indicates the trade's and the Government's fears about competition from Pakistan with her currency devalued.

Though Clive Street's immediate response to devaluation of the Pakistani rupee was illogical, the gunny and raw jute markets were logical in their immediate reaction. Initially, both raw jute and heavy goods fell. Later, both started moving up in anticipation of reduction or abolition of the jute export duty. What would be of interest to note in this connection is that Clive Street was doubtful about reduction or abolition of the duty, and yet pushed Jute shares up.

Dealers in the gunny market proved right in their speculation about abolition of the jute export duty. Prices of jute goods rose further on Monday evening. Jute goods were steady throughout Tuesday, but moved up further on Wednesday as it became known that the export minimum price for Pakistani raw jute would not be lowered. This also explains why raw jute prices in Calcutta remain steady.

If Clive Street was hasty in bidding Jute shares up on Monday morning, it was equally hasty in pushing Jute shares further up on Tuesday. Though abolition of the export duty on Indian jute goods was a "bull" factor, Clive Street was unwise on Tuesday in ignoring the possibility of a lower fixed minimum price for raw jute in Pakistan. It was widely expected that Pakistan would lower the minimum export prices for raw jute to offset the possible effects of abolition of the Indian jute export duty. That would have helped the Continental manu-

facturers to compete on more favourable terms with the Indian industry.

But Clive Street can now take consolation that all is well that ends well. With the abolition of the export duty on Indian jute manufactures and with no lowering of the fixed minimum export price for raw jute, the prospects for jute shares become brighter. Developments in India and in Pakistan since Sunday night relating to raw jute and jute goods indicate that the Indian industry may secure its requirements of Pakistani raw jute at cheaper prices. In this connection, it is necessary to bear in mind that both India and Pakistan are producing bumper jute crops this season.

Devaluation of the Pakistani rupee has no direct bearing on Indian Iron. But Indian Iron have been moving up in the last few days. Belief in issues of right shares by both Tata Steel and Indian Iron persists. Recently, however, Indian Iron have shown a tendency to follow closely the fluctuations in Tata Steel.

Company Notes

THE ASIAN ASSURANCE

THE forty-fourth Annual Report and balance sheet of the Asian Assurance Company Ltd., for the year ending December 31, 1954 show that despite the fact that the company has had to struggle hard to wipe off the legacy of loss relating to its General business, it has been able to record satisfactory results in the Life business. In 1954, proposals for assurance amounting to Rs. 320.79 lakhs were received out of which including those pending, proposals for an aggregate amount of Rs. 268.86 lakhs resulted in policies, as against Rs. 203.11 lakhs in 1953, indicating an improvement of 32 1/3 per cent.

The Life Fund of the company increased by Rs. 34.72 lakhs to Rs. 390.09 lakhs, at the end of 1954.

Net premium income during the year under review amounted to Rs. 62.56 lakhs as against Rs. 60.54 lakhs in the previous year. The company was also able to realise a net profit of Rs. 4.55 lakhs on the sales of investments.

Mortality experience has shown improvement in as much as the percentage of actual to expected deaths declined from 52.7 per cent in 1953 to 48.9 per cent in 1954.

Claims less re-assurances paid during the year amounted to Rs. 23.59

lakhs of which claims by death totalled Rs. 5.59 lakhs. The renewal expense ratio worked out to 15.87 per cent, and as the Directors point out in their report, that efforts are being made to bring it down further.

The General Department was closed down as from 15th February 1952 and the company has been engaged in winding it up.

Interest and transfer fees received during the year amounted to Rs. 20,198. After adjusting the loss transferred from the Fire Revenue account to the tune of Rs. 18,868, a net balance of Rs. 1,329 was credited to the Profit and Loss Appropriation Account, and adjusted against the loss being carried forward. At the end of the year under review, loss outstanding amount to Rs. 1.97 lakhs.

It would be useful if the company furnishes in its accounts previous year's figures also for purpose of comparison.

BENGAL CHEMICAL

ACCORDING to the report of the Bengal Chemical and Pharmaceutical Works, Ltd., for the year to April last, the work on installa-

tion of the new sulphuric acid plant is progressing according to schedule. For the repayment of the loan of Rs 30 lakhs from the Industrial Finance Corporation, the Company has executed a mortgage. In the year to April last, Rs 12 lakhs were drawn by the Company to finance its expansion plans.

In the year under review, profits were higher by Rs 3.07 lakhs. Dividend has been maintained at 6 per cent.

BRITANNIA BISCUITS

DESPITE an increase in capital, the Britannia Biscuits Company, Ltd., maintained the ordinary dividend at 10 per cent for the year to March last. This was possible because of higher sales and profits.

In the report, the directors complain about the increasingly difficult transport conditions. In view of the gradual increase in the demand for quality biscuits, the directors contemplate implementation of the Company's plans for replacement and modernisation of equipment in order to enhance the Company's reputation as a manufacturer of quality biscuits.

Branches Throughout India

The Tata Iron and Steel Company Limited

THE performance of the Tata Iron and Steel has been fully up to general expectations and shown excellent results during the year 1954-55. Sales (gross) of the Company's products recorded a small rise as compared to the previous year. The net profit, however, has increased substantially by about Rs 21 lakhs. After providing Rs 240 lakhs for taxes, Rs 32.28 lakhs for Managing Agents commission and Rs 235 lakhs for depreciation, the Company made a profit of Rs 224.47 lakhs compared with Rs 201.61 lakhs in the previous year. The Provision of Rs 106.60 lakhs has also been made for profit sharing bonus to employees. The directors have taken Rs 31.98 lakhs to General Reserve, Rs 10 lakhs to Development Reserve and Rs 191.50 lakhs to Dividend Reserve. Balance of Rs 5.52 lakhs has been carried forward.

Dividend on First and Second Preference shares and Ordinary shares has been maintained—Rs 9 per share subject to tax on First Preference, Rs. 7-8 per share, subject to tax, on Second Preference and Rs 10-8 per share on Ordinary shares, free of tax, have been recommended. These will absorb Rs 191.46 lakhs.

Production and Despatches

The total production of saleable steel during 1954-55 amounted to 783,000. This is about 3000 tons more than in the preceding year. The total despatches of saleable steel during the year amounted to 749,000 tons as compared with 767,000 tons while steel retained for construction purposes in the Company's works amounted to 49,000 tons in 1954-55, as against 22,000 tons in the previous year. Thus, the total quantities supplied during 1954-55 exceeded the previous year's total by 9000 tons.

Capital Expenditure

A total of approximately Rs 9 crores of capital expenditure was incurred during the year on the various projects of modernisation and expansion programme. The Company drew, during the year, Rs 4.8 crores from the Government Loan leaving a balance of Rs 5.2 crores, against the special advance of Rs 10 crores sanctioned by the Government for the Company's expansion programme.

The Company further bought Rs 32 lakhs worth of share of the Tata Locomotive and Engineering Company, bringing up its total holding in the Ordinary Shares of the company to Rs 112 lakhs.

The Company also made further advance of Rs 54 lakhs to the Indian Tube Company's projects, bringing the total advances to that company to Rs 66 lakhs.

Two Million Ton Programme

As against a production target of 6 million tons of steel ingot or about 4½ million tons of finished steel for the steel industry in the Second Five-Year Plan, the Company has a programme for expanding the capacity of its works at Jamshedpur to a total of two million tons of steel ingots or 1½ million tons of finished steel.

The details of the project are being worked out, and negotiations are also afoot to procure necessary finances from abroad. The preliminary estimate for the project total Rs 60 crores. This is to be financed partly from savings and partly from the fresh issue of Ordinary shares.

With No Comments!

“PEOPLE from far away places swarmed the village Tukral, in Ujjain, to witness Gend Kumar Bai commit “Sati” on the funeral pyre of her husband and the railway authorities ran special trains on the narrow gauge line between Agra and Ujjain to facilitate transport for this crowd.”—PTI message, July 30, 1955.

Imagine a world without
salt!

Can you imagine how poor the world would be without salt? Your food would lose its savour; there would be no paper to write on; no leather for shoes; no glass to replace the broken window panes; no medicine for the ailing.

In olden days man used common salt as an article of currency and commerce, but the scientists of today have turned it to richer and more varied uses. Out of it they produce such basic heavy chemicals as soda ash, caustic soda, bicarbonate of soda, magnesium chloride and bleaching powder. These chemicals are used in the manufacture of paper, leather, glass, soap, textiles, pharmaceuticals, and other useful commodities.

From the boundless sea as its ore mine, Tata chemicals recover salt and other marine products to convert them into alkalis and heavy chemicals so essential to Indian industry.

THE hopes that August 15 brought with it eight years ago were somewhat damped in the succeeding years. They seem at last in the process of fulfilment. And that is no mean gain, considering the many vicissitudes of the intervening years, the time and energy that had to be expended on giving our newly-won freedom a framework and direction and the labour that was involved in clearing the debris of the past and paving the way for planned development. Though the transition from preparation to actual achievement had started taking place some time earlier, it is this year that we have had the most heartening evidence of the speed with which the country is moving ahead. We are already beginning to taste the first fruits of all that has gone on silently these years—an undramatic process which could not be expected to stir much enthusiasm in the common man. Some of the frustration has been largely due to this; but now with planning and execution gathering slow momentum, the mental climate in the country has been changing, be it ever so slowly. The position of honour, prestige and influence that India has been gaining for herself in the international field has also contributed not a little to bring about this welcome change.

The most significant development since August 15 last year, and one which holds incalculable consequences for the pattern of political evolution in the land, the line and pace of future progress and the transformation of Indian life, has been the decision of the Congress to work for a socialistic pattern of society and the ready acceptance by Government of that goal. In a sense, this was no new declaration on the part of the Congress, though its intentions had come to be obscured by conflicting statements and hesitant policies in the early years of freedom. For the first time, the country's urge for progress has been given a certain direction to follow and a goal to reach. Some of the bewilderment has disappeared, and for good or ill, the Republic has taken a definite turn to the Left to the relief of the common people and the temporary chagrin of Socialist and Communist groups which have been left without much of an alternative appeal to the electorate. If there was any tendency towards a polarisation of political forces, it has received a setback for the time being; and the Congress has emerged as a party without a rival in a deeper sense than in the immediate past. Given its present fairly wise leadership and its recent aspiration, this accession of fresh strength to the Congress is largely to the good of the country, for it has thereby secured unchallenged authority and an unhampered opportunity to carry out its aims. But this concentration of power and mass faith in one party, however welcome at this moment, may lead to evil consequences in course of time particularly if the present leadership should waver, weaken or fade away. That is a danger which far-sighted politicians cannot possibly ignore.

India's peace endeavours in the course of the year, which have relieved if not removed international tensions, are too fresh in the public mind to need elaboration here. Though both in Korea and Indo-China, which have benefited from Prime Minister Nehru's peace initiative, there have been signs of unrest, it is unthinkable that any serious flare-up will

occur. On the contrary, the area of peace promises to grow wider, embracing the East and the West, and in this happy development, India has not been without her share. The 'Panchashila', the offspring of Indo-Chinese friendship and collaboration, has been winning more and more adherents, the latest being Soviet Russia and one country in the West, Yugoslavia. The Afro-Asian Conference, in which India played no small part, has given a wider meaning to Asian freedom and brought much nearer the day of Africa's deliverance. The crowning event in the international sphere was Pandit Nehru's visit to Russia and certain countries of Europe, where the great ovation he got was some measure of the appreciation felt by thinking people for our Prime Minister's untiring labours in the cause of peace.

Though our relations with our immediate neighbour, Pakistan, have not improved to the extent desirable, there has been a little tangible progress towards greater understanding and even a little co-operation in limited fields. But the Kashmir problem awaits final settlement, though

happily there has been no serious clash over the issue. The position of Indians in South Africa continues to be as bad as ever, while that of our countrymen in Ceylon and other parts of the world, particularly in Africa, has shown no improvement. Within the country, it was a tribute to Indian patience and wisdom and also to French realism, albeit belated, that the problem of French settlements came to be solved in the course of the year. Indeed, the first elections in conditions of freedom have already taken place in these former pockets of alien domination, and all that remains to be attended to is the question of a 'de jure' transfer. Meanwhile, blind alike to the lessons of history and the examples set by the British and French, the Portuguese continue to cling to Indian soil, committing atrocities which have set a thrill of horror through the country and led to massive demonstrations of indignation. But for our Government which in the face of calculated insolence and provocation has been scrupulously adhering to a policy of peaceful set-

THE ECONOMIC WEEKLY

tlement and, what is more, putting curbs on mass feeling, these islets of alien exploitation and intrigue would have been wiped off long ago. Despite the obstacles put and restrictions imposed by Authority, the nation's wrath has found expression in a new campaign of satyagraha to be launched on this Independence Day, with M.P.s and leaders of all parties except the Congress participating. Apart from the atrocities perpetrated and being perpetrated by the Portuguese, the mere fact that in the eighth year of India's freedom, a petty dictatorship of Europe should dare to besmirch our soil is something which free India's manhood cannot stand. Portuguese rule has to go: the sooner, the better for all—and for Portugal most of all.

Meanwhile, with teething troubles over and considerable achievement to her credit both within and abroad, India looks hopefully and even a little buoyantly forward to the unfoldment of the Second Five-Year Plan and the maturing harvest of the First.

THE ECONOMIC WEEKLY

language. But the United Front's acceptance of the one-unit plan for Western Pakistan is conditional on the grant of full regional autonomy to both the wings of Pakistan. This is the crux of the problem. Mr. Suhrawardy, an astute politician, has had the shrewdness to exploit this basic issue in dispute in Pakistani politics.

Mr. Suhrawardy proved wrong in his calculation that the United Front's uncompromising attitude to the future political status of the two wings of Pakistan would enable him to emerge as a balancing factor in Pakistani politics. Though the Muslim League was committed to the one-unit plan for Western Pakistan, it was vehemently opposed to full regional autonomy for the two wings of the State. It was known that Mr. Mohammed Ali would fail to secure the Muslim League's acceptance to a League-Front coalition Cabinet. This explains the decision of the Muslim League Party in the Constituent Assembly to replace Mr. Mohammed Ali by Chaudhry Mohammed Ali as its leader. But it does not explain the initial flirtations between the Awami League and the Muslim League. It would have been unseemly for the Muslim League, still the largest political party in Pakistan, to form a coalition Cabinet with the support of the Awami League on the condition that its leader, Mr. Suhrawardy, must be the Premier of the coalition Cabinet. Political implications of such a coalition cabinet would be far more disturbing. For such a coalition Cabinet would have been confronted with massive opposition by the United Front and Eastern Pakistan, with all its disquieting political repercussions on the whole of Pakistan.

Ministry making in Pakistan gave rise to many surprises but the exit of Mr. Mahomed Ali was not one of them. Ever since the rout of his party in the East Bengal elections, his position has been insecure. The election by the League Assembly Party of Choudhri Mahomed Ali in his place, it was taken for granted at one stage, was to bring the Awami League into the coalition. In the event, it is the United Front or that part of it which remained after the Awami League broke away and the Hindu group supporting it, that have come into the coalition and it is Mr. Suhrawardy who has stayed away. A national, all party Government was desirable most of all, but failing that, will the present coalition be able to give a stable Govern-

ment to Pakistan? That will depend on how far the Muslim League is prepared to yield to the United Front in the matter of granting autonomy to East Bengal which it had resisted until the other day. What reasons were responsible for the last moment changes in the composition of the Cabinet have not yet been disclosed. But pre-occupation with unification of the West seems to leave out one important fact from consideration. The opposition to it is not in the Constituent Assembly but outside, in the North-Western Frontier Province where Badshah Khan and Pira Manki Sheriff represent the forces to be contended with. Neither does the present coalition between the Muslim League and United Front necessarily convey the assurance that differences between the West and the East have been resolved. And yet, without such an agree-

ment in fundamentals, coalition is unmeaning. Let us hope that agreement has been achieved though it may not have been advertised that under the leadership of Pakistan's able ex-Finance Minister, the threat of the army and the civil service taking over, which has been looming large all this time, will formally disappear.

Without Comment

Calcutta, August 8

The Commissioner of Police, Calcutta, tonight issued an order under Section 144 Cr. P. C. banning assembly of five or more persons or carrying of dangerous weapons in the Assembly House area. The order comes into force immediately.

The autumn session of the Assembly begins on August 11.

—News item

Pakistan's Coalition Ministry

TO compare political conditions in Pakistan with those in some Middle Eastern or Latin American countries, is to over-simplify the issue. Pakistan, a Muslim State, has some of the characteristics of a Middle Eastern or Latin American country. Major-General Iskander Mirza's appointment as acting Governor-General may seem to emphasise this aspect of Pakistani politics. Political and economic conditions in Pakistan since the creation of that State have been such as to encourage the emergence of a military administration. That danger may persist even after the adoption of a Constitution by Pakistan. But as long as efforts to frame a Constitution continue, it would be premature to stress this aspect of Pakistani politics, or to interpret Major-General Iskander Mirza's appointment as acting Governor-General as a pointer to the shape of things to come. Contrary to speculation in some quarters, there is no evidence to suggest that Major-General Iskander Mirza's appointment amounts to a bloodless coup. It is probable that his appointment as acting Head of State has been made at the initiative of Mr. Ghulam Mohammed prima-

riarily because Major-General Iskander Mirza is a non-party leader with no pronounced inclination to any political party.

Subsequent developments lend weight to some such assumption. One redeeming feature of the political crisis in Pakistan is that it arises from a desire for a smooth and speedy acceptance of the proposed Constitution by the Constituent Assembly. Reasons for a Cabinet crisis at this stage would seem to be hidden by obscure political cross-currents. It may have been forced or hastened by the over-confidence of some political leaders. But once the decision to test the strength of political parties and personalities was taken, it became clear that party wranglings and personal rivalries would intensify the crisis. Immediately after the formation of the re-constituted Constituent Assembly, it became evident that the Muslim League did not command an overall majority in the Assembly. Whether the Muslim League is to be credited for the split between the United Front and the Awami League, or whether personal rivalries forced the rift, the differences between these two parties have enabled the Muslim

League to remain as the largest single party in the Constituent Assembly.

Under such political groupings, the Muslim League had necessarily to seek political allies. It could form a coalition Government with the support and participation of either the United Front or the Awami League. It has to be presumed that Mr. Mohammed Ali, the outgoing Premier, preferred an alliance between the Muslim League and the United Front because of the comfortable majority that the combination would command in the Constituent Assembly. Personal rivalries between the outgoing Premier and Mr. H. S. Suhrawardy, leader of the Awami League, are as much involved in the former's political decision as in the rifts between the Awami League and the United Front, led by Mr. Fazlul Huq. Mr. Mohammed Ali's appecart has been upset partly because of the political machinations of Mr. Suhrawardy, but mainly because of the United Front's adamant policy to one of the major issues involved. Both the United Front and the Awami League are committed to the one-unit plan for Western Pakistan and to adoption of Bengali as a State

Weekly Notes

Durgapur Barrage Opened

DURGAPUR standing a few miles away from the important railway, mining and industrial centre of Assansole, is only a short distance from the Grand Trunk Road. Though so conveniently situated from the point of view of location of industries, not many factories have yet been established there. But many will be, now that the coke-oven plant has been sanctioned and the new steel unit is also in all probability going to be set up there. The Durgapur barrage, however, which was opened with such great eclat by the Vice-President, will not play its full part in the industrialisation of the Ruhr of India, until the navigation canal which is to connect Durgapur with the Port of Calcutta, is completed. To its other advantages will then be added the very important one of water transport which will reduce the cost of moving heavy materials in bulk and enable direct shipments to the Calcutta port thereby reducing the congestion on this over-worked section of the Eastern Railway and also, let us hope, the congestion—not of shipping in the port, that is hardly possible—in the warehouses, wharves and sidings of the Port Commissioners Railway.

Whenever a project, or a part of a project, is completed, it has become customary to claim completion ahead of schedule. To keep track of the different dates and years which are mentioned from time to time as the targeted date or year is difficult, particularly in the case of a part of the D V C project. Many dead-lines were mentioned and naturally many of them have also been left behind. The earliest mentioned for the Durgapur Barrage as also for the first phase of the Damodar Valley Project was as early as 1953. It is only the Barrage that has been completed. In the construction of the irrigation canals, considerable progress has been made but it will be another year or two before the whole network is completed. It does not appear likely, either, that the irrigation canal can be opened to transport barges and heavy traffic before 1957.

Water for the Hooghly

IT is a matter of controversy among technicians what effect the completion of Mayurakshi and D. V. C. projects will have on the navigability of the Hooghly river and the silting up of the Calcutta port. While the monsoon outfall into the Hooghly will be reduced as a result of storing up of water from Damodar and Mayurakshi, it is a plausible argument that the larger flow that would be made possible in the lean summer months should improve rather than further damage the river channel. It may even help to deepen the Hooghly river bed as well as help to carry more silt into the sea. Viewed thus, the problem of the Hooghly may not have become any worse. But it remains very acute indeed, and the Ganga Barrage scheme alone held out the hope of salvaging the decaying port of Calcutta by restoring the draught of the river. This scheme, however, has been in the incubation stage for a long long time. Unconscionable delay in the issue of the report by the Gokhale Committee which was set up to examine the Ganga Barrage Project is explained by differences of opinion among members regarding the practicability of the project.

A navigational canal from Farakha farther up from Durgapur to Calcutta would be a great boon to West Bengal and an asset to the industrialisation of the areas served by the D V C though the Ganga Barrage project may not be organisationally or administratively a part of D V C project. The Committee, however, it is understood, has reported against the technical feasibility of the navigational canal and has recommended instead a project for the limited object of maintaining the flow in the Hooghly to help push back silt into the sea. This will be a great disappointment to Bengal and Government action on the report will be most eagerly awaited.

Variations on the Theme

WITH the threat of nationalization hanging on their heads—is it? We take the chairmen of the companies on trust, they should know—the speeches of the Chairmen at the Annual General Meetings of the Insurance Companies naturally give pride of place to this burning question of the day. There are individual

differences in approach, of course, and this week we have had some interesting variations on this theme. While Shri Mangaldas Mehta, speaking at the Annual General meeting of the Vulcan Insurance Co., did not exactly take the line made familiar by Shri A. D. Shroff, he reproduced many of Shri Shroff's arguments. His main points were that nationalization would drive out the foreign companies and State insurance would find it difficult to spread risks widely enough through re-insurance. And what is insurance, if not the spreading of risks as widely as possible? To this, Shri Mehta added some others such as the delay that policy-holders or their legatees were bound to experience in realising their dues, and the difficulty of determining compensation, which could not be effected through discussion and compromise as now, and so on, and finally he quoted the Communist Party of India in support of his contention that a socialistic pattern of society does not call for nationalization of insurance. And horror of horrors, he went on to compare the performance of Government-administered companies with that of others, violating the polite convention that comparison should always be between the public sector as it should be and the private sector as it is.

Sir Cowasji Jehangir, on the other hand, worked the human angle, quoting his predecessor with approval: "Hands off those for whom we insurance companies are trustees, particularly as they are normally widows and orphans". For the head of the company which has always left all its funds with the Government and built its fortune on the security offered by the Government on the funds entrusted to it, this is rather a curious position to take. But one should not be surprised. While the nationalization of the Bank of England was being debated in the British Parliament, it was often heard from the Tory back benches that if the Government took over the Bank of England, people could no longer be "sure of their money."

Don't Rob Policyholder

SIR Cowasji, however, was in very good company indeed. Only the day before the Oriental meeting,

What salt means to you!

How long ago man discovered salt is lost in antiquity, but he learnt that it came from the rocks and the sea. As he realised the value of salt, he made it an article of currency and commerce.

Science has gone far since then, and today it has learned to make many and varied uses of salt. Can you imagine your common salt being turned into a number of heavy chemicals, such as soda ash, caustic soda, bicarbonate of soda, magnesium chloride, bleaching powder and bromides? Can you imagine getting along without salt in the twentieth-century?

At the Mithapur Works of Tata Chemicals, salt and other marine products are extracted from the sea and converted into these alkalis and heavy chemicals. They find their way into many other factories where paper, leather, soap, glass, textiles and pharmaceutical products are made.

Here, then, is an industry using the boundless waters of the sea to keep the wheels of other industries moving. It is the aim of Tata Chemicals to assure the country of a national supply of these basic chemicals.

**Tata
Chemicals**
LIMITED

BOMBAY HOUSE, BRUCE STREET, BOMBAY 1.

Shri T T Krishnamachari, Minister for Industries and Commerce, addressing the Indian Merchants Chamber, had made the fantastic statement that nationalization of insurance would "rob policyholders" and had called upon the press to oppose the move boldly! Shri T T K has a weakness for saying hard things as well as an ear for the telling phrase but he is no lost soul, for he has also an amazing capacity for conversion which he displayed only recently by becoming a 'convert' to "the philosophy of the handlooms". Sir Cowasji may not have such spiritual resilience.

Of course ministers are entitled to their personal opinions, they can also learn, and in the manner of their chief, prefer to take their lessons in public. It is somewhat confusing for the public, however, when ministers do so. To take this particular question of nationalization, only the other day Shri M C Shah, Minister for Revenue and Civil Expenditure, said that the issue was being considered by the Planning Commission, and speaking for himself, he did not agree that "nationalization would not be in the best interest of the country". T T K is not only a minister; he is in the cabinet, but Shri M C Shah is not, which might mislead some people into thinking that he might be speaking on behalf of the Government. What Nehru thinks aloud today, may become Government policy tomorrow. It is not so with the other members of the Cabinet. When they forget it, there is perplexity which brings to the fore the necessity of a convention in the matter of the ministers speaking, learning and airing their respective views in public.

Oriental's Unique Performance

THE Oriental Chief's main concern was, naturally, the proposal for mutualisation which is awaiting sanction. The scheme that was put before an Extraordinary General Meeting is being given the widest publicity and the Controller of Insurance has given two months' time to policyholders and shareholders to send their objections and suggestions on it. Therefore there seems little ground for the fear, which Sir Purshotamdas Thakurdas has ventilated, of a decision being taken over the heads of policyholders. The question of compensation for shareholders is a vexed one and on behalf of the shareholders, the Oriental Chairman rightly claims that the life funds would not be what they are

today, had not the shareholders gone in the past what they could have taken in dividends. Sir Purshotamdas challenges this statement. The very large amount which the company holds today in its life fund, he maintains, belongs to the policyholders. This is of course formally correct but it does not fully rebut the shareholders' claim.

But not all that Sir Cowasji had to say was controversial. The progress of the company and its performance last year are beyond any controversy. It must be a unique achievement for any company which is mature and well-established to double its new business as the Oriental did; and simultaneously the company set up an all time record for new business. Its performance, judged by every criterion, has been unique all along the line, in terms of premium income, average amount assured under a policy, total premium income and mortality experience etc. True, the expense ratio did not show the same improvement; it amounted to 25.4% of the premium income in 1954 as compared with 23.4% in 1953, but practically the whole of this increase was accounted for by the provision made for the liability in respect of Gratuities to the Staff. This is another feather in the Oriental's cap.

Vulcan Chief on Companies' Bill

OTHERS, besides Shri Mangaldas Mehta in the world of big finance, have also been enthusiastic in their appreciation of the role of India in world affairs. They too have felt proud that India's voice is now being heard on international problems. But Shri Mangaldas alone has expressed the hope that the summit meeting at Geneva, which has already resulted in the easing of world tension, will also lead to ultimate entry of the Republic of China to the United Nations as a full fledged member. But he is far from enthusiastic in his appreciation of the Government's Economic Policy at home. He does not agree that the recommendations made by the Tax Commission can achieve the main aim that the Commission has in view viz., leaving adequate incentive to the private sector to develop. The rates of direct taxation he finds particularly severe: they are "the highest in the world" and are bound to discourage risk capital and retard capital formation. He is equally critical of some of the changes made in the

last Finance Act, particularly the provision made for aggregating the income of the husband and wife for purposes of taxation. This would make the wife more dependent, and is offensive to the Constitution in that it goes against the principle of equality between the sexes which is upheld by the Constitution. Another of his grouses against the Taxation Commission is on the score of the recommendation for withdrawal of tax concession on new buildings. This will weaken the incentive for building new houses, and the Vulcan chief is keen that this concession should be continued at least until March, 1958.

While generally welcoming measures to rid the managing agency of its undesirable features, Shri Mangaldas Mehta is afraid that the Joint Select Committee on the Companies' Bill has gone too far and that instead of improving the quality of company management, if the bill as it stands is put on the statute book, "no honest man would go forward to accept directorship of a company". This is a serious charge coming, as it does, from a legal luminary.

If Pimpri Delivers...

ONE is pleasantly surprised to learn that before very long, India will be in a position not only to produce all her requirements of penicillin and allied products, but also export some, if the present programme goes through. The expanded plan is for the production of 28-32 million mega units per year, as against an estimated annual domestic consumption of 8 million mega units in the past.

India has been importing all her requirements of anti-biotics such as streptomycin and penicillin valued at about Rs. 3 crores per annum. In January, 1949 the Government of India decided to set up a State concern for the manufacture of Penicillin. Next year, the WHO and UNICEF offered their help and an agreement was concluded with these organisations in July, 1951 according to which, the UNICEF was to provide all the imported equipment for the project to the value of \$850,000 while the WHO undertook to provide technical assistance valued at about \$350,000. From July 1953, however, the responsibilities of the WHO in this behalf were taken over by the UN Technical Assistance Administration.

The Penicillin factory at Pimpri (near Poona) was converted into a

private limited company with the name of Hindustan Anti-biotics Ltd., from June 1, 1954, with an authorised capital of Rs 4 crores. According to original plan, the factory was expected to go into production by the end of 1954 and produce 3.6 million mega units of penicillin to start with and increase it steadily to 9 million. The first process in production was commenced in December 1954, and the first instalment of penicillin made in India is expected to be on the market any day.

A Committee of Experts which enquired into the types of penicillin that are to be produced, recommended

Off the Record

THOUGH not the largest enquiry of its kind—the Reserve Bank Rural Credit Survey team violently challenges this claim—the Agricultural Labour Enquiry has at last published its findings on agricultural labour. In fact, the third report, which can be considered the final and most important, has been before the public for some weeks. Elsewhere in this issue will be found the gist of the concluding portion of the most important part of the report, viz., Pattern of Occupation and Employment. But what does it all add up to? Do we get a reasonably sound estimate of the volume of unemployment among agricultural labourers? We know so many of them do not get any wage-employment at all, i.e. not even for a single day in the month, even in the peak period. Now labour which is surplus even at the peak period will be surplus for the rest of the year and can be dispensed with, without any loss to production. So ignoring for the moment the utilisation of such labour in the idle period in self-employment or other partial (under) employment, we get a measure of surplus labour as 13 per cent of the total or 4.6 million in absolute figures, given a total of 35.4 million for agricultural labour in India. But this is a very unsatisfactory measure, since it takes as employed even those who get work only for one day in the month. And the estimate is a little better if instead of peak point unemployment, we take the monthly average of those who failed to get work in each month. If we do that, the

that all varieties of penicillin required by hospitals, and private practitioners should be produced, and the Government of India has accepted this recommendation.

The capacity of the Pimpri factory will be raised by 60 per cent so as to produce 28-32 million mega units of penicillin per annum. Among the other products that this factory is expected to manufacture are (bicillin, benzathine) penicillin, DBED penicillin, streptomycin and chloromycetin.

In the initial stages, raw materials required for penicillin production, such as corn steep liquor, chemicals

estimate of unemployed would be 16 per cent of the total or 5.7 million. But this is not the information we are seeking.

Idle Days and Idle Manpower

Though defined as employed, these 84 per cent remained without work for many days in the month, varying from 3 to 5 days in a month in some States to 9 to 11 days in others. On an average, they got wage-paid work for 218 days and were unemployed or self-employed for the rest of the year.

The unemployment or self-employment of the remaining 16 per cent of the labour force will have to be added to the above, in order to make the picture complete.

Leaving aside self-employment, as before, and taking the year to consist of 300 working days, if those who are employed have no work on an average for (300-218) 82 days out of 300, it amounts to saying that in terms of man-days, there is employment only for 218/300 of those employed and that 9.2 million in round numbers are unemployed and surplus.

Now about those who did not report any wage work at all, the remaining 16 per cent of the labour force, it is assumed that for half the year they are self-employed, and for the other half, fully unemployed.

How to add up the two i.e. the unemployment of the 16 per cent and the idle days of the 84 per cent who are unemployed for some days?

etc. had to be imported. Recently, however, successful efforts have been made to procure the raw materials from indigenous sources, and very soon the bulk of raw materials are expected to be obtained in India.

If the factory is able to fulfil the target of 32 million mega units, it will mean a considerable saving in foreign exchange on imports; in addition, if the domestic demand is taken at around 10 to 15 million mega units, there will be a sizable surplus for export. Will Pimpri be able to deliver less painfully than Sindri?

(Continued on page 981)

Surplus Labour in Agriculture

—Has it been Sized Up?

To the 9.2 million above has to be added the whole of this 16 per cent or 5.6 million to get the total, which works out at something like 14.8 million. This would appear to be incontrovertible if the underlying assumptions are accepted viz., that absence of wage-employment is unemployment and that idle days can be converted into idle labour. If on the other hand varying demands for labour in different seasons of the year according to the nature of the agricultural operations are to be given due weight, perhaps the safest estimate of unemployed or surplus labour would be the one at the peak point, i.e. 4.6 million. So unemployment in the sense of lack of wage-employment must range between these two limits, 14.8 and 5.6 million.

This is not a very definite finding. The composite picture presented here gets more blurred when allowance is made, as it has to be made, for self-employment, since casual labour has also its small quota of landholding and has to work on its own for part of the year.

A Third Estimate and Draft Plan

A third figure emerges when only 16 per cent of the total or 5.6 million who report no wage employment are taken to be unemployed but allowance is made for their self-employment. The Labour Enquiry assumes, for reasons which are not set out clearly, that those who do not report any wage employment are self-employed for half the year and are "fully unemployed"

for the other half. If the self-employed are left out, the hard core of the unemployed, according to this method of computation, would be 2.8 million. This is obviously a partial and incorrect estimate. The coincidence may be accidental but it may not be out of place to note that in his estimates of additional employment to be created in the Second Plan period, Professor Mahalanobis has provided for about this number of new jobs, in addition to jobs for new entrants into the working age group in the next five years, estimated at 9 million. If the employment targets are realised, there may not be jobs for all of these unemployed; the pressure will, nevertheless, be substantially reduced. But if the above analysis is correct, the magnitude of the problem would appear to be much greater than can be tackled by the Draft Plan-frame.

It is hardly necessary to mention that this attempt to size up unemployment in agriculture has been made throughout on the assumption that existing techniques will continue to be followed and that the pattern of cultivation will remain unchanged. If techniques are improved, of course, the extent of

direct employment in agriculture will be reduced and the surplus will be greater. That much of the present employment in agriculture is only disguised unemployment in this sense is well-known. The possible effects of improved techniques on the labour situation, however, cannot be judged a priori, for along with the scope of economy in labour, better yields and larger production may create new employment opportunities by increasing the demand for existing services and products and creating demand for new ones.

Subsidiary Occupations

The Enquiry also throws some light on the "subsidiary" occupations of agricultural labour. Taking all categories of rural families in the Indian Union, 26 per cent have subsidiary occupations, but of these, only about a third has subsidiary occupation outside agriculture, one sixth has agricultural labour and the remaining i.e. about 50 per cent, has cultivation of owned or leased land, as subsidiary occupation. For almost all the non-agricultural earners, the subsidiary occupation is agriculture! Thus, even subsidiary occupations add to the pressure on land. As against 30 per cent of rural families other than

agricultural labouring families, only 21 per cent of agricultural labour families have subsidiary occupations, the principal one accounting for more than 50 per cent being cultivation of land. The non-agricultural subsidiary occupations are house building and repairs, road construction, carting, selling vegetables etc.

A Study in Isolation

The Enquiry does not even mention cottage or village industries as providing any supplementary occupation to the unemployed or under-employed agricultural labour. The inference is, therefore, warranted that whether cottage industries provide full employment or not to those who ply them, they are not combined, to any appreciable extent, with agriculture as a part-time occupation to fill up the idle time of the agricultural labourer. Whatever their prospects, village industries are a whole-time occupation. This finding knocks one of our pet illusions on the head. There are others, but the pity of it is that the enquiry was so partial and sought to study agricultural labour in isolation from the rural economy of which it is an integral part. But that is no fault of those who carried out the enquiry.

The Vulcan Insurance Company Limited

Speech of the Chairman Shri Mangaldas B Mehta

THE following is the speech delivered by the Chairman Shri Mangaldas B Mehta at the THIRTY-FIFTH Annual General Meeting of the Company held on Friday, the 12th August 1955 at 3-30 p.m.

Gentlemen :

The Directors' Report and the Audited Balance Sheet and the Revenue and the Profit & Loss Accounts for the year ended 31st December 1954 have been in your hands, and with your permission I take the same as read.

India's Voice Now Heard

The strenuous efforts of our Prime Minister in persuading the two blocs to accept the principle of co-existence have been crowned with success. The tumultuous reception which our Prime Minister received in his whirlwind tour of U S S R, Yugoslavia and Poland has placed India in a prominent and respected position in the comity of nations. Her voice has now been heard in all the international problems facing the world. As a result of the summit conference of the Big Four, there has been considerable relaxation of world tension and peoples of the world are now engaging themselves in arts of peace rather than in the arts of manufacture of destructive armaments and bombs. The recent release by the Republic of China of eleven U S airmen has brought about a new rapprochement between U S A and China, which, it is expected, will result in the ultimate entry of the Republic of China as a full fledged member of the United Nations.

The vagaries of monsoon and floods in different parts of our country are causing great anxiety amongst the people. It is hoped that adequate relief will be forthcoming to the unfortunate sufferers.

Since we met last year, important events have happened in our country. The Reports of the Taxation Enquiry Commission and the Joint Select Committee on the Companies Bill are out. The Imperial Bank of India is now converted into a State Bank with the object of providing the necessary finance for the rural economy of the country. The draft of the Second Five-Year Plan is also before us. The Finance Act of 1955 has made drastic changes in the Income-tax Act. There have been re-

peated threats of nationalisation of insurance, banking and mining. Although agricultural and industrial production has increased, the problem of acute unemployment has still remained unsolved.

Tax Commission Criticised

The Taxation Enquiry Commission was charged with the examination of the present system of taxation, Central, State and local qua the development programme of the country, the objective of reducing the inequalities of in-

whole family for purposes of direct taxation.

India's Tax Rate World's Highest

As regards the structure of taxation, the Commission have suggested a maximum marginal rate of 85% on incomes above Rs. 1,50,000/-, but Government have gone further and in the Finance Act of 1955 rates of taxation have been further stepped up with the result that on incomes over Rs. 1,50,000/- the maximum rate has been increased to 89% from the previous existing rate of 82%. Compared to the rates prevailing in other countries, the rates of taxation in India are the highest in the world and will in the long run retard capital formation and the maintenance and development of productive enterprise. The risk capital is indispensable to industry for ultimately equity or risk capital must represent the capital investment in productive assets.

As regards the scheme of surcharge and compulsory deposit suggested by the Commission it will in my opinion further reduce the net surplus in the hands of individuals after payment of taxes.

As regards the Commission's recommendation for aggregating the income of husband and wife for the purpose of direct taxation in my opinion it is unsuitable to the conditions prevailing in India and it is likely to cause great hardship. This system is not supported even by the Royal Commission on the Taxation of Profits on Income in the U. K. It is common knowledge that in India, a woman acquires her own separate properties by inheritance, gifts or otherwise and if this system is adopted it will make her more dependent on her husband than at present. This is surely against the fundamental principle of equality of sex laid down in the Constitution.

Tax Exemption on New Building Should Continue

The Commission have also recommended that the concession for exempting income from new buildings erected before 31st March 1956 should be withdrawn. With great respect I submit that this recommendation should not be accepted by Government in view of the fact that there is still acute shortage of accommodation in urban areas. If this

Shri Mangaldas B Mehta

come and the effects of the level of taxation of income on capital formation and maintenance and development of productive enterprise. While the Commission conceded on the one hand that the taxation system should not be strained to a limit which would endanger the productive system of the country or impair the possibilities of its expansion by savings and incentives in the private sector, their recommendations are not in my humble opinion such as would bring about the desired results.

Some of the recommendations of the Commission aim at the socialistic pattern of society envisaged in the Avadi Resolution of the Congress. This objective is proposed to be attained by a change in the rate structure regarding personal taxation, levy of special surcharge and a compulsory deposit at graded rates on income exceeding Rs. 25,000/- and aggregation of the income of husband and wife, and perhaps of the

SEKSARIA COTTON MILLS LIMITED

Manufacturers of

HIGH QUALITY LONGCLOTH, POPLIN, MULLS, (BLEACHED & MERCERISED) DHOTIES, SAREES, SHEETING, YARN STAPLE YARN, HOSIERY GOODS, Etc. Etc.

SEKSARIA CHAMBERS, 139, MEADOWS STREET, BOMBAY I

concession is withdrawn, there will be no incentive left for investors to invest money in erecting new buildings in the urban areas. In any event I hope that this concession will be continued up to 31st March 1958.

I welcome the recommendations of the Commission regarding allowance of 5% of the premium income of general insurance companies to be free of tax up to certain limits. I suggest that for the healthy growth of insurance industry no ceiling should be fixed for such an allowance.

Draft Second Plan
