The Progress of An Idea

UPTO the nineteenth century, world events were dominated by any one single Power at any one time. Portugal, Spain, Holland and France dominated the world, each separately and in their turn, for a considerable span of time. Throughout the nineteenth century, Britain was the dominant world Power. This historical sequence of single-Power domination of the world ended after the end of the first world war. The League of Nations was formed. Collective security was its basis. This concept did not prevent the start of the second world war. After the end of the second world war, the United Nations came into existence. This organisation was also founded on the principle of collective security. Between the League of Nations and the United Nations, the difference would seem to be that, while the League had not the courage to apply collective security, the United Nations had the boldness to translate the concept into practical action.

Collective security has had a fair trial. Experience to date is not very hopeful. Only time can reveal whether collective security alone can prevent a third world war. But it is already evident that it has not prevented the "cold war". Another assumption underlies the attempts made so far to attain and to preserve world peace. It is that, though the era of single-Power world domination may have ceased, world peace cannot be maintained without an agreement among the Big Powers to maintain world peace. This is an assumption which is not altogether invalid. But recent developments indicate that this assumption, as well as some of its implications, may need re-consideration. From a closer examination of the underlying bases of this assumption and its implications, certain conclusions emerge.

Neutrality is, perhaps, as old a conception as Switzerland. But the concept of neutrality has changed, even as its justification and possibility have taken new shapes and significance. Upto the start of the second world war, neutrality, or rather the existence of one or some States as neutral Power or Powers, was considered as necessary even by the rival combatants. Neutral States existed throughout the second world war. Since the end of the second world war, and especially since the start of the "cold war", the argument has very often been advanced that neutrality is not a practical concept. In an atomic war, this may be true. But those who believe that neutrality is not possible do not stress this aspect. Their main argument is that, as world peace depends on the Big Powers, it is essential that all the countries must align themselves to those Big Powers who are striving for peace. Here, the question is not which of the Big Powers are trying to preserve peace. According to this argument, the main fact is that, if the Big Powers decide to wage war, the small Powers will be necessarily involved, whether the latter like it or not.

Consider, first, this Big Power argument. This is a projection from the era of single-Power domination to the present period, when the world contains more than one or two Big Powers. It is this changing

The Economic Weekly

Bombay
23406

pattern of the growth of Big Powers which is of some significance. It is doubtful whether war is inevitable, except under certain extreme circumstances, even if Capitalist America and Communist Russia decide to fight it out among themselves for ultimate world domination. That depends on certain other related circumstances. For one thing, neither America nor Russia is likely to "go it alone". Britain and France have repeatedly demonstrated that they want to prevent, if possible, a third world war. In America, there may be doubts whether Communist Russia and the Communist States in Eastern Europe have rendered, or will ever exercise, such a restraining influence on Russia. On purely strategic grounds, it would seem that Russia would prefer Communist China in the south and the Communist Eastern European States in the west to remain neutrals in the event of a war.

Another development since the end of the second world war has tended to shift the emphasis away from the Big Powers. Since the war, many Asian and African countries have attained independence; some others have emerged out of foreign political or economic domination. All of them are small Powers. All of them are interested in world peace so that they can

pursue their objective of economic progress. These Powers are not as much neutral as peace-loving. In their pursuit of peace, they have established two facts. One is that, collectively, they are able to exercise a major influence on world affairs. They have also demonstrated that the Big Powers cannot settle or decide world issues without prior consultation with them, and without their acceptance of Big Powers' decisions. Simultaneously with these achievements, the small Afro-Asian Powers have been trying to create and to extend an area of peace.

Only eight months ago, Colombo Powers met in Colombo to enunciate the basis of relations among them, and between them and the outside world. Since the Colombo Conference, India, China and Russia have, separately and jointly, undertaken to base relations between them on the "five principles" enunciated in the preamble to the Agreement between India and China on Tibet. Acceptance of national sovereignty and non-interference in internal affairs are the two main pillars of this foundation of peace. Not only the Colombo Powers and China but Yugoslavia has also aligned herself with this foundation, and with the "five principles" on which it is based. Both China and Yugoslavia are Communist coun-

tries, although neither is Stalinist in outlook. Colombo Powers and two Communist States are making sincere efforts to demonstrate that peaceful co-existence is possible.

At Bogor now, the Colombo Powers are exploring the prospects of extending these principles and concepts in space. It has been decided to hold an Afro-Asian Conference in Indonesia at the end of April. Most of the African States are peace-loving, and are opposed to aligning themselves with either of the rival power blocs. Along with Yugoslavia, China and the Asian Powers, they do not reject the possibility of peaceful co-existence. They have a common interest with China, Yugoslavia and the Colombo Powers in establishing and extending an area of peace. It would be unwise to ignore the conflicting interests of the Afro-Asian countries, or the inherent incompatibility within such a heterogeneous group of countries and Powers. But, as long as they profess a common interest in peace, it should not be difficult for them to unite in their common aim. Whether the objective be defined as peaceful co-existence or the creation and maintenance of an area of peace, all peace-looking peoples in all parts of the world will wish them success in their peaceful efforts.

Rural Reorientation through Credit

It would be a mistake both to the Committee of Direction of the All-India Rural Credit Survey and to the problem of Rural Credit Committees to pass judgment on the observations contained in the General Report in a cavalier fashion. The Committee have taken nearly three years to collect facts and interpret them and not all the facts which they have collected are available to those who want to comment on the findings. We have what may be termed the conclusions of the Committee as raw material and not the data collected through the sample survey spread over the entire country and over a considerable span of time. And even if all these facts so laboriously collected were available, interpretation would be a task requiring the knowledge of many extra-economic factors. It is therefore inevitable that any assessment of the findings of the General Report of the Rural Credit Survey

should be tentative—an assessment more in the nature of thinking aloud on a question which is likely to remain unsettled for a long time, rather than a definitive statement of the proper approach to rural finances.

This is not to say that what the report says is of little weight. On the contrary, the report draws attention to, and takes its stand on, issues wider than that of the mere mechanism of providing finance for the rural sector. Very commendably it deals with the rural problem as a problem not only of economic arrangements directed to several worthwhile ends, but also of social adjustments, leadership and psychological reorientation. For the substance of the Committee's findings with regard to the present position is that agricultural credit, as it is applied by the different agencies, falls short of the right quantity, is not of the right type and often fails to reach the right

people. It caters for the needs of a very small proportion of agriculturists and by and large assists only those who could help themselves to a very considerable extent. If it does not supply the requirements of the middle and small cultivator, it is not only because the credit-worthiness of the latter is less, but because owing to the present arrangement, the better-off landholder enjoys certain advantages which make it possible for him to establish contact with the institutional lenders. Indeed, the report goes further and brings home the point that it is the large landholders who exercise effective control on the institutional lenders operating in rural areas and are in a position to establish their contact with an urban sector. In the view of the Committee, therefore, any solution of the problem of rural credit will have to take cognisance of this total position of strength concentrated in a few as a result of the

operation of economic as well as social factors.

The way out of this difficulty that appeals to the Committee is contained in a slogan, "Co-operation has failed, but Co-operation must succeed." The several reasons which the Committee gives for the failure of co-operation as a means of satisfying the credit needs of the village are summarised elsewhere in this issue. Without going into the ramifications of this slogan, it may be pointed out that what is aimed at is a rejuvenation of the co-operative method of financing, partly through larger State co-operation and partly through a change in attitudes. As regards the former, the report envisages the greater provision of credit by the Government both directly and through the Reserve Bank of India, as well as establishment of a State Bank of India with a wide network of branches. This mammoth institution is to be created as a result of the amalgamation of the Imperial Bank of India and of several other banks operating in close association with State Governments. Admittedly this part of the recommendations of the Committee is capable of implementation, since it involves little more than mechanical adjustments. But the second set of recommendations, which in a sense are infinitely more important than the mechanical arrangements, are not likely to be easy of achievement. That adjustments in attitudes are necessary for a proper integration of the rural economy into a wider structure is indisputable. What is in doubt is how best it can be done. Unfortunately the Committee's panacea of co-operation all around is not likely to be a quick or a controllable process.

It should be recognised that even the mechanical adjustments recommended by the Committee raise a variety of difficulties. For instance, the Committee has recommended the creation of various funds which would all be concerned with augmenting different types of credit needed in the rural areas. A very substantial portion of the initial and working resources for these funds have to be provided by the Reserve Bank of India. One way or another, the liability of the Reserve Bank to keep these funds well supplied with liquid resources might end up in an injection of the medium of exchange into the rural system; such injection will have to be precisely at those points where it bears maximum fruit, if the ex-

pectations of the Committee are to be fulfilled. Quite obviously the Reserve Bank will have to operate through the co-operative system and the effectiveness of the Reserve Bank's lending will depend on the manner in which the co-operative societies at the base dispense credit. If one of the reasons for the present failure of co-operative credit societies is that the people managing it are not sufficiently rural-minded, the mere addition to funds at their disposal will not bring about any spectacular results. Along with the increase in credit resources, there should be an increase in the extent to which such credit is made available to those who need it most, namely, the small cultivators. This cannot happen unless those who manage the co-operatives have attitudes different from what it prevails now. In other words, even assuming that the various funds recommended by the Committee are set up and that the resources at the disposal of co-operative banks are enlarged, it will be of little import if at the same time the most vulnerable section of the rural community does not come to believe that the co-operative societies are there for his benefit and that the price he has to pay for utilising its benefits is not unduly high in monetary or other terms. It is not as if the Committee are not aware of this aspect of the trouble. The stress time and again is on the need for greater rural-mindedness in the field of credit. But short of a change in human nature, they are apparently unable to see how the position can be remedied.

Much the same sort of difficulty arises in respect of the second major recommendation of the Committee, namely, the setting up of a State Bank of India. With an increase in the number of branches of such an institution, it is no doubt true that various advantages in the field of remittance, etc., would be gained. It may also happen that the existence of a branch of a state-owned bank might attract deposits and strengthen the banking habit in the rural areas. But with all that, if the banks operate in a manner that would be suitable to an urban rather than a rural environment, it is doubtful if they will make any difference to the existing position and succeed in supplanting gradually the money-lenders and traders who now account for over 70 per cent of rural credit supply. Besides, the nationalisation of the Imperial Bank of India and the other banks might

create wider repercussions of a psychological nature. It is of course somewhat hazardous to go into the ramifications of this aspect, since one is likely to be urban-minded rather than rural-minded in one's response to questions of nationalisation. That is to say, to the urban sector of the economy, a phrase like State co-operation has certain undertones which are likely to discount the co-operation element in it. So for that matter would nationalisation. But what the reaction of a properly rural-minded person would be to these developments, it will be difficult to say. Maybe, the ideological battle that rages in the industrialised urban field in regard to State and private enterprise has little meaning to the small cultivator. So long as he gets his credit, he may not bother as to the nature of the agency supplying it. Despite all these, however, an increase in State participation in the rural sector, which would be inevitable if the Committee's recommendations are adopted, could have repercussions on those external influences to which considerable importance is given by the Committee in their analysis of the problem of rural finance.

There is, finally, the other side to the picture which also needs considerable attention. This is the emphasis laid by the Committee on the futility of concentrating on credit alone to the neglect of production and marketing techniques. These also have to be incorporated into a gigantic structure of co-operation in which both the State and the agricultural entrepreneurs participate with a fresh outlook. Change of agricultural techniques, improved communications, better method of supplying the raw materials needed by the agriculturists—all these and many others have to be attempted and achieved. It therefore ultimately becomes a question of the proper approach to agricultural problems, not as a problem of finance alone but of total economic and social reorganisation. It is a task so mighty that careful enunciation of it might look academic or visionary. But situated as we are, it is to be viewed with weight, and tackled on a massive scale. It is to the credit of the Committee, that they have not hesitated to pose the problem and suggest the remedy in a manner which makes it clear that the task to be performed is not that of an expert in only one field but of the community as a whole, both urban and rural.

Weekly Notes

Back to Academic Life

BOMBAY UNIVERSITY is lucky to get Dr Matthai to guide its affairs and let us hope, for many, many years. For a man of his academic background and intellectual bent Dr Matthai has shown an amazing flair for affairs and had had opportunities which, in his time, came to few men.

From a college professor to Director-General of Commercial Intelligence and Statistics, then the Tariff Board, Directorship in Tatas, portfolio for Railways in the first Congress Cabinet at the Centre, then the all important portfolio of Finance and back to the Tatas, the positions that Dr Matthai has held and the variety of jobs he has performed have not been excelled by many of our front rank public men. Yet, throughout, he has preserved a donnish air and academic detachment. With his alive mind that delights in exploring all sides to a question, though he has been in their front rank Dr Matthai could never be a politician proper, who looks at one side of the question and looks at it all the time. Rarely does the right job fall to the lot of the right person as it has done in the case of Dr Matthai.

Tea Export Quota

TEA prices have reached fantastic heights both in Mincing Lane and Calcutta auction. It may hurt consumers in Britain, but surely it does not hurt the Indian producers. That was the reassuring statement from the Minister of Commerce and Industry. Who ever hard of producers getting together to put a ceiling on the price of their own products? So that could not be the point. Surely no one ever imagined that producers would like the Government to intervene for the express purpose of bringing down export quota prices.

The economics of tea is extremely complicated, and it remains more than a little obscure to all, except perhaps the people in the trade. Despite a plethora of tea statistics, no one knows for certain—not even the Tea Board—what is the amount required for domestic consumption. Now there being two prices for tea—one for tea sold with export quota and another for tea intended for domestic consumption—ignorance of the latter is a serious handicap in deciding the

correct principle of allocation between domestic and over-sea market. As the price of tea with export rights has gone up—the export quota itself which is separately trade has reached an all-time high level of 380 pies per lb!—the difference between export and internal prices has widened. It has widened to such an extent as to raise doubts whether domestic consumers are not being pampered and worse still, whether from the wholly laudable object of helping the domestic consumer, the Government, acting without adequate data, is not losing the opportunity of higher export earnings by refusing to release export quotas to the level permissible under the International Tea Agreement. The permissible quota is 135 per cent of whatever the base year was out of which 129 per cent have been authorised for export but the Government is sitting tight over the balance of 6 per cent which amounts to some 20 million lbs of tea.

The reluctance to release the rest of the quota again is due to ignorance of the factual position. The Ministry would like to wait and make sure that the flood damage will not reduce domestic supplies before it takes any action. This does not make much sense to outsiders when they are told that the North India crop has been so much better this year. In fact, the published statistics of production upto the end of November are some

498 million lbs as compared to 473 million lbs in the same period in the previous year. If these figures are correct, there should certainly be a comfortable margin to justify the release of the balance of the quota without impinging on domestic supplies in any way.

If the Government has genuine concern for the domestic consumer, the real problem to tackle is the margin between retail and high wholesale prices. It is the prices of branded teas which are more than usually 'sticky'. At the moment, however, this class of retailers may claim to be virtuous indeed and forbearing, but in an earlier period when tea prices crashed, the Commerce Ministry had a real case against them which it did not pursue with much energy.

How fantastic the rise has been is brought out in the latest monthly statistical summary just issued by the International Tea Committee in London. The average fetched by North Indian tea at the end of November was 6s 11.2d per lb as compared with 3s 9d in the same week 12 months ago. Ceylon tea on the other hand averaged 6s 11.4d per lb as compared with 4s 1.7d per lb 12 months ago. It will be noticed that Indian tea has been fetching about the same price as Ceylon tea while a year ago the price difference was very much to its disadvantage. Is it because the quality of Indian tea has improved or scarcity tends to obliterate differences in quality?

Beneficent Nature in Pakistan

THE analysis of the factors contributing to the increased agricultural production in India during 1953-54 made by the Planning Commission in its *Progress Report* issued some months ago threw a wet blanket on the premature jubilation of those who were celebrating the solution of the problem of food shortage. The Report made the point that a 21 per cent increase in food production was not theoretically impossible on the basis of better weather conditions alone and that further, on a detailed regional analysis, even a conservative estimate of the role of a good monsoon could ascribe roughly 5 to 6 million tons of the total increase of 11.4 million tons to its beneficent character during the year. While the balance of the increase in food production could be depended upon in a normal

THE ECONOMIC WEEKLY

year, an abnormally bad year or two might well reduce total production to a level at which internal production would be insufficient to satisfy the needs of the country.

Support to the conclusions of the Planning Commission can be found in the final crop estimates for Pakistan for 1953-54 which are published in the Current Statistics on page 23 of this issue. Substantial increases in food production, as well as in other crops, have been recorded in Pakistan, although one could hardly say that any sustained or organised effort was being made there for the purpose.

Official crop estimates show an increase in rice production by ten lakh tons due mainly to an increase in acreage by 15 lakh acres but also due to an increase in output per acre. Assuming that the major part of this increase has taken place in East Bengal, a comparison with West Bengal, where also a large increase in rice production has taken place, becomes possible. In West Bengal, the increase in rice acreage was offset by a decrease in the acreage under jute caused probably by the price factor. The Pakistan figures, however, show a substantial increase in jute acreage at the same time.

Wheat production in Pakistan has risen sharply by 12.45 lakh tons, 51 per cent, while the area under wheat has risen only 1.14 lakh acres, or 12 per cent. Thus, the average output of wheat has risen sharply and if a special effort was not made, the weather must have been responsible for this.

Cotton, which is grown in Pakistan in the same region as wheat, and other cereals, shows a sharp fall in acreage and production. How far a shift in acreage from cotton to foodgrains was due to the price factor and how far to the weather must remain a matter for speculation in the absence of detailed data. In any case, the areas under jowar, bajra, maize, barley and gram also show increases and all these together are much greater than the fall in acreage under cotton. Perhaps land under fodder crops or which would otherwise have remained fallow was brought under the plough because of favourable weather conditions during the planting season, as happened in Rajasthan. These figures certainly tend to strengthen the suspicion of the Planning Commission about the stability of the increase in food production in India.

The Latest in Show Rooms

THE old landmarks disappear one by one in every city in the world, and new ones appear. But when sky scrapers replace junk shops in Calcutta, it usually heralds the emergence of some business house or other from the promiscuous obscurity of Burra Bazar to the forefront of big business. The tallest of the sky scrapers in Calcutta, however, to continue the metaphor, heralds something quite different, viz, the emergence of the bureaucratic state as the most outstanding spectacle of modern times. It is in the fitness of things, therefore, that the new secretariat should overshadow all other buildings.

In the case of some of the landmarks, the structure remains but the contents have undergone a sea change. Both in Bombay and Calcutta, the famous departmental stores where the Europeans and the anglicised Indian elite did their shopping have gone one by one. Whiteways, Army Navy Stores, have all gone and the buildings which housed them have now been converted into business offices. Insurance, handicrafts, airlines, advertising have filled the vacuum created by the disappearance of select clientele of an ancient regime. Curiously enough departmental stores in other countries cater only to the widest circle of buyers—Woolworth and Selfridges are for the common people. The more fastidious go to exclusive and expensive shops. East of Suez the habitual shoppers at Claridges used to be a separate and exclusive class and departmental stores that served them exclusive, too, and showed him his place if ever the Chandney shopper strayed into their sacred premises.

Though it has lost its old glory, Hall and Anderson are still carrying on an unequal fight, trying to keep up a link with the past. They still run some sort of a store, though space occupied by the store keeps on shrinking. A whole wing of the building has been taken up by Philips Electrical office for their Calcutta branch and show room. This was opened last month and it may some day become a landmark in its own right. It is not a big show by any means, but full of interesting possibilities. The casual visitor may not be able to take in

at a glance all that has gone into the designing of this bright little show room. Guests present at the reception on the opening day, however, had the benefit of having an expert look at things, which was indeed revealing.

Modern lighting is both an art and science. The ceiling of a show room may look no different from any ordinary ceiling. But if you watch it carefully, you will find that it is like a chess board, but a chess board in which the blocks can be moved instead of the pieces being moved from one block to another. Blocks can be shifted any way you like, to get the desired arrangement of lighting for a particular purpose. So if you want something to be high lighted, without making it too obvious, and letting the visitor suspect that his attention is being drawn to some thing in particular and avoid the effect of being garish you simply move the blocks to the desired position. As a result the object you want to be high-lighted at once get more illumination than others. It stands out. And the lighting can be varied indefinitely—tonight it may be a new model of radio that gets the limelight, tomorrow you may want to give special display to a refrigerator that works on D C current—whatever your electrician may tell you, some of these are still available for sale, though I am not sure that many more are being manufactured—another night, it may be some dish-washing machine that becomes the centre of attraction.

Lighting, again, has to be blended with the colour scheme of the room—harmony has its points, but it can sometimes be monotonous depending on the colour. Pleasing contrasts can be very effective and more cheerful, while if you have to work for long hours in a room, perhaps another combination may be more suited for the occasion, a blend that will tire you less.

Selling of modern electrical appliances which seem to slowly catch up with Indian homes, need special techniques with no little stress in educating the prospective buyers in the use of these gadgets. The new show room of Phillips is an effort, first of its kind in India, which will not only provide pleas-

ing environment for a buyer to see and know the product he is interested in, it will also educate hundreds of dealers who handle radios, lamps, lighting fixtures or domestic appliances, to display their wares in a manner that will attract more customers.

Vyapar Directory

THE new Vyapar Directory keeps up the high standard of its predecessors. By its extended coverage of the economic, agricultural and industrial development of the country and the progress of the Five-Year Plan, it adds much to its usefulness as a handy and complete book of reference for businessmen who find it easier to get their information in Gujarati than in English. Not that those who read English need despise it either. There are not many publications in any language which give such exhaustive information for businessmen.

The publishers have not been after a mere compilation of names and addresses, and have taken great pains to collect and collate useful information on each and every aspect of our economy and they have done it intelligently.

Among other attractions in the omnibus volume, mention may be made of the chapter 'Our States' which contains particulars of commercial importance of every city in India. Business houses dealing in export-import trade will greatly benefit from the chapter Foreign Trade, as also the one on Foreign Countries. The first traces the history of India's foreign trade and brings it up to date while the second contains information relating to commerce of all the important countries in Asia, Africa, Middle East, Far East and Australia.

The text of many of the important commercial and industrial acts as well as important press releases by trade associations have been reproduced in full. Exhaustive list of firms overseas interested in India's foreign trade continues to be a major attraction of the volume. Priced at Rs 20, the directory is good value for the money.

Conferences and Exhibitions

THINGS happen in Calcutta. That was what an Editor of a news agency told this writer a year ago. He was thinking of expanding his Calcutta coverage. Nothing materialised finally. But a year in Calcutta has taught this writer that things do happen in this city. All that happens is not political. Even Communists cannot be always active. Trade unionists cannot stage labour marches everyday. And sometime, some day, the dock labour dispute gets settled, the workers get tired of convening protest meetings, and PTI employees decide to postpone the threatened, one-day strike.

Calcutta is not the home of cricket in India. Even then, there was a one-day cricket match in which most of the all-India players took part. There was the quadrangular football tournament. India won the trophy for the third year "in a row". India's tennis stars are not from Calcutta. But the South Club tennis championship still attracts all the all-India stars. South Club is now holding the annual championship tournament.

CALCUTTA GOES GAY

This is the season when a part of Calcutta goes gay. But that is only a part of Calcutta. This city has always its serious aspect. Is there any other city in India where the Prime Ministers of India and Pakistan could meet, not by choice, but by chance? They did meet at the Dum Dum airport this week just by chance. And the people came to know that Pakistan was not going to raise the Kashmir issue before the Security Council until after the proposed meeting between the two Prime Ministers. That was good news, and a pleasant surprise.

This is the time of the year when Calcutta holds annual meetings and exhibitions. There is the annual exhibition of the Academy of Fine Arts at the Museum. At the Austin Showroom in Chowringhee, a rival body, the newly formed National Academy held its first exhibition. A budding Sher Gil put both into the shade by her brilliant one woman show. It is inevitable that one of the numerous all-India music conferences will now be on. In a nearby cinema, one can have a look at the "Stars of the Russian Ballet". One can have a glimpse of Ulanova, the prima ballerina.

Calcutta is at the periphery of the mining and industrial belt of India. This city is the headquarters of the Mining, Geological and Metallurgical Institute of India. This Institute holds an annual meeting in Calcutta during the Christmas holidays. Once a year, the scientists and engineers concerned drink to the toast of the "Mineral Industry of India". Important things are said and discussed in this annual meeting. One has not yet had the time to glance through the various papers read and debated this year. But this year's presidential address was rather prosaic.

MUSLIM BENGAL

This is not a criticism of the president. This year the toast was proposed by the President of the Mining Association. He has spent all his working life in the commercial side of the coal industry. He discussed the problems of the coal industry. It was thorough. It could not be bettered by any chairman of any coal company. It has provided valuable copy to City Editors for their discussion on the prospects of the coal industry.

Men of this Institute have a flair for philosophical speculation on material matters. Many years ago, one was impressed with the observation that perhaps, Muslim Bengal was a geological projection of Hindu Bihar. This religious classification of these two neighbouring States may not be mathematically precise. But one has had many occasions to wonder whether the geological phenomenon that is Bihar could have really ended at a line which now draws the regional boundaries between Bihar and West Bengal.

OIL AND COAL

Even last year, a reputed geologist informed this Institute that he had his doubts. He seemed to be confident that the coal and mineral belts extended far to the east of Bihar in West Bengal. Others have cited the Sunderbans as proof of the existence of a coal basin in West Bengal. There are traces of an oil basin in western and south-western West Bengal. New Delhi, one gathers, has a project of exploring oil prospects in the Bay of Bengal.

These were not the themes which were debated by the Institute this year. If the outgoing President discussed the burdens on the coal in-

dustry, the incoming President talked about the need for increasing output per man. This is not an unimportant matter. If the Finance Minister thinks he can solve India's economic problems through quantitative employment, the engineers and industrialists prefer qualitative production. There may be socio-political reasons behind the Finance Minister's choice. But the engineers' preference seems to be better economics.

TECHNOCRACY

Calcutta may have become conscious of technology. But this city rejects technocracy. Sardar K M Panikkar is a good judge of men and matters. He may not have heard that even the Jadavpur School of Technology has recently held a music conference. But he knows Bengal and the Bengali. He reminded the National Council of Education, Bengal, that technology could not be equated with civilisation. He was speaking to converts.

SERAMPORE TEXTILE INSTITUTE EXHIBITION

The Bengal Textile Institute at Serampore organised a five-day exhibition on its premises displaying some of the important stages of the processes carried on in the textile industry. The exhibition attained a high technical standard and was thus markedly different from others where shopping principally masks the educative aspect.

Planned on a broad theoretical background, the different sections displayed the variety of fibres coming under textile industry ranging from jute, synthetic fibres and cotton to silk. The display of jute products ranged from woollenised jute, jute felt, canvas, twills and linoleums to the fine specimens of carpets manufactured by Birlas on their Jacquard looms and Tapestry machine. On a different stall the Basanti Cotton Mills of Panihati displayed the different stages in cotton processing upto the yarn stage.

Two spacious halls were set apart for the display of handicrafts and needlecraft of displaced persons supplied by Handicraft Co-operative Societies of the Government of West Bengal. The exhibits included specimens both of art and daily utility, some of which were on sale at moderate prices. The Directorate of Industries, Government of West

Bengal, ran a stall displaying the processing of silk as a cottage industry from caterpillar rearing on mulberry leaves to silk reeling from cocoons. Some attractive specimens of leather handbags, toys and silk besides articles made of conch shells were also put up for sale.

In a separate stall housing the Research Section of the Institute there were some fine specimens of handloom work for door screens, bed sheets and carpets were displayed. The designs were worthy of appreciation.

The technical sections comprising the physical standardisation and analysis of fibres and chemical processing of fibres imparting to them special physical properties and attractive shades in print were highly educative. The students of the Institute ably explained the manipulation of the Lea-Winder, Lea-Tester, Twist Counter, Yarn Tester, Cloth Tester, the Microtome with its supplementary adjuncts, the Microscope, Photo-micrography apparatus and the ingenious Fibre Drawing apparatus. All these bring to light delicate properties of the fibres which escape the layman, though he may be constantly using them in different forms.

In the Chemical section, the different commercial processes were demonstrated that make the common fibres attractive and useful by endowing them with uncommon physical properties as in Mercerising, Organdy finish, and woolenising of jute. Besides, all the intricacies of different types of dyeing, printing like Photo printing, printing with Lepidiazol, Resist type printing, Block printing, metal dust printing (an ancient Indian art), Screen printing, air-spray printing and Crimps design printing were demonstrated by the students. Metal dyeing by the Electro-Chemical process was also shown.

In view of the present-day problems of finding employment, it would be helpful if the District Employment Exchange could collaborate with the Exhibition Committee and give some indication on such occasions of the probable employment opportunities in different sectors of the textile industry. This could be compiled through their wide all-India organisation. The students as also the public could thereby be guided for future employment which always looms large before the trainees as a difficult problem as their training nears completion.

PANDITJI TAKES HIS EDUCATION

One may end with Pandit Nehru's experience and observations in his brief stay in Calcutta on his way to

Djakarta. Panditji is the Chancellor of the Visva-Bharati University. He went to Santiniketan to deliver the Convocation address. Panditji has a sense of counter-point. Santiniketan is the home of art and culture in Bengal. It was typical of Panditji to stress the need for a scientific outlook and approach to the country's problems in such a surrounding.

Those who do not like the look of Panditji may think that he takes

his education in public. But his thirst for knowledge is one of his admirable qualities. It is good news that the international experts now, staying as guest visitors at the Statistical Institute have succeeded in informing him that it is more than time for New Delhi to abandon its obsession with finance, and to get familiar with the physical approach to economic planning. Therein lies hope for the future.

NEW INDIA STORIES FROM LIFE 2

'My advice saved this boy's future!'

Years ago, I persuaded my good friend and neighbour to take out an insurance policy. He thought I was being fussy, when I brought up the question of his son's education. His son was just six months old then!

Ten years later, my friend was struck down in the prime of life. A sudden heart attack, and he died almost at once. I took over the guardianship of his son.

Today, the boy is studying to be an engineer. The New India Life Assurance Policy his father invested in has paid for his education. And imagine my feelings, for indirectly I had ensured a successful future for the son of my friend.

An insurance policy taken out now may one day stand between you and disaster. For full information, write to

From the London End

Peace and Goodwill to All Men...

CARLYLE is quoted to have recorded somewhere in his diary that one evening he noticed "that the men on the street corner were unusually drunk". It was only then that he "remembered that it was the birthday of our Redeemer". Nowadays it is not so much the drunkenness which reminds us of the current Festive Season but the orgy of mass spending. The British Board of Trade has not yet come out with another of its regular surveys on Retail Trade but experience suggests that this season's turnover in the consumption goods industries is unprecedented, both in size and scale. The year-end festivities call for lots of food and presents; it is also the occasion for salary bonuses and other gifts that employers, both from pressure and custom, are forced to dish out to their workers. More than that, the occasion calls for considerable merriment and since in the West little merry-making is possible without added alcoholic consumption, the brewing industry is having a busy though not an unprofitable time. And in all this, the purpose of the festivities has become somewhat blurred—less and less people attend church and the anniversary of the birth of Christ has become a secondary, if not an unnecessary, feature of the whole business.

The merriment, however, is not without content. It remains steeped in graceful charity and above all, in sentiments of "Peace on earth and goodwill to all men". By a historical process, these noble sentiments have today come to apply only at national levels or within nations and this is today particularly true of European countries. It remains a harsh fact of the times that in international relations the one thing that remains disgustingly absent is charity. Indeed as the Christmas festivities were approaching, the cold war temperature fell several degrees in quick successive stages. Rearmament to "deter aggression" is being undertaken on all fronts and on all sides in real earnest. The question who is deterring whom, must with logic demand a clear answer and further a considerable rethinking about all that is held as current beliefs but the intellectual charity which is required for this exercise is conspicuously lacking. Reading the NATO press communique of

last week is itself sufficient to confirm how utterly irrelevant the noble sentiments of Christmas-tide are to relations between nations.

The armies of Nato are to be equipped with atomic tactical weapons and so, the next war, when it comes, will be a thermo-nuclear war which could end all civilized life in Europe and beyond. Of course the Nato Council has considered the question whether the military or the governments concerned should give the order for the use of atomic weapons when war begins. But in all respects, what character the next war will take has become tragically clear. The official communique explained that the governments would have the final decision but—and here is the rub—the precise method of reaching it would be kept secret.

On the day before Christmas, there appeared an enthusiastic editorial in the Manchester Guardian explaining in lurid details the implications of Nato's decisions. It went on to examine the doctrine of the "intolerable atomic absolute"—a doctrine purporting to pin-point the forms which a Russian atomic attack would take:

"Even when the new Russian jet-bombers become available in numbers . . . their range may not carry them much further than San Francisco, Chicago and New York . . . of course one does not know for certain",

and so on. Like the many irresponsible American Congressmen who never fail to bandy the atomic weapons, the once very sober Britain is beginning to lose sight of the immense destruction which another war will let loose. Military leaders of the calibre of Field-Marshal Montgomery preach with unflinching enthusiasm the use of the A-Bomb and the H-Bomb. One wonders whether all this is intended to put public opinion to sleep by preparing it morally for the inevitability and even the necessity of atomic war. From the other side there comes the counter-blast: Marshal Vassilevsky is reported to have warned Western military spokesmen that "your irresponsible statements force me to warn you that you are playing with fire—dangerous fire". And so the circle completes with "peace on earth" remaining an ever dimmer prospect.

That thermo-nuclear warfare means nothing less than general suicide is recognised from Sir John Slessor, unrivalled expert in air-warfare, to Dr Adrian, President of the British Association. And in 1954 decisive steps were being taken to step up on measures which would inevitably lead to this suicide. The mental condition which Geneva sponsored was a mere respite, for close on to the termination of the war in Indo-China there followed the SEATO organisation, the London and Paris Agreements and now the NATO Council decisions. If there is any task left for 1955, then it is certainly that of undoing these war-provoking measures, and to make sure that war as an instrument of policy will never be resorted to. In a timely year-end message over the B.B.C., Bertrand Russel has called upon the neutral powers to prepare themselves for the task of compiling a factual report on the consequences of thermo-nuclear warfare, to address this report to those nations faced with the agonising dilemma resulting from their participation in systems of military alliance and to convene a Congress in which they will provide the basis for accommodation to the rival forces which today stand menacingly facing each other. Even from the narrow view-point of national self-interest, the neutral powers will gain much benefit by taking such an initiative—the radioactive dust which spread over so wide an area outside the "danger zone", following the Bikini explosion of the Hydrogen Bomb, as to burn Japanese fishermen and to contaminate the fish in surrounding waters is sufficient to show the gains from such an approach. May the New Year hope—the only possible hope—be this. To the Neutral Powers, India in particular, millions of thinking Europeans now turn for a permanent respite from the appalling thoughts that burden their daily rounds. It was to voice this that so distinguished a spokesman as Bertrand Russel made the call.

Britain's Ageing Population

(From our London Correspondent)

THE land of Malthus has all of a sudden come to recognize that its population problem has nothing whatsoever to do with what Malthus in his more dismal moments predicted for his country and the world. Britain's problem is not one of a rising birth rate, but that of an ageing population. In 1901 only 6.1 per cent of the population were over the retirement age (65 and over for men; 60 and over for women) while in 1953 it was 13.9 per cent. In the same period the proportion of children (under the age of 15) to the total population fell from 32.4 per cent to 22.5 per cent. The size of the working force (the active population) as a percentage of the total population has remained stationary during this period.

The force with which the significance of these data has struck the country has led to quick reappraisals of current conventions and suggestions have been made to the effect that the retirement age should be extended, and that more incentives for larger families should be provided by the State. The lengthening expectation of life, now estimated at the limit of 65 years, has of course baffled the Neo-Malthusians of whom there are not a few in this country. It is noteworthy however that they are the ones who have remained mostly silent on the British problem, while at the same time they are most conspicuous in discussions about the "population burden" of under-developed territories. The cynical comment of William Vogt, the American demographer, that "sex is a national sport in India" is bandied around here as the problem of under-developed territories in equally cynical fashion.

Of course there is little reason for shock and surprise in Britain. Soon after the war, and again in 1951, when a national population census was taken, the ageing population of the country loomed large in public discussion. On this occasion, what appears to have revived keen interest in the question is the publication of the Phillips Report on Retirement Pensions and the political campaigning for increased old-age pensions in view of the rising cost of living. The Phillips Report recommended that the retirement age in Britain be extended by 3 years in view of the inability of the National Insurance Fund to meet the country's pension commitments against national in-

surance contributions from the working population.

The significance of the Phillips Report recommendations must be seen in the light of estimates of the future size and distribution of Britain's population. These estimates are summarized in the table below.

By the end of this century, nearly one out of every five persons will be over what is now accepted to be the retirement age. Although the number of children, increasing in the near future, is expected to decline, the dependent population will be larger than it is now: 38.4 per cent in 1993 compared to 34 per cent in 1953. In so far as the State is directly concerned, the implications of this population trend are necessarily concerned with the cost of education and the cost of pensions. Currently about three-fifths of the education cost is borne by the State (the balance by local authorities through rate levies). In 1929 the state-burden of education expenditure was £38.5 millions or £29 per child. Today it is about £145 millions, or £55 per child. And in spite of this considerable increase, over half of the school-going children are taught in over-sized class groups. While this aspect of the problem is important, it is certainly not as serious as that relating to old-age pensions.

Some six years ago the Government introduced a comprehensive national insurance scheme, giving a measure of security to everybody in sickness, unemployment and old age. By far the biggest cost was that of giving retirement pensions to every man over the age of 65 and every woman over the age of 60. In addition to the national pension scheme, there are many separate retirement schemes for employees in public service and for those in private employment. All these schemes are affected by an ageing population. It is generally recognised that the Govern-

ment's proposals to raise the level of pensions is part of an electioneering effort, but this is certainly an insignificant aspect of the problem. The Government Actuary estimates that, taking into account the Government's proposals before Parliament, expenditure on pensions which was £334 millions in 1953-54, will amount to £436 millions next year, £521 millions in 1959-60, £672 millions ten years later and some £120 millions more by 1979-80. These figures are based on the assumption that the rate of pensions will remain fixed—an assumption commonly held to be absurd.

How is this burden of dependence to be financed? The Economist has referred to the certainty of the national debt amounting to some £26,500 millions and the "breaking-point" system of taxation already in force. The proportion of the national income absorbed by pensions was a little over 4 per cent in 1952. Even if the national income rose by 1½ per cent per annum, the increasing cost of pensions could only be financed by maintaining current levels of taxation—a proposition that few tax-payers will countenance for any period of time. And yet the case for financing that burden now (after 15 years of inflation) and in the future is overwhelming. No definite proposals, apart from that of increasing the retirement age (by three years) has so far been made. The political pressures against an increase in the retirement age has already forced the Government to abandon the proposals of the Phillips Report, and thus the problem stands without a solution.

The total number of workers will change very little over the next thirty years, but if the expected increase in productivity occurs, the burden of the dependent population may be less than would appear at first sight. The main hope for the future, therefore, lies in greater output per head.

Population Forecast

	Under 15 years		15 to 65		65 and above	
	Size (million)	per cent	Size (million)	per cent	Size (million)	per cent
1901	12.0	32.4	22.9	61.5	2.3	6.1
1931	10.8	24.0	29.9	66.4	4.3	9.5
1953	11.2	22.5	31.5	63.6	6.9	13.9
1963	10.7	21.1	32.4	63.6	7.8	15.3
1973	10.4	20.1	32.2	62.2	9.2	17.7
1993	10.2	19.6	32.1	61.6	9.8	18.8

Not really. Everything has gone wrong with the village this morning. The rice mill has packed up. Perhaps the chukkiwalla left his fuel tank uncovered overnight, or he may have been fiddling about with the injector. (You'll never get him to admit it!) At all events, smoke is coming out everywhere and life in the village has almost come to a standstill.

GOOD MORNING BOKTARI!

It's on occasions like this that the engineer from Burmah-Shell's Technical Service enters into the nerve centre of Indian life. He takes his coat off and gets down to work. He's seen many rice mills and other machinery in his travels, and he's developed an uncanny knack of getting to the bottom of fuel and lubrication problems.

If you have your problems—large or small—ring up your nearest Burmah-Shell office (or contact the local representative) and ask for our Technical Service. You'll find them very sound people to deal with.

An insurance may one between you For full

In view of the bloms of finding would be helpful if the ployment Exchange could with the Exhibition Committee give some indication on such occasions of the probable employment opportunities in different sectors of the textile industry. This could be compiled through their wide all-India organisation. The students as also the public could thereby be guided for future employment which always looms large before the trainees as a difficult problem as their training nears completion.

PANDITJI TAKES HIS EDUCATION

One may end with Pandit Nehru's experience and observations in his brief stay in Calcutta on his way to

New Look for Jute

Nikhil Chandra Bhattacharya

FAR back in the dark days of India's industrial backwardness, the populous eastern districts of lower Bengal could discern the sheen of gold in the much-despised material, commonly called 'pat' or jute. Before the dawn of the 19th century, raw jute started moving to the traditional textile centre at Dundee, and as it evoked the interest of the flax-spinners there, there was increasing demand, so that we find at the dawn of the 19th century an oversea market for hand-woven jute goods steadily growing.

Jute bags from Bengal were in demand in Java, Borneo and other regions of S.E. Asia. The entrepreneurs at Dundee meanwhile worked fast and evolved a means of spinning jute on their power-driven flax machinery. By the middle of the 19th century, faced with the growing demand for labour, the most enterprising among them hopped to India with their machinery to monopolise jute manufacture. Thus originated the historic spinning factory of George Auckland at Rishra in 1855, a hundred years back. History has in store a surprise that one Bysumber Sen, a local Bengali capitalist, lent his capital and energies for the promotion of this nucleus! No wonder the early entrepreneurs could foresee the immense potentialities of this industry in those far-off days.

Shortly afterwards, in 1858, a big fire effaced the early attempt. The site is, however, still occupied by the Wellington Jute Mill of Messrs James Finlay & Co Ltd. Immediately afterwards, a weaving factory was started at Barnagore in 1859, followed by the India Jute Mill at Serampore in 1866 and the Hastings Mill at Rishra, next to Wellington Mill, about the same time. In the wake of the Industrial Revolution, as England led in the ingenuity of machinery, the cheap labour of India did its part, so that within just a quarter of a century, jute established itself as a formidable industry.

No doubt this big machine advancement spelt disaster to the native cottage industry in textiles that was at the time just beginning to flourish. The jute mill industry settled itself at and near Calcutta, the key to the jute hinterland and

an important harbour on the principal trade routes of the world. Today, there are over 100 mills in and around Calcutta, and their total output amounts to some 88,000 tons monthly. However, the phenomenal growth of the mill industry more than compensated for this passing hardship in the form of a greatly increased demand for raw jute, providing high cash-returns to lakhs of jute-growers and well-paid employment to over three lakh workers. There is perhaps no other article so widely diffused over the globe as the Indian gunny bag.

The reader will naturally wonder how the stem of the jute plant, grown so extensively in this province and around, comes to be woven into a fabric which commands such a pre-eminent position in the trade of this country. A closer look at this common plant will reveal a long straight stem growing to a height of some eight to ten feet without branches or twigs until it nearly reaches maturity. It consists of a central woody stick (used here as a bag when dried), surrounded by a bast layer in which the fibre grows. The crop in the rainy season comes entirely from this fibre. Sown between mid-February and mid-May, the crop gets fit for harvesting between January and September. The plant thrives best in damp heat and a not too heavy fall of rain. Sandy loam is the best type of soil for its cultivation. Bengal answers marvelously to these needs and hence is ideally suited for the cultivation of jute.

The next best centres for cultivation in India are in Bihar, Assam, and Orissa. With the partition of Bengal, a large proportion of the jute fields has gone to East Pakistan.

The first stage after harvesting is technically known as 'retting'. This involves steeping the plants in water—a sort of fermentation—which enables the fibre to be easily separated from the woody stem. Stripping and washing follow, and the fibre is separated from wood. Carelessness here will yield fibre of poor or "sticky" quality. The fibre is now ready to be dried and bundled for sale. The whole process is gone through in a largely perfunctory manner by unlettered

and uneducated, this causes a loss of time in the morning. Much improvement is about by a little paganda amongst his fuel regarding the rig he 'retting' and the commodity they are handling. Clear slow water, four to six feet deep for 'retting'. In the muddier water the stuff turns dull, thus failing to fetch price. Moreover, the threat of disease and disease emanating from these stagnant watery places, where 'retting' is usually done, reduces the zeal of our ignorant peasant to produce this commodity. It calls for the provision of tanks of clear water, which has not escaped the attention of the Planning Commission. It proposes to link this with the many river projects now in operation in West Bengal.

The fibre, thus developed, is next graded on the basis of length, strength, colour, etc., and then baled before being despatched in the form of "kutchra" or "pucca" bales, according as they are hand-pressed or power-pressed, mostly to economise shipping space, when meant for oversea markets.

Let us now follow these bales from the jetty of a mill to its Batching Department over trolleys, driven by Diesel or hand. Here the bales are broken and different assortments or batches made to answer the specifications of purchasers. This is a delicate job of high skill, needing mature experience, for while the fibre must answer to specifications, the salesman must husband out the fibre at his disposal most economically to ensure an efficient cut on costing. The different batches meant to turn out products of varied grades are next softened with an emulsion of oil and water, while the fibre is treated mechanically in softener machines. The coarse and rough fibre is thereafter prepared for the spinning stage in the Preparing Department, where fibre strands are split, shortened, drawn into smooth ribbons (Drawing Frames) and then wound in sliver form (in the Roving) on big bobbins called Roves.

In the Spinning Department, fine

THE land of Malthus, a sudden come at its population, ing whatsoever to falthus in his more, dicted for his c on the Sliver old. Britain's p of Messrs Mackie f a rising birth r of Messrs Mackie geing population. This marks a er cent of the modernisation of jute re retiremer the time-rate of the 1953 ple and speedy implementa me p piece-rates, which have pro en (v a satisfactory incentive to opers. This now yields an un ng stream of yarn in the factory ng d has more than overcome the additional bottleneck from the spindle to the shuttle on looms.

We next pass to the Winding Department, where the warp and weft yarn is wound on to two shapes, the cop and the spool—the former feeding the shuttle and the latter, the creels of the Beaming Department that turns out the Beams. This section has all the colour and gaiety of a women's gathering as mostly female workers are employed there. Intermediate in the process is the Twist Department where yarn is twisted into threads (3 ply, 4 ply, etc) and twines and despatched for export.

In the Beaming Department, the warp threads are dressed, starched and stiffened for the next stage on the loom where the final fabric is woven. The beams are designed according to specification and bear different coloured borders either at the extremities or right through the middle. Here comes into play the elegance of textile design, a very interesting and romantic subject, which can be appreciated only when one stops to ponder over the attractive borders of a lady's sari or the intricate checks of a shirting. Until jute fabrics figure in human attire, this section will remain neglected. Fortunately, we get some brilliant specimens of artistic work in jute carpets that are now being manufactured here.

In the Weaving factory containing the weaving looms, beams and winding machines, the looms stand out by their intense activity and continuous clatter and roar. The to and fro movements of the shuttle are bound to attract the attention of the casual visitor who is easily impressed by its deafening staccato.

The different sets of loom turn out fabrics of different quality and measurement; yet they are broadly grouped into two varieties, viz, hessian and sacking. While hessian cloth, with its finery and gloss serves, as tough packing material, sacking goes into the familiar gunny bags. For long the container par excellence, gunny bag is carried in enormous quantities to the store-houses of the world—the granaries of Argentina, Australia, and New Zealand, the sugar plantations of the Caribbean region, the rice fields of Burma and Siam, the coffee plantations of West Africa, to transport wool from Australia, linseed from Bombay, potatoes from Ireland—all of them moved in jute packing of some type or other.

In the Finishing Department, the woven fabric is given the necessary finish and gloss in the Calendar and Damping to satisfy the discerning buyer. Besides, certain processes incidental to packing and shipping are involved, viz, lapping, trumeter (measuring) sack sewing, hand hemming and finally baling in the hydraulic press and stencilling before being despatched over trolleys to the outgoing jetty on the river. Down the stream floats a cargo of the country's most common place material to be exchanged for dollars and sterling. Of the all-India exports for 1952-53, jute manufactures represented 23 per cent, their value being 129 crores out of a total of Rs 551 crores. In the same year India got a third of her total dollar earnings from the USA valued at Rs 111 crores through jute. The key position of this industry in the economy of the State will be further appreciated from the fact that it employs nearly half of the total industrial workers of this State and its wage bill in 1952 was over Rs 24 crores. The growth of the jute mills in India cut into British exports of textiles enough to cause resentment and jealousy at Dundee. But it must not be overlooked that the steady progress of Indian industries created new demands for imports of machinery and millwork which brought steady orders to British and other manufacturers. Time has shown that the early jealousies roused by the growth of textile industries in India were based on the unfounded fear that Indian industrialisation would deal a death-blow to the "workshop of the world".

The partition created a serious problem as the supply of raw jute

became uncertain and expensive, the better jute-growing districts being in East Pakistan. More than that, Pakistan showed a jealous preference in her export of raw jute to oversea markets in the USA, Spain, Puerto Rico and South Africa. This was a two-pronged drive against India's jute industry, cutting out her supply of raw materials on the one hand and on the other, feeding her rival manufacturers with the best quality of raw jute produced on the mainland. In 1953 with undeveloped manufacturing possibilities, East Pakistan exported 5,300,000 bales of raw jute. Secondly, after the hey-day of war-time sacking, the oversea markets, burdened with the high price of Indian jute manufactures, actively looked for alternative packing material. For, in 1951 an empty jute sugar bag landed in Cuba cost Rs 5. Thus development of alternative packing material was accelerated by war-time scarcity, post-war complications and to a great measure, by what may be termed the "smugness of monopoly" among our producers. As a result, today we find improved installations of bulk handling for grains and sugar in North American production areas—not confined to harbours alone, but down in the interior at railway stations and even at the factory gate. Once installed at a heavy capital cost, bulk handling bids farewell to jute for good. This is developing in Australia too. Next in the sequence we meet paper bags for potatoes, fertilizers and cement, kenaf bags for cocoa and coffee and cotton bags for flour. This is no mean challenge to the one-time monopoly of Indian jute in these lost markets. So, jute now faces competition in the struggle for the recovery of her oversea markets from these alternative devices.

Nearer home, in the factory, mill managers face the growing discontent of an erstwhile docile, though backward labour. Since the War, egged on by the rising cost of living, this discontent has been growing unchecked. Meanwhile, at different stages, palliatives have been offered to meet the demands of labour, as a result of which an individual labourer in the jute mills today earns five times his pre-war wage without contributing an iota of commensurate benefit to production. Consequently, the manager at the factory is dismayed to find his costs rising without any gain in production. State legislation has further burdened the management with

additional costs under the new Provident Fund Act (1952) and the Employees' State Insurance Act (1948), besides new amenities for labour provided in the amended Factories Act (1948).

This naturally calls for a revaluation and reconsideration of the prospects for this vital dollar earning industry. As we ponder we are reassured in this direction by some silver linings; for in the matter of raw jute supply, during the past five years, the cultivation of jute within the Union has been expanded with an astonishing success.

Year	Area under jute ('000 acre-)	Production of jute ('000 bales of 400 lb each)
1947-48	652	1,658
1948-49	834	2,055
1949-50	1,163	3,089
1950-51	1,454	3,301
1951-52	1,951	4,678
1952-53	1,834	4,695

Besides, cultivation has been tried in the new tracts of Orissa, Assam and Uttar Pradesh and Madras. This, augmented by the proposed double cropping (with a first crop in jute followed by a crop of *aus rice*) and researches in high yielding seeds and greater attention and education at the primary stages of 'retting', we can justifiably look forward to near self-sufficiency in jute. Meanwhile the industry looks to the Centre for smooth agreements on current deliveries with Pakistan.

Looking to our markets overseas, the situation has been sufficiently appreciated by the leaders of the industry and sales are being promoted by missions of the IJMA to USA, Australia and the UK. This in the coming years may be extended to our neighbours in the Far East and Middle East. Side by side, propaganda through exhibition stalls has been conducted by the IJMA in UK, Italy and lastly at Lille in France. These will go a long way to remove the suspicion among our valued consumers. Besides, the industry must forge ahead at the factory level in two principal directions, viz, modernisation of machinery and methods which are half a century old, and development of new fields for consumption of jute through active research and application.

Of the wider fields for utilisation of jute, our attention naturally turns to the variety of attractive goods that can be fabricated from this common fibre. During the last war, jute proved its mettle by being

transformed, as if by magic, into such varied forms as PBS, (bituminised fabric), jutlac, (a jute fabric/shellac laminate), khaki webbings, rot-proof bags, haversacks, belts, ammunition pouches, camouflage nets, fabricated water-proof stores, antiblast fabrics, etc. In this direction, the most significant role was played by the IJMARI in making all this possible. By biological cultures of bacteria medium, the IJMARI is trying to make the waste roots and cuttings fit for utilisation in spinning. This no doubt enlarges the scope of utilising this precious fibre fully. Looking to the future, may we not hope that jute will replace wool in the carpet industry and step into the manufacture of Linoleums and go further towards fashioning the winter dress for the millions! Only the traders must give up the much scorned "smugness of monopoly" in hessian and sacking and get busy to cater to the needs of the consumers. Surely then jute, our natural crop, can take its proper place in the economy of our country. To this end, the Government has a responsibility.

About modernisation, there can hardly be any two opinions. When it comes to rationalising the industry, the opposition comes because our trade unions and still more, the workers, apprehend that new machines will require less men. So rationalization in industry is unhappily wedded to retrenchment. This admits of no easy solution and can be met only by actual operation of the new machinery.

Looking to the operational cost of the industry, all technical personnel unanimously agree that rationalisation is the only way out of this impasse. This is appreciated by the trade-unionists who do not have any strong opinions against this move, if it does not entail drastic retrenchment. A long term programme of rationalisation in this industry, as will be seen later on, will not entail any drastic retrenchment for the men rendered surplus would be filling the places rendered vacant by natural wastage like death, retirement, etc, which will be quite sizeable, if spread over a period of years.

Now to return to our own sector, leaving the problem of employment to the nation's economic experts. Let us move into a factory installed with the latest machinery vying with its rivals abroad. Fundamentally the design of carding machinery is unchanged except that it is fitted with ball and roller bearings, and

run on individual electric motor drive. It is therefore now more speedy. The sliver is delivered in rolls through the Autocoil roll formers and thus does away with the cans. These rolls feed the modern high speed triple thread finisher drawing frames which eliminate the 2nd Drawing stage and Roving frames. The sliver is delivered at high speed into cans which again feed the modern sliver spinning frames that spin the yarn at high speed. The drafting unit is a roller or rubber apron control situated between the retaining roller and the drawing roller, which gives full control of the fibre during the drafting operation. These machines are fitted with an automatic sliver stop motion for each spindle and have a semi-automatic doffing mechanism operated by the spinner. The filled bobbins can be changed and the machine begins spinning again in less than half a minute. Run on piece rate basis, the workers attain high production efficiency on the incentive offered.

In Weaving, two of the most notable modernisations are circular loom and the automatic shuttle loader. The Saint Freres Circular Loom, designed in France and now built in Scotland, weaves cloth in tubular form and can thus manufacture seamless sacking. For the past one century, the weakness of jute sacks has been along the line of seams on one or both sides. With its enormous trade in gunny bags, Calcutta will find new opportunities in this field if the mills change over to circular looms, as demand for seamless bags is growing.

Coming to the common flat looms, now working for half a century, the most serious drawback is the enormous loss of time involved in re-shuttling. Another disadvantage is the necessity for such re-shuttling. Hence the tradition of putting only one weaver on one loom. With the introduction of the automatic shuttle loader which is now built into new looms, and which can be fitted, with the minimum of trouble, to existing flat jute looms, one weaver can attend to six looms.

Great interest has been taken by the Planning Commission in this direction. It is estimated that the cost for modernisation would be at the rate of Rs 7,500 per loom so that on the 62,000 looms now running, it will come to Rs 46.5 crores approximately. But since the programme of conversion will take

some 15 to 20 years to be put through, the mills need not despair for capital, as on this scale they may be able to manage it on their own. Moreover as a dollar earner and a principal contributor to India's export duty, the industry can well expect the much desired renovation out of a subsidy from the Centre. It will not be unwise on the part of the Centre either to provide for this investment when the return is so large and so well assured.

Dollar Earnings from Export of Jute Goods

Year	Dollars (millions) earned from jute	Total dollars (millions) from exports
1946-47	3.184	8.051
1947-48	5.783	9.797
1948-49	5.435	8.817
1949-50	4.766	10.106
1950-51	4.922	13.431
1951-52	8.736	16.916

In 1952 dollars earned from jute goods accounted for about 62 per cent of total dollars earned and about 38 per cent of total foreign currency earnings.

Against this, when we consider the total productive capital employed in the industry, amounting to Rs 66.10 crores, we can easily appreciate the high potentiality of developing this industry—not with the view of individual profits alone but with regard to revenue to the Centre. Besides, the industry controls two vital sectors in the country's economy; for while it employs 300,000 of workers in the factory it supports another one million cultivators on the fields cultivating this wonder crop. Following the example of our rival manufacturers in Pakistan, Africa, France and other continental countries, India must take up thorough modernisation of the industry along with the reorganisation on the plant site and of the wage structure in order to maintain the industry in a healthy and productive state.

Some Indian Cottage Industries

IN most of the underdeveloped economies, there are still pre-industrial revolution industries, using predominantly hand processes. Statistics regarding these industries are not generally included in the official government statistics about manufacturing industries. They are, however, more important, from the point of view of employment than the organized modern industries. In India, for example, about 13.5 per cent of the working population were engaged in these industries in 1948-49; while only 1.9 per cent were engaged in the organized modern industries. In Mexico about 15 per cent of the total population are engaged in these handicrafts.

The wages in these industries are much lower and the interest rates much higher than those of modern industries. In India, the average income of the whole family engaged in such handicrafts is only about half the income of the worker employed in organized industries. The interest rate for these industries is 12 to 18 per cent; while for organized industries it is less than 10 per cent.

The hand-loom weaving industry in India comes next only to agriculture from the point of view of employment. It employs 2.4 million workers, whereas the modern cotton textile industry employs only 0.5 million workers. It produces about 24 per cent of the total cloth consumed in India. While about 5 million workers are employed part-time in the hand-spinning industry it produces only 16 per cent of the total yarn requirements of the hand-loom weaving industry. The ratio of the value of plant and equipment to the gross annual output is 0.010 to 0.032 in the hand-loom weaving industry, depending upon the types of hand-loom used; in the hand-spinning industry it is 0.0062; while it was 0.146 in 1946 and 0.121 in 1947 for the modern cotton textile industry.

However, the production cost per unit of output was higher in the case of hand-spinning and hand-loom weaving industries than that of the modern cotton textile mills. The price per pound of hand spun yarn of counts 10 to 12 was 40 per cent higher, for count 20 it was 50 per cent higher and for count 30 it was 66 per cent higher than the mill-spun yarn. The price of hand-loom cloth per unit was 40 per cent higher for cloth from yarn of 60 counts, and 28 per cent higher for cloth from

yarn of 40 counts than the mill cloth in spite of the fact that a worker in a hand-loom industry earned on an average 50 per cent less in wages than a worker in a textile factory. For cloth from yarn below 20 counts, the hand-loom cloth was cheaper than the mill cloth.

The product of these handicrafts lacks finish and is inferior in quality as compared to that of the mills. Moreover, the tastes of the consumers have changed and they prefer mill-made cloth to the hand-loom cloth. For all these reasons, the hand-spinning and the hand-weaving industries are in a depressed condition and unless suitable changes are made in their organization and equipment with a view to bring down their production costs and improve the quality of their products, they might become less important than they are at present.

Hand-printing and dyeing is a 2000 year-old industry in India; it employs at present 0.2 million workers and is fairly prosperous. The famous Chhipa community is known for developing the technique for over a century and had added recently a novel process of discharge of aniline salt which was considered almost impossible until recently. . . . The technical advancement in respect of iron rust printing has reached a perfection that even Japan and Germany have not been able to attain". (Chhipa, K E, "Hand Printing and Dyeing," Output No 4, Bombay 1951.) It sells its products in India as well as abroad.

Sericulture is another 2000 year-old industry in India. It is now in its decline because of the lack of organization, the failure to change production methods and lack of much needed state assistance. It flourishes, however, in certain parts of India where the state has come to its assistance. The ratio of fixed capital to the annual gross value of output in silk reeling by Charkha is 0.010; while in silk reeling in modern filatures it is 0.089. The production cost per unit of output is 10 per cent lower in the case of the former than in the case of the latter.

The Patola industry of Gujarat was started in 1200 AD and at that time 700 families were engaged in it. In the beginning of the 20th century, about 100 families were employed in it. At present there is only one family engaged in producing Patolas. The product is highly artistic; it takes a long time for producing it and

its price is also very high. The change in tastes of the rich people, who patronized it and the lack of exploration of the foreign market explain its decline.

The Gur industry in India is still quite a flourishing industry at present. Its output is three to four times that of sugar. It gives supplementary occupation to the agriculturists engaged in sugar-cane growing. Fifteen million workers are engaged in sugar-cane growing and 78 per cent of the total cane output is utilised for gur-making. The ratio of the value of fixed capital to the gross annual value of output is 0.12 for gur-industry; while it is 1.36 for the modern sugar industry.

There are various other cottage industries in India; a list of 99 such industries is given in the National Planning Committee's publication on Rural and Cottage Industries. It seems that those cottage industries whose products have to compete with the products of modern industries are declining as a result of higher production costs per unit of output and inferior quality of the product as compared to the modern industries. While some cottage industries, like hand-loom weaving from yarn of 20 counts and below 20 counts, and hand-loom weaving of cloth of variegated design and colour, gur industry, hand-printing and dyeing industry, silk-reeling industry, etc, still flourish because their products do not compete directly with the products of the modern industries.

Book Review

TRADE UNION LEGISLATION IN INDIA

Indian Trade Union Law by V B Kher. N M Tripathi Ltd Bombay. Pp xvi+148. Rs 7-8.

ONE of the functions of the Labour Bureau, set up by the Central Ministry of Labour in 1946, is "to edit a Labour Code." No attempts, it seems, have been made so far in this direction by the Bureau and the field has been left to private enterprise. Labour legislation in India is of recent origin and hence adequate case law is yet to emerge to justify books on labour law cases. However, a few enactments like the Workmen's Compensation Act, 1923 and the various Industrial Relations Acts have brought about considerable labour litigation, providing quite sumptuous fare for lawyers specialising in labour cases.

Shri Kher, it appears, is fast becoming a labour law specialist. He has already to his credit a *Digest of Labour Law Cases* and another *Digest of Workmen's Compensation Cases*. Trade Union Law is comparatively less controversial. An Amendment Act was passed but never enforced. The comprehensive Trade Union Bill was kept in cold storage and then was allowed to lapse. We have thus before us a simple law enacted as early as 1926. This law is permissive in character; Unions may or may not register under the Act. If they register, they get certain privileges but at the same time, they have certain obligations to fulfil. If

they do not register, they are free from both privileges and obligations.

Because of the non-controversial character of trade union legislation, there is not much of a case law. To make the book a sizable publication, the author has traced the history of trade union legislation, reproduced texts of the Act and Regulations and given a model constitution of a trade union. The book will prove useful to all those interested in our trade union movement.

Shri V V Giri, former Labour Minister of the Government of India, has written a Foreword to the book.

Depressed Markets

Tuesday, Evening

MORE than once Clive Street made efforts to move up in the last fortnight. All these attempts failed. As equity prices are drifting downward, the volume of business has tended to diminish. There are reasons for the downward trend in equities. But it would be unwise to ignore that equities are declining not because of any selling pressure, but because of gradual liquidation by tired "bulls". This has certain "bullish" implications. But the absence of "bears" in the market suggests that the technical position is not quite strong.

Weakness in equities in the last few weeks is due to factors which have no relation to the usual market influences like yields and dividend prospects. Equities lack support not because the yields are low at current levels but because of other factors. Some of the arguments and assumptions underlying the lower trend in equities are not without justification. There is the other side of the coin. But investors do not seem to be far wrong in some of their fears.

State and Key Industries

No amount of sophisticated reasoning can obscure the fact that there has been a shift in emphasis in the Government's industrial policy. It is clear that, in the future development of the major industries, private initiative will henceforward play a secondary role. Development in these industries will be undertaken, guided and controlled by the Government. Private enterprise will not be completely shut out from these industries. But it will play a subsidiary role.

This is the main reason which has cast a gloom over stock markets. Investors have drawn a pessimistic conclusion from the Finance Minister's statement in Parliament on economic policy. They are not opposed to the employment aspect of that policy. But they have not missed the Finance Minister's guarded observation that such an employment policy cannot be implemented without a considerable expansion in small-scale, village, industries.

If private enterprise is to play a secondary role in the future development of capital goods industries, the future behaviour of stock markets is likely to remain uncertain. Such a policy means that private ini-

tiative will have full scope in the future development of consumer goods industries only. This interpretation of the shape of things to come during the second Five-Year Plan may not be entirely without basis, but it is unduly pessimistic.

The Other Side

Certainly, private initiative may have some cause to feel frustrated with the contours of the second Five-Year Plan, as outlined by the Finance Minister. But his statement on economic policy is not as much adverse to stock markets as some investors think. With the exception of the iron and steel industry there are not many capital goods industries in which private initiative is now taking interest, or in the shares of which the stock markets are interested.

At the moment, stock markets are unduly perturbed because of some of the implications of the outlines, already visible, of the second Five-Year Plan. But there is also a bright side to the picture. In the second Five-Year Plan, expenditure will be stepped-up to between Rs 1,000 and Rs 1,200 crores per annum. Such heavy expenditure in the private and public sectors taken together must necessarily lead to expansion in output and money incomes.

Consumer Goods Industries

As stock markets are not directly interested in any of the six industries, excluding iron and steel industry, in which future expansion will be exclusively in the public sector, there is no reason why equities should remain depressed. Increased employment, output and money incomes, as envisaged in the second Plan, must necessarily have a sustaining effect on stock markets.

From the recent behaviour of the stock markets it would seem that investors have hastily come to the conclusion that all the expansion in industry will be in the unorganised sector during the second Plan. Even so, it is apparent from the behaviour of equities, that stock markets are not very pessimistic about the future of consumer goods industries. This perhaps, explains the comparative steadiness in Tea and Jute shares on the Calcutta Stock Exchange.

In the last fortnight, raw jute and jute goods have developed a drooping

tendency. Lower raw jute prices are due to the fact that Pakistan has re-validated some of the licenses. Rumours that the Indian jute industry may revert to 45 hours a week are also partly responsible for the lower trend in raw jute.

As raw jute prices are declining, jute goods are developing an easier trend. In the main, however, the irregularly lower trend in jute goods is due to continued fears that the American off-take this season may not come up to expectations. In this week, sacking prices have hardened purely on speculative considerations. This explains why, despite the rising trend in jute goods, Jute shares have not shown any tendency to move up.

Along with Jute shares, Tea shares remain relatively steady. Both export and tea auction prices continue to be firm. Had the market as a whole not been sagging, Tea shares might have moved up. But it is symbolic of the present depressed phase in stock markets that, because there are no tea auctions this week, even Tea shares have been irregularly lower in the last few days.

"One has no protecting power save prudence."

Rural Credit: I—The Problem

IN the field of rural credit, the conclusion that "Co-operation has failed, but Co-operation must succeed" is by no means new or surprising. But the analysis of the reasons for that failure and the conditions necessary for its success contained in the General Report of the All-India Rural Credit Survey shows a penetrating insight into the problems of the rural economy and ability to think in wide terms which do great credit to the Committee of Direction consisting of Shri A D Gorwala (Chairman), Prof D R Gadgil, Shri B Venkatappiah and Dr N S R Sastry (Member-Secretary). There is little doubt that this report falls into an entirely different class from the usual run of official reports.

In examining the background against which the problem has to be considered, the report discusses four factors. First, the agricultural sector occupies the major part of the economy and the first Five-Year Plan's emphasis on increased agricultural production is likely to be continued, if not intensified in subsequent Plans in the context of a fast-growing population. Second, land tenure policies are likely to make the medium and small cultivators who already constitute 70 per cent of the total increasingly important in the future and their needs will have to be borne in mind in the formulation of policies of agricultural credit and agricultural development. Third, with little new land left to be brought under cultivation, the greater part of the increase in production will have to take place through more intensive methods of cultivation—more water and fertiliser, and better seed, implements and techniques—which will require considerable finance. Finally, the farmer's own resources are limited and his requirements of finance for subsistence, farming operations, special consumption needs, and enlargement of subsidiary occupations are considerable, while cottage industries also require to be financed.

Keeping these and other conditions in mind, the report recommends that the organised system of institutional credit should fulfil the following requirements:

(a) It should be associated with the policies of the State, especially

those which aim at larger rural production;

(b) It should be an effective alternative to—though not necessarily a complete substitute for—the private agencies of credit;

(c) It should have the strength of adequate resources and well trained personnel, instead of the weakness which is the present characteristic of co-operative credit whether in finance, administration or supervision;

(d) It should be in a position to co-ordinate its activities not only internally in relation to the different sectors pertaining to short-term, medium-term and long-term credit but also with complementary arrangements for marketing, processing and other economic activities of the cultivator; also, it should be in a position to co-ordinate its activities with those of the important institutional agencies, including Government, which are engaged in guiding the villager, improving his methods of cultivation, supervising his operations or educating him to avoid wasteful practices;

(e) It should pay special attention to the needs of the medium and small cultivator, and should, therefore, be based on a type of security which, consistently with its adequacy from the point of view of the creditor, will enable as large a number of solvent producers as possible to use the facilities available through it. In other words, it should lend not merely on the security of land and other more usual forms of security but also on the security of anticipated crop;

(f) It should disburse credit in a constructive way for the positive benefit of both producer and production; it should, therefore, effectively supervise the use of the credit and constantly bear in mind the borrowers' legitimate needs and interests; and

(g) It should be such that it helps in the effective growth and development, from the village upwards, of the co-operative form of organisation.

The extent to which the main agencies of rural credit contribute to the total credit supply to the cultivator is as follows:

Agency	Per cent of total credit
Government	3.3
Co-operatives	3.1
Commercial banks	0.9
Relatives	14.2
Landlords	1.5
Agriculturist money-lenders	24.9
Professional money-lenders	44.8
Traders and commission agents	5.5
Others	1.8
Total	100.0

The striking fact that emerges from this table is the weak position of the co-operative movement, which must be much worse in many States. Besides, "what reaches the medium and small cultivator from the co-operative institutions is a mere fraction of the little that co-operatives provide," because co-operative credit tends to follow ownership of land. It cannot follow produce, because co-operative marketing is much less developed even than co-operative credit. From the quantitative aspect, three factors proclaim the failure of the 50-year-old movement: many areas have not been covered; in those areas that are covered, large sections of the agricultural population remain outside the movement, and the large bulk of the requirements even of members of co-operative societies is met from other sources.

The supply of institutional credit from the other source, viz, the Government, has many flaws, eg:

- (1) Inadequacy of amount, inequality of distribution (assistance going mainly to large landholders) and inappropriateness of security;
- (2) Inconvenience of timing, incidental delays and impositions of various kinds; and
- (3) Inefficiency of supervision and incompleteness of co-ordination.

Private credit, therefore, predominates today. It is not only generally unsatisfactory, but "is wholly unsuitable in the content of planning for larger production." Institutional credit, if it is not co-operative, tends more than ever to confine itself to the bigger cultivators.

That is why co-operation must succeed, and "the foremost objective of policy then becomes the positive and deliberate creation of conditions in which co-operative credit will have a reasonable chance of success."

To determine what these conditions are and how they can be achieved, the reasons for the present weakness must be examined. The reasons usually advanced—functional, structural and administrative defects, dearth of suitable personnel, lack of training, background of illiteracy, etc.—are relevant but do not go deep enough.

In fact, there are certain fundamental weaknesses in the rural structure which have a socio-economic origin. Apart from old factors like caste and factors inherent in an agricultural economy, particularly where it consists of small farms spread over a large area, the most significant factors are "the combined impact of commercial colonialism, industrialization and urbanization on these pre-existing conditions." The powerful, urban and highly monetized economy which developed derived strength and support particularly from the big financial institutions, such as banks and trading houses that grew with it. While colonial rule underwent a transformation in character and ultimately gave way to independence, there has been little change in the powerful institutions of industry, trade and finance in their effects on the rural economy, their relations to it and their attitudes towards its real interests.

The weaknesses that are internal to the rural structure are well-known. The external aspect of the weakness of the rural economy is related to the maladjustment between the rural structure and the forces of the urban economy. The financial mechanism is basically urban; in the same sector is the whole organisation of urban trade. "By and large," the report points out, "neither the banking system nor the trading organization operates in a way which is in the interests of the rural economy; and together they are much more powerful than any factor or combination of factors that can be internally marshalled from the rural economy itself."

The internal and external aspects of the weakness of the rural structure are inter-related. The internal

weakness prevents the cultivator from making use of the external mechanism of banking or deriving his due share of benefit from that of trading. The external mechanism itself does not reach down to any except the top layer of the rural economy, while through its very powerfulness, it distorts those processes in the rural economy which stand for internal strength and cohesion.

This distortion is partly caused by the inter-penetration of the former into the area of the latter through moneylenders, traders, etc., which inter-penetration takes the form of the existence in the village itself and within the directorates and managements of rural associations and institutions of "a strong element of leadership and influence which, in its interests and attitudes, is attuned not to the other and weaker classes of the rural population, but to the urban forces from which it derives its strength." The possessor of certain advantages—large landholding, large financial resources, education—obtains a status in the village and a power for good or evil far out of proportion to the nature of the possession itself, and this can be explained wholly by the access which the possessor thereby obtains to the urban sector in which all the real power, influence and finance reside.

The failure of co-operative credit falls into place in this picture, especially that important aspect of the failure which consists in the relative neglect of the credit needs of the medium and the small cultivator and in the reluctance to enlarge membership or take on further responsibilities. At the same time the unequal competition offered by the external mechanism of banking and, linked with it, the often unfair opposition and wholly unequal competition presented by the external organization of trade, make explicable the utter inadequacy of the movement. Lack of understanding and of sympathy are other factors.

"Rural credit in India, therefore," the report asserts, "is part of the larger and living context of India itself. It can never be understood nor hoped to be solved except as part of such context." The activity and purpose which give rise to the need for credit, as well as the manner in which the need itself is satisfied, are conditioned by social background, social structure and social attitudes. The background is

part of the larger socio-economic background of the country and of the historical factors underlying it; the structure relates itself to the organization of the country's government; and the attitudes derive strength or weakness according to the degree of their attunement to the more important social, economic and political groups who share between themselves all real power in the country. Since power in India today resides predominantly in the urban areas, a search for remedies to the many problems of rural credit must necessitate an examination of urban institutions, groups and attitudes as they affect rural well-being.

The first objective of policy should, therefore, consist in undertaking the two-fold task of remedying the internal weakness and rectifying the external maladjustment of the rural structure. Reorganization of the socio-economic structure of the village is, therefore, necessary. The problem of rural credit is consequently much wider than usually realised.

Remedies hitherto prescribed have been attempts to counteract the internal weakness of the credit structure without taking into account the weakness of the rural structure as a whole, much less its maladjustment to the external mechanism of urban trade and finance. Most reforms of the co-operative movement have therefore been in the nature of inevitably futile attempts to combine the weak against the strong in conditions in which the weak have had no chance. The first task is to rectify this position and enable co-operation to function properly.

Credit must, therefore, be considered in conjunction with marketing, processing and allied economic activities. Bigger units and optimum conditions are necessary. These involve (i) finance, (ii) flexibility of finance, and (iii) business technique. Above all, the strength created must be such as to be effective against the competition and opposition of private trade and other private interests. None of these can be had from the internal resources of the co-operative structure. The choice before the movement is, therefore, to continue indefinitely in various degrees to be unable to help itself or to be helped in order that eventually it may not only help itself but need no other outside help.

Around Bombay Markets

THE debate on the economic policy in the Lok Sabha culminating in the adoption of a socialist policy had a bearish effect on the stock market during the period under review. The announcement earlier that the Imperial Bank of India and other ten State Banks would be nationalised, needless to say, had raised serious misgivings and the amendment to Article 31-A of the Constitution regarding compensation for acquisition of private property had raised doubts about the aim of the Government, despite all assurances given by Government spokesman that fair compensation would be given in the event of nationalisation. The slump in the shares of Imperial Bank clearly indicated how the confidence of the investors had been shaken. During the last two or three years, Bank shares has been ruling weak due to several reasons and investors complain that it would be unfair to assess these shares on the average value for the last two or three years.

The change in the Government's economic policy has disturbed the climate of the investment market, though the Government at this stage is not going to nationalise any more concern. True, a leading industrialist has tried to dispel fears regarding the future of the private sector, but confidence is not easy to return. The market later on stayed a partial recovery under the leadership of Tata Steel Ordinaries, but the modest improvement could not be maintained during Christmas holidays on account of lack of support at higher levels and persistent easier advices from Calcutta.

Though the prospects of Tata Steel Co getting a World Bank Loan of Rs 50 crores for further expansion are considered reasonably bright, it is to be seen whether Government would give the guarantee that the company would not be nationalised till 1965. There is no possibility of a sharp break in Tata Steel shares but the casiness in Indian Iron and other scrips may have a damping effect upon this counter also.

Textiles are relatively depressed due to discouraging performance of the cloth market but the popular counters have resisted further decline.

Associated Cements were better on reports of encouraging results while Belapur ruled steady. Bombay-Burmah were subdued. National Rayon met

More Shocks

with sellers at higher levels. Scindias attracted buying from bargain hunters on the belief that the worst is over.

The Securities market was lifeless.

The Stock market enters the new year with a somewhat obscure outlook. Much however will depend on the Budget which will reflect the recommendations of the Taxation Enquiry Committee.

Silver Unsteady

AFTER touching a new low level at Rs 152-13, silver staged a rally to Rs 156-4 on heavy short covering by North India traders following some recovery in commodity markets encouraged by the feeling that the Government would lend support to farm product prices with a view to arrest further fall. However as soon as this urgent covering was met, the market once again relapsed to Rs 154-12 on Thursday afternoon.

Following the recent sales of about 85 lakh bars by an agency Bank on behalf of an ex-native state's ruler, the bullion market is confronted with a dilemma as to whether further offerings will be made from these quarters. Apprehensions are there that further steady offerings in small parcels will be effected from these quarters and the market lacks nerves on the eve of the busy season. In view of lower commodity prices this season, the general outlook for the bullion is not considered bullish, apart from temporary spurts that may be caused by technical adjustments. Moreover, the monthly contango charges of about 10 annas per bar also came in the way of development of healthy trend.

With the recent confiscation of some smuggled gold, quotations went up to Rs 88-12 but subsequently the market eased to Rs 87-14 on anticipation that the confiscated gold might be put up for sale by the Government. The premium for spot has almost disappeared and this is encouraging bear operations.

New Low in Cotton

THE cotton market is once again in a nervous state with prices suffering a sharp drop of about Rs 20 per candy during the last fortnight. Disappointing advices from cloth market, the narrowing down of the premiums of spot over forward contract, the anxiety of the farmers to

part with their produce in a declining market and the attitude displayed by mills, particularly their preference for purchases in the ready market, and the proposed loan of one lakh bales of US cotton to India were some of the outstanding factors which played their part in bringing about a steady decline in values. The premium on Vijay which had gone up to Rs 207 on February, for February-March delivery, has declined to Rs 186.

ICC February which had gone up to Rs 640 has come down to Rs 612, while May contract was placed at a discount of Rs 6 only. Much depends on the anticipated offtake in cloth exports. If it does not materialise, with increased arrivals in the next two months, raw cotton prices would be difficult to be maintained even at the present levels.

Oilseeds Depressed

DEPRESSION in the oilseeds market has deepened, though sellers have been somewhat reserved in view of the prevailing low levels, and the expectation of an announcement of further export quotas for groundnuts as well as groundnut oil. The movement of the new groundnut crop, has gathered momentum during the last few days and large arrivals have been making steady inroad on prices. Shippers have already covered their requirements against their overseas commitments while trade quarters feel shy to lend any active support in view of the high premiums for distant deliveries. Groundnuts February-March after declining to Rs 22-12 rallied to Rs 23-10 to be placed at Rs 23-4 and April-May is quoted at a premium of annas 11 while spot goods are available at Rs 22-6.

Linseed market was steady in view of fairly large export business having been put through upto March. February-March was hovering around Rs 22.

Castor seeds after having touched a new low level has been fluctuating narrowly. Resistance to lower levels was offered by the market in view of recent export business in oil with US, though this business was effected at a lower level.

Castor oil commercial was available at Rs 9, linseed oil at Rs 12-8 groundnut oil ex-mill, January at Rs 11-6 and February Rs 11-0 to Rs 11-10.

What salt means to you!

How long ago man discovered salt is lost in antiquity, but he learnt that it came from the rocks and the sea. As he realised the value of salt, he made it an article of currency and commerce.

Science has gone far since then, and today it has learned to make many and varied uses of salt. Can you imagine your common salt being turned into a number of heavy chemicals, such as soda ash, caustic soda, bicarbonate of soda, magnesium chloride, bleaching powder and bromides? Can you imagine getting along without salt in the twentieth-century?

At the Mithapur Works of Tata Chemicals, salt and other marine products are extracted from the sea and converted into these alkalis and heavy chemicals. They find their way into many other factories where paper, leather, soap, glass, textiles and pharmaceutical products are made.

Here, then, is an industry using the boundless waters of the sea to keep the wheels of other industries moving. It is the aim of Tata Chemicals to assure the country of a national supply of these basic chemicals.

Bogor and Manila

IT has been remarked that, even as capitalism's conflicts arise out of its "over-rationality", France suffers because she is over-logical. Rationality and logicity are virtues. But both can be over-done. Mr John Foster Dulles, America's Secretary of State, may not be guilty of over-rationality. But he seems to suffer from the disease which makes France the sick nation of Europe. Mr Dulles believes in collective security. It, therefore, follows that he pins his faith in NATO, EDC, Manila Treaty and similar other military alliances. Neither Sir Anthony Eden nor M Mendes-France are opposed to collective security. But neither the British Foreign Secretary nor the French Premier will endorse Mr Dulles's grievance against the Geneva Agreement on Indo-China. To Mr Dulles, the Geneva Agreement is a "set-back" to America's foreign policy; France's rejection of EDC is another "set-back". In his assessment of developments in 1954, Mr Dulles, however, takes comfort that both these set-backs have been overcome. In the Western European Union, the basic aims of EDC have been achieved. The Geneva Agreement has been offset by the Manila Treaty.

Today, Mr Dulles is a satisfied Secretary of State. It may not have been possible for him to pursue his policy of "liberation" to its logical extreme. But he seems satisfied that the arrangements for regional military alliances are nearing completion. In the last year, some of the loose links in the chain have been tightened. With the approval of the Western European Union by the French National Assembly, Mr Dulles feels complacent about the problem of European security. In Europe, the Western Powers' aim of "peace through strength" has been attained. Implementation of this aim in Asia and the Far East is making rapid progress. ANZUS and the Treaty with Japan are the major means of achieving the ends of American foreign policy in the Far East. America has concluded mutual security pacts with South Korea and Formosa to further her Far Eastern objectives. South-east Asia is to be fortified by the Manila Pact. America is willing to extend military aid to those countries in Asia and the Far East with whom she has concluded military alliances in order to halt the spread of Communism in these areas. With the progressive fulfilment of his aims, Mr Dulles claims that "we (the Western Powers) can face the new year with confidence".

It is at once a symptom and a reflection of the "cold war" that the American Secretary of State and the Soviet Prime Minister will look at the world picture from different angles. Mr Dulles claims that "the danger of general war has receded". M Malenkov has issued a warning that "the danger of war is growing". It is obvious that M Malenkov and Mr Dulles draw conflicting conclusions from the same facts. Mr Dulles relies on NATO, WEU, ANZUS, the mutual pacts with Japan, South Korea and Formosa and SEATO for maintaining peace, or rather, to deter aggression. Communist States regard these military arrangements as attempts at their political and economic encirclement. Is any agreement on Europe possible between Communist Russia and the Western Powers with the military integration of Western Germany with Western Europe through the Western European Union? Can Far

The Economic Weekly
Noble Chambers, Parsi Bazar St.,
Fort, Bombay
Phone: 23406

Eastern issues be settled with the conclusion of a mutual security pact between America and Formosa, and with attempts to put "teeth" into the Manila Treaty? Mr Dulles answers that through strength alone can world peace be attained.

Mr Dulles's achievements are not unimpressive. He can feel satisfied that, through NATO and the Western European Union, he has not only contained Communism in Europe, but has also assured the defence of Western Europe against any threats of Communist aggression. Peace in Europe is to be maintained through the attainment of these two negative objectives. A similar policy is being followed in Asia and the Far East. Both the purposes of containing Communism and of defending these regions against any Communist aggression are to be achieved through the various military pacts and alliances which have already been negotiated, or are being arranged.

There is another aspect of America's foreign policy which deserves emphasis. Mr Dulles may have found it diplomatic not to stress his policy of "liberation". But it is evident that his aim is not only to contain Communism, but also to contain neutralism. Despite Marshall Aid, America was confronted with the problem of neutralism in Europe. Through consistent pushing and prodding, Mr Dulles has solved this problem in Europe.

France has approved of the Western European Union. Britain has accepted her obligations to Western Europe. Western Germany has agreed to participate in military integration of Western Europe. With his aims fulfilled in Europe, Mr Dulles turned his attention to Asia and the Far East. On his own admission, he had sponsored the Manila Treaty to neutralise the effects of the Geneva Agreement on Indo-China.

Mr Dulles does not seem to comprehend the meaning and significance of the forthcoming Afro-Asian Conference. He is reported to have observed that the simultaneous participation of Pakistan in SEATO and in the Bogor Conference is evidence of the conflicting interests of such a heterogeneous group. Evidently, Mr Dulles is not aware that, although Australia is both an ANZUS and a SEATO Power, she has expressed surprise that she has not been invited to the Afro-Asian Conference. Mr Dulles's reference to Pakistan is significant. There are reports that Washington is contemplating increased military aid to Pakistan, Thailand, Formosa, Philippines and some other countries which are not unwilling to align themselves with America in her foreign policy. This may be the Dulles way of containing neutralism in Asia and the Far East. Encouraged by the success of his policy in Europe, Mr Dulles seems to think

that he will succeed in Asia also.

Mr Dulles's attempts to win some Asian countries away from, what he thinks to be, neutralism, as well as the decision to hold a meeting of SEATO Powers even before their ratification of the Manila Treaty, emphasises his inability to understand the significance of the forthcoming Afro-Asian Conference. It has been repeatedly emphasised that, in calling for an Afro-Asian Conference, the Colombo Powers are not interested in extending neutralism. As emphasised by both Pandit Nehru and Marshal Tito, neither India nor Yugoslavia is interested in creating a third bloc. All the Colombo Powers are agreed on this. Their desire is to create and to expand an area of peace so that Asian and African nations can implement plans for economic progress. Their intention is to fight Communism by eliminating poverty. Mr Dulles is barking up the wrong tree. Instead of promising military help to some Asian and African countries to contain neutralism, America can help the Afro-Asian countries in their fight against Communism by offering monetary and technical help. From America's policy to Europe and to Asia and the Far East, the deduction is permissible that she is more interested in tilting the precarious balance of power in her and in the Western Powers' favour than in attaining world peace through an agreement with Russia.

Arms and the Man

THE amalgamation of the Production Ministry with the Ministry of Commerce and Industry is logical and sensible; so is the separation of the portfolio of Irrigation and Power from that of Planning. The remaining activities of the self-liquidating Ministry of States will now be taken over by the Home Ministry. The other changes are not organisational but of personnel. Katju takes over Defence, not immediately but within the next few days, after he has put through the work that he has taken in hand and Pant takes over the Home portfolio. So the Prime Minister is relieved of one of his many—too many, in all conscience—assignments.

Along with the organisational changes, there have naturally been changes of personnel also, which are perhaps even more significant. The present Commerce and Industry Minister's disagreement with the Cabinet on the question of the role of the private sector had been widely publicised. In fact, it had been let known, to put it mildly, that TTK had purposely kept away when Parliament was to have debated economic policy, because the Government had turned down the Birla-British proposal for a steel plant.

Now, steel making had been reserved for the public sector in the industrial policy statement of 1948. It had been widely expected that this policy statement would be modified, and hints to this effect had come from the highest quarters. For once, the wiseacres proved wrong. The proposal for a steel plant under private sponsorship, however, was not a straightforward issue of public versus private enterprise in heavy industry. There were many features about it which put it in a class by itself. For, by the very nature of the case, the proposal called for a large measure of public participation. And since public assistance in such an undertaking would not stop with the direct participation in the share capital or financial assistance in some other form but would also entail indirect assistance in the shape of provision of transport facilities, building up of a steel township, and so on, the proposal could be made to look like one of building up private enterprise at public cost. And not unfairly, since control was to be left with the sponsors, while assistance in such a large measure was to come from the Gov-

ernment. The rejection of this proposal, therefore, by itself, does not establish that the industrial policy statement was necessarily in the way. Certain other developments, however, also suggest the possibility of a modification, but for reasons altogether different from those stemming from the Birla proposal. The hints which were dropped from the highest quarters about the possibility or the necessity of a modification, therefore, are not to be ignored merely because the Birla proposals are now out of the way. There is little doubt that the Production Ministry could do with a little more drive and energy, and none at all that TTK is the person to bring to it both in an ample measure. Even so, in view of his reported unsuccessful fight for private enterprise in a field reserved for the public sector TTK's stewardship of the public sector, now that he has taken the Production Ministry under his wing, appears all the more surprising. What about leaving public undertakings in the hands of one, who, rightly or wrongly, has come to acquire the reputation of being such a champion of private enterprise?

So long as labels attach to persons and these labels continue to carry the same meaning, some perplexity is bound to be caused by such changes of role as are posited by the recent ministerial changes. But in going by labels, there is a risk of being unduly rigid in one's judgment of people and assessment of situations. So rigid an outlook does not make adequate allowance for the flexibility that has been the hallmark of Congress politics and politicians, particularly of those who speak and administer in the name of the Congress. While speculation invests TTK with so much concern for the private sector, the Minister himself in an address to Bombay Congressmen sought to clear certain misconceptions. "Congress," he said, "is nobody's organisation, but of the common man" and the amendments to the Constitution—Section 31 was the one looming large before the audience—would be a charter to a Welfare State. The tax structure of the country would be another, for it would be so modified gradually that it would lead to the disappearance of all monied classes within a couple of generations. The transformation, however, will be painless; it will be effected without causing

any suffering to people.

While these are merely sentiments, still in the realm of the distant future, the Commerce Minister's vehement assurance about setting up a really effective and country wide selling organisation for the products of cottage and small-scale industries is a matter of immediate concern. Of course a selling organisation for cottage industry products is innocuous in itself. Quite a number of bodies have been set up for the purpose, Khadi Boards and Boards for Handicrafts have opened beautiful show rooms in the poshest localities of every city of importance. These are, however, handling largely what may be called luxury products—artistic handicrafts, silk and woollen fabrics, toys and bric-a-brac that are a class by themselves and do not cater to mass demand.

But chain stores on the Latin American model for expanding the market for small-scale industries is a different affair and "this idea of mine", TTK said at his press conference in Madras, "will not remain a dream like many others". The reference to the activities of the Indian Institute of Statistics in this connection suggests that the Government is now thinking of cottage industries from an altogether different angle from that in the first Five-Year Plan. Or it may be, some of the members of the Cabinet are turning over the idea in their mind, or merely playing with it. But there it is. Take the question of the Centre's policy of progressively stabilising indigenous industries referred to by the Commerce Minister. There was to be a well-controlled and regulated system of exports and imports and effort would be made at the same time to steady the price level. This meant, he said, that there would be a compulsory reduction in certain cases while price support would be assured in the case of others. Does it add up to a common production programme—a cess on factory products to subsidise cottage industries in the same line of production? Or is there more to it than that?

It may well mean much more, though the meaning is clouded by tying up cottage industries, by implication, if not by explicit statement with the objective of creating 12 million jobs which has been on the

in agriculture

we have come to take integrated India so much for granted that it requires a mental effort today even to imagine that it could be different and yet the possibility of disruption in those early days of freedom did not lie in the realms of imagination alone. It was very much a reality, looming large over the horizon.

It may be that it was not all Sardar Patel's doing. The source from which the native states drew their strength had sapped and their withering away was only a matter of time. But even so, what would have come in course of time was put through in a matter of weeks and months—what would have been a process of history was made into a scheduled performance by the States Ministry with a despatch, planned order and deliberateness that has no parallel in the history of this country and hardly many in the history of other countries. The Sardar's share in this masterpiece of national welding was unique. The States Ministry was the instrument and the Sardar wielded it with inflexibility of purpose, clarity of vision, uncanny skill and a juggernaut-like display of determination. With a judicious blend of cajolery and bullying, he got their signatures on the dotted line from the princes to the document that consigned the princely order into the dust-bin of history. People in power do not part with their power so readily but that was the miracle that the Sardar achieved.

In the fitness of things, the States Ministry should have been winded up when it had accomplished this historic task. It left a trail of glory behind it. But so well did it perform its job, that it rendered itself superfluous. It left no mantle to fall on its successor and what the Home Ministry takes over today are some loose ends that the States Ministry collected later, such as the reorganisation of States which is quite a different affair from the integration of India.

Lignite, Coal and Dyes

AT long last some hard facts about the lignite deposits in South Arcot, Madras, have been reported by the British firm of consulting engineers whose services had been secured under the Colombo Plan. Armed with the report, the Government of India has set up a South Arcot Lignite Authority. Lignite has suffered as much from

thoughtless publicity as from uninformed popular enthusiasm fed on it and the outcome has naturally been disappointment, impatience and frustration. Here was the promise of a ready solution to the problems of industrial development in the South and yet nothing was done for years to redeem that promise. The least that can be expected now is that the Government should make amends for its past remissness by publishing the report submitted by the consultants.

The hard facts are that lignite deposits lie at a depth of 160 to 250 ft; the thickness of the seams vary but the average is reasonably high being about 50 ft. As the seam runs the length of a mile and a half, the potentialities are far from negligible. The water table is also fairly high and mining of lignite would not be possible until arrangements are made for drying the mines upto a sufficient depth, at least 50 ft below the base of the lignite seam. Drainage will therefore be a major problem.

The most immediate use to which these large deposits of lignite could be put is for running a thermal power station of considerable capacity, besides converting lignite into bricks for use as fuel. The other uses of lignite are also many, but these are in the range of by-products, the same as in the case of coal. And if we are serious about the building up a chemical industry based on coal—after all, lignite is only coal in the making—there was no point in waiting for lignite. Surely it was not the inadequacy of raw materials which had been holding us up. No one has complained about the inadequacy of low grade coals in this country nor has much concern yet been expressed in a practical manner for stopping the wastage of gas and by-products that can be easily derived from coal.

On the contrary, even the humblest beginning on these lines has run up against obstructions and unexpected snags. One such was the report, utterly senseless and quite incredible, that the Government had already come to a decision regarding the proposal for a Coke Oven Plant, the feasibility of which is now being examined by a Committee under the chairmanship of Shri D C Driver. The Committee's terms of reference are:

- (1) To make an assessment of the demand for coke and to

examine the expansion programme of existing producers of coke in the country;

- (2) If the need for additional coke is established, to report on the quantum and the size of plant that will be necessary as well as its appropriate location;
- (3) To examine the prospects of by-product recovery and coal-tar distillation plants, against the demand, current and expected, for the primary organic chemicals obtained as by-products directly from coke-oven gas or from distillation of coal-tar;
- (4) To examine the scope for and economics of a thermal power plant as an adjunct to a coke-oven plant, if established at Durgapur; and
- (5) To examine other possibilities of utilising coke-oven gas in the vicinity of a coke-oven plant for improving the economics of operation of the plant.

It should be noted that utilisation of by-products has not been made the principal object of the enquiry; it is only secondary. Even so, it is for the first time that this crucial first step to a whole range of development is being touched. Meanwhile the development of chemical industries has not been kept in abeyance altogether. It is being taken up in a piecemeal and uncoordinated manner, at points that are, so to say, widely dispersed from the base and no attempt is being made to develop that base. It makes little sense to serious students of economic development that the nucleus of a dye-stuff industry from imported intermediates should be started on the West Coast while the colliery belt should cry for the development of a whole range of by-products and the cry should attract scarcely any notice.

Backlog of Cottage Industries

THE possibility of the role of cottage industries undergoing a sea-change between the first and second Five-Year Plans, has been hinted at elsewhere in this issue. There is, however, a considerable backlog to be cleared and as the first Plan period draws to its close, the Government appears to have been suddenly alerted and is putting through a number of measures all at once. For the present,

to get the best results and gain useful experience, Shri Nityananda Kanungo, the Deputy Minister in charge of cottage industries, has been concentrating on cottage industries in the two States which have done most for their development, viz, Uttar Pradesh and Madras. An important beginning is the extension of co-operation to production by cottage industries. The first industrial co-operatives of handloom weavers have been formed in Madras State to run two weaving factories in North Malabar. Both these factories had been closed some time ago. The Government of India have sanctioned over Rs one lakh to help the newly started industrial co-operatives to acquire new looms and to provide them with working capital. The workers of the two factories who had so long been mere wage-earners will henceforth share in the profits if any. This is a small beginning but in view of the potentiality of industrial co-operatives, it is a very significant one, however belated.

Another important development is the decision to set up a Small Industries Corporation, as recommended by the Ford Foundation team, the primary purpose of which will be to organise production by small industries for meeting Government orders. In stores purchase, for quite some time now a preference has been given to cottage industry products but the Supply Department has been experiencing much difficulty in effecting purchases in view of the lack of any adequate organisation.

The Corporation is to be registered as a private limited company with an authorised capital of Rs 20 lakhs and it will receive additional financial assistance from the Government as its activities expand.

Another Corporation to be set up is for handling the export trade in small scale industry products, primarily handicrafts, and to open selling centres abroad. This looks like the replica of the Cottage Industry Emporiums that have now been set up in many of the cities.

Bigger and Better

THE New India Diary maintains its undisputed lead in the field by incorporating some new features every year. From experience, the Editor has come to realise that not all readers find it easy or convenient to get their facts from figures; in short, the statistical coverage has

to be supplemented by written text. A clear, succinct but adequate account of the Indian economy with a competent review of recent developments is the result. This, along with the account of the international scene which has been a regular feature of the diary, will enable not only insurance men, but also the fortunate few who get a presentation copy, to keep themselves well posted with the march of events with the minimum expenditure of time and effort.

One can be objective about facts and try to eliminate all bias when compiling statistics, but selection as well as presentation brings out the particular point of view of the compiler. For in selection, there is also a value judgment and here is the editor's assessment, tucked up at the end of A Page of History on page 12. (There is a slight printing error in the page numbers given in the contents.) The events of the year noted against 1954 are:

"Food rationing ends,

India helps to bring about peace in Indo-China."

There is dissent, but not from many. Indeed, has there ever been a greater consensus of opinion on anything in recent times?

Beginning with the explanatory notes on our National Flag and Emblem, Section I deals briefly with our history, constitution, composition of the Government, political divisions, diplomatic representatives, foreign exchange, public holidays in 1955 in the different States, postal rates, reviews of the international scene and of the Indian economy. Section II consists of important data pertaining to 1951 census, national income, First Five-Year Plan, community projects, currency and coinage, banking and insurance, stock market, balance of payment and a Century of Indian Statistics. The economy of space and the ready intelligibility with which the census data has been presented has rarely been surpassed.

The value of the diary is considerably enhanced by inclusion of several histograms and two excellent maps showing roads, railways and air routes and the River Valley Projects.

The only grouse is that so useful a compendium is not made available to a wider public by making it a priced publication. If one may air another, without appearing to be churlish, why this preference for Dr Pattabhi Sitaramaya's translation of Vande Mataram when there is one

by Shri Arabindo? Though the source of the English rendering of the National Anthem is stated to be Rabindranath, the text is not an exact reproduction of the final version authorised by the Poet in his life time.

India Steamship Progresses

SHAREHOLDERS of the India Steamship Company, Limited, will welcome Sir A Ramaswami Mudaliar's assessment that the future of the Company seems bright. He revealed that the Government had granted the Company's request for a loan for the construction of vessels. With this loan, the Company placed orders with a German Shipbuilding Yard for the construction of two ships. One ship was delivered by the end of last year; the other ship will be delivered by the end of this month.

These two ships are the fastest vessels that are in the freight trade between India and Continent and the UK. In his speech as Chairman, Sir Ramaswami disclosed that the directors hope to reach the target of twelve ships by the end of this year, as fixed five years ago in the agreement with the India-UK Continent Conference Lines. Sir Ramaswami is mild, but firm, in his criticism that the Indian Lines have not yet been admitted to the membership of the various Conferences from ports on the route between India and the UK and Continent.

Sir Ramaswami is a believer in growing trade relations between India and her neighbours in south-east Asia. He is, however, aware, that unless Indian Shipping Companies enjoy the full facilities of cross trade, this growing trade and commerce between India and her neighbours may not benefit Indian companies. He pleads for the removal of the anomalies so that trade to and from India to south-east Asian countries can be carried in Indian bottoms.

Discussing the working of the company for the year to March last, Sir Ramaswami complains that labour legislation and "go slow" tactics of dock labour are responsible for unsatisfactory working results. Because of the "go slow" tactics of dock labour, the Company's freight earnings dropped by Rs 33 lakhs in the year to March last. It also meant an increase of Rs 8 lakhs in port charges. Even so, the Company made a gross profit of Rs 27.80 lakhs before providing for depreciation.

Vinoba in West Bengal

GANDHIJI evolved a new technique in politics. It succeeded because it had its roots deep in the history, tradition and culture of the country. As the guru, so the disciple. Vinobaji has mastered the Gandhian technique. That is why, he is loved, respected and revered. That explains the gradual spread of his Bhoodan Movement. He, like Gandhiji, talks in a language the people understand. They comprehend the meaning of what he says because that is the way they think things out. So, they respond to his call, as they did once before when Gandhiji invited them to action.

There were reasons why the revolutionaries of Bengal failed where Gandhiji succeeded. 'Ahimsa' is an ideal which the people of India understand. Self-respect, through self-purification, is what their religion has taught them. So, when Gandhiji told them that they were under foreign domination because they had lost their self-respect, they understood. And, so, when he advised them to strive for independence through peaceful means, they followed his advice to the last man.

BHOODAN YAGNA

Under different circumstances, but based on the same underlying concepts, Vinobaji applied the same technique with equal success. At Telengana, the Communists had succeeded in establishing a temporary regime by confiscating land from those who had land, for distribution to the tillers who did not possess land. Familiar with socio-economic theories and ideologies, the Communists of India were imitating Mao Tse-tung in exploiting the land hunger of the peasant in Asia. The military administration, created temporarily after the "police action" in Hyderabad, failed to halt the spread of Communism in that State.

Vinobaji entered the scene at this crucial phase of the situation. He, the true disciple of Gandhiji, had the instinctive sense to realise that the Communists in Hyderabad, like the revolutionaries in Bengal, were relying on techniques and ideologies which were foreign to the people of this country. The

Bhoodan Movement was born. It has since spread throughout the country.

At Telengana, Vinobaji started the Bhoodan Yagna. Telengana's landless proletariat understood the essence of that ceremony. It was not the absence of the cash nexus in the Communist strategy that mattered as much as the spiritual issues involved in the forceful dispossession of landlords of their lands for free distribution to the landless. That technical, contractual, legal issue has been solved by the subsequent legislation, in many States, relating to zamindari abolition through compensation.

SENSE OF DRAMA

Vinobaji, like his Master, is not a nihilist or an anarchist. He may or may not be a rebel against the contractual basis of capitalist society. But in his insistence on the lack of consent in such forceful or legal dispossession of ownership, he was symbolic of the mind and spirit of India. In inviting Telengana's landlords to be cheerful givers, Vinobaji was appealing to instincts inherent and inborn in them. They responded willingly. The battle was won. The Communists had to beat an ignominious retreat.

Vinobaji, like his guru, has a sense of drama, and is aware of the value of publicity. At Saltora, on the New Year's day, Vinobaji crossed Bihar to enter West Bengal. The press in Calcutta was then busy covering Marshal Tito and Pandit Nehru's impressions of the Djakarta Conference. One of Vinobaji's first utterances was to express surprise that the spread of the Bhoodan Movement had not received as much publicity as foreign news and items. He deplored this trend in journalism in this country.

BUDDHA AND CHAITANYA

It was characteristic of Vinobaji to describe his crossing of the Bihar-Bengal border as a sojourn from the land of birth of Lord Buddha to the land of Sri Chaitanya. This was not only a fitting reply to the parting remarks of Jayaprakash, or to the current Bihar-West Bengal boundary controversy. It was an

exquisite exposition of the dual basis of the Bhoodan Movement. Sacrifice is the essence of Buddhism. At and from Nadia, Sri Chaitanya preached his gospel of love. Vinobaji's Bhoodan Movement is based on the twin concept of sacrifice and love.

Over and over again, Vinobaji has expounded his ideas in his prayer meetings. His prayer meetings have become as famous as those of his Master. Everybody knows, by now, the bare essentials of the Bhoodan Movement. Landowners must willingly part with a portion of the land they possess. Those who are not landowners must pay a sixth of their income. This is *Sampattidan*. Lands thus made available to the Movement are for distribution to the landless peasants. Funds collected through *Sampattidan* are for settling the landless proletariat on the lands donated to the Movement.

These are the dry details. But the spirit of the Movement is more important. He who has, helps him who has not. It is the principle of good neighbourliness on which the Movement is based. Vinobaji is a beggar who begs of the rich and of the poor alike. Both the rich and the poor can give so that everybody can share the common pool. Vinobaji's approach to the Movement is typical. He is aware that the more land and *sampatti* are made available, the better for the Movement. But he is more anxious that the spirit and the thought behind the Movement should take roots. Then, and then only, can the Movement progress by its own momentum.

GRAM RAJ

Neither the practical details nor the spiritual basis of the Bhoodan Movement are unknown any longer. But it is still not widely realised that Bhoodan is part of a bigger Movement. In his prayer meetings since his entry into West Bengal, Vinobaji has been emphasising this larger concept. His Bhoodan Movement and *sampattidan* are the nuclei around which the larger concept must develop. It is typical of Vinobaji that he does not talk of village self-sufficiency. "Gram Raj" is his ideal. He wants to revive the "village republics".

Immediately on entering West Bengal, he began emphasising this State's major problem—the over-aggrandisement of Calcutta at the cost of everything else in this State. Calcutta has been thriving on the ruins of West Bengal's villages. This is a hard fact. But only a Vinoba Bhave could accuse Calcutta as a "city of sins". Calcutta has been described by others as the Chicago of the East. Over-development of Calcutta must stop, says Vinobaji, so that the other parts of West Bengal may develop. Only a cynical city-dweller will fail to comprehend what Vinobaji means.

AN ALTERNATIVE?

Today, it is an insult to call somebody a Liberal, or a Fabian or a Quaker. Vinobaji's back-to-the-village cry is not new. But those who have read the Finance Minister's recent speech on economic policy in Lok Sabha, or the report of the Committee of Direction of the All-India Rural Credit Survey, will not brush Vinobaji away as another brainless co-operator or a visionary advocate of "Gram

Udyog". Shri Chintaman Deshmukh and the members of the Committee of Direction are not woolly Fabians. They emphatically endorse Vinobaji's ideal of "Gram Raj". New Delhi is a convert to Vinobaji's ideas and ideals.

WILL HE SUCCEED?

There is nothing mystic about Vinobaji or his preachings. Panditji boasts that India, a democracy,

does not compare unfavourably with Communist China. Vinobaji claims that he has discovered an alternative to Communism. Who knows? He may have. Moscow and Peking may be sceptical. For entirely different reasons, a weekly news magazine in America may claim to have popularised Vinobaji and his ideals to the outside world. But this writer wonders whether Vinobaji would succeed where even Mahatmaji had failed.

Gold and Dollar Reserves of Sterling Area

GOLD and dollar reserves of the Sterling Area at the end of December 1954 stood at \$2,762 m, representing a fall of \$163 million during the month. The fall, however, is more than accounted for by the payment on December 31 of \$181 million as the service of the United States and Canadian lines of credit of 1946, the US Lend-Lease Programme loan. Payment was also made on December 1 of the \$8 million quarterly instalment on the Canadian interest-free loan of 1942.

During the month, defence aid from the United States amounted to \$8 million. Three million dollars were received in gold or dollars from the European Payments Union (EPU) in respect of November, and \$2 million were paid to creditors of EPU in bilateral settlements.

On the provisional figures for the month, the United Kingdom had a deficit of £7 million with EPU, which will fall to be settled in January, as to 50 per cent in gold or dollars and as to 50 per cent by increase in debt to EPU.

From the London End

INDUSTRIAL output in the United Kingdom in the first 10 months of 1954 was 5 to 6 per cent higher than a year earlier, so the Board of Trade reports. After seasonal correction, there was a rise of nearly 2 per cent from the first quarter to the second, from the second to the third the rise was about 1 per cent, and the estimate for October does not show much further improvement. Britain's advance in the first half of 1954 was therefore in line with that of Western Europe as a whole; it was much the same as that of France, Belgium and the Netherlands, among the major industrial countries.

Comparison with Rest of Europe

	1953	1954 1st half	Per cent increase 1st half 1953 to 1st half 1954
W Germany	139	148	11
Italy	127	134	11
Netherlands	117	124	8
France	109	119	7
UK	106	116	7
Sweden	105	113	5
Belgium	112	117	5

In Western Germany the most rapid rise (first half of 1954 over the first half of 1953) was in motor vehicles and transport equipment in which a gain of 28 per cent was recorded against only 12 in Britain. In textiles, the German increase was greater than that of the United Kingdom, but not markedly so. In chemicals, it was 16 against 12 in Britain. In almost all West European countries there were more than average increases in chemicals and transport equipment particularly motor cars, and less than average ones in textiles.

What are the factors that have contributed to expansion in production? In Britain three industries were particularly prominent in the increase: paper, vehicles and chemicals. They were, in order of their percentage increase, paper and printing with a 21 per cent rise, vehicles with 13 per cent, and chemicals with 12 per cent. Exports have made a varying contribution to this result. For paper, the increase in the value of exports was about in line with the output increase. In passenger cars, which have made the biggest contribution to the rise in

Report on Production

vehicle output, the home market was the predominant factor. Nearly 230,000 new cars were registered between January and July of last year. In chemicals, however, the volume of exports have risen more sharply than output and was nearly a quarter higher in the first six months of 1954.

Another substantial contribution to the real increase came from the big engineering, ship-building and electrical group which has been expanding in 1954 at about the average rate for all industries. The completion of merchant ships has been a post-war record. Industries where production has risen less than average include textiles, food, building and building materials.

Both exports, in which there has been a rise of 9 per cent by volume and personal consumption at home, which has been 3 per cent higher in 1954, have contributed to the rise in output. Durable consumer goods have been selling more readily and sales of motor cars in the country have been a major factor in rising output. Greater building activity has stimulated output in the build-

ing materials and other industries but the growth of factory building and the increased flow of orders for plant have yet to show their influence in a marked rise in output from the engineering trades. It is here that observers look for further improvement, not least for its effects in fortifying the competitive power of the economy.

To what extent has the rise in output been derived from higher productivity? Employment in manufacturing production rose something like 2 per cent in the first half of 1954 compared to a year earlier. The production increase of 7 per cent, therefore, suggests that per capita productivity rose by about 5 per cent. Since further increases in employment is unlikely (in the current full employment situation) increases in production in 1955, other factors, remaining unchanged, will depend on further increases in productivity and this in turn will be determined at the rate at which capital equipment is increased. With high level of current investment, the possibilities for a further rise in productivity are very strong.

Statistical Concepts in Agricultural Economics

(From a Correspondent)

STATISTICAL concepts in agricultural economics came up for discussion at the last conference of the Indian Society of Agricultural Economics. What are statistical concepts? One answer is that they are concepts which can be statistically measured. Another may be that the reference is to statistical constants such as average, mode, standard deviation, correlation, regression, sampling error etc. The question may also be interpreted very broadly: how far the technique of the econometrician, the activity analysis, the input-output approach and linear programming—these are overlapping expressions—can be used in the study of agricultural economic problems? At the Conference all the three interpretations occurred in the papers read and the discussions held.

Prof D R Gadgil related his own experience when he designed investigations with high hopes of good response and ended by accepting replies from whichever cultivator responded. He also referred to the detailed terms of reference for the Rural Credit Survey made by the Reserve Bank of India, particularly to "capital formation in agriculture": in actual practice what was really recorded was data of such variety that it became difficult to see any uniform and useful concept of capital formation in them.

Similarly Sri J K Pande, the Economic Adviser, to the Government of Uttar Pradesh, mentioned his difficulties in defining (i) under-employment, (ii) normal working hours in an agricultural day in view of their variation in different seasons and in different parts of Uttar Pradesh, (iii) number of working days per month due to uncertainty regarding the number of off-days (holidays) to be allowed in a month and (iv) gainful employment in view of the dilemma whether it should be restricted to (a) those actually employed on the day of enquiry, (b) those usually employed or to (c) to those, who, though without work at the time of enquiry, were expected to be employed soon after.

These instances suggest that in view of the conditions prevailing in our agriculture, we should not be in a hurry to collect comprehensive statistical data. We are faced with the difficulty of (i) uniform definition either because of a lack of a standard manual of definitions or because of the variety of circumstances in the

different tracts of India and of (ii) bias due either to (a) insufficient, wrong or deliberately false response or (b) wrong interpretations placed, wrong questions put or wrong entries made unconsciously (or deliberately) by the investigators.

It is no doubt true that there is general agreement with regard to the use of sampling mainly because it saves time, labour and funds, besides enabling us to lay down the error involved and its level of significance and to plan for specified lower limits of error. A problem, however, has arisen due to certain modes of study, such as case-studies and studies of model units. A case study need not be the study of an unit which is representative in a particular region, or field of activity. It is often the result of availability of response, data and records; it can then be representative at best only in a subjective way. As to the study of model units, the need for it has been emphasized even by some foreign experts like Black and Stewart, presumably in order to arm the village level worker and the extension worker with normative advice that he may give to the cultivators. Weighed on the scales of common-sense, it would appear that something is better than nothing and that a few good and clear-cut data are better than a multitude of complex and incoherent data. Hence both case-studies and even studies of model units have their place and importance. We must, however, realise that even model units should desirably be representative of what is judged subjectively or objectively the main characteristic features of the universe which the extension worker endeavours to influence and improve. Hence it should perhaps be better to select some criterion (or a few criteria) from general experience and use them to decide upon the model units.

It will definitely be better if we select a narrow universe and prepare a complete frame of units to be studied with the help of some criteria and then choose a number of sample units randomly; alternatively all the units falling in the frame may be listed in a frequency table or a manifold-classification table and model units selected for study, experiment or demonstration. These ideas are only to guide, and are not to be rigidly followed.

A word about non-sampling er-

rors. It is said, and rightly, that in a country like India these are more important than the sampling errors. Hence some may belittle the need for random sample, while others maintain that proper care, suitable instructions and due check and supervision can enable one to reduce the non-sampling error to an extent. There is another idea. If the surveys are carried out by academic institutions rather than Government departments, there is likely to be greater sincerity and efficiency on the part of the investigators who are mostly ex-students of the academic departments concerned. More research projects should, therefore, be entrusted to academic institutions. If possible, institutions should be helped to acquire specialisation to ensure a permanent set up for tackling a steady flow of statistical studies.

In the West studies have expanded from the stage of micro-analysis and relationships between values observed in individual units to macro-analysis and studies to determine models and parameters (or constants) of the models. They have passed from the study and comparison of averages, deviations and correlations to econometric studies on the basis of the least square method, method of moments and maximum likelihood methods; to activity analysis; and to input-output studies. We in India have contributed our mite in the field of sampling methods and are keen to learn and adopt the latest western techniques. There is a danger that we may dissipate our energies and funds in using such novelties though our agricultural sector offers a heterogeneous appearance in contrast to the homogeneity of western economy. Consequently, while one may not mind an experiment here and an experiment there—pilot experiments, shall we say—we should choose a few well-defined agro-economic concepts such as can be statistically measured and analyse the features and relationships of our economy with their help.

One is reminded here of the idea arising out of the presidential address by Prof Gadgil at the Conference of the Indian Society of Agricultural Economics that notwithstanding the controversies with regard to the definition and desirability of acting on the basis of such terms as ceiling, optimum holding, economic holding, floor, and basic holding, we have got

(From a Correspondent)

AGRA was the venue for the 37th session of the All-India Economic Conference, held in the last week of December. The Taj and the historical glamour of Agra more than the utility of the conference as a rostrum for discussing and exchanging views on the problems selected, loomed large in the imagination of the delegates. The food served was an eloquent testimony to the fertility of the Jamuna valley, and the hospitality of the host university. The lunches and dinners more than compensated the delegates, lodged at various places, for the inconvenience of rattling to and fro in the buses and the boredom of attending the sessions.

It was a treat to listen to Shri K M Munshi's inaugural address. He can switch over with a remarkable degree of tact from his original professions of a lawyer and a litterateur to the more intriguing but nevertheless interesting ones of a politician and an economist. He confessed, however, that the items on the agenda, though meat for the illustrious gathering, was for a layman like him, forbidden food. An attentive listener would have definitely taken him for an amateur called upon to speak to experts on their own job. For one thing, his inaugural address was conspicuous by the absence of any reference to Vana Mahotsava and its utility for ameliorating economic ills.

Dr Balkrishna's presidential address, which ran into 32 printed pages, was in a serious vein and much too heavy. His thoughts appeared to be struggling to peep through the attire of an involved and verbose style and throughout, he made a conscious attempt to read each printed word rather than to make himself understandable to his listeners. The value of his speech would have greatly increased, had he practised the economy of words.

The topics selected for discussion were (1) Growth of Population in India; (2) Bank Rate and Monetary Policy—Recent Developments; and (3) Finance and Management of Public Enterprises. One could gather the impression from the old-fashioned way in which the first topic was treated, that a dead horse was being flogged. There were stimulating observations as regards the problem and its solutions, while con-

siderable data was supplied regarding birth rate, death rate, fertility rate, sterility rate, mortality rate, rate of growth of population and sex ratio.

'Bank Rate and Monetary Policy' called forth the maximum number of contributions. A few of these showed pains-taking efforts at tracing the history of Bank Rate movements in different countries including India and thereby evaluating its efficacy as an instrument of monetary policy. Some of the others dilated on the contribution of Keynes and the tool of liquidity preference which he made available to the future generations of economists—unfortunately to be mishandled and maltreated. The limitations of Bank Rate policy alone as an effective instrument of monetary policy—especially in a country like India—were realised. Out of the discordant notes, a harmonious symphony emerged—the Bank Rate to be an effective weapon of monetary policy should be accompanied by fiscal and monetary measures and selective controls.

The discussion of the third topic was marked by the absence of almost all the contributors and most of the delegates. The birds had flown to Fatehpur Sikri. The monumental constructions of the Moghuls had proved more attractive than the 'dismal science'.

The discussion on the current topic—An Appraisal of the Progress of the Five-Year Plan—aroused the keenest enthusiasm. The participants were in their elements. It was suggested that a more handy technique should be adopted for reporting the progress of the plan to the public. Dr K N Raj of the Delhi School of Economics made very succinct and clear-sighted observations while pointing out that saving was definitely lagging behind investment. He suggested that a distinction should be drawn between recurring investment and fresh investment, between utilisation of unused capacity and the creation of new, one, between amenity investment like residential building activity and investment for industrial development. Dr V K R V Rao acted as the defence counsel for the Planning Commission. It was true, he said, that the first Five-Year Plan was just a programme of expendi-

ture. With the second Five-Year Plan the Planning Commission had embarked on an ambitious investment programme with definite targets in view and a definite policy to achieve them. Prof D R Gadgil hinted at the necessity of distinguishing between the achievements of the Five-Year Plan and those attributable to other developmental factors. Shri J J Anjaria, like one pleading guilty before he was accused, modestly urged that the achievements of the plan should be judged from an objective and an unbiased viewpoint.

And so the conference ended, successfully, as one would say, more as a sightseeing excursion than an intellectual feat. To say that the quality of the papers submitted was poor would be to run down the efforts of those who had found the time and the enthusiasm to make their contribution to the work of the conference. Nevertheless, it cannot be denied that the standard left much to be desired. The senior economists, scattered all over the universities and Government bodies need to be painfully reminded of their duty. They should not limit their duties to those of detached observers. The discussions which follow reading of papers offer only restricted scope for active participation while the public speeches given by the senior economists offered almost unlimited scope for expressing ideas and developing them at length. The volume of conference papers, which stands as the only evidence of the work of the conference, is a much too poor testimony of what is discussed and what is achieved. Next year, the Indian Economic Association is holding its conference at Poona. The scholastic achievements and the austere simplicity of Maharashtra augur well for its success.

to think in terms of fulfilling the felt-needs of the masses and to recognise the justification even for the very small owner-operated holdings which are being created as a result of the Bhoodan-movement. If we think in terms of advancing technology and think of developing our economy, then the size of the cultivated unit should be increased, indeed the whole economy has to be reorganised. But if ownership rights in very small units are created, may it not lead to opposition by such owners to future attempts at consolidation to increase the size of the holding? An opinion survey is likely to suggest itself here, which would not call for many complex concepts. We are led to this when we think, not merely of abolition of intermediaries but also of land management with regard to structure and size of the farms.

The idea implied in the previous paragraph concerns production—particularly production in an exchange economy. But we may also think of consumption and of the need for multiplicity of consumption. If the very small farms can be cultivated intensively to grow vegetables and eggs and other protective food-items, it would be far better. It would help to reduce the demand for cereals. Also, if those producing non-agricultural goods and services do not insist on having their pound of flesh but instead ask for just enough to keep their body and mind in active, vigorous health and to provide them with incentive for innovations, the very small farms would not appear so very undesirable. Here, again, is a scope for opinion surveys. We know that farmers and even other low income groups have been accused of inertia, for continuing on gruels and tattered clothes although they have more money. A Research Officer of the Planning Commission accused the cultivators in the Tungabhadra Valley Project area of showing this inertia. This may well be good from the point of view of capital-formation in a sense, but we referred to it here only to fortify the argument for simple-looking surveys of man's behaviour in the agricultural sector.

Finally, a warning must be given about the indiscriminate use of statistical measures of central tendency, correlation and statistical tests without clearly understanding the assumptions underlying their use: as also about statisticians making much ado about technicalities which slow down investigations or involve large expenditure.

Protection to Textile Machinery Industry Extended

THE Government of India has accepted Tariff Commission's recommendation on the continuance of protection to the cotton textile machinery industry.

Protection will be extended to cover (a) all types of looms, namely, automatic and plain, whether used in rayon, silk or cotton textile mills, and (b) fluted rollers, and that it should continue for a further period of three years, that is, up to Decem-

ber 31, 1957.

The Government has also accepted the recommendation of the Tariff Commission that indigenous tin rollers are no longer in need of protection and should be removed from the scope of protection.

The rate of duty on the protected categories of cotton textile machinery will, during the extended period of protection, remain at 10½ per cent *ad valorem*.

Community Organisation and Development in Lebanon

K G Sivaswamy

[The working of Community Projects in Lebanon from the angle of methods of operation, difficulties encountered and the success achieved, is examined in this article by the author who visited that country as a member of the UN Mission on Community Projects in the Middle East in December 1952. The impressions are his own, and the UN is in no way responsible for them.]

THE small farmer of Lebanon depends for his living on an export market for the citrus fruits, onions and potatoes that he raises. His holding is small. Any assistance in reducing costs of cultivation and transport adds substantially to his income. Further, as compared to countries of the Middle East, Lebanon is a land of small owners in mountain tracts who have security and are an economically stable peasantry.

Favourable conditions therefore exist for the success of co-operative societies. The Abadiya Co-operative Society is one of such small owners. It has reduced the costs of marketing fruits and vegetables by half. It has prevented cheating in weight. It has helped members to learn market prices. It has shown that a society can maintain out of its own funds a staff for direction and administration costing about Leb £625 per month. Further the society has contributed to social activities out of its funds such as the construction of a canal, bridge, and road and provision of free medical relief.

OTHER SOCIETIES

But many societies attempted at other places have failed. At one place this was due to family feuds and at another, to the lack of perseverance on the part of the organisers. At Gibrail there has always been opposition from influential money lenders to the starting of a credit society.

1941 DECREE ON CO-OPERATION

The Government of Lebanon was not lukewarm in promoting co-operation. On the basis of the experience gained in working the Abadiya Co-operative Society, it issued a decree for the development of co-operatives. The 1941 decree of the Lebanon Government provided for the development of co-operatives. A Supreme Council was to supervise the over-all policies of agricultural co-operation. This Council comprised the Director of Agriculture, head of the Co-operative Service which is a section of the Ministry of Agriculture, a representative of the Director of Finance, three members

from among managers of Lebanese banks and four members elected by co-operative societies from among their members. Again the decree provided that the rate of interest for short-term (one year) loans to members should not be more than 3 per cent, and not more than 2 per cent in the case of medium-term loans (five years). The decree further provided for unions of agricultural co-operatives for different objects, and an audit union for inspection, audit, education and development. The decree should be appreciated for many of its good features. It brought together Directors of both the agricultural and co-operative departments of the State under a single Council, thereby recognizing the organic connection between the two departments in assisting the farmer. Secondly, it recognized the need for central societies for credit, supplies and sale in order to aid primary co-operatives. Thirdly, it provided for co-operative education and audit. But the issue of loans at a nominal rate of interest cannot be more than a pious wish.

OBSTACLES TO ECONOMIC PROGRESS

The co-operative movement, however, could not be fostered by the State. Obstacles to it were both within and outside the movement. But external obstacles were more powerful. In the first place, credit was costly. Even the members of the Abadiya Co-operative Society borrowed at 9 per cent from commercial banks. Private banks, both foreign and native, always stood against the growth of agricultural central banks. Also firms dealing in seeds and fertilisers or marketing lent at high rates of interest. Secondly, the seed companies had their extension agents to sell fruit nursery products imported from American and European markets, vegetable seeds and fertilisers. Some of them had monopolies for importing certain varieties of fertilisers. They sold these articles on credit at an interest rate of 12 per cent with the extension agent realising the price at harvest at 16 per cent interest for a period of three months. The cost was high and seeds and fertilisers could not reach the small farmers.

Small business with innumerable petty farmers was not profitable and therefore unattractive to private merchants. As regards the suitability of seeds, the technical supplement of the UN Economic Mission says that 'seeds of potatoes, cereals and vegetables were imported without ascertaining their suitability to climate and soil.' It adds that 'though provision was made in the six-year plan of a sum of Leb £1,000,000 for multiplying approved seeds, it is not yet exactly determined how the money is to be spent.'

MERCANTILE ECONOMY

The Lebanese economy is mainly a merchant economy. By history and tradition, an important community living by foreign trade has grown in Lebanon. State policy is very largely influenced in the legislature by representatives of the commercial community. One of the methods by which the State is thinking of assisting the farmer is by promoting an agricultural project of the French Government for the sale of agricultural requisites. But in spite of the large place given to concessionaire companies doing big business, they feel that individual dealings with innumerable petty farmers will raise their establishment charges and consequently the costs of distribution and that some collective form of buying and sale by the farmers will help their wholesale business.

EXPORT SUBSIDIES—HARMFUL DEVICE

An exporting economy such as that of Lebanon will have to adopt all kind of devices to reduce the costs of cultivation and marketing. At present a number of difficulties are experienced in selling oranges and other fruits. Government is subsidizing the growers and traders for furthering exports. Having allowed the costs to increase in consequence of the absence of control over credit, supplies and marketing and finding that reduction in the principal exports must lead to distress within the country, Government has been forced to adopt the easy, though slippery, device of export subsidy.

CONTROL OF PRIVATE BANKS AND TRADE

Dr Tannous wrote as early as 1944 that the obstacles to the growth of co-operation have been "money-lenders, traders, brokers and factions among Arabs." A recent article in the *Middle East Journal* (V 6.4) on economic nationalism says, "Lebanon is the paradise for private merchants and money-lenders. Foreign concessionaire companies are criticised for exorbitant charges or inadequate services, but there is little talk of State industries." Some degree of control will be needed over private companies regarding their costs of distribution and quality of articles. Also the State agricultural research stations should be able to test and approve the quality of seeds imported.

Egypt, a neighbouring State, has a different story to tell. Its agricultural bank lends at special rates to primary co-operatives and also sells fertilisers at a concessional price. It supplies cotton seed from its experimental stations in such large quantities as to minimize the sale of contaminated seeds by private merchants. It has fixed the price of seeds and fertilisers. Its agricultural bank, through its 800 shoonas (store-houses), sells seeds and fertilisers to the co-operative societies. What must be noted is that small farmers will hardly be able to fight unaided powerful companies and banks, and their own primary and central organisations will need to be fostered by special concessions as a definite State policy. The Abadiya Society has shown how farmers can benefit by co-operative supplies and marketing even in the present economy where private trade has the upper hand. So too the milk-marketing activity of Mr Feldmahn at Anjar has shown how it can further cattle-breeding, ensure some income to the farmers and supply the essential needs of milk and dairy products to the town of Beirut. The decree of 1941 for promoting co-operation needs therefore to be improved and implemented in these directions. Primary co-operatives for credit supply and sale should take the place of private agencies. The Director of the Department of Social Affairs in Lebanon, in an article in the *International Labour Review* of January 1952, refers to the importance of this policy in the following words, "It is easy to imagine the progress that could be made as a result of a sound rural policy providing for irrigation schemes and a system of co-operative credit, mar-

keting, purchase and hiring of equipment. This is the thread which runs through all the plans of farmers and Government."

AGRICULTURAL FINANCE

The proper functioning of co-operative societies rested on the supply of necessary finance at fair rates of interest.

The one working society at Abadiya was forced to contract with a commercial bank to lend to its members at the high interest rate of 9 per cent. It has always failed to supply credit to its members. At Chetoura and Gibrael the farmers had to pay exorbitant rates of interest. Mr Feldmahn referred to his difficulty in finding funds to supply cows, buy dairy equipment and promote fruit-growing. At Gibrael soil conservation and terracing could not be furthered for want of funds. The NEF centre could supply motor pumps only to the rich who had capital, but not to the hundreds of farmers who required them. These facts indicated that the main bottleneck against the development of agricultural co-operatives was scarcity of finance. A central agricultural bank or State finance for supplying short-term and long-term credit to the primary agricultural co-operatives and to central societies for the purchase of agricultural requirements for the latter is essential. The State should therefore find the necessary funds if co-operative farmers' organisations are to thrive.

A radical change is necessary in the financial policies of the State. The decree of 1941, which had high aims of promoting co-operation, failed mainly because of want of a State policy to provide short and long-term credits for farmers. Capital has also to be raised by preventing conspicuous consumption by taxation and by regulating internal investments. (See the article by the Director of Social Welfare in *ILR* of January 1952.) Community co-operation cannot make any headway in promoting economic progress unless the State provides the necessary financial aid for short-term, medium and long-term needs, and the agency of primary rural co-operative societies for taking this aid to the farmer in the village.

CENTRAL SUPPLY SOCIETIES

Reference has already been made to the difficulties of farmers in getting proper supplies of seeds and fertilisers. Without a Central Supply Organisation, co-operative societies

and social centres could not distribute seeds and fertilizers of good quality at a reasonable price. But central supply societies cannot function unless priority is given to the import of agricultural requisites. Further, if imports are not regulated so as not to affect the internal production of food supplies, co-operative societies will be adversely affected in their production plans.

If cattle and cattle feed, motor pumps and tractors, seeds and fertilisers and insecticides and sprayers are to be imported, the import policy will need regulation so that priority is given to these imports instead of luxury articles. During my stay in Lebanon my attention was drawn to American readymade clothes in Lebanon, which tended to drive local tailors out of employment. The import of Dutch cheese, New Zealand butter, Australian butter, Australian jam, and Dutch biscuits must affect the local cattle breeding, fruit-preserving and food industries.*

Success of community organisation on the economic side rests on a sound import policy regarding priorities of supplies of agricultural requisites and prevention of imports which hinder the internal development of the agricultural processing industries.*

STRUCTURE OF RURAL SOCIETY

The prerequisites for the working of any community organisation are that the individual should be free to act without fear of being deprived of his source of livelihood, and that power and leadership are not concentrated in the hands of a

* The Director of Social Affairs, referring to this state of things, says in the article already referred to:

"Many of the imported goods are luxuries or are not necessary to the economy. From the social point of view, this state of affairs is harmful, since it encourages the natural inclination of the Lebanese to spend money unprofitably on goods which are quickly used up. As an example we may cite the extraordinary number of expensive cars which are converted after a few years' use into taxis or delivery vans."

The UN Mission's report puts the case for priority of imports needed for agricultural development in the following words: "The first requirement is to feed its own people and provide exports to other lands, by these means paying for the imports of these manufactured goods, necessary to modernise agriculture."

few as a result of the ownership of means of production such as land, water, money and trade. Land ownership in the hands of a few is hardly conducive to the working of community organizations.

Religious feuds, political feuds and family feuds prevent the working of community organisations particularly in villages dominated by big landlords. To illustrate this, while the co-operative, at Marg, succeeded because of the equality of status in land-ownership, that at Kubelias failed because of the power-mongering type of leadership.*

These problems have to be faced. In the area of the Litany river project undertaken by Point 4 American aid, a large portion of the agricultural land is owned by three big

* Writing about the need for trained leadership, in the *Scientific Monthly* of January 1951, Tannous says, "There is a small minority stratum of privileged elite on the top of a tremendous mass of depraved peasantry, and some industrial workers at the bottom; the vacuum has to be filled up or this society will not hold longer." In the same article, he refers further on to the existence of big land-ownership and foreign business enterprises and the difficulty of carrying technical skill to the new leadership under these conditions.

land-owners. Crop-sharing tenants and agricultural labour do not get a fair return for their work.

EXTENT OF BIG LAND OWNERSHIP

The area of big ownership existed in the coastal plains of North and South Lebanon and parts of Bikka Valley. Most of these landowners are city families having no interest in cultivation. Some of these estates belong to the wealthy families of Ottoman times. Some have been grants by Turkish Sultans to powerful politicians such as the very large estates in the Bikka and Litani Valley.*

INCREASE IN NUMBER OF OWNER-PEASANTS

Community development cannot prosper in these areas unless a homogeneous community with equality of land status is created. Tenants and petty owner-farmers who have traditional skill to manage farms should get security and sufficient land to cultivate. The large areas of big land-owners will have to be acquired

* The ownership of holdings is estimated as follows: "83,000 small owners hold 5 acres and below; 15,000 between 5 and 12½ acres, 1,000 between 12½ and 25 acres, and 171 large landowners hold 3,37,500 acres or about 2,500 acres each on an average."

at a price which can be paid out of the land income in a definite number of years. This will have to be re-distributed among poor farmers. Simultaneously, co-operative organisations for developing these lands will have to be promoted where possible in varying degrees of co-operation according to the measure of development achieved by farmers in different localities. Where agricultural labour is not mature enough to own land and develop it on a family basis, a paternal type of central organisation may be necessary. But unless this land concentration is broken, family feuds among big owners are bound to continue.

OTHER DIFFERENCES OF VILLAGE LIFE

Differences, due to political parties, cannot, however, disappear in democracies, and they have a value in giving importance to submerged people rousing their self-respect. Religious feuds have lately been disappearing, and festivals of different religious groups are gradually becoming occasions for bringing together all the communities. The main obstacle to the growth of rural leadership among the large mass of the working class is their feudal subjection to big landlords. This can only be broken by the adoption of bold land reforms similar to those attempted in other countries of the Middle East.

Rural Credit: II—The Solution

THE problem of rural credit can only be solved by a regeneration of the co-operative movement for which the movement must receive considerable assistance from outside. While such assistance can only come from the State, the tendency to over-administer and under-finance evident till now must be given up. The total programme required is one of rural re-orientation, which implies a combination of rural conscience, rural will and rural direction. Such a combination strong enough to be an over-riding factor in the situation has to come from Government and the more powerful institutions of Government.

With this approach to the problem and its wider aspects, the Committee bases its recommendations on three fundamental considerations. It is argued that there must be not merely State guidance and State aid but also State partnership with co-operatives in credit, processing, marketing, etc.; that this raises the need for positive State association with a defined sector of commercial banking; and that the State must take the initiative in the creation of suitable institutions for the promotion of storage and warehousing on an all-India scale with State participation. For all these purposes training of proper personnel is necessary.

The integrated scheme proposed by the Committee requires State participation at different levels, full co-ordination between credit and other economic activities and administration through trained personnel, responsive to the needs of the rural people. For these purposes the creation of certain funds is recommended.

The development of co-operative credit is considered under the following heads: (1) Reserve Bank, (2) Central Government, (3) State Government, and (4) the Co-operative Movement.

(1) RESERVE BANK

In collaboration with the State Governments, the Reserve Bank is expected to draw up plans for the co-ordination and re-organisation of co-operative credit on the lines recommended by the Committee outlined below. The Reserve Bank should further be empowered to make long-term loans to State Govern-

ments, from the National Agricultural Credit (Long-term Operations) Fund that is proposed, to enable them to participate directly or indirectly in the share capital of state co-operative banks, central co-operative banks, larger-sized primary credit societies, central land mortgage banks, primary land mortgage banks, etc.

Short-term accommodation by the Reserve Bank on the guarantee of State Governments through state co-operative banks, should be continued but medium-term loans (from 15 months to 5 years) should also be given. The existing overall limit of Rs 5 crores and other limits should be removed and actual assistance should be left to the discretion of the Reserve Bank.

The Reserve Bank should be enabled to give long-term accommodation to land mortgage banks through direct loans or purchase of 'special development debentures' either from the National Fund mentioned above or otherwise. Such purchases should be apart from normal purchases in pursuance of existing policies.

In case repayment of short-term loans to various types of co-operative societies becomes difficult due to the occurrence of famine or drought, the National Agricultural Credit (Stabilization) Fund should be used to convert these short-term loans into medium-term loans though the Reserve Bank may insist that similar funds are maintained within the movement and are used to meet part of such liability.

The operation of the two funds mentioned and the planning and, to the extent feasible, execution of programmes and policies should be left to the Reserve Bank and its Board. For this purpose, however, the Agricultural Credit Department should be reorganised and strengthened. The Standing Advisory Committee of the Reserve Bank should be continued as a smaller expert body, while a representative Advisory Council should be constituted, common to the Reserve Bank and the Ministry of Food and Agriculture.

(2) CENTRAL GOVERNMENT

The Ministry of Food and Agriculture should have a National

Agricultural Credit (Relief and Guarantee) Fund to give grants to co-operative credit institutions through State Governments for writing off irrecoverable arrears, where these have become so large as to threaten the stability of the structure and are due to such causes as widespread or chronic famine. State Governments may be required to make contributions for the same purpose from similar funds maintained by them.

(3) STATE GOVERNMENTS

These will be responsible for the implementation of the planned programmes of credit development drawn up in consultation with the Reserve Bank. The Committee has recommended that *taccavi* and similar loans from State Governments should be limited to 'distress' finance to meet contingencies such as famine, drought, etc. The only exceptions to this rule should be (a) Where co-operative credit institutions are yet to be developed, until that is done; and (b) Where special credit arrangements are made for certain areas—chronic famine areas or those inhabited by backward tribes—and for certain classes for whom special policies of rehabilitation are adopted.

(4) THE CO-OPERATIVE MOVEMENT

The recommendations with regard to the Reserve Bank, Central Government, and State Governments, outlined above, are all based on their operating to improve the co-operative movement. The crux of the matter is, therefore, the way in which the movement itself can be reorganised and strengthened.

THE STATE AS MAJOR PARTNER

It is recommended that a phased programme for the reorganisation of co-operative credit institutions at all levels should be drawn up by the State Governments in consultation with the Reserve Bank. This reorganisation should be on the basis of partnership with the State, which should continue to be major partner for an indefinite period at the apex and district levels, and for more limited periods at the primary level. The Committee has recommended that State participation should be direct only at the apex level, and that it should be through the State co-operative bank in the central

banks, and through State and central co-operative banks in the larger primary credit societies.

To ensure maximum co-ordination between short-term and long-term parts of the credit structure, State co-operative banks and central land mortgage banks should have a common administrative staff and board of directors as far as possible, though they should remain independent legal entities. State and central co-operative banks and larger primary credit societies with limited liability should be established and one of the main lines of future development of the primary credit structure should be the organisation of larger primary societies, with limited liability.

MODE OF OPERATION

Certain very important recommendations are made about the mode of operation of the co-operative societies. Short-term credit should be given as crop loans—i.e. for productive purposes, on the basis that a crop is anticipated, related to the estimated outlay and providing for recovery from the proceeds of the sale of the crop. Such loans should be disbursed as far as possible in kind.

Subsistence needs should be met by the primary credit society while credit needed in connection with specific items of consumption should be provided through *chit* funds, incorporated within the framework of larger primary credit societies, though including non-members.

Medium-term should be provided by the short-term credit structure, special attention being paid to loans for purchase of livestock.

Long-term loans should be given by land mortgage banks which should be established or reorganised in different States. Central banks or branches of the State Co-operative Bank should establish a section for dealing with long-term credit on an agency basis and this can be converted into a branch of the Central Land Mortgage Bank. Primary land mortgage banks should be established eventually. The Government and the Reserve Bank may give various kinds of assistance to land mortgage banks and the flotation of 'rural debentures' is recommended.

Trained personnel for key posts in co-operative institutions at higher levels, and even for larger primary societies should be 'deputed' from cadres instituted by the State co-operative banks or State Government. Various measures for administrative reorganisation are recommended in this connection.

STATE BANK OF INDIA

To ensure the development of rural banking, whether co-operative or otherwise, the Report has recommended the establishment of the State Bank of India, through the amalgamation of the Imperial Bank of India with the State-associated banks, namely, the State Bank of Saurashtra, the Bank of Patiala, the Bank of Bikaner, the Bank of Jaipur, the Bank of Rajasthan, the Bank of Indore, the Bank of Baroda, the Bank of Mysore, the Hyderabad State Bank and the Travancore Bank (together with a few minor banks).

In making this recommendation, the object of the Committee "is the creation of one strong, State-sponsored, State-partnered commercial banking institution with an effective machinery of branches spread over the whole country, which, by further expansion, can be put in a position to take over cash work from non-banking treasuries and sub-treasuries, provide vastly extended remittance facilities for co-operative and other banks, thus stimulating the further establishment of such banks, and generally, follow a policy of advances—including advances for agricultural purposes—which, while not deviating from the canons of sound business, will be in effective consonance with national policies as expressed through the Central Government and the Reserve Bank."

EXTENSION OF BRANCHES

It is recommended that the new bank should pursue a large and expeditious programme of branch extension and that losses, beyond an agreed level, on new branches should be met from an Integration and Development Fund to be established within the bank itself from the dividends on shares held by Government and the Reserve Bank. This dividend should not exceed 5 per cent.

It is a fundamental principle underlying the Committee's recommendations that other activities must be encouraged to develop on co-operative lines, if co-operative credit is to succeed. It is recommended that co-operative processing and marketing should be encouraged through a planned programme by long-term loans from the National Co-operative Development Fund at the disposal of the National Co-operative Development and Warehousing Board.

WIDENING CO-OPERATIVE ACTIVITIES

Co-operative societies for marketing, processing, dairying, etc should be developed in conformity with a plan on the basis of major State partnership. Initially, such societies should be organised at selected places, selected carefully to ensure success. Every marketing society should give effective representation in all cases to the medium cultivator and where possible, to the smaller cultivator also. Where regulated markets exist, local marketing and credit societies should be entitled to nominate members on the Marketing Committee.

In marketing and similar societies, members should be compelled to make additional contributions to share capital in proportion to turnover of their sales or to the size of loans taken. Existing processing plants may be compulsorily acquired if co-operative societies are willing to run them and licenses for new plants should not be issued to private parties unless no co-operative organisation is willing to and able to undertake such work.

For storage and warehousing, an All-India Warehousing Corporation, and State Warehousing Corporations are recommended while co-operative marketing societies may also undertake provision of storage or warehousing as one of their primary functions. The Report makes detailed recommendations about the functions and finance of these different bodies to ensure that through their effective functioning, the rural economy may be considerably strengthened.

THE MONEY LENDER

In its scheme, the Committee has not assigned any place to private agencies, but has expressed the hope that the moneylender, trader, indigenous banker and the other commercial banks will supplement the scheme, though not finding a place within it. The network of godowns and warehouses will assist them in doing so.

RURAL SAVINGS

About rural savings in the light of its study of the rural economy, the Committee concludes that

- the need to make rural savings possible is much more important than to render them available;
- to the extent they exist, rural savings are most likely to be made available where they

(Continued on page 49)

India Steamship Company Limited

Address of Sir A Ramaswami Mudaliar, KCSI, DCL (Oxon), Chairman, India Steamship Company Ltd, delivered at the Annual General Meeting of the Shareholders of the Company on 30th December 1954.

Gentlemen,

The Audited Accounts and Directors' Report for the period ending March 31st, 1954, has been in your possession for some time. With your permission I shall take them as read.

Trading Experience

The Directors' Report shows that the freight earned during the year is Rs 3,60,27,999-2-2—Rs 33 lakhs less than the freight earned during the previous year. This drop in freight and its resultant effect on the profit and loss account of the Company has been attributed by the Directors to the 'go-slow' movement adopted by dock labour in various ports and the general attitude of dock labour in ports. The consequential delay in the turn round of the ships and the time taken by ships in port as a consequence of the intransigence of labour is reflected both in the earnings of your Company and in the expenditure which the Company has had to meet. To take one item, Port Charges increased during the year by more than Rs 8 lakhs.

In spite of the unforeseen loss due to these circumstances, the Company has made a gross profit of Rs 27,80,081-8-2 before providing for Depreciation. It will easily be realised that the year under review has been a most anxious one and it is only by the careful management of all departments and of our Agents abroad that even this result has been possible.

Delay at Ports

I have frequently referred to the unnecessary and inordinate delays that are experienced at some of the ports both in India and abroad and have pointed out that the earning capacity of a shipping company is seriously crippled by such delays. The year under review has brought this problem to a critical stage. I must be frank and state that the crisis has been the result of reforms and regulations in themselves probably good, which have been enforced by the Ministry of Labour, without, however, being in a position to control or direct the labour situation in Indian ports. The waterfront in almost every country presents special problems which do not arise in industrial units in the country. The De-casualisation scheme adopted two

years back without adequate consultation with the interests concerned and in fact in spite of the serious apprehensions entertained by Shipping interests and the difficulties pointed out by them, has led to results which the Government did not contemplate and to situations which the Government so far has been unable to meet. It is unfortunate that sometimes proposals adopted in Great Britain in such matters are copied in India without a proper appreciation of the inherent difficulties involved in the application of such proposals. Even in Great Britain with labour better disciplined and with leaders of labour exercising greater authority over trade unions, dock labour has not proved as disciplined as the labour leaders would like them to be. In India with rival Trade Unions competing and with some leaders trying to get advantageous positions among the Unions it was a foregone conclusion that the reforms copied from England were bound to result in chaos, to the serious detriment of the economic position of the country itself and in particular of Shipping.

Go-Slow Movement

The most distressing aspect of the labour situation at some Indian ports is the 'go-slow' tactics adopted by various classes of dock labour. In spite of the fact that attempts have been made by Government representatives to prescribe the normal work that may be turned out by a gang of workers and the promises held out by labour leaders that these norms will be observed, the situation has deteriorated, indiscipline being rampant and authorities who can supervise or control such labour being incapable, owing to various reasons, to deal with the situation. Where one gang was in the recent past responsible for loading a certain quantity of cargo, more than two gangs and not unoften even three gangs, are required to load the same amount of cargo.

Last year addressing you, I stated that your Company, along with others, desired to co-operate in providing all reasonable amenities and levels of wages to labour but wished to emphasize that the labourer must be worthy of his hire and that he should do that amount of work which may be reasonably expected of him. Unfortunately conditions have steadily deteriorated. The Port Commis-

sioners labour, the stevedores labour, the winchmen alternately adopt 'go-slow' tactics and ships are held up for weeks on end in loading and unloading their cargo. This situation should not be allowed to last any longer and the public must clearly understand what the continuance of such a situation would mean to the economy of the country.

Economic Consequences

The Report of your Directors shows the economic consequences to your Company as a result of the labour situation, but there are wider consequences than those affecting your Company which result from labour's indiscipline and unreasonable attitude. The trade of the country will seriously be affected, and indeed has already been affected to some extent, by such an attitude on the part of labour. Shippers are unable to meet their contracts and deliver the goods to their importers in time. In an extremely competitive world where countries with the same resources which India has got wish to establish markets for their products, it can easily be realised that the economic consequences of delayed shipments and of shipments made at higher freight rates will be extremely serious to the normal trade of the country. It wants no imagination to forecast that once there is a diversion of trade from one country to another it will be an uphill task to recapture the original normal markets. Government and the public, therefore, have as serious a situation to face as the Shipping companies and I trust that the gravity of the problem having been now realised effective steps will be taken to regulate the conduct of dock labour. The 'go-slow' movement is nothing else than a direct attempt at sabotaging the efforts that the country is making towards economic progress. The Prime Minister has aptly observed "Aram haram hai". If his attention is drawn to this situation at the major ports in this country he will be shocked at the extent to which this evil practice of idleness is prevalent. When one looks at the amount of unemployment that exists amongst the educated classes and even the skilled workers and compares it with the position generally speaking of dock labour, one will realise how totally

unjustified and extremely anti-social the attitude of much of this labour is. It must be stated in fairness to some of the Trade Unions controlling part of the Dock Labour in these ports that both their leaders and the members of such Unions are willing to do their shares of work properly but are often threatened with violence for such proper behaviour by the Members of some other Unions.

Wages and Amenities

In all that has been stated before, speaking generally on behalf of Shipping companies, I should like to state that there is no suggestion that they are not willing to meet the legitimate and reasonable requirements of labour. Whether it is Port labour, Stevedore labour or any other kind of labour connected with the dock, the financial burden has ultimately to be borne by Shipping companies and they are well aware of this fact; but they cannot afford to be put to enormous losses quite unnecessarily by the attitude of sections of labour and by the result of factors beyond their control. It is time that the Government sets up a reasonable standard for all such labour and enforces such standard both in work and in wages and amenities on the employers and on the workers. If such a firm decision is not taken by the Government the commendable progress which Indian Shipping has now made in spite of odds and difficulties, will be seriously jeopardised and further progress retarded.

The Second Five-Year Plan envisages large industrial development in the country both in the public and in the private sector and consequently a much larger movement of freight between India and various countries of the West and Far East. Indian Shipping wants to play its part in this National effort to increase the economic strength of the country to raise the standard of living of its people and to promote greater employment for all classes of the citizens of the country. It will put forward proposals for increasing the tonnage that is now owned by Indian Shipping companies and map out routes other than the existing routes which will have to be served by Indian Lines. All this contemplated progress can only be possible with the goodwill and active co-operation of all kinds of workers in the industrial and the Shipping world, while on the other hand employers must realise their obligations towards the legitimate request of workers of all classes.

At a recent meeting of the Consultative Committee of Indian Ship-owners their views on the lines I have indicated above have been fully stated and the Shipping companies now look forward to the Ministry of Transport and the Ministry of Labour acting jointly not merely in the interest of Shipping companies but in the interest of the very economic progress of the country.

A Brighter Picture

Let me turn now from this gloomy and unethical situation that I have portrayed to a brighter picture which seems to emerge for your Company in the near future. I mentioned last year that your Company was negotiating with the Government for a loan for the construction of vessels which may be added to your fleet. I am glad to inform you that a loan was granted by the Government for the construction of two ships of 10,000 d/w approximately and orders were placed with a German Shipbuilding Yard—Messrs Howaldtswerke for their construction. One of the ships will be delivered after the trial run by the end of this year and the next ship is expected to be delivered by the end of January 1955. These ships are of the most modern type equipped to carry cargo of all kinds from and to India and with a speed of over 17 knots an hour. In fact they are the fastest vessels that have been built for Indian Shipping and the fastest vessels that are in the freight trade between India/Continent and the UK. It may be recalled that according to the agreement arrived at in 1950 with the India/UK/Continent Conference Lines your Company was allowed to trade with twelve ships on this route. Your Directors wish to attain this limit of twelve ships before the period of five years expire, i.e. by the end of 1955, and they are now considering the addition of two more vessels of the same type as has been recently built which will enable them to fulfil the target accepted by them in 1950. With these four fast going vessels of over 17 knots speed and with the six Victory ships whose speed is not less than 15 knots, the India Steamship Company will have a fleet of fast vessels comparable with any other Line on this trade and shippers will have no reason to complain of delays. Their shipments to and from India will be transported as expeditiously as by any other Line—in fact more expeditiously than by almost any other Line. I would only reiterate that I trust that all this effort of your Company will not be rendered intractable by

labour troubles and by labour indiscipline.

Indian Shipping and the Public

It has not yet been realised by a large section of the public that Indian Shipping of adequate strength and engaged in carrying freight to different parts of the world is an essential prerequisite for the development of the trade and commerce of the country. Shipping plays a large part in channelling trade and commerce in right directions. It has been my experience that Shipping companies in many countries have been promoted and encouraged not purely for earning adequate returns but even more for the contribution they can make to the trade and commerce of the country. They form, therefore, a vital economic factor in the country's development. Instances can easily be adduced to show that the trade of certain countries has been promoted and that of others has been almost extinguished by the manner in which shipping companies have plied their trade. If the public were to realise this aspect they would be even more anxious to co-operate in encouraging, fostering and developing Indian Shipping.

I am thankful to many Indian shippers who have appreciated the importance of Indian shipping and have regularly encouraged us. But I am bound to point out that there are some at least who have failed to realise that they cannot be dependent completely on foreign shipping for their trade and business and that their indifference to getting their cargoes through Indian shipping or their lack of interest will ultimately affect them adversely. I trust that the Federation of Indian Chambers of Commerce and Industry and its affiliated commercial organisations will make it clear to their members that in their own interests a healthy development of Indian shipping is essential.

Five-Year Plan

The need for the progress of Indian shipping has, I am glad to say, been adequately realised by the Government and proposals for the target which should be attained for Indian owned shipping tonnage during the next Five-Year Plan have been invited by the Government. Shipping interests are willing to respond to this call and the only request that they have made to the Government is a continuance of loan arrangements on similar terms as exist at present. They have not asked for an operation subsidy nor any kind of discriminatory legislation

such as has been proposed and is in operation in some other countries and yet the cry has been raised against Indian shipping that flag discrimination is resorted to. I have shown in what forms discrimination has been practised or at any rate 'restrictive business practices' have been adopted by the various shipping concerns. In the political field a great deal has been heard of negotiating from strength. There are serious differences about the wisdom of this policy. But I think it cannot be gainsaid that in the economic field 'negotiation from strength' seems to be the only armour which can adequately protect the interests of a country. I trust, therefore, that Government, the public and shipping companies, with enlightened self-interest policies, will create a situation where Indian shipping companies can 'negotiate from strength' and break down the discriminatory and 'restrictive business practices' which are so frequently adopted by vested interests in the shipping world.

Around Calcutta Markets

Better Sentiment

Wednesday, Evening

IT is symbolic of the uncertain phase of stock markets that even the New Year enthusiasm does not seem to be lasting for more than a couple of days. It would appear, in retrospect, that Clive Street's steadiness in the first three days of this week was a belated reflection of the higher dividends announced by an influential group of jute companies. This was partly responsible for the steadiness in equity prices on the Calcutta Stock Exchange on the last day's session for the year.

Clive Street opened after the Christmas holidays with a firmer trend in Indian Iron. There are many explanations for the rise in Indian Iron, although they are mainly technical. Indian Iron were bid up to unduly high levels due to speculative support and remained steady at higher levels until the announcement of the dividend. Subsequently they developed a drooping tendency, despite the satisfactory financial position indicated in the annual accounts, as the yield on the declared dividend was considered low.

Settlement Day

Indian Iron steadied-up during this week because of technical reasons. Some interested "bull" support was evident. It was also evident that in-and-out operators thought it prudent to cover their sales before the settlement day. Informed circles are inclined to the view that this week's steadiness in Indian Iron is, to a large extent, due to *teji mandi* operations based on the respective open positions of "bears" and "bulls".

Even so, the further improvement in Indian Iron after today's

clearing indicates that the recent spurt is not wholly technical. It is evident from this week's price fluctuations on the Calcutta Stock Exchange that market operators are not pessimistic about the future outlook of industries like tea and jute.

On the last trading day of the year, Clive Street steadied-up because of the improvement in Jute shares. This week's steadiness was due to the spurt in Indian Iron, although the continued strength in Jute shares helped the market sentiment. Tea shares also picked-up in the last few days.

Bird Dividends

In the last few days, there has been a broadening of activity in Jute shares. Almost all the important groups of jute companies have announced their dividends for the half-year to September last. A few days ago, the Bird group announced theirs. With one or two exceptions, all the companies in this group are paying higher dividends. That is why, Jute shares are moving up.

From the reports published so far, it would seem that the spinner's margin was favourable in the last half-year. Raw jute prices had not, by then, firmed-up appreciably; whereas, jute goods were fetching relatively better prices. This favourable spinner's margin was reflected in better earnings and profits. So, last half-year's jute dividends were higher than those of the previous six months.

For a proper appreciation of the current half-year's trading conditions, it is necessary to realise certain facts. In the half-year to September last, the relative parity

prices were in favour of those mills manufacturing hessian. Trends in parity prices in the last few months indicate that, in the current half-year, those mills manufacturing heavy goods are likely to experience better working results. It is necessary to add a foot-note. In the last few days, raw jute prices have resumed their upward trend. If this tendency continues, the spinner's margin may either become less favourable or may be affected in certain ways which are, as yet, not predictable.

Tea Export Quota Raised

For the recovery in Tea shares, there are two obvious reasons. For one thing, the tea export quota has been raised by a further 2½ per cent. This is a clear indication that the export demand continues. Clive Street has interpreted this to mean that fears of consumer resistance developing in the importing countries are exaggerated. This was one of the factors which was retarding activity in Tea shares in the last few weeks.

Despite the increase in the tea export quota, this week's average export auction prices have not declined. On the contrary, both the export demand and prices have improved further. It is, of course, natural that, with a further release of the export quota, the average internal auction prices will improve. This week's internal tea auction prices prove that this anticipation is not wrong.

Wider Issues

Stock market trading for the first few days of the new year indicates that investors remain cautious. They are perplexed with the outlines of the second Five-Year Plan sketched recently by the Finance Minister in Parliament. They are disturbed with the Government's attitude to managing agents. They are none too happy with the proposed legislation relating to the regulation of stock market trading. These doubts and fears explain why the New Year enthusiasm seems to be lacking depth.

But it is also clear from this week's price movements in equities that investors are not as pessimistic now as in the last few weeks. There is gradual realisation that an annual expenditure of Rs 1,000 to Rs 1,200 crores per year during the second Five-Year Plan must necessarily have a sustaining effect on stock markets.

Around Bombay Markets

Confident Beginning

Thursday, Evening

IT is the usual experience of the Stock Market that certain significant developments take place in kerb trading during the Christmas holidays. Generally the movement would be upwards, so that the new year opens with a bullish start. This year, however, contrary to expectations and past experience, kerb trading displayed no significant movements. The market remained exceptionally steady over the holidays. Perhaps the repeated pronouncements by the Cabinet Ministers of the socialist objectives of the Government had a sobering influence on an otherwise bullish attitude. The uncertainty regarding the nature of the Taxation Enquiry Commission's proposals was the other restraining factor. Big speculators avoided substantial commitments during the holidays.

As against this, the enthusiastic welcome accorded to the Government's socialist policies by top industrialists like Shri G D Birla and Shri Kasturbhai Lalbhai gave the market an excellent filip and the hesitancy of the holidays gave way to cautious optimism at the beginning of the New Year. This has been reinforced by the news of excellent production figures for December 1954 by the TISCO.

The first few days of the New Year have witnessed good support for Tata Steel as well as Indian Iron. A leading industrialist is reported to have gone long in Tata Ordinaries and there are talks of a bull syndicate in Calcutta acquiring a grip over Indian Iron. There has been aggressive buying in both these scrips over the last two days. Tata Ordinaries touched Rs 230 last Thursday. There has also been a follow up support in textiles, though not very pronounced.

The working of the market during these first few days of the New Year indicates that the market sentiment is bullish, in spite of the repeated talks of Socialism. Technically the market is quite healthy. The sturdy old bear operator is reported to be still short to the tune of a lakh of Tata Ordinaries; and there is no corresponding long position held by any one or few

operators. Market is showing sign of confidence in the future, and is perhaps preparing itself for the expectations of a favourable budget.

Bullion

Price movement in bullion have been confined within a very narrow range, silver moving between Rs 155-156 and gold between Rs 88 and Rs 88-12. Sentiment, however, has slightly improved on reports of support to agricultural prices at an unduly low level. But occasional sales in silver by the Reserve Bank acted as a damper. For a busy season, the offtake is poor, judging from the experience of previous years. In gold, the undertone appears to be fairly steady in view of a succession of wedding dates ahead.

Cotton

There has been further weakness in cotton during the week due to absence of buyers. Mills both in Bombay and Ahmedabad have been keeping aloof. The cloth market continues to be dull and hopes of early revival of activity have been receding. The ready section as well as forward delivery touched a new low on Wednesday at Rs 609-8.

Oilseeds

The arrival of groundnuts from Hyderabad, Madras and Saurashtra continued and weak tendency prevailed throughout the week. The release of a further quota of 15,000 tons for exports gave no fillip to castor seeds. Hardly 2,000 tons of business could be put through by shippers and that, too, at unremunerative price.

Foreign market advises promise little possibility of export sales at this stage. Production figures for castor seeds estimated at 125,000 tons and the corresponding estimate of internal offtake of 40,000 tons pin-points the underlying weakness in castor seeds. Forward rates touched a new low at Rs 85-8 and the undertone was very weak.

RURAL CREDIT: II—SOLUTION

(Continued from page 44)

are most useful for rural needs; and
(c) rural savings fall so short of rural needs that they must be supplemented from, not diverted to, urban areas.

In the context of these conclusions, the Report has recommended that mobilisation of savings should be left to co-operative institutions and Government loans should not touch them at all. It has also recommended that mobile banks should be restricted to areas in which there is no immediate prospect of development of co-operative institutions and even there, on condition that advances for agriculture and allied purposes should not be less than the deposits they collect from the area.

A number of subsidiary recommendations and the subject of the staff of co-operative institutions has been elaborated in considerable detail. The entire problem is also discussed from the wider standpoint of the character that India's socio-economic structure should acquire in future.

Finally, the Committee lays considerable emphasis on urgency in the implementation of its recommendations. "The pressing need today," it says, "is to initiate measures which, if possible, will prevent damage". And for this, the Committee urges, there is no time to lose since its Survey indicates that an upward swing in indebtedness has, perhaps, just begun after a decade or more during which a process of liquidation of past debts has been made possible by relatively good prices.

of course I'm a busy man, but...

... I always find time to see
Burmah-Shell's representative.
He's a very useful chap. And my
Factory Manager knows that
a short chat on lubrication can
well save time and money,
and even avoid a breakdown in
the plant. His is really sound
advice—freely given: that's
the beauty of it!

of course

I'm a busy man
but...

There may be weak spots in your
plant. Why not take advantage
of the technical service offered by
Burmah-Shell? Not only do they
ensure that the correct lubricants
are used for each job, but also
they often recommend economies
by reducing the number of
different grades.

They look for likely trouble spots
and they also look for ways to
economise on the amount of
oil you use.

URRENT STATISTICS 74

Flutter in Dovecots

ECONOMISTS today are very much on the defensive and the more talk there is of physical planning, the more afraid they are of losing ground to statisticians. They are supposed to have all the theory while the statisticians have the facts. And if the former get the worse of the bargaining, it is not necessarily because an ounce of fact overweighs a ton of theory. If an agreement has to be brought about between facts and theory, the statisticians and economists have to meet half way. It is easier, it appears, for statisticians to grasp the theory of planning and go ahead than it is for theorists to collect the facts and put up a plausible programme for development so that they, too, may get a hearing from the country. If the economists could have it their own way, they would like to use the statisticians for collecting facts while reserving the right to themselves to tell the statistician which facts to collect and of course also the right of interpreting these facts. To say, however, that asses carry oats while horses eat them would be to put the argument on the same level of vulgarity as the earlier one of an ounce of fact overweighing a ton of theory.

Another way of explaining this threatened eclipse of economists, albeit temporary, would be to consider the development of econometrics as a separate branch of study, a discipline in which economists in this country have not yet taken a conspicuous part. And if we have to build up econometrics in a hurry, it is easier for statisticians to shoulder the task than it is for analytical economists, who, both by choice and necessity, are somewhat out of touch with the world of facts.

It is not their inadequate knowledge of the background of economic development in this country, not the ignorance of facts, however, which can be held to be responsible in the last analysis for the failure of economists to play their part in giving a direction to affairs by helping to formulate economic policy on the right lines. Economists themselves will be the first to admit their own deficiencies and may plead with justification that they never had the opportunity of acquiring a greater mastery of facts. In many important respects, the collection of facts necessary for a systematic study of concrete economic problems is beyond the province of non-officials, however diligent or painstaking they may be. The elaborate organisation that is necessary for the collection of facts can only be mobilised by Government and Government has always its own purposes to serve, which are urgent and practical, and override the claims of academic research. Even what can be done by private agencies or academic bodies has been beyond the reach of academic workers in this country because the economic faculties of most of the universities have been so poor. The organisation of statistics has been a by-product of the administration. Not only are the data that are collected inadequate, the private practitioners of the science have no free or ready access to them.

Before one can pronounce a judgment on the failure of economists to rise to the occasion and give proper advice to the country or the failure of Government to utilise the services of economists to the best advantage, one has to be quite clear in one's mind what the

The Economic Weekly
Chambers, Parsi Bazar St.,
Fort, Bombay
Phone: 23406

economists are expected to do and what the Government can expect from them. Outside the dovecots, the economists are rated according to their power to capture popular imagination, to place before the country a solution that can appeal to the majority of the people and pave the way for purposive, determined action that promises a solution of the country's problems. But to suppose that the economists can ever meet this test and fill the bill is to misjudge their function woefully. There are such things as means and ends. What the ends should be, what kind of economic system people would like to build up, economists prefer to leave it to others to decide. This is a matter of social philosophy and surely economists claim no particular competence for moving the minds of men,

setting up ideals before them and have these ideals accepted by the majority of the people and not only accepted but accepted with all the strength of their emotions, which is necessary for their eventual implementation.

To repeat, it is not the lack of acquaintance with the background of economic problems which impairs the effectiveness of economists in this country. They have been brought up in a tradition which does not always enable them to keep in tune with the swiftly moving forces as those who hold the reins of power can. Their specialised training has been in a field which does not equip them either to understand the present day forces or to bend them to their own will and direct them. The laboratory of *laissez faire* economics has not

been a very helpful training ground for those who are called upon to work today in a different environment. In short, the basic postulates of the present economic situation in the country are not those which many of them can accept. If they cannot accept these postulates, they can neither change them. The mantle necessarily falls on others who are in a better position or more advantageously placed to direct affairs.

This is a distressing thought but there is no ground for despair. What it points to is the necessity of firmly grasping the ends; once these ends are firmly grasped and accepted without mental reservations, their technical competence will find a more fruitful field for application. Only then will economists come into their own.

Mathematics of Defence

PRESIDENT EISENHOWER has a pronounced nineteenth-century background. He is a liberal in economics. In politics, he is a rugged individualist. He, as President of America, may or may not have admitted the possibility of "peaceful co-existence". But, as a man, he has no faith in any such possibility. It is necessary to realise this in order to appreciate the contradictions in America's foreign policy. President Eisenhower pledges himself to "strive in every honourable way for enduring peace". But there is no doubt about the sort of peace he wants. His aim is not to maintain world peace in which the Western Powers and the Communist States can co-exist. In President Eisenhower's world, Communism can have no place. "It is of the utmost importance", President Eisenhower emphasises in his State of the Union Message, "that each of us understood the true nature of the struggle now taking place in the world".

President Eisenhower is a soldier who seems to detest the politician's outlook on world affairs. To him, the present struggle is not a reflection of the fight for world domination between the rival power blocs. He is not interested only in maintaining a balance of power in order to maintain world peace. He looks

on the world from the pulpit. He is a moral crusader. To him, "it is not a struggle merely of economic theories, or of forms of government, or military power. At issue is the true nature of man. Either man is the creature whom the psalmist described as 'a little lower than the angels', crowned with glory and honour, holding 'dominion over the works' of his Creator, or man is a soulless, animated machine to be enslaved, used and consumed by the State for its own glorification". Whether the individual in a democracy is what President Eisenhower describes him to be, is doubtful. He may not be wrong in his criticism of the Communist aggrandisement of the State, although it is contrary to the true Marxist conception of the gradual withering away of the State. It may be that neither the Communist States nor the Western Powers, as they exist at present, conform to their respective ideals. What is more relevant is that, as long as President Eisenhower, a typical American, views world affairs as he does, there can be no "peaceful co-existence" between the Western Powers and the Communist States.

Enduring peace is the aim of President Eisenhower and his Administration. In his Message on the State of the Union, he elaborates the means of achieving the end.

He is masterly in his exposition of the strategical aspect of the means to be employed to attain the end. It is the principle behind the means which is at fault. All impartial observers deplore the competitive race in armaments between the Western Powers and the Communist States. Some form of international inspection and control of national armies and armaments is an essential precondition of world peace. President Eisenhower impatiently rejects the recent Russian overtures on world disarmament as not "realistic". Instead, he emphasises that "the massive military machines and ambitions of the Soviet Communist Bloc still create uneasiness in the world". From this diagnosis of the world situation, President Eisenhower prescribes his recipe for world peace. "Free" nations must maintain countervailing military power to persuade the Communists of the futility of seeking their ends through aggression. As the Communists understand that America's response to aggression will be "swift and decisive", they will be "powerfully deterred" from launching any military venture.

There may be inherent contradictions in the means and principles enunciated by President Eisenhower for maintaining world peace. But he is logical in his defence planning. In his plans for mobilisation, his

emphasis is on armaments in preference to men. This may be good strategy. But its sinister implications must be fully realised. In his elaboration of the principle of collective security as a means of deterring aggression, he talks about the need for preventing "the catastrophe of a nuclear holocaust". But the recent re-statements of the principle of "massive retaliation" by the Western Powers make it evident that they have decided to rely on atomic weapons for the defence of Europe. This is the main reason for the recent American policy of a gradual reduction in the ground forces. In Paris last month, the NATO Council endorsed the policy of instant retaliation with atomic weapons. In a Press Conference, subsequent to his Message to Congress, President Eisenhower has emphatically implied that the use of atomic weapons, including atomic weapons, could be precluded in military affairs. It is not the Communist States, but the Western Powers who seem determined to provoke the "catastrophe of a nuclear holocaust".

Retaliation with atomic weapons is to be the policy not only to counteract the threat of aggression. "We must not only deter aggression", President Eisenhower elaborates his global strategy, "we must also frustrate the efforts of Communists to gain their goals by subversion". So far as Europe is concerned, the point has been raised that there can be no justification for compelling France to accept the Western European Union if the American policy is to retaliate instantly with atomic weapons. Military commentators in America have paraphrased the recent re-orientation in America's strategy. So far as Asia and the Far East are concerned, its implications need to be emphasised. If, to take an example, Red China launches an assault on Formosa, which, as the proposed mutual security treaty would indicate, Washington regards as vital to security, America will instantly enforce "massive retaliation" with atomic weapons. It is not without significance that such a policy of "massive retaliation" with atomic weapons may be enforced even in the event of indirect aggression, or acts of subversion, by Communists. This re-orientation of policy may be meant as a warning to Red China against any direct or indirect military action in Formosa or in Indo-China. But its sinister implications

will be deeply deplored by all peace-loving nations and peoples.

Even as military pacts and alliances have not prevented the "cold war", or the world tension, the new policy of "massive retaliation" with atomic weapons is not likely to ensure enduring peace. President Eisenhower emphasises the need for mobilising military strength in order to deter aggression. But he himself admits that such a policy can only lead to world stalemate, and not to enduring peace. Russia, too, now knows the secret of manufacturing atomic weapons. She, too, has the hydrogen bomb. Thus, even if America implements the new policy of "massive retaliation" with atomic weapons, it will have no more deterring effect on Russia than the present Western Powers' policy of military alliances has. Enduring peace can be had only if the Western Powers accept peaceful co-existence in political as well as in economic spheres. President Eisen-

hower, a nineteenth-century Liberal, is good in his economics. He is in favour of freer world trade. He has promised to request Congress to offer inducements to private American investors to lend to underdeveloped countries to help economic progress. He will ask Congress to approve of American participation in the proposed International Finance Corporation, whose main aim will be to increase private investment in underdeveloped countries. These are better and safer ways of combating Communism than issuing threats of "massive retaliation" with atomic weapons. America will be wise in accepting Russia's challenge of peaceful competition in co-existence. But this pre-supposes America's and the Western Powers' acceptance of the possibility of "peaceful co-existence". President Eisenhower can reject such a possibility only at a great peril to, if not annihilation of, the present civilisation.

Annual Number 1955

The next issue of *The Economic Weekly* will be the Annual Number. It will be out on January 26, Republic Day.

There will, therefore, be no issues of the paper on January 22 and 29.

The Annual Number will contain a minimum of 80 pages and will be bound neatly in art cover. It will be priced Rs 2 per copy.

Besides the usual features, the Annual Number will devote special attention to problems of co-existence in the economic sphere, of the private and public sectors. It will also try to throw some light on proper inter-industry relations, which are essential alike for utilising to the full the existing productive capacity in the organised as well as unorganised sector of industry and for releasing resources for laying the foundation of heavy industry.

Complete statistical coverage will be a special attraction.

Copies should be ordered in advance to avoid disappointment.

All communications to be addressed to

The Business Manager,
The Economic Weekly,
Noble Chambers, Parsi Bazar Street,
Fort, Bombay-1.

Weekly Notes

Truant MPs and their Mentors

ABSENTEE MP's may occasionally be a headache to party whips when the voting is close and party members have to be mobilised in full force. But otherwise, absence of members from parliament or their indifference to its proceedings even when present is no more than a subject of light banter to others. Such lapses on the part of legislators as being absent when important business is being transacted by the House or dozing in their seats instead of attending to the debate, these are tolerated good-humoredly. After all, one has to make concessions for human frailties. One must escape from boredom once in a while and monotony of debates is not a punishment that the voters sought to inflict on their favourite candidate when they gave him the vote. When august legislators steal away from debates to enjoy a cup of tea, or a chat with friends or even to doze off in peace, there is no doubt an element of the comic in it, but nothing so serious as to call for severe condemnation.

Not all legislators, however, are prepared to dismiss these lapses lightly and certainly not Shri M Ananthasayanam Ayyangar, the Deputy Speaker of the Lok Sabha. What is mildly amusing for the spectator in the gallery is serious remissness in the eyes of the Deputy Speaker: so very high is his conception of a law-maker's duties and responsibilities. Addressing the Laski Institute of Political Science at Ahmedabad, Shri Ayyangar described absenteeism among MP's as a "mockery of democracy". But even if such absenteeism betrays indifference to parliamentary affairs, surely it does not cause "considerable" or any inconvenience to the proper functioning of the machinery of law-making? Quite the contrary, in fact. For modern parliamentary system functions at its smoothest when the members leave it to function by itself and help it to do so just by registering their approval or disapproval but doing nothing more. Electrical recording of votes has simplified their part in the proceedings; the less they participate in debates, the smoother it is for the machine to function.

It will be difficult to establish

that lack of interest taken by members hampers the working of parliament unless MPs go to the extent of keeping away in a body and numbers of them fail to turn up to register their votes. True, members absenting themselves may appear to show a certain disregard for the electorate. But are not appearances deceptive sometimes? What could the individual member do to safeguard the interests of his constituency? Sober reflection might suggest the wisdom of keeping away rather than being present and doing nothing, or merely obstructing.

Shri Ayyangar demanded that such truant legislators should resign their seats, because it would be too expensive to allow voters to recall their erring representatives and also somewhat impracticable. A political columnist joins issue with him. "Such absenteeism", he writes, "should not be overlooked any longer. The voters should not allow themselves to be ignored or stultified in this fashion. They should follow Shri Ayyangar's suggestion that they form voters' associations, keep an eye on their representatives and call them to account whenever they play truant or err in other ways. Public opinion must assert itself on this question and absenteeism should no longer be made a subject for banter, but exposed as what it really is—a threat to democracy. If indifference on the part of legislators is accompanied by indifference on the part of voters too, there will be no force left to prevent democracy from sliding down the slippery path. . . ."

These comments suggest as inadequate an appreciation of the use of rubber stamps in running a big organisation as of the functions of the private member in Parliament.

Rural Credit—Second Round

BECAUSE the Rural Credit Enquiry Committee had recommended the nationalisation of the Imperial Bank—a subject which has been on the tapis all these years—and the utmost secrecy had naturally to be maintained about this recommendation and the decision of the Government on it, the stages through which a report

of this type usually passes had to be reversed. So the decision for the nationalisation of the Imperial Bank and the constitution of a State Bank to take it over came first and it is only now that the report itself is being placed before the Standing Advisory Committee for Agricultural Credit. By and by, the report will pass through the other stages such as its presentation with the observations of the Advisory Committee to the Board of Directors of the Reserve Bank, and finally, with a chit from the Reserve Bank, the report will be presented to the Government for whatever action the latter may choose to take on its other recommendations. Extraordinarily little interest has been taken in these other recommendations, considering the drastic changes the Committee proposes in the organisation of agricultural credit. It is the nationalisation of the Imperial Bank which hits the headlines though, however revolutionary the measure may sound, it is really not much of a change, so far as the organisation and the functions of this bank are concerned.

Fully admitting the case, which the Committee makes out, for a colossal expansion of rural credit, it still remains an open question whether the State Bank that will take over the Imperial Bank is the proper institution through which the desired transformation can be or should be effected, or whether it would not be better not only to keep the functions of supply of commercial and agricultural credit separate but also to have separate institutions for the purpose. There remains also the question of the initiative of the Reserve Bank in the matter, and the reactions of the co-operators to the proposed change. From the ashes of the old Imperial Bank may rise, phoenix-like, the State Bank of India, but can a similar metamorphosis be expected in co-operative credit also? As discussion proceeds and ideas crystallise, it would be surprising if the co-operators do not gird up their loins and offer a united front of resistance against the measure of initiative that, the Committee recommends, should be taken by the Reserve Bank. Exciting developments may well be in the offing.

Price Support

TRUE enough, there is no point in extending an open invitation to speculators to help themselves. But Dr Punjabrao Deshmukh's categorical statement at a public meeting held under the auspices of the Dharwar Congress Committee to the effect that the Government of India would not undertake any price support policy to check the falling prices of foodgrains, as reported in the daily press, is liable to serious misunderstanding. For one thing, it contradicts flatly the Food and Agriculture Minister, Shri Ajit Prasad Jain's statement in Bombay in the previous week that "Government would step in wherever prices fell to an unremunerative level and would deal with the situation". This is taken from the official version of Shri Jain's speech published in the latest issue of the *Food Bulletin*, and the authenticity of the text is not therefore open to doubt. True, Shri Jain took care to add that the "adoption of a general price stabilisation policy by Government was different".

This is not a matter of quibbling. Without committing itself to a general policy of price support, the Government may yet come to the rescue of distressed farmers and extend effective support in pockets of very low prices. The Minister for Food and Agriculture himself made a clear case for just this kind of selective, discriminating support. The peasant, he said, was devoid of retentive power. When the State Bank, which is to be formed by the amalgamation of the Imperial Bank with some State-associated banks, sets up a network of branches for financing rural credit, it will also sponsor the erection of godowns. When the credit system is strengthened on these lines, the peasant's retentive power will improve, so a sharp fall in prices immediately after the harvest will be avoided and the grower will get a better price. All this is still in womb of the future.

Without waiting for it, the Bombay Government has announced its decision to open grain banks in 12 districts, to begin with. It was "very seriously" watching the fall in prices and it intended to purchase at reasonable prices cereals in areas which were economically backward.

So, whether there is formal commitment or not, Government has acted more sensibly than its profes-

sions would lead one to expect. A case in point is the recent fixation of a minimum price for jowar, bajra and maize. The Government of UP has also been known to have extended support to wheat at a minimum price of Rs 10 and surely, it could not have acted thus without consultation with the Centre.

In the case of commercial crops, there is even clearer evidence of extension of price support in the indirect form of liberalisation of export quotas and reduction of export duties. The export duty on castor oil has been reduced with immediate effect from Rs 200 to Rs 125 per ton. Export of castor oil is now being liberalised freely and in the case of groundnut oil, following the reduction in duty earlier, fresh export quota for 40,000 tons has been announced in addition to 26,000 tons announced earlier. This makes up a total of 66,000 tons compared to only 37,000 tons last year, in keeping with the improved supply position. Black pepper is another export produce on which the export duty has been reduced, from 30 to 15 per cent *ad valorem*. It is only in the case of groundnuts HPS that the export duty has been raised but a further quantity has been released for export. Even in the case of *gur*, while imports of sugar keep mounting export is now being permitted, following the cry of distress raised from Andhra.

The trend is clear. Why did then Dr Deshmukh sound a discordant note to raise unfounded doubts?

New and Old in Airlines

NO face-saving formula could be found by which the old standing Indo-US Air Agreement, which is due to terminate on the 14th, could be continued while India's demands could be met by voluntary reduction of services by the American Airlines operating in this country. The compromise discussed in these columns last week did not eventually come through. Hence the agreement which has long outlived its usefulness will lapse on that date. Pending the signing of a fresh agreement, the Government of India is issuing temporary permits to Pan American and Trans World Airlines to operate two instead of three round trips weekly for the time being.

India is not the only country by any means, even among the under-developed countries, which is hav-

ing an international air service of her own. Indonesia has one, so has Thailand and so have others. Pakistan is one of the latest to join this company, and it gets off to a flying start with its Pakistan International Airlines, formed as a new corporation as a result of the amalgamation of the Orient and Pakistan Airlines. Its first Super Constellation will take off for London on February 1; this service will operate once a week for the present but the frequency may be increased later when traffic develops. The other foreign service of the PIS which was inaugurated on the 16th of the last month, is that between Bombay and Karachi. It is operated with Convair planes and runs three times a week.

Pakistan has a wide scope for internal air traffic as this is virtually the only practicable means of travel between its two far flung wings. Therefore stepping up the frequency of the services from Karachi to Lahore, introduction of Super Constellation services via Lahore and Dacca and what is more, the extension of tourist fares to internal flights are among the immediate objectives of the newly formed Corporation. The two Pakistan air services, from which the Corporation takes over, had the advantage of adequate traffic right from their inception. Pakistan did not have to face the problem of too many air carriers and too few paying routes. The new corporation therefore starts under very favourable auspices and should have a bright future before it.

Of Poultry and Planning....

THE crowds that flocked to the State Poultry Association's show in Bombay last week-end were probably too awe-struck by the gigantic fowls that were exhibited to think very deeply about the significance of the occasion. They had come out of curiosity and their curiosity was fully satisfied, for the specimens on show were undoubtedly impressive, contrasting vividly with the scraggy Indian fowls usually seen scratching around village huts.

Most of the world famous varieties—White Leghorn, Black Minorca, Rhode Island Red, Orpington, Australorps, Light Sussex, Wyandotts and Plymouth Rock—were represented. Judged by the number of exhibits, White Leghorns and Rhode Island Reds were the most popular varieties, which is not surprising in view of their special qualities.

The White Leghorn is perhaps the most popular breed throughout the world and with an annual average of 175 to 200 eggs, it is the world's greatest egg-layer. It also stands the climate well. The Rhode Island Red has a slightly lower average at 140 to 180, but it grows to a larger size and is prized as a table bird. Apart from its strong constitution, its special advantage is its ability to develop in relatively close confinement. Another variety, the Australorps, does not appear to have become so popular in this country as yet, although it is considered the best variety to breed with Indian hens so as to improve the egg-producing qualities and size of the chickens produced. Its vivid black colour may be responsible for this unpopularity.

Two aspects of poultry-breeding were stressed at the show. First, scientific breeding of poultry can be an important source of revenue and, therefore, provides to the small farmer in particular, a very interesting and valuable subsidiary occupation. Second, eggs and chickens provide a valuable supplement to the diet and increased supplies of these will, therefore, help to improve the quality of our food.

Better breeds of fowls give more and bigger eggs, and grow to larger

sizes than the ordinary Indian fowls. Though breeding and rearing them involves much more care and trouble, and also much more expense, the returns obtained make all this worthwhile. That the specimens on show, some of which were for sale, were priced at anything from Rs 15 to Rs 40 each might be considered illustrative of the values of these varieties in contrast with the maximum price of about Rs 5 at which an ordinary full-sized fowl can be bought in the city. Yet, experts were heard to comment that most of the better specimens were not for sale at all.

The advantage of poultry breeding as a business consists in its low requirement of initial capital expenditure. Any person making a small beginning would be in a position to gain experience and build up his business simultaneously to a level at which a fairly high flow of income could be expected from it. And this need not involve a very long period either.

An interesting side-light on the main object of the Association of developing scientific poultry-breeding and egg-production as a cottage vocation was provided by the show in Bombay. The villagers' section of the exhibition was much poorer in size and quality than the open section. While this may have been due to the difficulty faced by the small farmer in sending his stock a long distance on the off-chance of winning a prize, it is equally likely that the real reason was that poultry-breeding has not yet caught on in the villages on a sufficiently large scale.

In the open section, the competitors included well-organised, well-financed poultry farms run on business lines, middle-class people who had taken to the vocation on a small scale as a spare-time occupation and Government poultry farms. Apart from the Government farms which are meant to provide training in poultry farming and to popularise it among villagers, the others seem to be established in and around the larger cities and towns, which obviously provide a ready market for the products. As larger

numbers of people are taking to the business, a market is also provided for those already established by those who wish to enter the field and buy fertile eggs, day-old chicks or fully-grown birds in order to make a start or to increase their stock.

An attempt is being made in the Bombay State to encourage the farmer to take to poultry farming as a vocation. The discussion during the AIR programme for the rural areas centred around the Bombay show, being skilfully planned to develop in the rural listener an interest in this field. A Poultry Development Officer, with headquarters at Poona, has been appointed, and in various ways, attempts are being made to popularise the idea among the villagers. It is good to see that the Government has taken to this work in right earnest. One is reminded about the pioneering work in this direction done by voluntary workers in the past. The YMCA centres in and around Martandam described by D S Hatch in his excellent study *Towards Freedom from Want* devoted a considerable portion of their energies to encouragement of poultry farming on proper lines. Now that the Government has taken up the work, results should not be as difficult to obtain.

The food aspect of the poultry movement was symbolised at the show in the slogan, "An egg a day keeps the doctor away." There can be little doubt about the nutritive value of eggs and of chickens and the plea for an "egg-vegetarianism" made by the Union Minister of Agriculture at the show, will be endorsed by many. With our achievement of the targets of food-grain production, it has been suggested that the emphasis will have to shift to the supplementary foods. Planning in the future will have to think more in terms of poultry and of eggs. That is the message of the Poultry Show.

The Centre has a countrywide scheme for setting up a large number of poultry development centres in the various States during the Second Five-Year Plan. The Bombay Government has also been active

to popularise poultry farming among villagers. One has to make a start with a flock of birds. That can be arranged easily now; but one has also to acquire experience, there's the snag. There are two major handicaps which have retarded development so far. One is that of protecting poultry from their natural enemies—foxes, mongoose, snakes and the like. And the other is that of protecting them from diseases which often break out in epidemic form and take away his whole flock before the amateur has much chance to acquire experience. The problem of protection is not equally difficult everywhere. It depends on the construction of huts and natural surroundings in which the farmer lives and so on. Assistance is now being provided in meeting some of these dangers and where poultry keeping has caught on, private practitioners have also come on—the scene to help farmers to take preventive measures against outbreak of epidemics.

But while there is encouraging evidence of progress in so many directions, opposition as well as active hostility to the development of these protective foods is coming from an unexpected quarter. Adivasis not being inhibited by caste taboos have been traditionally keepers of poultry, if not always quality breeders. The reform movement that is now being carried on by Congress constructive workers among Adivasis—and they have every support from the Government—is doing much harm by thoughtless propaganda against keeping poultry and the traditional food habit of Adivasis to take eggs and chickens on the ground that these are unclean foods. To rob their frugal diet of vitamins by prohibition on toddy is bad enough; to deprive them of such nutritive foods and discouraging them from raising poultry is a great deal worse. There is little sense in discouraging the movement at one end—and at the most promising end at that—and encouraging it at the other end.

It is not that the Centre and the State Governments are of two minds about breeding of poultry. It is the conflicting attitudes and approach to the problems of tribal peoples that leads to this sorry state of affairs and calls for the severest condemnation.

Beauty and the Beast

THERE is nothing much "oriental", except the mongoloid features, about the members of the Chinese Cultural Delegation as one notices them entering or stepping out of the Grand Hotel. They look smart in their navy-blue trousers and buttoned-up coats and invariably years younger than their age. But they do not seem to be as unscrutable or simplex-like as the Chinaman of Calcutta's Chinatown. That, one is told, is the new People's Republic of China.

There is the new China. One gets a glimpse of that China as one attends the Chinese Cultural Delegation's performances in the City. The shows are popular. There is an "oriental" atmosphere. Costumes and make-up are elaborate and exotic. There is nothing "bazar" about the show. But it is bizarre. The dances are subtle and delicate. But there is a perplexing inter-mixture of acrobatics. It is part South India. But it lacks the virility of *Kathak* in its gymnastics. Modernism occasionally intrudes to make it garish.

As an after-thought, one wonders how and why the opera is popular in China and Japan while it is not popular in this country. Art-forms like the dance-drama or the musical-drama are not unpopular in India. There is now growing popularity, in Bengal particularly, of *katha-katha*, *jatra*, *jari*, *kavi* and the *dhop*, although all these art-forms have developed a nauseating streak of modernism. The Chinese opera is an admixture of all these and, yet, something different. But one who does not claim to be an art critic must leave this discussion on the different cultural manifestations in India and China to some of the enthusiastic members of the Indo-Chinese Cultural Society.

NEW LOOK OF REHABILITATION

For three days, Shri Mehr Chand Khanna, the Union Rehabilitation Minister, had talks with MPs from West Bengal about what New Delhi is doing, and intends to do, to rehabilitate the refugees from East Bengal. The discussion was frank and informal. It emerged that the end of the problem was not yet in sight. But it was admitted that, at

long last, the problem is being dealt with as it should have been from the beginning.

This problem of rehabilitation of displaced persons from East Bengal is receiving top priority in New Delhi. Calcutta is now the headquarters of the Rehabilitation Minister. The local secretariat has been strengthened. A senior officer of the Finance Ministry is now permanently at Calcutta for prompt investigation of the financial implications of the various schemes to rehabilitate the displaced persons. Expenditure to date for the settlement of East Bengal "refugees" comes up to Rs 30 crores. Another Rs 21 crores will be spent in the next two years.

"NEW LOOK"

In their distress, East Bengal "refugees" may feel impatient that their problems have not yet been solved. But the people of West Bengal realise that their settlement will take time. What has, until recently, caused irritation is New Delhi's unresponsive attitude to these problems. This feeling of resentment was forcefully expressed in Parliament some months ago. Panditji had the political sense to respond to this militant gesture. That has had the desired effect.

It is a tribute to Shri Khanna's sympathetic approach to the problem that the members of Parliament from West Bengal have expressed appreciation of all that he has done in the last few months. Panditji can feel assured, and Shri Khanna can feel flattered, that Dr Meghnad Shah, a combative critic of New Delhi's policy to East Bengal's displaced persons, is happy about the "new look" of the Rehabilitation Ministry's efforts in Calcutta.

POLITICAL ISSUE

New Delhi is not without blame. But all impartial observers will lament that the settlement of East Bengal's displaced persons has suffered because it has been made an issue in party politics. Most of partitioned Bengal's social, economic and political troubles are aggravated by the problem of the displaced persons. It is not unnatural that political parties will make this

a political issue. But Shri Khanna must now feel satisfied that his explanation of his Ministry's activities has prompted an assurance by the West Bengal MPs that refugee rehabilitation will be kept above party politics. It is welcome news that there will now be a chance to deal with their problems from a human angle.

That the rehabilitation problem in the eastern zone is much more difficult than that in the western zone has never been denied. Almost as many people migrated to India from Western Pakistan as emigrated from India to Western Pakistan. Thus, land, rural and urban houses and properties and industrial undertakings were available for the rehabilitation of displaced persons from Western Pakistan. More people have come from East Bengal to West Bengal than have left West Bengal for East Bengal. Therefore, the facilities for settlement of displaced persons in the eastern zone are restricted.

LAND PROBLEM

Again, displaced persons from Western Pakistan have been settled in the various parts of India. Attempts made so far to rehabilitate East Bengal "refugees" outside West Bengal have not been successful. This makes the problem of rehabilitation much more difficult. West Bengal is a densely populated State. There is not enough land to settle the East Bengal "refugees". These are hard facts. But one wonders why the Rehabilitation Ministry or the West Bengal Government has not actively encouraged the Bhodan Movement, or why

For ECONOMY & COMFORT USE

THE INDIA ELECTRIC WORKS LTD
6 SIR PHIROZ SHAH MEHTA ROAD FORT BOMBAY

even Vinobaji has not stressed this aspect of distribution of land in West Bengal.

This is the crux of the problem. Most of the East Bengal "refugees" are from rural areas. They are either landless peasants or unskilled or semi-skilled workers and artisans. There is neither enough land nor enough opportunities for employment in the organised and the unorganised sectors of industry to settle them. These difficulties exist. They are not solved by payments of cash doles.

WORK CENTRES

Under a scheme, the West Bengal Government is providing facilities to industrialists to acquire land and property and to start industries on the condition that they give preference to "refugees" for employment as unskilled or semi-skilled labourers. In West Bengal, the response of private enterprise to this offer has not been unencouraging. But it is clear that the West Bengal Government and the Rehabilitation Ministry will have to take a more active part in absorbing the "refugees".

Soon, the West Bengal Government, in collaboration with the Government of India, will form development and industrial committees for re-organisation of work and production centres. This is an ambitious plan. It is a move in the right direction. It needs planned creation of production and employment centres and a simultaneous scheme of secondary vocational education so that the rural, unskilled, East Bengal "refugees" can become semi-skilled workers, fit for absorption into the planned growth of small-scale industries.

But this is not the end of the poignant story. If the end of the problem of settlement of refugees is not yet in sight, the end of the exodus is also not yet in sight. Even now, displaced persons from East Bengal are pouring in at the rate of 10,000 per month. Dr M S Mehta, the retiring Indian High Commissioner in Pakistan, explains that there are many reasons for the continued exodus, although the economic factor is the most important. This is too painful and unpredictable a chapter in the story about East Bengal's displaced persons. This writer does not claim the foresight to be able to write that chapter here and now.

United States Investment in Europe

IT is one of the contradictions of the recently-published OEEC Report entitled *Private United States Investment in Europe and the Overseas Territories* (Paris, December 1954) that it should claim, on the one hand, that all the countries of Western Europe had given an increasing importance to American private investments as a contributory factor to European economic development and payments equilibrium while, on the other, list a whole series of restrictions imposed by each of these European countries on the inflow of such investments. In fact, according to the statistics now published, the hopes of the OEEC for a significant expansion of the rate of private investment from the United States since the ending of Marshall Aid has not been realised. The report under review gives various reasons for this and it would appear that the most significant has been the dangers usually associated with United States investment, particularly its implications for the economic sovereignty of the capital receiving countries.

The background to American foreign investment is now well-known. After the first World War the United States emerged as a major creditor nation. Throughout the 1920's until the crash with which the prosperity of that decade had ended, more long-term capital flowed out from New York than from any of the other great financial centres. Private American investors were investing in foreign countries at the average rate of \$800m a year, equivalent to something like \$1,600m in terms of current prices. Following the financial collapse of many European nations, in the 1930's, exports of American private capital had practically ceased. In addition, the environment of inconvertible currencies and multitudinous restrictions on trade and payments had set up considerable barriers to foreign investment. After the second World War it was expected that the 1920's would come again and that American investment would represent the main channel for the flow of dollars to a generally dollar-starved world. At least this is the impression given by the OEEC Report.

The total net exports of private

capital from the United States reached an average of \$860m annually during the years 1947-53—a figure which is hardly greater than that of the years of 1926-30. The total yearly exports of private capital has varied a great deal from year to year since 1947, ranging from a maximum of \$1,116m in 1950 to a minimum of \$544m in 1953. In fact, according to data given in the OEEC Report, the repatriation of US capital as well as service payments on past US investments in 1953 was almost equal to the total movement of private long-term American capital in that year.

Apart from the quantitative change in the level of American investment between the 1920's and the period since 1947, there have been significant changes in the form of such investments. In the 1920's more than two-thirds of private long-term capital exported from the US went into portfolio investments. In the post-war years only about one-fifth of private investments in foreign countries by US investors had taken this form. Concurrent with this virtual disappearance of private lending activity, loans abroad made by US Government agencies have assumed much greater importance than before the war. Whatever private portfolio investments have taken place, these have been mainly channelled through bond issues of the International Bank, whose resources are in any case mostly provided by the American capital market.

There has also been a geographic redistribution of US foreign investments between the two periods here considered. Two-thirds of private US foreign investments in the post-war years have taken place in the Western hemisphere itself, more or less equally divided between Canada and Latin America. Some 10 per cent has been directed to OEEC countries and less than 3 per cent to their overseas territories. Of course, American direct investment since the war has been mainly directed to the petroleum industry, to mining and processing of ores. This, it may be mentioned, is typical of the "colonial" structure of American investments abroad—its role in international economic development is negligible.

The merit of the OEEC Report is the detailing quantitatively of the distribution of American investments in Western Europe itself and the attempt to correlate the various West European restrictive measures to the inflow of such investment. It would appear from the Report that the United Kingdom at the end of 1952 was the largest recipient of direct private United States investments—something like \$1,200m compared to that of France and Germany between \$200m and \$300m each. In fact, American investments in Britain's overseas colonies were more than those in any single continental European country. Most, if not all, American direct investments in Western Europe have gone into the manufacturing industry. In the dependent overseas territories, however, the industrial location of such investments have been strongly orientated towards the

petroleum industry and to industries producing raw materials for export to the United States. A feature of these investments in the dependent territories is that re-investment of non-repatriated earnings have been a major source of capital; this accounted for a little short of half of the total amount invested in the petroleum industry during the post-war years.

The OEEC Report details the motives of American investors for undertaking more direct investment than portfolio investments. Much of direct investments has as its object "obtaining or securing of supplies of raw materials required by the enterprise itself or by an independent producer intent on selling the bulk of its output in the United States rather than in the world market". Further, the Report suggests that direct investments in manufacturing concerns have frequently been undertaken in order to gain or to prevent the loss of foreign markets for American export products.

All the countries of Western Europe, with the exception of Switzerland and Italy, impose restrictions on the inflow of US capital and the OEEC suggests the reasons for this control. The potential dangers usually associated with the United States private investments fall into two broad categories: those concerned with balance of payments effects; and those associated with foreign activity in certain economic fields. With regard to the first, the experience of sudden and massive withdrawals of foreign capital during the early 1930's is still vividly remembered by European countries. This risk explains the attitude of national authorities which are reluctant to allow short-term borrowing abroad or the entry of capital not likely to remain in the country for less than a given time. Even long-term investments carry some dangers of violent capital outflows to the extent that they can be liquidated by sale to residents. There are various long-run repercussions as well. In 1953 transfers of earnings from private investment in Europe amounted to \$185m. The future balance of dollar payments of Europe may, therefore, become increasingly burdened with the charges of servicing American investments.

More significant, of course, is the second of the two reasons given above. There always remain the risks involved in allowing foreign

interests to gain control of industries or enterprises connected with national defence, products of strategic importance or which play a major part in the basic sectors of the economy. This concern is particularly apparent with regard to the exploitation of mineral deposits or oilfields, transport or communication systems and the development of energy resources. The history of

international investments for the past 150 years gives ample reason for such concern. Today, in overseas territories, American foreign investments raise political conflicts with the parent country and consequently governments exercise their right to supervise foreign activity which means restricting the right of foreigners and foreign corporations, in this case, of American nationality.

Small Scale Milk Producers

Survey of Milk Production in the Jamia Development Circle in 1952-53, by M Sultan. The Jamia Institute of Agricultural Economics and Rural Sociology. P.O. Jamianagar, New Delhi. October 1954. Pages 127. Price Rs 2-8.

Reviewed by R K Hazari

THE Rural University of Jamia Millia is well-known throughout Northern India as a pioneer in its field. Its inspiration has been mainly Gandhian, but the publication under review—the first of a planned series—gives the refreshing impression that it is supplementing the ideal of service with scientific investigation, which is no less important. It is heartening to note that an institution which started as an experiment in basic education now finds itself in a position to widen its activities.

The Jamia Development Circle consists of 21 villages on the west of the Jamuna River, with the Delhi-Muttra Road as its western boundary. The area is spread around Okhla, a favourite picnic spot for Delhites. It supplies a little more than one per cent of the daily supply of milk to the city. It has 1,013 milk producers, owning 2,379 milch cattle, about one-half of which were not yielding milk at the time of the inquiry. Most (1587) of the cattle are buffaloes and only one-third of them are dry, as compared to two-thirds of the 792 cows whose yields, too, are much lower than the average for buffaloes.

Only 3 per cent of the producers follow dairying as their main occupation; 70 per cent follow it as a subsidiary occupation; 25 per cent produce milk for their own consumption; the remaining one per cent are breeders. The Circle as a whole sells two-thirds of its milk output. Forty-five per cent of the producers have only one head of cattle each, 29 per cent have two heads each, and 13 per cent have three each. The scale of production, therefore, is very small, the average sale per selling producer being about 3 seers per day. The scale of production and proportion of marketed output is, of course, higher for those following dairy farming as their main occupation.

Much the greater part of the fodder fed to cattle consists of by-products of crops: cultivation of special fodder crops is significant in only a few villages. Concentrates,

which are a cash expense, are used only by those who sell milk. The scarcity and inferior quality of fodder, together with the generally inferior breed of cattle and the large number of uneconomic and dry cows, are largely responsible for the low average yield of 2.3 seers per day. However, nine villages accounting for one-third of the total buffaloes and one-ninth of the total cows have average yields of 3 seers and above, the maximum being 5.5 seers in a village where there are no cows. In one village, namely, Madanpur, with nearly one-fifth of the producers in the circle, the comparatively greater availability of fodder and grass account for the large number of producers as well as an average yield of more than 5 seers per milk-giving cattle; the large number of cows, three-fourths of which are dry, however, reduces the total average yield to about 2 seers. Producers normally do not give any fodder even to milk-giving cows, except in winter, and leave them to pick up what little grass they can find. The general absence of proper grazing grounds further impoverishes the cows. Generations of underfeeding appear to have rendered the cow unfit as a dairy animal.

Evaluation of average yield by scale of production leads to the rather disconcerting conclusion that as the number of cattle with an owner increases, the average yield per head of cattle steadily diminishes. The author has not fully analysed the causes of this phenomenon. Is it due to limited managerial ability or shortage of fodder or inferior quality of cattle or the keeping of a comparatively larger number of transitionally dry cattle and/or useless cows? Mere scale can be responsible for a decline in yield beyond some range, but it does not appear plausible that it could per se explain the consistent decline from 3.6 seers for those keeping one head to 0.4 seer for those having more than 10 heads.

The small scale of production and sale makes the middleman an indispensable intermediary between the producer on the one hand, and

the city confectioner, dairy or the consumer on the other. He gathers the small quantity of milk sold by each producer and transports it to the market; he often advances loans to producers for the purchase of cattle, evens out the fluctuations in demand and supply and bears the attendant risks. The city middleman is another link in the chain. Together these two middlemen appropriate about one-third of the average retail price of about Rs 27 per maund prevailing in the city. Considering that this is a gross margin, it can hardly be called exploitation, especially when the scale of production and sale is so small. Much more objectionable are the use of false measures, adulteration of milk and inefficiency or corruption of public health authorities that seem to have become close associates of this chain.

The results of the Trading Account, which he has compiled for a sample of 30 producers, has considerably perturbed the author who comes to the conclusion that "most of the people in our Circle are carrying on the milk business at a loss". This conclusion is arrived at by imputing money values to all items of debit and credit. Depreciation and appreciation are also allowed for. The statistics presented in Tables 12 and 13, however, support this conclusion only partially. Fourteen producers in the sample are shown as making profits, most of the remainder do not make any profit but they do not sell milk either. The milk producer's idea of profit, moreover, is the difference between his cash income and cash expenditure; he does not estimate profits from imputed values. By this criterion, as many as 18 producers are making profits; of the remaining 12, all except one consume the whole of their output. The author has not glossed over this fact, but has underestimated the value of subsidiary dairying as a cash earner for the cultivator, notwithstanding the probability that this cash earning is offset by an equivalent or greater expenditure in kind.

Finally, the reviewer would like to

Hydro-Electric Project in Assam Canadian Assistance

point out one deficiency in presentation of material. The author does not explain how he has estimated the input of male and female labour in dairying as distinct from the main occupation, and the basis on which he has assigned money values to them. Nor does he mention the amortisation period for which depreciation has been calculated.

The major problems confronting dairying in the Jamia Circle seem to be (1) the elimination of dry cows, (2) greater supply of fodder, and (3) the need for a co-operative organisation to handle the marketing of milk and provide finance for purchasing better cattle. The last is perhaps the most urgent, as it would also enable the producers to get a better price than hitherto. The Jamia Millia might not be able to do much for the solution of the first two problems but its local prestige should enable it to participate actively in the setting up of such an organisation.

The survey is an extremely useful publication, and though deficient in presentation, it is the product of commendable painstaking research.

AN agreement has been reached for the joint Indo-Canadian participation in the Umtru Hydro-Electric Project of Assam. Canada has agreed to assist in the implementation of this project which is included in the first Five-Year Plan. The Canadian contribution for the project will be in the form of engineering services and electrical equipment at an estimated cost of 1.2 million Canadian dollars which is equivalent to about Rs 50 lakhs. Canada has also agreed to cover rupee expenditure on the project upto 2.1 million Canadian dollars or about Rs 10 lakhs. This contribution will be made from the rupees which become available from the sale of Canadian industrial raw materials provided to India under the auspices of the Colombo Plan.

The technical and administrative arrangements for the construction of the project have already been discussed between the Canadian consulting engineers and the Central

Water and Power Commission of the Government of India. The Electrical Engineer of the Government of Assam had also been in Canada recently for final discussions relating to the layout and design of the project and the procurement of the required equipment.

The Umtru Hydro-Electric Project is located about twenty miles from Gauhati on the road to Shillong. The total area which is likely to benefit from the project covers about 1,000 sq miles with a total population of nearly one million people. Benefits will be in the form of hydro-electricity for irrigation and land reclamation, for existing cottage and small-scale industries and for the development of new industries in the area. The project covers both the civil works and opening of hydro-electric power stations. Three generators of 2,500 kw each are expected to be installed at the site of the project which is likely to be completed by the end of 1956.

The Carp and the Whale Rehabilitation of East Bengal Refugees

(From a Correspondent)

A FEW years back a correspondent wrote in this journal that the West Bengal Government was tackling the problem of rehabilitating the East Bengal refugees in the manner of a carp nibbling at the tail of a whale. With due acknowledgements, this phrase may be repeated now with certain additions. The whale has got bloated and is full of maggots and the carp is still nibbling at the tail. There has always been a steady population of 50,000 in the camps since 1950; it now stands at over 90,000. A certain number of these camp inmates migrated back in 1950, a large number have returned from migration sites in Bihar and Orissa and of late, the rate of migration is on the increase. Sealdah is taking on its 1950 look and if the rate of migration continues at its present level, it is just about time someone thought something about it. One cannot treat this huge problem apart from the new Five-Year Plans that are now being put into operation and in which the displaced persons find no place.

Without going back to 1947, let us start with the influx of 1950. In this influx approximately 26 lakhs migrated to W Bengal, say, upto 1953. According to the latest statement made by the Union Minister for Rehabilitation, of this 26 lakhs, the government had given rehabilitation assistance to approximately 3,25,000 families, or 15 lakhs of persons. Let us now examine the nature of rehabilitation assistance given to these people 2,76,464 were given rural rehabilitation loans and 1,71,871 received urban resettlement loans. Another 10,000 got business loans varying from Rs 1,000 to Rs 10,000 from either the State or the Central Government. The last figure of business loans must be noted.

NO LAND FOR AGRICULTURISTS

The majority, being agriculturists, were given rural loans which include Rs 75 for land purchase, Rs 500 for house building and approximately another Rs 750 for agricultural implements, seeds, etc. No agricultural land was made available for them, neither was any amount allotted for the purchase of agricultural land. Two years later, in 1953, it was de-

cided to let the agriculturists have another Rs 300—Rs 150 on acquisition, Rs 50 per acre for reclamation and Rs 100 per acre on irrigation. But the entire Union Board Scheme and the variant to the UB Scheme under which about 8,000 families were sent to the districts at a cost of roughly Rs 70 lakhs, did not make any provisions for the purchase of agricultural land. It is like sending a groom on horseback for a wedding without choosing a bride.

The schemes of urban resettlement, Ganeshpur and Taherpur, are yet unsolved problems and tentative talks are now in progress about setting up a weaving mill in Taherpur, three years after the families were despatched there. The condition of these families is the same as that of others sent under official aegis without any planning. Plans are now being formulated but it is understood that the weaving mill scheme has fallen through. The new plans do not envisage the resettlement of these displaced persons but aims at creating small islands of prosperity by better production and marketing facilities, in a wilderness of economic turmoil. It may also be mentioned in this connection that the desertions from the Union Board and the variant of the UB Schemes were at the rate of 27 and 28 per cent. These figures are 1953 figures. By now the desertions must be almost cent-per-cent or the few families left are eking out an existence by hawking vegetables or grinding rice; they never received any agricultural land.

BUSINESS LOANS

On the other side, the number of business loans granted in West Bengal both by the RBRB and the RFA does not exceed 10,000 persons. That gives the total picture of rehabilitation in FIVE YEARS at a cost of Rs 50 crores. These figures of expenditure are quoted from a statement by the Union Minister on January 5, 1955, in his address to the members of the Lok Sabha and Rajya Sabha. The figures given in the course of this article are also from statements issued from time to time during the course of the years. The problems are there right enough—the almost complete absence of good agricultural lands, already de-

veloped, the existing problem of landless labour and above all, the unwillingness of the East Bengal refugee to break new ground by migration outside the state. Andaman has not yet been fully exploited by the East Bengal refugees, their quota is too small, only to be matched by their unwillingness to go that far. The few hundreds that did migrate, are doing well, according to the latest reports.

THE CONCEPTION STINKS

When there is a problem ways must be found of tackling it; if it is a big problem, the remedy may have to be as drastic as the malady. One cannot solve this problem by cash doles, maintenance grants, petty loans for purchase of land and agricultural implements, small house building loans and small trades loans for grocery and stationery shops. Someone, somewhere has to think in bigger terms, in terms of a generation and crores of rupees in constructive efforts. The entire conception of rehabilitation just stinks, the publication of statistics does not hoodwink anyone because the actual truth is never revealed. The actual number of persons that have found a means of livelihood, however meagre it may be, to keep body and soul together, to maintain our self-respect while our international prestige goes sky-high, it is this contrast that makes all our efforts in this direction so entirely ridiculous. When one totes up the sums spent in psychologically 'unsettling' these people for taking any responsibility in life, the total loss of human material and money would be baffling.

LOANS ALONE NOT ENOUGH

The number of people resettled and rehabilitated is small indeed unless one considers a person as resettled the moment his little grants and loans are entered in the ledger and he is entirely forgotten after that. He is left after that to his own resources and instability. The task is much greater than the granting of loans, the people have got to be psychologically 'reconditioned' to their new circumstances and ways of life. There is absolutely no supervision, except on paper, of these families after they have received their meagre dues. Most of them fall by the wayside and then the battle starts; it is a

long battle with frequent visits to the headquarters of the district and finally a vigil in Writers Building, to redress what has been done. There are numerous instances, one can literally quote a few dozens where agricultural and horticultural loans were given on lands that might yield some results after five years of intense 'feeding' and development.

ACKNOWLEDGE THE FAILURES

It would only be gracious to acknowledge the failures and start anew but not on the old lines. No other nation has faced such a gigantic upheaval along with a change of government and constitution in such a short time. The achievements in the other fields have opened up new visions of prosperity and hope, has brought water where there was sand, has engendered optimism where dark clouds of doubts reigned supreme. But the failure in one field of nation building also stands to be criticised, the failure has been remarkable and there are no signs of any change in policy. Admitted that the East Bengal refugee is a difficult social factor, admitted that he is not given to hard work or persistent efforts, that his physical stamina is not equal to the task he has to face, little consideration has been given to these human factors. The 'human factor' angle has been publicised at great length without paying it any consideration. Governmental machinery moves slowly, many at the helm of affairs take the problem as they take other schemes in which human beings are not involved, there is apathy and carelessness all round and human nature cannot be changed overnight. It must also be understood that sympathy and pity will not solve the problem. These human virtues have to be harnessed into a system that will be applicable to all without distinction of recommendations from higher quarters, a most favourite practice today. Pity cannot administer or discipline, it must be converted into a system, well thought out, well planned and boldly executed.

DOLES OFFER NO SOLUTION

The ideas of cash doles to keep people alive from year's end to another and so forth for four years, without an initiation of a policy, the giving of small loans that cannot serve any purpose whatsoever even if they are given in one instalment, the system of bargaining with refugees for amounts for loans, the system has to be thought out anew. We still think in terms of budgets

and pies and much as one may try, the system allows of no deviations. The result is zero. Our failure in our first nation building attempts with say 30 lakhs of people, has been abject. Money alone will not solve the problem. There is a complete absence of constructive thought and ideas. Why has the Government not called for a nationwide conference of industrialists to find ways and means of solving this debacle? Why must the question be at the tender mercies of persons who have been elected by the party but whose intellectual calibre leaves a lot to be desired, in this particular field? Must party politics be responsible for ruining the future of a nation, or a part of a nation? It is ineptitude in the field that spells disaster. In the West, the problem was easier, as indicated by the Minister for Rehabilitation by the fact of there being evacuee property that could immediately accommodate large numbers of the displaced persons. In West Bengal the amount of evacuee property is negligible. The precedence of West Punjab is not applicable here, their problems were different, so was the human material,

THE ECONOMIC WEEKLY

sturdy, hardworking, healthy. There has got to be a new approach, a new outlook and above all a freshness of mind that is not easily available. Unfortunately, it appears that this is exactly what will not be done. The appointment of superannuated personnel, however great their experience under the old regime, will not help. Neither will voluntary workers do for the purpose. Brains have to be recruited and the willingness to face the problem. The general tendency has been to hoodwink the public and the department. Decisions have to be made and there are few in Bengal that can do so with the exception of one and he cannot be expected to run most of the departments all the time. A lot of dead weed has to be cut out but as time goes on, the experience of the problem does not arouse many hopes. It has often been said that the department has been put on a war footing. Well, in a war footing it is the poor soldiers that give their lives. Here it is the refugees who are at the mercy of persons who have shown neither the ability nor the inclination to face and solve this gigantic problem.

Community Organisation and Development in Lebanon

K G Sivaswamy

(Continued from the last issue)

IT should not be construed that big landownership prevails in the whole of Lebanon. Lebanon has many special features conducive to the rapid development of community organisations. The mountain tract, where vegetables and fruits are mainly grown, is inhabited by sturdy owner-peasants who struggle hard to make a living by terrace cultivation. There are peasant-owners in mountain valleys also. Peasant ownership, unlike farming by tenants-at-will, supplies the right type of human material for community development. Good rainfall and a large number of small rivers provide the material resources for such development. Secondly, a large number of Lebanese live abroad. They are mostly traders in the USA, South America and Europe. They not only send remittances to their dependants at home but influence their lives by creating in them the desire to modernise agriculture and crafts. They maintain their ancestral holdings, however small they may be, and are proud to call their lands by their family names. Thirdly, 60 to 65 per cent of the Lebanese are literate, and 80 per cent of the children go to school, though not all of them complete elementary school. This is not because of compulsory education through Government schools, but because of the innumerable primary schools run by communal charities and private agencies. The Lebanese are also kept well informed on current problems by an extensive press.

THE TRADING MIDDLE CLASS

One other feature of Lebanese life is worth mention. The trading community, spread in towns and big villages, forms an educated middle class which responds willingly to schemes of community organisation particularly on the social side. The trading community of clerks and shop-assistants forms a significant proportion of the total population. Municipalities in towns and big villages draw their leaders from these classes. If therefore there is any country in the Middle East which has exceptionally favourable conditions for

community development, it is Lebanon.

Where conditions are suitable for the growth of community organisations, much can be done by a whole-time worker operating through the community. Such workers have been doing extension work for the spread of fruit and vegetable cultivation and for the wider use of fertilisers. It is noteworthy that whole-time workers are needed to contact small peasants, that they get better results by working through cohesive groups such as the Armenians of Anjar and that the extension service is not without the aid of credit.

EXTENSION THROUGH CO-OPERATIVES

Some extension work is being done by the "Friends of Trees Association" for the last seventeen years. It receives some aid from Government. The association sells pine plants. In summer it holds agricultural and hygienic film shows with the aid of agronomists. But these activities do not go very far. The six-year plan of the Lebanon Government made provision only for research and not for extension. The State has left this work to private agencies without any regulation, which has led to harmful consequences to the farmer. A small State like Lebanon, with limited resources, will never be able to take to all farmers improved practices from its research stations through a paid staff. While big farmers in some areas may on their own initiative take advantage of such research for improving farming practices, others will need to be contacted and educated by whole-time workers. Even in the USA, the land of big farmers, "extension workers reach those who want and demand assistance but not the submerged third who are most in need of assistance but are too timid to ask for aid or not aware of its availability".

The need in poorer countries of taking extension to the door of the cultivator is greater. The only way out lies in co-operative organisations of farmers assisted by a paid staff, properly trained and directed for popularising improved methods. It

is here that the experience of the Abadiya Co-operative Society in maintaining a permanent director out of its own funds is valuable. It shows that a co-operative society is to be valued not only for the organisation it provides, but also for supplying technical and administrative assistance for training the farmer in necessary skills for managing his own organisation and improving his occupation.

THE VILLAGE APPROACH

As to the importance of the village approach instead of individual approach, Mr S Neale Alter, Director of the Jibrail Rural Fellowship centre makes the following meaningful suggestion, based on his ripe experience of 17 years of community organization work. "In the East the village resembles a large family; consequently there must be a unit approach, rather than the departmental approach as is used in the extension system of the West. After there is considerable development, the departmental approach may apply equally well to the East." The farmer too will take to improved methods when they are carried to him by committee members of his own village co-operative society. The needed credit for the purchase of agricultural requisites will be available in the society. Demonstrations can be carried out with the aid of the society's committee in farmers' fields. In short, what the Anjar centre has been attempting through an extension worker, community meetings and demonstration plots in farmers' fields can be secured through the provision of an agricultural co-operative society where possible with a whole-time worker as its secretary. A subvention from the State to societies towards the salary of this secretary for aiding extension work is financially easier than the maintenance of a costly State staff unconnected with the people's organizations. Further, where the state extension service is on a higher level, there will be less bureaucratic control over the agricultural activities of the people.

AGRICULTURAL EDUCATION

Village leadership is trained in two

ways. The working of a co-operative or village council or social centre, assisted by a whole-time secretary, provides continuous and effective education of village leadership. Rural education too has its importance in training the younger generation in leadership. A new type of education has come into vogue as a result of the working of the rural school at Gibrael. This school combines teaching of agriculture along with the 3 R's and theoretical and practical training in civics, citizenship and community organization. The aim of the school is to provide a course of education which will not only help boys to escape from the village but also improve their skills for living in the village. With the co-operation of the State, it hopes to have more schools of this type. It is fortunate that the American University of Beirut, which is intimately connected with the Gibrael rural centre, has entered into an agreement with the State council engaged in Point 4 work to train villagers in the skills they need. The NEF workers adopted also the device of teaching agriculture in primary schools as an extra-curricular course. This has had response from farmers. But when they started an agricultural school at Talabeya with a two-year course, the response was extremely poor. This only showed that an environment of agricultural development should precede the starting of such schools. Providing an agricultural and community bias in existing primary schools was a more feasible proposition. But Government did not seem to have favoured such education according to the UN Economic Survey Mission report.

TRAINING IN CITIZENSHIP

Apart from agricultural education, the Gibrael centre laid special emphasis on village work through boys and knowledge of community organisations in the curriculum of studies. Rural schools may create a generation of new leaders with a broader outlook only when the present youths come of age, i.e., after ten years. Even this educational work had to face opposition from the far-sighted rich who saw in these new youths potential rivals. The training of the youth was objected to by richer landowners as they feared that education of the poor would awaken them to a sense of their rights for better living. Opposition to the centre has always

come from the influential classes. The latter prevented the erection of a pipe to take water to the school. This led to a quarrel and the case is before a court. The centre purchased lands for the school at fancy prices, as the richer classes exploited for their own gain its devotion to the object of educating rural youths. Its workers call these influential opponents as 'Veto-men' who always object to any useful work for the poor.

AGRICULTURAL MIDDLE CLASS

Everyone will admit that the size of the middle income group in Lebanon should be increased. Such an increase cannot, however, be achieved without a time lapse and a definite programme of purposeful training for achieving it. But one should be clear about the kind of middle income group a country wants to develop. In the West, a professional middle class of technical men, doctors, lawyers and teachers has grown in towns and villages in consequence of industrial progress. In the words of the Economic Survey Mission for the Middle East, "the middle income group in the West usually furnishes professional and technical skill and initiative, enterprise and civic leadership". But in Eastern countries, which are mainly agricultural and have no scope for a rapid mechanisation of agriculture, it will be difficult to expect the kind of middle class which has generally evolved in the West. The medium holders of agricultural lands supply leadership in the villages of undeveloped countries. There is no doubt that there is a large class of poor farmers and labourers, leadership among whom has yet to develop. But rural leadership does exist today in villages of owner-peasants in Lebanon, and, if properly directed they will warmly respond to any scheme of community organisation which will add to their income and provide water supply and medical services. Their management of co-operative societies and municipal councils with the assistance of whole-time workers and guidance of the technical staff of rural departments of the State will ensure continuous education in building their capacities for leadership.

It is but a philosophy of despair to set the impossible task of building a professional middle class such as that of the industrialized West in Middle East villages, to under-

rate existing capacities of agricultural leadership and to assess human nature so poorly as to conclude that the educated middle class in towns will not produce at least a few workers devoted to the cause of building community leadership at some sacrifice to their standards of security and comfort.

TRAINING OF COMMUNITY ORGANISERS

What must be appreciated about the Gibrael centre is the psychological approach it is making to build community leaders. In its nucleus of directors are some university lecturers and Mr and Mrs Neale Alter. The centre selects properly-motivated students and community leaders for its activities. Its staff of teachers take the minimum salary. Its buildings are simple. Its activities are modestly confined to conducting a rural school as an instrument of community development.

The directors of Gibrael centre found that costly foreign agencies were suspect in the eyes of the local people. The high standard of life of the workers was apt to create a gulf between them and the people. Costly buildings and establishments were deterrents to the growth of community responsibility. All this experience has created a new outlook among them of identifying themselves with the life of the people and adopting methods of work to which the people could contribute. Continuous fight for freedom against foreign rule and liberal education in universities have created in the younger generation a national spirit to devote themselves to the uplift of their countrymen without calculating costs. Gibrael is canalising this new energy of the students and ex-students of the American University. It is from the ranks of such young men and women that new community leaders for training village leadership have to be recruited. The Point 4 rural improvement council has entered into an agreement with the American University for training students and Government workers in the needs and problems of Lebanese villagers. The University, with its experience in training students in rural work, is bound to play an effective part in creating an efficient State staff and outside specialists for community development.

(To be continued)

Around Calcutta Markets

SINCE the beginning of the new year, equity prices have been moving up. It has been partly due to active "bear" covering. Those who had sold "short" since September last had been squaring-up their books during the last fortnight. Some fresh buying has also been in evidence. It is apparent that the market is receiving support at all set-backs. But, on closer analysis, it would seem that the Calcutta Stock Exchange still lacks the confidence which it showed until September last.

Indications are that the immediate outlook is moderately "bullish". Current steadiness is partly due to technical reasons. One is that "bears" are covering-up their sales. And the other is that speculators are rigging the market up in anticipation of the budget. This is not an unusual procedure even in the "bear" phase of a market. Equities are pushed up as the budget time approaches so that sales can be effected at higher levels.

Awaiting Budget

To some extent, this is the explanation of the current "bullish" sentiment in stock markets. That being so, the near-distant outlook necessarily depends on the budget. Next year's budget proposals are expected to reflect the recommendations of the Taxation Inquiry Commission. That is a hurdle which stock markets may have to cross. Any appreciable increase in direct taxation is not expected. But a further increase in indirect taxation is widely anticipated.

In the circumstances, it may seem strange that equities are now moving up. If current indications are any guide to the future, it would appear that stock markets seem inclined to the view that the effects of any further increase in indirect taxation will be more than offset by the appreciable increase in deficit financing in the next financial year. Experience in the last eighteen months indicates that the stock markets may not be wrong in this interpretation of the future behaviour of equities.

Tea Export Quota

Although the higher half-yearly dividends by jute companies initiated the spurt in equities since the beginning of the new year, the Calcutta Stock Exchange received consistent support from the continued strength

Cautious Optimism

Wednesday, Evening

in Tea shares. Jute shares have now developed an irregularly lower trend. But, despite fast-moving developments, some of which are unfavourable, Tea shares continue to remain steady. This week's fluctuations in Tea shares indicate that, on balance, the market is not pessimistic about the outlook.

In the last fortnight, the tea export quota has been raised, in two successive stages, by 5½ per cent. This is visible proof that the export demand for tea continues. This interpretation of the Government's decision to release a higher quota for exports is obvious. But the other decision of the Government, relating to an increase in the export duty, is not quite favourable to the industry, although it may help the replenishment of the Central exchequer.

Good Dividends

Export auction prices did not decline when the export duty was raised twice in recent months. That was rightly interpreted by the market to mean that the industry was able to pass the higher duty on to the foreign importer. This time, the increase in the export duty has been reflected in a fall in the average export auction prices. This means that the recent increase in the export duty will have to be borne by the home producer. It is, indeed surprising that, even after last Monday's export auction results, Tea shares have not declined.

Some time must elapse before it can be known whether the unexpected steadiness in Tea shares since Monday is partly due to dividend considerations. Satisfactory interim dividend announcements for 1954 have almost coincided with the Government's decision to raise the export duty and the export quota further. Almost all the tea companies in the McLeod group have declared encouraging interim dividends. This explains why Tea shares remain comparatively steady.

Jute Perplexes

There are reasons why Jute shares have developed an easy tendency. This group was moving up partly because of higher dividend payments for the half-year to September last, and partly because of expectations of encouraging working results for the current half-year. Data relat-

ing to mill stocks at the end of December last are not discouraging. It is apparent that the industry is able to sell the higher output as a sequel to increased working hours. But there are other factors in operation which are rather discouraging.

In the last fortnight, raw jute prices have firmed-up appreciably. In sympathy, jute goods have also improved considerably. Rising raw jute prices are due mainly to the Pakistan Government's recent measures relating to stricter enforcement of export and price controls. That the statistical position relating to raw jute is "bullish", is a fact. If raw jute prices continue to move-up, jute goods prices will also improve. This may affect the export demand for jute goods.

Indian Iron

Along with the improvement in Tea shares, and with the steadiness in Jute shares, there has been some broadening of activity in Miscellaneous shares. In sympathy with the spurt in Indian Iron, Engineering shares have also been moving up. In these groups, Jessop, Texmaco and Karanpura Development have recorded appreciable gains in the last few days.

Fluctuations in Indian Iron since Wednesday last make it evident that the upswing in these shares is not wholly technical. For one thing, production at the Bumpur Works continues to be encouraging. In recent days, there has been inspired buying of Indian Iron in Calcutta by Bombay operators. Bombay is reported to be optimistic about this year's dividend. Calcutta has its doubts, but it is evident that Calcutta has been caught napping.

Expansion in Sight

Thursday, Evening

THERE are visible signs of expansionist monetary policy which is indeed stimulating. The busy season is getting into swing and banks had to face a rising demand for credit. The usual feature under these circumstances is a shift in the flow of funds from the gilt-edged into short term channels. And therefore it was quite intriguing to observe over the last two weeks, that with an expansion of commercial bank credit, there was also a rise in the gilt-edged values. The 3 per cent Conversion Loan 1946 has gone up by 8 annas and now stands up to Rs 81-5. The rise has been so conspicuous that there has also been a follow up in the other gilt-edged securities, indicating an all round rise and not merely a redistribution in the portfolios.

It was being doubted whether this strengthening of gilt-edged was due to purely institutional support. The explanation is now obvious, after the publication of the Reserve Bank statement for the week ending January 7. The Reserve Bank has increased its holding of rupee securities over the week to the tune of Rs 9.94 crores. Add to this the other notable feature in the statement, viz, that the Central Government cash balances have fallen further by Rs 1.92 crores and now stand at Rs 52.96 crores. The balances have thus almost reached

what the Finance Minister calls the "irreducible minimum". It appears that the Government is now preparing the ground for a sizeable rise in money supplies and easy money conditions. The new physical resources budgeting concept seems to have helped the Government in overcoming its inhibitions in the matter of large scale spending. If this is so, it is really a welcome development.

Steady conditions, however, prevailed on the Bombay stock exchange throughout the week ending January 12, 1955. Steels moved within a narrow range. Textiles, after an initial rise, steadied at lower rates. Shipping shares and Tata Chemicals met with good enquiry from influential quarters.

Tata Ordinaries experienced alternate bouts of profit-taking and renewed buying within the range of Rs 227 to Rs 229. Indian Iron was steady around Rs 33-8 to Rs 33-14. Calcutta was a seller for the last two days.

This week the market had no significant news except that of the impending increase in the freight rates from February. Narrow range in speculative scrips might develop into stagnancy which usually takes a steep turn either way. It may be that after next settlement, the market will take a big turn. In the

meantime, the New York stock markets' steep rise taking the Dow Jones average to 408 and the subsequent sharp reaction, bringing it down to 390, to settle down finally around 400, seems to have no effect on the Bombay Market. The principal reason for the market's hesitation to move upwards seems to be the bad plight of the cotton and seeds markets, where the sentiment is adverse. The weakness in the cotton market especially affected the textile shares which even otherwise were dull owing to lack of enquiry in the cloth markets. The increase in tea export duty brought some profit taking in the Bombay Burmah. On the whole the markets ruled steady. The eighteen crore increase in note circulation had no tangible effect on the curb rates on Wednesday.

Bullion

Silver opened disastrously at Rs 153-12 against the previous close of Rs 155 due to heavy unloading by Calcutta bulls, and anticipation of further sales by the Reserve Bank. Subsequently, however, the recovery of silver was remarkable indeed, the quotation touching Rs 157-11 on Wednesday on Reserve Bank support and better off-take.

Gold ruled very steady throughout the week.

THE ECONOMIC WEEKLY

Absence of mill enquiry which in its turn was due to continued dullness in the cloth market was responsible for further sagging in cotton which touched a new low this week. Heavy option was also responsible for the fall. Starting lower at Rs 607, cotton met with heavy short covering which took it to Rs 619 in mid-week. But the spurt was short-lived, and on Wednesday, cotton touched Rs 603-8, a new low. Confidence was lacking and a distinctly weak tendency prevailed.

Oil Seeds

This week the seeds market was very weak, and all the centres in the country showed a distinct uneasiness due to increased pressure of supplies. Government's measures such as reduction in export duty or liberation of exports failed to arrest the decline in prices and the situation worsened further towards the end of the week.

Castor seed started around Rs 85-8 and jumped to Rs 88-8 on Government's notification regarding export duty cut by Rs 75 per ton, but this level could not be maintained. Prices declined, with intermittent short coverings, to Rs 81-2 on Wednesday to close at Rs 81-14. The undertone was barely steady.

Almost the same conditions prevailed in groundnuts. Neither the increase in export duty to Rs 300 per ton from Rs 150 nor the fresh allocation of quotas for export could stop the downward tendency. February-March commenced around Rs 22-13 to touch Rs 20-6 at the end of the week. Though the quotation tended to steady around Rs 20-12, confidence was lacking.

Smuggled Gold

SMUGGLED gold affects the bullion market in various ways. In fact, it has never been a matter of secrecy that ever since the beginning of the last war, the only two sources of new supply have been the production of Mysore Gold Mines and the smuggling of gold across the frontier either from Pakistan or from other parts of the world. It has been a favourite pastime of bullion market reporters to speculate about the possible volume of new arrivals from the latter source, it being accepted on all hands that marginal supplies of smuggled gold form one of the most, if not the most, important factors influencing the price of gold in day to day trade.

If the smuggled gold that finds its way into the market affects prices directly, the gold that falls into the hands of the Custom Authorities also exercises an indirect influence. There is periodic speculation about the possibility of the threat of such contraband gold in the possession of Government being unloaded on the bullion market.

Lately, however, much concern has been caused to bullion brokers

and dealers by a change in Customs regulations which, it is apprehended, will seriously interfere with the normal transactions in the yellow metal. For the Customs regulations are proposed to be modified in the case of gold so that the onus of proving the origin of gold found in the possession of a broker or a bullion dealer should be on the latter, and not on the police as it is in the case of other goods.

To light this lamp...

they chained the monsoon!

From the ghats the water comes swirling, pent up by dams, released into reservoirs, rushing through pipelines . . . an artificial river compelled by man to flow westward, where formerly it had flowed to the east.

For thirty-six years this man-made river has been harnessed to create almost one-third of the electricity generated in this country, to drive the wheels of transport and industry, to illuminate towns and cities, to provide entertainment in cinemas and to bring, through the radio, music and news into your home.

Today, cheap electricity provided by Tatas, at rates on a par with those in any large industrial and commercial centre of the world, makes possible higher standards of living and more opportunities of development and expansion in the territories it serves.

Your bright electric bulb is an eloquent symbol of the many Tata enterprises at the service of the nation . . . at your service.

Tata contributions to our national life include :

Steel . Textiles . Electric Power . Chemicals . Locomotives & Engineering . Soaps, Glycerine and Edible Oils . Hotels . Machine Tools . Radios . Insurance . Cement Industrial Investment . Social Sciences . Scientific Research.

TATA INDUSTRIES LIMITED

the sturdy growth of a mighty tree ...

is symbolic of our nation's progress. Rooted in her native soil, maintained by the endeavours of her people, India's chart of industrial and agricultural progress has soared to encouraging heights within a short space of time. We take pride in this progress achieved not by the talents of a few individuals but by the concerted efforts of an united people.

MAHINDRA AND MAHINDRA LIMITED

our children will know each other better...

In a great effort to improve and extend the transport and communications network, India is spending Rs. 497 crores in the Five Year Plan period. The building of new roads, railway lines, port facilities, and air terminals proceeds side by side with the opening of new telephone exchanges, wireless circuits, post and telegraph offices throughout the country. At the same time, Indian factories are now turning out locomotives and railway coaches, automobiles and aircraft, telephones and electronic equipment, thus paving the way for a more rapid advance in the future. Apart from material benefits, this great deve-

lopment of transport and communications will serve to bind closer together peoples of diverse tongues and creeds who inhabit this vast land. Mutual understanding will prevail over distance and our children will know each other better.

Since bringing the first pneumatic tyres to India in 1898, Dunlop have played a vital part in the development of transport facilities in the country. The Dunlop factory near Calcutta—the largest tyre plant in Asia—produces a wide range of tyres and it stands ready to meet any additional demands to help fulfil the tasks the nation has set before itself.

Alladin's Lamp

FIVE years ago, the Indian Republic was formally inaugurated on the twenty-first anniversary of the day on which the country took the pledge of independence on the banks of the Ravi. That association remains and it is invariably renewed whenever the Congress, then the common forum for the whole people and today a political party holding the reigns of Government, meets in an open session and takes important decisions. On the anniversary of this day of hallowed memory, questions inevitably arise; what is the state of the Republic and what is the direction in which the ship of state is going? Is this ship being steered in the right direction and is it going to be smooth sailing in the foreseeable future? No one bothers much to look very far into the future. Many, and in this country their number is legion, do not even

bother to think of the morrow, so pressed down are they by the cares of today. The last ounce of their energy and strength is sapped by the struggle for a living. They toil and bear patiently all their burdens. The future they resign to fate, but by not thinking about it they store up trouble for themselves as well as for others. By and large this is the background against which have to be studied the problems of development, of rapid capital formation, of social justice and all the other desirable objectives that we are after.

The pledge of independence taken quarter of a century ago comes back to mind because those who guide the country's affairs today still rely on their achievement in the past in winning independence as a main motive force that will propel the country forward. Moving the economic policy resolution at the Subjects Com-

mittee meeting at the Avadi Congress, Pandit Jawaharlal Nehru asked the members to recall how the country had marched forward as one man to attain freedom, and then to visualise how great it would be if the same people marched in a great sweep towards the achievement of progress in many directions. Moving the same resolution at the open session of the Congress last week, Pandit Nehru said:

"I hope you all will accept this resolution at this Avadi session and understand its meaning fully. We are today taking a pledge before our people and the whole world to work for the fulfilment of the socialistic pattern. This pledge marks a turn in our mental attitude to our economic problems and we have to work hard to realise it."

To this pledge there was a preface. The Congress could not

MILESTONES OF PROGRESS!

1916: Goodyear supplied the longest Conveyor Belt for a 735 feet centres conveyor at Zenith Furnace Co.

1920: Goodyear made first vulcanised splice with steam vulcanizer.

1924: Goodyear developed Electric Vulcanizer, eliminating mechanical splice.

1925: Splice Vulcanization enabled Goodyear install the world's longest belt 2,434 feet centres at H. C. Frick Coke Co.

1938: Goodyear supplied the world's longest belt installed at Grand Coulee Dam with 4,745 feet centres.

1940: Goodyear installed belts for world's longest over-land conveyor system at Shasta Dam; Conveyor length 9.6 miles.

1948: Goodyear supplied second longest over-land conveyor system at Bull Shoals Dam. Conveyor length approximately seven miles

1949: Goodyear installed world's longest single flight Conveyor Belt of steel cable construction, total length of conveyor 10,960 feet centre to centre at Weirton Coal Company's Mine, West Virginia.

1950: Goodyear installed world's highest single flight lift belt for Chicago-Wilmington & Franklin Mine — total lift 868 feet.

1954: Goodyear developed and installed first Speedwalk belt at Hudson & Manhattan Railroads, Eire in Jersey City to unload and load 10,800 people per hour commuting to and from the city.

We are pleased to announce that in accordance with Goodyear's world wide expansion policy, we can offer you conveyor belting manufactured in India in the quality that is expected of a product bearing Goodyear's name.

INDUSTRIAL PRODUCTS DEPARTMENT

thrive in the future on its past glories. It could exist only if it found an answer to the new challenge that modern times had thrown up. This was the challenge of uplifting 37 crores of people economically and socially.

The Congress could only survive if it succeeded in providing an answer to these new problems. "The Congress became such a mighty organisation only because it lighted a spark in the hearts of men. It drew them within its fold and ultimately the people became the Congress and through their work and sacrifice wrote the history of India of the last three decades and more. But now the Congress can continue to find a place in the hearts of our people only if it remains a living body and helps them solve their new problems". Pandit Nehru said that "our eyes" were always set on the goal of establishing a socialistic pattern, but "now we have to fix our gaze on it more sharply in order to make greater efforts to build the socialistic pattern". This would also help in formulating our future Plans in the right perspective.

All these sentiments are unexceptionable. It is the text of the economic policy resolution, however, which leaves room for thought, and for different thoughts to different people, should they go through it carefully, take it seriously and not dismiss it as just words, or mere electioneering propaganda. For what the Congress has resolved is to define its aim afresh. The national aim, henceforth, is a Welfare State and a socialistic economy. This can only be achieved, says the resolution, by a considerable increase in the national income and a more equitable distribution of that income. Keeping these objectives in view, the second Five-Year Plan should be based on the physical needs of the people and these needs should be mainly provided for by production within the country. This necessitates the building up of heavy industry, including machine-making industry, as well as a wide extension of small-scale and cottage industries.

With the declared objective of a socialistic pattern of society, the State will necessarily play a vital part in economic development. In particular it will (1) initiate and operate large scale schemes providing services such as power, transport service, etc., (2) control over-all allocation of resources and ensure the essential balances in the

economy, (3) check and prevent anarchy in industrial development, and (4) set targets for the economy in its basic and broad aspects.

While the public sector must in future play a greater part than in the first Five-Year Plan—more particularly in the sphere of basic industries—the private sector, including the co-operatives and small-scale industries, "are necessary for adding considerably to production and employment", provided it functions "in terms of the National Plan". The contents of the resolution outlined above are startling, since no one can doubt Pandit Nehru's integrity, sparkling sincerity and genuineness of intentions. The effect on the minds of those who had been lured so long by past and equally authoritative statements into exploring possible financial resources of the country, is more than startling. The exercises into which they had been led, had proved baffling. The financial outlays suggested in the Second Plan could be related in no possible way to known or imaginable magnitudes. And while most experts are scratching their brains trying to solve what seems insoluble, the Congress puts the Alladin's lamp in their hands—planning in terms of physical resources. How these resources are to be collared and mobilised is, however, quite another matter.

Along with the designed expenditure for the Second Plan had been given a target of additional employment to be secured—12 million jobs in the next five years. Whether the limit has now been expanded or not, no one knows for certain. Now it is going to be full employment, whatever that means in the Indian context, in the course of the next 10 years. All these are to be achieved by democratic means. But the evils of anarchic industrial development are to be checked and prevented by strategic controls exercised by the State.

Those who despair of ever finding means for getting anywhere near the financial targets proposed for the next Plan, find no comfort in deficit-financing either. For the circumstances under which the latter could be possible as a second best, are not themselves amenable to control. A situation is not difficult to conceive where a bad monsoon or crop failure could upset all calculations and precipitate a severe crisis, should such a *contretemps* occur just when deficit financing was getting under way and gathering momentum. Planning in terms of phy-

sical resources seems to cut out all these complications; all that it will require is the maintenance of balances in the strategic sectors of the economy. But how are these balances to be maintained and who will maintain them? We come out by the same door as we go in.

If the achievements of the Congress in winning the country's freedom is a rickety base from which to start the programme of economic reconstruction, the achievements of the Five-Year Plan so far as a positive quagmire in which the country will be bogged, unless serious efforts are made to examine closely the reasons for its failures and shortcomings, and the lessons to be drawn from it are taken to heart and acted upon. Until this is done, financial resources will continue to fall short of the targets and expenditure authorised will not be incurred. The States will go on blaming the Centre for being grasping and unhelpful, the Centre will lay the blame on the States for being non-cooperative and wilful. The spending departments will point accusing fingers at the Ministry of Finance for being too rigid and sanctimonious, while Finance in self-righteous indignation will keep up its pose of being the martyr, claiming credit for saving the country from criminal waste and utter ruin and getting no thanks for all its pains.

The Congress now holds the reins of Government. So any resolve taken by it as a political party will in due course be endowed with the authority of the Government. It therefore behoves the Party to think again and ponder deeply before it commits the country to any particular line of action—whether it is in regard to the way in which a plan is drawn up or in the manner in which it is to be implemented. Planning in terms of physical needs and resources is clearly most alluring. It shows a desire to break fresh ground. But it should not lead the Government to view finance as a means which is always and completely amenable to one's control. Beyond a certain point, physical planning can well take the initiative and become a Frankenstein monster—especially in a country in which controls are anathema. To point this out may appear faint-hearted to Pandit Nehru who is impatient of the leisurely pace in which things are moving in the country. Nonetheless, it is a point which needs to be remembered by those who strive to advise him and translate his vision into reality.

Congress Redefines its Aims

"COLD WAR" may be a by-product of the second world war. But the ideological conflict between Capitalism and Communism is, perhaps, as old as the Industrial Revolution. It assumed significance the day Communism was established in Russia. Since that day, Capitalism has been fighting a rearguard action. This losing battle has been, and is being, fought on both the political and economic fronts. In Capitalist States, political parties and labels have been changing. Today, the party system of government is based not as much on political as on economic considerations. If the late Lord Keynes became the most popular Briton in Europe after the first world war, he was also the most hated economist in Russia in the 'thirties.

Keynes started the fight against Communism with its own weapons. America was then suffering from the aftermath of a devastating slump. Throughout the world, there was the problem of equating purchasing power with production. Keynes advocated full employment. It had a twin objective. It was aimed at stimulating demand. It was expected to lead to a more equitable distribution of income and of wealth. It has been remarked that Keynes has, perhaps, extended the life of Capitalism by at least half a century.

That remains to be seen. But it was not without significance that Keynes's theories were translated into action first in America, which was, then, engulfed in economic chaos. To the late President Roosevelt goes the credit for the political projection of Keynes's economic theories. To him also may be traced the beginnings of a one-party State, even outside Communist Russia. By the time the second world war came, five major countries in the world—Russia, Germany, Italy, Spain and America—had become one-party States. This political phenomenon still continues. Since the war, the party system of government may have re-emerged. But the distinctions between the political parties are being blurred. Today, even non-Socialist parties believe in the socialist pattern of economy, of government, and of society. Jointly, all the political parties everywhere, outside the Communist States, are fighting, by

proxy, in their countries, the battle against Communism.

Superimposed on these political trends, there is another influence in operation in post-war Asia. Asia is a poor Continent. Poverty prevails with excessive concentration of wealth in a microscopic minority. All the newly-independent countries in Asia are under an urgent compulsion to raise the standard of living of the masses. Governments in this region are judged by their economic policies. Communist China is an alternative which is a constant threat to them and their peoples. This is the main problem before political parties and governments in India, Pakistan, Ceylon, Burma and Indonesia.

This is the broad background against which the re-orientation of policy by Congress, in its diamond jubilee session at Avadi, is to be assessed. It would be wrong to assume that no change in policy is contemplated by Congress. Both Maulana Azad and Pandit Nehru have been at pains to assure vested interests that no revolutionary change in policy is intended. Here, the question is not whether the private sector can co-exist with the public sector. Congress is wiser by the experience in Britain. It is not for nationalisation. But there is ample evidence that Congress has, under the compulsion of wider political and economic influences, come to a decision that it is necessary to ensure social control of the major means of production. Speculators and gamblers are free to take comfort from Panditji's suasive diplomacy. But those who are aware of the fundamental politico-economic trends may not be wrong in their assumption that acceptance by Congress of a policy more revolutionary than that of a co-operative Commonwealth is inevitable.

Achievements of Congress are not unimpressive. It is in power in all the States except two. By tolerating non-Congress governments in Andhra and in Travancore-Cochin, Congress has shown its faith in democracy and in its own strength. There is political stability throughout the country. Economic progress to date may not have exceeded all the targets of the first Five-Year Plan, but what has been achieved has strengthened the confidence

that more can be done. It is a tribute to the sense of responsibility of Congress as a political party that it has decided on a more ambitious second Five-Year Plan. Its stress on relative expansion of the unorganised sector of industry will not lack a sound economic basis, if this expansion is not made an end in itself but a part of a coordinated programme of development. But its emphasis on full employment is conditioned by fundamental politico-economic influences. Experience has taught Congress of the urgent necessity of a re-definition of its aims for smooth execution of an expanded Plan.

Political reasons equally necessitate a re-definition of objectives by Congress. It is good electioneering tactics for Congress to pose as a party of the Left. Thus alone can Congress hope to recover its position in Andhra and in Travancore-Cochin. Congress has to show a bias to Left to maintain its hold in the South as well as in some of the problem States. By re-defining the policy in socialistic terms, Congress can hope to steal the thunder from PSP. It has not been unsuccessful in this aim. In Andhra and in Travancore-Cochin, PSP seems to be losing ground. As it professes faith in the socialistic pattern of government and of economy, without any emphasis on doctrinaire Socialism, it can hope to win the Right-wing of PSP back to its fold. This is a policy which will appeal to all progressive elements. The all-India Forward Bloc has already decided to merge with Congress. Many of the splinter groups in some of the southern States may be tempted to follow suit. Simultaneously, with the re-definition of the aim and with the prevailing dissensions among its rivals, Congress has taken a more firm stand. In Andhra as well as in Travancore-Cochin, Congress has had the boldness to disown any alliance with PSP.

These electioneering tactics may have been partly responsible for the re-definition of aim by Congress. But there are wider compulsions behind the Congress attempt to equate itself with the country. Certain facts are beyond dispute. There is no alternative to Congress. Only the Communist party is a potential rival. To fight Commun-

ism on the political front, it is necessary for Congress to emerge as the only other single party. A re-definition of aims on a broader, more progressive, basis was needed to achieve this objective. Those who are aware of the political assumptions behind the progress of an under-developed economy will accept the inevitability of a re-definition of Congress aims on leftist

lines. Whether Congress will succeed in equating itself with the country, or whether it will be able to ensure stable, democratic, political and economic progress, depends on whether Congress is conscious of these fundamental political and economic trends. Some time must elapse before these questions can be answered decisively.

Co-existence in Peace

IMEDIATELY after India attained independence, she took two major decisions. She decided to remain a Republican member of the Commonwealth. She took the initiative to convene an Asian Conference. These were symbolic gestures by Free India. She, a Republic, rejected kingship, but willingly accepted kinship with like-minded members of the Commonwealth. Her active membership of the United Nations and her insistence on kinship as the basis of relations with the countries of the world underline her peaceful democratic approach to world problems. India is one of the free nations of the world. But she cannot ignore her geographical position as an Asian nation. In convening an Asian Conference, she initiated developments some of which have been fulfilled while some others still continue to be sources of conflict.

Two assumptions are implicit in the United Nations. All the nations of the world must be members of the United Nations. It, therefore, follows that all the countries of the world must be independent. There are many countries in Asia and Africa which are still not independent. This is a danger not only to peace in Asia and Africa, but to world peace. Even as India emerged as a free nation, she realised this fact. That is why she convened an Asian Conference as soon as she became free. That Asian Conference initiated developments which led to the independence of Indonesia. Many years later, Pandit Nehru issued an appeal to the parties and powers concerned to end the war in Indo-China. This appeal was endorsed by the Colombo Powers. In Indo-China, the incidental arrangements of an armistice are being gradually implemented.

All the countries in Asia are not yet independent, but Asia is in the

process of emerging as a free Continent. Africa still remains the Dark Continent. Because India believes that colonialism is a danger to peace, she has espoused the cause of freedom in African countries. Through contact and co-operation at the United Nations, Asian and African countries have realised the bond of unity among them. All of them are aware of the demoralising effects of colonialism. They are all poor countries. They have two common enemies. Their poverty is an invitation to Communism. They do not want to remain as spheres of influence either of Communist States or of Western Powers. It is natural that Asian and African nations will like to discuss their common problems. This is the basis and the justification of the forthcoming Afro-Asian Conference. No pacts or alliances are under contemplation. Asian and African nations will assemble in Indonesia for informal talks about the problems in which they are jointly interested.

India can claim to have established before the world that world issues cannot be solved in the context of Europe alone. There are many nations in Asia and Africa. Both are populous continents. Both are politically conscious. Both demand acceptance of their due importance in world affairs. Many of the countries in Asia and Africa are economically poor and militarily weak. They want to eliminate poverty. But they have no desire to join the Western Powers or the Communist States in any mad race for armaments. They do not believe in military pacts or alliances. To emphasise their neutrality is to misinterpret them. They abhor war. They are trying to make the rival power blocs realise that a third world war will not solve any of the world's problems. As members of

the family of nations, they claim to have a voice in world affairs. This demand is now accepted.

Even while India, along with the Colombo Powers, is trying to impress on the rival power blocs of the suicidal consequences of war, she, and the nations of Asia, are trying to prove how peace can be attained and maintained. This attempt is based on the Five Principles, enunciated first, in the preamble to the Indo-Chinese Agreement on Tibet. These principles have since been unilaterally and jointly endorsed by India, China, Ceylon, Pakistan, Burma and Indonesia. Marshal Tito has repeatedly expressed his conviction that world peace as well as amicable relations between the various nations can be achieved on the basis of these Five Principles. These principles conform to the objectives of the United Nations. In emphasising sovereignty of nations, and non-interference in the internal affairs of nations, the Five Principles underline the basic aims of the United Nations. It is the intention of India, as also of the other Colombo Powers, not only to create an area of peace, but to extend such an area. Extension of the area of peace will be one of the aims of the Afro-Asian Conference.

To those of the Western Powers who argue that collective security is a better means of ensuring world peace, India and the other Colombo Powers reply that there can be no enduring peace as long as fears of war persist. To eliminate these fears and suspicions, it is necessary to agree to base relations among nations on the Five Principles which have been accepted by China and the Colombo Powers as the foundation for amicable relations between nations. Once these principles are accepted, peaceful co-existence follows. Collective security can, at best, lead to world stalemate. Therefore, the pursuit of an alternative way to world peace is all the more desirable. Only those who deny the possibility of peaceful co-existence can refuse to give the Five Principles a fair trial.

In the wider search for peace, India has, since her independence, been confronted with peculiar regional problems. Colonialism may have retreated from Asia. But there are renewed, and more subtle, attempts by some of the Western Powers to create spheres of influence in Asia. To many Asian

countries, the Manila Treaty is such an attempt. Not only in Kashmir, but in all parts of Asia, India has been, and is, opposed to the stationing of troops of outside Powers. India is reluctant to enter into any regional military alliance with any of her neighbours. She is more intensely opposed to any alliance like SEATO, which is a regional military arrangement between Powers some of which are not situated within the region concerned. America is not a south-east Asian Power. Britain and France have ceased to be such Powers. Neither of these Powers can, therefore, have any legitimate interest in creating SEATO.

If SEATO is a threat to peace in South-East Asia, the latest developments in the Formosa waters are potential threats to peace in the Far East. Although President Eisenhower has hinted that the Red Chinese offensive around the Tachen and adjacent islands may not provoke "massive retaliation" by America, there are reports that he may seek authority to send the Seventh Fleet into action in the event of any Red Chinese attack on Formosa. More intriguing is the report that America may not be unwilling to lend her support to any proposal that China and Formosa should exist as separate States. It is doubtful whether Peking will accept any such plan even with an inducement of America's support to Red China's admission to the United Nations. America may not, but many member-States concede, that China has an abiding political interest in neighbouring islands like Korea and Formosa. In their efforts to create and to extend the area of peace, India and the Colombo Powers must persuade the Western Powers not to conclude regional military pacts, or to foster developments which are obstacles to peace.

BUSINESS MEN ask for

ACCURACY
in a watch...

Appointments must be kept—on time! Long-distance telephone calls must be made at a pre-arranged minute! Journeys by plane and train mean accurate timing! The wise executive, with valuable contracts to sign and contacts to make, knows that he can depend on his "West End" watch to give him long-lasting service with reliable accuracy. Problems of West Bengal Industries

West Bengal's industrial make-up has been undergoing a change. The move for dispersal was initiated for the first time during the war; it has continued since then, though for very different reasons.

The present attitude of the Government to managing agency may further strengthen this process. For a necessary corollary of the break-up of managing agency will be a dispersal of the offices, now concentrated in Calcutta, which control the coal and tea industries.

WEST BENGAL, partitioned Bengal, is a small Part A State. But it is still one of the biggest industrial States in this country. If West Bengal, divided Bengal, has become a problem State, its major industries have also become problem industries. Like the State, its industries have not yet succeeded in overcoming the consequences of partition. Two of its major industries, jute and coal, depend, to a large extent, on supply and demand respectively from Eastern Pakistan. Although the tea industry's problems are different, all the three major industries of the State have shown a pronounced tendency to suffer from alternate bouts of booms and depressions. These industries have two common problems. All the three have labour problems. Each is dependent on fluctuating export demand.

EXPANSION DISCOURAGED

During and since the war, this State's industrial make-up has been undergoing a change. The move was initiated for the first time during the war, that the location of industry should be away from Calcutta. This was because of this city's proximity to the war zone. Kanpur has gained, in consequence, as an industrial centre. The trend towards dispersal has continued ever since, though for very different reasons. The development of new industries in this State has been discouraged. This has some relation to the anti-non-Bengali feeling of the Bengali. It is partly due also to industry's fears of growing Communism in this State. This raises the question of labour troubles. There have been labour disturbances since partition. All may not have been quiet on the labour front in 1954. But it was a year of relatively smooth relations between labour and capital. Labour troubles may start again in the near future.

Not only industrialists, but New Delhi also seems reluctant to encourage expansion of new industries in West Bengal. There has been an unseemly quarrel between Calcutta and New Delhi about the West Bengal Government's coke-oven pro-

ject at Durgapur. Rejection of Durgapur as a location for one of the State-sponsored steel plants has caused severe resentment in West Bengal. New Delhi's refusal to allow Birla Brothers to erect a pig iron and a steel plant at Durgapur may be due to a variety of reasons. But there is a feeling in this State that New Delhi is unwilling to encourage development of new industries in West Bengal either because of strategic or of ideological reasons. West Bengal is a border State, with land frontiers with Eastern Pakistan and Burma. Communist influence exists in all these three areas.

COAL—THE MOST CONTROLLED INDUSTRY

These are wider problems which do not directly affect the existing major industries. For some years now, the coal industry has been in the doldrums. It complains of two troubles. Many years ago, the transport bottleneck was blasted. But the coal industry still seems to suffer from wagon shortage. This complaint is really a sequel to its major grievance that it is, with the possible exception of the iron and steel industry, the most controlled industry in India. Distribution and price of coal are regulated in details. This affects internal consumption. Exports have been falling in recent years.

An Export Promotion Committee has recently recommended measures to stimulate exports. These suggestions are in the process of being implemented. But exports are not looking up. Internal consumption is stationary at a not unsatisfactory level. But the industry does not expect any appreciable improvement in internal demand. To meet this situation, the industry has been restricting output. Labour is its main problem. About 66 per cent of its production costs are absorbed by labour charges. A Tribunal has been appointed to adjudicate on the dispute between labour and the industry. Its future depends mainly on the Tribunal's verdict.

These problems are undoubtedly important. But an examination of this industry's problems indicates

that the industry is diplomatic in not stressing the basic issues involved. Coal is one of the major mineral resources of this country. This seems to be the main reason why it remains the most controlled industry. New Delhi has made no secret that it is determined to ensure conservation of metallurgical coal. New Delhi and some of the States concerned are interested in fuller exploitation of mineral resources in the wider interests of the country. This raises the problem of mineral rights and leases. Colliery-owners are apprehensive that their rights and leases may be re-adjusted at their cost. On wider grounds, no exception can be taken to the Government's policy of ensuring proper conservation and utilisation of a major mineral resource like coal. But there will be surprise that the Government is not yet fully aware of the supreme need for controlled exploitation of such vital strategic materials as mica, manganese and shellac.

PROBLEM OF RAW JUTE SUPPLY

Before the jute industry's problems can be discussed, it is necessary to refer to an issue which is of common interest to jute and coal industries. Since partition, the supply of raw jute has been a constant problem with the jute industry. It was acute in 1950 and 1951. It was comparatively comfortable in 1952 and 1953. It has again become acute now. Raw jute prices are rising mainly because of restricted imports and of hardening prices of Pakistani raw jute. In Eastern Pakistan, price and export controls are now being more strictly enforced. Exports of kutchra bales are banned. This affects India only. It is only natural that Pakistan will try to exploit the advantage it enjoys in its golden fibre. But it should not be forgotten that, even as India no longer enjoys a near-monopoly in the manufacture of jute goods, East Pakistan is no longer the only area which produces raw jute.

Both coal and jute interests have a common grievance that New Delhi has never been adroit in using its bargaining counter against Pakistan.

Amicable economic relations between India and Pakistan are necessary for progress of both countries. Neither of the two Bengals can develop without free and unrestricted trade intercourse. Economic warfare is as undesirable as political conflicts. Many thinking persons hope that economic inter-dependence between the two neighbours will be the urge to political amity. This cannot be over-emphasised. Even so, it is surprising that India has never realised fully that she has a quid pro quo in coal. It should not be impossible for New Delhi to inform Karachi, mildly but firmly, that if the Indian jute industry is to be forced to pay higher prices for supplies of Pakistani raw jute, India is in a position to retaliate by charging correspondingly higher prices for coal supplies to Pakistan.

While both friends and critics of the jute industry are keenly debating its future, it has not shown lack of adaptability. It seems to have mastered the technique of adjusting total production, as well as the output of the different types of jute goods, to the changing demand. There has been a substantial fall in demand for sackings in recent years. Through trial and error, the jute industry seems to have almost succeeded in adjusting its production to the changed pattern of demand. But there are other problems which confront the industry. Since the war, there has been a tendency for the consumer countries in Asia and the Far East to try to produce their requirements of jute goods. East Pakistan has now one of the biggest and most modern jute mills in the world. Three years hence, Pakistan will emerge as a serious rival to India. Although India seems to have recovered the ground lost some years ago in America, the Continental countries have completed the process of modernisation of their jute mills in the last three years.

PHASED RATIONALISATION

Rationalisation is the major problem before the Indian jute industry. It has been emphatically recommended by the Jute Enquiry Commission. Both the industry and the Government endorse this remedy. Twenty-eight jute mills are now implementing phased rationalisation. So far, the process has been financed by the industry out of its own resources, or through issues of bonus shares and debentures. Ultimately, it will involve an expenditure of Rs 50 crores. Negotiations between the industry and the Government are going on. As one of the specific

responsibilities of the State-owned National Industrial Development Corporation is to finance modernisation of jute and cotton textile industries, it should not be difficult for the Government and the jute industry to reach a satisfactory arrangement for the financing of modernisation. To overcome competition from rivals, the jute industry must rationalise. But this and the reports now current that the industry is thinking of curtailing working hours, raise the problem of labour troubles. Prevention of labour troubles is as important as implementation of rationalisation. It will require all the combined wisdom and diplomacy of both the industry and Authority to achieve these two aims successfully.

COST FACTORS IN TEA

Like coal and jute industries, the tea industry faces the problem either of labour troubles due to the possible recommendations of the Plantation Inquiry Committee, or of rising production costs due to mounting labour charges. Although colliery-owners constantly deplore rigid labour costs, labour-management relations have been comparatively amicable in jute and tea industries in the last year. Some years ago, when the tea industry was passing through a crisis, tea labourers accepted a cut in wages. A year ago, when tea started to recover, planters were wise in reciprocating the earlier gesture by labour. Wages were restored. Now that the tea industry is prospering, labour is demanding higher wages. In the last year, the tea export duty has been raised by successive stages. A transport duty has been levied by the Assam Government. From the questionnaire of the Menon Committee, it is apparent that the industry may be foisted with certain additional responsibilities which may raise production costs appreciably.

TEA AUCTION AND PLANTATION COMMITTEES

Even as the future policy of the Government to plantation industries, including tea, is under investigation by an expert committee, the prospects of selling a larger proportion of India's tea output through the Calcutta and Cochin auctions are under examination by another committee. Even today, more than fifty per cent of India's crop is sold within the country. Those who are in favour of continuing sales of Indian tea through London auctions argue that such sales fetch better prices. Assuming that expansion of sales through internal markets will not raise the earnings of the producers,

but it will improve the earnings of middlemen and people engaged in the trade, this will, of course, augment the income of the country. Today most of the tea brokers and auctioneers are non-Indians. The situation will change as Calcutta auctions develop and expansion of sales through internal auctions will also augment the country's invisible exports in the shape of shipping, freight and insurance earnings.

This, unfortunately, raises the vexed question of non-national interest and influence in the tea industry but it should not. Tea may be the only industry which is still owned and managed by non-nationals. A couple of years ago, tea labour made representations to the Government that the tea industry should be nationalised. Long ago, New Delhi abandoned any intention of wholesale nationalisation of industries. Although the Government did not consider seriously the demand of tea labour for the nationalisation of the industry, it let it be known that it was in favour of rapid Indianisation of the industry. Indianisation of the tea industry's technical and managerial cadre is desirable. But there does not seem to be any reason for nationalisation of the industry. Tea is a valuable foreign exchange earner. But India has no monopoly in tea. Nor is tea a scarce, strategic raw material. There can, therefore, be no justification for utilising public resources for nationalising the industry. Not only that, but in view of the critical shortage of capital in the country and the pressing need for fresh capital formation, the utilisation of private savings for acquiring existing assets—in this case the European-owned tea gardens—would be wasteful in the extreme.

During and since the war, Indian capitalists have purchased ownership or managing agency rights in many of the companies formerly owned by non-Indians. As Calcutta was the home of British capital in India, it was inevitable that this process of change of ownership was in extensive application in Calcutta. Many jute and engineering companies have thus been bought over by Indian capitalists. Many managing agency houses have thus changed hands, and the change of ownership has often been effected at an unduly inflated cost. This is one of the main problems of many of Calcutta's industries. These reflections are prompted by reports that a similar process of change of ownership is now taking place in the tea industry. In the last eighteen months, the tea industry has made

steady progress. It is now enjoying boom conditions. Tea prices are soaring. So also are the industry's earnings and profits. These developments are reflected in rising quotations for tea shares, and in higher dividend payments by tea companies.

BREAK UP OF MANAGING AGENCY?

An examination of recent trends and developments in West Bengal's major industries will be incomplete without a reference to the Government's change in attitude to the managing agency system. This was the main topic in the speech of the outgoing President of the Associated Chambers. In his reply to the President's criticism of the Government's hardening attitude to the managing agency system, the Finance Minister emphasised that what was of importance in the private sector was the "dynamism of private enterprise and not static adherence to traditional forms or institutions". Although the Finance Minister was not prepared to discuss an issue which was under reference to a select committee, he assured the British business community that the Government was contemplating only to clothe itself with discretionary powers.

DISPERSAL AS COROLLARY

Despite this assurance, apprehensions prevail that the Government has already decided to introduce substantial adjustments in the managing agency system. Here, the question is not whether the managing agents perform any useful function, or whether the principle of inheritance should be allowed to continue in the system without certain restrictions. But the effects of the Government's decision to introduce adjustments in the managing agency system on West Bengal's industrial development may be emphasised. There are reports that the Government's new policy to the managing agency system has some reference to the respective locations of managing agency houses and the managed industries. There are many managing agency houses in Dalhousie Square which manage tea gardens in Assam, collieries in Bihar and, to take a few other examples, light railway and electrical undertakings and various forms of business enterprises in areas outside Calcutta or West Bengal. If current reports are true, the managing agency houses of Dalhousie Square will have to undergo a complete transformation in their make-up and location. Its repercussions on West Bengal's industrial status will be far-reaching. Calcutta will no

longer be the controlling centre of Assam's tea industry, or of Bihar's coal industry. Calcutta will, then, be the controlling centre of the jute industry alone. And this will be the only major industry in which West Bengal will remain interested. This is a dismal, but not, perhaps, an inaccurate description of the shape of things to come.

Behind the West German "Miracle"

The achievements of West Germany in the past year have been hailed as a triumph for "free market economy". That this is a myth is, of course, now well known. The various artificial incentives to stimulate exports, the deterioration in the living standards of the working population and the re-emergence of trusts and combines expose the myth.

The German "miracle" is the result of astute planning, but planning of a type—its effect on the German people is harmful; from the point of view of the neighbouring industrial exporters, it is positively alarming.

"MIRACULOUS," "spectacular"—that is how all observers have come to describe the almost unbelievable recovery and expansion of the West German economy. The year 1954 has been a good year for Europe as a whole, but it was by far a better year for the Federal German Republic. Industrial production is now double that of pre-war, exports three times the level of 1950 and income almost four times that of 1936. No other country in Europe can boast of such a record; the rate of economic growth for West Germany is now probably the highest in the entire Western world. In continental Europe it has become as *The Times* put it "the dominant economic power" and the remarkable fact which in 1954 became clearly visible is that West Germany is beginning to rival the United Kingdom more than the United States for world leadership as an industrial exporter.

SPECTACULAR RISE IN PRODUCTION

Between 1953 and 1954, industrial production rose by some 10 per cent (compared to 8 per cent in Britain) and this expansion has been for the most part concentrated in the heavy industries (see Table I). Hard coal production has risen by 3,500,000 tons to 128,000,000 and West Germany is now producing 53 per cent of the coal output of the entire Schuman Plan Area. The progress of the steel industry has been spectacular, and production of steel has jumped from 15.4 million tons in 1953 to 17.5 million tons in 1954—an increase of 14 per cent. And a large part of this achievement belongs to the Ruhr—the focal point of Germany and in many ways, that of Europe.

In spite of this rapid growth in the output of these industrial materials, the Germans continue to claim that the capacity of the steel industry is still 15 per cent higher than the production actually realised. It is further claimed that orders for all sorts of steel products are still

running at a higher level than production. There are, for instance, orders on hand for over 4.5 million tons of rolled steel products and delivery now takes an average of five to six months.

WHAT SUSTAINS IT?

What are the factors that sustain this high level of demand for the output of the basic sectors of the German economy? The two principal ones appear to be internal investment and exports. Capital investment (gross capital formation) which now absorbs about one-third of the national product, house-building and expansion of industrial capacity have been among the strongest stimulants.

Between September 1953 and September 1954, it is recorded that some 220,000 new dwellings were put up. This was 13 per cent higher than for the previous year. But building activity is not only confined to residential houses. As a result of the increase of output in the capital goods industries, the past year has seen a substantial increase in the amount of building done for industry and trade. If measured in terms of man-hours worked, the output in this category of building during the first eight months of 1954 was 7 per cent greater than in the corresponding period of 1953.

In a recent report, the Bank Deutscher Lander, the Central Bank of West Germany, remarked that production in the capital goods indus-

tries was "still receiving stimuli from the activity of capital investment", and that activity in this field was continuing to grow. The inclination of industrialists to engage in capital expenditure shows little signs of weakening; the capital expenditure plans of industrialists are not merely concerned with increasing efficiency, but more importantly with expansion.

OTHERS DWARFED

The industries most affected by these plans of expansion are chemicals, steel, transport equipment, particularly ships and motor vehicles, machine tools and, finally, electrical machinery. The rate of expansion in each of these industries cannot be quantitatively determined, but it is clear from the general production records that the expansion in West Germany dwarfs that taking place in any other country. According to figures compiled by the UN Economic Commission for Europe, the West German metal-using industries increased output by some 17 per cent between June 1953 and June 1954. In chemicals the increase was of the order of 16 per cent. For Britain, comparative figures are 9 per cent and 7 per cent respectively; for France, 5 per cent and 14 per cent; and Italy, 7 per cent and 15 per cent.

The stimulus has other sources as well. The Government, though loud in its cry for "free enterprise", has been itself sponsoring, through

Table I—Indices of Economic Activity in West Germany

	1950 = 100			
	1937	1952	1953	1954 (Jan-Sept)

...contributing to India's progress and prosperity

Is there any aspect of human activity which is not sustained by the use of chemicals in some form or other?

We remain in the background but our effort is vital to the industrial progress of India. New products, new processes, new usages, new techniques are being discovered daily all over the world at the cost of crores of rupees—I.C.I. England spent 10 crores on research last year. The fruits of this research are made available to India through the medium of this company.

In addition to maintaining a large staff of technical experts to service any industry consuming chemicals, our contribution extends to training young Indians in our laboratories in India, promoting fundamental scientific research at Indian Universities through endowments and scholarships.

IMPERIAL CHEMICAL INDUSTRIES (INDIA) LIMITED

ICG 126

various State agencies, a considerable amount of investments which are not strictly non-economic. From counterpart funds released through United States aid, exceeding DM 4,400 millions a year on an average, State agencies are financing private interests to expand the ship-building industry in particular. Western maritime nations were recently startled to see the world's biggest tanker being put on trial by a Hamburg shipyard. More than that, the Government has undertaken to build a new shipyard with a building capacity of 30,000 tons and employing a staff of 2,500 in the Voss sites of Hamburg.

ADVANCE IMPACT OF REARMAMENT

Underlying all these, there is another important factor: rearmament. West Germany has not yet started her programme of arms production. The London and Paris Treaties are yet to be fully ratified. But the industrial capacity for arms production is being laid. Investments in several typical armaments industries, the Financial Times recently reported, have been "under way". These industries include electronics, steel alloys and aircraft. The matter has reached the stage where "plans for the setting up of purchasing machinery are being discussed by experts in various Ministries". Military expenditure for the fiscal year 1955-56 has already been fixed at £780 million.

FINANCING OF INVESTMENT

How is this giant expansion of West Germany's capital producing industries being financed? The West German capital market has shown encouraging tendencies, but is certainly still too small to be as significant as a "collector" or "distributor" of the nation's savings. The most important source is, of course, the release of counterpart funds from United States aid. In the entire post-war period West Germany received some \$7,670 million in aid from the United States and of this some 30 per cent was given after 1950. But apart from this, corporate profits have been an important source for capital expansion. The fact that it is important suggests that the considerable rise in productivity since 1950 has gone mainly to the benefit of the capitalists.

This last is probably one of the most significant factors explaining West German "miracle". As data in Table I shows, the industries producing consumer goods

have grown less fast than the others, in spite of the fact that the West German working population has been increased by some one million refugees from the East over the past two years. The standard of consumption in West Germany, in spite of the appearance of all-round prosperity, remains dismally low, compared to that in other West European countries. The proportion of national income which goes into consumption is 55 per cent, compared to 67½ per cent in Britain and 65 per cent in France. The increase in productivity can be gauged from the increase in industrial production (per working day) compared to the rise in the working population (employed persons). Between 1952 and August 1954, industrial production (per working day) rose by 19 per cent. In the same period the number of employed persons increased by 11 per cent. And in the same period wage rates (all operatives) rose by only 1 per cent.

BANK-INDUSTRY INTEGRATION

In the mobilisation of the country's capital resources, the West German banks are, like in old days, again playing a dominant role. In the early years of Allied Occupation, the "Big Three" in Germany—the Dresdner, the Deutsche and the Commerze Banks—were split up into 30 banks. Later, after the monetary reform of 1948, these banks were reorganized into nine regional banks, that is, each of the Big Three was divided into three regional banks. Following the great success of West German banking in acquiring the initiative on the West German capital market, it is reported that soon after the ratification of the Paris Agreements (for German rearmament), the "Big Three" will be revived. The traditional role of German banking in financing industry will then be resumed and once again, concentration rather than decentralization will be the feature of German banking as is the case with German industry today.

The reorganization of the German industrial trusts which the Occupying Powers over the last ten

years were attempting to break, was recently brought to public knowledge by the reconstitution of the pre-war and war-time Guetehoffnurgschuette Steel and Coal Mining combine. Previous to this, the Mannesman Steel Trust was reconstituted; it was among the first to be broken up in 1945 and the first to be reconstituted. It has been given permission by the High Authority of the Schuman Plan organization to commence business. The other pre-war trusts are on the way to being reconstituted though none of these would be of the size of the Mannesman group which currently accounts for 5 per cent of German coal output, 6 per cent of pig-iron and 8 per cent of steel. Ironically, the Mannesman trust now owns as much steel as before the Allied "decartelisation" and twice as much coal. The full return of the big trusts is now only a matter of time.

It is expected that those sectors of the German industry which happen to be State-owned at present—not by design but largely through accident—will in due course be taken over by the trusts and combines that are now being set up or reconstituted. The State is currently the biggest producer of motor cars mainly because it had to take over and honour the obligations of the Volkswagenfabrik which Hitler had set up in 1936.

"COME-BACK ON THE WORLD MARKET"

The achievement that is referred to most often, as described by her own Minister of Economic Affairs is West Germany's "come-back on the world market". West Germany's exports are now running at an annual rate of \$5,348 million compared to \$4,389 million in 1953. In other words, the increase in exports in a single year has been of the order of 25 per cent—a feat unparalleled in European post-war history. The broad picture of West Germany's foreign trade can be seen from Table II. Western Europe (the EPU Area) is the most important market for West Germany, while the United States and Canada are increasingly

Table II—Foreign Trade Balance (DM millions)

Trade Areas	1952	1953	Aug '54	Sept '54
EPU countries	+ 2036.0	+ 2624.2	+ 284.4	+ 236.8
Bilateral "offset" countries	+ 489.5	+ 533.3	+ 29.8	— 57.2
Dollar area	— 1856.4	— 697.9	— 3.4	— 61.2
Others	+ 36.8	+ 55.6	+ 10.0	+ 9.1
Total for all countries	+ 705.9	+ 2515.2	+ 320.8	+ 127.5

becoming unimportant.

The force with which West Germany has come back into the world trade area can be gauged from comparative advances made by Britain. There are two main differences between the exports of UK and West Germany. The first lies in the destination of exports: half of Britain's exports now go to the Sterling Area while over half of West German exports go to Western Europe. The second difference lies in the composition of exports: metal, engineering products of all kinds and chemicals make up 65 per cent of West Germany's exports and 57 per cent of Britain's exports. Textiles and foodstuffs make up 18 per cent of British exports and about 7 per cent of West German exports.

DESTINATION OF EXPORTS

In 1952 West Germany's exports to the Sterling Area amounted to only about 5 per cent of those of Britain—in 1954 this rose to 10 per cent. In Western Europe, Germany has maintained its lead where its exports are now 40 per cent higher. Britain's trade continues to depend on the prosperity of the Sterling Area, while West Germany's trade remains linked to Western Europe. The significance of it will be realised when it is remembered that West European markets have expanded more than the Sterling Area markets since 1950.

British exports to United States and Canada are more important and thus more vulnerable than West German exports. In the first eight months of 1954, British exports to these markets were 12 per cent below those of 1953, while German exports were only 4 per cent lower. In Central and South America, Germany has taken Britain's place as the second largest exporter after the United States. The distribution of the trade of the two countries in these markets is given in Table III.

Table III—Exports: January-August 1954 (\$ millions)

	W Germany	UK
Mexico	21	11
Columbia	32	17
Venezuela	33	42
Brazil	93	15
Uruguay	16	25
Argentina	53	41

West German exports to all the other markets are the same as those of Britain. Britain exports more to the Middle East and Finland; West Germany exports more to the East European countries, Indonesia, Japan and Yugoslavia (Table IV).

Table IV—Exports: January-August 1954 (\$ millions)

	W Germany	UK
Eastern Europe	47	36
Middle East	141	184
Indonesia	28	20
Japan	29	25
Yugoslavia	41	15

MARK READY FOR CONVERTIBILITY

In the sphere of trade and exchange restrictions, West Germany in 1954 undertook the greatest measure of relaxation. By July of last year, over 70 per cent of the country's dollar imports were freed from all quantitative restrictions. At the same time, the maximum tariff rate on a wide number of imports was reduced from 40 to 35 per cent. In the field of exchange control, West Germany now has a non-resident transferable and dollar account system similar to that of the United Kingdom. The blocked Deutschmark arising from war-time property and other claims has been completely unfrozen. On the status of the Deutschmark itself, the 1954 Annual Report of the Bank Deutscher Lander proffered its "all-rounded view" that West Germany "had definitely reached the stage of being ready for convertibility".

Here, only a summary of the reasons for this massive increase in exports can be given. West Germany's principal weapons for export promotion have all along been (1) export credits by requesting banks to finance exporters who, in turn, extend credit

to foreign importers and, (2) liberal terms to countries which are prepared to trade under agreements (the so-called off-set countries). For example, in the trade agreement with Turkey, West Germany increased its long-term export credits from DM 160 million to DM 225 million. Apart from these two, a third and totally new weapon came into her hand in 1954—cuts in export prices to steal a march on other competitors in the same market. Thus in 1954, export prices as a whole were reduced by some 5 per cent in the struggle to win and maintain markets. That it meant a deterioration in the terms of trade (import prices fell by only 2 per cent) did not matter as long as the world economic expansion of Germany went forward unhampered.

In West Germany, the achievements of the past year have been hailed as a triumph for "free market economy". That this is a myth is, of course, now well known. The various artificial incentives to stimulate exports, the deterioration in the living standards of the West German working population, and more significantly, the re-emergence of trusts and combines of the hideous pre-war variety, belie the claim of the West German apologists. The German "miracle" is the result of astute planning, but planning of a type; its effect on the German people, harmful and it is positively alarming, from the viewpoint of the neighbouring industrial exporters.

THE GREATEST ACHIEVEMENT IN INK INDUSTRY

Of all the wonderful qualities for which Sulekha Fountain Pen Ink is regarded as the best of its kind, its unique property to baffle the adverse effects of varying climatic conditions is the most pronounced one. Be it ice cold Darjeeling or the hot region of Rajputna Sulekha Ink flows freely and uniformly from the Pen.

Is Marxism Out of Date?

A Marxologist

No, there are abiding elements in Marxism, elements which are strong enough to pass through the porous bodies of specific cultures and particular historical situations and remain effective.

It is the only clue to an historical understanding of the way the world has been going in the last few centuries at least.

ON a number of recent occasions Pandit Jawaharlal Nehru has declared that Marxism is out of date. As his speeches are seldom bowdlerised in the Indian Press, one can take these declarations to be an accurate version of his opinion about Marxism. Though the occasions were political—and in meetings, particularly, on the eve of elections, some latitude of expression is quite in order—Panditji's candour is so transparent that he can never be accused of saying anything in which he does not believe even before a crowd of unthinking voters. He would much rather lose a thousand votes than win them by verbal dexterity. In fact, if our memory does not fail us, on one occasion he went so far as to appreciate the 'economics' of communism. So there can be no suspicion of political design behind the expression of his opinion. It is in no sense an ideological counter-move against the Communists either in Andhra or in Travancore-Cochin. That was his view in 1940; and it continues to be so in 1954. And none but a fool will interpret it as a gesture towards the UK and the USA, or a stance against China and the USSR to prove his genuine independence of attitude.

AS A TOOL OF RESEARCH

Yet, the statement demands scrutiny on its own merit. Students of ideas should be grateful to Panditji for sharply focussing their attention on an ideology with which the destiny of about eight hundred million people are tied and on a theory to which quite a number of intellectuals no less aware of the living problems of the age than Panditji subscribe. Those who will read this article need not be told who they are. Marxism, instead of being discarded as out of date, is being used as a tool of research by positively first-rate scholars from archaeology to zoology. It is not a political view having no connection with the technique of research; it is claimed by these scholars that Marxism has helped them to understand their respective problems in a new light. And it has happened not merely in the physical sciences and the social disciplines; it has also affected philosophical, literary and

aesthetic criticisms, though not fine arts and metaphysics to that extent. Surely, Panditji knows a few of the Marxist scientists, even if he is not interested in the history of art. So he must have meant something else which he had not the time to elaborate.

M N Roy also used to say that Marxism was out of date. We know that he had outgrown it. But his approach was different. He put Marx in the grand tradition of humanism and found Marxism as interpreted by some people, to be a bar sinister to humanism. Not quite a strikingly original point of view, but for most young intellectuals it was. In answer to his argument it could probably be maintained that far more than the concern for theoretical constructs to which objections have been laid, Marx's own writings reveal his passion for social justice, his deep involvement with the future of man—the future that is jeopardised by capitalism, and above all, his stern call to the dispossessed to make history in full possession of their wits. Of course, M N Roy was a thinker, though in his lifetime only a few recognised him as one. Today, Panditji is doing the work of thinking for the majority of Indian people. Indian intellectuals pretend to think; and whatever they may have 'thought', which is not much, never gets across to the people, no, not even to the student community. Panditji fills this vacuum.

JAWAHARLAL'S OBITER DICTA

To put it specifically, few, very few Indian academics know their Marx, and the majority of the literate have heard of him as a materialist, atheist, revolutionary and what not. As nature abhors a vacuum, and as Gandhiji's ideas do not form a theoretical system, and, still further, as Indian culture is usually identified with revivalism and tends to make most young men who are itching to think, feel ashamed, Panditji's obiter dicta remain the only stimuli to the majority of the people. None can deny his supreme services to adult education; he has made thousands of men and women world conscious. All honour to him for that. Yet the

fact survives that his pronouncements are not substitutes of thought—the thought that is the result of obstinate vigour of reasoning. This writer at least feels that Panditji must needs elaborate his view that Marxism is out of date.

INDIAN MARXISTS DISCREDITED

Meanwhile, let us guess what he means. If he refers to the Indian Marxists of the Communist Party, then one can hardly differ from him. For them Marxism is a series of slogans raised by other people in other countries. It is difficult to trace in their writing a single original rendering of Marxist thought in the light of Indian conditions. The real charge against them is not so much their out-of-dateness as their ignorance of the second elementary dynamics of knowing that knowing ceases to become a dogma—which means in this case out-of-date prejudices—only when it is related to, and in a general way, springs from the facts of specific existence, which means Indian existence in course of emergence. The Indian Marxists only related knowing—that is, theory, to action, and bare physical action at that. They were not interested in the growth of Marxism, nor in the study of actual evolving conditions of Indian life. No wonder that they have been mostly in the wrong, that they have not produced anything worth reading from the point of view of thinking.

SOCIALISTS ARE WITH NEHRU

Who else in India could Panditji refer to whose Marxism is declared to be out of date? Leaving aside M N Roy only the Socialists remain. Are they Marxists? Hardly. Among the top Socialists of India there is more of Bernstein than of Marx, more of Gandhism than even of evolutionary socialism. Bhoodan is not Marxism by long chalk, nor is theosophy, nor is world-consciousness. Only one Socialist leader still believes in class-conflict, which one usually associates with Marx and Marxism. Otherwise, from the point of view of thought, the Indian Socialists are just not Marxists, whatever else they may be. If they have outgrown Marx, as some Socialists assert, then they are with Panditji. He could not

50 YEARS OF PROVED Caterpillar

In 1904 Benjamin Holt introduced his 'Caterpillar' track type Tractor, the first commercially successful machine of its kind ever built..... 1931 heralded the entry of the 'Caterpillar' Diesel Tractor, a distinctive mile post on the long trail of agricultural history..... In 1954 the latest model of 'Caterpillar' track-type tractor is bigger and better than ever before, a dynamic symbol of industrial progress.

TODAY In addition to five sizes of track type tractors, Caterpillar Tractor Co. manufactures Wheel-type tractors, Diesel Engines, Motor Graders and Earthmoving Equipment. 'Caterpillar' products can be found in all parts of the world working on deserts and forests and ice-lands, on private and government projects laying vital concrete roads, building bridges and dams, tilling and terracing out farms, etc.

have them in his mind when he declared Marxism to be out of date. The young Socialists are not yet in the picture. And the splinter-groups that take the name of Marx are not important enough for Panditji.

A HOUSE OF MANY MANSIONS

Is it then that the reference was not to parties and men but to certain lines of action? Here the difficulties of identification are greater. Marxist action is a house of many mansions, but it has no room for insurrectionism, which is the theory of Blanqui, Bakunin and Co rather than of Marx, Engels and Lenin. Telengana is as far away from Marxism as defence expenditure, community projects and national extension blocs (Fordism) are from Gandhism. Is the socialist programme of action, say the agitation against enhancement of irrigation rates, Marxist? The local programmes of action undertaken by the students in their ample spare time are more in the nature of crowd action than anything else. So far the Congress programme has been alleged to be Gandhist and empirical. Its line of action has been definitely non-Marxist. The Five-Year Plan is hitched to the binary star of mixed economy. Its economic theory is orthodox in the main. Its theory of Welfare State Marx would have abjured. It may have a dialectics of its own, but it resembles Dewey's instrumental logic rather than Marx's dialectics. In any case, Panditji could never have accused the Congress programme of anything so ancient as Marxism.

CHARGE OF OUT OF DATENESS

So the reference is most likely to be to the Marxist theory. That is out of date in his view. Panditji is in eminent company if he considers the following features of Marxism as out of date, eg, the labour theory of value, which incidentally is Smithian cum Ricardian, the theory of surplus value, the theories of class conflict, the law of increasing misery, the impending doom of capitalism, dialectics, which is more of Engels than of Marx, dictatorship of the proletariat, which is definitely Lenin's show, etc. He will also be on the side of angels if he considers the anthropology of Engels crude, the rationalist psychology of Marxism to belong to the eighteenth century and Marx's theory of prices insufficient. Nearly all professors who have read about Marx in books written by professors have been repeating these criticisms for quite some time by now. Bohm-Bawerk declared Marxian economic

system closed about fifty years ago; Keynes relegated Marx to the under-world twenty-five years ago; and Sombart and Schumpeter had been desperately trying to cast out the original sin in the last days of their life. It is all in the textbooks of the history of economic thought most familiar to Indian students and teachers alike. And, of course, no well-known metaphysician ever took Marx seriously and most philosophers have had a dig at Marxism at some time or the other. The historians we know never could discover any pattern in history; and those who do, like Toynbee for example, have discovered non-Marxist, idealist or Christian patterns. The same with the sociologists. And most proper scientists were either deists or idealists all along.

So the indifference to Marxism, the hostility to Marxism, the misunderstanding of Marxism, the declaration of Marxism as an out-of-date dogma are all ancient occupations of the intelligentsia, more ancient than their allegiance to Marxism. Even the attempt to evacuate Marxism out of the system, if one had gone to it at some salad days of youthful enthusiasm and irresponsibility, is old. To the last category belong a whole host of intellectuals whose genealogical tree is not a new plant. The charge of out-of-dateness is itself an out-of-date charge, if it were not just a matter of personal outgrowing.

ABIDING ELEMENTS

All said and done, Marxism as theory survives in France, England and Italy, and is living vigorously in eastern Europe, Russia and China, both in theory and practice. There must be reasons to it. It will not do to say the Chinese Communism is so Chinese as to have ceased to be Marxist. That will be self-delusion. Mao's writings would disprove it. Similarly, it would be idle to hold that the Russian economic and social structure has gone off the Marxian rails. That would mean that the cold war is a shadow fight. No, there are abiding elements in Marxism, elements which are strong enough to pass through the porous bodies of specific cultures and particular historical situations and remain effective. Which means that Marxism, as a theory, was never, and still is not, a dogma. Idealism, too, was not and is not. The only point about the former is its greater fit with the modern situation in which it is difficult to perceive the priority of ideas to life when life itself is being crushed, in which advance in

technology is incidental to profit and more profit, where the noblest of spiritual ideals are used as cover for exploitation, where the highly developed means of communication are used to take the mind of man away from reality and the free scrutiny of ideas. One would also like to think that the test of an 'ism' is its usefulness for the understanding of the social process. Who passes the test, Toynbee, Spengler, Schiwietzer, Sorokin, the phenomenologists, the existentialists, the neo-realists, the neo-Thomists, Gandhiji, or Marx and Engels? Toynbee and Spengler offer no hope at all; Schiwietzer and Sorokin do not seem to offer any clue to the past that is in the present and moulds it for the next phase; and the other recent philosophical systems of the West are not interested in changing the shape of the world.

GANDHIJI'S CHANGE OF HEART—NO THEORY OF SOCIAL PROCESS

Gandhiji alone was interested in changing the shape of the world, but the world he wanted to change was the immediate world of political subjection and the economic miseries of the poor. And of course, one knows his vision of India. But his principle of change was psychological, viz, change of heart. Its operation would, in his view, do the needful for an ethical order which he could identify as socialism. But if one believes that human nature does not change except under the heavy pressure of life's needs, then this change of heart does not add to our understanding of the social process beyond a certain point. That point is only known to Grace. But there is a whole way to go beyond that theometrical point. And if one has to travel some distance in that way, change of heart is only a name for the fact that for some reason or other somebody's heart has changed. This is not much of a theory of social process. It is good for explaining individual conduct, but inadequate for the aggregate historical behaviour. Gandhism is non-historical in this sense; perhaps it is too eternal to be historical. On the other hand, Marxism is definitely historical. It is the only clue to an historical understanding of the way the world has been going in these few centuries, at least.

A WORLD OF GOOD

One could take the calculated risk of stating further that a bit of Marxism would do us a world of good. A

Marxist approach could tell us a lot about the nature of the State, about the processes of knowledge formation, ie, what is known as sociology of knowledge, about the nature of economic crisis—that blind alley of modern economics, about a good deal of the transition from feudalism to commerce and industrial capitalism and of its protean protective colourisations, about the recent happenings in the world, and particularly in India. If our experiments in planning were a little more Marxist than what is permitted by the non-Marxian doctrines of Welfare State and mixed economy, our failures would have been less and our successes greater. At any rate, the tempo would have been definitely faster. This is not a matter of faith but of reasoning. One need not have the faith of the Indian communist to be a Marxist. It is enough to know Marx and argue from his theoretical premises. The danger of being superficially modern in declaring everything which is not up to the minute as out of date looms over every drawing room of Bombay, Calcutta and Delhi. Let it not cast its shadow over the counsels of a party or a government that is officially pledged to Socialism. And Socialism without the Marxist core is jelly-fish.

A COAL-BASED THEORY IN ATOMIC AGE

There is probably a larger, a very much larger sense, in which Marxism may not be quite up to the minute. The economic theory of Marxism is based on the energetics of coal and iron. Lenin extended it to electricity. Now atomic energy is coming. Will Marxism be thrown out? When atomic energy will be available to everybody in some shape or the other, then Marxism like other 'isms', except anarcho-humanism, will die of disuse. But there is plenty of scope for Marxism in understanding the transformation of coal, iron, petroleum, interests into socialised interests served by atomic energy. And this process has been described by many scientists. Paradoxically enough, it has been pointed out only by those scientists who do not consider Marxism to be an ancient superstition, who are not ashamed of being called back-dartish for their Marxism. So in many ways and from many an historical angle there is still plenty of life in Marxism pace Panditji. In any case, our atomic energy, it must be admitted, has not yet been socialised.

The Third Alternative

Balraj Puri

The assumption behind the controversy public sector vs private sector that capitalist undertakings and State undertakings are the only and exclusive alternatives, is unreal and false. There is a third alternative. No tear need be shed if capitalists, monopolists and exploiters are eliminated.

Let us not put exclusive reliance on bureaucrats as their substitutes. Let the capitalist system be replaced by a decentralised and cooperative economy which would assure the common man not only more bread but also greater freedom.

THE respective roles of public and private sectors in India's economy were discussed in the last week of 1954 by three leading economists of the country at what was supposed to be an academic level. Dr V K R V Rao, Prof C N Vakil, and Prof D R Gadgil, participating in the 37th conference of the Indian Economic Association at Agra, selected, probably coincidentally, identical themes for their public lectures. Notwithstanding some unavoidable repetition, however, the three lectures were, on the whole, complementary to one another. This discussion at Agra deserved better notice by the Press as it would have helped the public to understand the key question of India's future set-up and also to realise some of the gaps in this discussion as also in similar other discussions on the subject.

SOCIALISM INCONSISTENT WITH PRESENT CONSTITUTION

Initiating the discussion, Dr Rao dwelt at length on the probable trends in India's economy. Piling up evidence after evidence and quoting profusely from the utterance of the men in authority he drew the conclusion, which was rather obvious, that the public sector would go on expanding and the private sector would be accorded a subordinate role in the national economy which will have to function under the control and guidance of the State. Dr Rao then pointed out the incompatibility between the socialistic professions of the Indian leaders and the provisions of the Constitution. Even a mixed economy, he suggested, cannot function under the existing Constitution. For a mixed economy presumes the reservation of certain fields for the public sector which means that private enterprise is not to be allowed to function in those fields. But the Constitution not only grants the right to acquire, hold and dispose of property without any qualification but also guarantees the right to adopt any profession or business to all citizens.

Thus no area of economic activity can be declared, constitutionally speaking, to be out of bounds for private enterprise; but this is contrary to the conception of mixed economy.

Dr Rao thus implied that in order to make planning effective, the State would have to be armed with more drastic powers and some of the fundamental rights granted by the Constitution would have to be withdrawn. He also implied that the relations between the States and the Centre would have to be revised so as to make the grip of the latter over the former somewhat stronger. Co-ordination, guidance and control by the Centre are, according to him, necessary for the effective implementation of the Plan. Present provisions of the Constitution, he felt, do not give sufficient powers to the Centre. Due to a single party being in power in almost all the States at present, there is a singleness of objective that should make co-ordination and central control much easier. But in the event of different parties coming into power in different parts of India, which is not unlikely, the Centre might become ineffective and planned development of the country would be seriously handicapped.

MISBEHAVIOUR OF PUBLIC ENTERPRISE

Prof C N Vakil picking up the thread, dealt with another aspect of the question. If private enterprise is misbehaving, he pointed out, public enterprise is capable of worse misbehaviour. He quoted many instances of errors of judgment and miscalculations on the part of government leaders. He also recalled the contention of the Finance Minister that there was no incompatibility between the private and public sectors and asserted that the talk of co-existence between the two was only diplomatic in character as the former had already been served with a quit notice and at the most, it can only mark time. Prof Vakil,

however, refused to be called a champion of private enterprise either. Whose champion, then, was he? If private and public sectors are both evils and cannot co-exist, what is the way out?

Dr Rao, too, left some of the implications of his analysis hanging loose. Arming the Government with absolute powers and making the Centre stronger certainly have some totalitarian implications. The concentration of economic power in the hands of a handful of capitalists is bad; it is against the social interests and also that of the economic growth of the country. But even the concentration of the same power along with absolute political power in the hands of a group of politicians has some dangerous potentialities. A strong Centre might enable economic planning to be more effective, administratively. But initiative from the bottom would disappear and by shifting the responsibility from local to central level, people's co-operation, even to the extent it is available at present, would not be forthcoming except through methods of coercion. Even from the point of view of economic development, a regimented set-up, might not prove to be more effective, apart from the cultural and political stagnation that it would generate. The fate of totalitarian experiments in economic development is too well known by now and there should not be much temptation to adopt that very procedure in this country.

Prof D R Gadgil, in his speech at Agra, he defined the role of an economist as a detached expert who would simply prescribe certain courses to be followed in order to achieve

WHY YOU SHOULD INSURE WITH NEW INDIA

India's greatest Composite Insurance Company

FULL SECURITY

Like all great financial corporations, the New India Assurance Company believes in, looking ahead. It plans for its own future — realising, at the same time, that this is closely linked to the future of its policy-holders.

EXPERT SERVICE

Alone among Indian insurance companies, New India runs a school where it trains all its agents, so that they can offer you the right policy for your needs. New India's trained agent can offer you the best insurance service.

FULL PROTECTION, ANYWHERE

The New India Assurance Company is *unique*. It underwrites both Life Assurance and General Insurance. Whatever the protection you may be seeking — Life, Fire, Marine, Motor, Aviation, Machinery, or Live-stock — a New India policy will provide it anywhere in 46 countries of the world.

Foresight and planning have turned New India, in just 25 short years, into the greatest composite insurance company in India — a world-wide company, with branches or agencies in 46 countries.

HIGHEST RETURN

Even as you read this, the New India Assurance Company, 25 years young, is planning for the future.

Its plans include further expansion and greater benefits — in which you will certainly share, should you hold a New India Assurance Policy.

THE NEW INDIA ASSURANCE COMPANY LIMITED

certain social objectives set by the statesmen. India has accepted a socialistic pattern of society as its goal. Prof Gadgil would not discuss the merits and demerits of this objective as he considered that this was outside the scope of his subject. He did, however, criticise the Government for not pursuing certain courses without which socialism could not be built. Social ownership of the means of production and better distribution are the *sine quo non* of Socialism and the Indian Government by not adopting these policies was not being true to its professions.

This delimitation of the field of economics by Prof Gadgil has, no doubt, certain virtues. In developing his theoretical equipment an economist can usefully take an objective view of things. "Economics is neutral between ends," said Prof Robbins. But the same economist also suggested, "An economist is a poor economist if he is simply an economist and nothing else." When an economist suggests measures of practical policy, he must needs be a bit of a statesman, a sociologist, a constitutional expert and many other things. All that is required of him is to be conscious of his other capacities. In the same way a statesman should also be a bit of an economist. For there cannot be any policy which is purely political or purely economic. Every public policy must be an integral whole having many aspects—economic, political, cultural, etc.

AD HOC MEASURES

What we lack today is an integrated policy—an integration of economic plans, social objectives and political aspirations. Something might be said in favour of an empirical approach not based on any 'ism'. "We face the problems," said Pandit Nehru, "as they come." But this approach of *ad hoc* economic measures and *ad hoc* socio-political experiments without any idea of the ultimate picture cannot carry us far. The discussion about an industrial system for India—Public vs Private Enterprise—should take place against some perspective, for like any discussion of practical policy, it involves explicitly or implicitly value judgments.

We do want a rapid rate of economic growth, but not at the cost of the people, i.e., by further tightening their belts and prolonging the period of suffering. In

other words, we want simultaneously a rise in living standards and a better distribution of the increased production. The period of initial capital expansion always entails sacrifices which Soviet Russia extracts from her people through a totalitarian and ruthless State machinery and which *laissez faire* England forced her working people to undergo, shifting part of the burden to her colonies. Since a totalitarian set-up and an imperialist policy are both ruled out, the economic growth of this country should have a new pattern. Let the economists and the statesmen of this country—whether as economists or statesmen or both—keep these objectives and given conditions in view in formulating a theory of development and suggesting an industrial system for India.

DIFFUSION OF ECONOMIC POWER

The capitalist system, characterized by concentration of wealth and means of production in a few hands, stands in the way of achievement of our objectives in two ways. Economic activity being primarily determined by the profit considerations of the few, need not necessarily be in the best interests of the nation and the utilisation of resources may not take place in a desirable and planned manner. The second disadvantage of the concentration of wealth is from the point of view of distribution which incidentally also affects the tempo of economic activity. If we do not want the few to exploit and dominate the rest, we should devise a system in which economic and political power is shared by the maximum number of people. The transfer of the concentrated wealth and ownership from some capitalists to some 'representatives' of the people alone would not enable the common man to share the economic and political power which would still be exercised by others and not by him with the difference that it would now be done on his behalf. But democracy would remain incomplete till it is not only for him but also by him.

This can only be done by maximum diffusion of economic and political power and making the unit of economic and political activity as small as possible so that an individual behaves at a level at which he can have a significant say in the matter. Let every member of the big community of 360 million Indians behave as a distinct entity and as an end in himself and not as an

insignificant part of the mass, just one more in a crowd, just an instrument in the service of the mythical interests of the nation or the class.

THE CRUCIAL ISSUE

If we have this objective in mind, the controversy of public vs private sectors seems less important than that of bigness and smallness of industries and of an appropriate political framework. There has been no lack of tall talk in this country about cottage and small-scale industries. But probably in no other case the gap between the professions and the policies of the Government is so wide. It is not a question of encouraging or protecting this industry or that, it is a question of organising our entire industrial system on a big or small level. Apart from the confession of the Finance Minister that his Government might be blamed for the neglect of cottage industries, some commonplace facts speak louder. If we had even a small preference for a smaller size of industries, could we not import small machinery worth a few crores from Japan or some other country or set up a small machinery producing factory ourselves, instead of or in addition to the one producing machine tools for big industry at Bangalore? The net result of our seven-year industrial policy is that not even a single additional industry has been organised on small scale.

The net result of our scientific policy is that no new invention or technical improvement has been made in the organisation of any small industry. The direction of our financial policy too is not different. The Government has no doubt provided assistance of a few crores of rupees to small enterprises for their subsistence. But does that stand any comparison with the hundreds and thousands of crores given to encourage and help big industrialists who have also the advantage of raising credit in the market and get accommodation from the banks and insurance companies? The small producer in India hardly gets any credit from non-official organised financial institutions, whereas in Sweden, we are told, loans granted to small enterprises constitute 35 per cent of the loans from commercial banks to industries and service trades. A radically different approach is thus called for on the part of the economists, Government policy-makers, scientists and financial concerns to make industrial units smaller.

THE NEGLECTED SECTOR

True, some industries cannot be of small size, till technology develops in that direction. In such cases, steps should be taken to reduce the unit of ownership. More and more of our economy is coming under the domination of a few business houses. What we need, from the point of view of both development as well as distribution, is an arrangement to enable small investors to pool their resources and set up big undertakings. The industrial policy statement of 1948, did accept industrial co-operatives as one of the major objectives of the Government. The record of the first four years of the Five-Year Plan is very discouraging as far as this objective is concerned. In the two pages devoted to the co-operative movement in the bulky Progress Report of the Plan, industrial co-operatives are not mentioned at all.

It is the Shroff Committee, however, which gives us some figures of industrial co-operatives. There are only 1,652 societies, it tells us, with a working capital of Rs 8.65 crores. Out of this capital, more than two-thirds is concerned with handlooms, most of which was in existence before the Plan started. A paltry sum of Rs 10 lakhs provided in the Plan for training of personnel in all types of co-operatives still remains unutilized. If we view co-operation as a form of economic system—as an alternative to capitalism and communism—we cannot help the feeling of despair at so indifferent an attitude towards it on the part of our planners. The industrial policy of our Government, on the whole, makes it abundantly clear that whatever be its objective, it certainly does not aim at establishing the economic system on the basis of small industrial and ownership units. Yet, some bold steps in this direction alone can secure maximum employment, equality and freedom. What other ingredients of socialism are more important than these?

This could be a partial answer to the controversy about public versus private enterprise. Partial, as it has not dealt with many aspects of the controversy.

CO-ORDINATION, NOT CONTROL

The discussion of capitalist undertakings and State undertakings as the only and exclusive alternatives is unreal and a society could be gradually built on what might be called a third alternative. No fear need be shed of capitalists, monopolists, exploiters

ters is eliminated. But let us not put an exclusive reliance on bureaucrats and Government leaders as their substitutes. Let the capitalist system be replaced by a decentralised and co-operative economy which would assure the common man not only more bread but also greater freedom.

The activities of petty producers, co-operative undertakings and State enterprises would need co-ordination. An effective system of co-ordination between these sectors, as also between States and Centre, can do away with the necessity of rigid controls and centralised power. This can best be attained by taking the economic activities of the State out of the orbit of party politicians, as far as practicable. An all-India economic service or a managerial cadre could be trained to undertake the responsibility of economic development so that whichever political group comes into power the co-

ordination already achieved is not much disturbed. This would also help in running the State undertakings on business lines and raising their efficiency.

A new sense of responsibility is also needed on the part of political parties and some very radical reforms are called for in the political and administrative system. Here we are confronted with some undefined regions between the borders of economics and politics where specialists of both fields feel shy of intrusion. But an integrated philosophy of development cannot overlook these gaps and we certainly need an integration and synthesis of the philosophies of economic security and political freedom. The lessons of the political thoughts of last one hundred years and of the political experiments in various countries in the last forty years clearly indicate that freedom and bread are, in fact, not separable.

Pakistan—A Bi-zonal State.

Hashoo Kewal Ramani

Basically, the merger plan is a desperate measure to preserve West Pakistan's strategic hold, military no less than political. The plan was brewing in the secret counsels of the top men long before it was made public. Its other purpose is to bring the strategic but backward parts of West Pakistan under unified administration for a more effective and speedy utilisation of their rich mineral and agricultural resources.

The fact that West Punjab has received two million more refugees than the number of evacuees, and the continuing influx of refugees from India by the Khokropar route at the rate of about 6,000 per month indicate the direction in which further resettlement of population may be expected.

The test of its success will be the scope that the merger can give to the democratic forces to remove the wide disparities in the land tenure system.

SEVEN years of continuing crisis shadowing Pakistan since its birth, arising from the incongruity of its ethnographic composition and socio-economic pattern, have now led to certain desperate measures for saving the State itself. Stemming from an "act of State" that dissolved the progenitor of the State, viz, the Constituent Assembly, the new phase has brought with it its own complexities. Under this state of emergency, a new scheme has been formulated to reconstitute Pakistan as a bi-zonal State which would be neither unitary, nor confederal, but will maintain a delicately balanced "partnership of equality" between the two wings of Pakistan.

The integration of various provinces, princely states and tribal territories of West Pakistan into one administrative and political unit is the corner-stone of the new scheme. Indeed, it was its refusal to accept the merger plan sponsored by the Punjabi group that really sealed the fate of the Constituent Assembly, just when it had finalised the draft Constitution. On all other aspects of this "Islamic" Constitution, there was refreshing unanimity among the rival groups. What the Punjabi group resented most was the perpetual threat of an encirclement from an alliance between the representatives of East Bengal and the non-Punjabi elements in West Pakistan. The dominance of Punjab in the Army, police, civil services and other walks of life, even outside West Punjab, being an unchallengeable fact, the Punjabi reaction set the tune for what followed.

FORCES BEHIND MERGER PLAN

This genesis of the move for unification of West Pakistan is bound to colour whatever positive results are expected from the merger as a device to abolish provincialism by

abolishing provinces. The methods adopted to push through the plan in West Pakistan have been, to say the least, extremely unorthodox. In Sind particularly, where the ailment has been the same as in East Bengal, the reaction is articulate and sharp, and to that extent, the suppression of the opponents to the merger has been ruthless and high-handed. No less disturbing is the language of provincialism used by the pro-merger advocates themselves, as if they conceive the West Pakistan single legislature as the cockpit where the same clash of regional claims and counter-claims will be enacted again, with even greater vehemence.

While the acceptance by West Punjab of 40 per cent representation instead of 56 per cent to which it is entitled according to its population is a concession to win over the non-Punjabi population, the idea of weightage has itself a "provincial" bias. Further, the decision to continue the present system of provincial quotas and reservation in central government services and trade licences emphasises the perpetuation of the same bias. Even on the issue of the choice of a new capital for West Pakistan, or the appointment of the first Governor or Chief Minister of the new unified province, similar controversy animates the pro-merger elements. The failure to weld the two wings of Pakistan into a unitary system has aroused the fear that even if the provinces cease to exist, the politics of provincialism will not be exorcised.

CHANGING THE PSYCHOLOGICAL CLIMATE

However, the desperate nature of Pakistan's internal crisis has made the optimists hope that the merger plan may, in the long run, change this psychological climate and facilitate the formation of political par-

ties based on some programme and ideology cutting across these provincial loyalties. Such a hope can be fulfilled only if democratic forces are strengthened and given a free play, not by curbing these forces and putting them into the strait-jacket of a pre-conceived plan. The malaise of provincialism has its roots deep in the historic and socio-economic developments; the post-partition shifts in the population of West Pakistan, and the marked disparity in the social development of the different linguistic groups have intensified it. The parochial elements, not all of whom are evil or reactionary, have been egged on to revolt, as in East Bengal, by the arbitrary and biased policies followed by the Centre so far.

Much will, therefore, depend on the quality of leadership that comes to the top as a result of the merger. If the present ruling League leadership continues to remain in power in West Pakistan, the expected move for national solidarity can come only from the Oppositionist parties. Most of these parties, however, have either opposed the plan, or condemned its enforcement without securing the popular verdict.

THE ECONOMICS OF UNIFIED ADMINISTRATION

Basically, therefore, the merger plan is a desperate measure to preserve West Pakistan's strategic hold, military no less than political. The plan was brewing in the secret counsels of the top men long before it was made public. Its other purpose is to bring the strategic but backward parts of West Pakistan under unified administration, for a more effective and speedy utilisation of their rich mineral and agricultural resources. Such a development programme in the underpopulated but potentially rich areas

Model-Making and the Second Plan

K N Raj

The rate of saving particularly at the margin is one of those institutionally conditioned responses which cannot be changed at will without certain operational levers in hand. If a socialist pattern of society is the objective, it is a matter of basic importance who does the investment, to whom accrues the income, who is called upon to save, and how all the loose ends are tied up.

Deficit financing is of course possible but only upto a point and, in a completely decontrolled economy, only under circumstances which can change at any time and cause sudden dislocation.

If model building is regarded as some kind of a wondrous technique which will somehow help us to move on without having to face the political and, to a smaller extent, the administrative problems which have all along been shirked, much time will have been lost in arriving at decisions which, in other progressive countries, have preceded model making.

PUBLIC interest in the second Five-Year Plan has been stimulated in the last few months by a succession of high-level policy statements. The first of these came from the Minister for Industries and Commerce when he announced his 'six million tons' target for steel; it was only logical to conclude that, if steel production was going to be stepped up by more than 200 per cent, the Government must have in view also a supporting programme of industrialisation which could absorb the steel. The Finance Minister followed up soon after with his employment target of 24 million additional jobs in ten years. And to top it all, the Prime Minister came out with his declaration that the objective was a socialist pattern of society.

An obvious question to ask, however, is how these are to be achieved. A complete answer cannot of course be expected at this stage, since the targets must be broken down, linked with each other, worked out in terms of resources required and available, and pieced together again before all the implications are clear. This is the job of model-makers, and it would be grossly under-estimating the technical complexities of their work to presume that what they themselves can arrive at only through multiple correlations and elaborate regression equations can be foreseen by others who do not, in the first instance, have the required statistical and technical data and who, even if they had, would not know what to do with so many little rats running in so many directions.

INVESTMENT AND SAVING

But even if input-output matrices and linear programming are outside the normal beat of the economist, and he cannot pretend to be

able to prejudge issues which have yet to be thrown up, there are certain relationships which he understands. One of these relationships is that industrialisation, even of the not so capital-intensive kind, requires a larger amount of capital per unit of employed labour than normally exists in a pre-industrial society; if then more manpower is to be absorbed than ever before alongside a programme of industrialisation, the rate of investment must also be substantially higher. Secondly, a higher rate of investment, even if it may not require a reduction in the absolute levels of consumption, must be matched by a higher rate of saving out of the increased incomes, but the rate of saving (particularly at the margin) is one of those institutionally-conditioned responses which cannot be changed at will without certain operational levers in hand. And last but not least, if a socialist pattern of society is the objective, it is a matter of basic importance who does the investment, to whom accrues the income, who is called upon to save, and how all the loose ends are tied up. (Talking about loose ends, we must remember that it is often the tail that wags the dog!)

These are almost platitudes, and yet one has only to examine the experience of the last few years to see how much of the administrative and political implications of planning still remain to be understood and accepted before any models of the kind that are being attempted now can be the basis of action and achievement. To illustrate the point, it is sufficient to touch upon a few of the more prominent facts which are open to verification.

In the first place, it is clear that in this period the only increases in

investment activity, of a kind that can be regarded as promoting economic development, are those which have been undertaken under the auspices of the Government, either directly or indirectly, and for which the financial resources were therefore found by the Government (foreign private investment is in one sense an exception, to which we shall come shortly). The other increases, so far as one can judge from available data, have been almost entirely on account of building activity on an expanded scale, which, however much it may help to alleviate middle-class discomforts, cannot be regarded as directly assisting economic development.

WHERE ARE THE FUNDS TO COME FROM?

Other things remaining the same, we must expect therefore that the rate at which 'productive' investment can be increased in the future will depend upon two factors: the rate at which Government can organise investment of this kind, and secondly, the extent to which Government can finance such investment. Both of them are almost equally important. In fact one has only to see the immense shortfalls in planned Government expenditure (incidentally, the shortfall in 1954-55 is likely to prove an all-time record) to realise how serious the organisational problems can be. But we must proceed on the assumption that these organisational difficulties will be progressively overcome; the choice of projects which involve bulk spending, as in heavy industries, power generation, railway transport, and irrigation, may itself be of help in this regard, and if the required funds are available it is always possible to expand the system of Government lending money for approved investment schemes in the private sector.

of Sind and Baluchistan, where oil concessions have already been granted, would necessitate free and unhampered shift of population on a progressively large scale. The fact that West Punjab has received two million more refugees than the number of evacuees, and the continuing influx of refugees from India by the Khokropar route at the rate of about 6,000 per month indicate the direction in which further resettlement of population may be expected.

The unification of West Pakistan should reduce the expenditure on administration, though the official figure of the net annual saving from it may be exaggerated. Khan Abdul Ghaffar Khan's alternative proposal of effecting slightly less saving by setting up two units (West Punjab and the rest) was turned down for obvious reasons. The princes may possibly receive a smaller privy purse and only for their life-time.

The over-all budgetary position may also improve as a result of the pooling of resources which would compel the surplus provinces to share the burden of the deficit provinces, until such times that development projects may mature and alter the situation. The annual subvention received by Baluchistan and NWF Province may continue after the merger. It is also clear that the problem of central allocation of revenues to various provinces, under the Raisman Award would be simplified as income-tax receipts will have to be shared between the two wings instead of being distributed among a number of claimants. East Bengal, however, is not likely to be happy at the revised decision to include in the western unit the city of Karachi (excluding the Federal Area), which contributes a major share of the income-tax revenue.

FREER TRADE AND BETTER PLANNING

The abolition of provincial barriers within West Pakistan would produce a "large and automatic" economy, enabling trade to flow in one single market throughout West Pakistan and eliminating price disparities, local inflation and artificial scarcities. Similarly, the establishment of a single authority for Power, Irrigation and Development projects would facilitate economic planning in this region. Hitherto, inter-provincial conflict of interests, such as the old Sind-Punjab dispute over the utilisation of the Indus river

water, has had a retarding effect on planning. The pooling of resources would result in savings and ensure more uniform and balanced development of the economy as a whole. Provinces like NWF Province with inelastic and inadequate sources of revenue would be benefited, as presently they cannot undertake even modest measures of development.

The merger will undoubtedly place the industrial and commercial sections in a position of greater advantage. These sections, however, consist almost exclusively of Punjabis and refugees from India. The reaction against them and against their kinsmen who invariably come in their wake as camp-followers, has already been formidable in the backward areas. Though these modernised classes, who have now taken the place of the displaced non-Muslims, are propped up as the heralds of civilization in these backward areas, playing their historic role of injecting a sense of nationhood into this heterogeneous mass of people, their activities during these seven years have produced a powerful parochial reaction against them. How this reaction expresses itself, under a centralised administration that orders the posting and promotion of particular civil and police officers in particular areas, will determine the pattern of future politics in this none-too-peaceful region.

BARGAIN WITH FEUDAL ELEMENTS

So far, the fact that the local feudal lord has been the pillar of local resistance has brought into play subtle processes of bargaining as a result of which the trading and industrialist classes could move in without disturbing the feudal interests. The merger plan has been advertised, rather furtively, as a step towards the liquidation of these feudal interests and the introduction of an expanding market for the commercial and industrial progress of the region. However, as in Sind, the alliance with a traditional custodian of feudalism like Mr Khuhro, who has gradually won over other Zamindari elements on his side, indicates the new process of bargaining that is taking place. It is the Sind Hari (Peasant) Committee leaders and progressive Opposition leaders like Mr G M Sayed who have opposed the merger plan at the risk of inviting savage repression against themselves. The demonstrations against the merger

plan by the students and Government servants in Sind also reveals another side of the story. What the Pathans and Baluchis, and even refugees in Karachi feel may not find expression in violent outbursts but it will also be a factor influencing the future pattern of politics.

As a *fait accompli*, even as Pakistan was seven years back though by very different methods, the merger plan will remain a challenge to its authors for producing some positive results. In the first place, it will be a challenge to produce, by whatever democratic means that may be feasible, a uniform pattern of agrarian reforms throughout West Pakistan. The present disparity in the land tenure system, from one province to another, is an anomaly that can no longer be tolerated by enlightened public opinion. So far, even the modest land reforms recommended by the Muslim League High Command in 1949 have not been put through in their entirety.

The disparity among these land tenure systems is enormous. In Bengal, it is Zamindari permanently settled; in West Punjab and NWF Province, Zamindari and village communities temporarily settled; in Sind, Ryotwari; and in the tribal areas, there is no tenancy law whatsoever, so that the tiller is entirely at the mercy of the tribal head. The disparity in land holdings is enormous in the backward areas and accounts for the backwardness of these areas. What scope government policy gives in the immediate future to the democratisation of this feudal order, or what compromise is struck with the feudal elements, will be, by and large, the decisive test of the success or failure of the merger plan. The ferment that has been created in East Bengal cannot be held back in West Pakistan for long. That is the solid reality facing Pakistan today!

For ECONOMY & COMFORT USE

THE INDIA ELECTRIC WORKS LTD
6 SIR PHIROZSHAH MEHTA ROAD FORT BOMBAY

But this is precisely where the difficulty arises. Where are the funds to come from? Deficit financing is of course possible but only upto a point and, in a completely decontrolled economy, only under circumstances which can change at any time and cause sudden dislocation. Already there is some reason to suspect that the output of food-grains in the coming year may be somewhat lower than in the current year, and no one can say what will happen if the Finance Minister provides for a large deficit (on the basis of current price trends which are definitely downward), there is a failure of the monsoons, and the Government's spending machinery at the same time becomes suddenly efficient and incurs all the expenditure provided for in the budget. The point is that, even if all these terrible things do not happen next year, there is always the possibility of their happening, and rapid economic development over a period cannot be planned on that basis.

PROFITS OF STATE ENTERPRISE

In countries where public investment on a large and growing scale has been visualised, the governments concerned have also taken care to find and reserve for themselves fairly firm sources of revenue. 'Profits of state enterprises' is a familiar item in their budgets, and the enterprises which bring these profits to the exchequer are often largely in the sector of consumer goods industries. In this respect, the policy followed in India stands out in marked contrast; it has been one of virtuous self-denial, on the ground that the Government will concentrate all its attention on the basic industries (in which field, State enterprises cannot possibly earn large profits if the establishment of these industries is to serve its purpose), and that in any case it is no use frittering away the limited administrative and technical resources of the Government by either taking over "ramshackle" units already existing or trying to set up new units in this sector.

TAX COMMISSION NOT FREE

It has therefore been left to a Taxation Enquiry Commission, tied hand and foot by various institutional assumptions, to suggest possible sources of additional revenue for the Government. Taxation, by itself, has never helped any country to find resources of an order large enough to finance rapid economic

development (except perhaps in Japan under nineteenth century conditions, with a peasantry which could be exploited without any untoward political consequences), and there is no reason why it should in India. Borrowing from the public has been often talked about as a potential source which has not been tapped adequately, but it is difficult to understand how, without effective restraints on consumption and on alternative uses of private saving, this can bring in funds of any significant magnitude on a regular basis; the net yield from the last National Plan Loan, after making allowance for the conversions and the official window-dressing, should have dispelled any illusions on this point.

NO MIDDLE-OF-THE-ROAD

It is impossible to avoid the conclusion that, without a radical change in the attitude of the Government to the whole question of State enterprise, which of course might require looking in the face some of the vested interests in trade and industry for the first time, it cannot find the resources for maintaining a high rate of public investment. If, in addition, it does not also change its policy in regard to physical controls—and here it will not be enough merely to put house building on a strict licensing basis, because what is not allowed to be spent on houses can be spent on something equally or more 'unproductive'—even the possibilities of changing the pattern of investment to better advantage on a planned basis will be limited. In these matters, the trouble is that one cannot follow a middle-of-the-road policy without getting run over; one has to go the whole hog, or not at all, and it is a difficult position for liberal-minded economists and politicians to be in.

There is still another complication. If the Government, for one reason or another, is not in a position to follow up the logical implications of its professed objectives, and decides to function within the framework of a "mixed economy" (even if it is called hereafter "a socialist pattern"), it has to contend with the 'foreign' sector within the private sector of the economy. This sector has always been important, but its importance is now growing at a rate which, if allowed to continue, will make the objective of "social ownership of

the means of production" increasingly difficult.

THE FOREIGN SECTOR

The innocence of economists, no less than of politicians, about the facts of this 'foreign' sector is remarkable, considering the amount of published material on the subject. Merely by juxtaposing income-tax data about corporate profits, with the data on foreign investment in India published by the Reserve Bank, one can see that the profits per annum of foreign companies operating in India are nearly half of the total profits of all joint stock companies in the country. From the balance of payments figures, also published by the Reserve Bank, it can be inferred that about two-thirds of the profits of foreign companies are remitted abroad regularly, leaving one-third for ploughing back; this rate of plough-back is perhaps as high, if not higher than, than the plough-back in 'Indian' companies.

There are also fresh imports of capital being made, all of which do not have to go through the Capital Issues Control. Taking these fresh imports of capital, along with the amounts ploughed back, it is perhaps not unlikely that foreign private investment in India in the last five years has gone up by as much as Rs 125 to Rs 150 crores. It is not difficult to prophesy that, if the present policy in regard to foreign private investment continues, the rate of growth of this 'foreign' sector within the private sector of the economy will be faster than the rate of growth of the 'Indian' sector.

DECISIONS BEFORE MODEL MAKING

These are concrete issues which, whether looked at from the economic or the political point of view, cannot be brushed aside by a Government which aims at rapid economic development within a framework designed to be increasingly socialistic in form and content. If model building helps to throw them up more clearly, it will undoubtedly do a service, but if instead it is regarded as some kind of a wondrous technique which will somehow help us to move on without having to face the political and, to a smaller extent, the administrative problems which have all along been shirked, much time will have been lost in arriving at decisions which, in other progressive countries, have preceded model making.

A Dispersed Hamlet in the Panchmahals

A M Shah

The following is the result of a field study of Navi Padardi, a village in the Panchmahals, carried out during the years 1953 and 1954.

The author is indebted to the M S University of Baroda for providing him with funds to make this study possible.

MORE than two-thirds of the Panchmahals district of the State of Bombay forms part of the hilly and forested tracts bordering, in the north and east, the large plain of Gujarat. In most of the highland area there are dispersed villages in which each house, or a group of a few houses, stands isolated in its own farm, whereas in most of the plains area we find nucleated villages in which the houses form a compact group with the fields lying beyond.

The dispersed hamlet Navi Padardi is in the central part of the Panchmahals. The dispersed settlements in this part of the district are populated chiefly by the Kolis, the widespread peasant and labourer caste of Gujarat. Over a hundred years ago, they were a congeries of aboriginal tribes, but now-a-days they are regarded as castes within the Hindu caste system. The two most important signs of this change are that they now-a-days employ the Brahmins as priests and they want to be called Kshatriyas and not Kolis.

The farm in which a house is situated is called vado. Usually, in addition to his vado, a man possesses some land situated at some distance from it. The vado land receives much more attention than the land situated away from it. The vado gets the first preference in the matter of manure. The manure pits or heaps are, in fact, located in the vado. Every vado has a well providing water both for domestic purposes and for irrigation.

The house may be a small one, accommodating a small elementary or joint family, or it may be a big one accommodating more than one elementary or joint family; and not infrequently there may be a small cluster of small or big houses on a single site. Occasionally, houses are built on the edge of their respective farm-lands, in order to form a cluster in the middle. Both isolated as well as loosely clustered houses occur in this area, and often it is difficult to tell which group of houses belongs to which hamlet.

The smallest administrative unit

of the government is of course the village, but in this area the administrative village does not frequently have any basis either in geography or in social life. It is a village only for purposes of collection of tax on land, registration of births and deaths, etc. Its boundaries can be known only by consulting the survey maps. The clustering of houses does not correspond to the administrative divisions. Each administrative village has a headman (patel) with village servants (ravanias) under him to help him in the collection of tax and other matters. They are all given tax-free land as remuneration for the work they do.

Every administrative village is divided into a few muvadas, and a muvada may be called the de facto village. People use the general term gam (meaning village) for a muvada and not for the administrative village. The word muvada has two meanings: 'a small village' and 'a ward'. A muvada is a village when considered by itself, and it may be called a ward in relation to the administrative village. I use the term hamlet for it.

A HAMLET

A hamlet is composed almost entirely of persons belonging to either of the two sub-castes of Kolis, viz, Barias and Palias. Navi Padardi is a Palia hamlet in the administrative village of Padardi, the other two hamlets of which, Juni Padardi and Gorada, are both inhabited predominantly by Barias. Each hamlet is an exogamous unit while the sub-caste is an endogamous unit.

Even the hamlet is difficult to mark off as a distinct unit. There is no clear physical boundary between the hamlets, and the houses are not built in a single big cluster, but are spread over a wide area either singly or in small clusters. Though most of the houses in a hamlet occupy a continuous stretch of land in a part of the administrative village, some of its houses may be far away from the hamlet as in the case of Navi Padardi. (In the map 'NP' refers to these houses.) The houses of a hamlet, again, may be separated from those of another

hamlet on a side or two by a stretch of non-vado land or waste land, a stretch of forest, a bare patch of granite rock, or by a hillock, but there is no hamlet the houses of which are isolated on all sides as in a nucleated village. On one side at least, a few of its houses are found very near the houses of another hamlet, belonging to the same administrative village or another village altogether. Only a close inquiry reveals that they belong to two different hamlets. Furthermore, though all the houses of a hamlet are usually found in one administrative village, sometimes a few houses may be in the adjoining administrative village just near the border, which means the houses of that hamlet belong to two administrative villages. A hamlet is thus a very vague entity.

Nevertheless the continuous stretch of land occupied by the majority of the houses of a hamlet is considered the territory of its own, and this has a symbolic expression. On every New Year Day, as a part of the Diwali festival, a big festoon of a particular kind of grass is tied between two trees on either side of a cart track leading to the majority of houses of the hamlet. This is called gam no zampo or the entrance to the village. Some ritual is performed there, and cows with painted horns are run under the festoon. During the Holi festival the big bonfire is lit somewhere in the hamlet where most of the houses are situated.

EMIGRANT FAMILIES

Eleven families of Navi Padardi hold some land far away from the hamlet also. Some land was reclaimed about ten years ago from the forests fifteen miles in the north, and some was reclaimed from a jungle fifteen miles in the south. Nine out of the eleven families cultivate such land as an additional joint family property. Such land is reclaimed mostly by a large joint family, and usually one of its constituent elementary families establishes its household on the newly acquired land, with an agreement that this

land will be given to it as its share at the division of the joint family. At present, however, all the property, including livestock and grains, is jointly owned, and the head of the joint family supervises the affairs of the family both in and outside the hamlet. Only two families hold the new land independently, and they have their permanent home on it. They, however, continue to hold some land in Navi Padardi also. All the emigrant families keep constant contact with their kinsmen in Navi Padardi. They come to Navi Padardi to celebrate weddings and funeral ceremonies and to attend such occasions in other families in the hamlet. Some of them come to take part in Holi and Diwali festivals also. Thus these emigrants are in many important ways members of the hamlet.

SALARIED EMPLOYMENT

Twenty-one men of the hamlet are employed in salaried jobs as school-teachers, policemen, peons, and village-level revenue officers such as the *talatis* (village accountants) and circle officers (in charge of a group of a few administrative villages). Even though they have to remain away from the hamlet for long periods of time, they are in all important respects members of the hamlet. When a man is posted far away from his hamlet he takes his wife and children with him, though not for a very long time. He sends them home periodically during his wife's confinement, for important festivals, and for harvest. Besides, all of them have to come home to celebrate weddings and funeral ceremonies in their family, and to attend such occasions in the families of other members of the hamlet. Most of these men devote vacations and periods of long leave to agricultural work. Many of them are able to get themselves posted near the hamlet. They then keep their wives and children at home, and come home every day if they have bicycles or only on holidays if they have to walk. They consider it a great honour to hold an official job in their own hamlet. They settle down in their hamlet after retirement, and some of them even resign their jobs in order to give their entire time and energy to their land.

The hamlet is thus composed of both those who live permanently within its territorial bounds and also of those who live outside it for a long time but have their moorings in it.

Navi Padardi, like many other

hamlets in this part of the district, came into existence not more than 150 years ago. Before that time this area was covered with dense jungle. It was reclaimed by immigrants from different parts of the district. The Palias came from the southern and eastern part which is known as Pal, as their name testifies. From the accounts given by old informants as well as from the genealogical charts, it is clear that the immigration was a gradual process taking place in a small but steady trickle. One family after another, each belonging to a separate agnatic lineage and a separate village in Pal, would come, clear a part of the forest for itself, build a hut and cultivate the land. Twelve such families had settled in Navi Padardi. Their descendants in the agnatic line, numbering about 477 today, constitute the hamlet. This includes those who permanently reside in the hamlet as well as those who have settled on newly reclaimed land and those who are employed in salaried jobs.

The agnatic descendants of each of the twelve families that first settled in the hamlet, constitute an exogamous group called *kutumb*. The number of families in a *kutumb* may vary from only one with five members to twenty-five with about one hundred and fifty members. Neither the term extended family nor lineage is therefore a proper translation of *kutumb*. I will not therefore translate it into English.

FIELDS OF A KUTUMB

The fields, especially the vado fields, of the members of a *kutumb*, are generally contiguous with each other. A family seems to have begun with one or more big plots of land, and in course of time this has been divided among a number of descendants, each generation witnessing a new sub-division of ancestral land among the agnatically descended male heirs. When the land of a joint family is divided and one of the new splinter families wants to build a house, it prefers usually to build the house in its share of vado land. But continued division of vado land results, at some stage, in its being divided into very tiny strips. New land is then converted into vado. In such a case the field near the vado of a member of the *kutumb* is selected.

The members of a *kutumb* have special rights and responsibilities towards one another, especially during marriage and funeral ceremonies, during feasts, and in emergen-

cies. A heirless man usually adopts a member of his *kutumb* rather than his son-in-law. Children without parents are reared by a family belonging to their *kutumb*, and their land and other property is managed by the same family. The members of a *kutumb* hold certain common beliefs. For instance, in a big *kutumb* it is believed that the entrance of a house belonging to any of its members should always be in the north, otherwise it brings ruin to its inmates. The members of this *kutumb* who have built houses outside the hamlet have also adhered to this rule. It is also believed that if a person has a bullock of any colour except white or black it brings ruin to his family.

For some time after immigration the twelve families had close relations with the members of their *kutumbs* left behind in Pal, and with those, if any, settled in neighbouring hamlets. These relations became gradually less intimate. Today only a few old men remember their old ties with their kinsmen in Pal. About five years ago an old man had been to his native village in Pal to meet the people of his *kutumb*. About ten years ago the news of an old man's death was sent to this *kutumb* people in Pal, and old men from there had come to Navi Padardi to attend the *termun*, an important ritual on the thirteenth day after death. The younger generation remembers only this much; the principle of *kutumb* exogamy applies to all wherever resident.

FACTIONS

The twelve *kutumbs* are divided into three factions or *tads*, which shall be called A, B and C. From the accounts of old informants it is clear that tensions existed between the three factions since the days when they migrated into this area. The factions, however, have taken their present form by a gradual process.

Before the factions took their present form all the members of the hamlet participated—at least it is the tradition that they participated—in every activity connected with marriage and funeral ceremonies in any member's house. They took part in each other's harvest ritual and feast. The whole hamlet together celebrated the Holi and Diwali festivals. During the Holi they collected cash contributions from each house for a fund to be spent in buying things for the common use of all the members of the hamlet. For example,

that such a visit causes a diminution of the groom's wealth. The custom in question was originally common to both the factions, and faction B's non-observance is due to their desire for reform.

In spite of division into factions, the members of a hamlet do keep up speaking relationships with each other. If two persons of different factions met on the way they greet one another and exchange news. A sick person may go to a man of another faction what is reputed to have a knowledge of drugs. A cattle-doctor of another faction may be called to cure a sick ox, cow or buffalo. A cow may run away and it may be sheltered in the house of a member of another faction. Furthermore, even though there are no direct affinal relationships in the hamlet due to hamlet exogamy, two members of different factions may be related affinally in an indirect way. For example, a man's wife's sister may be married into another faction in the same hamlet. Similarly, a man and a woman, or two women, belonging to two different factions, may have common parents-in-law in another hamlet. Two persons of the hamlet related in this way keep a certain degree of cordiality with one another. Moreover, a man may be asked by his relations in another hamlet to go to the house of a member of another faction in the same hamlet to discuss a possible marriage between the two. Similarly, he may be asked to issue a wedding invitation on behalf of his relatives or send news of death to the people of other factions in his hamlet.

All these relations are, however, casual and at an individual level. The nexus of kinship relationships which link up the hamlet with the people of the same caste in other hamlets works as a restraint on inter-factional hostility. It indirectly ensures that factional hostility does not proceed far enough to create violent conflicts. It is, however, not as powerful as to weave the members of different factions into a unified social unit. People say: "In every hamlet there are such quarrels."

I am at the present moment unable to account for the existence of these factions. I would, however, point out two important factors that have contributed to the formation of factions.

Firstly, there are three big and powerful kutumbs in the hamlet, and each belongs to, and heads a

different faction. The other kutumbs in each faction are smaller and poorer. The ancestors of each of the three dominant kutumbs were the first to migrate into the hamlet. They came independently of each other though at the same time, and then each of them induced a few families to settle with it. Between each set of invitor and invitee families there usually existed affinal ties which involved special rights and duties towards one another. The former seems to have helped the latter in settling down in the hamlet. Today the descendants of the latter speak very gratefully about this help. The vado lands of the smaller kutumbs of a faction are usually contiguous with those of the dominant kutumb in it. And only about twenty years ago it was not common for each house to own a well, but each faction had a well, and the kutumbs comprising a faction drew water out of the same well. The faction thus seems to have been the unit of co-operation since the days of immigration.

THE LARGEST FACTION

Secondly, of the three dominant kutumbs, the one in faction A has been the most dominant. It has the backing of five other kutumbs in its faction and this makes it the largest faction. It owns the largest share of Navi Padardi land, and in addition, the largest number of families which have reclaimed land outside belong to it. It has the largest number of men drawing income from salaries. The ward-headmanship belongs to it. It has, thus, a sway over the hamlet, and it uses its power in the favour of its allied kutumbs. The two other dominant kutumbs and their allied kutumbs strongly resent this, which has led to the formation of factions.

The hamlet thus began as a group of twelve families, between some of which there existed affinal ties and between some others there were no such ties. As the twelve families shared a common territory they developed local ties among them in course of time. These ties got expressed in kinship idiom, which resulted in hamlet exogamy. People say: "There is no real ban on marriage between members of different kutumbs of the same hamlet. But it is not good to marry with people who constantly live with you and whom you call brother, sister, uncle, aunt, etc." Hamlet exogamy exists even today, but the hamlet is no longer a unifying bond of society. The faction, rather than the hamlet,

is the unit of all important social activities. The factions are also based on bonds of kinship and affinity. Though factional segmentation is expressed in territorial segmentation also, kinship and affinity, and not territory, is the essence of factional segmentation. Factional tensions do not result in violent fights due to the nexus of affinal relationships that link up the hamlet with other hamlets of the caste. It is, again, kinship that pulls the emigrants back to the hamlet.

So far I have confined myself to a single Palia hamlet and ignored the wider social framework of which it is a part. A few lines about the latter might help to place the hamlet in its proper perspective.

The Barias and Palias have each their own hamlets. Kutumbs and factions are found in Baria hamlets also. The two castes, however, differ from one another in several other respects—dress, speech, manners and customs. Each regards itself as superior to the other. Every administrative village contains both Palia and Baria hamlets, but the members of a caste have more intense relations among themselves even though they are dispersed in different administrative villages, than with members of another caste found in the same administrative village. The Palias of Navi Padardi, for instance, go to the Baria headman and Baria village servants, or the latter come to them, only on those infrequent occasions when there is some governmental work. And the whole of Juni Padardi and Gorada come to the blacksmith of Navi Padardi. Except for this, the contact between the Palias of Navi Padardi and the two Baria hamlets is of the most casual kind.

There is a substantial population of Naiks, a scheduled tribe, and Vanzaras, but it is very much less than that of either the Barias or Palias. While Naiks are found in almost all administrative villages. Vanzaras are found in only a few. Both of them are primarily peasants and labourers. Some Naiks are drummers and wood-cutters, while some Vanzaras are barbers. The houses of each are usually in a distinct part of the administrative village, separated from the houses of Barias and Palias. They have a social life of their own, and the group of houses in which they live might sometimes be as big as a hamlet. Except that they have some economic relations with Barias and Palias, they do not form part

of the social organization of any hamlet.

There are a few servicing castes: Brahmins (priests), Baniyas (shopkeepers), Kumbhars (potters), Ravaliyas (barbers), Dheds and Chamars (skinners of carcasses of cattle), Bhangis (basket-makers) and gypsy-like Vadis (sellers of stone-querns). There are Muslim shopkeepers also. Dheds, Chamars and Bhangis are untouchables. Brahmins, Baniyas and Kumbhars are natives of towns and nucleated villages of the Panchmahals and other parts of Gujarat. They have come to this area to earn money. When they are here they live detached not only from their caste fellows but from their families also. Most of them keep their wives and children in their native place and visit them periodically. Even if they keep them here they have to go to their native place to perform weddings and funerary ceremonies in their families and to attend such social occasions in their relatives' families.

A hamlet contains a few families of only one or two of these castes. No hamlet and even no administrative village contains members from all the servicing castes. For instance,

in Navi Padardi, there is a Brahmin family and two Dhed families, in Juni Padardi there is a Bhangi, and in Gorada there are Chamars and Ravaliyas. A member of a servicing caste has some permanent customers in his hamlet and a number of casual customers in surrounding hamlets. The latter may go to anyone they like to get the particular service. The Brahmin of Navi Padardi has a permanent service relationship only with faction A. Faction B is served by a Brahmin from a neighbouring administrative village, and Juni Padardi and Gorada are served by more than two Brahmins. The Dheds of Navi Padardi serve a part of Juni Padardi besides Navi Padardi, while the other part is served by the Chamars of Gorada. Navi Padardi is served by a Vanzara barber living about two and a half miles away, and not by the Ravaliya barbers of Gorada. The people of Navi Padardi, then, go to Muslim as well as Bania shopkeepers in the neighbouring administrative villages. The area of economic relationships of a person of a servicing caste is thus very nebulous. He has, moreover, no place in the festivals, the assembly of elders, lah, or such other public activities of a Baria or Palia

hamlet. On the whole he is very loosely attached to a hamlet. The servicing castes are peripheral groups of the society.

Among the four majority castes Barias, Paliyas, Naiks and Vanzaras the houses of each are to a great extent territorially separated from those of the other. This factor coincides with many other divisive features of caste such as endogamy, the ban on commensality, distinctive cultural traditions, machinery to settle disputes within the caste, and the concepts of pollution and purity. Such insulation of one caste from the other increases solidarity within each caste and at the same time prevents the four castes from developing into a unified social unit. The limited social relationships existing between different castes do not give a picture of a coherent multi-caste social group which would receive a loyalty overriding the castes composing it. The administrative village which is comprised of several castes remains a superficial entity.

It can be said in general that kinship and caste, and not village, are the forces of social cohesion in this part of the Panchmahals.

Financial Implementation of the Five-Year Plan

Panchanan Chakrabartty

The financial policy of the Government of India during 1951-54 has been governed more by considerations of stability than of the need for growth. It is contended here that this policy was carried rather too far, and that, but for the bounty of nature, it would have resulted in a gradual fall of per capita real income in the country.

A bolder policy would have involved more deficit financing than was either budgeted for, or actually undertaken (the actual deficits being smaller than those proposed in the budgets of the Union and of the States), and, instead of generating inflation, it would have led to higher money incomes as well as to higher real incomes, for this would have stimulated both the organized and unorganized sections of the private sector.

THE period covered by the First Five Year Plan* of the Government of India is nearing its end, and a Second Five-Year Plan, based on the achievements and experience of the First, is already in the blueprint stage. There is room for interpreting the experience of the years 1951-54 as either commendatory or critical, of the policies pursued by the Government in connection with the implementation of the Plan. On the one hand, spokesmen of the Government can point to the increased production, particularly in agriculture, and more especially in food, to the withdrawal of controls and the abolition of food rationing, to the success of the disinflationary policy as indicated by the fall in prices, to the relatively strong balance-of-payment position, and to the near accomplishment of some of the targets, and, in some cases, the actual surpassing of the targets even before the end of the Plan period, as evidence of success. All this, it may be claimed, has been achieved, in the face not only of a smaller amount of external assistance than was anticipated in the Plan, but even in the absence of surpluses in the State Budgets, and a smaller surplus in Railways than expected, and, with only a moderate amount of deficit financing up to 1954. Let it be remembered, besides, that special emergencies, like floods, or sudden spurges of refugees, which were unanticipated in the Plan, have interfered with the smooth working out of the projects.

On the other hand, critics may legitimately point out that the First Five-Year Plan was not originally adumbrated as the maximum which might be achieved in five years, but

rather as something which, in the absence of grave internal and external causes of dislocation, could be reasonably expected to be achieved. What measure of success has been achieved during these years, the critics may say, is to be found in a large number of other countries, in many of which, particularly in Europe, the success achieved is much greater on all counts. We have not only failed to march ahead with many other countries, which started with equally grave problems, but we have failed to tackle the problems of agricultural underemployment, industrial and middle-class unemployment, structural maladjustment in the economy, and the inequality of incomes. When it is remembered that three successive good monsoons have favoured the country, the over-all performance of the Government appears to be very meagre indeed, the rise in per capita incomes being ascribable almost entirely to nature, but for whose favours, per capita income would have most probably fallen to a figure lower than in 1951.

OBLIGATIONS ON THE TWO SECTORS

It cannot be gainsaid that there is strength in the critics' point of view. The Five-Year Plan laid obligations on the Government as well as on the private sector. On the Government, the Plan laid, in the first place, certain financial and production obligations, and in the second place, a number of other obligations concerning the basic re-orientation of the economy which, it was agreed, would take a relatively longer period to be implemented fully, but which could be started within the period of the Plan. On the private sector, the only obligations imposed were the curtailment of non-essential consumption, and the undertaking of productive investment. As regards productive investment, the main reliance was placed on organized

industry, which itself participated in the setting up of production targets. About the capacity or the willingness of either the Government or organized industry to act in the manner envisaged, the First Five-Year Plan entertained hardly any doubt. But as regards the unorganized sectors of industry and agriculture, the Plan had grave misgivings, and it addressed its chief attention to these. As things have turned out, it is the agricultural sector, though not the unorganized sector of industry, where the expectations of the Plan are nearest fulfilment, thanks to the bounty of nature, and, to a certain extent, to Government undertakings in connection with agriculture and irrigation. It is in the sector of organized industry, and in the public or Government sector, apart from undertakings connected with agriculture, that the achievements fall far short of expectations.

It might have been expected that, having set up certain output targets for the economy as a whole, the Government would not rest on the assumption that the private sector would carry out its obligations, and the Government's only problem was to carry out its own part of the programmes. Even if the only task that the Government set itself had been the maintenance of effective demand at a high level so as to minimize cyclical fluctuations, it would have been incumbent on the Government to make good the deficiency of aggregate demand by its own expenditure policies, when the approved incentives to private industry had failed to evoke the required response. This obligation could not be escaped by the plea of the tendency of an underdeveloped country with underemployed resources to start an inflationary spiral from increased Government expenditure, for that argument would apply equally to investment expenditures in the private

an aircraft is never old

Every component of an aircraft has a service life of its own, calculated at so many flying hours. Before one of them reaches the limit—that is, while it is functioning perfectly—it is replaced by an entirely new part. And after 12 months' flying an IAC aircraft is grounded for complete renovation, when it is taken apart section by section and reassembled with new components. With every part always as good as new, an aircraft is never old.

**INDIAN AIRLINES
CORPORATION**

ector when their fruits have a relatively long gestation period. (Besides, in a situation of increasing unemployment and falling costs of production as obtained in India since 1952, this argument has little validity in any case.) Nor would the argument that increased Government investment must await the generation and mobilization of genuine private savings, which is the standard argument nowadays for restricting the volume of Government investment, be applicable in a situation in which it has been recognized at the very inception of the Plan (i) that the low national income means a small volume of savings, and (ii) that the underdeveloped character of the economy makes very difficult the task of mobilizing what savings there are, so that, on both counts, aggregate investment has to be stepped up, which is, in fact, the rationale of the Plan itself. Since the Government aims at promoting growth, and not merely at ironing out industrial fluctuations, it was all the more incumbent on the part of the Government to increase the rate of its expenditure when the organized private sector lagged behind.

DEFICIT FINANCING

To this *prima facie* argument, there are apparently obvious answers, arising out of the facts of the situation in India between 1952 and 1954, and from *a priori* theoretical considerations relating to an underdeveloped economy, which wants to have a democratic plan with a well-recognized private sector. As regards the facts of the situation, it may be argued that the position as regards external assistance, Government revenues and the capital market being what they were, further Government expenditure beyond what was actually undertaken could only be done by deficit finance, *ie*, treasury bill issues and bank borrowing which would have nullified the good effects of the disinflationary policy of the Government, which had been reinforced in November 1951 by the raising of the bank rate and the refraining of the Reserve Bank from buying Government securities to facilitate the seasonal requirements of scheduled banks. Now, in considering this argument it has to be remembered that we are dealing specially with the years 1952 and 1953, and not with the situation in 1950 or 1951. By February 1952, the inflationary impetus of both devaluation and the post-Korean ex-

ternal demand had spent itself and been controlled by monetary policy, and measures had to be adopted to prevent "disinflation from developing into a dangerous recession". (*Reserve Bank Bulletin* August 1954, page 731.) These measures included a moderate amount of deficit financing, relaxation of controls, and reductions of export duties. But neither organized private industry, nor the Government itself increased their investment expenditures during 1952 and 1953 to the extent anticipated. As regards private industry, there was little investment in equipment, and the general complaint was about the lack of capital, which led to the appointment of the Committee on Finance for the Private Sector by the Reserve Bank and to discussions regarding the establishment of a private corporation with the assistance of the World Bank. It has to be remembered that during 1951, as the Reserve Bank's analysis of the use of company funds in that year shows, investment had taken principally the form of inventories. During that year, 757 joint stock companies, including most of the organized sector, had increased their total incomes by nearly one-third as compared with 1950 (from Rs 831 crores to Rs 1,076 crores), while their aggregate expenditures had risen from Rs 759 crores to Rs 996 crores, so that their surplus of income increased by Rs 9.08 crores, and this surplus, together with the excess of closing over opening stocks, gave an increase in gross profit of Rs 24.71 crores (from Rs 84.26 crores to Rs 108.97 crores). "The increase in the value of stocks has been due to an increase both in *cost* and *quantity*," as the Reserve Bank's analysis points out (page 770.) Though figures are not available on a comparable basis for 1952, it would not be grossly inaccurate to say that it was not the want of financial resources in that year which prevented investment in *fixed capital* on a desirable scale. In fact, as statement 38 on control of capital issues, in the Reserve Bank Report for 1952-53 shows there was very little desire for long-range schemes.

EXPANSION OF PRODUCTION

Yet, in spite of little new investment, production in industry has made considerable progress, the index of industrial production having risen from 117 in 1951 to 129 in 1952 and 135 in 1953, being as high as 144.7 in December 1953

(after which date there was a fall up to April 1954 in which month it rose to 145.1, May 140.8, June 146.2). Indeed, in some cases, in cotton textiles, sugar and cement, the targets set under the Plan have been practically reached or are near attainment, which only shows that the original targets were very modest. For, as the Shroff Committee pointed out, "Broadly, . . . the achievements for the past three years or so consist in greater utilization of installed capacity mainly in certain consumer goods industries. In terms of additions to the industrial potential of the country, the gains so far have been much less than are anticipated in the Plan" (page 10).

The reason for the short-fall in private investment in fixed capital has been examined by the Shroff Committee. Briefly, their finding emphasises three causes: (i) over-all shortage of capital, due to "redistribution of incomes in favour of those classes whose propensity to save is relatively small, and whose savings are difficult to tax by the existing agencies in the private sector", though the Committee admits that it is difficult to say whether or not aggregate savings have changed one way or the other. Besides, "the internal resources of enterprises that could be utilized for re-investment" have also been reduced by increased labour costs and restrictions on prices; (ii) Government borrowing from the capital markets because of which "the resources available for investment in industrial shares and debentures have been reduced", though the Committee recognizes that the public have shown a preference for Government paper due to fluctuations in industrial securities and to loss of confidence in industry, due to malpractices by some entrepreneurs; (iii) Government's general economic policy, including rumours of nationalization, procedural uncertainties under the Industries (Development and Regulation) Act and the control of capital issues, labour legislation and policy—the net effects of which have been the creation of an unfavourable climate for risk-taking and the increase of costs and uncertainties of production.

INVESTIBLE FUNDS

Apart from its implications regarding Government policy with respect to taxation, control of capital issues and labour legislation, this

TEA POWER for industry

'Time study' in the industrially advanced countries has proved that better results are achieved by the introduction of rest pauses during work; and rest intervals become more effective if refreshment is provided at time to workers. A cup of tea served after a long spell of work replenishes the energy that is lost. It is small wonder, therefore, that tea has come to be regarded by those privileged to fashion policies in industrial houses as a symbol of impetus to work, if not as an extra motive force in stepping up production.

The Tea Board maintains a specialised 'canteen service' to render practical assistance in this direction to employers of small and big labour force.

Many employers have made good use of this service, which is offered free of cost, to the benefit of the industry and labour. The trained Tea Board staff bring their technical knowledge and wide experience to the aid of employers interested in opening new or reorganising existing canteens. The Tea Board staff advise on planning, location, equipment and the estimated cost of canteens. They also supervise on the spot the working of the canteen in its initial stages, and train the staff necessary to take over the management of the canteen—industry's second power-house.

The Tea Board has so far opened and organised 2057 canteens all over India.

On an average, 14 million cups of tea are served annually in the canteens organised by the Tea Board.

analysis implies that Government borrowing on a substantial scale would inhibit private investment in India. But is the analysis acceptable at its face value? If there is over-all shortage of investible funds in India, the main reason for it is not the "redistribution of incomes" in favour of non-investing classes. The rise in their incomes has not been at the cost of the incomes of the investing classes, but has come at best from their securing a relatively larger share from a slowly growing national income, the chief sufferers being the professions, the "middle class", and the unorganised sector of cottage industries. The trend of industrial profits has been rising during 1951-53, which in fact explains the increase in production by utilizing idle capacity. The chief reason for shortage of available funds is not so much the shortage of investible funds, but an increase in the reluctance of the holders of such funds to invest in private industry including ordinary members of the investing public as well. The Committee themselves have noted this reluctance.

The Committee have noted that many people are unwilling to keep

their savings in banks because of inquisitorial inquiries by the Income-tax and Sales-tax authorities. The Income-tax Investigation Commission have already revealed the existence of about Rs 300 crores of income which evaded taxation during the war and post-war years. This throws strong light on the shortage of available funds, though not of investible funds in the hands of the "investing classes".

INTERNAL RESOURCES

On the amount of "internal resources available for reinvestment", it is necessary to remember that Indian companies in recent years have not only distributed dividends on a liberal scale, but have also watered their capital by the issue of "bonus shares" in a large number of cases. It is difficult, on all these grounds, to accept the thesis that there is an over-all shortage of investible funds. The funds are there, but the desire to invest is lacking.

One reason for the shyness on the part of some investors must be the fear of divulging unreported income and evaded taxes. Another, and

much more serious reason, lies in the structure of Indian industry, particularly in the managing agency system as the US Department of Commerce publication *Investment in India*, notes:

The concentration of control prevailing in India's large-scale industry provides a means by which the efforts of outsiders to establish enterprises competitive with existing undertakings may be blocked. (p 26, col 2, last paragraph.)

From this brief consideration of investment in organised private industry, it may be concluded that Government investment during the Plan years need not have been kept down through fears of undesirable reactions on private investment, the short-fall in which had little to do with the probable magnitude of Government investment under the Plan.

GOVERNMENT PERFORMANCE

We may now consider the performance of the Government. This may be set out in the form of a table.

Financing of the Plan 1951-52 to 1954-55

	(Rupees crores)					
	Total (Centre and States)		Centre		States	
	1951-56 Revised Plan	1951-54 Total for 3 years	1951-56 Revised Plan	1951-54 Total for 3 years	1951-56 Revised Plan	1951-54 Total for 3 years
Outlay in the Plan	224.9	884.8	1330.7	444.9	918.2	439.9

Covered by	—	—	—	—	—	—
(a) increase in floating debt	—	49.6	—	30.6	—	19.0
(b) sale of securities held in reserve	—	22.6	—	—29.8	67.9	52.4
(c) withdrawal from cash balances	—	145.7	—	110.9	67.9	34.8

Source: Reserve Bank of India Bulletin, October 1954, (pp 985-987). (The totals for the three years 1951-54 are on the basis of actuals for 1951-52 and 1952-53, and the revised budget estimates for 1953-54. The figures for the States include those for Jammu and Kashmir.)

In considering this table, it has to be remembered that during these 3 years the chief features of State financing, apart from increased transfers and grants by the Centre, have been a large volume of developmental expenditure outside the Plan, and the low yield of additional taxation. Even though expenditure under the Plan is so low, the necessity of having to incur other developmental expenditure points to a shortcoming of the original plan. That plan could not envisage some of the social expenditure, for example on refugee rehabilitation and famine relief, which became so important during these years. At the same time the additional taxation which it was possible to impose brought in very small amounts. As the *Planning Commission's Progress Report for 1953-54* points out, "The bulk of the increase in total tax revenues has been on account of the larger share of central taxes. The major increase in State tax receipts has taken place under land revenues consequent on the abolition of Zamindari and other intermediary tenures. Taxes on motor vehicles and motor spirit show increased yields, but these are partly neutralized by decreases under excise and agricultural income-tax."

This low yield of additional taxation by the States is a matter of serious concern. While all students of the Plan emphasize the need for securing additional revenues through increased taxation by the States, it is not clear how this can be done. As has been evident for a long time, the revenue resources of the States are inelastic, particularly since the introduction of prohibition. In fact, as the *Eastern Economist* put it (March 26, 1954, pp 523-24), "The States have mental reservations regarding the ability to repay their loans which the Centre is advancing out of the incomes which have been or will be created out of loan expenditure—a fear which has already been expressed by the Mysore Chief Minister, and which may in the future lead to an argument in favour of grants rather than loans by the Centre."

PLIGHT OF THE STATES

As it is, the plight of the States, due both to unanticipated expenditure and the low yield of taxation, has compelled them, in spite of increased central transfers, to borrow from the public on a relatively larger scale than contemplated in the Plan and also to increase their

floating debt and withdrawals from cash balances and the sales of securities held in reserve. As these cash balances are almost depleted, they would have to rely much more on loans from the public and transfers from the Centre in the coming years.

As for the Centre, apart from the complication caused by the plight of the States, which has caused it to come to their aid, there has been disappointment as regards practically every one of the expected resources. Only the savings from current revenues have apparently come up to expectations. The Plan envisaged Rs 160 crores on this account for the whole period, whereas they have amounted to Rs 161.1 crores for 1951-54. Of this, however, Rs 119.6 crores were realized in the year 1951-52 alone, while Rs 41.4 crores were realized in 1952-53, the realization in 1953-54 being only Rs 0.1 crore. Evidently, it was the post-Korean boom which was responsible for this happy result and though Rs 31.8 crores have been provided under this head in the 1954-55 budget, this is going to be a headache for the Finance Minister unless economic conditions in India and abroad improve considerably. The greatest disappointment has been the small contribution from railways. Among the budgetary resources the only encouraging item is small savings. As regards external assistance, the amount actually realized (Rs 131.4 crores) was much less than anticipated. Apparently, the only way in which the total outlay could be increased was by increased loans from the public. During these three years there was a net discharge of such loans by about Rs 33.4 crores, though the Plan had envisaged Central borrowing of Rs 36 crores during the Plan years. To some extent, increased borrowing by the States offset the repayment of loans by the Centre, but still there was apparently considerable scope for increased loans from the public.

THE HEART OF THE PROBLEM

This question of increased borrowing brings us to the heart of the problem of financing the Plan. It has to be noted that, like the States the Centre covered its deficit largely by withdrawals from cash balances, the increase in floating debt (Rs 30.6 crores) being practically offset by the sale of securities held in reserve (—29.8). There was thus hardly any interference with the volume of

money in circulation by Central Government action during 1951-54. The state of the capital markets during these years may seem to have made it difficult to expect much from the floating of new long-term loans. In our discussion about the supply of investible funds in connection with the private sector, we suggested that there was not so much over-all shortage of funds as a reluctance to lend, particularly to private industry. Following the same train of argument, we may state that the outlook for Government loans was much better than has usually been supposed, which is borne out by the successful floatation of loans by some of the State Governments. It seems as if it was not so much the impossibility of securing funds through loans or by increasing the floating debt, which circumscribed the total outlay by the Centre during 1951-54, as the fear of the direct and indirect repercussions of an increase in total outlay brought about by these means. That this was the reason is indicated by the failure to spend appropriations made in the budgets in each of these years. Besides, not all the external assistance, including sterling releases and IBRD loans, have been utilized to the extent that one expects them to have been during these three years. We thus have an improving external balances position, a not inconsiderable amount of unutilized budget appropriations, a small amount of borrowing from the public, a small amount of deficit financing, and a large short-fall of outlay on the Plan by the Centre, co-existing during these three years.

UNUTILISED APPROPRIATIONS

As regards unutilized appropriations, Ministers in charge of Planning and Production have expressed the opinion that these are due to the stringent financial scrutiny exercised by the Finance Ministry, while the Finance Minister has declared that "it was not so much a question of financial scrutiny as the question of the thorough planning and formulation of schemes." (*Eastern Economist*, April 23, 1954.) But when we know the predilection of the Government of India for quick-yield projects during these years, while most of the plans have been rather long-period and slow-yield ones, it appears that the defence put forward by the Finance Minister cannot be taken at its face value. Since the Government of India is now known to be planning

ATUL

DYES CHEMICALS PHARMACEUTICALS

THE ATUL PRODUCTS LTD. ATUL VIA BULSAR, WESTERN RLY.

a higher rate of expenditure, it stands to reason that it has not suddenly lighted upon worthwhile projects, but has merely taken out of cold storage projects mooted during the past few years but shelved at the time because of their slow yield. There is no doubt some scope for increased expenditure through attempts to make up for the lagging under the existing projects like the DVC. But, for any substantial increase, new plans have to be set into operation, and these, it is submitted, are the ones brought out of cold storage. The Planning Commission has summarized the reasons for the lags in expenditure in the Progress Report for 1951-52 as follows: "These lags are attributable in part to the late finalization of the Plan, in part to the late commencement of some of the schemes, and in part to what might be called insufficient working out of schemes in advance. In some cases, the lack of availability of certain types of equipment, shortages of technical personnel and the time needed for setting up the necessary administrative machinery have prevented more rapid progress." While these reasons were no doubt operative to a certain extent, a real urge for getting on with the plans would not have allowed them to stand in the way—the sort of urge which surmounts difficulties when a country faces a war, and the plan is nothing but a war against poverty and low standards of living.

RELUCTANCE TO INVEST

In the case of the private sector, it has been hinted at above that the will to invest was lacking, rather than the means. Similarly, in the case of the public sector, there appears to be a similar reluctance to expand investment, even within the means available. This is in direct contradiction to the finding of the International Monetary Fund (Bernstein) Mission, in October 1953, who came to the following conclusion:

"The analysis above indicates that resources will not be available for carrying out the investment contemplated under the Five-Year Plan. Domestic savings, private and public, cannot be expected to reach the estimates. A large part of the foreign resources required for the Five-Year Plan is not assured. Active measures will have to be taken to increase the total resources available to carry out the Plan. In the absence of additional resources from do-

mestic and foreign sources, the planned level of investment will result in inflation." (Report, p 37.)

The position taken here rests on the possibility of undisclosed resources in the private sector, the activation of those resources through Government investment, and a more open mind regarding inflation than the Bernstein Mission. Even the Planning Commission's Progress Report now says that,

"It is clear that a rapid and substantial stepping up of expenditures, both at the Centre and in the States is called for from now on, and indeed, this must be regarded as a matter of top priority."

The only explanation of the low level of public expenditure is that, with the memory of the instability caused by inflation in the past, the Government was afraid that the stepping up of expenditure would undo the good effects of the disinflationary policy initiated by itself and by the Reserve Bank. It has already been noted above that, by the middle of 1953, this policy led to the emergence of recessionary conditions which the Government should have been able to anticipate at least a year ahead. However much we may harp on the difference between an underdeveloped economy like India's and that of a developed country like USA and the United Kingdom, and emphasize the inapplicability of Keynesian analysis to a country in which agriculture and the unorganized industrial sector, using relatively little money, form a preponderant part, it is still true that the concept of aggregate demand has a role to play in such an economy, unmeasurable though it may be in practice. In the economy of India, a decline in private investment expenditure and in the value of exports has bitter consequences which can only be offset by increased production in the unorganized sector of industry and agriculture, and by increased expenditure by the Government. Since there is no reason to assume an automatic offsetting from agriculture and unorganized industry, it is the clear duty of the Government to increase its rate of expenditure when there is a short-fall in investment in organized private industry, and a fall in exports.

INFLUENCE OF EXPORTS

As regards fall in exports, it has been pointed out by Mr Wallich,

in *Money, Trade, and Economic Growth*, that exports occupy a strategic position, more important than private investment, in an underdeveloped country, though he expects India, because it does not live predominantly by foreign trade. On the other hand, the *Economic Survey of Europe in 1953* points out that the Western European countries during 1951-53 were influenced more by changes in the export earnings than by any other constituent of the national incomes. Thus, some underdeveloped, as well as some developed, economies, at least since 1950, have found the key to fluctuations in the value of the exports. India is not so different from either of these groups of countries that export earnings would not be almost as important in her case as in theirs. In fact, after the First World War the relative importance of export earnings in India's economy has been emphasized again and again, during the depression of the thirties, during the war period, and again during the Korean episode. Though obviously the effects of changes in the balance of payments work themselves out in quite a different manner in India than in most developed countries, a change in this balance has been found to tip the scale for industrial employment and that part of the national income which is measured in money on every occasion. Hence, a fall in export incomes has to be offset for practically the same reasons as in many developed countries. It has been singularly unfortunate that the Government of India did not apparently think on these lines during the last three years.

Of course, it may be argued that expansion of Government expenditure would increase the demand for imports, both directly in connection with the purchase of capital goods from abroad and indirectly through increased demand for consumer goods imports due to increased incomes, and thus impair the favourable balance of payments position. But this depends on the way in which the increased expenditure is financed. To the extent that such increase can be financed from external resources, the pressure on the balance of payments will immediately be alleviated. Again, to the extent that such expenditure is devoted to schemes which require little of imports, the detrimental effects may be reduced. As in every other case of Government expenditure, it

'This mighty adventure of building up a new India...'

How Insurance Companies help to finance national projects

INAUGURATING the National Plan Loan in April 1954, the Prime Minister appealed to the people of India to subscribe liberally to the loan, and share in 'the mighty adventure of building up a new India'. And the people responded generously, subscribing 156.75 crores of rupees in a few months. The share of Indian Insurance Companies in this huge total was notable. Insurance Companies continuously invest a large part of their funds in Government Securities. At the end of 1953, such investments totalled 150 crores of rupees.

Insurance Companies, by canalising the savings of lakhs of our countrymen, help the Government in financing national projects calculated to improve the living conditions of the masses.

New India, as the largest composite Insurance Company in India, is carrying the message of life insurance to a vast number of families. On their behalf, it invests crores of rupees each year in Government securities, and in the many industries that are helping to change the face of the country.

is not merely the volume, but the type of project and the kind of resources used, that would determine to what extent it would be inflationary. Only if prices and wages rose proportionately to the increased expenditure or more, would there be an adverse income and employment effect. With careful selection of the type of project and method of financing, there is no reason to fear an unhealthy inflationary development. On the other hand the failure to offset the diminution in export earnings would result, as it already has done in an aggravation of the unemployment situation and fears of a deflationary spiral which persisted for some time.

There is little reason for believing that increased Government expenditure in the face of a fall in export earnings would increase the export earnings themselves, and it may conceivably even diminish them, through a rise in export prices and the consequent fall in demand from abroad—though we do not think it would have been so in the case of India, during 1951-54, particularly if it had been accompanied by a more far-sighted export promotion programme. On the other hand, increased expenditure by the Government to offset the lack of private investment would very probably have acted as a fillip to the latter. Thus, there was a revival in the capital markets after increased Government expenditure programmes were announced in the budgets of 1953-54 and 1954-55. The lack of enthusiasm on the part of investors, bewailed by the Shroff Committee, could very well have been cured by a more liberal dose of public expenditure. Indeed, something like this seems already to have come about, though as yet on a modest scale.

LIMITS OF DEFICIT FINANCE

At this point it is desirable to look at the problem of financing the extra expenditure a little more closely. In the above pages, the source of finance contemplated is borrowing from the public by means of medium- or long-term loans which are supposed to come out of so-called "genuine" savings. It is to the inadequacy of such savings that the Shroff Committee and the Bernstein Mission refer when they talk of the necessary limitation on the scale of Government expenditure. Much of the extra expenditure contemplated in the last two budgets has, however, depended on deficit

financing, which we usually regarded as inflationary. The Bernstein Mission, however, has argued that, within certain limits, such deficit finance need not be inflationary, and to that extent may be resorted to. It seems then that the Government of India has been following the analysis and the advice of that Mission which sets a rather rigid limit to the amount of deficit finance.

Of course, both on *a priori* grounds, as well as from experience of the recent past, any method of finance which might appear to be inflationary would seem to be condemned in the case of India. Yet, fighting shy of the slightest trace of inflation is inconsistent with the adoption of a development programme. It would not be very much to the point to refer to the role played by "forced" savings—which is another name for inflation—in the earlier phase of capitalism. This is so not only because the social and economic conditions in India are so different and the period in view is so short, but chiefly because of another reason. In the case of the earlier phases of capitalism, the mechanism of credit creation and forced savings operated through the transfer of real resources to the growing class of entrepreneurs, and thus by swelling the profits, and encouraging the reinvestment of the same, fostered economic growth. This is not the process contemplated by and large in the Five-Year Plan of the Government of India, but though the processes have to be different, there is this to learn from the earlier history of capitalism—that credit creation may so activate the economy, if accompanied by proper institutional and fiscal changes, that new resources are created and released, and thus made available for transfer. It is to the Government sector, rather than to the private sector that the bulk of these resources would be channeled, though the private sector would not go without its share. The chief objections to such a point of view are two: (1) that in an underdeveloped country like India resources would not in fact be created so that there will be inflation and dislocation of economic life, and (2) that the processes would limit the scope of the entrepreneur, inhibit his activity, retard the development of the private sector and either bring stagnation to the economy or lead to the all-comprehensive socialistic state in the not very long run.

FISCAL MEASURES

As regards the second of these arguments, it depends very much on the extent of deficit financing and the fiscal measures adopted along with it. So long as a free rein is not given to inflationary forces, the Government should not be unduly afraid of moderate price increases. The very recognition of the private sector sets a limit to the fiscal measures that can be adopted by the Government to prevent too great a rise in profits. In a mixed economy, where the responsibility for economic development has been undertaken by the Government, organized private industry must accustom itself to an enlargement of the public sector. The Shroff Committee has urged as follows: "Indeed, the business community has to recognize the fact that planning in a mixed economy necessarily involves some control and regulation of the private sector." (p 52 of the Shroff Committee Report.)

As regards the first objection above, it depends basically upon the fact that on account of inelasticities in supply, "the normal state of the Indian economy can be assured to conform to the classical model of an economy on the verge of full employment," and therefore "in financing the investment of development expenditure, which is intended to raise the full employment ceiling on these lines, the classical prescription should be applicable". (The Theory of Indian Economic Development" in the *Economic Weekly*, August 15, 1954.) The specific discussion of the theory with reference to deficit financing by the Bernstein Mission on pages 41-45 of the Report is inspired by the assumption that the availability of resources is independent of deficit financing, that is to say, by the assumption of inelasticity of resources. Thus, the Report states:

"As deficit financing is undertaken without regard to its effect on the money supply and the availability of resources, it will inevitably lead to inflation and hamper the achievement of the Plan" (page 41).

Now, if the projects financed through deficits aim specifically at removing these inequalities, through education, propaganda, provision of opportunities for migration, etc, the argument loses much of its force. Besides, the change in relative incomes brought about in this way exercises some influence at least in

breaking down bottlenecks, as was experienced in India during the later years of World War II. As Professor Samuelson has pointed out,

"Especially for young developing countries, where investment opportunities always seem (at conventional interest rates) to be running beyond the full employment voluntary saving of the community, control over inflationary banking policies may slow down the rate of progress; and this possibility should be admitted. On the other hand, if over the years the public authorities find themselves pursuing expansionary monetary and fiscal policies in order to offset incipient stagnation, then savings which would have been abortive may be brought into effective being." *Income Stabilization for a Developing Democracy*, Edited by M F Millikan, page 570.

OPponents OF DEFICITS

It might not be amiss to refer in this connection to the theoretical predilections of opponents of deficit financing. In general, they are impressed by the effectiveness and the necessity of thrift as the precondition of the growth of capital,

and of economic development. Thrift, may, however, be regarded as an effect rather than as a cause. Thus, A K Cairncross writes "on the one hand, this (growth of capital) resulted from the prodigious thrift of the Victorians. In a deeper sense, however, the faith and outlook that express themselves in thrift were born of economic expansion and growth of capital, and the line of causation was from accumulation to thrift rather than the other way around." (*Home and Foreign Investment*, 1879-1913, chapter 1, page 3.) The possibility of savings being a residual, and of investment not having to wait on prior savings is ruled out in the minds of the opponents of deficit financing because of the applicability of the classical analysis to the case of underdeveloped countries. We are here trying to make out a case for deficit financing, even if it leads to some degree of inflation, partly on the ground that it will activate idle savings, partly that by increasing incomes it will make for more savings, and partly because it will break down rigidities and bottlenecks.

Enough has been said to demonstrate that the Government of India

need not be tied down to the rigid rules limiting the amount of deficit financing, laid down by the Bernstein Mission. There are sources enough which work to make it impossible for the Government to go on a spree with deficit financing. The need now is to advise boldness rather than caution. To the extent that agricultural production improves, whether due to the working out of the Plan, or any other cause, the dangers from deficit financing would be reduced, and indeed a stronger case would be made out for such financing, because it would otherwise lead to disastrous price falls. Again, to the extent that external resources become available, the need for deficit finance will be lessened. But, in working out the Plan, as has been proved during the last few years, much reliance cannot be placed either on external aids or on the private sector. The responsibility is the Government's and it must not fight shy of having to use one of its most potent weapons because of supposedly unfavourable effects, conjured up by people who are more interested in maintaining price stability, even if it leads to stagnation than in economic development proper.

Constitutional Amendments and Electric Supply Industry

R P Aiyer

The proposed Amendment to the Constitution now before Parliament has a sub-clause that strikes at the root of the principles under which Electricity Supply Companies have been operating in this country as well as elsewhere in the world.

The author who has been the secretary both of the Federation of Electricity Undertakings of India and of the Association of the Electricity Undertakings of Bombay State, right from the inception of these bodies, argues powerfully the case for the deletion of the reference to electricity licences from the proposed Amendment.

THE Constitution (Fourth Amendment) Bill introduced by the Prime Minister in the Lok Sabha in December 1954, proposes primarily to amend Articles 31 and 31A of the Constitution which deal with the citizen's fundamental right to property. Under the proposed amendment while compensation would be payable for a property compulsorily acquired, the quantum of compensation is a matter entirely within the discretion of the Legislature and no Court shall have any jurisdiction to go into the adequacy or reasonableness of the compensation; in short, the issue of compensation will become non-justiciable.

This new clause enunciates a principle quite foreign to, and at variance with, the hitherto accepted principles governing relations between licensees of electricity supply undertakings and the State—principles which have the sanction of statutes passed by the Central Government and which accord moreover with the customs and traditions of the industry elsewhere in the world.

REGULATIONS

A license for supply of electricity is a charter granted by the State to an entrepreneur to effect electric development in a given area. For this purpose the licensee, subject to the regulations laid down in the license, in the Indian Electricity Act, 1910, and in the more recently enacted Electricity (Supply) Act, 1948—which latter limits the return to the investor to a bare minimum of 5 per cent—is free to operate in his area and the license itself provides for the manner and method of taking over of the undertaking by Public Authority, the compensation payable for such acquisition being the fair market value—a term fair to all concerned.

If the proposed amendment to the Constitution is enacted, it would presumably be quite possible for State Governments to repeal the

very salutary provision in the Indian Electricity Act, 1910, mentioned above. Without protection of this nature, the prospects of licensees embarking on costly ventures such as the building of new power stations, or the expansion of existing ones, would be seriously imperilled.

It is appreciated that the intentions of the framers of Article 31A are laudable and it is agreed that some assistance is necessary to those engaged in improving agricultural land and removing slums, etc. The Electricity Supply Industry is alive to the needs of the hour with regard to such matters. It is however incomprehensible to it that organised industries and in particular one as important as the Electricity Supply Industry should be classed in the same category as the exploiters of slum property.

POWER TO CANCEL OR MODIFY

The Electricity Supply Industry is particularly concerned with sub-clause (i) of the proposed amendment which reads as follows:

- "(1) Notwithstanding anything contained in Article 13 no law providing for . . .
- (i) the extinguishment or modification of any rights accruing by virtue of any . . . License for the purpose of supplying power, light to the public, or the premature termination or cancellation of any such . . . License;

shall be deemed to be void on the ground that it is inconsistent with, or takes away or abridges any of the rights conferred by Article 14, Article 19 or Article 31:

Provided that where such law is a law made by the Legislature of a State, the provisions of this Article shall not apply thereto unless such law, having been reserved for the consideration of the President, has received his assent."

This clause will give any Government, Central or State, (with the President's assent) the power to cancel or modify an electric license granted under the Indian Electricity Act whether such cancellation or modification is merited by the circumstances contemplated by the Act or not. The Bill in the Statement of Objects and Reasons puts forward the "interests of national economy" as the justification for making this innovation. For a reason so vague and insubstantial as to be virtually unintelligible one can only conclude that the Electricity Supply Industry has been included in the proposed Article 31A in complete ignorance of the surveillance that the State, fortified by two very comprehensive statutes, has always exercised over the industry.

ELECTRICITY ACTS 1910 AND 1948

Reference has already been made to the Indian Electricity Act, 1910. This Act which has been constantly amended to bring it into accord with changing conditions, and is even now receiving further amendment, and its complementary Act, the Electricity (Supply) Act, 1948, codify the law and practice governing the operation of the private sector of the Electricity Supply Industry and co-ordinate the working of the latter with public utility services run by the State, where these exist.

As mentioned above, the "license" referred to in the proposed Article 31A is a concession given by the State Government to the electric licensee on terms and conditions meticulously laid down in the Indian Electricity Act, 1910. In return for this so-called monopoly right to supply electricity in a given area, the licensee assumes long-term responsibilities, financial and technical, which no prudent man would accept if his tenure were to be insecure. The discharge of these responsibilities entails investment of capital in the installation of costly

plant, machinery, cables, etc., the value of which would be reduced to little more than scrap if the licenses under which they operated were suddenly withdrawn. If this were to happen through the licensee's own misfeasance—the 1910 Act contains ample provisions to meet such cases both by way of amendment and revocation of the license—there would be no injustice. This is one thing but it is quite another for the Constitution to include a provision empowering the Government, on the nebulous and ill-defined grounds of national economy, unilaterally and without adequate compensation subject to judicial decision, to repudiate the contract that it has voluntarily, and with adequate safeguards, entered into with the private licensee.

PLANNING COMMISSION AND PRIVATE SUPPLIERS

Perhaps some confusion exists as a result of the employment of the word "license" but in the case of the Electricity Supply Industry, the license is merely an agreement, no more and no less. An agreement between private citizens is binding upon them and if one of the parties fails in carrying out his part of the agreement, the other has recourse to the Courts where he can obtain an order for specific performance or alternatively, obtain damages in lieu. Surely, the Licensee is entitled to these reasonable safeguards.

The Planning Commission has assigned an important role to the private sector in the development of the Electricity Supply Industry during the current and ensuing Five-Year Plans. This role will go largely unfulfilled, if the protection under which the industry has hitherto operated is thus suddenly to be withdrawn.

BROAD ASPECTS OF POWER SUPPLY

It may be appropriate here to make some observations on the broad aspects of electric power supply, both by public and private sectors. There is no public power supply in the sense of the supply being confined exclusively to public buildings, Government-owned factories, or public highway and conversely there is no private power supply exclusive for say a private building or a private estate. The business of electric supply, irrespective of who owns it, is a public utility and every electricity system is a public supply system in that the service is to be made available

according to law to the public within the area of the system. As between private ownership and Government ownership, however, there is one great difference. All privately owned public utility systems are subject to financial and technical control exercised by the Electricity (Supply) Act, 1948, and the Indian Electricity Act, 1910, whereas in the States where the Boards are not yet formed, Government systems are not so controlled. In other words, there is this paradox that the power industry in the private sector which is dedicated to public use is under strict regulation whereas State Electricity Departments in most cases are not subject to any comparable regulation.

PROFITS OF PUBLIC UTILITIES

That, they work for a profit motive is generally held against licensees' undertakings. There is no need, however, to apologise for or to defend the concept of profit. Even Government departments recognise the necessity for a positive balance between income and out-going as a measure of their ability to carry on operations economically and without danger of closure. In the case of public utilities, however, earning of profit becomes a matter of discredit, the assumption being that profit represents something abhorrent and exclusive, the participation of which is limited to a favoured few.

A scrutiny of any well-established public utility undertaking in the private sector will show how erroneous this assumption is. The bulk of the owners of such concerns are men of small means who have sunk their life's earnings in buying the equity of the undertaking.

Then, again, how 'private' profit can be when the participants of equity ownership are charitable institutions, insurance companies and other institutional investors? Overriding all these is the consideration that the rate of return to the undertakings in the private sector is limited to a bare minimum, which for the present is regarded as not even sufficient to raise finance necessary for the proper functioning of the undertaking, let alone expansion.

When an industry operates under such rigid restrictions, surely, the imposition of further shackles, the threat of which is held out in the Constitution (Fourth Amendment) Bill, would be disastrous to its future development.

In view of the fact that existing legislation contains ample safeguards against all possible exploitation of "the public economy" by private licensees, the overriding provision in the proposed amendment to the Constitution for the arbitrary cancellation of licenses is quite unnecessary and will only add to the uncertainties facing the industry which is already overburdened by control. There is no need whatever for bringing the Electric Supply Industry under the purview of the proposed Article 31A, and in the interests of the industry's development, it should be removed.

Co-existence in Finance

(Contributed)

The emerging ideas on financial arrangements for the economy pose a question: if peaceful co-existence of different types of suppliers of credit in urban areas is considered possible, why not a similar approach to rural finance? Why try to bulldoze the unorganised lenders, especially when they are the main sources of rural finance instead of linking them up properly?

TWO clear facts emerge out of the recent reorientation of the Government's economic policy. Socialisation of the economy is the ultimate goal. Some time, some day, the policy relating to land may be projected to industry. But this is not the immediate policy of the Government. Industrial development is to be furthered through implementation of mixed economy. This involves co-existence of the private and the public sectors. But there will be more stress on the expansion of industry in the public sector in order to ensure purposive direction of industrial development in the private sector.

These are logical sequels to mixed economy. As in the general economy, or in industry, such a policy raises the problems of co-existence in finance. Co-existence in industry or in finance involves harmonious relations between the broad sectors, as well as between the various subdivisions within the broad sectors. It is a mistaken popular impression that a few, large-scale, organised industries exhaust the private sector. This sector includes various other forms of economic activity than those concerned with large-scale, organised industries. There is, for instance, the large unorganised sector of small industries, rural and urban.

In finance, as in industry or in the general economy, there are similar problems. Industrial development in the public sector needs finance. Much has been heard, since the publication of the report of the Shroff Committee, about the financial problems of the private organised sector of industry. Even the Shroff Committee concedes that the financial problems relating to expansion of small-scale industries will have to be solved satisfactorily. It is clear that the private, small-scale, unorganised sector of industry will receive top-most priority in the second Five-Year Plan as a corollary to the Government's emphasis on full employment. There is, besides, the problem of rural finance. For the first time, the Committee of Direction of the All-India Rural Credit Survey has stressed the need for simultaneous development of the rural and urban

sectors of the economy with its accompanying financial concomitants.

Finance has so far been treated as incidental to the various sectors and groups and sub-groups of the economy. Within finance itself, there is more than one sector. Both in rural and in urban sectors of the economy, there are organised and unorganised elements in the financial structure. New Delhi does not seem opposed to economic or industrial co-existence. In certain spheres, it concedes financial co-existence. But within finance itself, the authorities seem to have a pronounced bias against the unorganised, non-institutionalised sector of finance. This has implications which do not seem to have been widely realised.

Both the reports of the Shroff Committee and the Committee of Direction of the All-India Rural Credit Survey have been widely publicised. Each has had a good press. Both the investigations are comprehensive. Both the reports reflect intimate familiarity of the members concerned with the respective problems under investigation. Most of the recommendations of both the Committees are commendable. Here, however, the suggestions of both the Committees are discussed in relation to the problem of co-existence in finance.

THE COMMITTEES AND RURAL FINANCE

It is irrelevant to discuss whether or not the Committee of Direction of the Rural Credit Survey is in favour of co-existence between the rural and urban sectors of the economy. But the Committee is emphatic that over-aggrandisement of the urban sector of the economy is mainly responsible for the chronic anaemia in rural economy. All its major recommendations follow directly from this basic premise. There are reasons why commercial banks are not eager to open branches in rural areas. With the possible exception of the suggestion relating to mobile banks, the other recommendations of the Shroff Committee on this issue are, admittedly, controversial. To question the wisdom of some of the suggestions of the Shroff Committee for expansion of rural

branches by commercial banks, is not to accept without qualification the implications of the recommendations of the Committee of Direction.

It is clear that the Gorwala Committee is of the opinion that it would be harmful to encourage commercial banks to open branches, including mobile banks, in rural areas. There is repeated emphasis by the Committee that any such policy will lead to a diversion of rural funds for further aggrandisement of the urban sector of the economy. It has not recommended any direct ban on rural branches by commercial banks. But it suggests that such branches and mobile banks should give an undertaking that the rural deposits received by these institutions should be employed for the development of agriculture and allied rural industries.

Problems of agricultural finance are duly appreciated by the Committee. It is one of its virtues that it emphasises the 'altogetherness' of things. It is right in its emphasis on the development of warehousing, marketing and processing facilities. It is aware of the supreme need of expanding rural banking facilities. It has discovered a facile solution to this problem by recommending the creation of a State Bank through amalgamation of the Imperial Bank and the other State-associated banks. Its suggestion for the nationalisation of the Imperial Bank has been accepted by the Government. It is difficult to appreciate why this has created such a furore.

It is equally strange, that the other major recommendation of the Gorwala Committee has not attracted the attention it deserves. Non-institutional sources, like the private money-lender and the trader, now supply over ninety per cent of the financial requirements of the farmer. To the Committee, this is a challenge which must be met by excluding non-institutional sources altogether from the sphere of rural finance. Institutionalisation of sources of supply of finance, rural and urban, is desirable. This is the main justification of the Gorwala Committee's recommendations relating to the Imperial Bank. But it is a major flaw that the Committee has no practical recommenda-

The '622' heralds a new advance in precision technique. The critical parts of the projector's film path mechanism are now faced with sapphires at point of contact. Since the sapphire is the second hardest jewel to the diamond, wear on working parts is practically eliminated. This innovation, together with the many new technical improvements, gives the '622' extra dependability and greater operational efficiency.

Outstanding new features of the '622'

- Sapphire inserts } gives 400% longer life
- Sapphire tipped shuttle } to critical parts.
- Cam-shaft and counter gear combination—reduces wear and noise.
- New type clutch—gives more positive action—reduces maintenance.
- Improved governor end cap—obviates adjustment.
- New style lamp house—far more effective cooling.
- Improved speaker unit.

Bombay — Madras — New Delhi — Calcutta

tion to associate the private money-lender with the recommended improvements in the organised structure of rural finance because it rejects him as a by-product of the colonial-cum-commercial-cum-urban domination of rural economy. It would seem that, even as Washington is reluctant to accept co-existence between Capitalist Powers and Communist States, the Gorwala Committee has not much faith in co-existence between the organised and unorganised sectors of rural finance.

Here, it may not be out of place to relate the Gorwala Committee's hostility to the money-lender to the Shroff Committee's recommendations relating to shroffs. Unlike the Gorwala Committee, the Shroff Committee is in favour of direct linking of the shroffs with the organised, urban banking structure. But the Reserve Bank, like the Gorwala Committee, seems to have developed a pronounced antipathy to the unorganised sector of urban finance. The Reserve Bank and the Gorwala Committee are agreed that the rural money-lender and the urban shroff must become co-operative societies or banks to enable their association with the respective organised financial structures in rural and urban areas.

Denial of co-existence between the organised and unorganised sectors of rural and of urban finance, is not as relevant or important as the lack of suggestions for utilising the services of the unorganised sectors in both the spheres. There are, however, not a few who feel that the encouragement of shroffs and hundis on the one hand, and direct or indirect participation of the private money-lender in the business of discounting warehouse receipts on the other, provide useful means of expanding and popularising the internal bill market. It is strange that this form of finance has not received the emphasis it deserves from the Reserve Bank and the expert committees. There is much to be said in favour of the English pattern of commercial banking. But, to emphasise one of the arguments against the Shroff Committee's major recommendation for creating a consortium, many would prefer a bank discounting even a pig on pork worth Rs 100 than investing even a single pie in "risk" capital. This problem is discussed later.

If the Reserve Bank and expert committees are opposed to co-existence of organised and unorganised sectors in rural or in urban finance, and are in favour of integration of the unorganised sector only through annihilation, the Committee of Direc-

tion seems also opposed to co-existence of private finance in the rural sector. Rural credits are to be supplied by the various national funds. Flow of rural credits is to be directed by the Agricultural Credit Department of the Reserve Bank, now a wing of the Finance Ministry. According to the Gorwala Committee, the State Bank and its various rural branches are to be the means through which rural credits are to be canalised. Both the Shroff Committee and the Gorwala Committee are agreed on the need for institutionalising credits. But, while the Shroff Committee accepts the importance of private credit institutions for urban industrial development, the Gorwala Committee rejects private initiative in rural finance. Both the Government, and the Reserve Bank accepts the Gorwala Committee's recommendation for State monopoly in rural finance, and, also perhaps, in rural economy.

THE URBAN POSITION

So much about the problems of co-existence in rural finance. In urban, industrial finance, co-existence between the State and private initiative is accepted. In its recommendation that banks should subscribe to a greater extent to the shares and bonds of the Industrial Finance Corporation and the State Financial Corporations, the Shroff Committee urges private initiative to collaborate with the State, even as the State accepts its responsibility for helping industrial development in the private sector by providing financial aid through IFC and the State Financial Corporations. Nor is the Shroff Committee opposed to co-existence of the organised and unorganised sectors of industry. It recommends a National Development Corporation for providing finance for the development of small-scale industries.

Even so, the Shroff Committee implies that private industry will have to depend mainly on private institutional sources like banks and insurance companies for financial aid. It is conceded by the Shroff Committee that the organised sector of industry does not suffer from short-term financial stringency. It has no problem relating to its working capital. But industry needs long-term finance. One of the major recommendations of the Shroff Committee is that banks should participate, indirectly and directly, in long-term industrial finance. For the main purpose and argument of this article, it would be unnecessary to discuss the arguments against even indirect participation of banks in long-term indus-

trial financing, or the permissible ways in which banks can, and should, participate indirectly in long-term industrial financing.

Far more intriguing is the Shroff Committee's recommendation that banks and insurance companies should directly participate in long-term industrial financing. It recommends that leading banks, in co-operation with insurance companies, should form a consortium or syndicate for underwriting or investing in new issues of shares and debentures of industrial companies. By investing five per cent of their deposits, banks could, the Committee estimates, make available a further sum of Rs 30 crores for the long-term finance of industries in the private sector without seriously jeopardising their liquidity. From the action subsequently taken by the Reserve Bank, it would seem that neither the Bank nor the Shroff Committee is aware of the vital distinction between "risk" capital and long-term capital. To damnify the Committee because of its recommendation for a consortium would now seem to be flogging a dead horse.

Even as the Shroff Committee's report was published, it became evident that the Committee was outdated in its major recommendation relating to the proposed consortium. Swiftly developing events since the publication of the report make it clear what the make-up of industrial finance is going to be. Some of the details will have yet to be settled. There are doubts whether IFC, with its small capital structure, should be allowed to continue to finance industry in both the private and the public sectors. If, and when, the Shroff Committee's suggestion for a Development Corporation for small industries is implemented, or, if, and when, this suggestion is dovetailed into the Gorwala Committee's suggestions for re-vitalising rural economy, the question will arise whether State Finance Corporations can be of any further use.

Apart from these details, the set-up of industrial finance in both the sectors is now clear. It will be the function of the State-owned National Industrial Development Corporation to finance industrial projects in the public sector. Even for this purpose, the capital structure of NIDC may seem inadequate; the more so, because of the recent proposals to expand industrial development in the public sector. On top of this, NIDC is supposed to finance rationalisation of the two major exporting industries such as cotton and

jute textile industries. Either the share capital of NIDC should be substantially raised, or this latter function should be delegated to the newly-formed Industrial Credit and Investment Corporation.

If the State-owned NIDC is to finance mainly industrial development in the public sector, ICIC, to be exclusively privately owned, will function exclusively for the promotion and development of new and existing industries in the private sector. Here, it is not the intention to discuss the interesting experiment of attracting domestic and foreign private capital through ICIC, or the attempts at indirect collaboration between private and State capital, both domestic and foreign. More rele-

vant is the emphasis on indirect participation of banks and insurance companies in ICIC. All those who are familiar with banks and banking will agree that this is a safer way of participation of banks and insurance companies in long-term industrial finance than the consortium proposed by the Shroff Committee. ICIC's capital structure is not inadequate. Its potential resources are quite ample. With ICIC, the problems of finance for industrial promotion and expansion in the private sector would seem to be nearer solution.

Certain conclusions emerge out of this discussion of the problems of financial co-existence. In the urban

sector, financial co-existence is conceded. Respective financial obligations of the State and of private institutional sources are also clearly demarcated. In the rural sector, co-existence would seem to be rejected. There is an undue emphasis on State monopoly of rural finance. In both rural and urban sectors, the unorganised financial sector is left to fend for itself. In the urban sphere, this sector is tolerated. But the Reserve Bank's endorsement of the principles behind the recommendations of the Committee of Direction would seem to indicate that the unorganised financial sector in the rural areas is not only not to be tolerated, but may be eliminated through combative discouragement.

In a South Indian Village Non-Economic Activities

IN my village very little time is spent on Puja. In fact, I was most surprised to find this. There is of course a division of labour between men, women and children. Now the men perform the majority of the operations involved in the cultivation process individually and not in a team. They work singly with their bullocks or buffaloes. This means that during most of their working time they are fairly isolated. To make up for this isolation, they sit together in groups in the evenings and talk gossip or discuss their work, and at least once a week, they walk five miles to the nearest market town and back to their village. In the market town—it is really a village where the weekly market is held—they sit around in cafes and talk. These trips mean a long walk and also quite an expense, as the men smoke a lot there and drink a lot of coffee.

To the outside observer the villagers appear lazy, spending so much time sitting around in groups in their own villages as well as in the market town. This is the picture a number of Western economists portray of villagers in "underdeveloped countries", but if you live here you learn better. During these long talks in their own villages and in the market town, the farmers do not only talk idle gossip, but they get to know about likely brides or bridegrooms for their children and they hear of likely buyers or sellers of cattle, jaggery, paddy, etc. Since most of the farmers are illiterate, their market would be strictly limited if they did not discuss avail-

ability of goods as well as prices with people from their own and other villages. These long talks help to widen the market and also make it more perfect. These casual meetings which look on the surface like a form of laziness do give the

farmer not only the companionship he needs, but also widen his social as well as economic horizon. In the West we have farmers' clubs corresponding to these casual meetings. The only difference is that here the meetings are not organised and take longer.

Men perform their daily activities, except at harvest or transplantation time, on their own or in groups of no more than three. Women always work in larger teams of about eight to twelve. Some teams are composed of particular age groups, others are made up of three generations in a kin group. The activity determines the composition of the group. Fetching water, washing, etc., is done in age groups; cooking combines the generations in a household. Whilst working, these women will gossip away and periodically they will take rest and just enjoy their time together.

Sickness combines an even bigger group. I suspect it combines women of one street, but am not quite sure on that yet. Practically every day there is bound to be at least one sick child in a street and so the women of the whole street will gather in the affected house and give advice and suggest remedies.

For women, their social life and economic activities are knitted into each other and it is difficult to disentangle them. I find it absolutely impossible to measure the daily working time of a woman. Her daily life is one pattern of work and pleasure woven into one unit.

Calculus of the Second Plan

Diversion of 10 to 12 per cent of the national income to investment is not an impossible task in itself. Other countries have attained higher ratios during periods of rapid development, but under quite different circumstances. Some did it during the hey-day of private enterprise, others did it through rigid controls and State direction.

In India, however, this increase has to be brought about in a climate which has the elements of both, but not the punch of either.

INDIA's first Five-Year Plan commenced officially from April 1, 1951. But on that date, few knew definitely what the size of the Plan was, or how the expenditure targets were to be shared by the public and private sectors. It was only a couple of months later that the Draft Outline of the Plan suggested the likely outlay over the five-year period. And it was towards the end of 1952 that the Plan was finalised.

In the circumstances in which the first Plan was evolved, this was perhaps inevitable. All aspects of planning had to be examined *ab novo*, and the programmes decided through the cumbrous mechanism of directives to States, scrutiny of State plans, discussions with them and so on. The machinery for mutual consultations had to be evolved, and the procedure for drawing up the Plan had to be democratic. The Plan, that is to say, had to be built up from States rather than handed down from the Centre. All this contributed to delay.

ADVANTAGEOUS START

To the extent that the planning machinery is already there, the second Five-Year Plan, which is to commence in 1956, starts with certain very definite advantages. The most important of these is the slow crystallisation of ideas regarding the theory and practice of planning in a mixed economy. This arises in part from an increased knowledge of the basic features of the Indian economy and in part from an awareness of the administrative difficulties inherent in a programme of democratic planning. More intangibly, the second Plan will also benefit from a widening of the mental horizon of the planners, administrators as well as of the general public. It is being accepted more and more widely that like peace, development is indivisible; and that, therefore, the unit to be considered is India rather than this State or that sector. This is all to the good; and together with the experience of planning gained during the first five years, it will help reduce delays and bottlenecks of various types in the

subsequent period. It will also reduce conflict between sectional interests.

DIRECTION AND MAGNITUDE

Given this change in the environment, it is natural that the Centre should start thinking and talking about the second Plan earlier and with greater freedom. In the past six months or so, there has been as much airing of views regarding the next plan as assessment of the progress of the present plan. Affirmation of the goal of a socialistic economy has come not too soon. And more remarkably, very definite suggestions have been made regarding the expenditure targets for the second Plan. Clearly, the object of the first of these tactical steps is to prepare the country for a more rapid transformation; and of the second, to gauge the reactions of the public to the proposed size of the second Plan.

Let us consider the latter first. The proposed outlay under the second Five-Year Plan is Rs 5,500 crores, of which Rs 2,500 crores are for the private sector. The corresponding total of planned outlay for the first Plan is Rs 3,500 crores—Rs 2,300 crores in the public sector and Rs 1,200 crores in the private sector. It should be borne in mind that the figures above relate to planned outlay in the first Plan, and should not be confused with actual expenditure between 1951-52 and 1955-56. This is a distinction of importance, as will be seen later.

GREATER EXPANSION OF PRIVATE SECTOR

Now, in terms of planned outlay, the second Plan will be about 57 per cent larger than the first Plan. This represents a very considerable expansion, though it might not satisfy those who are impatient of the rate of development at present and want a three-fold or four-fold increase. Even more striking is the suggested distribution of this outlay between the public and private sectors. While in the first Plan, the ratio between outlays envisaged in the public and private sectors was

two to one, that in the second Plan it is nearly half and half. Reckoned in absolute terms, the shift is even more impressive. Outlay in the public sector is to increase by about Rs 700 crores, whereas that in the private sector is to be larger by as much as Rs 1,300 crores. Looking at it in yet another way, the private sector has to more than double its five-year programme.

At first flush, this seems surprising in view of the pronouncements on socialisation of the economy. For, this objective is to be sought by increasing State participation in newly-developed fields, rather than by acquiring industries which are now in the private sector. That, at any rate, is what Government spokesmen are straining to clarify. But whichever way we look at it, the roles proposed for each of the two sectors in the second Plan seem somewhat out of line with the basic pattern envisaged. For, if the projected outlay is in fact achieved, the private sector will have grown faster than the public sector at the end of the second five-year period and the economy will, in terms of collective ownership, be less socialistic than at the beginning. If, on the other hand, the relative size of the public sector is increased through nationalisation, one of the two things is inevitable: either the planned outlays for the two sectors will have to be revised, or the rate of development in a truncated private sector will have to be something stupendous to reach the target of Rs 2,500 crores in five years. And if this miracle happened, the private sector would, despite its limited extent, be a powerful element in the economy, not only because of its achievement but also because of the impression such spectacular progress would have on society.

SIZE IS RELATIVE

All this is, in a sense, incidental. It could be argued that by the end of the second Plan, the Government will be so familiar with all the instruments of planning and control that the size of the private sector will not matter. One could take

EMPIRE'S...

Forward Leap

NEW BUSINESS

1954 Rs. 3,79,00,000

1953 Rs. 3,22,00,000

This substantial increase is symbolic of the growing confidence of the insuring public in the strong financial position and satisfactory service of the Company.

Applications for Agency invited

THE EMPIRE OF INDIA LIFE ASSURANCE CO. LTD.,

that comforting stand and concentrate on the question of implementation of the Plan. That is to say, assuming an aggregate expenditure target of Rs 5,500 crores, what does it imply in terms of resources and efforts needed to achieve it?

Posed thus, the actuals of the first Five-Year Plan become more important than the planned targets in any scheme of reckoning. For, the starting point of the second Plan in 1956-57 is not where in 1951-52 we thought we would be, but where in fact we are. From all accounts, it would appear that the outlay in the period 1951-56 will be considerably smaller than the Rs 2,300 crores envisaged in the Plan. It is likely to be Rs 2,000 crores or even less, so that the attainment of the target of Rs 3,000 crores in the second five-year period would mean an increase of over Rs 1,000 crores in public expenditure. This is taking the commonsense view that the proposed outlay for the second Plan includes the short-fall in expenditure on schemes covered by the first Plan, and is not in addition to it. Even so, the mobilisation of resources both financial and physical needed to carry out the programme will have to be on a much bigger scale than has so far been done.

TASK FOR PRIVATE SECTOR MORE ONEROUS

When we turn to the private sector, the contrast between the actuals of the first Plan and the programme for the second becomes even more striking. It is at the moment not known exactly what fields of private investment are covered by the target of Rs 2,500 crores. Indeed, it is not even clear how the corresponding target of Rs 1,200 crores for the private sector has been arrived at. For the Planning Commission envisaged an outlay of only Rs 613 crores in the private sector for the period of 1951-56. This covered the larger industries, and it may be presumed that the target of Rs 1,200 crores for the first five years is inclusive of expected investment in small-scale industries, agriculture, etc, which are predominantly in the private sector. Even if we take this extended view of the private sector covered by the first Plan, there is little evidence to show that the actual investment outlay during 1951-56 will be anything like Rs 1,200 crores. From which it follows that the task set for the private sector in the second Plan is even more onerous than that set for the public

sector.

It is worthwhile pondering over this for a while. For the scope for overcoming the obstacles which prevented the achievement of the targets in the first Plan becomes a matter of primary importance in judging the prospects for the second. These obstacles may be psychological, physical or financial. Enough has been said already about the changing outlook in the country, so that as time passes, the psychological hindrances could possibly be overcome. On the physical side, the administrative resources may also be expected to improve with experience. It is the physical resources in the sense of productive factors that go to raise national output, and the financial resources that are necessary to shift factors of production and put them into use which need greater attention by the planners.

INTER-INDUSTRY RELATIONS

One might digress a bit here to take note of an important change in economic thinking that is taking place in the country today. With the coming into prominence of what is called input-output analysis, more and more attention is being paid to the inter-relations between industries of all types, and to the technical questions of physical inputs needed to obtain specified outputs of different commodities. This is coming to be recognised as basic to planning, as indeed it is. As a consequence, two things could emerge—one of which would be of immense advantage to policy, while the other could become a hazard. To take things in that order, the input-output analysis will help discover how much of each of the different inputs will be needed to obtain a given pattern and volume of outputs; and as a corollary, the precise points at which bottlenecks are likely to arise and have to be avoided. Given this information, it would be of assistance in drawing up the plans and the priorities. If it is the input of steel that is required in larger amounts, it is the programme for steel that should be taken on hand. And so on, down the labyrinths of the input-output matrix.

But in this process, there is danger of losing sight of the financial aspect of it all. This is the risk mentioned above, and has to be guarded against. If the tendency to view pre-occupation with financing the Plan as outmoded and conser-

vative becomes widespread, it could defeat the whole Plan, especially in an economy in which part of the shifting of resources is to be carried out through the price mechanism. Even as the financial problems inhibited thinking on the first Plan, deliberately ignoring the question of finance might throw the second Plan out of gear.

NATIONAL INCOME AND OUTLAY

To revert to the main theme. With little known about the likely pattern of outlay in the second Plan, it is hard to say in which of the sectors physical resources will be adequate or lacking. Broadly, it would appear that there will be a shift of emphasis as compared to the first Plan, inasmuch as industries will receive greater attention. This will mean that it is the physical resources needed for speeding up industrial investment and output that will occupy the centre—or nearly the centre—of the stage. One might think of the implications of this in regard to specific industries like steel, cement, fertilizers, heavy structural engineering and so on.

Much the same applies to the question of resources in the broad sense. But there is here some room for reasonable speculation. For one thing, the size of the outlay envisaged, viz, Rs 5,500 crores, may be viewed against other likely aggregates, to get a hang of the situation. It is not clear whether this outlay is to be viewed broadly as development outlay just as in the first Plan, in which case it is somewhat wider than the economists' definition of investment outlay. Also, it is not clear whether this includes all investment outlays or only those which are covered by the Plan. In other words, does the outlay of Rs 2,500 crores in the private sector include investment in housing, trade, etc, or does it not? This also is not clear, and it is, therefore, hazardous to relate the outlay to likely aggregate saving in the economy plus the likely import surplus. However, one might this with the figure to some extent, as long as one is aware of the limitations. We

A five-year outlayable opportunity means an access to better outlay of Rs 1,100 (the end, build up mental purposes, so the highest sary that the target employment, should be equal to act us briefly Staggering it evenly, tactical impli- be achieved with thesis.

Rs 900 crores in the first year, rising gradually to Rs 1,300 crores in the final year. If we assume, on the basis of present trends that national income in the first year of the Plan, viz, 1956-57, will be of the order of Rs 11,000 crores, development outlay in that year will absorb about 8 per cent of the national income. If this percentage is maintained year after year, to ensure an outlay of Rs 1,300 crores in the last year, national income will have to be around Rs 16,000 crores. In other words, the increase in national income during the quinquennium will have to be from 45 to 50 per cent. Such an increase will, incidentally, provide adequately for an increase in consumption expenditure *pari passu* with development outlay.

Considering the rate at which India's national income has increased in the past, this appears rather optimistic, if one is focussing attention on real income. It will be remembered that the Planning Commission assumed in the first Plan a capital-income ratio of 3:1 for India. This may or may not be a correct ratio. But even assuming a smaller capital-income ratio,

say 2:1, or even 1.6:1, it is obvious that to get a rise of Rs 5,000 crores in national income between 1956-57 and 1960-61, investment during the quinquennium will have to be much more than Rs 5,500 crores mentioned these days. Looking at it the other way round, national income will rise to a level considerably lower than Rs 16,000 crores as a result of the outlay envisaged in the second Plan. How much lower will depend on the precise relationship between investment and income-flow in the economy. Whatever that may be, it would imply that carrying out the Plan will require an increase in the proportion of national income diverted to development purposes. In the final year of the Plan, this proportion may have to be between 10 and 12 per cent.

This is manifestly not an impossible figure by itself. Higher ratios have been obtained by several countries during the periods in which they developed rapidly. But the circumstances in which they were achieved were different. Some of the countries engineered such a diversion through rigid controls and State direction. Others were able

to attain such high ratios during the hey-day of free enterprise. In India, however, this increase has to be brought about in a climate which has the elements of both but not the punch of either.

The magnitude of the problem will become clearer if it is realised that a substantial part of this additional outlay is to be in the private sector. Quite obviously, this sector will have to depend on the savings that become normally available to it, and cannot, like the Government, force savings through taxation or deficit financing. Alternately, the State has to obtain the resources and pass them on to the private sector in one way or another. Either way, there will have to be a drive to make the country conscious of the need to maintain austerity standards in consumption. Such restraint can come in only one of two ways—rigid control or voluntary sacrifice of present consumption deriving from a realisation of the desperate need for higher investment. Without these, achievement in the second five-year period will fall far short of expectations—even allowing for a reasonable amount of external aid.

Economics of Resource Development Some Fundamentals

Sudhir Sen

Even when our objective is to create jobs for the people, our planning should proceed from the resource-end.

We should plan for the best employment of our resources; only then we shall be able to plan for the best employment of the people.

THE second Five-Year Plan, as we are told, is going to be based on the physical needs of the people and will lay greater stress on the physical resources of the country. This is perhaps an indirect recognition of a major shortcoming from which the first Plan suffered. That Plan, as we all know, was the outcome, not of any incisive economic-scientific analysis, but primarily of an assembly operation, a mechanical juxtaposition of schemes; and, consequently, it remained weak in integration, and could not become what a Plan should be—a well-knit well-balanced entity. In fairness we must admit that the authors of the Plan did the best they could in the difficult conditions they had to face five years ago—the country was in the grip of a financial crisis, the worst since the early thirties, and of an acute food shortage with near-famine conditions in many areas. It was crystal-clear to all thoughtful people that things would have to be stopped from becoming worse before we could expect them to be better. The chief tasks before the Commission were to tackle the food problem, to cut down expenditure, to minimise fresh financial commitments, and to fix down-to-earth targets in different fields. Besides, priority had to be given to those projects which had already been under way, or for which irrevocable commitments had already been made. The Plan, in other words, was determined more by the force of circumstances than by conscious design. Judged against this background, the first Plan, in spite of all its weak spots, was a remarkable performance.

WELCOME EMPHASIS ON BASIC RESOURCES

Today things are different; the country has definitely come out of the woods, mainly as a result of the gigantic effort made under the first Plan; the nation as a whole has acquired valuable experience in development work. The second Plan will therefore be largely free from the compulsion of circumstances, and so it can be moulded with much greater

freedom. Its quality will depend, above all, on the objective thinking and scientific analysis that will be brought to bear on it in establishing priorities and fixing targets. The task will be simplified if we can bear in mind a few fundamentals to which a well-thought-out development plan should conform.

The greater emphasis proposed to be laid on physical resources is indeed most appropriate. It is a sign of growing realism in our economic planning. What, then, are these resources? The bewildering complexity of the modern world with the thousand-and-one articles that we use or encounter in everyday life, often makes it hard to see the inter-relationship of things in the right perspective. Yet the fact remains that our physical resources consist of half a dozen broad items—waters, soils, minerals, forests, sunlight and air. It is out of these that we must obtain all the wealth to meet all the requirements not only of our vast family of 360 million people, but also of the steady stream of newcomers that are being added to it at the rate of five millions a year. For this our industry and ingenuity must be harnessed as fully as possible to these resources. This is the biggest challenge that faces our generation.

NOT INEXHAUSTIBLE

The six resources mentioned above can be divided into two broad categories: sunlight and air, which are *inexhaustible*, and the other four which are not so, although the degree of exhaustibility varies in each case. Minerals are the most exhaustible of our resources—for example, coal or oil, once mined and used, are gone for good. Soils, on the face of it, may appear to be a durable asset; but it is the relatively thin layer of top-soil that concerns us most, for it is this top-soil that supports plant life; and, unless this layer is carefully protected, it may be washed down by water or blown away by wind. Besides, it may also die of exhaustion if its fertility is thoughtlessly

“mined” without attempt to replenish it. Forests, even when depleted, can no doubt be re-grown, but it takes a generation or two to raise a good forest. Besides, where the pressure of population has been steadily encroaching upon forest lands, we know very well that forests, once gone, seldom reappear. Nor is it easy to repair the damage that is often inflicted on old forests when the unbridled greed of exploitative businessmen is let loose upon them. With water the position is more reassuring. Although in the long run rainfall in a given area may to some extent be determined by how well or how badly forests are looked after, water remains a self-renewing asset. The problems it creates are mainly due to its maldistribution, both over space and time, and it is the business of the water planner to rectify them as far as possible.

LOGIC OF RESOURCE ECONOMICS

Our natural resources are no doubt vast, but so is our population; and if we consider the two in relation to each other, we shall certainly have no reason to look upon ourselves as the chosen people under the sun. The resource-population ratio is much smaller in India than in many other countries; and it is shrinking steadily with the increase in the denominator. To support this vast mass of people on such a resource-base at a reasonable level of material well-being will call for all our vision and imagination, all the modern science and technology, as well as the united effort of the whole nation. To achieve success in this unique enterprise we shall have to husband our resources with the strictest sense of economy. We must relentlessly search for and make use of every possible opportunity to put the resources to better use so that we may, in the end, build up on this resource-base the highest possible edifice of employment, wealth and income. Let us briefly look at some of the practical implications of this general thesis.

Hyderabad State Bank

K. P. R. MENON,
Managing Director.

Today we are out to control floods in North-West India through embankments, which, in the case of the Kosi, will be seventy miles long. Will these massive embankments be able to hold the flood, or will they give way? Even if they come up to our best expectations, the waters will continue to flow down to the Bay of Bengal, albeit without causing any damage, but also without rendering any service. And, as a result, millions of acres of land will continue to be deprived of the dry-weather irrigation so badly needed to grow food and other crops for tens of millions of people, and the billions of kilowatt-hours of energy will continue to run to waste without lighting a single house or turning a single wheel. It is odd that so many experts should plan so carefully to waste so much of our resources and potential wealth. This is an example of how not to plan.

From the angle of resource economics the logic of multi-purpose development of our rivers on a valley-wide basis is impregnable. For only then can we expect to extract all the benefits from our water resources—flood control, irrigation, power generation, navigation, supply of water

for industrial and domestic use, fish cultivation, recreation. This is the approach which we had adopted, only ten years ago, with a good deal of enthusiasm. There is no justification to beat a hasty retreat from it today.

PATTERN OF LAND-USE

Our pattern of land-use is the outcome of the pressure of population and other historical forces, not of any scientific thinking or planning. Consequently, it will need a good deal of readjustment in many directions before it can satisfy the tests of proper resource-use. Provision of irrigation wherever feasible, and control of erosion through soil conservation are of course two of our biggest problems. In addition, far greater attention will have to be paid to the problem of building and maintaining soil fertility at a high level. The broad requirements here have long been known: better seeds, more scientific crop rotation, mixed farming, greater use of farmyard manure, also of fertilizers, especially phosphate, potash and lime, to maintain proper mineral balance in the soil, greater emphasis on horticulture, poultry, dairy

farming and fish culture. Optimum use of our land resources, as we all know, is also impeded by the uneconomic size of our holdings. To this a more "equitable distribution" of land is obviously no answer, and, if anything, it will further accentuate the problem of fragmentation and subdivision. Nor is there any guarantee that change in the ownership of land will by itself make for a more rational pattern of land-use. The magic of property may not, after all, give us two blades of grass where we now grow only one, because our cultivators are, as a rule, too poor and too ignorant to adopt and apply modern agricultural know-how.

DISCOVERY OF UNDERGROUND INDIA

In the case of land resources, we more or less know the main facts, also what ills they now suffer from and how they could be best remedied. What we need in this field is, above all, to apply in practice what we already know. With our mineral resources the position is quite different. Our geological data are much too fragmentary, with yawning gaps in our information about

the mineral wealth that may lie buried in the ground, for over large parts of the country there has been no adequate geological survey. Here is a vital link still missing, and until this link is supplied, resource planning will, to a large extent, be a leap in the dark. One of the first tasks in our planning today is therefore to plan for the complete discovery of underground India; and for this we should create an army of geologists in the same way as Russia did in the twenties under her first Five-Year Plan.

To judge from the available geological data, our position is particularly weak in non-ferrous metals, especially in tin, zinc and lead; the deposits of copper, too, are far from adequate; the oil deposits are almost negligible—this deficiency is perhaps our worst single handicap; the only fuel, of which we have a reasonably abundant supply, is coal; but the bulk of it is low-grade with a high ash content, while the deposits of high-grade metallurgical coal is far too small. On the other hand, there is no dearth of bauxite while our iron ores are among the largest and richest in the world. As the modernisation of our agriculture gets into its stride, the need for phosphate and potash will be increasingly felt. So far no mentionable deposits have been located for either of them. Unless future geological investigations throw up some pleasant surprises, lack of these two minerals, and more particularly of phosphate, will remain a grave drawback for our agriculture.

In a well-planned programme of resource development the law of substitution must play a big role. This means that to meet a given social need or demand we must, as far as practicable, substitute an inexhaustible resource for an exhaustible one; and, similarly, a resource available in greater abundance should, wherever possible, be substituted for a resource of which the supply is more limited. Let us illustrate.

SUBSTITUTION BY LESS SCARCE

Coal as fuel is a single-use resource—once burnt it is gone for ever. In terms of resources thermal power is therefore far more costly for us than water power which can be tapped, year after year, from a self-regenerating resources. However, sometimes one has to go in for thermal power if only because there may not be enough scope for hydro-electric development. This

has been the case in the Damodar region where the DVC has set up a large thermal power station with an ultimate capacity of 200,000 KW. But in doing so the DVC deliberately decided to use low-grade high-ash coal, of which the supply is plentiful, even though this would give less BTU per ton of coal. The effect of this lower thermal value on the cost of generation has been made good by the economies in other directions—the location of the power station in the heart of the coalfields, an up-to-date efficient plant, the benefit of large-scale generation. The unit cost of power could have been kept lower if high-grade coal were used as fuel. This is what a privately managed commercial concern would do as a matter of course in order to widen its profit margin. But this is what we have to avoid in the interest of proper resource-use.

CASE FOR SYNTHETIC OIL

Since we are heavily dependent on foreign countries for petroleum and petroleum products, the case for a synthetic oil plant to produce oil from low-grade coal is obvious. It may be far more important for the USA to produce synthetic rubber than synthetic oil, because she has oil in plenty while for natural rubber she has to depend on others. The UK which still dominates the sea-lanes of the world may find it both expedient and cheaper to continue to depend on imported oil. Our position in this respect is more similar to that of Germany, and, like the latter, we should have given high priority to the production of synthetic oil even in our first Plan. This omission needs to be made good without further delay.

Meanwhile it is meet and proper that high priority has been given to atomic research and the development of atomic power. The fuel base of our economy is none too large; the need for a switch-over to atomic power will therefore be felt by us much earlier than in countries which have been blessed by Nature with very large deposits of coal, gas and oil.

There are of course numerous other examples where the principle of resource Ersatz can be fruitfully applied. We shall have to substitute aluminium for copper in many cases because of the relative scarcity of the latter. The need for developing our aluminium industry has hitherto received no more than fitful attention, yet in any rational scheme of pro-

rities it will rank very high indeed. In the production of steel we should try and replace coal, as far as possible, by electric power or oxygen. To meet the nitrogen requirement of the soil we may, to a large extent, tap the atmosphere by growing leguminous crops rather than depend on chemical fertilizers. Similarly, cow-dung, instead of being burnt as fuel, ought to be returned to the soil as manure; and to make this possible we should find some suitable substitute for it.

OPTIMUM UTILISATION

The economics of resource-use also involves what we may call the principle of optimum or maximum utilisation—a given resource should be made to go as far as possible in producing wealth. Its implications for our water resources, as already mentioned, are source-to-mouth treatment of each river system, storage reservoirs, multi-purpose dams. For lands and forests the first task is their rehabilitation, that is to say, to bring them to a high level of productivity so that they may yield optimum output, year after year, on a sustained basis. But even this is not enough. If the primary products obtained from lands, forests and mines are used up or exported as such, the volume of wealth, jobs and income derived from these resources will remain relatively small. On the other hand, these would multiply by leaps and bounds as soon as we begin to process the new material and to build up a whole range of manufacturing industries on their basis. Where a vast population is heavily pressing on a relatively narrow resource-base, a high degree of industrial development is essential in order to support it on a reasonable living level. This is as good as a truism, but it needs to be emphasised since so often it tends to be overlooked by us.

The biggest curse of colonialism is that a colony has to subsist mainly as the producer of primary commodities; it is deprived of the opportunity to develop processing and manufacturing industries; as a result there is a mounting pressure on resources, which in their turn tend to be depleted at a fast rate, while the population continues to languish at or near a subsistence level of income. Today India is free to mould her destiny as she chooses. She can, if she so wills, build up an imposing range of industries, relieve the pressure on resources, and raise the living standards of the people. And she will no doubt do so once she is

able to approach the issues about our economic survival with an uninhibited mind and without those emotional blinkers that often tend to distort her vision.

NEED FOR RESEARCH

Take, for example, coal. We can burn it for heat, or we can use it as the foundation for a wide range of chemical and dye-stuff industries. Similarly, we can use our 50 to 60 per cent Fe content ores for developing a mighty steel industry, and go further and develop a number of steel-based industries, to meet our own requirements as well as to cater to the needs of South and South-East Asia. The same remark would apply substantially also to an aluminium industry. To take a somewhat different example, our manganese fields are now littered with what are classed as low-grade ores; yet if Mn and Fe contents of these ores could be separated through some suitable technical process, we would at once get a lot more high-grade manganese, which would be an important foreign exchange earner, in addition to a substantial quantity of iron. Technical research on problems of this nature holds out big

promises of better resource utilisation; and in the modern world such research usually produces the desired solutions in due course.

HUMAN RESOURCES

What about the human resources? We have in this country billions of idle man-hours; if we can mobilise and harness them to productive jobs, would it not be possible to step up the output of wealth? No one can deny that. But where and how can these billions of man-hours be best invested? This is really the point at issue, and we cannot answer it offhand. If we plan to develop, use and conserve our natural resources on the lines indicated above, we shall in the process also create endless avenues of employment where these man-hours can be best utilised. In other words, even when our objective is to create jobs for the people, our planning should proceed from the resource-end. To put it differently, we should plan for the best "employment" of our resources; only then we shall be able to plan for the best employment of the people.

The end of all resource-use is of course to meet the needs of the

people. Planning, it goes without saying, must be directed towards that end. We shall therefore have to keep our eyes continuously fixed on both—the natural resources of the country and the physical needs of the people, and their probable needs in future. If resource planning has to be geared to the needs of the people, their needs as well as their habits and outlook will at times have to be adjusted to the requirements of resource use and conservation. For example, we are a great cereal-eating nation; yet this method of obtaining our calories imposes a heavy burden on our land resources. Suitable changes in our dietetic habits could appreciably reduce that burden. If, for instance, the production of fish were stepped up in our Eastern States through an all-out effort, and if the per capita consumption of fish could be doubled and that of rice halved, people and land would both be much better off in this region. To a large extent we are also a nation of cow-worshippers. A high proportion of our cattle population today is unproductive, yet they live on the same resources and therefore compete with men. Our economy cannot indefinitely

carry this holy burden which has been acting as a drag on the living standard of the masses of people.

The task of the planning authority is, first and foremost, to establish the closest possible harmony between what the people will, or should, need and how the resources can be best mobilised to produce goods to meet those needs. Once this harmony has been established, the Plan will automatically become more balanced and integrated; and gaps and voids from which the first Plan suffered, eg in a 200-crore Plan there was practically no provision for steel and very little provision for communications, would tend to be automatically avoided.

PRIORITY AND SPEED

This is certainly no easy task. The needs when assembled will tend to be sky-high—they will need to be pruned and brought down to realistic limits. The projects competing for entry into the Plan will be countless—one will have to pick and choose to keep the programme within manageable dimensions. To fix the priorities and targets the planning authority will require a mass of data, a good deal of strictly scientific analysis, and high-grade economic statesmanship. Once the targets have been laid down, the merit of each project will have to be assessed, above all, with reference to three simple criteria: how much wealth is it going to produce, at what cost in terms of money as well as of resource, and in what time. The greater the wealth-creating potential, the lower the cost, and the shorter the time lag between the investment of capital and the realisation of the benefits, the higher will be the priority to be allotted to it.

In developing the resources of an underdeveloped country like India the economics of speed has a special significance. Starting late on the gigantic task of upbuilding a vast and backward economy, with generations of leeway to make up, and with a huge population still growing at a frightful rate, we shall have to move with the utmost possible speed in achieving economic progress in order to make an appreciable impact on the general living standard. In the expanding public sector optimum speed and economy in the execution of the projects can be maintained only if far-reaching adjustments are carried out in the existing administrative machinery. Our foremost requirement here is a much larger degree of decentralisation of responsibilities, which can be best

achieved through the wider adoption of the institution of public corporation. Only next in importance is the need for building up a vigorous heavy construction industry in the country. A very large part of the expenditure envisaged under the Plans will fall on heavy construction work of various types. Without an adequate construction industry the execution of the Plans will not attain a sufficiently high tempo. Lastly, to achieve simultaneous all-round progress, the private sector will have to be encouraged to make its utmost possible contribution. Given a favourable milieu, judicious encouragement and legitimate incentives, it can be turned into a first-rate vehicle of social and economic progress. Once its latent dynamism has been unfolded, the transition to the socialistic pattern of society will be greatly accelerated.

Even after all this has been achieved, there will still remain a big problem to grapple with, a problem that has long been casting its dark shadow over our economic future. Can we continue to accommodate five mil-

lion newcomers a year in our economy and yet crawl above the subsistence level of income? This fateful question looms more and more ominously on our horizon. In the forty-four years preceding the first World War when Germany made phenomenal progress, her industries could absorb 20 million people, or the net increase in her population during the same period; the rate of absorption was less than half a million per year. In Russia, even when her industries were forging ahead under the Five-Year Plans, they could absorb only one million a year. These are significant facts. Yet till now we have been amazingly self-complacent about the problem posed by our mounting population. The first Plan touched it much too delicately and tangentially. We can no longer afford to fight shy of this problem. A frontal attack on it has long been overdue. The more we put it off, the more we shall jeopardise the prospects of attaining freedom from want while the pattern of society will tend to become more ascetic than socialistic.

Input-Output Analysis as a Planning Technique

(Contributed)

In underdeveloped countries, the inter-industrial demand for goods and services cannot be determined without knowing the structural coefficients and the structural coefficients cannot be known without knowing this inter-industrial demand. This problem, therefore, is insoluble within the framework of the dynamic input-output model.

INPUT-OUTPUT approach has been developed by Prof Leontief to provide a framework for "an empirical study of interrelations among the different parts of a national economy". The advance of economics as an empirical science has been rather slow and uncertain, because of a lack of sustained contact between the wheels of theory and the hard facts of reality. Empirical implementation, Prof Leontief argues, should be considered as much a part of an economic argument as the consistent development of its logical consequences. It is to this task of widening radically and effectively the empirical basis of economic science that he addresses himself in his two major works, *The Structure of the American Economy 1919-1939* and the more recent *Studies in the Structure of the American Economy*. Prof Leontief developed a simplified version of the classical general equilibrium theory which constitutes the theoretical framework of his input-output analysis for the purposes of exploring and utilising available statistical data and for gathering further obtainable data. In this static model, the economy is divided into a number of sectors on the basis of the nature of the product turned out. Each sector is considered to buy its inputs from other sectors and to sell its output to other sectors. There is an autonomous sector comprising of households, government, etc, which has no output and which represents final demand, and is unexplained within the model. This model to be internally consistent must satisfy his conditions. Firstly, the aggregate output of each sector must be equal to the aggregate purchases by other sectors from that sector. Secondly, the purchases of each sector from others must be

Economists, Political Economy and Government

(Contributed)

*"But I was thinking of a plan
To dye one's whiskers green,
And always use so large a fan
That they could not be seen."*

—Through the Looking Glass

AN important Minister was reported to have said that "hard working departmental people" had been far more useful than economists in preparing the First Five-Year Plan. It was also rumoured that the National Development Council had entrusted the preparation of the Second Five-Year Plan to a group of statisticians. The *amour propre* of the economists was naturally hurt when the role of economists in economic policy-making was not properly recognized by Government. An elderly Professor muttered something about Robbins and finally took shelter behind a quotation from Nassau Senior: "The conclusions (of the economist) whatever be their generality and their truth do not authorise him in adding a single syllable of advice." But the younger economists were not to be so easily put off. They had been brought up on Keynes and were concerned with the fruit-bearing no less than the light-giving aspects of their science. The interregnum of 'economics', they fondly believed, was over with the eclipse of *laissez faire* and that 'political economy' which even Adam Smith had once described as "a branch of the science of a statesman or legislator" had once again come into its own. These practitioners of "welfare economics", equipped with a full complement of modern tools, were only too ready to give their advice on all matters of economic policy. But what could they do if Government did not seek their advice and were content to leave economic policy-making to administrators and statisticians? It was unfair not to give them the chance for helping Government, and worse still, not even to make all relevant data available to them, and then to blame them for not helping!

The fact of the matter is that although everyone swears by economics these days, economists as a tribe are not very popular with the politicians. This is largely because economists are not always very con-

venient advisers. When the politician itches to do something, the economist has to ask him to weigh the cost against the expected benefit and also to remind him of the scarcity of resources as compared to the various things which the politician wants to be done. Like the physician or the accountant, it is often the duty of the economist to tell the unpleasant truth. Naturally, he cannot be very popular. If he is too rigid, he runs the risk of being ignored as a mere theoretician. If he is too pliable, he is likely to earn the contempt even of the politician as a mere provider of arguments for anything that political expediency may demand. Moreover, every politician in these days is his own economist. He may acknowledge the need for special study in the field of medicine or architecture or natural science, but when it comes to economics he does not think that specialisation is equally necessary in this field also. This is why the statistician is more popular in administrative circles compared to the economist. Not only do the rather unintelligible mathematical symbols used by the statistician have their value as a "mantram" with the lay public, the statistician is also only a useful subordinate. Not so the economist; he is a potential competitor in the field of policy-making, and no politician likes a competitor.

Besides, the economist himself also has his own short-comings. The economist who wants to leave his ivory tower to take part in economic policy-making has to possess a rare combination of qualities which Keynes envisages for the Master Economist:

"He must be mathematician, historian, statesman, philosopher in some degree. He must study the present in the light of the past for the purpose of the future. No part of man's nature or his institutions must lie entirely outside his regard. He must be purposeful and disinterested in a single mood; as aloof and incorrupt-

ible as an artist, yet sometimes as near the earth as a politician."

In fact, he has to be something like the Philosopher-Statesman of Plato's conception. It is unlikely that any common mortal will be found to fit this exalted role and even if one were found, he will be so uncommon that he will be promptly ostracised by his fellow-beings.

There is some wisdom, therefore, in the attitude taken by the elderly Professor but the difficulty is that the "Political Economists" as a class cannot do that and yet retain the respect of their fellow-men. They have also to prove their "utility" if they want to survive. But if it is not open for them to become Master Economists, they can do the next best thing and find a solution in division of labour. To quote old Adam Smith again,

"sub-division of employment in philosophy as well as any other business improves dexterity and saves time".

The members of the fraternity who want to function as "Political Economists" have, therefore, been obliged to divide themselves into two broad groups—The "Academics" or the specialists and the "Government Economists" or the family physicians. Academic economists have to specialise in particular fields and function only as consultants on particular aspects of economic policy when referred to by Government. It is not for them to go to the sick bed of the patient unless specially summoned and even when summoned their job is only to examine the specific organ in their special field of study—the throat or the nose—that they have been asked to examine, give the benefit of their specialist knowledge to the attending physician and depart without further concern. They should not complain nor should they criticise if they have not been entrusted with all aspects of economic policy-making or economic planning.

related to the level of output of that particular sector. In Leontief's model this relation is assumed to be such that the amount of each input required per unit of output by each industry is constant. He assumes constant input coefficients.

Given these invariant input coefficients and a known 'bill of final demand', output of each industry could be determined by solving a system of simultaneous linear equations. The 'final demand' constitutes the demand of the autonomous sector (Government and households). The structure of the economy is described by the invariant input coefficients, and structural change is therefore a change in these coefficients. Leontief applies this static input-output scheme to study and measure the changes in the structure of the American Economy between years 1919, 1929 and 1939.

DYNAMIC MODEL

The set of input coefficients used in the static model determines merely the flow of labour, all kinds of materials, fuels, replacement parts, etc, which each industry would have to absorb per unit of time in order to be able to maintain a certain rate of output. However, these input coefficients do not reflect the stock requirements of the economy. All investment demand for the product of each industry is not explained in that model; this is assumed to have been independently determined and is included in the 'final demand'.

The investment demand for the product of each industry cannot be explained unless together with the input coefficients, the capital coefficients are also included in the model. A set of capital coefficients for a given industry describes the stocks of various commodities required per unit of its output. With the introduction of these capital coefficients or the stock-flow relationships, the model assumes a dynamic character. This dynamic model has a predictive value, at least for the short run, which the static model does not possess.

Given the appropriate sets of input and capital coefficients, the time-shape of 'final demand' and the initial state of the economy in terms of the outputs of the various sectors of the economy, the output of each particular industry can be determined with the help of the dynamic model by solving a system

of linear non-homogeneous differential equations. Or alternatively, given the initial state of the economy at the time, *t*₀, the desired state of the economy at the time *t*₁, and the appropriate sets of input and capital coefficients, a quantitative description of all the paths which the final demand could take while leading the economy from its given original position to the prescribed final state can be obtained by solving the system of linear non-homogeneous differential equations.

DYNAMIC MODEL AS A PLANNING TECHNIQUE

This dynamic model can be utilised for the purposes of planning in quantitative terms, if the input and capital coefficients are given. In that case, if the time-shape of the final demand is to be taken as given, we can determine with the help of this model, the feasible rate of growth of output of the various sectors of the economy. With the help of the same model, we can also determine the way in which the final demand should be controlled,

"The cautious seldom err."
Confucius.

if we want to attain certain targets in terms of the outputs of various commodities.

In an underdeveloped economy, however, when new industries are to be started, it is not possible to obtain these coefficients from observed data regarding industries. It can be argued that with the help of engineering data and the relative prices, these coefficients could be determined. Even in that case, can we take these coefficients as fixed and invariant, as is required by the dynamic input-output model?

For an advanced economy, in which the marginal changes in the outputs of various industries are likely to be fairly small as compared to the total outputs, it is perhaps justifiable to take the observed coefficients as fixed and invariant for a short period of time. This assumption, however, would not be tenable even for an advanced economy, if the period taken is fairly long.

THE PECULIAR PROBLEM

For the underdeveloped economies, thus, there arises a peculiar problem. The countries which are underdeveloped want to plan for rapid economic development and the planned increases in outputs of various industries are quite significant. Now the coefficients for each level of output would be different. Therefore, unless we know the level of output of a given industry, we cannot determine the magnitude of these coefficients, and we cannot know the level of output of a particular industry, unless we know the levels of outputs of the other inter-related industries. Thus the inter-industrial demand for goods and services cannot be determined without knowing the structural coefficients and the structural coefficients cannot be known without knowing this inter-industrial demand. This problem therefore is insoluble within the framework of the dynamic input-output model.

Apart from this main difficulty in the use of the dynamic input-output model, there would also arise some other problems. Gestation periods of various industries, changes in coefficients as a result of changes in relative prices (these changes may be quite significant in a developing economy, even within the short period), inadequacy of data, etc—all these will have to be taken into account, before we can apply this dynamic model.

The present provisions relating to export subsidies, which provide merely for consultation with affected countries, are likely to be tightened up. Some attempt may be made to define these subsidies and to decide how far they should include indirect subsidies given through fiscal devices and incentive plans. Orderly disposal of agricultural surpluses may be allowed. The present US practice of applying quotas against the import of agricultural products in contravention of GATT will not be permitted.

ORGANISATIONAL OVERLAPPING

It is not yet clear whether the new GATT would include within its purview international commodity stabilisation schemes and international monopolistic practices, which were included in the Havana Charter. In the sphere of commodity problems, there is at present considerable duplication and overlapping of efforts. Under the Economic and Social Council, there is firstly the FAO, which studies agricultural commodities; secondly, there is what is called the ICCICA (Interim Co-ordinating Committee for Inter-Governmental Commodity Arrangement) which sponsors studies and agreements on individual commodities and prepares an annual re-

port; and thirdly, the ECOSOC has recently set up a permanent Advisory Commission on International Commodity Trade, with 18 members, including India, which is at present meeting in New York, for study and examination of general stabilisation measures affecting commodity trade, as recommended by the UN Experts in their report on Commodity Trade and Economic Development. The UK and the USA feel that this duplication should be avoided and commodity problems should be studied under the forum of GATT. Some under-developed countries, however feel that they have better chance of support for their purposes in the ECOSOC rather than in GATT.

Some one has said of the GATT that "it consists of half-a-dozen principles, half-a-dozen platitudes and half-a-hundred escape clauses." It remains to be seen whether the new GATT will be anything better. It is gratifying to note, however, that there is such a wide measure of support towards an agreement to promote international trade and regulate it according to a code of international commercial conduct, in contrast to the discredited policies and practices of the inter-war period.

Jute as Fabric of Commerce

THE importance of jute as a dollar-earner is stressed in a statement issued by the Indian Jute Mills Association's London office, which says that the export of Calcutta gunnies maintains jute's position as India's largest dollar-earner and its ranking among the biggest dollar-earners in the Commonwealth. Following the war, there were shortages in Britain, but recently Britain has absorbed more jute than in pre-war years.

"This progress," says the IJMA, "is not only remarkable but significant, for ever since the war ended many alternatives have been produced to take the place of jute—plastics, paper sacks, and other materials." Although the present stock and price position had, no doubt, helped much, another reason for the "comeback" was felt to be the propaganda work now being carried out on behalf of jute. The jute industry had made available to customers new research and packaging advisory facilities.

Specimens of the different forms of jute are a feature of the Packaging Exhibition now being held in London.

Nationalisation of the Imperial Bank

H T Parekh

How are the shareholders to be compensated when the Imperial Bank and the State banks merge in the proposed State Bank of India? It will be inconsistent to have two different principles of valuation—market price of the shares in one case and the value of the assets in the case of the others.

In the case of the Imperial Bank, the analogy of the Reserve Bank is quite untenable, and considering the special character of the share-holding, present investors should be entitled to a fair, if not liberal, treatment. It will also be much the better policy, since the proposed State Bank may have to raise fresh capital.

THE Government notification of December 20 announcing the decision to exercise effective control over the Imperial Bank of India was the first step taken for implementing the recommendations made by the Committee of Direction of the All-India Rural Credit Survey. But it is already becoming apparent that Government move may take a different shape from that suggested in the Survey, and effective control will mean nationalisation through the Government taking over the shares of the bank held by private shareholders. The implications of his move may well be examined from the point of view of the shareholder on the one hand and the present depositors and the clientele of the Imperial Bank on the other.

While the Survey suggested the conversion of the Imperial Bank into the new State Bank of India by retaining the present shareholders, presumably with the right to dividend distribution undisturbed but with additional share capital owned by Government as a major partner to the extent of 52 per cent, Government appears to be proceeding to an outright purchase. This in one sense is more practicable because the Survey proposition would have created Government and private parties as two classes of shareholders, the dividend payable to the former being limited to 5 per cent while the latter, by implication, would go on earning the present rate of 16 per cent. Sooner or later Government would view such a situation unfavourably and may lower the dividend distribution of the private shareholders from 16 per cent, thereby prejudicing their interests.

BASIS OF COMPENSATION

But in another respect, the Survey recommendation may be more consistent than what Government proposes, if the State Bank of India is formed by a merger of the ten banks named in the notification of December 20. The Survey contemplated no cash compensation to the shareholders of the Imperial Bank while

the basis of compensation for the shareholders of the other banks was to be determined "after taking into account all the relevant considerations, including in particular the value of their part of the assets". The Rural Credit Survey Report suggested no meticulous valuation but it clearly indicated that the value of assets to be taken over should be the basis of compensation, which is quite different from the concept of market value of shares.

The Government proposal, however, starts with the market value of shares of the Imperial Bank as the basis for compensation. Should Government finally decide to the merger of other ten banks on the lines suggested in the Survey, then Government will be adopting two altogether different methods for determining the amount of compensation, viz, market price of shares for the Imperial Bank and net value of assets for the other banks. It is obvious that market price of shares cannot be adopted as the basis for other banks because some of these banks have no share capital with a market price, while the share of the others have an unduly low and misleading market price. It remains to be seen how Government proposes to overcome this hurdle while framing legislation for taking over these banks.

NO ANALOGY WITH RESERVE BANK

In fixing the amount of compensation for the shareholders of the Imperial Bank, it has been announced that, on the analogy of the Reserve Bank shares, market price of the share will be taken as the basis though how many years' average price will be considered for the purpose remains to be decided and is probably left to the Reserve Bank to recommend. The analogy of the Reserve Bank, however, must be regarded as inappropriate and unfair. Dividend on the Reserve Bank shares was limited to 4 per cent (taxable); shareholding in the Reserve Bank was restricted to 200 in one name; and all the surplus

profits of the Reserve Bank went to Government. In all these respects, the position of the Imperial Bank shares is entirely different. There is no limitation on dividend, nor on shareholding and its surplus profits have been freely ploughed back. Thus the Imperial Bank has operated as a commercial, private profit-making enterprise while the Reserve Bank always functioned as a State enterprise. That large secret reserves have been accumulated by the Imperial Bank over the years has been widely known; this has weighed heavily with the investor in Imperial Bank shares who has regarded them as near-gilt investment with an intrinsic value much higher than what the market price indicated. Moreover, charitable institutions, widows and other investors with whom these shares have been popular have counted on the income from their investment which has roughly been of the order of 6 per cent, after allowing for income-tax.

If compensation is paid to the shareholders of the Imperial Bank in Government bonds bearing 3½ per cent interest, a drop in income of nearly 50 per cent would result which would be most upsetting to this class of investors. In determining compensation, therefore, much avoidable hardship could be averted, if Government were to ensure that the fall in income to the investor is moderate and not excessive. This would be possible if the market price basis is somewhat liberally interpreted as an average of last 7 years price, ie, from February 1948 when the late Shanmugham Chetty announced in Parliament the Government decision to nationalise the Imperial Bank. This would give a somewhat higher average. Further, if an alternative is given to the shareholders to accept cash or a long-term Government loan of about 20 years maturity on the ruling yield basis of 4 per cent, Government will be doing much to regain investors' confidence.

Foreign Trade...

Extensive international trade is essential for the development of national economy. A country's foreign trade largely depends on efficient banking service.

With a network of correspondents at all important trade centres of the world the United Bank is equipped to render adequate service and give expert guidance in matters of foreign trade.

★ Paid-up Capital & Reserves Over Rs. 3,73,00,000

★ Working Funds Over Rs. 34,72,00,000

United Bank of India Ltd

HEAD OFFICE: 4, CLIVE GHAT STREET, CALCUTTA-1

The case for a liberal rather than a harsh treatment to the investor has much to recommend it when it is realised that the declared object for nationalising the bank is to provide better remittance facilities and to establish a far more widespread network of banking in the interests of the cultivator. The Imperial Bank has always been regarded as a pillar of commercial banking, providing short-term credit to industry and trade and if, as a result of State policy, there is a major shift in its banking activity, the investor in the Imperial Bank shares should not, in fairness, be asked to pay for such reorientation. He is surely entitled to a fair deal. State action which seeks to retain the investor's faith and not to shatter it, is of much long-term value to Government. This is not tantamount to yielding to vested interests, at least in the case of shareholders of the Imperial Bank.

To strengthen the investor's confidence may also be useful in another way. The Survey has suggested increase in the share capital of the State Bank of India to a much larger figure. After the contemplated take-over of the Imperial Bank is completed and Government becomes the majority shareholder, the share capital of the bank could be increased in due course and public subscription invited with dividend limitation on lines suggested in the Survey in respect of Government capital. That would mean implementation of the Survey recommendations, though in a reverse order.

DEPOSITOR AND BORROWER

An impression is widely prevailing that the proposed change in its name will also imply change of function of the Imperial Bank, that it would in future provide credit mainly to agriculture instead of serving commerce and industry as it is doing at present. This view is unfair to the Survey which makes it clear at more than one place that provision of rural credit must remain the ultimate responsibility of the Reserve Bank and that the State Bank will facilitate remittances, set up more branches with that aim in view, thereby helping co-operative banking, but that the bank will continue to provide credit to trade and industry as at present on accepted banking principles.

The fear, however, that the bank may lose a large part of its deposits

after the change will not be shared by many; for a considerable part of its deposits is held by public and semi-public bodies and by leading commercial concerns. Such depositors are hardly likely to withdraw their accounts merely because the bank is reconstituted.

The average lending operations of the Imperial Bank are of the order of Rs 100 crores at present. This includes considerable credit to leading industries such as sugar, steel, etc. The large credit lines which

the Imperial Bank allows will be difficult to replace, for no other bank commands resources large enough for extending such facilities. No shift need, therefore, be expected unless of course under the new set up, the bank wants to modify its lending policy in a different direction and change its existing pattern of lending. All this will depend largely on the new board of directors, ie, on the extent to which Government will be interested in maintaining continuity while nominating the directors.

Labour in the Plan

(From a Labour Correspondent)

Of late there has been a growing tendency on the part of the State to have more and more control over labour matters with less and less financial liabilities. Social security and welfare measures, financed out of contributions from employers and workers, are being administered mainly by Government representatives.

During the last three decades, there has been a definite swing from laissez faire to state control in labour matters. It has been a challenge to enlightened employers' and workers' organisations, who should bear in mind that the problems of industry and labour should be a bipartite affair, which could be settled without any intervention from the third party.

PLANNING is not new as far as labour is concerned. The Government of India formulated a Five-Year Plan for the amelioration of labour conditions as early as 1946. This was probably the first Five-Year Plan for the country; its contents can be looked up. A summary of this plan appeared in Indian Labour Gazette, March 1947, on pages 377-81. The necessity for labour and industrial planning was keenly felt in the post-war years, when the country was passing through acute industrial unrest. This plan for labour resulted in a plethora of labour legislation in 1946-1948 and the statute book has been crowded up by enactments relating to conditions of work in factories, fixation of minimum wages, social security and labour welfare schemes, prevention and settlement of industrial disputes and regulation of employment of dock labour. Inadequate enforcement, however, has made labour lose faith in this kind of legislation and the Planning Commission had to recommend that every effort must be made to complete the implementation of existing laws before new legislation is undertaken.

Labour has naturally a very important place in the Plan, as the main instrument in the fulfilment of its targets. On the co-operation of this uncertain human factor depends to a large degree the success or failure of the Plan. The perusal of the Plan, however, shows that whatever importance labour has got, is due to its value as one of the factors of production. The primary motive of the Plan is maximisation of production and the approach to labour, which has proved to be an uncertain factor, is from this angle alone. Maintenance of industrial peace, fixation of minimum wages, provisions of social security, betterment of working conditions, labour welfare, industrial housing, employment service and training organisations, productivity studies—all these have one aim, namely, maximum production. This tendency of judging human values

by productivity standards, without regulation of the goods produced, is naturally resented by labour. If men are treated merely as means of production, and are not convinced of their patriotic role, there would hardly be any difference between men and machines.

WORKERS' EDUCATION

It is commonly accepted, therefore, that to get the best out of labour, workers should be taken into confidence both by the Government and the employers, so that they may feel that they are just as important partners in industry as the others. This is, of course, the theory. The Planning Commission went further and suggested that workers should be given an increasing share in the working of the industry to enable them to have a sense of responsibility. The first step in this direction would be workers' education, but this is overlooked by the Planning Commission. Even now a large number of industrial workers are illiterate and before we entrust them with the responsibility of running an industry, they must first be taught the three R's. An organised drive for providing the industrial workers first with primary education (worker's education) and then with training in labour problems (labour education) may not, by itself, solve all of the problems at present facing Indian labour. But it will be an important step, perhaps the most important step that can be taken, towards better labour relations. Let us hope that second Five-Year Plan would attach some importance to this problem.

By way of new suggestions or ideas, the First-Year Plan has contributed practically nothing, presumably because a five-year labour programme had already been formulated. This programme, however, faced many difficulties, and except for enactment of labour laws, it could not be successfully implemented. The major portion of the "Labour"

chapter of the Five-Year Plan reiterates the recommendations already made earlier, which unfortunately have not met with any success so far.

INDUSTRIAL RELATIONS

In the field of industrial relations, the Plan makes reference to various methods of industrial peace, such as legislation, tripartite committees, works committees, and healthy trade unionism. Legislation in labour matters is in excess of requirements and suffers from non-implementation. Indian trade unionism is still weak, qualitatively speaking. Consequently free collective bargaining is still not possible and this gives an opportunity for State intervention and consequent control over labour matters. Works committees, on the success of which the Plan hoped to build a superstructure of industrial peace, have been on the whole a failure; hence the base of harmonious industrial relations remains to be laid. Tripartite committee on higher levels have helped, but they are generally dominated by Government officials and outsiders in the Indian labour movements.

In the matter of a proper wage policy, we are still toying with the concepts of "minimum wage", "living wage", and "fair wage". The inordinate delay in the implementation of the Minimum Wages Act and the fate of the Fair Wages Bill raise doubts about the intentions of the State. The Plan unfortunately has no new suggestions for a wage policy.

SOCIAL SECURITY

Social security for Indian workers is restricted to the Employers' State Insurance Scheme and the Coal Mines Provident Fund and Bonus Schemes. All the three are narrow in scope. The State Insurance Scheme applies only to factory industries and covers the risks of sickness, maternity and employment injury. So far it covers only about 6 lakhs out of an insurable population of 25 lakhs of industrial workers

in the country. Lately the scheme has been extended to Greater Bombay and has evoked innumerable complaints from insured persons and panel doctors alike. The Provident Funds Scheme applies to six selected factory industries and the factories covered are those employing 50 or more persons. In case of both these schemes, the only suggestion the Plan could make was that they should be extended to new centres or new industries.

WORKING CONDITIONS

Working conditions of Indian labour are admittedly satisfactory and the Government of India has been trying to improve the situation through legislation, which lays down statutory obligations on the employers in factories, mines and plantations to ensure safety, health and welfare of the workers engaged by them. The provisions of labour laws, however, are not adequately enforced and the Plan recommended their proper implementation, especially of the provisions relating to medical and occupational health. It also emphasised that inspection services in factories and mines should be strengthened. This much about factory labour, labour in mines and plantations. About agricultural labour, nothing has been done so far except collection of data about wages and conditions of work through the Agricultural Labour Enquiry conducted in 812 sample villages.

Labour welfare is another field, which has been slowly but gradually brought under statutory control. The provision of amenities like canteens, crèches and medical aid and appointment of labour welfare officers were voluntary some years back; they now form a part of statutory obligations. The Factories Act, the Mines Act and the Plantation Labour Act lay down welfare measures to be followed by the employers. Besides, the Coal Mines Labour Welfare Fund Act and the Mica Mines Labour Welfare Fund Act are concerned exclusively with labour welfare of these workers. Some of the State Governments have also started welfare work for industrial workers.

HOUSING FOR LABOUR

Progress in industrial housing has been very disappointing, in spite of attractive subsidy from the Central Government. Under the Subsidised Industrial Housing Scheme, which came into force in September 1952, the State Governments get a subsidy to the extent of 50 per cent of the

approved cost of houses to be built by them for labour housing and the balance is given as a loan, i.e., the entire cost is initially borne by the Central Government. Employers and workers' co-operatives get 25 per cent of the approved cost of building houses as a subsidy. Besides, employers get an additional 37½ per cent of the cost as a loan, while workers' co-operatives get an additional 50 per cent for the same purpose. The response, however, has been poor as can be seen from the table below.

EMPLOYMENT AND PRODUCTIVITY

The employment service organisation (Directorate-General of Resettlement and Employment) has some work to its credit in the field securing employment and training, though at an out of proportion cost. The spectre of unemployment which caught the Planning Commission napping, has not been exorcised; the number of the unemployed is still on the increase. The second Five-Year Plan, it has been announced, will concentrate its efforts on fighting unemployment. What role employment exchanges will play in this all out effort, however, cannot be visualised at this stage.

Perhaps the only new suggestion the Plan has made is about organising productivity studies. Unfortunately, too much reliance for this work is being placed on foreign experts who are reported to have completed a few pilot experiments. Rationalisation has evoked fierce controversy and much discussion; but its introduction is held back for fear of displacement of labour. The case for the employers has been put forward very neatly by the Millowners Association. The trade unions have also given their views. The Planning Commission, however, is still sitting on the fence. It should vigorously pursue the matter, because rationalisation without displacement of labour can make a big contribution to production and prosperity.

This brief review will show that

the Plan has practically nothing new to say on labour problems. In contrast to other aspects of Indian economy, such as industrial policy, power, irrigation, rural development and transport, labour appears to have been completely neglected by the Planning Commission. Whatever attention it has received is due to its utility in increasing production. Unfortunately, this motive has been so much emphasised that one wonders whether labour has any other role except that of a factor of production. Even the few welfare measures that have been introduced appear like crumbs thrown to labour to get loyal, machine like service from it. The fact that the workers form a distinct class of citizens as such, have certain rights and privileges is overlooked and labour, in turn, has ignored with impunity its responsibilities. It is not difficult to find out why Indian labour has remained indifferent to the implementation of the Plan.

Of late there has been a growing tendency on the part of the State to have more and more control over labour matters with less and less financial liabilities. Social security and welfare measures, financed out of contributions from employers and workers, are being administered mainly by Government representatives.

Compulsory conciliation and arbitration, enforcement of labour laws, tripartite committees and conferences, employment service and training organisation and even fact-finding committees and research institutes set up by the State—all these have directly or indirectly been responsible for strengthening the position of the Government.

During the last three decades, there has been a definite swing from *laissez-faire* to state control in labour matters. It has been a challenge to enlightened employers' and workers' organizations, who should bear in mind that the problems of industry and labour should be a bipartite affair, which could be settled without any intervention from the third party.

Assistance for Industrial Housing Sanctioned up to March 31, 1954

Agency	Assistance sanctioned (Rs lakhs)		Tenements (number)

Jungle Clearance in Pepsu

On vast stretches of land in Pepsu, a reclamation drive is making rapid headway as a result of a fine organisation laid down by the firm of E M Allcock & Mohatta Ltd, of Calcutta and Delhi, who are reclaiming 50,000 acres of land on contract with the Government of Pepsu.

With a fleet of about twenty Hanomag tractors, many of them fitted with Root Rakers and Bulldozers, the unit is clearing 150 acres of jungle and bushes per day. The rates charged are considerably lower than those offered by the CTO.

IN the Statesman dated November 10 last, an article on "Work on Community Projects not going to schedule" was published and it was stated that a serious view of the situation was being taken.

In that same article, however, appeared one small paragraph which stated, "Progress in land reclamation, as stated earlier, has been markedly slow. Only in one project, in PEPSU, is reclamation by tractors and ploughs proceeding rapidly."

PEPSU is quite enlightened and progressive in agricultural operations and this small State has now got over 1,000 tractors in operation and there is a definite trend towards mechanised farming.

There has been an overall increase of food production in PEPSU as a

result of intensive and extensive field operations. In some cases the target of additional production of 1.75 lakh tons of food grains, 80,000 bales of cotton and 7,000 tons of raw sugar earmarked in the Five-Year Plan has been accomplished in advance.

Out of PEPSU's total area of 6,400,000 acres only 4,900,000 acres are under plough. To step up production a survey was conducted sometime ago and it was estimated that 8,27,000 acres are culturable wasteland.

The PEPSU Government has enforced (1) The Pepsu Land Reclamation Act and (2) The Pepsu Land Utilisation Act for maximum utilisation of land. Under the Land Reclamation Act, the Government is to

provide a sum of Rs one crore out of which Rs 75 lakhs is to be utilised for land reclamation and the balance for the installation of tube-wells.

On vast stretches of jungle land in PEPSU, a reclamation drive is making rapid headway as a result of a fine organisation laid down by the firm of E M Allcock & Mohatta Ltd, of Calcutta, and Delhi, who are reclaiming 50,000 acres of land on contract with the Government of Pepsu.

With a fleet of approximately twenty Hanomag tractors, many of them fitted with Root Rakers and Bulldozers, the unit is clearing 150 acres of jungle and bushes per day. These operations are carried out to a depth of 36 inches to extricate stumps and roots, and a further

A 'Hanomag' K.90 equipped with root-raker ripping up jungle.

number of tractors are expected in the course of the next few weeks, which will increase the output considerably.

Visiting the Allcock & Mohatta camp, one is given the impression of a minor industrial township, with its own electric lighting system, mobile workshops, fuel tankers, etc. All accommodation is tented. The camp site also provides a field hospital, recreation rooms for the staff, play-grounds, and the company also runs its own canteen to provide food to the workers. The quality of the food is excellent and the men are given to eat as much as they require.

The Camp Carpentry Section turns out all furniture, timber from the packing cases in which machinery is received being used for this purpose. The camp is, in short, a self-contained unit, dependent entirely on itself—and in spite of this, is completely mobile. The camp shifting from one spot to another can be done within twenty-four hours. The service station, mobile workshops, spare parts van—are all mobile.

There are several operations for reclaiming land. The first operation being reaping out jungle and shrub with the help of two K 90 Hanomag tractors each with a 4-ton anchor chain. The second operation is root raking and stacking all timber and shrub in long wind rows, which is followed by ploughing to a depth of 10 inches with Eberhardt Disc Ploughs—again followed by harrowing and planking.

Work in the field is highly organised and it moves without a mishap. Field supervisors and guide operators co-ordinate their movements. All areas to be worked are flagged and there is no time lost in the course of operations. Operations are done by two shifts—the first working from 4 am to 12 noon and the second from 1 pm to 8 in the night. Shifts are changed in the field where mid-day maintenance is done by a maintenance squad from the camp site. The working of the maintenance squad is remarkable. At the mid-day halt for change of shifts, to the field comes a tractor-trailer with the workers for the second shift—followed by the maintenance squad, which is followed by mobile fuel tankers. Before the second shift takes over, the maintenance squad goes to every tractor and does daily maintenance and re-fuelling. When this is complete, the first shift returns to the camp. The maintenance squad then takes

on the work of weekly maintenance for such tractors as are due for it on that date. If there is any breakdown in the field, word is sent back to the camp site, from where in a matter of minutes the maintenance and repair squads are immediately sent to the field with required tools and spare parts.

The most remarkable aspect of the organisation is its efficient fuel handling and re-fuelling. Supplies are drawn from the Standard Vacuum Oil Company's depot in Patiala in a 1500 gallon, tractor-drawn fuel tanker. This is fitted with filters, dispensing pump and flow-meter. Fuel is pumped direct from the tanker to the tractor tanks. This method has completely eliminated wastage and the possibility of dirt and dust entering the fuel. As a result from the date of commencement of operations till date, the unit has not had a single fuel stoppage on any tractor. Where re-fuelling is to be done in the field, that is done by smaller 300-gallon fuel tankers, where again the fuel is dispensed direct from this tank to tractor tanks through a hose.

The workshop unit, which is mobile, is under the charge of Mr Bredow, a Hanomag Factory Engineer. He teaches his men with the greatest of care. The field work and overall control is in the charge of Mr Kneer, the Chief Engineer, who is also German. Mr Kneer has had

considerable experience in reclamation work having been attached to the Kaki Reclamation Project in Assam, where the company gained considerable experience in this type of work.

The whole unit is definitely working in a most organised manner. Every member of the personnel whether fitter, operator or mate, camp cook or chowkidar—each goes about his work with an air of confidence and this continues for eighteen hours a day.

Due to this high standard of organisation and also because of the welfare of the personnel, the unit can achieve its present output at the extremely low cost quoted to the Government of Rs 75 which is made up as follows:

	Rs per acre
(1) Clearance of jungle trees and bushes, etc. to a depth of 1½ ft below the ground level ...	34
(2) Reclamation ploughing up to the depth of 10 inches ...	26
(3) Discing up to the depth of 6 inches ...	10
(4) Heavy planking (Sohaga) ...	5

These rates are considerably lower than that offered by the CTO.

Dr. P. N. Thapar—Chairman of the Planning Commission, Pepsu Government Officials and E. M. Allcock & Mohatta Staff visiting the mobile spare parts van.

The Poor Half of the Western Hemisphere

R K Hazari

The problems of development are not the same in every underdeveloped economy. They are very much complicated for Latin America, by its extreme vulnerability to external influences, especially those originating from the US.

The basis of its development will have to be sought for within the countries themselves since foreign capital hardly makes any net contribution to their foreign exchange receipts nor can they produce for the domestic markets because of the small size of most of them.

Then there are the usual penalties for rapid but unsteady growth in countries which suffer, above all things, from organisational deficiencies.

This study is based on the Economic Survey of Latin America for 1951-52, and 1953. United Nations. Department of Economic Affairs. Price \$2.50 each.

FOR the economy of Latin America, the period from 1945 to 1952 was a long honeymoon. During this period, output expanded at an annual rate of 4.3 per cent, but owing to favourable terms of trade, the gross product expanded at an even higher rate of 5.6 per cent. The improvement in terms of trade was equivalent to \$21 billion or 8.3 per cent, of the aggregate gross product. This favourable development raised the proportion of investment to gross product to an all-time peak of 16 per cent, which surpassed for the first time the previous record of 13.2 per cent in 1925-29. Capital stock expanded at an annual rate of 5.6 per cent as against 3.1 per cent during 1940-45—a rate higher than that of output, causing a decline in the output-capital ratio from the high level it had attained during the war.

In spite of this decline in the output-capital ratio, output per employed person rose at an annual rate of 2.4 per cent, while capital stock per worker was increasing by 3.3 per cent. Goods and services available *per capita* however, increased at a higher rate than output *per capita*, viz, at 4.6 per cent, owing to favourable terms of trade, which despite a 3 per cent decline between 1951 and 1952, were 31 per cent higher in 1952 over the previous peak attained in 1925-29. The performance appears even better if Argentina, which accounts for 22.3 per cent of Latin American gross product, is excluded because of its slower rate of growth and the drought which swallowed up its agricultural surplus for two consecutive years. The rate of growth of investment was all the more remarkable, coinciding as it did with a 3.4 per cent annual increase in *per capita* consumption.

The honeymoon ended in 1953

when there was a pause in the rate of growth. The investment coefficient declined to 14.3 per cent from the level of 18 per cent attained in the previous year, while gross product *per capita* increased by 1 per cent only, compared to 4.2 per cent in the preceding year. The terms of trade were sustained only by the high relative prices of coffee and cocoa, while mineral and sugar exporting countries suffered a severe set-back. There was a further decline in the output-capital ratio owing to a slump in foreign demand and contraction of domestic markets which, with the exception of three countries, were already quite small. An increase in the proportion of consumption to gross product was noticeable while the latter was increasing at a lower rate.

CRISIS OF GROWTH

The determinants of this "crisis of growth" were the same as those which accounted for the phenomenal prosperity of 1945-52. The international reserves accumulated during the war helped the region to import beyond current capacity during these years; fiscal deficits and private investment—much of which was under the circumstances naturally speculative—were liberally financed from bank credit; industrialization was pushed ahead at a pace which demanded considerable imports of capital goods, raw materials and fuel, without a corresponding increase either in export capacity or internal supplies. Agriculture was comparatively neglected, and its export surplus was actually reduced by higher domestic consumption. Prices and wages chased each other around through every sector of the economy.

Only the serious depletion of reserves and a persistent increase in the cost of living ultimately brought

the realization that inflation was undermining development. Restrictive economic policies followed, the main features of which were lower fiscal expenditure, reduction of imports, credit restriction and price and wage stabilisation. These policies have met with varying degrees of success in different countries. In Chile and Paraguay, they unintentionally added more fuel to the fire; in others, they succeeded in deflating the economy in a rather rough-handed manner. The one fundamental fact that stands out from Latin American economic policies that *fiscal policy has accentuated, rather than compensated, movements outside the public sector*, highlights the complete failure of the Governments of the Latin American countries to discharge their responsibilities in the matter of the development of a mixed economy.

In the field of industry, Latin America made considerable progress in these years in substituting imports by domestic production, a basic feature of growth in many of the underdeveloped countries today. Argentina, Brazil and Mexico, the only countries with large domestic markets, have been able to reduce the imports of machinery, motors and railway rolling stock. Vehicle assembling is making good progress in Brazil. Significant increases have taken place in the production of cement and basic chemicals. Steel production, largely in Brazil, Chile and Mexico, has reached 1,500,000 tons—a 100 per cent increase in five years. Textile output has risen as a result of the use of artificial fibres.

SHORTAGES AND RESTRICTIONS

This rate of progress, however, could not be maintained. Severe power shortage and transport bottle-

necks reduced the annual rate of increase of industrial production from 7.7 per cent in 1949-50 to 4.1 per cent in 1952; restrictive economic policies pushed down the rate further to 1.3 per cent in 1953. Foreign competition, especially from European goods, has been a contributory factor in the decline, in spite of protective tariffs and import restrictions. This competition was the severest in Venezuela, which owing to its petroleum industry has the highest labour costs in the region; its abundant derricks are therefore becoming effectual barriers to industrialization, though they have prodigiously increased the country's capacity for external payments. The production of petroleum, too, has been diminishing lately owing to competition from Middle East oil.

The Survey ascribes power shortage to the insufficient utilisation of capacity in some cases and to insufficiency of resource in others. The extreme poverty of energy resources of Latin America is, of course, well-known. According to Prof Usher's estimates, the region's resources expressed in terms of bitu-

minous coal are as follows:

	(in million tons)
Coal	3,000
Oil	7,000
Water power	158,000
Total	168,000

The small resources of coal in the region are concentrated in Chile and Peru, while more than half the oil is found in Venezuela. While some attempt has been made to utilise coal resources in recent years, oil is the main energy producer; and most Latin America countries have to import it, thus straining their import capacity. A fuller development of water power resources is as yet a rather remote possibility and would, in the short run, create more problems than it could solve. The inadequacy of coal, according to current indications, may still remain a difficult handicap for industrial development in the long run—the immediate problem is inadequacy of capital for development of electric power, to keep pace with urban growth and industrial development.

MINING FOR EXPORT ONLY

Except for Chilean copper, there is scarcely any intra-regional (or for that matter, internal) market in minerals; mining activities are almost exclusively directed towards exports. The dependence on the US market, capricious and tariff-conscious as it is, is very great. In recent years, power shortage and inadequate and expensive transport have together prevented further mining development. More alarming, however, is the fact that in respect of practically all the four important minerals, namely, copper, tin, lead and zinc, high grade ores have been almost exhausted. An increasing amount of sulphide is now being found in copper mines, demanding a change in refining methods. The peak years of copper output were 1946 in Bolivia, 1944 in Chile, 1945 in Ecuador, the twenties in Mexico and 1938 in Peru. The 1953 Survey explains: "In general, the reduction is due to the fact that some mines have gradually been worked out without being replaced by new enterprises or by extensions to the remainder." New mines are not being opened because of lack of reserves. Further,

the world production of copper is fast running ahead of consumption and is actually expected to be double the latter by 1958. The Korean boom may perhaps be the last for Latin American copper, unless a war breaks out.

Tin, which comes from Bolivia to the extent of 97 per cent of the Latin American total, is in an even worse predicament. The average tin content of ore produced declined from 3.94 per cent in 1929 to 2.18 per cent in 1950 and is known to have declined further since then. Bolivian tin mines are located at an altitude of 10,000 to 12,000 ft; their location is widely dispersed and labour productivity is low, while operational and transport costs are high. Moreover, there appears to be a long-term decline in the world consumption of tin, caused principally by greater use of scrap. USA meets one-third of its tin requirements from scrap.

Lead and zinc are usually found mixed with other minerals, and their exploitation depends mainly on price and ore grade. Technological progress has been reducing the consumption of these metals in recent years and the process is likely to be accelerated in future. Competition from other sources has also been increasing.

In sulphur, too, lower grades of ore have been reached and though new processes of recovery and increase in world demand are likely to render large reserves of sulphur capable of exploitation, they are also likely to create difficulties for existing high cost producers.

Mining in Latin America is almost entirely in foreign hands; the only three large copper mines in Chile, producing 93 per cent of its copper, are owned by US companies, while 400 Chilean firms, helped by some French capital, produce the remaining 7 per cent.

LITTLE IMPETUS FOR AGRICULTURE

Coming to agriculture, one has the feeling that Latin American Governments consider this activity rather drab and lowly and prefer to dabble in more respectable activities like industry—and multiple exchange rates. Agriculture has been largely treated as a source of private and public revenue and not as the occupation of the greater part of the population. Little genuine impetus has been given to agricultural development. Domestic crops

have generally increased much more rapidly than export crops, thereby impairing the capacity to export. There has actually been a substantial decline in export volume, which in 1951 was 26 per cent lower than the 1937 level and 12 per cent below that of 1948. The production in 1952-53 of export crops was 6.4 per cent and 8 per cent above those of 1937-38 and 1947-48 respectively. The production of domestic crops in that year was 60 per cent above prewar and 17 per cent higher than in 1947-48. The agricultural economy is, therefore, less vulnerable than before, but the capacity to import has been correspondingly reduced. On the other hand, increase in agricultural production has failed to keep pace with the growth of numbers. Chile, Guatemala, Paraguay and Bolivia show a decrease in agricultural production *per capita*. The Surveys deplore the failure to open new areas, of which there are plenty, and at the same time laments the traditional method of clearing new land, namely, by burning. Since this tradition is not likely to change in the near future, it is perhaps just as well that natural resources are not being depleted too fast and that Governments are largely concentrating on the intensification of cultivation.

LAND UTILISATION POOR

The inefficiency of agricultural production is well illustrated by the fact that to produce beef in Argentina, one animal is raised on an area that would feed six elsewhere. Progress in pastureage methods has been negligible so far. There are, in the main, four adverse factors operating in agriculture, viz, lack of reinvestment, a long period of waiting in crops like coffee, difficulties in the purchase of machinery, and internal inflation. Encouraging factors are the increase in mechanisation in Argentina and Cuba—in the former it became necessary owing to the diversion of rural labour to industry—and a 80 per cent increase in fertilizer consumption between 1938 and 1952, though the production of fertiliser increased only by 45 per cent. The only major lasting development also thus appears to have originated at the wrong end. Two crops, showing significant expansion, are rice, mainly in Cuba, which has quadrupled its output in ten years by increasing yields, and coffee. Hardly any country has diversified its agri-

cultural production; on the other hand, in some there has been an increase in dependence on one or two crops, especially coffee, the price of which has continued to be favourable.

WORLD'S LARGEST FORESTS

Latin America has the largest forest resources in the world. Thirty-nine per cent of its land area is under forest, giving a *per capita* figure of 4.9 hectares (about 12 acres), against the average of the rest of the world of 1.7 hectares. As much as 75 per cent of the land area of Costa Rica and Panama is under forest, while Brazil accounts for about a half of the South American total. Bolivia and Paraguay have the largest area under forest *per capita*, 16.7 and 14.9 hectares respectively, followed by Brazil (7.4) and Panama and Venezuela (7.2 each). The *per capita* area is, however, insufficient in Cuba, El Salvador, Haiti and Uruguay, where it is about half a hectare.

The large size of these resources is unfortunately offset by their poor quality and inaccessibility. Only 2 per cent of the forests are coniferous, half of them being located in southern Brazil. Only 10 per cent of the cutting yields industrial wood, the rest being fuel wood. The percentage of the latter elsewhere is as follows: North America 17, Europe 39, Asia 63, Oceania 45, and world average 46. Even with the adoption of better methods, the Latin American proportion is not likely to be reduced beyond 80 or 70 per cent. Forests are being depleted rapidly by illegal felling, shifting cultivation and fire. In Chile, it has been estimated that fires take a toll of trees six times the recorded wood felling, while unrecorded felling is as great as the latter. Moreover, 40 per cent of the felling is from coniferous forests which, as stated before, are only 1 per cent of the total.

Practically no attention has been paid to the utilisation of forest resources. How grievous is the neglect will be apparent from the fact that Latin America imports \$330 million and exports only \$60 million worth of forest products.

BALANCE OF PAYMENTS

Each country in Latin America has unique features in its balance of payments according to its stage of development, nature of primary

CEMENT

A VITAL FACTOR IN THE FIVE-YEAR PLAN

CEMENT is a basic material of universal use. Cement comes first in the building of a house or the building of a great dam. But today cement like steel is twice as precious because under the Five-Year Plan India is at war.....war against poverty, disease and hunger. Great dams have to be built to provide water to a thirsty soil; millions of houses have to be built to give shelter to the homeless; thousands of schools and colleges have to be built to educate our brethren.

For all this Cement is a vital factor and we are proud to say that we contribute our mite towards this National Goal by producing more cement to hasten National Building work of constructing more houses, dams, schools and colleges to uplift the standard of our living thus changing the face of this country from poverty to prosperity.

output and internal policy. The problem of balancing payments is more acute for the non-dollar zone, consisting of Argentina, Brazil, Chile, Paraguay, Peru and Uruguay, because of their vulnerability, bilateral trade agreements, drain of reserves and the strain on import capacity caused by increase of gross product. Lately, they have also been unable to have a third area surplus to pay for their dollar deficit. Brazil's problem was the most serious and had to be met by short-term official and private credit. Argentina attempted to solve the problem by deflating her bloated economy, while Chile's attempts in the same direction have been frustrated by inflation.

DOLLAR ZONE COUNTRIES

The countries of the dollar zone have not been free from trouble either; but they managed to maintain their reserves at an adequate level. The capacity for external payments as percentage of gross product has, however, been declining for the region as a whole since 1950, when it reached the peak of 24 per cent. It was 23 per cent

in 1951 and 15 per cent in 1952, and moved up to 18 per cent in 1953, largely owing to severe import restrictions and simplifications of exchange rates which amounted to heavy devaluations.

Imports reached a record quantum in 1951, and all types of goods showed an increase, including capital goods from the USA, in spite of rearmament pressure. Germany nearly doubled her exports to the region by extending credits. The current account dollar deficit in that year was \$1 billion, interest and dividend remittances accounting for \$731 million. While Venezuela, with 40 per cent of the total dollar liability, had little difficulty in remitting funds on this account, Brazil, Chile and Peru found their capacity considerably strained, consequently endangering their prospects for getting dollar credit in future. The *Survey* concludes very rightly that private external capital does not contribute to Latin America's net foreign exchange receipts.

There was a record payments deficit in 1952 owing to a reduction in exports caused by the Argentina drought and a fall in Cuban

sugar and Brazilian cotton and cocoa exports. While the 1952 deficit was more than double that of 1951, the loss of reserves was only one-third of that in the previous year, owing to the extension of short-term credit, the largest share of which went to Brazil.

CONCENTRATION OF EXPORTS

In 1953, there was a 14 per cent increase in exports as a result of Argentine recovery and sale of accumulated surpluses. The increase in exports coincided with an increase in competition, while their prices, except those of coffee and petroleum, reached the lowest level in six years, largely owing to the stoppage of strategic purchases by the US. The period 1947-53 has seen a further concentration, instead of diversification, of exports. Petroleum, coffee, sugar and wheat, which formed 45 per cent of exports in 1947, increased their share to 57 per cent in 1953. Petroleum improved its share from 17 per cent to 25 per cent. By value, coffee and petroleum accounted for 50 per cent of exports in 1953, compared to 26 per cent in 1947.

The excessive dependence of Latin American countries on one or two commodities is shown by the following figures: Bolivia, tin, 73 per cent of export volume (64 in 1952); Chile, copper and nitrates, 66 per cent (exports of industrial goods were one-half of those in 1951); Colombia, coffee, 73 per cent (65 in 1951); Peru, cotton, sugar, lead and zinc, 70 per cent (severe decline in prices of all of them); Uruguay, wool, 33 per cent; Venezuela, petroleum, 98 per cent.

Prospects for the future are not at all bright, with the accumulation of large cereal stocks in Argentina and of copper in Chile. Attempted valorization schemes have all failed so far. After the economic recovery of Europe, Latin America has become somewhat less dependent on US imports. The proportion of imports from US to total imports declined from 69 per cent in 1947 to 52 per cent in 1952, while the net balance available for import from US rose from 41 per cent to 54 per cent during the same period. Two other developments in the balance of payments were: (1) from 1951 to mid-1953, there was a severe shortage of sterling; (2) non-dollar earnings declined from an annual average of \$500 million before 1952 to \$175 million in that year and went down further during 1953.

The fundamental problem of balance of payments in Latin America is a stationary (and in some cases, declining) capacity to export, while the possibilities of import substitution appear to have reached their limit for the present, especially since the effects of recent import restrictions and curtailment of credit and public investment have fallen more heavily on the import of capital goods and raw materials.

FOREIGN CAPITAL MOVEMENTS

Foreign capital movements have, broadly speaking, taken place in three stages:

(1) From 1946 to 1949, the US invested quite heavily, particularly in Venezuela, but the purchase of European-owned assets practically offset this movement. 1950 was a transition period in which US investment declined to bottom level.

(2) From 1951 to 1952, the US interest revived and dollars flowed into manufacturing and mining. There were net capital receipts

from Europe as well as receipts from IBRD and the Export-Import Bank. The greatest amount of investment took place during this period.

(3) 1953 saw a sharp contraction in US investment owing to remittance difficulties; there was also a decline in receipts from IBRD and the Export-Import Bank. The petroleum industry experienced some disinvestment during 1950-52, while manufacturing, mining and smelting, which were receiving \$50 million annually before 1950, attracted \$150 million annually in 1950-52. Three-fourths of the US net direct investment in manufacturing is concentrated in Brazil and Mexico, which have large domestic markets. Investment in mining and smelting has been mainly in Chile and Peru and since 1952 in Venezuela. The average rate of return on US direct investment was 11 to 12 per cent. Venezuela accounts for 40 per cent of the total profits remitted. Capital inflow into Central American and Caribbean Republics has been negligible, but servicing charges have mounted to well over \$100 million annually. More than one-half of US investment since the war has come from old firms, indicating lack of interest on the part of new investors.

INFLATION

1953 saw an improvement in international reserves, but internal inflation continued. The causes of inflation in South America, country-wise, were as follows: Brazil, investment financed from bank credit; Bolivia, Chile and Paraguay, deficit budgets and wage inflation; Argentina, wage increases and industrialisation financed from liberal credit, depletion of monetary reserves and crop failures; Mexico, favourable external balance, high investment especially in public sector, a larger increase in money supplies than in available goods and services, and devaluation.

Some indication of the results of inflation can be had from the following indices for the last quarter of 1953 (1948=100):

	Money supply	Cost of living	Nominal wages	Real wages
Argentina	239	318	244	76
Paraguay	890	1200	n.a.	n.a.

In Central America, on the other hand, there was no inflation, nor, however, was there any development. The *Survey* discounts the

opinion that in Latin America, inflation *per se* has brought about development, which it ascribes to improvement in the terms of trade, higher export values, foreign investment in certain basic sectors and official action to promote industrialisation. It describes the events in 1953 as a healthy reaction.

Fiscal and monetary policies suffer from severe limitations in Latin America owing to the familiar facts of underdevelopment. The fiscal structure is generally regressive. Taxes have little anti-inflationary effect because a large portion of them is paid by foreign companies. But since the crisis of 1952, there has been greater co-ordination between fiscal, monetary and wage policies, which, though not very successful in most countries, has at any rate been attempted.

DANGERS OF GROWTH WITHOUT ORGANISATION

Latin American experience points to the dangers of rapid, but unsteady, growth in countries which suffer, above all things, from organisational deficiencies. The other basic difficulty in Latin America is its extreme vulnerability to external influences, especially those originating from the US. The terms of trade in their very nature cannot be a perpetual aid to industrialisation, when export volume is stagnant. The basis of Latin American development would have to be sought for within the countries of this region, particularly since it has been demonstrated that foreign capital hardly makes any net contribution to their foreign exchange receipts, nor can these countries produce for the domestic markets because of the small size of most of them.

The excellent quality of the two surveys is a tribute to the Executive Secretary of the Economic Commission for Latin America, Mr Roul Prebish, who has brought to bear upon these surveys his remarkable powers of penetrating analysis and lucid exposition. Indeed Mr Prebish may be regarded as one of the outstanding workers in this field of study of underdevelopment; every year the survey widens its scope of exploration and though people of Latin America may gain nothing from it, for the periphery of the industrial West does not expand, students of the subject elsewhere get both stimulus and new light from it.

A Year of Shattered Hopes

Nineteen fifty-four was a year of hopes and fears. It experienced all the symptoms of a developing stock market boom only to close on a note of uncertainty. A year ago, investors were optimistic. Today, as the country celebrates the fifth anniversary of the Republic, there is gloom in stock markets.

Booms and slumps alternate. This is deplored as one of capitalism's flaws. But there are, perhaps, not many instances when the stock market sentiment has changed for the worse, as it is doing now, without any confirmatory economic evidence.

EIGHTEEN months ago, the Calcutta Stock Exchange started the upward journey. It is customary to trace the spurt in equities on Clive Street to the reduction in the jute export duty in September 1953. That might have been the psychological stimulus for which Clive Street was waiting. But before stock market operators realised that a boom was in the offing, investors and industrialists had sensed it. By the second quarter of 1953, industry had started broadening its capital base through issues of bonus shares.

BROADENING CAPITAL BASE

Here, one must digress from purely stock market factors to an appreciation of the influences which helped to broaden the capital base. After remaining poised on a precarious balance, the payments balance had begun to improve. Industrial production had begun to improve. Although taxation continued to be at a high level, inflation had been checked. Savings began to be generated as inflation was being curbed. Lower food prices not only cheapened production costs, but helped to create an atmosphere in which savings were encouraged. Declining prices for industrial raw materials not only cheapened production costs further, but tended to stimulate corporate savings through accumulation of reserves.

Effects of the world-wide recession in prices after the end of the Korean war boom were being felt belatedly. With a temporary break, industrial production had always been moving up. Good monsoons helped to improve agricultural production. By the end of 1953, it became apparent that there was not enough employment or money incomes to absorb the improving industrial and agricultural production. That was what was worrying investors and stock market operators then. It soon transpired that the Government had decided to step-up deficit financing. This was a signal which investors and stock market operators understood.

Although stock markets had started moving up since the middle of 1953, equities continued to be irregularly higher until the first quarter of 1954. This was the period when the stock markets were speculating about the coming recession in America. That recession did not come. It took stock markets some time to realise that it would not come. By then the stock markets had received the stimulus of considerable deficit financing in the 1954-55 budget. As time passed, the apprehended American recession was ignored as stock markets came to accept the sophisticated verdict that the only explanation why the American recession did not occur was that it did not occur.

Equities reached a peak level dur-

ing August-September 1954. But the foundations for this rise were laid in the previous six months. As, one after another, industrial companies started issuing bonus shares, equities continued to move up. As companies of various groups of industries began issuing bonus shares, the sentiment improved. Talk of an extension in the forward list on the Calcutta Stock Exchange revived memories of the war boom. Stock market activity flourished as realisation grew that increased public expenditure would help employment and money incomes. Consequently, fears of mounting unsold stocks subsided. Expectations of better industrial earnings and profits gained strength.

If the improvement in Jute shares

initiated the boom on the Calcutta Stock Exchange, steady and continuous improvement in Tea shares sustained Clive Street throughout 1954. By the third quarter of 1953, it became evident that the tea industry had overcome the crisis. Tea auctions and prices since the beginning of 1954 left no room for doubt that the industry was doing better. Satisfactory working results of tea companies confirmed market expectations. Tea shares were bid up and up. As Tea shares continued to improve, Clive Street as a whole steadied-up.

Before the first half of 1954 was over, it became clear that the jute industry was faring well. Increase in working hours from 42½ to 45 per week was celebrated by the Calcutta Stock Exchange by pushing Jute shares up. Throughout the first half of last year, simultaneous business in raw jute and jute goods was profitable. As the spinner's margin improved, speculative operators continued to accumulate lines in Jute shares. Hopes were reviving that Jute shares might still continue to dominate Clive Street.

COAL NEGLECTED, PAPER COMES UP

From the beginning of the stock market boom to date, Coal shares have remained neglected. But, in 1954, Clive Street discovered the prospects of certain other industries. Despite occasional strikes, the paper industry has made progress in the last two years. So, Paper shares have been moving up. There is growing realisation that the demand for paper will expand as population and literacy increase. To stress this is not to suggest that Paper shares can take the place of Coal or Jute shares on the Calcutta Stock Exchange. But there are other industries which have potentialities.

From the beginning to the third quarter of 1954, there was active demand for Engineering and Miscellaneous shares on the Calcutta Stock Exchange. Improvement in these groups was significant as the reasons for the growing demand for these shares were vital to the stock market boom. These shares were moving up on the growing belief that, as the first Five-Year Plan broadened the capital base, industry will begin to diversify. It was argued that, as industrial progress was being speeded-up, engineering and miscellaneous industries will begin to expand and flourish.

New Delhi encouraged this stock

market expectation. There was repeated affirmation by official spokesmen that industrial development would receive topmost priority in the second Five-Year Plan. These statements led stock markets to believe that the Government will encourage the private sector of industry to expand and to develop in a congenial atmosphere. Shri T T Krishnamachari succeeded in creating confidence in industry by his targets for steel production and for the total outlay during the second Five-Year Plan.

These were the influences which pushed equity prices to peak levels by August-September 1954. Since then, the Calcutta Stock Exchange, in common with the other stock markets, has developed a drooping trend. Despite higher dividend payments for the half-year to September last, Jute shares are stagnant. In sympathy with the quiet undertone in Indian Iron, all the forward shares have developed an irregularly lower tendency. Paper shares are well below the peak levels. Miscellaneous shares have turned inactive. With few exceptions, Engineering shares are marking time. Tea shares alone remain comparatively steady.

STAGNATION IN JUTE

There are reasons why Jute shares are stagnant. In October last, the working hours were extended further to 48 per week. Although data relating to exports and stocks are not unencouraging, the possibility that the industry may have to revert to shorter working hours is having a psychologically "bearish" effect on Jute shares. In any such event, labour trouble is likely to grow. But Clive Street is wondering whether there are talks of curtailing working hours because of difficulties relating to sales and exports.

In the main, however, Jute shares remain idle because investors apprehend that the spinner's margin may continue to be unfavourable. In the last few weeks, raw jute prices have been consistently moving up. Jute goods have also improved simultaneously. But the relative increase in the prices of raw jute tends to make the spinner's margin more and more unfavourable. Both the supply position and the export restrictions imposed in Eastern Pakistan indicate that raw jute prices will remain steady to firm. There is, besides, the fear that even at current jute goods prices, the foreign demand may fall. Jute shares are quiet on apprehensions that the current half-year's dividend

payments may not be encouraging.

Tea shares remain quietly steady because of the prevailing adverse sentiment on stock markets. Recent developments, however, indicate that there are other reasons why Tea shares are not higher still. Although the first export auction immediately after the recent further increase in the export duty indicated that the home producer might have to bear the additional burden, the latest auction results would seem to indicate that he might succeed in passing a part of the extra burden on to the foreign importer. Interim dividend payments for 1954 are also satisfactory. Prospects for Tea shares may be moderately "bullish". But these shares, naturally, will behave in the immediate future according to the general stock market pattern.

FUTURE OUTLOOK

So much about the technical factors shaping developments in some groups of shares. What of the future? For a proper appreciation of the future behaviour of equities, it is necessary to realise the sequence of events since September last. Equities began to sag since the last quarter of 1954 for a variety of reasons. Fears about the possible recommendations of the Taxation Inquiry Commission started the ball rolling. At about the same time, the stock markets were disturbed by the possible implications of the Government's intention to amend Article 31 of the Constitution.

This was not the end of the story. Before the stock markets could recover from these shocks, apprehensions cropped up about the Government's proposals relating to the managing agency system. On top of this, stock markets were perturbed over the Government's haste in introducing the Bill relating to regulation of future trading. As a result of all these unfavourable developments, equities developed a sagging tendency.

As the stock markets started declining, fears about the Government's determination to implement a more forward economic policy demoralised stock markets. As official spokesmen began to admit that the Government was contemplating a shift in emphasis in its economic policy, the downward movement in equities gathered momentum. This and the Government's changed attitude to the managing agency system are the major influences responsible for the transformation of sentiment on stock markets.

TAX FEARS EXAGGERATED

By now, the stock markets have come to realise that fears about the possible recommendations of the Taxation Inquiry Commission are exaggerated, if not unjustified. It is true that the Government's resources will have to be mobilised further in order to finance the expanded second Five-Year Plan. There are possibilities of readjustments in direct taxation. But, on current indications, it does not seem likely that the level of direct taxation will be raised further.

Effects of the Government's proposal to amend Article 31 of the Constitution cannot be ignored; nor can the possible repercussions of the Government's intention to introduce legislation relating to regulation of futures trading. But neither the drop in equity values nor the current lack of activity in the new issue market is due to these influences. Equities are falling because of fears that the private, organised sector of industry may not be allowed freedom to expand during the second Five-Year Plan. For a correct assessment of the future outlook, it is necessary to discuss these factors in all their aspects.

SHIFT IN EMPHASIS

By now, the outlines of the second Five-Year Plan are clearly visible. It is clear that the public sector will be expanded further in the second Plan period. It is also clear that this expansion will take place not through irrigation and power projects, but through extension of major industries in the public sector. In the six key industries, the future development will be in the public sector, although private enterprise will be allowed to play the role of a junior partner in any such future progress.

No amount of reassuring statements by Government spokesmen can obscure the hard fact that the shift in emphasis in the Government's economic policy is a depressing development for private enterprise. Admittedly, there will still be scope for development in the private organised sector of industry. But it is clear that major industries will be developed henceforward through the public sector. It is equally clear that small-scale industries will receive preference, as these industries offer more immediate scope for employment. It is not, therefore, surprising that industry and stock markets are pessimistic.

Equally significant is the Govern-

ment's attitude to the managing agency system. This is the predominant form of private economic activity in Calcutta. It is, therefore, understandable why the Government's reported hardening of attitude to the managing agency system has had a pronounced depressing effect on the Calcutta Stock Exchange. This was the main point raised by the outgoing President of the Associated Chambers. Industry and the stock markets were eagerly awaiting the Finance Minister's elucidation of the Government's attitude to the managing agency system. His observations while he was in Calcutta recently

failed to lift the stock market gloom.

These are without doubt, depressing developments. Even so, it would be unwise to emphasise the "bearish" repercussions of recent developments. An outlay of Rs 1,000 to Rs 1,200 crores per year, as envisaged in the second Five-Year Plan, must have a salutary effect on the economy. Such an annual expenditure should have a sustaining effect on the economy and, hence, on stock markets. Latest stock market movements indicate that investors are not unwilling to accept this assessment of the outlook for equities.

From the Chair

The Associated Cement Companies Limited

Speech of the Chairman, Shri Dharamsey M Khatau

THE Eighteenth Annual General Meeting of the Associated Cement Cos Ltd, was held in Bombay on 21st January, 1955. The Chairman, Shri Dharamsey M Khatau, referring to the recent debate in the Lok Sabha and the policy statement made by the Prime Minister on the industrial pattern in the country, and on the declared national objective of a socialist society through democratic means, said: "As to whether the creation of increased national wealth and, through its equitable distribution, the raising of the standard of life of the people of India, will be more effectively realised through a socialist rather than a free enterprise approach is a point which can be debated. The phenomenal resurgence of Western Germany and the truly remarkable progress which has taken place in the United Kingdom since the release of the energy of industry by freeing it from bureaucratic controls and political uncertainties, are both examples which have proved the efficacy of what might be termed the Voluntary Approach."

While admitting that industrial problems in India were very different from those of industrialised Western countries, the Chairman was of opinion that in the context of our under-development, the method of economic development now approved by Parliament may prove to be more effective.

The Pattern of Industrial Development

Speaking on the respective roles of the public and private sectors, the Chairman observed that in a mixed economy the two sectors were complementary to each other and that there could be no fixed and unalterable dividing line between them. "The guiding principle as to what industrial development should be undertaken under the auspices of State control and what should be left to Free Endeavour must be what serves the national interest best in the particular context of the development required." The Chairman cautioned against a doctrinaire approach to the question as it would result in "by-passing of reality and in an endless ebb and flow of theoretical discussions."

"The time has come," the Chair-

man continued, "to abandon theoretical and academic discussions on the merits of the State-sponsored as opposed to the Voluntary Approach. The Lok Sabha has now laid down what the country's policy is to be. There is still so much lee-way to make up in production and employment, so as to maintain even existing standards of living in the face of our growing population, that there is ample scope for every kind of endeavour without any rigid definition of boundaries. It is to be hoped that an enlightened public opinion will be increasingly brought to bear on these matters and will result in course of time in the adoption of a more flexible approach to economic policy. Meanwhile, at least let us who are men of action and who believe in constructive effort, be done with further talk."

So far as free enterprise was concerned, the Chairman added that the right way in which it could justify its right to exist in the country and strengthen public opinion was by producing actual results. "If we are able to fulfil the targets now laid down for us, and can convince the work people, our consumers and shareholders, that by pinning their faith on Free Enterprise they ensure their own security, progress and well-being, then it may well be that in due course the national emphasis will be laid on individual initiative rather than, as is the case at present, on State enterprise." To create this awareness and to educate public opinion about the achievements of Indian Industry, Mr Khatau advocated the creation of a suitable and vigorous machinery.

Referring to the aspirations of the Private Sector within the framework of national economy, the Chairman observed: "Now that the function of the Private Sector has been accepted as being essential for the development of the country, Joint Stock Companies and other forms of Private Enterprise have a right to expect that the integrity of this sector will be respected and that no further attempts will be made to encroach upon it. In the same way as we are bound to accept the scheme for development of the Public Sector and the overall strategic control by the State of the Private Sector, so we can legitimately expect

that there will be an end to the multitude of contradictory and conflicting statements which have served in the past to undermine the confidence of Free Enterprise. We must be allowed to work unhindered, and, indeed, we hope that we shall be provided with every encouragement to assist us in bringing to fruition the ambitious targets of production which the Second Five-Year Plan holds in store."

The Profit Motive

Deploping the current fashion of denouncing the profit motive in industry, Mr Khatau pointed out the all-important role of the profit-making capacity of industry in economic development: how it helped the creation of employment and formed the very basis of our credit structure; how it enabled the repayment of loan capital and how it made possible auto-financing for rapid industrialisation; how it provided increasing revenues to Government and how it speeded plant rehabilitation by enabling management to plough back profits into industry. "In these circumstances, one cannot over-emphasise the fact that risk capital, the life-blood of industrialisation through free endeavour, is based on faith in success of the endeavour and on the incentive of profit. The profit when it materialises is the result of diligence, foresight, hard work and determination—the attributes on which great nations are built. The development of your own company, the ACC, stands as testimony to the inherent rightness of the profit motive honestly applied."

Unemployment

Speaking of the increasing unemployment in the country and the Government intention to attain full employment within 10 years through creation of 24 million additional jobs, the Chairman expressed his satisfaction that the attention of Government was being directed towards this problem. On the question of rationalisation in industry, as it affects employment, the Chairman urged that any substantial and beneficial increase in the volume of gainful employment could only come through an expanding economy based on efficiency of operation.

"It would be at the peril of industry and indeed of the nation if it were sought to reduce the degree of unemployment by insisting upon major industries maintaining redundant and unnecessary employees at the expense of mechanisation, efficiency and progress."

The Chairman, however, expressed his anxiety about the gravity of the problem and made certain valuable suggestions towards its early solution: (i) He advocated the clear definition of targets, both in the private and public sectors, as to the number of jobs which they were expected to create in the context of the Second Five-Year Plan. This was to be arrived at separately for each industry in the private sector after discussion between the industries and the Planning Commission. (ii) The Chairman suggested active collaboration between large-scale industrial units in both sectors with the proposed All-India Board for the development of Cottage and Small-scale Industries so as to explore all new avenues of employment and to actively assist the development of small-scale industrial units, the major factories playing the role of a 'big brother'. The Chairman said, however, that the private sector by itself may not be able to provide all the employment that was required.

Turning to the Cement Industry, vis-a-vis the Second Five-Year Plan, Mr Khatau observed that it was a matter of pride that the industry had been able to achieve the target set for it in the First Plan. Pointing out the magnitude of the task before the industry in achieving the target of 10 million tons of cement by 1962, the Chairman mentioned the ACC's determination to achieve the production expected of the company. He, however, sounded a note of caution, since limestone, the basic raw material in cement manufacture, was not available in unlimited quantities in India. He suggested investigations into the sources of other usable materials such as slag and calcium carbonate sludge and the utilisation of these by-products of industry, in cement manufacture. He emphasised the need for consultation in this connection between representatives of the cement industry and Government prior to the establishment of steel plants and fertiliser factories.

Excise Duty

Referring to the Central Excise Duty of Rs 5 for each ton of cement, Mr Khatau said that it was most unfortunate that this basic building material should have been selected

for the imposition of excise duty. He hoped that this further tax on cement would be removed by Government at the earliest opportunity.

Production and Offtake

The Chairman reported yet another successful year of working of ACC. Both production and sales of cement were satisfactory. These results were due to the ACC's policy of plant modernisation and rehabilitation along with constant expansion and to the excellent work done at all levels by its employees.

Plant Rehabilitation and Expansion

The Chairman stated that the ACC's post-war expansion schemes so far completed have increased its annual capacity by 11.75 lakh tons. Satisfactory progress was maintained during the year in the modernisation and extension of the factories at Shahabad, Kistna, Bhupendra and Kymore. The new refractory plant at Katni was expected to go into production by the end of 1955. Mr Khatau said that the ACC was investigating the details of a very large expansion programme in the context of the ten-million ton target set for the cement industry in the Second Five-Year Plan.

Coming to the field of new operations, the Chairman announced that the first unit of the Sindri plant with an annual capacity of one lakh tons would come into production by the third quarter of 1955, and a second unit of similar capacity a few months later. The ACC has also negotiated with the Hyderabad State for establishing a factory at Mancherla. The bulk of the machinery for these projects was manufactured in the ACC's major workshops at Lakheri, Shahabad and Madukkarai which were now under centralised control. The Chairman hoped that they would soon be capable of producing all the machinery used for cement manufacture. He also stated that a flotation plant had been installed at Khalari Works and it was now possible there to utilize the low grade limestone available.

Bulk Cement

Referring to the lead the ACC has given in the matter of supply of unpacked cement to the consumers, Mr Khatau stated that the first Bulk Cement Depot in India (under construction at Delhi) was expected to be ready by July 1955. "The intention is to supply initially to the large scale, and ultimately to the small scale consumer, unpacked cement at the actual site of work, in

such a way as to enable them to make immediate and easy use of it without the burden of additional cost, and by doing away with the problems of packing, storage, and handling, with which they are now faced. Depending on the experience which we gain from this experiment it is our intention to increase this system of supplying bulk cement wherever it can be usefully and profitably employed."

Pakistan

The Chairman stated that the ACC's Pakistan factories were working efficiently, and that the Company continued to pay careful attention to their development and working. The negotiations with the Pakistan Industrial Corporation for the formation of a new company in that country, had however been abandoned.

Labour-Management Relations

Coming to labour-management relations, the Chairman observed: "The past year has been one of distinct improvement in so far as the relationship between management and labour is concerned. Apart from one instance of stoppage of work at the Kistna factory, which was due to political rather than economic considerations, and another short-lived dispute at Chaibasa, there has been no strike or lock-out during the year. On this I would like to congratulate my labour friends and the officials of the trades unions at the various factories. I would also claim that the enlightened and progressive policy which your Company has always followed with regard to the welfare and well-being of its workmen has played its part in achieving this happy state of affairs. Increasingly, I believe, our workers are realising that it is only through industrial peace and by increased output due to hard work that greater wealth can be created for equitable and fair distribution."

Mr Khatau continued: "Of particular significance was the meeting called at Hyderabad in March of last year by the Government of India to study certain problems within the cement industry. At this conference important and far reaching agreements were come to by members of trades unions and managements representing the entire industry. I must record our appreciation of the part played by the Labour Ministry of the Government of India in bringing this about. Ensuing from this meeting it has been decided to hold a further conference

Bombay Co-operators Protest

THE failure of the co-operative movement is pin-pointed in the finding of the All-India Rural Credit Survey that, taking the country as a whole, agriculturists got no more than 3.1 per cent of their loans from co-operative banks and co-operative credit and other societies in the year 1950-51 in which the survey was carried out. This is, indeed, a terrible indictment and as applied to the all-India co-operative movement, it is also amply justified. Statistical aggregates or averages, however, completely blot out the differences of achievement as between one State and another. For example, the same Survey mentions that in 1950-51, the year of the survey, co-operative societies in the Bombay State supplied 16.2 per cent of the total loans obtained by the farmers from all sources. This is in regard to all forms of credit, short-term, medium as well as long-term. But if only short-term credit is considered, the borrowings of the farmers from co-operative societies would account for no less than 42.1 per cent of the total. Thus, the contribution of the co-operatives in the matter of providing current finance for agriculture has surely not been negligible.

If only the very small contribution made by the co-operative movement in India to the supply of agricultural credit hit the headlines and the far from modest achievements of the movement in the Bombay State fail to get due recognition, there is serious risk of misdirection of effort and resources in the future. While every effort should surely be made to improve the supply of credit to agriculturists and to expand it manifold, it would be wasteful in the extreme to throw away valuable experience and start *de novo* when solid foundations have already been laid which can provide a sound basis for future development. The publicity given to the failure of the co-operative movement also obscures the fact that movement, as it has developed in Bombay, has furnished both the basic data for the recommendations of the Rural Credit Survey as well as the framework of the model which is now proposed to be set up for future development.

Bonus to Staff, etc

The Chairman then announced that the Board had recommended this year the payment of a bonus equivalent to three months' basic earnings to the employees at the Head Office, the works and other places and concluded by recording the Company's appreciation of the excellent work and the fullest co-operation of the staff and operatives.

The Report and the Audited Statement of Accounts for the year ended 31st July, 1954, were then adopted.

A 20-YEAR PLAN FOR YOU...

Invest your savings in Western India Life Policy while your earnings are growing and make sure of a guaranteed monthly income for your family for twenty long years.

Provide for your Dependents THIS way

From age 35 to 55, or till death, if previous, set aside for us about Rs. 58 per month.

Immediately on death whenever it may take place, we shall pay Rs. 102-8 per month for twenty years.

Please write for details or drop in for a personal consultation at the

The Population of India

A Statistical Analysis

M N Jai

ONE man out of every seven is an Indian. Against an estimated world population of over 2,300 millions, the population of India, according to the 1951 Census, is 356.89 millions, larger than that of any country in the world excepting only China.

Table I depicts the growth of population since 1872 when the first Census was taken.

Table II shows the Birth, Death and Infant Mortality Rates since 1931. During this period of twenty years, there has been a noticeable drop in the birth-rate, and the death-rate too is on the decline. The State does everything possible to fight disease and insanitation, to check the death-rate, but the problem of birth-rate is more intractable, as it has to be tackled by methods of persuasion rather than compulsion. A climate of opinion is slowly being created in the country both by private and governmental agencies in favour of restricting the size of the family. Still, too many are born and too many die than is desirable or necessary according to modern standards. In parti-

cular, the mortality among infants is distressingly high, and this is a big factor in lowering the average expectancy of life at birth. The 1951 Census estimates the life expectancy at 32 years and 5 months. In 1931 this figure was put at 26 years and 11 months.

In Table III is shown the classification of the population by languages, on the basis of their mother-tongue. Infants and the dumb too are accounted for; on the other hand no account is taken of persons who speak more than one language. Speaking a language is different from the ability to read and write; there is no reference here to the latter which is the test of literacy.

Table IV depicts the age and sex composition and civil condition of the population. Taking age 15 to 54 as the economically productive years, the working population forms 52.3 per cent of the total. At all ages, the number of males exceed females, in the aggregate there being 947 females per 1,000 males. This is unlike the situation in Western Europe where, statistically speaking, females predominate over males.

Table III

Insurance

A Record Year for Insurance—1953

T Bagchee

Life insurance reached an all time high in 1953, breaking the past record of 1946. The trend of new business which had been irregular and had registered a slight decline in the year before, turned sharply upwards. How did it come about that the year immediately following the post-Korean recession, was a record year for life business?

The Controller of Insurance attributes this upward trend in life business to the habit of thrift formed during the war and the immediate post-war periods and the activities relating to "the mighty adventure of building up New India".

Those who demur and are reluctant to associate inflation with growth of thrift, may find some connection between disinflation and the increase in life insurance.

Fire and Miscellaneous insurance also showed an increase; Marine business alone was smaller. Indian insurers operating outside India had a fruitful year.

The Controller of Insurance assisted by the Executive Committees of Life & General Insurance Council, discharged creditably the responsibility of administering the Act and keeping a vigilance over insurance. Checking the evil of illegal rebates on premiums and controlling the expenses of the insurers, however, continued to be difficult.

THE Indian Insurance Year Book, 1954 just out contains, as usual, comprehensive statistics compiled from the returns of the insurers for the year 1953. The publication has been enlarged to include several additional features on lapses, bases of life insurance premia and tables showing actual expenses incurred by insurers against the allowance for expenses prescribed in the Insurance Act 1938 and Insurance Rules 1939. A detailed note has been included in the Report of the Controller of Insurance on the composition and activities of the Executive Committees of Life and General Insurance Councils of the Insurance Association of India. All these new features have enhanced the value of the publication considerably and the department of insurance deserves to be congratulated for these much needed improvements.

INSURERS IN INDIA

As on November 15, 1954, there were 319 insurers registered under the Insurance Act 1938, out of

which 215 were Indian and 104 were non-Indian. There were 113 Indian insurers engaged in transacting only life insurance business and 11 engaged in life and other classes of business, while 61 stuck to purely non-life business. The corresponding figures for non-Indian insurers were 3, 13, and 88 respectively.

There were 72 Provident Societies registered under the Act operating during the year.

LIFE INSURANCE BUSINESS

(a) New Business: In 1953, the insurers in India issued 5,58,000 policies of life insurance assuring a sum of Rs 154.5 crores with an annual premium income of Rs 8.36 crores. The corresponding figures for 1952 were 5,34,000 policies assuring a sum of Rs 145.7 crores with a premium income of Rs 7.89 crores. The share of non-Indian insurers in the new business for 1953 was 23,000 policies assuring Rs 17.03 crores with an annual premium income of Rs 1.02 crores. The average sum assured per policy issued by

Indian and non-Indian insurers amounted respectively to Rs 2,569 and Rs 7,490.

(b) Total Business in force: Excluding the Annuity Contracts, the net amount of life insurance business in force in India at the close of 1953 amounted to 40,79,000 policies insuring a total sum of Rs 961 crores (including bonuses) with a total premium income of Rs 47.41 crores. The figures show an increase of 1,21,000 in the number of policies, Rs 40.01 crores in sum assured and Rs 2.22 crores in premium income. The positions of new life business and total business in force in India in 1953 effected by Indian and non-Indian insurers are summarised in Table I below.

(c) Life Insurance Business outside India: In 1953, the new life insurance business transacted by the Indian Insurance companies abroad amounted to 30,000 policies insuring a sum of Rs 14.66 lakhs with a yearly premium income of Rs 0.95 lakh. The total life insurance business in force under this head

Table I—New Life Business and Total Life Business in Force, 1953
(Effected in India)

	New Life Business, 1953				Total Business in Force, 1953

amounted to 2,72,000 policies assuring a sum of Rs 77.03 lakhs with a yearly premium income of Rs 4.26 lakhs.

(d) Annuities: New annuity bonds assuring payment of Rs 12,37,000 per annum were issued during the year by Indian and non-Indian insurers. Total annuities for payments of Rs 73,95,000 per annum remained in force at the end of the year.

TREND OF LIFE INSURANCE BUSINESS

A reference to totals of new life business for the decade 1944-53 in Table II will show that the recovery from the recession of business during the period 1947-50 which began to show itself in 1951 gained momentum in 1953 and it is expected that the increase in business will be steady particularly in view of various development measures taken up by the State, which aim at improving the economic condition of the country.

Table II—New Life Business 1944 to 1953
(in crores of Rupees)

Year	New sum assured	Sum assured [with bonuses] in force
1944	108.9	454
1945	136.3	557
1946	153.8	651
1947	139.6	706
1948	134.6	724
1949	142.2	765
1950	139.5	780
1951	147.9	873
1952	146.7	922
1953	154.5*	962*

* Subject to correction.

LAPSES OF POLICIES

A table of combined experience of lapses of the policies issued by Indian insurers has been added to the Report of the Controller of Insurance. This shows that the ratio of total amount of lapses in 1953 to the mean gross direct business in force during the year worked out at 8.9 per cent. The Controller remarks that lapses occurring in a particular year may serve, in a restricted sense, as an index of the economic condition of that year.

INCOME, OUTGO AND EXPENSE RATIO

The total revenue income in life business of Indian and non-Indian insurers in 1953 were Rs 54.27 crores and Rs 9.60 crores respectively. During the year, the corresponding figures for outgo were Rs 29.48 crores and Rs 6.98 crores respectively. The Life Funds of Indian and

non-Indian insurers were increased by Rs 27.79 crores and Rs 2.62 crores respectively using the balances left over. Table III shows the sources of income and outgo in respect of life insurance business of Indian and non-Indian insurers for the year 1953.

In the outgo side it will be noticed that payments made by Indian insurers to the policy holders by way of claims, surrender values and annuities amounted to Rs 16.11 crores, ie 50.6 per cent of the total income. The corresponding figures for payments made by non-Indian insurers was Rs 4.48 crores ie 67.1 per cent of the total income. The overall expense ratios of Indian and non-Indian insurers were 27.3 per cent and 20.7 per cent respectively in 1953. This showed a nominal in-

crease over the corresponding figures for 1952.

The Life Fund and assets of Indian insurers as on December 31, 1953 amounted respectively to Rs 255.61 crores and Rs 315.80 crores. The life fund and assets of non-Indian insurers at the close of 1953 were respectively Rs 48.60 crores and Rs 53.89 crores. The distribution of the assets of Indian insurers is given in Table IV. The distribution of the assets of non-Indian insurers is not given in the Year Book.

INVESTMENT OF THE CONTROLLED FUND

A summary of investment of Controlled Fund (meaning all funds pertaining to life insurance business) under Section 27A of the Insurance Act, 1938 given in the Year Book

Total	3,15.80	100.0

January 26, 1955

effected in 1953 amounted to Rs 4.38 crores of which the premium underwritten by Indian insurers amounted to Rs 2.72 crores. The marine claim ratio of Indian and non-Indian insurers together was 56 per cent as against 57 per cent in the previous year. The commissions and expenses of management consumed 8 and 28 per cent of the net premiums as against 9 and 27 per cent in 1952. The total profit transferred to Profit and Loss Account from marine business of Indian insurers amounted in 1953 to Rs 23.51 lakhs.

MISCELLANEOUS INSURANCE

The particulars of miscellaneous insurance business given in the Year Book do not show separately the relevant statistics for business under Accident (motor), Workmen's Compensation, Burglary, Fidelity Guarantee, Plate Glass, Cash in Transit and other special forms of insurance, though the bulk of the business transacted in India is composed of insurance of motor vehicles, both Third Party and Comprehensive risks. In the absence of data, it is difficult to determine the trend of this class of business. During the year under review, the total premiums less re-insurances of miscellaneous insurance business effected by Indian and non-Indian insurers amounted to Rs 6.36 crores and the claim ratio worked out at 50 per cent. The premiums underwritten by Indian insurers amounted to Rs 4.46 crores. The commissions and expenses absorbed respectively 15 and 29 per cent of the net premium income. The Indian insurers transferred a sum of Rs 32.43 lakhs to the Profit and Loss Account from miscellaneous insurance business.

The premium income in 1953 in Fire and Miscellaneous Insurance business showed an increase over that in 1952 while the marine class showed a slight fall as compared with 1952. There are some Indian insurers who transact non-life insurance business outside India. A net premium income of Rs 8.29 lakhs was received by these insurers from such business in 1953.

INSURANCE AGENTS

The total number of licences to act as an Agent in force on December 31, 1953 was 2,80,162 out of which 94,140 were fresh licences issued during the year. Of the total number of 94,140 licences issued in 1953, 32.4 per cent were issued to women. The average premium of business procured by insurance agents

in all classes of insurance business amounted in 1953 to Rs 2,610.

In addition to the above, 859 certificates for Principal Agents, 443 for Chief Agents, and 5,634 for Special Agents were issued during the year.

TRANSFERS, WINDING UP, ETC

During the year the life insurance business of 8 insurance companies and 3 provident societies were transferred to other companies. Under orders of court, one life insurance and three provident societies were wound up. The North China Insurance Company Ltd went into voluntary liquidation in 1953.

Under Section 103 of the Act, one Provident Society was convicted and fined in 1953 for contravention of Sections 73 and 70(5) of the Act.

CAPITAL RECONSTRUCTION

Of the 30 schemes for capital reconstruction under sub-section (1) of Section 6B of the Insurance Act submitted, 26 schemes have been sanctioned by the Controller and the rest are under consideration. Under the provision of sub-section (1) of Section 6C of the Act, one insurance company with share capital was converted in June 1954 to a company with capital limited by guarantee. There has been no further legislation regarding insurance since the date of issue of the last Year Book and no Administrator has been appointed under Section 52A of the Insurance Act, 1938. The Administrators already appointed in the previous years continued to manage the affairs of six insurers during the year under review.

EXPENSES OF MANAGEMENT

Under the provisions of Sections 40B and 40C of the Insurance Act, 1938, limitations have been imposed on expenses of management of the insurers. The basic limits for expenses of life and non-life insurance business are prescribed in Rules 17D and 17E of the Insurance Rules, 1939. The Controller, in consultation with the Executive Committee of Life and General Insurance Councils, is empowered by the Act to relax the basic limit for a particular year in respect of any insurer. In 1953 relaxations ranging from 1/2 per cent to 3 1/2 per cent were allowed to a number of insurers, both Indian and non-Indian, who contravened the provisions of the Act by spending in excess of the basic limits for life insurance business. Likewise, relaxations in expenses ranging from 1 1/2 per cent to

THE ECONOMIC WEEKLY

5 per cent gross premiums written direct in India were allowed to the insurers for non-life business, who spent in excess of the basic limits. Tables showing the experience of insurers transacting life and non-life business in the matter of expenses have been given in the Report of the Controller. A reference to the tables shows that in case of life insurance business, there were 184 insurers who spent more than the basic limits prescribed for expenses. In case of non-life business, there were 128 insurers who spent in excess of the limits for expenses. The number of insurers who spent in excess in 1953 shows an increase.

The detailed analysis of expenses incurred by insurers and the basic limits allowed for life and non-life business show further that the experience of bigger insurers have been more favourable. The Controller in his Report has expressed the hope that the insurers "will give due attention to this disquieting feature and take remedial steps."

SETTLEMENT OF DISPUTES BY THE CONTROLLER

The number of applications under Section 47A of the Insurance Act 1938, as amended in 1950, for settlement of claims under life insurance policies with a sum not exceeding Rs 2,000 each referred to the Controller in 1953 was 162, and settlement was made in respect of 29 such applicants. The rest are either withdrawn or under his consideration.

INSURANCE ASSOCIATION OF INDIA

In terms of Section 64F of the Insurance Act, 1938 as amended in 1950, the Executive Committee of Life and General Insurance Councils of the Insurance Association of India constituted in September 1951, completed their term of office in September 1954. In his Report the Controller has given an interesting account of the composition of the committees and of their activities. In terms of the Act, these committees have been assigned to aid and advise insurers carrying on life and non-life insurance business by setting up standards of conduct and sound practice, and to advise the Controller in the matter of controlling the expenses of life insurance business and in the matter of commission and other expenses for non-life business. The committees are also empowered to bring to the notice of the Controller the cases of any insurers acting in a manner prejudicial to the interests of policyholders and to act in any

THE ECONOMIC WEEKLY

matter ancillary or incidental to any of the above specified matters.

ILLICIT REBATES

The principal object for which the committees were formed being the control of expenses and commission, the committees devoted their attention to putting a stop to the widely prevailing practice of paying illicit rebates on premiums, particularly on non-life premiums. This unhealthy practice is the bane of non-life business in India. It not only increases the expenses, but makes the insurers resort to falsification of their accounts in order to cover up the breach of law. In order to eradicate the evil, the committee prepared a Code of Conduct to regulate employment of agents, inspectors and other salaried field staff, opening of branches, collection of outstanding and current premiums, agents' balances, elimination of dummy agents, bogus branches, etc. After several modifications carried out in the light of suggestions received from insurers, the Code was finally adopted by the committee. An administrative machinery was set up with investigating officers in Bombay, Calcutta, Madras and Delhi, to enforce the Code.

CODE OF CONDUCT

Although the insurers, one and all, agreed to abide by the Code, it appears that the evil, for the eradication of which the Code was introduced, has not been checked to any great extent, mainly on account of lack of co-operation on the part of the insurers. "Ultimately the success of the scheme", remarks the Controller of Insurance, "must depend upon the extent to which the insurers themselves are in earnest in eradicating an evil which, if allowed to go unchecked, is bound to prove suicidal to them". In case the experiment fails, he adds, "it will be clearly necessary to consider whether Government should assume greater police powers over insurers in the interest of insuring public." A similar code for life insurers has also been evolved by the Executive Committee of Life Insurance Council, but in life business, the problem is comparatively simple.

REDUCTION OF LIFE PREMIUM

During the first term, the committees dealt with various other matters such as, standardization of policy contracts, discrimination made by banks in accepting non-life insurance business, enquiry into the outflow of re-insurance premiums from India, prohibition of differential rates of life insurance premiums being offered to different classes of people, and controlling and regulating the extension of activities of Indian insurers abroad.

Last year, the committee had to deal with the situation created by the

heavy reduction in premium rates for life insurance business offered by New India Assurance Co Ltd and other big insurers. This matter vitally affecting life insurance business was referred to a sub-committee appointed by the Life Council. Although the report of the sub-committee showed that there was no need to interfere with the reduction which most of the insurers had made, the sub-committee asked the insurers that no further reduction in premium rates should be made for a year and that subsequently, premium rates could be reduced only after giving prior notice to and sanction from the Executive Committee of the Life Insurance Council.

DELAY IN PUBLICATION

The Controller regrets that in spite of the appeal made in the past, the accounts and valuations reports are not submitted to him by some insurers and provident societies in time for inclusion in the Year Book. The result is that the Year Book is being published every year with incomplete statistics, thereby detracting from its usefulness. The Controller has now threatened to invoke the penal provisions of the Act in case of failure of the insurers to furnish the returns within the statutory time limit. It is hoped that insurers will, in the interest of business as a whole, co-operate with the Department of Insurance in this matter.

Flood Control at D V C with Euclids

J I C

Beneath the surface of today's hardships, shortages and a host of other problems that fill the Indian scene, another picture can be discerned. Giant hydro-electric stations such as DVC, Bhakra-Nangal, Hirakud and Tungabhadra have been built, and Euclid has been there doing the building. Work will shortly commence on a further five major projects: Kosi, Koyna, Krishna, Chambal and Rihand.

It is Euclid's proud boast that wherever there is a big job to be done, Euclids will be found doing it and here in India, Euclids backed by a first class After Sales Service offered by Euclid distributors—Blackwood Hodge (India) Ltd.—are playing a very big role in the development of the country's vast potential wealth. Men and machines of great power are on the job ensuring India's future stability and prosperity. Dreams of the past are becoming today's realities.

FLOOD devastation is by no means new to India and as long ago as 1852, Government has been concerned with the problem of flood control, but the very large scale devastation brought by the recent monsoon floods have made it absolutely essential to begin the work of controlling India's large rivers without further delay. The magnitude and complexity of the flood problem is such, that the Central Flood Control Board has set up two River Commissions who will be responsible for assisting the States to implement suitable and adequate measures, among which will be afforestation, construction of embankments, dams and diversion channels.

The work being carried out by DVC in harnessing and utilizing the flood waters of the Damodar River, formerly known as the "River of Sorrows", will be a pattern for future flood control projects. Damodar Valley Corporation was constituted by an Act of Parliament in July 1948 and is modelled on the Tennessee Valley Authority. An entirely new way of life is being built, one which will influence the lives of millions of people who previously lived in dread of river floods, bringing grim suffering, famine and untold poverty.

PROGRESS

Considerable progress has already been made in the first phase, which involves an estimated cost of Rs 89 crores, and includes four major dams, three hydro-electric stations, one thermal-power station and a barrage with a network of canals and tributaries. This is scheduled for completion in 1956.

Tilaiya Dam and Bokharo Thermal Power Station, along with 250 miles of high transmission lines, sub-stations, and receiving stations,

have been completed and commercial distribution of electric power has already started.

Konar Dam has been completed without its power house.

Maithon Dam upon which 50 per. cent of the work has been finished is scheduled for completion in February 1955 and Panchet Dam will be completed by the end of 1956.

Durgapur Barrage is due for completion by June 1955.

MAITHON AND PANCHET HILL DAMS

The dams at Maithon and Panchet Hill were designed primarily for flood control and with help from the upper reservoirs, will bring under cultivation 1,140,000 acres of land. Maithon alone is expected to provide perennial irrigation of 270,000 acres and hydro-electric generation by this dam is anticipated to be 164,000,000 KWH per annum.

At both these dam sites Euclid Rear Dumps and the famous Euclid Loader, working with a fleet of Euclid Bottom Dumps, have been busily at work.

The Executive Engineers at Maithon, are all Euclid enthusiasts. "We have found," said one, "that Euclid earth-moving equipment is most reliable. Our operators have found them easy to handle, and most of the Euclid equipment on the various projects at DVC have been operating for over two and a half years, many machines have completed more than 5,000 hours of service. In the previous two seasons, Euclids have been in operation continuously for twenty-four hours a day." When questioned further, the engineer said, "Even when fully loaded, Euclids have

proved the fastest units and they easily cope with the undulating country. Each Euclid Bottom Dump regularly hauls from 15 to 20 tons of material in one trip from the loading centre to the dumping site. In a day of eighteen to twenty available hours, the total load hauled by a Euclid Bottom Dump can be between 1,000 to 1,300 cyds. DVC mechanics and fitters have found that the simple, rugged design of all Euclids greatly assist them where cleaning and maintenance is concerned."

On the performance of the Euclid Loader, he continued, "The maximum loading capacity of the Euclid loader on operation at Maithon was estimated to be 700 cu yds per hour. In the soft borrow pit, which is mainly of gravel and sand, the Euclid Loader has done a remarkably fine job."

At Maithon there are in all twenty-one Euclid Bottom Dumps, one Euclid Loader and eight Euclid Rear Dumps. At Panchet ten Euclid Rear Dumps, seven Euclid Bottom Dumps and one Euclid Loader.

DURGAPUR BARRAGE

This barrage has been designed to control a net-work of irrigation canals which will irrigate 1,025,762 acres, for kharif and 300,000 acres for rabi cultivation.

This barrage consists of:

(a) A barrage across the Damodar at Durgapur and regulators over the canals to the right and left banks.

(b) Main canals and tributaries on both banks, the principal one on the left bank being navigable. This navigable canal will connect the coal-mining areas around Raniganj with the Hooghly about 35 miles above Calcutta. It is estimated to take traffic of 1,500,000 tons of coal

Illustrated is a EUCLID 20 ton BOTTOM DUMP being loaded with spoil at one of the many sites on the DAMODAR VALLEY PROJECT.

All the major projects, such as BHAKRA NANGAL, HIRAKUD, LOWER BHAVANI, NEYVELLI, TUNGABHADRA, MANIMUTHAR, DAMODAR VALLEY, and mines and quarries throughout India, have **EUCLID EARTHMOVING EQUIPMENT**. In fact, wherever there is a big job to be done, **EUCLIDS** will be found doing it. Remember, Euclids are AVAILABLE FOR STERLING.

and 500,000 tons of miscellaneous cargo. The main canal system will be 120 miles long, branch canals 335 miles long, tributaries 674 miles long and drainage canals 422 miles. The total length of canal system being approximately 1,552 miles.

(c) Drainage system of approximately 422 miles of drainage canals.

RUHR OF ASIA

South Bihar and West Bengal is rich in mineral wealth and is sometimes described as the Ruhr of India. This area contains 80 per cent of India's coal reserves, 98 per cent of her iron ore and 100 per cent of her copper and kyanite. Rich deposits exist of limestone, mica, chromite, bauxite, asbestos and other minerals. This area has already been developed. Here are India's two major steel plants (her third steel plant in which Krupps-Demag of Germany have a big financial and technical stake will be sited just across the borders at Rourkela in Orissa) and a variety of secondary industries.

From the four hydro-electric stations at Maithon, Panchet, Konar and Tilaiya and from the Bokharo Thermal Power Station, it is estimated that at least 1,000 million KWH of energy per annum will be available. This vast power production will greatly assist in the exploitation of the valley.

A 15-year plan known as the Durgapur Project is now being drawn up. It is proposed to start this project with a coal carbonisation plant, which will be integrated with a host of chemical industries based on coal derivatives. The development of meteorological industries and the completion of a fertilizer factory will follow. The final stage will be the erection of the synthetic oil plant.

Apart from industrial and mineral development, the DVC Project, by controlled irrigation, will greatly assist agriculture. An additional production of 350,000 tons of food and 100,000 acres of jute is expected.

SUBSIDIARY DEVELOPMENTS
These included pisciculture carried

out by the Fishery Research Station, model villages, afforestation and electrification of the railways.

Thus beneath the surface of today's hardships, shortages and a host of other problems that fill the Indian scene, another picture can be discerned.

Giant hydro-electric stations such as DVC, Bhakra-Nangal, Hirakud and Tungabhadra have been built, and Euclid has been there doing the building. Work will shortly commence on a further five major projects: Kosi, Koyna, Krishna, Chambal and Rihand. It is Euclid's proud boast that wherever there is a big job to be done, Euclids will be found doing it and here in India, Euclids backed by a First Class After Sales Service offered by Euclid distributors—Blackwood Hodge (India) Ltd.—are playing a very big role in the development of the country's vast potential wealth. Men and machines of great power are on the job, ensuring India's future stability and prosperity. Dreams of the past are becoming today's realities.

Banking

Money Supply, Prices and the Plan

The relative trends in money supply and prices in the recent past may strengthen optimism about the scope for deficit financing in future; but there is risk in basing calculations on what has been witnessed so far.

NEARLY four years of the first Five-Year Plan are now over. It will be of interest to study the broad monetary trends during this period. The outstanding feature of the monetary situation is the net decline in money supply with the public by over Rs 100 crores, during the period April 1951 to December 1954. The main constituents of money supply with the public are currency and demand deposits. It is not customary to regard time deposits as forming part of money supply; they are regarded more as investments. During this period, time liabilities of scheduled banks shot up by Rs 75 crores due, to a large extent, to the higher rates of interest offered on such deposits during the last three years. But even if we take time liabilities as forming part of money supply, it will be seen that that during the plan period April 1951-December 1954, money supply with the public has suffered a net decline of about Rs 30 crores. Therefore, the conclusion is warrantable that either there has been no deficit-financing or such deficit-financing as has taken place has been more than offset by a deficit in the balance of payments and contraction of Reserve Bank credit.

From the table alongside, it will be seen that as against a decline of Rs 117 crores in Government balances with the Reserve Bank (which may be regarded as representing very very roughly the magnitude of deficit-financing), foreign assets of the Reserve Bank have declined by Rs 153 crores and the credit extended by the Reserve Bank also declined by Rs 88 crores. These variations are those that meet the eye; these are only gross figures. Possibly there have been special transactions and if adjustments are made for these transactions, the net effect of these variations would be of a different magnitude. For instance, the sharp decline in Reserve Bank holdings of rupee securities may not wholly represent sales to the public. Nor may the decline in Government balances be wholly due to deficit financing in the sense of disbursements

within the country in excess of revenue receipts and net borrowings from the public. But whatever be the gross impact of each of these items, the net position of money supply remains unaltered. There has been a net decrease in money supply which means no visible inflationary development at all in the economy. It may also be noted that during the four years of the Plan

period, scheduled banks' loans and advances recorded a net decline of Rs 20 crores.

This is what emerges if one takes into account the aggregate change during the four-year period. Looking at it a little more closely, however, it will be observed that the

bulk of the decline in money supply occurred in 1952-53. In fact, for the period April 1953 to December 1954, there is an increase of nearly Rs 100 crores in money supply.

Yearly Changes in Money Supply (crores of Rupees)

1951-52	..	..	-171

1953-54	..	..	+51
1954:			
April-December	..	..	+49
Total period	..	..	-107

Obviously one's judgment regarding the present position as well as the future prospects will be coloured by the relative importance attached to the aggregate change as against the variation in the past twenty months or so.

Parallel to the change in money supply, there has also been a remarkable shift—rather a series of shifts—in prices. Between the beginning of the Plan period April 1951 and December last, there has been a very substantial lowering of the price level, the wholesale index (year ended 1939 = 100) having come down from 456 to 368. It is true that this was not a gradual process, but was heralded by a steep fall in 1952 during the disinflationary phase, 367 touched in May being the lowest for the year. Subsequently, in the early part of 1953, prices moved up slowly and by the middle of September 1953, the wholesale price index had gone up to 412 from 367 in May 1952. But since then the price index has moved more or less steadily downwards and by the beginning of 1955, it had fallen to 366.

Admittedly, the wholesale price index is not as satisfactory an index of the price situation in the country as it should be and it is hazardous to base elaborate theories on changes in it. Nevertheless, as long as one remembers its limitations, certain broad conclusions could be drawn by reading the changes in prices along with the changes in money supply. The point that strikes the eye is the divergent movement in the two in the recent past. While money supply has tended to rise, the price level has receded. This is not surprising if one remembers that side by side with the increase in money supply, there has been an increase in production—an increase which is more than proportionate. Much the most significant element in the increased

output is the rise in agricultural output, the index for which moved up from 102 in 1952-53 to over 113 in 1953-54 (Base: agricultural year 1949-50 = 100). This naturally pulled down the agricultural prices and as a corollary, the wholesale price index.

All this is familiar, and in accordance with the proposition that if aggregate output increases faster than the demand for it, prices will fall. But the point is that the demand for products of all types has not increased *pari passu* with supply. The facts relating to deficit financing mentioned above throw some light as to how this could have happened. It would seem that the increase in output has come about in a manner which did not involve an extension of money investment, so that while the goods were being produced, new money incomes were not created. If the larger output were the consequence of an increase in investment outlay over a period, a substantial shortfall in the money demand for goods would imply that additional money incomes were hoarded. It may be that the propensity to hoard is

pretty high in India; but it is not certain if with an increase in money incomes, this propensity also increases.

It is, therefore, possible to argue that such increase as has occurred in aggregate output is due to very special factors and is not directly related to changes in the level of investment. One has only to think of the enormous variations in agricultural output which can occur as a result of changes in the monsoon to appreciate this. Given this view, two things seem to emerge. In the first place, the consolidation of the supply position is due as much—if not more—to fortuitous circumstances as to any increase in investment outlay. And in the second place, it has a moral for the future. The relative trends in money supply and prices in the recent past are likely to make one optimistic about the scope for deficit financing in the future. That there will be need for deficit financing nobody can deny. But it will be risky to base one's calculations on the relation between increase in money supply and increase in production on what has happened so far.

State of Education in India

R K Swamy

The Constitution directs that by 1960, free and compulsory education should be provided for all children up to the age of 14. The target laid down by the Planning Commission stems from this directive and the progress made so far is not altogether unsatisfactory.

The pace of development, however, is not the same in all States, and there is little emphasis on quality. This is unfortunate, because a democratic set-up demands intelligent participation of the people in the affairs of the country. The most promising line of approach to economic development also lies in a vast effort at raising the general level of education, particularly in rural areas.

IN the present stage of transition in this country from a police state to an organised co-operative commonwealth it would be interesting to study our objectives in the sphere of education, and how far our existing system has been geared to achieve them. The democratic set-up demands intelligent participation of the people in the affairs of the country. Economic opportunities have to be created and distributed to all sections of the community in an equitable manner to raise their standards of living and to maintain the stability of the nation. In our relations with the world abroad, we have to pull ourselves up to a level of intellectual activity that will command spontaneous admiration and respect. We have, therefore, to stimulate our creative faculties, encourage a way of life suited to our native genius and promote a taste for the finer aspects of art, literature and culture. The key to these developments lies in an integrated system of education, carefully and progressively administered.

PRESENT POSITION

The 1951 Census reveals that four persons out of every five in the age group of ten years and above were illiterate. Among the six crores of people who could read and write a simple letter, over five crores had schooling for only four years or less. A further half a crore did not go past the middle stage. There were only 38 lakhs who were matriculates, diploma holders or graduates.

These reports,* which cover periods corresponding roughly to the census year, obviously do not have a brighter story to tell. Our expenditure on

education in 1950-51 was of the order of Rs 115 crores. It was a great improvement on the Rs 55 crores we used to spend in 1947-48, and the position has been further improved in recent years with nearly Rs 150 crores allotted to this nation-building activity. It is officially estimated that a national system of education that will adequately serve our needs will require an annual expenditure of Rs 400 crores. In addition, Rs 200 crores would be required to train 27 lakh teachers, and Rs 272 crores for buildings. This shows how inadequate our resources are to meet requirements so basic to our progress.

MAIN DEFECTS

Even granting that we find the financial means to support a national system of education, it will not be possible to extend educational facilities overnight for a variety of reasons. It has been noted above that of the six crores of people who could read and write a simple letter, over five crores stopped schooling at the primary stage. The money spent on their education has been largely wasted for they did not derive any permanent benefit that could be an asset to them in their future. Among those who have gone beyond the primary stage, most of them have gone through a pattern of general education taking no note of their aptitudes and unsuited to the general requirements of the nation as a whole.

Evidently, the different stages of our educational system are not clearly marked, so as to make each stage complete in itself. Also, facilities for adequate technical and vocational education that would train the students for various trades are absent.

Worse than these factors, and more fundamental to the entire educational structure, is the lack of attention paid to the quality of teachers. In 1950, the percentage of untrained teachers was as high as 41 per cent in primary and 46 per cent in

secondary schools. Moreover, the teaching profession does not normally attract the right persons due to inadequate payments and unsatisfactory service conditions.

In the context of our planned economy, therefore, our educational system requires complete re-organisation and a coordinated integration. The Planning Commission has given this subject careful thought, and has assigned priorities taking into consideration our present and future needs, and the resources at our disposal.

PRIORITIES

In 1950-51, facilities available for primary education were adequate for 40 per cent of the children in the ages 6 to 11. This is required to be expanded to cover 60 per cent or three crores of pupils. The percentage of girls in this age group would increase from 23 per cent to 40 per cent in 1955-56. Students in the secondary stage would increase from 11 per cent of the age group 11-17 in 1950-51 to 15 per cent in 1955-56. The corresponding percentage of girls is required to go up to 10 per cent.

Since illiteracy is highest among the older age groups, and it is they who count in moulding our destiny today, a scheme of social education is envisaged. This is expected to cover at least 30 per cent of the people, including 10 per cent of women among them, within the age group of 14-40. The scheme, if it works as the planners intend, will benefit nearly 15 crores of our people.

It is recognized that the various stages of education are interlinked. Every advance made in the primary stage requires more and better teachers, who can only be supplied if standards of secondary education are improved, and this in turn depends on the provision of better teachers educated in Universities and prepared for their profession in training

colleges. In effect, a simultaneous advance on all fronts is essential to maintain and improve the system in the years ahead. But the pattern of education will have to change.

A NEW APPROACH

Our planners pin their faith on the successful implementation of a scheme of basic education for the education of children in the ages of 6 to 14. A learned authority has described this system as follows:

"It is a seven years' course which ensures that the children at school will not only acquire effective and abiding literacy but will also be mature enough to understand and appreciate social problems and develop social habits and attitudes. This education is to be basic, ie, related to the basic interests of the child's mind and the basic occupations of community life. And as the mind of the child is an active, pragmatic and social organism and the life of the community is sustained through various types of craftwork, education, too, must centre round some suitable basic craft, chosen with due regard to the occupations of the locality.

This craft is not to be just another subject like manual training; it is the pivot of the entire teaching, to which all the other subjects are to be correlated. As the craft is practised and its 'why and wherefore' studied with care, problems will arise and questions press themselves on the child's attention and in tackling them and following up their ramifications under the tactful and unobtrusive guidance of the teacher, the child will gradually find his way into the domains of history, geography, science, etc. Thus education, starting as a unified and integral activity, will lead him into ever-expanding regions of knowledge. Such an approach to the unlocking of the child's mind and creative powers is more effective and fruitful not only because it enlists the powerful support of his instincts but also because it offers opportunities for co-operative and group work in school and outside. It bases his education on the bedrock of productive work, which is as essential for moral and social training as for the training of practical aptitudes."

The broad framework of basic education has been worked out, but many of its details remain untouch-

ed. An enthusiastic and energetic introduction of this system requires a detailed technique of approach, and a body of teachers trained to implement the scheme. The benefits of the scheme are well understood, but experience in working it is limited. Although several States are experimenting with this system in a manner suited to their resources and convenience, progress in this direction has been slow. The subject requires research, careful preparation of relevant books and tools on a large scale, and a bold drive if the objectives are to be achieved. Only when this scheme is able to yield results can the primary stage be considered to be fully integrated with the requirements of the secondary and later stage.

SECONDARY EDUCATION

In the field of secondary education, some of the important recommendations of the Secondary Education Commission have been approved. These are the diversification of courses; the revision of curriculae to provide for effective teaching of general science, social studies and crafts; the improvement of school libraries; the introduction of crafts in middle schools; the improvement of teacher-training facilities for craft instructors and teachers of special subjects; and the organisation of refresher courses, seminars and conferences of teachers and headmasters. There is no doubt that these schemes will do a lot of good in toning up the entire system of education at this stage and will be producing immense benefit to the growing generation.

At the university stage, there is at present an element of over-crowding in colleges and the high cost of education has prevented many an intelligent student from proceeding to higher studies. There is undue stress on examinations and memory work which is not conducive to developing originality or a proper attitude towards research. In consequence, there is a general neglect of the study of our own culture. This results in widening the gulf between our educated classes and the general mass of our people. Our planners have, therefore, asked for efficient consolidation of the facilities already available rather than any tangible measure of expansion.

TECHNICAL AND SOCIAL EDUCATION

The Indian Institute of Technology at Kharagpur has progressed satisfactorily. There are nearly a thousand students on the rolls,

working in eight departments, studying in different stages of undergraduate and post-graduate courses. Reorganisation of the department of Internal Combustion and Engineering, Metallurgy and Physics, the establishment of a Power Engineering Department and the setting up of a High Voltage Engineering Laboratory have been completed at the Indian Institute of Science, Bangalore. Further developments have been planned, and these too will be soon implemented.

The All-India Council for Technical Education has been actively associated with a development scheme for technical education and research. This scheme has greatly assisted training in special fields of technology, such as, printing, silk, woollen and worsted, industrial administration and business management and others in which training facilities were non-existent or inadequate.

Though good work is being done in regard to literacy and cultural programmes, there is little progress in other aspects. An integrated programme of social education that will increase economic efficiency and provide training in citizenship is being worked out in the Community Project areas. This may benefit a large number of people in the years ahead.

THE FUTURE

The Constitution directs that free and compulsory education should be provided for all children up to the age of 14 by 1960. The target laid down by our Planning Commission stems from this directive and the progress made so far is not altogether unsatisfactory. But the tempo of development is not shared equally by all States, and there is little emphasis on quality.

Over ten crores of our people are self-employed. There is, therefore, an increasing insistence on organising our cottage industries on a stable footing by extensive introduction of power and modern methods of production. Our progress in agriculture, industry, trade and transport also is showing steady improvement. Therefore a continuous supply of skilled manpower of the right type at the required rate is a necessary condition for balanced development. Seen in this light, the general attitude towards education appears to be lukewarm. There is a danger that we might be caught putting the cart before the horse.

Around Bombay Markets

A Year of Relief

R D Banatvala

If the stock exchange is to be relied upon as a barometer recording the country's economic position, the reading for 1954 was favourable indeed.

The career of Tata Ordinary during the year was unique; it gives an idea of the manner in which the boom developed on the Bombay Stock Exchange. Never since Liaquat Ali's budget, has the stock exchange shown such liveliness.

The down-trend in commodities awaits appropriate credit measures for stopping the rot. Surely good crops should not prove a curse, but they well may, unless measures are taken to carry them over the year.

AFTER many a year, 1954 can be regarded as a year of relief for the common man. The relief came mainly from a fall in cost of living. The economic situation showed improvement allround, the major indications being (1) a fall in cost of living, (2) increase in industrial production, (3) satisfactory exports, (4) boom in stock exchange, and (5) success in Government borrowing programme.

Much of the credit for the reduction in cost of living should go to nature as the improvement in agricultural production was largely the result of excellent monsoon. Removal of controls and cuts in the selling prices of imported foodgrains further helped in bringing down food prices, thereby reducing the cost of living. Liberalisation of imports also helped to bring down the prices of some of the consumers goods.

In industrial production, cotton textiles hit an all time high, followed by cement. Steel production did not show any significant rise, as the plans for expansion were still in a preliminary stage. Better results are expected during this year.

Cotton textiles exports continued to go ahead as planned, reaching very near the target fixed for 1954. And export prices maintained a fairly good average, considering that Japan went all out to capture the export market.

After the debacle caused by Liaquat Ali budget investors had completely lost confidence in the equity market. It was during last year that they showed welcome signs of regaining that confidence, albeit partially. 1954 was a boom year for stock exchanges all over India, but the brightest of them all was the Bombay Stock Exchange. Many shares touched a new high regaining the levels attained in 1946-47. If stock markets are accepted as reliable

barometers indicating the country's economic position, they gave a very favourable reading indeed.

The Government of India issued the National Plan Loan during the year at 3½ per cent. The loan was successful in that the target fixed at Rs 150 crores was reached. This was very creditable, because when the ban was raised, the trend of commodity prices was downwards and the tempo of development expenditure was rather slow. Inflationary pressure was totally absent and still the Government could get the money without any undue strain on the capital market.

Development of the Boom

There was almost a non-stop rise in share prices on the Bombay Stock Exchange for about six months, and the market rarely saw the previous week's level till September. While presenting the budget, the Finance Minister had drawn a bright future for the country and indicated an increase in the tempo of expenditure. Thereafter, Tata Steel Deferreds, the market leader, were converted into ordinary share, and along with it, issue of bonus shares was announced. After conversion, all the above factors helped the market to gather momentum and institutional investors entered the market for investments, chiefly in Tata ordinary shares at around 185.

Speculators anxious not to miss the bus, came in at the right time and started accumulating. Trading public followed them and activity suddenly increased. Almost all the scrips on the list started showing gains day by day and week by week. Thereafter, the volume of trading jumped to record figures for a small share like Tata ordinary when speculators from centres like Calcutta, Madras and Ahmedabad followed suit. This was the beginning of the end. The market had become vulnerable. Speculators who were reap-

ing nice profits did not relax their grip on the market and the rise continued unchecked. There was not a single settlement on the forward market between April and September when the clearing rate for Tata ordinary was lower than at the previous settlement. Starting from Rs 185 cum dividend, Tata Ordinary moved up to Rs 248 ex-dividend and during this settlement, it reached the peak of Rs 255. The career of Tata Ordinary was unique; nevertheless, it also gives an idea of the manner in which the boom developed on the Bombay Stock Exchange. By this time, however, the barometer had started to misbehave. Overtrading had to react on the market.

When trading entered the danger zone, institutional investors began to disinvest. Capital appreciation was too quick and too large. About 50,000 Tata ordinaries came in for delivery within two settlements, and prices started tumbling down. Some shares like Scindia lost their entire gain. About 3,00,000 Scindias were delivered during two to three settlements. Tata Ordinary lost Rs 40.

The fall was inevitable for the rise had been too fast and steep. The boom was really glorious as long as it lasted. It came during the period when the National Plan Loan was on tap, public spending was slow, bank rate was unchanged, and disinflation was barely over.

Movement in Shares, Upward Phase

	April 1	Sept 13
Tata Ordinary	187	254-8-0
Indian Iron	29-8	35-14
Bombay Dyeings	420	535
Kohinoor	315	360
Scindia	18	21-8

After the Break

During October and December market moved both ways. Speculative interest in a big way was absent. May be, it was due to heavy losses

incurred during September fall.

Weakness in commodity markets, apprehension about the Taxation Enquiry Commission's report, and the slackness in the cloth market accounted for occasional falls while expectations of a rising tempo of public spending, hope of a loan to Tatas for expanding their steel production and prospects of bonus issues by some leading companies helped intermittent rallies.

The sluggishness in cloth markets discouraged inquiry in textile shares, and even when there was a general rise, textiles market lagged behind. This can be noticed by the following figure:

There were plenty more shocks for the market. These came during the later part of the year. After his China tour, the Prime Minister declared his faith in socialised economy and laid emphasis on public sec-

tor. Market reacted nervously to this; it steadied up only after Parliament passed a resolution that it stood by the Industrial Policy Statement of 1948, though the application of this policy will be naturally in a new spirit.

Immediately after this, the nationalisation of Imperial Bank together with some State Banks, gave a fresh jerk to the market. Statements from prominent industrialists like Shri G. D. Birla and Shri Kasturbhai Lalbhai, expressing their faith in the future of private enterprise, impliedly, restored the sentiment to a considerable extent. Thereafter, till the end of the year, market ruled steady. Speculators tended to keep aloof as two opposite factors were actively affecting the market sentiment. On the one hand, the economic condition was sound, but on the other, there was the new trend of thought towards socialism and stricter control

over the private sector. The market felt that the Government was blowing hot and cold at the same time and did not know which way to turn.

Leaving aside speculation, one could definitely say that during 1954, the improvement in the equity market was substantial but the outlook for 1955 is difficult to judge; as it will depend mostly on political developments.

The year ended with definite gains except in Bank shares. Apprehensions regarding the Labour Appellate Tribunal award brought forth long liquidation and on balance, bank shares have shown sizable losses. The tendency during latter part of the year was steady.

	Rs
Imperial Bank lost	80
Central Bank lost	14
Bank of India lost	9

Giltedged showed small gains and had no big fluctuation during the year.

Far East

EVENTS in the Far East since the involvement of the United Nations in the Korean war, at the instigation of America, emphasise one clear fact. Few of the member-States support the American policy to the Far East. Fewer still are willing to support America in her provocative attempts to start a war in this region. America now knows that she will have to “go it alone” in the Far East. This should have had a restraining influence on America. But her repeated actions in the Far East indicate that she is determined to ensure her interests in this region even if that involves denial of the legitimate rights and interests of the other parties concerned. To fortify her Pacific defence system, she has concluded mutual defence pacts with Japan, South Korea and Formosa. All these pacts are potential threats to China and Russia, the two Communist States in this region.

For the second time within a year, America has taken actions in the Far East which are direct provocations to war. America was, it is now no longer a secret, determined to start a major conflagration by active military intervention in Indo-China. Britain, then, made it clear that she was opposed to intervention because Dien Bien Phu was not defensible. France had the sense to accept the British assessment of the military situation in Indo-China. That was how a Far Eastern War, which would surely have been intensified into a world war, was avoided. At the initiative of the Colombo Powers, the Geneva Conference was held. An agreement was reached to end the war in Indo-China. America did not participate directly in this agreement. She did not actively defy it. But she hastened her efforts to create SEATO.

If America's intention in creating SEATO is to fortify the border between south-east Asia and the Far East, her motive in the proposed treaty of mutual defence with Formosa is to maintain a constant pressure on Red China from the eastern end. SEATO is condemned by all the Colombo Powers as a potential menace to peace in Indo-China. Red China is apprehensive of being militarily sandwiched in between SEATO and the Formosa Treaty. It is significant that, pending ratification of the mutual defence treaty with Formosa, President Eisenhower has sought, and received, authority from the American Congress to take military action in consonance with the terms of the proposed Formosa Treaty.

Before an analysis of the wider issues involved, it is necessary to discuss some of the minor, relevant questions. When Chiang was driven out of the Chinese mainland, he used the fleet under his possession to cover his retreat to Formosa and to the coastal islands off the mainland. From these adjacent outposts, Chiang has made frequent attempts, aided and abetted by America, to make raids on the mainland. America does not regard these off-shore islands to be within her “island defence ring” in the Far East. Nor is occupation of these islands by Chiang's forces deemed necessary for the defence of Formosa and the Pescadores. It is necessary, on the other hand, for Red China to be in occupation of these islands for the safety and defence of the mainland. Yet, in assuming responsibility for the defence of Formosa

and the Pescadores, America did not impose any condition on Chiang that he should withdraw from these off-shore islands.

This is not the season when Red China, with her weak navy, can start even a limited offensive on the coastal islands in the Formosa Straits. It would seem, in retrospect, that Peking started the raid on the Tachen group of islands, as the time for ratification of the Formosa Treaty approached, in order to force America to declare her commitments and intentions in detail. Peking has not been altogether unsuccessful in this manoeuvre. Although arrangements for the evacuation of the marooned Kuomintang forces in the Tachen group of islands, under American air and naval protection, have been completed, there are reports that Chiang is reluctant to issue orders to his forces to withdraw, pending cease-fire. Far more disturbing is the discretion left to President Eisenhower to decide which of the local areas in the Formosa Straits region must be protected for the defence of Formosa, which America regards as a bastion which must be fortified for the defence of her Pacific interests. There are reports that Chiang is putting pressure on Washington that Quemoy and Matsu must be declared as two such strategic off-shore islands.

President Eisenhower is not hasty in his action or speech. He has clothed himself with powers to take all necessary military action against any Red Chinese military move on Formosa. But he has also let it be known that he will prefer arrangements for a cease-fire under the auspices of the United Nations. This is a wise diplomatic move to counter-act the Red Chinese accusation of aggressive action by America in the Formosa Straits. The Security Council of the United Nations has endorsed a resolution, sponsored by New Zealand, that Red China should be invited to participate in its discussion of a cease-fire in the Formosa Straits. This invitation has been communicated to Peking by the Secretary-General of the United Nations. It is not without significance that the invitation to Peking, actively supported by the British delegate at the United Nations, has been endorsed by the American delegate also. Although Red China's Premier has been aggressive in his opposition to any attempts by the United States, or the United Nations, to

interfere in matters relating to Formosa, which she claims to be within her dominion, the Commonwealth Prime Ministers, now assembled in London, seem inclined to the view that Peking will lose nothing by accepting the invitation. It is argued that acceptance of the invitation will not imply conclusions relating to rights to Formosa and the Pescadores by the parties concerned.

It may be doubted whether Red China will accept the invitation to participate in the Security Council's discussion on a cease-fire in the Formosa Straits. This does not mean that Red China is eager to hasten a war with America in the Far East. There are, perhaps, better chances of Red China's co-operation in peace efforts if such attempts are undertaken by the powers and parties directly interested in the developments in the Formosa Straits through an organisation outside the United Nations. There is a strong case for repeating the Geneva experience in relation to Formosa. Whether reconciliation efforts are undertaken directly by the United Nations, or by some such organisation as the Geneva Conference, there are certain conditions to Red China's co-operation with such efforts. Red China is entitled to demand certain political assurances. Few member-States ac-

cept America's stand that the defence of Formosa is necessary for the security of America's Pacific system of defences.

So far, two plans relating to Formosa have been formulated. One plan is that Red China and Formosa should exist as separate States. There is the second plan, formulated by Mr Attlee, which envisages a plebiscite in Formosa under the auspices of the United Nations. Red China is sure to reject the first plan. Peking will accept Mr Attlee's assumption that the Kuomintang is a discredited regime and that, in the era of the hydrogen bomb, America is neither wise nor entitled to regard Formosa as essential for her security. But Peking may reject Mr Attlee's recipe of a plebiscite for the settlement of Formosa's future status. It is evident that it will not be easy to discover a solution to the problem of Formosa. But it is equally evident that any solution to the Formosa problem must have relation to the realities of the situation in the Far East. Is America prepared to accept the realities of the situation in the Far East?

In the wider interest of world peace, her NATO allies have a responsibility to convince America of the need to concede the substance of Peking's claim in the Far East.

Dyestuffs and Steel Plant

WHILE the broad outlines of the pattern of industrial development in the next plan period is being debated and the end-point of the effort that is to be made keeps hovering between the limit of physical resources on the one hand and a financial target on the other, the first altogether nebulous at this stage and the second absolutely unattainable on present showing, two important decisions have been taken during the week, which are more than of passing interest. One is the granting of protection to the dyestuff industry which may not initiate development in this direction but acknowledges the development that has taken place and in a way, puts a seal of approval on it. The other is the conclusion of an agreement between the Government of India and the Government of the Soviet Union for the establishment of an integrated iron and steel plant. The

second in its entirety is a State enterprise while the first is in the main a product of private enterprise.

To say this is not to deny the indirect help the industry has got from the Government's policy of restricting the imports of dyestuffs, though primarily on considerations of maintaining the balance of payments. The developments which led to the emergence of a sizeable dyestuff industry are not entirely *sui generis*. But whatever the indirect contributions of the Government to the limited progress in this field, this post-war baby has not been a product of planning in any legitimate sense. Yet the vital importance of the dyestuff industry and its value for the general all-round development of the country have been fully appreciated for a long time. In fact as early as 1941, a Committee had gone fully into this question and under the able direction of

Dr K Venkataraman, drawn up a 15-year programme for manufacturing the dyes principally used in this country. The Committee recommended that the industry should be established in India to manufacture 51 dyes and all intermediates required within 15 years, that a graduated programme of manufacture should be fixed in advance, that on completion of this scheme, 50 per cent of the country's requirements should be met from dyes manufactured in one plant, and finally, the dyes made in India should be marketed under their own name so that—vain hope!—"in course of time Indian dyes will be recognised and valued throughout the world." The location of the industry, however, the Committee left to be decided after a further enquiry, so important was it for the success of the industry. The position of dyestuffs was emphasised by the Committee in the following words:

"The dyestuff industry acts as an important link in the chain of other essential chemical industries, such as the heavy chemical inorganic industry and coal-tar industry on the one hand, and the fine chemical and pharmaceutical industry, explosives, synthetic plastics and solvent industries on the other."

A major group of dyes being coal-tar products, the initial handicap, which is the hardest to overcome, is the high cost of these products which are required for the manufacture of intermediates. There is a vicious circle here as in many other points in the links of chemical industries. Coal-tar, the basic material, is itself a by-product, obtained from the carbonisation of coal. That is to say, the pace is set by the demand for coke. Carbonisation cannot be carried on merely for the recovery of coal-tar in the absence of a corresponding demand for coke. In contrast to the inorganic chemicals, the production of coal-tar cannot be increased according to the demands of the dyestuff industry. But on the other hand, output of the dyestuff industry will be limited by the supply of coal-tar hydro carbons from the by-product of coke industry, if the intermediates are also to be produced within the country. The agreement for the third steel plant concluded this week, with the prospects of a fourth plant in the offing, therefore radically changes the outlook. So may the proposal for a coke oven plant sponsored by the Government of West Bengal, if it is accepted and imple-

mented. There is the same vicious in the matter of supply of inorganic chemicals also—costs are high because production is limited.

But without waiting for all these vicious circles to be broken, beginnings of a dyestuff industry have already been made by Atul Products in Bulsar in collaboration with American Cyanamide and Imperial Chemical Industries, by Messrs Patel & Hickson Ltd, who have entered the field for the manufacture of sulphur black and two other Indian companies and several associates of established dye manufacturers on the continent.

This is a pretty kettle of fish to handle, if development is to take place along sound lines and in a manner so that each unit in the industry fits into the whole, for without such close dove-tailing, no solid foundation can be laid for the chemical industry. There is more to it, for even the dyestuff industry is only a fragment of the infinitely greater synthetic chemical organic industry. And with dyes as the base, an enormous edifice of synthetic chemicals has been built up in other countries. From it, almost any organic material can be manufactured. Its wide ramifications and inter-connections embrace inorganic chemicals and coal-tar industries as well as explosives, fine chemicals, pharmaceuticals, plastics and so on. After the preliminary work that had already been done by scientists and technicians, there is little reason why the significance of this industry should still be so inadequately appreciated.

But this is not all. The Tariff Commission had to contend with quite other problems which, though not germane to the logic of development, yet happen to be at the moment the most embarrassing single factor hindering development, namely, India's commitments under the GATT, the vexed problem of unbinding 'bound' tariffs and even more baffling problem of Imperial Preference. To overcome the first, the Government had to negotiate with the GATT but the main issue still remains to be faced. Protection has been given to the industry for a period of 10 years on a limited number of items by converting the prevailing revenue duty to a protective one. The unreality of this protection will be apparent from the fact that it is not high import duty which has so far protected the industry or made it possible for it to

come up. It is the quantitative restrictions on imports and these will have to go some day or India will have to get out of the GATT.

In the case of intermediates which will continue to be imported until the industry is set on a more sensible footing by developing it on lines which are not under contemplation at the moment, difficulties are created by the continuation of Imperial Preference. As raw materials of industry, the import of such intermediates may be allowed free. But what about Imperial Preference? Had the intermediates been imported from Britain, the solution would be simple. British imports can be duty free but corresponding imports from other countries—in the case of intermediates, the sources of supply are the continent and the USA—have still to pay the differential duty. Hence the compromise—grant of 'concessions' in import duty for a year on certain specified intermediates used exclusively in the manufacture of dyes.

To get back where we started from. However imperfect, the dye industry is a reality. The Soviet steel plant is integrated and perfect, but only on paper. But are these mutually exclusive alternatives in the pattern of development of industries? Much lost ground will have to be covered to set the dyestuff industry on a sound footing but it does not follow by any means that similar mistakes need be made in the future also. Where private enterprise is willing and able, it can be yoked to the task just as well; there are fields enough for public enterprise to win its spurs.

Weekly Notes

Panel of Economists

THE Panel of Economists appointed by the Planning Commission met in Delhi last week under the Chairmanship of the Finance Minister, Shri Chintaman Deshmukh, and considered the basic issues relating to the preparation of the Second Five-Year Plan. The econometric studies prepared at the Indian Institute of Statistics were reviewed broadly. The main conclusions that emerged from the discussions were:

(i) That the physical and financial approaches to planning were complementary and not mutually exclusive, and that in a money economy, the financial aspects of planning should receive careful consideration along with the physical possibilities of the resources available;

(ii) That econometric plan models were a useful device for testing the consistency of the different targets that might be proposed in the Plan, but these models would have their limitations because of the inadequacy of data, the changing technical relations within the economy and the large number of psychological and institutional factors in economic growth which could not at the present stage be quantified;

(iii) That before formulating targets and means for their realisation, it was necessary to lay down at least in outline the framework of governmental policies and the type of institutional changes that would be undertaken in the Plan period;

(iv) That while econometric studies should be continued and expanded, there was advantage at this stage in proceeding with the methods and techniques of planning that the Planning Commission had already developed—methods which involved and allowed for due exercise of qualitative judgements;

(v) That the objectives of the Second Five-Year Plan must be a big enough increase in incomes, together with a substantial expansion in employment, and that these twin objectives should be related to the pattern of income distribution that is felt to be socially desirable;

(vi) That the instruments and techniques of mobilising the resources needed for securing the defined increases in national income and correspondingly in the rates of investment should be studied in detail and that the goals of achievement should be related to the efficacy of the instruments and techniques available to a community which seeks to advance democratically.

Following these discussions, the Planning Commission has appointed a Standing Committee of the Panel of Economists to map out the studies which the economists will undertake in the field of economic policy and institutional changes. The Standing Committee will be presided over by the Finance Minister. Prof D R Gadgil will be the Vice-Chairman and Shri J J Anjaria will be the Convenor. Other members of the Panel are: Prof C N Vakil, Dr V K R V Rao, Dr B K Madan, Prof Balakrishna, Prof D G Karve, Prof S K Muranjan and Prof A K Das Gupta.

The Standing Committee will suggest the programme of studies to be taken up immediately. It will set up for this purpose working groups of economists to work in co-operation with the economic staff of the Planning Commission and in the Ministry of Finance. Continuous liaison will be maintained between this Standing Committee and the Indian Statistical Institute.

Czech Industrial Exhibition in Bombay

THE Czech Industrial Exhibition, being held in Bombay from February 4, is the first of its kind in this country, for never before has a single country organised an independent exhibition of its products with the idea of developing a market in India. The value of India's imports from Czechoslovakia in recent years has not been very large; it has declined from about Rs 2 crores between 1948-49 and 1951-52 to a little over one crore of rupees in 1952-53 and 1953-54. Indian exports to Czechoslovakia have also been at the same low level and shown similar declining trends. There should, therefore, be considerable scope for expanding both.

The products on show will range from aeroplanes and capital equipment to ceramics and cut glass work, but it is probably the engineering products that will attract the greatest interest, in view of the plans for economic development and the Government policy in the matter. That the exhibition is being held in India is in itself a recognition of the changing pattern of the country's demand for imports. Like some other machinery exporting countries, Czechoslovakia is also prepared to extend export credit and facilities on the merits of each case. This should prove an added attraction for prospective buyers of heavy machinery.

Among the exhibits, there will be heavy engineering products, tractors, bicycles, machine tools, chemicals and pharmaceuticals, cement, imitation jewellery, timber, textiles, leather goods, vehicles and light engineering products, motor cycles, precision engineering products, textile machinery, chinaware, hygienic and sanitary ceramics, domestic, industrial and laboratory glassware, fancy goods, agricultural products and implements, textile accessories, etc.

Of particular interest to India's textile industry will be the novel Czech shuttleless jet loom. These looms have a speed of 400 revolutions a minute, which is almost twice the speed of the best shuttle looms in use today. Czechoslovakia has been a leading manufacturer of sugar mill machinery for over a hundred years and some of our sugar mills are run on Czech plants. An expansion of the sugar industry being in the offing, the plants on show will fulfil a 'felt' need.

The exhibition will cover 3,000 square yards, and the main pavilion will consist of a semi-cylindrical building made entirely of wood imported from Czechoslovakia. The heavy machinery on show will be seen in action, while two of the four aeroplanes, piloted by ace Czech pilots, will visit prominent cities and give aerial displays.

Since the purpose of the exhibition is to stimulate a market for Czech products in India, facilities will be provided for Indian importers to negotiate deals on the spot, if they so desire.

Will TTK Quit?

Our Delhi correspondent writes:

IT was said of a temperamental British Minister of old that he employed two footmen, a lame one and a fast runner, the former to carry resignations to the Prime Minister and the latter to intercept them before they reached the Prime Minister. In the case of TTK, there was definitely a 'fast runner' to carry the news to the Fourth Estate before the Prime Minister had time to think about it. Had it been the intention of TTK really to quit the Cabinet, he could have done it without much ado. Perhaps, there is a feeling that 'influential' sections of public opinion will guide the erring Prime Minister before he takes a decision. It is, therefore, necessary to see what the political implications of TTK's resignation are.

It is the popular belief that TTK is the most class-conscious supporter of private enterprise in the Cabinet. He knows what is good and what is bad for private enterprise. At no time since Independence has private enterprise been so close to Government as it is today. His policy of encouraging Indian capital to collaborate with foreign capital has given strength and better security to the private sector in the country. With TTK's departure, the question that will loom large is how far his policies will be followed by his successor. As far as private enterprise is concerned, TTK, Deshmukh and Pant are the three stabilising elements. The forces tending to push TTK out today will gather strength to remove Deshmukh in the not distant future. That will clip the wings of Pant, because it is TTK and Deshmukh who appear to understand the intricacies of high finance; and without their influence, Pant will become innocuous. Will TTK's departure be, therefore, the red signal to private enterprise?

In the present context of things, TTK's strength does not lie in his championship of private enterprise; it may indeed be the source of his weakness. His strength lies elsewhere which is seldom understood by those who try to unseat him from the Cabinet. It is true that he is not a man of the masses. He has not the popular appeal to be leader of a party. But he represents the South in the Cabinet. And he is a close associate of Shri Kamaraj Nadar, the man round whom the fortunes of the Congress turn in Madras. Without a strong man from the South in the Central Cabinet, Nadar's

position will be considerably weakened. He has two powerful opponents to fight in the South, the Communists and the Dravida Kazhagam. If Congress is to remain alive in the South, Nadar has to arrest the inroad of Hindi imperialism in the South and obtain assistance for the rapid development of industries in that area. With TTK's departure from the Centre, Nadar's hands will be weakened, unless Nadar can put an equally competent man of his choice in the Central Cabinet. TTK knows this; so also Nadar. That is why TTK soars so high.

Will TTK's resignation be accepted? That will depend on what advice Shri Pant is going to give Nehru. If Pant is inclined to strengthen the UP group in the Cabinet, TTK has to quit. But if Pant is conscious of the political alignments in the South and the problems that may be thrown up by the States Re-organisation Commission and if he stands for political stability in the country, he will find some compromise formula to keep TTK in till Nadar can get a suitable substitute.

Controlling the Floods

FLOODS have so long been regarded in this country as visitations of nature against which man is powerless, at least, by and large, this has been the attitude of the Government. As in the case of other calamities, the ravages of flood have been alleviated by relief works and only in exceptional cases, when a town was threatened or a bund was likely to give way, some *ad hoc* measures have been taken to meet the emergency. But as soon as the flood abated, the river has been forgotten.

Not so the people who had to live with the river. They could do little when the river was angry and in spate, but they knew its seasons and rages and slowly adjusted their ways of living and methods of cultivation so that they could come to some sort of a compromise with their temperamental partner, even if they could not tame the river. Thus was evolved, through the ages, cropping patterns, structure of huts and layouts of the villages that could take the flood when it came. All this one can see in the Gangetic plains and the Brahmaputra valley. By lying low for a time, men survive the ordeal, most of the times, except in the years when floods are unusually heavy. But not all rivers are prepared to compromise, certainly not

the Kosi. Hence the need for more effective collective action.

It is only very recently, since the last year's floods to be precise, that Government acknowledged the need of a rational approach to the problem and of planned action, both short-term and long-term. The acknowledgement came with the inauguration of the Central Flood Control Board and the setting up of the Ganga River Commission and Brahmaputra River Commission in September last. State Flood Control Boards have also been set up in various States. The Central Board has now decided to set up a River Commission for the North-Western Zone also, covering Jammu and Kashmir, the Punjab and Pepsu.

Both the Ganga and Brahmaputra River Commissions are meeting to consider flood control schemes for inter-State rivers and emergency schemes formulated by UP, Bihar and West Bengal, including those that are meant to protect 300 villages in UP and five towns in West Bengal, which are most directly exposed to floods. The Commissions are finalising the proposals for seeking the co-operation of China, Nepal, Sikkim and Bhutan in the planning and execution of the schemes of controlling flood in the Ganga and Brahmaputra rivers. Consolidated proposals are to be sent to these States through the External Affairs Ministry to avoid delay and frequent references in the future. These rivers do not respect political boundaries. The catchment area which feeds them and therefore the source of their floods or devastation is not confined to any one country. This makes any scheme unilaterally drawn up and executed by India not only incomplete but also ineffective. Kosi is a case in point. The Kosi project was finalised in November 1953. But as it involved the construction of a barrage which was to be partly in India and partly in Nepal, the project could not be proceeded with, pending an agreement with Nepal. Only last month, work was started on Kosi.

The co-operation of all these countries is immediately needed in the preliminary task of installing rain gauges and enabling the Meteorological Department to collect essential data. Permission has been sought for entering their territories for the purpose. Co-operation on a wider scale is yet to be sought and achieved.

Political Review

"Observer"

The sovereign democratic Republic of India, founded on January 26, 1950, to secure to all citizens justice, liberty, equality and fraternity, has completed five years of political and administrative consolidation, taken notable steps towards social and economic reconstruction, tried to stimulate interest in science, art and culture and won much respect and prestige abroad.

The preliminary phase is over, and the Republic, in its sixth year, is on the threshold of a major endeavour to impart to the political freedom that has been stabilised a social and economic significance acceptable to the common people. A socialistic pattern of society has been acclaimed as the goal of the country both by the ruling party and Government; and the Avadi session of the Congress, the sixtieth of its life, may well prove to be a turning-point in the progress not only of this time-honoured party, but also of the nation.

FIVE years are a brief spell in the history of any country, and particularly of India which has almost a timeless glory about it. Nevertheless, into these years have been crowded exciting events, noble enterprises and great undertakings which in a more leisurely but less impatient age might have filled a century. And even by comparison with nations similarly placed and similarly driven to make up the leeway of past decades of alien domination, India has reason to be proud of what she has achieved.

There was something of the urgency of Fate in the way the country, dotted with princely pockets of resistance, was welded into one solid unit, the Constitution hammered out in less than three years, the initial spate of freedom's complexities and challenges faced, the Republic established, the most gigantic experiment in adult franchise conducted, inflation checked, the food problem solved, the country's international status established, the first Five-Year Plan put through, and the foundation laid for progress in a multitude of directions. And the country set vibrating with new desire, hope and enterprise. It seems as though India's destiny, trammelled so long, is making a frantic bid to leap the gulf of centuries.

THE OTHER SIDE

While that is the bright side of the picture, the dark side may not be ignored. While there has been political consolidation of a type rarely witnessed before, linguistic and caste divisions threaten to weaken the foundations. The Constitution, carefully drafted and minutely discussed, has shown many cracks and weak joints, which inhibit progress in many desirable directions. And the social and economic justice it has promised and the fraternity it seeks to promote are yet to be realised in a tangible measure.

The policy of non-alignment and

dynamic neutrality that the present Government has pursued in the foreign sphere, though productive of much good will and esteem, has not been without embarrassments or even impediments to country's progress in the domestic field. The economy of the land may have achieved a certain stability; but progress has not been at a pace equal to the needs of the people, and there is the paradox of unemployment accompanying the execution of the Five-Year Plan. Kashmir remains still a ticklish issue; the differences with Pakistan have not been resolved; the Portuguese possessions continue to cause irritation; the position of Indians in South and East Africa threatens to become worse; the affairs in Nepal have not ceased to cause anxiety.

STILL OBSCURE

Even with the adoption of a socialistic line of progress, the goal of the country and even the means to be adopted are still somewhat obscure; and the evolution of political parties and policies in the country leaves much to be desired. Great projects have no doubt been launched and constructive endeavour is very much in the picture; but whether for lack of publicity or for some more serious reason, their results have not been such as to capture the public imagination yet. Science, language and the fine arts have been receiving more impetus than in the past; but here too, whether because of misdirected enthusiasm, bureaucratic interference or ill-advised patronage, the outcome has not always been inspiring.

It is against this background of well-meant intentions and actions, providing considerable hope to the people and yet falling short of facile expectations, that the fifth year of the Republic—and the most significant as a prelude to another and perhaps a more fruitful phase in the country's progress—may be usefully reviewed.

SOCIALISTIC IDEAL

The most pregnant development in the domestic sphere has been the acceptance of a socialistic ideal by the Congress and also Government in preference to the earlier and more nebulous aim of establishing a Co-operative Commonwealth. This followed a declaration by the Prime Minister of a desire to renounce the offices both of Congress President and Prime Minister so as to refresh his mind and devote himself to tasks nearer his heart, his open expression of dissatisfaction with the speed of progress in the country, his fulminations against the restrictive clauses of the Constitution and his visit to China, which sequence of events is perhaps not altogether without meaning.

It would seem as though after a spell of compromise, indecisiveness and some drift to the Right with no commensurate advantage either in the shape of accelerated economic and social progress or of response from the protagonists of private enterprise, Pandit Nehru felt that he had to check the drift and return to his earlier aims so as to speed up progress, end frustration in the land, stem the tide of extremist thought and prevent the defection of the common people from the Congress. Perhaps also the magnitude of the proposed Second Five-Year Plan and the great demand it was likely to make on the country's resources and the nation's co-operation appeared to him to need the inculcation of a socialistic trend of thought in the people.

In a sense, this is nothing new from the point of view of the Congress or at least of some of its leaders, though the reassertion of the socialistic ideal, so strongly and with a certain degree of abruptness, might have caused some surprise in certain quarters. On careful scrutiny, however, it will be found that the difference, if any, is of emphasis rather than of direction, as private enterprise will, under the Congress

scheme, continue to function and receive encouragement within its sphere as before, though it will have to work in cohesion with the public sector under the overall direction of the State, which will exercise control over 'strategic positions' in the country's economy. In a sense, the effect of the resolution passed by the Congress session at Avadi is more negative than positive. It only calls a halt to any tendency that may exist at present to slide to the right, and sets the face of the Congress firmly in the other direction. But whether it will incline positively to the left and, if so, how far it will venture to progress in that direction, must await the slow unfolding of events and may well depend on the relative strength of the opposing forces that will be brought into action by the resolution.

A 'HOLD-ALL' AS BEFORE

To all appearance, it seems as though the Congress will continue to be the 'hold-all' of various schools of thought and conflicting forces that it has always been, unless certain elements, the rightist mainly, leave the fold to seek succour elsewhere. If there is such a tendency at all, it may well be strengthened by the return to the organisation of certain radical groups like the Forward Bloc, the KLP and the Praja Party which had broken away from it earlier on one ground or another. But it is doubtful whether even ardent rightists will so soon dare to think of forsaking the all-embracing security and the protective cover of the Congress to go into the wilderness or embrace groups of the extreme right side which have been dwindling away.

Indeed, the possibility is that while they continue to cling to the Congress, some groups and elements which have been supporting a precarious line of independent, progressive thought in between the Congress and the Communist Party may jump on to Nehru's socialist band-wagon, leaving perhaps only an attenuated Praja Socialist Party to provide the semblance of a middle force. Even the advocates of a two-party system may not like such a polarisation if the only alternative to Congress Socialism or socialistic trend is to mean a clear break with tradition and threaten the very foundation of parliamentary democracy, as it is understood and practised in this country. Then it may well be asked whether the two-party system with all its advantages is to be welcomed at all in such a context.

OWN MANUFACTURE

It would be overconfident of the Congress to think that it could always carry the country with it; and socialism or socialistic experimentation is a field where Communists can perhaps manage to show themselves to better advantage in the eyes of the masses. In the circumstances, should the Congress slip or fail in its experimentation because of internal conflict or hesitation, then mass opinion in revulsion may well swing to the other extreme, unless the Praja Socialist should grow strong enough or a new middle force arise to check the swing of the pendulum, which, however, seems problematic at least at this stage.

This is the prospect that faces the Republic in the sphere of internal political evolution in the sixth year; and it is not by any means a cheery one. But it will certainly provoke much thought, and earnest thought may well call forth stabilising forces that have been dormant or remained unsuspected so far.

'PANCHASHILA'

In the international sphere, India reached, and remained at, the very zenith of prestige throughout the year. Her part in bringing peace to war-ravished Korea and Indo-China, highlighting the positive element in her attitude of neutrality and her sincere quest for peace, won for her not only immense praise, but also much good will from all over the world. The visit of Chou En-lai, the Chinese Prime Minister, to Delhi, and the meetings and discussions between him and Pandit Nehru, two great Asian leaders, shaping between them the destinies of about half the human race, made Delhi for once the political centre of the world; and their attestation of the now-famous five principles (panchashila) to promote good-neighbourly relations between nations, though neither sensational nor in any way new, has won great acclaim.

RIGHT SPIRIT

It has since become the basis of relationship between Burma and China, and Marshal Tito, the Yugoslav President and the first head of a European State to visit India after freedom, has found in it the right spirit to guide the growth of friendship between his country and India, thus becoming the first European adherent of Panchashila. Pandit Nehru's return visit to China was not only an occasion for strengthening the ties of friendship and culture that have existed between that country and ours for centuries and for

underlining the importance of the Five Principles, but also a happy opportunity to new China's leaders and people to give a great welcome to our Prime Minister. Further support to Panchashila came from the Indonesian Prime Minister, Dr Ali Sastroamidjojo, who came to India in September last to discuss preliminary steps for holding the proposed Afro-Asian Conference to promote close co-operation among countries of Asia and Africa and extend the area of peace.

Thanks to the signing of the SEATO treaty by the USA, UK, France, Australia and New Zealand and three Asian countries, Pakistan, Thailand and Philippines, ostensibly for united defence against any aggression in South-East Asia and the South-West Pacific, opinion in other parts of Asia has been hardening against Western designs on the international stage. Pandit Nehru took the lead in attacking this alliance as a most unfortunate form of interlocking in international affairs. Declaring that it militated against the provisions of the UN Charter and also that it would perpetuate colonialism in the world, he added that it was very odd that non-Asian countries should seek to impose something in the form of a defensive alliance when Asian countries, primarily concerned, had felt no need for it.

ASIA AND AFRICA

With the exception of Pakistan, the Colombo Powers, far from taking any interest in this alliance, have generally shown themselves to be opposed to it; and if the consolidation of Asian purpose for peace and freedom from alien interference needed any stimulus at all, there has been no lack of it since. The projected Afro-Asian Conference is bound further to strengthen this purpose and give it a concrete shape, thereby enabling the long-suppressed nations of Asia and Africa to play a decisive role on the world stage. In formulating Asian aspiration from time to time and enabling it to get the place that rightfully belongs to it, India is proud that her Prime Minister has had a remarkable part to play. He has surely been midwife to the emergence of Asian destiny, should he disclaim a more dynamic role.

INDIANS ABROAD

The position of Indians in neighbouring countries and elsewhere showed signs of deterioration except in one instance. India could at last come to an agreement with Ceylon

on the long-drawn-out dispute over the future of Indians settled there; but the settlement was not such as to cause complete satisfaction. As a result of this agreement, a large number of Indians will become stateless and their position is to be decided two years hence. The only relief secured for them is that they are not to be dislodged meanwhile from the jobs they hold or squeezed out by other methods. With the rise of Strydom, a high priest of apartheid, to power in South Africa, Indians there face a peril graver than ever before.

Elsewhere in Africa there may be no insolent racialism of the South African brand, but the rights of Indian settlers have yet to get adequate recognition. In British Guiana, the valiant fight of Cheddi Jagan, the deposed Prime Minister, has had no success so far; and repression continues. Indians in Malaya were deeply concerned over the implications of federal citizenship there, wondering whether it would deprive them of the right to seek Indian citizenship if needed later. The External Affairs Ministry of the Government of India, however, has assured them that they would continue to be eligible for Indian citizenship unless they gave an express undertaking that they would seek no other citizenship while accepting federal one.

LINK WITH COMMONWEALTH

India has remained in the Commonwealth as a Republic, retaining complete freedom of action. This has been of some advantage, but one does not know what the future holds, thanks to South Africa's policy of racial suppression and sharp differences among the Commonwealth countries on international issues. Let us hope that this free and willing association of nations for common benefit will survive these and future difficulties, as it has survived those of the past and continue to provide an example of fruitful unity in diversity to the rest of the world. Meanwhile, with Pakistan wishing to be a republic, Ceylon inclining to the same view and South Africa under Strydom tending to break loose, the Commonwealth will have further problems of readjustment to face, some of which, however, should prove fairly easy, after the Indian precedent.

Inside India, one more finishing touch could be given to the task of political integration, following the

graceful, though belated, decision of the French to transfer *de facto* control over their possessions in this country to the Union Government. The event was celebrated in November last with great jubilation by the people of the French settlements, some of whom dared to declare themselves free earlier at considerable risk and suffering, while others had to undergo even more severe hardships before they could achieve their goal. The *de jure* transfer is now to follow more or less as a matter of course in eight months.

LAST TOUCH

There is only the final touch left to be given now; and that concerns the Portuguese possessions in India, one of which has already shaken off alien rule. But for the intervention of the Government of India which wanted the problem to be solved peacefully and without complication despite the gravest provocation from the Portuguese, the other possessions too would have come under the Indian flag by now. The *satyagraha* launched in Goa on August 15 last by Goan nationals, without Indian participation or support, did give a further impetus to the freedom movement in the Portuguese pockets, though it could not succeed in its objective. After an exchange of notes between Portugal and India which came to nothing, there has again been some talk of negotiations; and the recent report about the re-establishment of diplomatic contacts may be taken as a pointer in that direction.

Despite the pompous utterances of the Portuguese authorities, the internal situation has been deteriorating rapidly and their control over the pockets weakening; and it may well be that they will soon decide that discretion is the better part of simulated valor and quit the scene, thus bringing to finis the sorry chapter of alien adventure on Indian soil. As the first to get a foothold in this country, it may satisfy Portugal's vanity in being the last to get out. That is their business. What India is interested in is that they do get out, and that too without further delay. The nation eagerly awaits this final clean-up.

LINGUISTIC AGITATION

Political integration has in a sense given a new urgency to the problem of reorganisation of States, which in any case would have had to be thought of, thanks to the encourage-

ment of linguistic aspiration by the Congress in the past. The first linguistic State to be set up under the Constitution was Andhra; and though its subsequent career has not been too edifying, the zeal for linguistic States has abated by no means. There is a lull at the moment, pending the findings of the States Reorganisation Commission. Though this Commission was appointed by Government to go into the question of linguistic States, the terms of its enquiry extend beyond the limited issue of linguism into the broader one of re-drawing the map of India on a variety of other considerations as well. The Commission has truly a difficult task before it; and it is more than one can say whether its report will end controversies or provoke them to greater intensity.

Karnatak is disturbingly impatient for a new State, and others betray varying degrees of impatience and eagerness. While the accession and integration of former Princely States have been of the utmost importance to national unity, which has come to be stabilised as never before in history, the separate existence of the larger of these units nevertheless poses very serious problems for any attempt at reorganising Indian States, particularly on a linguistic basis. This threatens to be the biggest headache of the Republic in the years to come. Meanwhile, it is of interest to note that the States Ministry, which, under the doughty Sardar, had performed its function so well as to outlive its utility in a few years, came to be merged in the Home Ministry in the fifth year of the Republic, thus closing a brief, but somewhat perilous chapter in the history of free India.

AMENDMENTS TO CONSTITUTION

The working of free India's Constitution in the last five years has brought out its points of strength and also its crippling weaknesses. The supremacy of the judiciary, which the Constitution so firmly established, has not only acted as a healthy check on the tendency to excess on the part of the executive, it has also widened the arena of freedom to an extent that was not fully foreseen at the time the great document was being drafted. Indeed, this extension of the citizen's sphere of freedom and range of rights has often been a source of embarrassment and even of anxiety to the executive

Concepts and Definitions of Capital Formation. Statistical Office of the United Nations, New York. Pages 20. Price 1s 9d. Available from Oxford Book and Stationery Co, New Delhi.

RECOGNISING the importance of national income estimates for enabling countries to measure their own progress and for the purpose of international comparison, the United Nations has issued a number of reports in recent years dealing with the problems involved in their preparation. Capital formation is one of the most tricky concepts that requires clarification in this connection and such clarification is attempted in this report.

The discussion of capital formation contained in the report and the recommendations made bring out clearly the one characteristic which seems to be common to all discussions in the sphere of national income. As the report points out, any proposals made "must inevitably be a compromise between the different uses to which the estimates of capital formation are put and the statistical resources available in various countries". So that, although the report is not concerned with the problems involved in actual measurement, "considerations of their actual measurement could not be omitted in choosing between the alternative formulations". The compromise suggested in many cases is the adoption of conventions that should be used in common in order to ensure international comparability, while detailed breakdowns of published figures are recommended wherever necessary so that those who use such data may adjust the totals to suit the particular purposes they may have in hand.

Of the three possible approaches to the subject of capital formation—the physical, the funds available for capital formation, and the expenditure on it—the report deals mainly with the first. The other two approaches are equally useful and in fact, for many purposes, essential. Since consistent definition of items and proper adjustments of statistics should give the same results by all three methods, the use of all three methods simultaneously would provide an important cross-check on the validity of the estimates and also suggest a measure of the error involved. This kind of cross-check is one of the funda-

mental features of a system of social accounts. It would be useful, therefore, to follow up the present study by equally thorough studies of the other two approaches.

A combined Saving and Capital Account for an economy would show under the funds approach, two items on the left hand side: (1) Saving; and (2) Provisions for the consumption of fixed capital. On the right hand side would be (1) Gross domestic capital formation, and (2) Net lending to the rest of the world. The totals on the two sides should be equal. The "physical" method of estimating capital formation would give results comparable item by item to the gross domestic capital formation on the right hand side of the account. Under this method, as presented in the study, net changes in foreign investment are not included in gross domestic capital formation, but are shown separately on the right hand side of the saving and capital account "since the concept of capital formation is designed to measure changes in the physical capacity of a country's economy."

Fixed capital formation is measured in terms of domestic production *plus* imports of capital goods less those, other than dwellings, sold to households or exported. This must be adjusted for changes in inventories of producers or distributors. The commodity flow approach requires supplementary information also on transport costs, dealers' margins and purchased services in connection with the acquisition and installation of fixed capital goods, as capital formation must be valued at cost to the user of capital goods.

When the production approach is adopted, it becomes possible to classify the results obtained by major product groups and by industries producing the goods. This is a definite advantage; that definitions can be made by the statistician and need not be left to the business accountant is also an advantage. Of course, the practices actually followed by business must be studied, for they may be such as to make it impossible to obtain information to

fit the refined concepts which the economist-statistician would like to have. But since accountant's decisions are frequently so little related to economic concepts, it is not always desirable to follow them closely in all respects. There is also some strength in the argument, however, that business decisions being related to the results shown in their own accounts, concepts which differ widely from those of accountancy may have little significance in actual practice. How far these conflicting views can be reconciled by the publication of detailed breakdowns or alternative sets of figures is a question into which the report does not go.

A number of problems which arise in relation to capital formation are examined in the report and specific recommendations are made in each

Law, State and Society

ALL open air shows and open sessions of conferences in Calcutta are held at the Ranji Stadium. There, the Russian Cultural Delegation had their open air show at cheap, popular prices. That "democratic" example was also emulated by the Chinese Cultural Delegation. In between, Uday Shankar had a successful and profitable season with his shadow-play, *Ramleela*. Last week, the Asian Lawyers' Conference had its open session at the Ranji Stadium.

Some of the conveners of the Conference are indoctrinated Communists. Some others have pronounced Communist leanings. Thirteen Asian and two African countries participated in the Conference. Dr Radhabinod Pal inaugurated the open session. Mr D N Pritt, President of the International Association of Democratic Lawyers, was the principal speaker on the first day of the open session.

WORKERS AND WOMEN

Economists may have doubts whether wealth and welfare are synonymous terms. But "democratic" lawyers do not seem to have any doubt whether justice and peace mean the same thing as humanity. From the deliberations of this Conference, it would seem that its main concern is to ensure national and international justice and peace. These aims are to be achieved in the wider interest of humanity.

It is inevitable that a Conference of lawyers will discuss the problems of world peace. It has endorsed the Five Principles. It is opposed to the use of atomic and hydrogen bombs because it is as much a contradiction of international law as of humanity. Some of the participating members seemed concerned about civil liberty and rights. All are agreed that the rights of workers and of women must be preserved and protected.

If many of the conveners and participating members of the Lawyers' Conference are Communists, or have Communist inclinations, they must have felt uncomfortable in their seats while listening to the addresses of both Dr Radhabinod Pal and Mr D N Pritt. Any impartial observer in the audience also must have noticed the skilful

acrobatics of tight rope dancing of Mr Pritt, if not of Dr Pal.

Mr Pritt was intriguing in his exposition of the "democratic" lawyers' responsibilities in relation to the implementation of the Five Principles. He was right in his interpretation that sovereignty was the main basis on which the Five Principles were based. He was also right in his analysis that non-interference in internal affairs was a direct sequel to the principle of sovereignty of nations.

CO-EXISTENCE

It was inevitable that Mr Pritt would emphasise peaceful co-existence. His annotation of the principle of sovereignty shows that he is a good democrat. But many Communists may not like his emphasis that sovereignty is still a necessary basis of relations among nations in order to prevent imposition to systems of government and of "ways of life" by the powerful States over their weaker neighbours. It should be the duty of "democratic" lawyers, Mr Pritt implies, to equate the juridical concept with the humanistic arguments in defence of the principle of sovereignty.

Not only Communists, but Socialists also were "international" in their outlook. Many years ago, Socialism shed its "international" complexion. Today, the Socialist parties in every country seem to believe in sovereignty and nationality. In advocating peaceful co-existence, the Communists will also now seem to accept the principle of sovereignty.

Sovereignty is a concept with which international jurists may not be in conflict. They endorse the politicians' faith in maintaining a world balance of power on the basis of sovereignty of nations. Some political thinkers may wonder whether wars can ever be prevented as long as the principle of sovereignty is accepted. These are wider issues which Mr Pritt found it convenient to by-pass. But all thinking persons will echo Mr Pritt's hope that lawyers should help the realisation that the use of atom and hydrogen bombs is as much a negation of international law as of humanity.

No less significant were the issues raised by Dr Radhabinod Pal. Dr

Pal, an eminent jurist, will naturally express concern about the rights of the individual. He is against regimentation of the masses. He is for a political order in which the individual can develop completely. This is supposed to be the main issue at conflict between the Communist States and the Capitalist Powers. It has been remarked that if Russia can prove that it can ensure individual freedom, whatever that may mean, Communism will succeed in conquering the whole world without firing a single shot.

Dr Pal is not unaware of the changing relationship between State and Society. He is right in his observation that the aim should be to reconcile individualism with maximum social good. Whatever be the position of the individual in Communist States, it is necessary to realise that rule of law has also its limitations. Clearly, a synthesis is necessary. It is equally clear that, in the process of reconciliation, both the State and the Individual must become less and less important than Society.

PLAN AND LAW

Dr Pal posed the same problem from another angle. Today, every country has a Plan; everybody is now a planner. Political and economic planning has social repercussions. Jurists do not seem to be enamoured of the social, political and legal implications of a Welfare State. There is the problem of a proper balance of relationship between the Legislature, the Executive and the Judiciary. It is natural that jurists will stress the supremacy of the Judiciary. This is now accepted as an occupational mania with lawyers and judges.

Law cannot function in a vacuum. It is related to the prevailing basis of State and of Society. As the basis and functions of State and of Society are changing, there must be corresponding modifications in the legal system. Dr Pal seems to concede that the changing political and economic relationships will have to be expressed and interpreted in terms of law. Jurists are combative in their role of interpreters of political, economic and social changes. They are less conscious of their responsibility to express the developing relationships in terms of law.

case. These include the treatment of used assets, international carriers, prepayment by foreign residents, gold transactions, valuation, current/capital expenditures, increases in stocks, and consumption of fixed capital. In each of these fields, the report covers highly controversial ground and taking this into consideration, the recommendations finally made are not sufficiently supported by discussion of alternate views and statement of the reasons for particular decisions.

For instance, it is stated that "the discovery of sub-surface mineral or petroleum deposits while enhancing the value of land is not included in capital formation, nor are the expenditures for such exploration, except as they involve expenditures for durable structures such as wells and mine shafts". This may be the correct approach but no explanation is given of the reasoning behind it.

Again, the transfer of used assets, being recorded both as a negative and a positive item, will not affect total capital formation as such, but since it is recommended that transfer costs should be counted as part of new capital formation, misleading results may well be obtained during periods when excessive transfers take place, or in countries in which the rate of obsolescence is high and yet an organised market for used assets exists. These possibilities are not discussed in the report.

Two other subjects of great interest are the treatment to be accorded to increases in stock and to consumption of fixed capital. For the former, it is recommended that the value of the physical increase in stocks should be counted and not the increase in the value of the stocks. For the latter, detailed recommendations are made after some analysis of the economic and accounting approaches to the problem and the various difficulties involved, but alternative approaches have been permitted. In other words, no final decisions have been made.

The only complaint that can be made against this very useful report is that it is not much larger, that no attempt has been made to detail the reasoning behind the recommendations made. Therefore, the economist interested in national income statistics will have to take these recommendations only as points of reference for a more detailed study.

sell his plot. Further, conversion of dry into wet lands and the preparation of such land for wet crops need initial investment which the small farmer may not afford. Neither is it wise to permit the unrestricted use of water lest it leads to an unfair appropriation of the benefits of irrigation by a handful of big landowners. Land in excess of a fixed limit should be purchased at pre-project price and made available to small owners and tenants. The problems of absentee landlordism and of investment in land purely for letting out on rent which is such an undesirable feature of landholding elsewhere should be guarded against in advance in the new project area.

Again, some villages may be suitable for setting up co-operatives for aiding farmers; in some others, agricultural labour may need control and direction either by an agricultural company or a state-controlled corporation. Dr Tannous raises the issue regarding the structure of farm organisation in the following words:

"As the irrigation projects now under way are realised and expanded, on what socio-economic basis will they be operated, family ownership, collective community cultivation, or large-scale absentee ownership?"

The pouring in of aid may bring about some improvement in physical production but it may not bring equal opportunity to every one nor help to promote equality of landholding. So when new opportunities of production are created, as a result of irrigation, development must be planned in advance and regulated from stage to stage. Economic development will be unequal and benefits may not reach the small farmer at all, unless a proper socio-economic policy is pursued right from the commencement of the project.

COMMUNITY ORGANISATION AND TECHNICAL AID

In the Point 4 Litany Project, community organisers will have to be trained in the first instance to organise co-operatives and village councils in those villages where farmers are mature enough to elect proper leaders for these bodies. In other areas which are less advanced, some state-aided but independent corporations may have to be set up to provide the necessary services and to train people in community participation. Central organisations will also be needed to help co-operative societies with credit, agricultural and

domestic supplies and in the marketing of produce. All these organisations, particularly primary societies and village councils, will need whole-time workers. Village councils will need town clerks. These will be the second grade workers, the first being the community organisers.

Moreover, an overhaul of state services will also be necessary to promote community research and extension. For instance, the health department must have the minimum preventive staff, and the education department adequate staff to set up and run primary schools with a rural bias. At a higher level of administration, senior officials and the executive subordinates of these departments should have the necessary training and the proper outlook to be able to help the organisation of co-operative societies and village councils and promote the development of voluntary welfare centres in rural areas. While the upper layer of officials may need training abroad, the training of the lower strata, namely, the subordinate staff, unofficial trade organisers and village leaders will have to be organised within the country. The association of the American University at Beirut with this important work under Point 4 is highly commendable.

ADVISORY BODIES

Co-ordination will be necessary at each stage and in various directions. Officials of the administrative departments will have to work together at the village level, through co-operative societies and village councils. Similarly, the work of the senior officers of the departments concerned will have to be co-ordinated at provincial and state levels. As the participation of the community is the aim all along, advisory bodies of non-officials have to be set up both at the provincial and state levels. The Government of Lebanon has already provided for participation at the state level, it only remains to extend such participation at other levels by setting up similar ordinary bodies.

From the commencement of the scheme there should be clear demarcation of the functions of the different kinds of staff. Technical experts who help to set up the project may withdraw when their work is over but organisers of co-operative societies and village councils may have to be absorbed as regular staff of these bodies or the State. Similarly, village level workers should be absorbed as secretaries of co-operative societies and village councils. The

staff of the rural departments of the Administration, which are concerned with community improvement will, of course, have to remain.

Training centres should restrict themselves to train the required staff, training being restricted to the development of co-operatives and village councils. Instruction may also be given in related subjects which could be feasibly undertaken at present by such centres. Experts who conduct training courses should be chosen from countries which are at a comparable stage of development as Lebanon. Special care should be taken to see that social welfare training has some relation to what underdeveloped countries can attempt with their own resources in the near future.

AUTONOMOUS BOARDS

Where the population consists of different communal groups, it is difficult to get an incorruptible administration, the loyalty of officials to communal groups being stronger than their loyalty to the state. A responsible community leader expressed himself in these words about the present state of things in Lebanon: "There is a persistent feeling that government should be for the benefit of the governing group or that even a programme of social service should bring some tangible personal gain to the managing group or their friends." There cannot be any immediate cure to this, neither is it possible to prevent the government controlling the institutions which it helps in several ways. Political interference may, however, be reduced to some extent by a proper set-up of administrative services, and secretariat rules. The device at present adopted by Point 4 of having joint councils of heads of departments and outside experts is certainly a step in the right direction. Another device could be the organization of independent boards, free from interference in day-to-day affairs but subject to the over-all control of the state. Where the state undertakes economic activities such as distribution of credit and export of fruits and vegetables, such boards could be of considerable service.

SOCIAL CENTRES IN LEBANON

The determination of Lebanon to develop community welfare centres was made clear by a recent decree authorising the establishment of social centres whenever the need arises and the finances can be provided. These centres are obviously conceived of, not as people's institutions, but as state agencies for

carrying out social services needed in rural areas. The government has possibly thought of departmental action rather than community organization, due to difficulties created by the existence of communal groups, in the country. A social worker will be stationed at the centre. The council of ministers will decide the programme of work for the social centre, the number of officers to be appointed for the purpose and their qualifications. Each centre will have a hall for meetings, a library, a clinic with laboratory, dispensary, maternity and child clinic, workshops for rural industries, literacy classes, rural club and play ground, stable for bulls, a demonstration field, and an institute for delinquent children. The expenditure will be shared by the respective ministries while the social affairs ministry will put up the necessary buildings. The local people will have to bear one-third of the cost of construction and also provide land for the building.

The scheme seems to be a copy and a mutilated copy of the Egyptian original which the Government of Egypt is now modifying in the light of their experience. Such a centre cannot be a community institution for which the community is responsible; it merely brings together in one place the activities carried on by the different departments of the government.

The scheme provides for an addition to the existing staff in the shape of a social worker for these centres. In so far as the Council of Ministers decide the expenses of all the departments in the centre, it may help to economise expenditure, if the work in the villages is co-ordinated through these centres. The social worker who will be a governmental official is expected to help every department. To some extent co-ordination of staff will be achieved through the Council of Ministers. But when the decree lacks the fundamental character of social centres, namely community ownership and management, it only adds another departmental activity to the social affairs ministry. This decree, however, has not set up a department of social centres with all the paraphernalia of a directing staff of experts in all lines. This much can be put to its credit. Its main aim seems to be to provide a building in each centre. To ask the villagers to contribute a third of the cost of such buildings, however, is to give undue priority to what is, after all, a non-essential service.

Some minor points in the decree also call for comment. It proposes an institute for delinquent children in each centre. Are delinquent children so many that every centre will need this institute? Neither are public baths and laundry likely to interest the average farmer.

TRADITIONAL COMMUNITY ACTIVITIES

I had also an opportunity to study some other types of projects aimed at promoting community development on a self-help basis, such as (1) traditional community activities and communal charities, (2) community organization in urban areas and (3) social activities of the progressive socialist party.

I visited three social service institutions, the Al-Maqassad-Al Khairiyah, the Catholic press, and a women's institute.

Certain forms of traditional community activities and communal charities for social services have always existed in Lebanon. Common ownership among the middle classes of silk-factories, oil-presses, and flour mills, wool-weaving by artisans, maintenance of village services as watchmen, and shepherds, the holding of land in common and its cultivation by rotation in some villages are examples of such traditional communal activities. Communal charities concern themselves mainly with hospitals, schools, and orphanages and they developed quite considerably under foreign rule. Both Christianity and Islam encouraged social assistance among the different religious groups. Community development in Lebanon may fruitfully utilise existing Wakfs and benevolent associations, by trying to co-ordinate their activities, avoiding duplication and wastage and integrating them with state services. Community self-help in the sense of all citizens sharing social responsibilities cannot be widespread in undeveloped countries. It presupposes the existence of individuals who are above poverty, have achieved some amount of economic stability and are eager to assume community responsibilities. Where workers already enjoy a minimum of security, according to the existing standard of life, they may be persuaded to contribute their mite for social services, and may also leave the management to the middle class or the leisured rich.

The test of community organization in such countries should be, not whether those who derive benefits from social services also contribute towards their maintenance and

conduct them themselves, but whether there is sufficient leadership outside these needy groups to organize social services, and whether voluntary funds are available to render such services effectively. Judged by these tests, the communal Wakfs (pious foundations) are certainly a form of community organization. But though Wakfs do act as community agencies, as the communities are themselves stereotyped, the sectional endowments act as a barrier to the evolution of a real community scheme. The lack of harmony in local communities which has found statutory recognition in the constitution of the country in the shape of communal representation indicates a situation in which the problem of bringing the communal groups together has to be approached with caution. These charities and endowments need guidance and direction in promoting community participation in several ways. A federation of the various associations will greatly help in systematising their social services, and increasing public participation through community chests and volunteer services.

COMMUNITY HOUSING IN URBAN AREAS

The provision of housing for the working classes who are living in slums is a major problem in Beirut. The government asked the United Nations to send an expert on housing. But the expert seems to have little work to do in the absence of provision of funds by the government. He has worked out a scheme of low-cost housing, costing per house (Lebanese) £4000 to £5000. Co-operative housing has great possibilities of developing community life. But speculation on building sites militates against any housing project. If the rental value of land can be controlled by law, capital values too can be restricted, say, to those prevailing in 1939. Supply and cost of housing materials need control. Some stipulation regarding the allocation of state funds for purposes for which the services of the UN are sought, seems to be called for. The investors in Lebanon are not satisfied with a 5 per cent return on housing. Beirut municipality has not got even the funds for priority projects, eg, a modern slaughter house or a sufficiently big plant for garbage disposal. Most of its revenue is spent on salaries and wages. The garbage goes into the sea though, incidentally, it provides some employment to the slum population who make a living by sifting this garbage. Armenians form

a large proportion of the population in the slum area. Foreign benevolent funds of Armenians as well as big employers ought to help the implementation of the low-cost housing scheme of the UN expert. The one silver lining in the cloud is the proposal made by the Director of the Port of Beirut (a French company) to build houses for its own employees. This company maintains a dispensary and two social workers for its workers.

The trade union law leaves ample scope for the promotion of social activities among clerks, shop assistants and industrial employees. Being a food importing country, Lebanon can build permanent community organizations, through the trade unions in the first instance for an economic distribution of wheat and other imported food grains.

COMMUNITY WORK OF THE SOCIALISTS

Through the kindness of Professor Baty and Mr Victor Aramouni, I had an opportunity to interview at his country house Mr Kemal Djumblatt Baig, the leader of the progressive socialist party community work in his area.

The libraries and night schools run by Mr Djumblatt in some villages, are open to members of all communities. The villagers provide the space and maintain the volunteers who do the teaching. The night-schools work three days per week. At the villages where there is a branch or office of the socialist progressive party, the villagers are asked to provide a room to be used as a clinic. A doctor or a nurse visits it once or twice a week to treat the villagers who pay 25 piasters per patient. This is called Djumblatt's medical aid.

These activities, though open to all, are run by the leader of a political party. Social services are bound to be run by political parties in democratic countries. In the absence of non-party community organisations and state services, these activities have to be appreciated for evoking community responsibilities. Communal charities partake of the same colour as social activities of political parties. The state has an important duty of evolving non-party organisations for community undertakings and fostering them with financial grants and technical aid.

THE TASKS AHEAD

Two essential institutions which are founded on community responsibility namely the primary agricul-

tural co-operative society and the municipal or village council should be organised throughout the country in such villages where farmers are able to manage them.

The state should adopt a definite policy of fostering agricultural co-operation by offering special concessions and facilities. They should be recognised as essential institutions of the farmers with definite services to perform in regard to sale of agricultural requisites, supply of credit and marketing of produce. They should be nourished by a central agricultural bank and central supply sale organisations. In order to promote social activities, there should be a legal provision enjoining on the co-operatives to set apart a fund out of its profit for the purpose.

All obstacles to the promotion of social and economic progress by community organizations should be removed. Export subsidy to growers and traders is a costly and unworkable policy. Bringing down costs of cultivation and marketing is a more enduring method. This has to be achieved through control of profits of private trade and by setting up a co-operative organisation. A measure of control will be needed over private companies distributing credit, agricultural requisites, and doing marketing service. Priority for imports which promote agricultural development should be given. Imports which hinder the growth of agricultural industries should be restricted to the minimum. Short, medium and long-term capital should be provided for agricultural projects and individual farmers by internal savings through the prevention of conspicuous consumption, and taxation, and by regulation of internal investments. Extension work should be promoted by a state extension staff working through co-operatives which should maintain a wholtime secretary from their own funds and partly aided by the State.

Training of village leaders should be promoted firstly by creating conditions for the growth of such leadership. The minimum land reforms which will redistribute lands belonging to big land owners, provide security and fair rents for tenants and a fair wage for agricultural labour should be undertaken, thereby creating the basic conditions for the growth of a self-respecting population and new leadership. Rural schools with an agricultural bias and training in citizenship should be promoted. The co-operative societies and municipal councils will be an effective training ground for rural leadership.

The Lebanese peasant in the mountain tracts is sufficiently awakened to be able to manage community organizations. Community leaders are coming up from the educated classes in towns to give the necessary lead and direction to village leadership.

CONCLUSIONS

The methods of work of community welfare centres need examination. A higher standard of living can be attained only from a nation's own resources. It cannot be planted on an undeveloped economy. Economic progress, therefore, should be given the first priority along with preventive health work. A reorganization of state departments in order to integrate agricultural development under a single department, staff for various rural services, provision for co-ordination, training centres for village level workers and higher grades of staff and training abroad for superior officers are the minimum requirements. The training scheme of the American University in Beirut can be trusted to create an efficient staff for community development.

In areas where new irrigation projects are undertaken, a socio-economic policy should be followed which gives maximum security to the small producer and aids agricultural production. Where owing to the domination of traditional big landownership, the farmer has not developed a sense of 'belonging', a paternal type of state-aided but semi-independent boards aiming at the goal of community participation should be provided for. It is better that economic services involving investment of funds are managed by independent boards or corporations, with a view to avoid political interference in infant democracies.

Some form of community welfare is promoted through the various communal charities and endowments. They should be co-ordinated at the centres where they operate and also at the state level so that they may evolve into welfare centres for the community as a whole, instead of for different religious and communal groups. Community welfare can be promoted in urban areas through housing schemes, trade unions, and enforcement of a welfare section in private company undertakings.

Community organizations on an area basis have a special importance in democracies where political parties cannot but lead to divisions among the people, and in countries such as Lebanon where communal loyalties and institutions have struck deep roots.

THIS IS AN ANNOUNCEMENT - NOT A PROSPECTUS

"Consent of the Central Government has been obtained to this issue by an Order of which a complete copy is open to public inspection at the Head Office of the Company. It must be distinctly understood that in giving this consent the Government of India do not take any responsibility for the financial soundness of any schemes or for the correctness of any of the statements made or opinions expressed with regard to them."

A Formal Prospectus dated 20th January 1955 has been filed with the Registrar of Companies, Bombay, as required by Section 92(2) of the Indian Companies Act, VII of 1913, which states that the Subscription List will be open on Thursday the Third day of February 1955 and will close on Monday the Fourteenth day of February 1955.

THE INDUSTRIAL CREDIT AND INVESTMENT CORPORATION OF INDIA LIMITED

AUTHORISED CAPITAL Rs. 25,00,00,000

Divide into
5,00,000 Ordinary Shares of Rs. 100/- each and
20,00,000 Unclassified Shares of Rs. 100/- each.

PRESENT ISSUE:—
5,00,000 Ordinary Shares of Rs. 100/- each, at par.

The Central Government has declared by a notification in the Official Gazette the Shares comprised in the present issue to be an approved investment for the purpose of Section 27A of the Insurance Act, 1938.

Out of the above issue 3,50,000 Ordinary Shares of Rs. 100/- each are agreed to be taken up by the following:—

- Several Indian Banks and Insurance Companies and certain of the Directors of the Company and their friends and associates.
- Certain Nationals and Corporations of the United States of America.
- The British Eastern Exchange Banks and certain United Kingdom and other Commonwealth Insurance Companies and other British Companies.

REGISTERED OFFICE

FORT HOUSE, 221 DADABHOY NAOROJI ROAD (HORNBY ROAD), BOMBAY 1.

1. The Company has been incorporated on the 5th day of January 1955 for the objects mentioned in the Memorandum of Association and particularly for the purpose of carrying on the business of assisting industrial enterprises within the private sector of industry in India

in general by

- assisting in the creation, expansion and modernization of such enterprises;
- encouraging and promoting the participation of private capital, both internal and external, in such enterprises;
- encouraging and promoting private ownership of industrial investments and the expansion of investment markets;

and in particular by

- providing finance in the form of long- or medium-term loans or equity participations;
- sponsoring and underwriting new issues of shares and securities;
- guaranteeing loans from other private investment sources;
- making funds available for re-investment by revolving investments as rapidly as prudent;
- furnishing managerial, technical and administrative advice and assisting in obtaining managerial, technical and administrative services to Indian industry.

Copies of the Prospectus as filed with the Registrar of Companies, together with the application forms are available at the Registered Office of the Company.

THIS ANNOUNCEMENT IS NOT TO BE REGARDED AS AN INVITATION TO THE PUBLIC TO SUBSCRIBE FOR SHARES AND APPLICATIONS WILL ONLY BE RECEIVED ON THE FOOTING OF THE FULL PROSPECTUS AND IN THE FORM ISSUED THEREWITH.

Around Calcutta Markets

Block Buying of Shares

IF the London money market is celebrating the re-emergence of the era of flexible money—an era, which was supposed to have ended by the early 'thirties—the Calcutta Stock Exchange is behaving as stock markets used to behave in the era which knew no controls, no dividend limitations, no attempts at legislation to regulate figures trading or managing agency rights. Clive Street is trying to behave as Clive Street used to, until, what many City Editors still deplore as, the Liaquat Ali budget.

It started more than two years ago. Then, the move away from controlled economy began. Some years ago, the International Monetary Fund assumed the responsibility for re-educating governments and monetary authorities in the elements of monetary economics. It took some time to re-indoctrinate the American Treasury and the Federal Reserve System into the Era of Finance. But once these authorities were re-converted, the task was almost completed. West Germany and some of the Scandinavian countries introduced dearer money. Later, Britain raised the Bank Rate. India followed Britain's example.

Free Economy

Both in Britain and in America, there was a change in the party in power. Both the governments are in favour of freer, more flexible economy. In both countries, money has since been made dearer or cheaper to neutralise wider, undesirable economic trends. In both countries, unnecessary controls and restrictions on the economy have been lifted. With a time lag, India has adjusted herself to the changing world economic trends.

This is the broader background against which some of the activities on the Calcutta Stock Exchange have to be viewed. It is, perhaps, a historical fact that the Calcutta Stock Exchange initiated the prevailing boom in stock markets. Calcutta was also, perhaps, the only financial centre in India which witnessed some of the features incidental to an industrial and stock market boom. In the last two years, Calcutta repeated Bombay's experience during and immediately after the war.

There has been a revival in the new issue market in the last two years. But there has been a variation in the form of activity between Bombay and Calcutta, which is significant. Bombay can claim to have underwritten and subscribed a major portion of the biggest capital issue in recent years. Calcutta has been more interested in bonus issues. Many tea, jute and engineering companies have issued bonus shares. Many such projects are awaiting the sanction of the Controller of Capital Issues.

Corners

This is an inevitable and a legitimate sequel to any industrial or stock exchange boom. But Clive Street is witnessing a parallel development which deserves emphasis. It will not be quite accurate to call it a craze for cornering shares. Corners, bear raids and bear squeezes seem to be things of the past. But something akin to cornering shares is happening on the Calcutta Stock Exchange. It is different from an attempt at cornering a share because the motive is different. Corners are not necessarily attempted to secure controlling interest in the companies concerned. This is the main motive why shares of some companies are being accumulated by interested parties.

Interested parties are reported to have acquired enough shares in three rupee tea companies to enable them to have controlling interest in these companies. Under similar pressure, Assam Company, a sterling tea company, has proposed measures which are highly questionable. Another sterling tea company is reported to be under a similar pressure. Two jute companies and one cotton mill company are also under similar threats. It is possible that the recent spurt in some of the selected Engineering shares is partly due to the same cause and motive.

Three Factors

Three major influences are in operation. Some shares are being bought in anticipation of bonus issues. This is an inevitable stock market activity. It is more often

than not profitable. It is at once a speculative and an investment proposition, although there have been many instances where genuine investors have suffered because of over-rigging of such shares. Whether or not it is desirable to take interest in the share of a company which is issuing a bonus share depends partly on the terms of the issue, but mainly on whether future profits would be sufficient to cover the expanded capital structure.

Some shares are being bought in anticipation of higher dividend payments. This is also a legitimate activity. This has been the main urge to hectic stock market activity in the last eighteen months. Issues, or expectations, of bonus shares and higher, or anticipations of better, dividends are accentuating the urge to buy-up shares in some companies in order to acquire controlling interest in these. This is also not necessarily an illegitimate form of activity. But there are certain considerations which must be kept in mind so far as the movement for securing controlling or managing agency rights in certain companies are concerned.

Change in Ownership

During and immediately after the war, many companies owned or managed by non-Indians have been bought over by Indians at unduly inflated prices. That is how, non-Indian investments have been, and are being, liquidated. Transfer of ownership to Indian nationals is not undesirable. But such transfers should not be effected in a manner which is prejudicial to the shareholders concerned. This is the main problem so far as attempts at acquiring controlling interest in sterling tea companies are concerned. Today, the tea industry may be prospering. But it is doubtful whether, in the long run, the industry or the companies concerned can bear the inflated cost at which foreign investments are being acquired.

Agency Rights

Whether as regards liquidation of foreign capital or managing agency rights in industries in India or as regards transfer of ownership or of

managing agency rights of rupee companies, managed and owned either by Indians or non-Indians, the main problem is the cost of such liquidation or transfer of ownership. Experience of such liquidation or transfer of ownership during and since the war is painful. This is one of the main problems facing some of the major industries of West Bengal today. To avoid the costly mistakes made immediately after the attainment of independence by India, any such move needs to be scrutinised carefully by the Controller of Capital Issues.

It is not the intention here to discuss the ways in which such moves can be thwarted by the existing management, or, whether the present movement in Calcutta is motivated by intentions to by-pass the normal channels of sanction by either the Controller of Capital Issues or the Registrar of Joint Stock Companies. But it is relevant to enquire whether those who are now trying to acquire controlling interest in some companies are aware of the Government's hardening attitude to the managing agency system. Attempts at transfer of ownership or managing agency rights in some companies might have started before the Government's intention to modify the managing agency system was made known. But it is not a little strange that these attempts persist, despite the knowledge about the Government's contemplated legislation relating to the managing agency system.

Around Bombay Markets

Oils and Oilseeds in 1954

AFTER a year of acute scarcity of edible oils, the fifth year of the Republic witnessed plentiful supply, thanks to the bumper groundnut crop in 1953-54. In fact, the planned increase of 4 lakh tons of oilseeds during the First Five Year Plan has already been exceeded. Yet the oil market behaviour was rather intriguing, and the groundnut oil price which sets the pace for all edible oil prices tended to rise till end of April as indicated by the table at the end of this article.

A remarkable change during the year was the determined effort of the Government to bring down and stabilise groundnut oil prices at a reasonable level. In November 1953, the Commerce and Industry Minister had warned that no export of groundnut oil would be permitted until its price came down substantially. This, combined with a bumper crop, should have initiated a decline. Far from declining, prices of oil, on the contrary, began to show an upward tendency. Farmers, it was reported, began to withhold the crop in anticipation of higher prices. Some State Government Ministers encouraged them to do so by promising to secure export quotas. The Forward Markets naturally did not take the Commerce Minister's statement seriously, and the demand for oil from the vanaspati industry had also increased substantially during the first few months as vanaspati production was being maintained at a very high rate. A small export quota of HPS groundnut issued in

March on the ground of maintaining export contracts, encouraged expectations of a larger export quota, and the price level continued to rise. A deficit budget and buoyant conditions in other markets also helped to maintain groundnut oil prices at a high level.

From May onwards, however, prices began to decline and the reversal of this declining trend is not yet in sight. The factors responsible for this change in market sentiment were fall in prices of foodgrains, expectation of dishoarding by farmers with the approach of the monsoon and poor prospects for export quota.

Government tried to cushion the fall in oil prices through free exports and abolition of export duties on rape and mustard, kardi, niger and cottonseed oils and by announcing small export quotas of groundnut oil in July and October. As a precaution against a sudden rise in groundnut oil prices, due to a high profit margin in the export of groundnut oil, a duty of Rs 350 per ton was imposed; but it was subsequently reduced to Rs 225 in September and to Rs 125 in December to check the fall in prices. However anticipation of another good crop and continued pressure of arrivals in terminal markets have so unnerved the trade that, despite a liberal export policy, the price of groundnut oil has continued to fall, and fallen well below the level of Rs 1,000 per ton which, the Government had hinted earlier, was a reasonable level to achieve and maintain.

Oilseeds and Oil

The problem of oilseeds and oils is similar to that of cotton. Indeed, the continued fall in oilseed and other agricultural commodities has begun to cause serious concern to Government and the country because of its unfavourable effect on the purchasing power of the masses and, consequently, on the off-take of industrial products. So far as prices of edible oil are concerned, there was no justification, however, for the recent slump as there is no large surplus available. After the disastrous failure of the groundnut crop in 1953, there was no carry-over of groundnut to 1954, and although the crop in 1953-54 was excellent at about 23 to 24 lakh tons of kernel, the consumption during the year was also fairly high. The vanaspati industry alone is estimated to have increased its consumption by 2 lakh tons of kernel in 1954. The exports permitted in July and October and the quantities required to build up normal trade stocks, depleted during the previous year, would absorb the excess above normal available in 1954. The crop in the current (1954-55) season is not expected to be very large; trade estimate places the quantity at 20 to 21 lakh tons of kernel. Since Government have already permitted exports of nearly 2 lakh tons of kernel from the current crop, a fair assessment of supply and demand would not suggest the possibility of a slump. If Government are persuaded to further liberalise the export policy, the country might well face prospects of seed shortage and high prices after 6 months.

The immediate problem appears to be largely that of financing arrivals of the crop in the primary and terminal markets which have been very heavy, as farmers appear eager to unload the crop as soon as possible in view of the bitter experience of last year and the desire to avoid losses through further fall in prices. Prices can therefore be easily brought up to a reasonable level and maintained if, instead of permitting large quantities of groundnut being exported, the large crushers and vanaspati manufacturers are persuaded to cover their requirements during the season. Credit facilities may be extended for the purpose through Banks, as was done in the case of cotton a few years back. Had development expenditure kept up to the scheduled level, it would have provided adequate money for financing the increasing agricultural and industrial output and prevented the slump in commodity prices.

The trend of prices for inedible

Big Things...!

They are BIG!

But even your biggest printing problems are not big for us.

For an Indian Press to attain the standards of printing as in the United States of America, England, Germany and countries where most progress is made in this direction, is an achievement. Clientele will testify to our attainments in this direction.

With our photo offset, blocks, letter press, litho and packaging material manufacturing departments and a capacity one of the largest in India and twenty-five years' experience behind us, we can undertake all types of printing.

Let us tackle your printing problems.

New Jack Printing Works Ltd.

GLOBE MILLS PASSAGE, DELISLE ROAD

BOMBAY 13

oils has largely been determined by the international situation. The dumping of linseed oil by the American Commodity Credit Corporation made export of linseed oil impossible until very recently and that too after the domestic prices had declined substantially. In castor oil, Brazilian competition has virtually pushed out Indian exporters from international markets and exports have been more than difficult.

In conclusion, it is only just to record the welcome change in Government policy which was concerned hitherto primarily with the balance of payment position of the country. The role of oils and oil-seeds exports was, therefore, mainly that of foreign exchange earners. It now appears to be concerned with the need to ensure their adequate supplies at reasonable prices to consumers. This welcome change of attitude also calls for an appropriate

change in the technique of control, exports can no longer be used freely as an instrument of price support. A policy of selective bank credit may be the answer.

Our Star in the Sky

Thursday, Evening

AS mentioned in the last review which appeared in the issue of January 15, Tata Ordinary were moving into a state of stagnancy from which, it was further remarked, there is usually a sharp turn one way or the other. Tata Ordinary continued to move narrowly till January 20. On the following day came the news that Pandit Nehru had rejected the case for total nationalisation at the Avadi Congress. The stalemate was broken and Tata Ordinary which were quoted around Rs 224-8 on 20th evening, were being quoted around Rs 234 on the 21st evening; ten points rise within a day.

A well-known Calcutta operator who was reported to be accumulating Tata Ordinary around Rs 225 earlier, bought a good number of shares at rising rates, and his long position is estimated at more than 30,000 shares. A Bombay operator joined hands with the Calcutta bull and came forward to buy in thousands.

A sudden spurt, and influential buying made bears nervous, and heavy short covering helped Tata Ordinary to rise further, and in the process, rates touched Rs 240 for the first time since September last.

Strangely enough, Textile shares, which had been lagging behind, continued to do so. Century prov-

ed an exception, however, following influential buying on rumours of better profits for the current year, which lifted the quotation by about 15 points. Other textile shares moved up a little but the rise was merely sympathetic. Only short covering enabled this section to come up a little. The earlier bull activity in Bombay Dyeing proved short-lived.

The Miscellaneous section, which tried to rise with the market leader, met realisation pressure at bulges, and shed much of their gains.

In the cash section, in contrast to the rise in Tata Ordinary, there was a steep fall in New India Assurance shares. The Finance Minister's passing remark on nationalisation of insurance companies caused heavy liquidation and this small valued share lost about 10 points! This only shows the investor's concern over the Government policy.

United Commercial Bank shares met good inquiry on reports of better profits and on prospects of a rise in dividend of annas 8 to Rs 2-8.

Looking to the market's behaviour in general, the lead given by Tata Ordinary does not appear to have been followed by the majority of the shares; not even by Indian Iron. Earlier gains in the only other steel scrip could not be maintained.

THE ECONOMIC WEEKLY

Another important market factor is the tendency of larger deliveries of Tata Ordinary at higher rates. A genuine revival should cause all-round rise in the market, and public participation. At present, the buoyancy which is significantly present in Tata Ordinary is absent in other sections.

Buying in Tata Ordinary is very strong and the share is passing under the firm grip of bulls. The international situation has helped the bulls to maintain their recent gains. Any easing of the international situation may bring about a decline as the other shares have been lagging behind.

Bulls can usually get out successfully when there is replacement buying in considerable volume at higher rates; but the general public comes in only when the market as a whole is buoyant. Political developments are likely to affect the market in near future.

BULLION MOVES UP

In contrast to commodity markets, bullion prices moved up in the period under review. Excellent off-take in both silver and gold, and speculative support account for the rise. Reported seizure of contraband gold further helped the rise in gold.

After many months, the carry forward charges for silver were even. Hitherto they used to be against buyers. In gold, however, they continued to be against sellers.

The law of commodity markets do not apply to bullion. As imports are totally prohibited and the usual demand continues, movements depend on the off-take. Both the metals gained about Rs 3-8 during the three weeks ending February 2, the closing being around Rs 161 for silver and Rs 92 for gold.

COTTON CAUSING CONCERN

After some heavy short covering in January, cotton has continued to fall unchecked. Mills are still reluctant to buy. Reports of a bumper crop made the bulls very nervous and on February 2, the price touched a new low. The market is keenly awaiting some Government measure to check the downward trend. As the fall has been steep, profit taking is likely to bring some rally.

THE ECONOMIC WEEKLY

(Continued from page 194)

which is in itself not unwholesome. But the Constitution has also tended to hold up progress on desirable lines or slacken its pace, as in the case of the property rights. While sound in themselves, these provisions, as interpreted by the judiciary, have acted as a curb on progress.

The Constitution has already been amended in places, but not necessarily out of progressive zeal. The approach in these instances has been the old, familiar one of law and order. This stigma, however, does not attach to the recent proposal to amend Article 31 of the Constitution which relates to the right to property. The intention behind the proposed amendment is not to expropriate property, without payment of compensation, but to make the quantum of compensation decided upon by legislatures, above challenge in courts. When the amendment is passed, Government will still have to pay compensation, but it would be a 'fair' compensation rather than one at market value, and it would no longer be 'justiciable'. Other amendments also have been proposed, but they are not of any great significance.

GESTURE OF FAITH

The greatest gesture of faith made by the country's leaders and the authors of the Constitution was in voting for adult franchise in a country of such vast size and population, where more than 80 per cent of the electorate are illiterate, politically backward and more or less new to the process of democracy. Yet the gigantic general elections, first of their size and complexity in the world, were conducted with an orderliness, discipline and decorum that were truly impressive. And the results of the elections on the whole and the position of party representation were such as to vindicate the faith of the country's leaders in the robust commonsense and sound judgement of the Indian people.

Only in a few States like Travancore-Cochin, Madras and Pepsu, the results gave an unstable party position, with no group sufficiently strong by itself to form a government. Since then, the position has somewhat improved in Madras, thanks to the shrewd and masterly leadership of Shri C Rajagopalachari. In Pepsu and Travancore-Cochin, fresh elections were held after a period of uneasy administration, as a result of which there was some improvement in the former,

but little in the latter. The newly-created State of Andhra was found to inherit an unhappy party position from the parent State of Madras which is now sought to be set right through fresh elections. A notable feature of the first general elections was near-rout of the Praja Socialist Party and the comparative success achieved by the Communists, particularly in elections to legislatures in Madras, Travancore-Cochin and Hyderabad and to Parliament.

In the five years of our Republic, there have been efforts at progress in other spheres of national life also, apart from the inauguration of the Five-Year Plan. A string of national laboratories have been established; organisations have been set up or steps taken for the encouragement of literature, music, drama and a number of other arts; and there have been attempts at remodelling the entire system of education so as to bring it closer to the genius of

the nation and the needs of the country. An exhaustive enquiry was conducted into the Fourth Estate to put it on a sounder basis, with regard to its structure, functioning, lines of future progress and the condition of working journalists; a common social code is being evolved, and as a first step, the Special Marriages Act has been passed; and, apart from the steps already taken to popularise Hindi, a special endeavour is to be made now to help it replace English within the period of fifteen years stipulated in the Constitution.

This is, in brief, the story of our Republic and the progress achieved by it in the five years since its inception. An interesting story it is, if one may say so, and quite a heart-warming one too.

[This review was to have appeared in the Annual Number, but had to be held over for lack of space.—Ed.]

THE HINDUSTAN CONSTRUCTION COMPANY LTD. CIVIL ENGINEERS, BUILDERS AND CONTRACTORS

FOREMOST IN THE FIELD IN

Designing and construction of Dams for Multi-purpose Projects;
Railway and Road Bridges with all types of foundations (including Caisson and monolith sinking);
Docks and Jetties;
Water Supply and Drainage Schemes;
Aerodromes and Hangars;
Tunnels;
Heavy Earthworks;
Buildings—Industrial and Administrative;
Marine and Land Pipe Lines;
Road Constructions;
Guniting, Core Drilling and Grouting;
Sewage Purification and Public Health Engineering;
Etc. Etc.

WE ALSO UNDERTAKE PILING WORK
UNDER HINDUSTAN-ZEISSL SYSTEM

Head Office

"CONSTRUCTION HOUSE", BALLARD ESTATE, BOMBAY I.

Party and the State in Russia

ONE clear fact emerges out of M Malenkov's resignation. It is the re-assertion of the Party as the supreme source of authority in Russia. Russia is a Communist State. It has always been, and will be, guided and governed by the Communist Party. This conflict between the Party and the Government never arose in Lenin's time. Lenin was the respected, revered Father of the Revolution. In him, the Party and the Government were merged. There was no one to dispute his authority. So the inherent conflict between the Party, which completed the Revolution, and the Government, which the Party established, never arose. It arose after Lenin's death. Stalin resolved it by firmly establishing the superiority of the Party. He, the General Secretary of the Party, became the Head of the State. Trotsky, a brilliant theoretician, but never a Party-man in the sense in which Stalin was, was liquidated.

Stalin transformed Russia into a monolithic State. Since Stalin's death, there has been speculation throughout the Capitalist States as to when the battle for succession will start, how will it end, and whether this struggle will lead to disintegration of Communist Russia. Those who are supposed to be experts on Russia are busy speculating about the continuing battle for succession. They had argued that Molotov and Beria were Malenkov's rivals to the succession. Beria was liquidated. It was then assumed that Malenkov had purged Beria to assure his right to the succession. These experts now realise that Beria was liquidated at the instigation of Khrushchev, First Secretary to the Communist Party. They are now telling the world that Khrushchev has now established himself as *far more equal*, to vary a famous Orwellian phrase, than Malenkov.

Any such interpretation of developing events in Russia in relation to personalities has obvious limitations. Peaceful co-existence was always a weapon of diplomacy with Stalin. Malenkov seems to be more sincere in his faith in peaceful co-existence. Malenkov has not succeeded. Western Germany is to be re-armed as a NATO Power. America has rejected his policy of conciliation. His foreign policy has involved significant economic shifts. Malenkov has reduced defence outlay. Production of consumer goods has been encouraged at the cost, his critics argue, of expansion of heavy goods industry. Such an economic policy, Malenkov's critics argue, has weakened Russia's military potential. Four months ago, Malenkov was accused by Khrushchev of pursuing a wrong economic policy. This charge was debated and re-debated in secret joint meetings of the Party and the Government. This issue was publicly discussed in *Pravda* and *Izvestia*. Khrushchev won the day.

Only those who are unaware of the developments within Russia will express surprise at M Malenkov's resignation. It is now being confidently predicted that Malenkov will go the Beria way. Some of the self-appointed experts on Russia are, perhaps, mistaken in their assessment of Russian developments because of their ideological incompatibility. Malenkov still remains a Cabinet Minister. Both he

and Mikeyan, Malenkov's Minister of Domestic Trade, remain members of the Presidium. Malenkov has been appointed as a Deputy Premier. Because ministerial resignations have no precedent in Communist Russia, it is suggested that Malenkov is still allowed to live because Khrushchev is not yet sure of his position. There are two possible arguments against any over-emphasis of the personal equation. Unlike Beria, Malenkov has never had any control over the Police or the OGPU. Malenkov, therefore, is not suspected of attempts at any secret or military coup. With Malenkov, it seems to be an instance of the Party rejecting his policy. In a democracy, a Minister resigns when his policy is not accepted. This is precisely the step that Malenkov has taken. Malenkov may not be liquidated as long as he is not found guilty of secretly sabotaging the policy now adopted by the re-organised Bulganin Government, at the initiative of the Party. There is evidence to suggest that, although Malenkov's policy has been rejected by the Party, Russia has outgrown the Stalinist era of one-man dictatorship, and has accepted the principle of collective responsibility. That Malenkov should be put in charge of electric power, including atomic energy, so vital to defence, confirms this interpretation.

Some of Marshal Bulganin's remarks in his first speech as Premier are liable to the opposite interpretation that the changes imply a return to Stalin's policy, if not to Stalinism. There is a familiar, Stalinist twist in Marshal Bulganin's assurance that his Government will carry out "a policy of building up a Communist society in our country, of consolidation of our State..." But, on closer analysis, it will be evident that Marshal Bulganin is more emphatic in his acknowledgment that he and his Government are subservient to the Party, and that both have a responsibility to pursue the policy adopted by the Party. Marshal Bulganin and his Government will "unceasingly carry on the policy elaborated by our own Communist Party..." In the economic sphere, the Soviet Government will in future carry out the general line of the Communist Party for the development of heavy industry. It is inevitable that, in Communist Russia today, the Party and the Army must be equally important. But even as Marshal Bulganin's election as Premier and the ap-

pointment of Marshal Zhukov as Defence Minister imply the importance of the Army, Marshal Bulganin's explicit acceptance of the dictates of the Party indicate that the Party is, to use the Orwellian phrase without any variation, "more equal than the Army".

Whether the developing events in Russia imply a return to Stalinism, or to one-man dictatorship, or to a more militant policy to the world, are not irrelevant questions. But the more relevant question is the cause of the developments in Russia. Western Powers, or some of the self-appointed experts on Russia, may find it convenient to explain these events away as inevitable, incidental consequences of the continuing struggle for power among the top men at the Kremlin. But impartial observers will be inclined to draw a lesson which the Western Powers

PSP Loss, No Congress Gain

IN Travancore-Cochin, the Praja Socialist experiment in Cabinet making has ended. Nevertheless, one might admire the courage and optimism of Shri Pattom Thanu Pillai, the PSP leader, when he accepted the Rajapramukh's invitation to form the Ministry. Even a novice in politics could not expect his Ministry to last long with a voting strength of 18 in a house of 117. How the PSP came into power is now past history. At the time of the last general elections, it entered into an electoral alliance with the Communist-sponsored United Front and deprived the Congress of a majority in the legislature. The situation then warranted that the PSP should either join a United Front Coalition Ministry or lend support to a United Front Ministry till such time as the policies of the United Front actually clashed with Socialist ideals. But the Central Executive of the PSP had its own views. By a queer process of logic, it came to the conclusion that it was the PSP that should form the Government and that all other parties should support it. This was convenient to the Congress because that seemed to be the only way to keep Communists out of office. The leader of the Congress party lost no time in offering responsive co-operation to the PSP Ministry. It is for the political historian to probe into what transpired behind the scenes at that time. The fact is that for the first time, the PSP formed a Ministry in the country

should try to learn. Malenkov would not have lost his position had his policy of conciliation succeeded. By rejecting his plea for peaceful co-existence, the Western Powers have compelled Russia to adopt a policy of aggressive defence. Few will blame those in Russia who fear that the Western Powers' policy compels them to strengthen Russia's military potential through over-expansion of heavy industries. Within Russia, the people will have to tighten their belts further; there will be more regimentation; the Malenkov experiment of gradual economic and political freedom to the people will have to be jettisoned. And all this, because the Western Powers will not show any inclination to discuss with Russia the terms and conditions on which they and the Communist States can co-exist in peace.

and that too, with an insignificant minority. There is no denying the fact that but for the Congress assurance at that time, the Rajapramukh would not have asked Pattom to form the Ministry.

It was only political expediency that prompted the Congress to lend a helping hand to the PSP at that time. It was its fond hope that the people would again look to the Congress for leadership. In the meantime, the Congress wanted to take credit for any good that the PSP Ministry might do, and put the blame squarely on it for omissions and mistakes. Pattom, who knew that any close alliance with the Congress would be suicidal to his party, tried at every turn to stress that the PSP had nothing to do with the Congress and that its policies were its own. The result was that Pattom was inclined to appease Communists and their allies rather than associate with the Congress. This was a position the Congress could not tolerate, and the inevitable happened. What are the lessons of the PSP experiment in Travancore-Cochin?

Law and order are essential for the working of even a progressive Government. In a country, where Satyagraha and hunger-strike come in handy to focus attention on minor issues, the handling of law and order is doubly difficult. A Ministry with sufficient backing can maintain law and order under such circumstances.

ity Ministry cannot have that privilege. Besides, to complicate matters, the Central Executive of the PSP had its own notions about maintaining law and order. Worse still, the police, the guardians of law and order too had their ideas on the subject, which, to some extent, were not in tune with public opinion. Under these circumstances, it is not surprising that the PSP Ministry had to crumble; and its achievement is, to say the least, poor.

The second difficulty the Ministry had to face was in regard to the contents of its economic policy. The last elections revealed that Leftist forces were very strong in Travancore-Cochin, and it was necessary for the PSP Ministry to take steps for radical reform to solve the land problem and unemployment problem. But before moving in this direction, the PSP Ministry had to take some measures to catch the imagination of the public immediately. Some of the measures introduced with this end in view were integration of service, free education up to the 6th standard, enforcement of the Minimum Wages Act etc.

As time was of vital importance to the party in consolidating its position, some of the hasty measures taken were ill-conceived. It tried to meet situations as and when they arose with an eye on the Leftist opposition, which naturally came in the way of its taking an overall view of the situation and evolving a well-thought-out policy. It introduced a bill for land reforms which did not go far enough to satisfy the Leftists, though sufficient to frighten the Congress. Its achievement on the unemployment front has been practically nil.

In spite of all these, people started considering the PSP Ministry better than the previous Congress Ministries. From the point of view of the Congress, this was a dangerous trend. But whether the Congress can win another election in Travancore-Cochin, is very doubtful. The present attempts of the Congress to get into power by any means will not help it to enhance its prestige unless it can bring about improvements in the economic life of the people. That will necessitate complete re-orientation of present Congress policies on Socialistic lines. Never the Avadi resolution says, Congress does not seem to be

anywhere near Socialism. So, if the Assembly is dissolved immediately, Leftist forces are likely to get added strength in the next elections. On the other hand, if the Congress manages to get into power with a precarious majority, its position both on the economic front and on

the law and order front will be worse than that of the PSP. The situation in Travancore-Cochin is full of possibilities. The general elections in Andhra will finally decide the issue in Travancore-Cochin even if the Congress should get into power for the time being.

All the advantages of . . .

AOLLERITA
Electrical PUNCHED CARD
ACCOUNTING

to help
you
when
you're
really
busy

If the size of your business does not justify the installation of HOLLERITH, you can still, at peak periods, have all the advantages of HOLLERITH services and methods.

Submit your accounting problem to a HOLLERITH Service Bureau and it will produce the results—tabulations, invoices, statements or other documents as may be required. Your original documents are returned to you and all the information, which is now on punched cards, is filed and treated with strict confidence, ready for you to call upon at any time.

Alternatively, you may hire or buy Punching and Verifying machines to record your information on Hollerith Cards in your own offices and then use the Bureau to produce the finished result.

Apply to us at any of the offices listed below, and we will send a representative, who, with knowledge and foresight, can help you when you're really busy.

Weekly Notes

Dissolution Declared Invalid

CONSTITUTIONAL developments in Pakistan have taken a new turn with the Sind Chief Court declaring invalid the Governor-General's dissolution of the Constituent Assembly in October last year. The Court has also issued a writ of *quo warranto* prohibiting five Central Ministers from exercising the office of Minister, and a writ of *Mandamus* restoring Moulvi Tamizuddin to the office of President of the Constituent Assembly and prohibiting the Federation of Pakistan, Prime Minister Mohammed Ali and others from obstructing him in the performance of his duties. An appeal is being preferred to the Federal Court at Lahore against the Chief Court's judgment, but it does not appear likely to succeed, for an act by which a sovereign body is dissolved by an authority external to itself can hardly be legal.

Provisions of the Indian Independence Act, 1947, by which sovereign power was transferred to the Pakistan Constituent Assembly leave no room for any doubt, as Mr Justice Mohammed Baksh pointed out in his concurring judgment, "that the Constituent Assembly was the sovereign body and was not subject to any checks and balances, restraints and restrictions and could make any law it liked, even though it was against the laws of England or the Independence Act." The prerogative to dissolve this body had been given by Section 5 of the Indian Independence Act only to the Assembly itself. Within the Commonwealth, barring England, a legislature cannot be dissolved except in accordance with express provisions contained in the Constitution. Even in England, it is the Prime Minister who advises the Crown to dissolve Parliament, thereby signifying the consent of Parliament to its own dissolution. Also, in the field of the Government of India Act 1935, the Governor-General cannot exercise any power of the Crown unless it is specifically assigned to him. In the light of these principles, it is "unthinkable that the only legislature of the country, which was also a sovereign body under the Independence Act could be dissolved on the principles of justice, equity and good conscience."

If no provisions exist in the Indian Independence Act for the kind of situation that has arisen in Pakistan, it is because the Constituent Assembly was expected to perform its task expeditiously. Pakistan is, in fact, reaping today the consequences of its delay in framing a Constitution, however imperfect. The internal dissension and bickering that has prevented the Constituent Assembly from completing its work has done much harm to the country, and the reinstatement of that body is not, therefore, something over which there can be much enthusiasm, however illegal its dissolution might have been. If the Assembly learns the lesson of recent events and approves a Constitution at an early date, it will mean a definite step forward, as a government functioning on normal constitutional lines is one of Pakistan's first requirements. But this is probably too much to expect in the light of past events.

In an interview this week, Major-General Iskander Mirza is reported to have stated that Pakistan was thinking of introducing the American form of government in the country, "with certain modifications." There may be strength in his argument that the application of the Cabinet form of government over the last seven years has failed in Pakistan, though one may prefer to doubt whether that system has in fact been tried there at all. But his argument in favour of the presidential form is disturbing. Under the American system, he is reported to have said, "the Chief Executive, namely, the President, and his advisers, had a fixed tenure of office and did not depend on the support of various parliamentary groups." The trend of thought suggested by this argument does not augur well for the constitutional or political future of Pakistan.

Chittagong Port

THE plan for the development of the port of Chittagong is being worked out at the Hydraulics Research Station at Wallingford, Berkshire, which will carry out an investigation of the Karnafuli River for the purpose. The Government of Pakistan is being given this assistance under the Technical Co-operation Scheme of the Colombo Plan.

Chittagong is the main port of East Pakistan, and practically the only port. But it has only a very limited capacity. Conditions in the Karnafuli river will need considerable improvement if the port is to expand and to offer adequate facilities for shipping. Until this is done, some of the East Pakistan traffic will still have to be routed through the port of Calcutta.

There are two main problems to be investigated. Firstly, where the Karnafuli River flows into the Bay of Bengal, the depth of water over the outer bar must be increased; and secondly, in the tidal reaches of the river at and immediately above Chittagong, the rapid fluctuation of the channel meanders must be stopped, and the channel position stabilized alongside the shipping jetties.

To study these problems, a large mobile-bed model of the Karnafuli River from the sea to its junction with the Halda River some 20 miles upstream will be constructed at the Wallingford station. Data regarding tides and coastal currents is at present being collected by the port authorities at Chittagong. The design of the model, and of the complex mechanism required to produce and synchronize the tides and coastal currents, is being worked out at the Wallingford Hydraulic Research Station.

Low-Grade Tobacco

NATURE has obviously been as kind to tobacco as it has been to many other crops, i.e., to the point of causing some embarrassment to growers and to others. The pressure of unsold stocks was felt very acutely last year because of the bumper crop of 1952/53 amounting to 240 million lbs after the modest crop of 206 million lbs in 1951/52. The special measures adopted to cope with the situation are believed to have helped to bring about steadier conditions in the tobacco market, so that further increase in the size of the crop in 1953/54 to 256 million lbs, despite a slight decline in the area under cultivation, does not really represent a problem of the magnitude which the latter figure might suggest. The measures adopted were reduction in excise and export duties, drawback on import duty on wrapping tobacco used in the manufacture of cigars for export, and issue of *ad hoc* import licences to those who could find a market for the carry over of the old crop. The last was subject to a number of conditions, one of them being that export of low grades of flue-cured tobacco pertaining to the pre-1954 harvest would have to be effected within a period of four months.

A delegation was also sent out to find a market for surplus stocks in the countries of South-East Asia and as a result of its efforts, an agreement was signed with China for the export of 4.7 million lbs of tobacco from the 1953 crop and 9 million lbs from the 1954 crop. As the export notification giving effect to this agreement was issued only late in October, it is not possible to judge the success of any of these measures from the latest *Accounts Relating to Foreign Trade*, which is for the month of October, though a general improvement in the exports may be noted, export of tobacco for the seven months ending October 1954 being around 55 million lbs compared to 49 million lbs in the same period in the previous year. As exports for the same period in 1952 were higher, being 56 million lbs and this, in a year when the crop was much smaller, the net improvement in the export situation is problematical.

When the crisis was debated last year, the consensus of opinion was that the quality of tobacco had to be improved and that the outlook for non-flue-cured tobacco, in any

case, would continue to remain bleak. The concessions of excise duty announced this week are intended to meet precisely the situation that was anticipated, viz, over production of non-flue-cured tobacco. The excise duty of 6 annas per lb normally leviable has been reduced to one anna per lb on non-flue-cured tobacco from the 1953/54 crop which might be lying with producers on the 5th of this month and which is purchased from them for warehousing or cleared on payment of duty on or after that date.

Monopoly Buying

THE hard core of the problem appears to be the disposal of inferior varieties classified as non-flue-cured tobacco. The importance and significance of this class of tobacco has only lately been appreciated. Even a separate classification for non-flue-cured tobacco in foreign trade statistics is as recent as April last from which month, for the first time, the exports of non-flue-cured tobacco is being specified separately in the monthly *Accounts Relating to the Foreign Trade of India*.

So it is not possible to say from figures of exports, the comparative performance of non-flue-cured as against flue-cured tobaccos. In this category however, production of *biri* tobacco, it is reported, has shown a welcome decline with consequent improvement in the price trend of this particular variety. But there has been no corresponding fall in the production of other varieties of non-flue-cured tobacco. Hence the necessity of relief given in the shape of reduction of excise duty. The press note announcing this reduction emphasises, however, that it is purely temporary and is liable to cancellation at any time when warranted by a change in the conditions. This is presumably to avoid creating an impression that the Government is committed in any way to maintaining the prices of this or any other agricultural produce. The selective assistance that is now being given, however, provides yet another example of price support at work, notwithstanding professions to the contrary, though the acceptance of the principle is only indirect and very general.

Apart from any special distress that might have been caused to any particular group of producers, the marketing of tobacco has some features which need immediate attention and remedial action, if the growers are to be assured a reason-

able price for their produce. The delegation which visited the countries of South East Asia to find a market for unsold stocks drew pointed attention to some of them. In their report, which was never published, they highlighted the serious difficulties encountered by producers and dealers in the marketing of tobacco arising from the practice, increasingly being followed by tobacco importing countries, of channelling their purchases through monopoly organisations.

The delegation had recommended to the Government that an official or non-official organisation should be set up in India, representing all interests, particularly the interests of growers, for negotiating with such monopolies effectively. Is the Ministry of Commerce and Industry reluctant to accept this recommendation and take action on it, lest it be accused of countenancing State trading?

The other suggestions made by this delegation were:

(1) Indian tobacco enjoys certain advantages in the markets of South-East Asia on account of its better quality and comparative cheapness. In order to face competition from USA and Rhodesia, it is necessary that there should be frequent contacts between our exporters and foreign buyers to keep these aspects before the importers.

(2) Arrangements for inspection to ensure that consignments come upto 'Agmark' standard should be tightened.

(3) The quality of Indian tobacco should be improved.

(4) Facility should be provided for issue of Quarantine Certificates to comply with Import Regulations in the country to which tobacco is exported to avoid fumigation at the other end.

It is high time that Government took the public into its confidence and told them what action it has already taken or proposes to take on these points.

World Rice Survey

AFTER being a nightmare for nearly a decade for the whole of monsoon Asia, the world rice situation took a definite turn for the better in 1952/53, better, that is, from the point of view of the consumers. Indeed, the sharp rise in global rice production which continued at an unslackened pace in 1953/54 would have created an even greater problem of disposal,

had not Japan experienced her worst rice harvest in 20 years and India not come to the aid of Burma. While the latest FAO Commodity Report on rice assures the consumers that at least for the next year or two, they need not harbour fears regarding the recurrence of a world wide scarcity, the expert opinion is that both exporting and importing countries should make it a regular practice to hold larger stocks, in order to smoothen out fluctuations, to which the rice crop is more susceptible than most others.

The complete crop estimates for 1954 are not yet available. Burma and Thailand, however, are not expected to have as good a crop as a year ago. Nevertheless, both the countries are likely to have a substantial carry-over, in view of reduced import programmes of the major importing countries. The amount available for export in 1955 is, therefore, expected to be as great as in 1954. Imports on the other hand may show a considerable fall among the countries which have been the major importers during the last few years, India and Indonesia are likely to drop out altogether, Japan has also decided to cut imports, and switch over to wheat and barley to a greater extent than before. The relative prices of rice and other cereals have now become the most important determinant for demand in the rice importing countries and the price ratio, until very recently, was in favour of other cereals. It is only during the last few months that the fall in prices of rice has been sharper than that of competitive cereals.

The easing of the supply situation has made some selective buying possible for the first time in many years. This was reflected in the increasing spread between the prices of higher and lower grades which has been a feature of world markets in 1954 and against this has to be viewed the new export policy of the Government of India. India is, however, following the lead given by Egypt and Pakistan and more of quality rice coming on world markets may halt this spread between higher and lower grades. The spread in India, itself, however will not be narrowed by the latest decision of reducing the export duty of 20 per cent *ad valorem* to a nominal specific duty of 2 as 3 pies per maund.

Pre-War Pattern?

DOES the emergence of India as an exporter of finer qua-

lity rice presage a return to the pre-war pattern when she used to import eight times as much rice as she used to export (annual average of exports for 1934-38 2,160,000 tons and of imports 277,000 tons)? The ceiling for export has been put at 200,000 tons of special high quality rice while 900,000 tons are being exported from Burma under the special agreement. The emergence of selective buying and such cross movements might suggest a return to pre-war pattern but it would be entirely misleading, considering that there is nothing like a world rice market today and none is likely to reappear in the near or foreseeable future. In the largest exporting countries as well as in the main importing ones, decisions regarding the price policy and trade are made by their respective Governments. Among the former, again, Burma has been more sensible and successfully concluded long-term contracts, eg with India, for disposal of stocks, while Thailand has been less successful in adjusting her exports to the changing market situation.

More significant perhaps than the selective buying of finer grades is the unexpected development of new markets for inferior grades. Japanese insistence on importing rice with a high percentage of broken rice, for example, has led to the development of an exclusive market in broken rice. Thailand, similarly, has successfully developed processing of lower grades rice into rice cakes which is finding a market as animal feed. Indeed, as the problem of selling grows, rice is again being used more and more as feeding stuffs for animals.

This may be regretted when population in the rice consuming countries is growing and nutrition standards leave so much to be desired. Some day, some when, rising standards of consumption may lead to a decline in the share of cereals in the diet. When this happens, the growing use of rice as animal feed could be welcome, but not today, when the poorer half of the world is still underfed. It is, therefore, not a little disturbing that so many of the rice consuming countries are being driven to try for self-sufficiency at high cost. Some programme for increasing production and better distribution of rice in monsoon Asia could well be the foremost plank in the councils of the nations of South-East Asia when they meet to discuss the question of closer economic integration between themselves.

From the South

On the Eve of the Andhra Elections

HE would be a bold man who could predict confidently the outcome of the general elections in Andhra which, as these lines are being written, have got off to a start. The elections in this, the newest State in the Union, have a significance far beyond that of the government of a unit in a large federation. Andhra is a test case in a sense for the protagonists of linguistic States as well as for those who hope for or fear the advent of communism in India. The stability and success of the democratic method which that State is able to achieve is bound to influence the decision about further reorganisation of States on a linguistic basis. So far Andhra has, from this point of view, proved a disappointment. In the last 18 months there has been as sorry a spectacle as any, of political manoeuvrings and jockeying for power. It would be recalled that just on the eve of the formation of the State, Shri Prakasam left the Praja Socialist Party. The creation of the Praja wing of this party in this part of the country had been almost wholly his own. His leaving the PSP made the way clear for him to head the ministry in a coalition based largely on Congress support. With the defection of Shri Viswanathan from the PSP, that party was split beyond repair and the youthful P V G Raju (the Raja of Vizianagaram in racing and golf circles!) emerged as its spokesman. The fact of the largest zamindar in the State heading a Socialist Party and even courting arrest on the Inam tenants issue does not seem to have appeared incongruous to the PSP leadership, though the humour of it was not lost on the Andhra public and the propaganda value of it not missed by the Communists. The Krishak Lok Party (KLP), after a trial honeymoon with the coalition when Shri Latchanna was in the ministry, was also split with the defection of Shri Thimma Reddi to the Congress. The contagion of schisms spread even to the Communist Party and some of their able workers, including a few Assembly members, left the party to form a small group of their own; in their case at least it could be said the deserters were not rewarded with the crumbs of office. Thus with the Congress demoralised after the 1952 elections and the KLP and PSP in pieces as a result of defections, despite their good showing at the 1952 elections, the situation

was deteriorating rapidly enough to raise the gorge of the Andhra public—not exactly a patient people. A snap vote on Prohibition ended in defeat for the Government and when on the top of earlier defeats (on the University and High Court issues) the Government still clung to power, a no confidence motion tabled by Shri Latchanna (himself an ex-minister) was carried, supported; it may be added, by an office bearer of the Congress, Shri Sankara Reddi—a former Congress minister in Madras and a PSP nominee in the present election!

The period of Governor's rule has been uneventful—a wag even remarked that in Andhra that was an event—and preparations have gone on for the present elections where over 11 million voters will go to the polls to elect 193 members out of 573 candidates, 3 Congress nominees already having been returned.

The elections in Andhra are of interest for it will be a direct trial of strength between the United Congress Party comprising of the Congress, the KLP and Praja parties on the one side and the Communists on the other. The alliance of the former is basically electoral and it is odd to think that the Praja Party and KLP, both of which were splinter groups from the Congress, are now working with it. The alliance, however, is not without its stresses and strains. That is bound to be so when the original breaks were more on personal grounds rather than on principles. Even among the Congress members there are group, district and caste rivalries; there is also the difference of opinion between those members of the Congress who wanted to 'go it alone' and those who were prepared to go to any length to ensure Communist defeat. While the generous ascribed the motives of the former to a strict adherence to political scruples, the critical discerned an attempt to discredit the leaders of the party responsible for the alliance.

Behind this political jigsaw, there stands out one factor—the elections will probably be decided not so much by economic and political factors but by group loyalties and caste influences. While the United Congress Party (UCP) has been infected, with this view to a considerable extent, even the Communists are not

above it. The Kapus (Reddis) and the Kammars (who sometimes sport the name 'Choudhary') are the two main groups and the division of votes might be decided more on the caste pattern than by economic arguments or political principles. The UCP has generally been careful to select its candidates with this consideration in mind; the Communists, too, have adapted themselves to the social base—their way of saying that generally their candidate is from the major caste group. A notable exception to this is Shri Sundarayya (a Kapu) who is reported to be standing in a constituency which though normally Communist in leanings may not have a Kapu majority. In fact, it would not be wrong to say that this particular constituency would be a pointer to whether caste or other arguments will finally prevail.

This interest has been further heightened by the arrival in Andhra and the campaigning done by the

all-India leaders of both the principal parties. Shri Nehru's popularity in Andhra is not a whit less than elsewhere and even the Communists who have generally been supporting the Nehru line in foreign policy had no answer to the Prime Minister's taunts at them on the one hand and his frequent defences and tribute to India's foreign policy on the other. The Communists have found it a little difficult to tell the Andhra peasant that a vote "for a builder of world peace" is also "a vote for tyranny". Thus the popularity of the Prime Minister and the organisational ability of Shri Patil have strengthened the Congress chances which Shri Dhebar, fresh from Avadi, has done not a little to further. There is, on the more local plane, the still immense popularity of Shri Prakasam and in some of the districts, of Shri Ranga.

The Communists too have brought their important leaders to the election front. Shri Gopalan, Shri Dange, Shri Hiren Mukerjee and Shri Ajay Ghosh have all visited Andhra and addressed innumerable meetings. The importance they attach to the elections is indicated by the fact that some of their top leaders are themselves contesting the elections—Shri Chandra Rajeswara Rao, a Politburo member, Shri Sundarayya, their leader in the Rajya Sabha and other MPs like Shri Vallabha Rao are all in the fray. The main plank of their programme has been radical land reform—5 acres of wet land for all cultivators and a ceiling of 20 acres. Against this, all that the UCP has to show is the Socialistic Pattern of Society—Avadi style, and the bogey of Communist penetration.

A remarkable feature of the Andhra elections is the absence of definite predictions by supporters of either party. True, some leaders, both Congress and Communist, have declared that their parties would win but much of this may be dismissed as part of the usual electioneering propaganda. The most optimistic estimates of both parties put their expectation at 140 seats. While the even balance of strength of both parties may suggest a more or less equal number of seats, one should not be surprised if either of the parties wins an absolute majority and a landslide occurs. The prestige of both the parties are at stake and both have gone all out to force an outright victory.

There is no doubt about it. The issues in Andhra are large—not for the State only, but for the country

as a whole. In the parched plains of Rayalaseema and the fertile deltas of Andhra's three rivers, the issue between Communists and the Congress ideology is being fought out in the polling booths and should the Communists win, it would perhaps be the very first time they do so

anywhere in the world through the medium of free elections conducted with all due regard to the democratic process. If they did, it would be history and the Red Star that would rise over Andhra would be watched—with interest by all and with anxiety by a great many.

NEW INDIA STORIES FROM LIFE

'My good turn helped me most'

MY FRIEND'S son came to sell me insurance. My business was doing well, and I thought I did not need any. But the boy was so young and enthusiastic, that just to encourage him and please his father, I agreed to take out a policy.

Some years later, business slackened and everything I touched seemed to fail. My business took some hard knocks; and my partner got too ill to share my problems. I had to reorganise, but where was the necessary capital to come from? The only solution was to sell our house—and it was my wife's pride and joy.

Then my young friend dropped in to remind me that my New India Endowment Assurance policy would mature shortly. What a wonderful relief! I would get the money I sorely needed at exactly the right time.

I thought I had obliged a friend—actually he had helped me!

An insurance policy, taken out now, may one day stand between you and disaster. For full information write to

Mahatma Gandhi Road, Bombay 1.

Anatomy of Unemployment

BENGALIS are supposed to be idle. They are accused of being *adda*-addicts. It is grudgingly conceded that they are educated. But they have an over-fondness for a liberal, classical system of education. Many decades ago, they developed a preference for science. Even in arts, economics and mathematics are now a more common combination for graduates. Engineering colleges and institutions are now better patronised. Still, Bengalis are supposed to waste their time, energy and money to become lawyers, or doctors, or professors.

This educational make-up is supposed to have a social basis. Bengal is the home of permanent settlement. Every Bengali is supposed to be a zamindar, or a holder of one of the numerous intermediary rights to land. Bengal's life, society and civilization is supposed to be land-based. Bengal, it is concluded, has all the characteristics of an agricultural civilization. That is why Bengal has culture. But that is also why Bengal, it is presumed, reflects the economics of the leisure class.

HALF TRUTHS

Today, these assumptions and conclusions have become half-truths. Because the changed, and changing, socio-economic make-up is not widely realised, many who take upon themselves the task of interpreting Bengal jump to false conclusions. There are many angles from which one can look at the overall picture. An interesting sidelight is provided by the Report on the Survey of Unemployment in West Bengal, 1953, Volume II, Part I.

West Bengal is not a predominantly agricultural State. It is still the most industrialised State in India. It is, therefore, inevitable that a survey on the unemployment situation in West Bengal will disclose characteristics which have no relation to an agricultural economy. Some of the social and economic changes in West Bengal, as revealed in the unemployment survey, reflect the inevitable effects of partition. But the changes could not have occurred within a few years, or even a decade. Unbeknown to many, the former, undivided Bengal's socio-economy has been under-

going a process of change for many decades.

Adda is still a popular institution in Calcutta. In cafes, coffee houses, book clubs, book shops, hotels and homes, people group together to gossip about men and affairs. But the Bengali does not seem to be any longer idle. He likes to have and enjoy his leisure. Gossip on art, on life, on politics, on society, is still one of his major pastimes. But he works hard. There are obvious reasons why he has got to get a job, and keep it.

AN URBAN STATE

It is a mistaken impression that every Bengali has some land somewhere in a village, where he can take shelter after he has discovered that he cannot get a job so easily. This is what is supposed to make the Bengali shy of manual labour, even as this is the customary explanation in text-books of Indian Economics for labour absenteeism and irresponsibility. This is, as the unemployment survey discloses, an economic myth. Of all the families living in Calcutta, 95.1 per cent own no agricultural land in the State.

Undivided Bengal was not urban. West Bengal is predominantly so. It is, today, the most urbanised State in India. This is only to be expected, as it is also the most industrialised State. Partition has automatically transformed the economic make-up of West Bengal. It is known that one of the reasons why the displaced persons cannot be absorbed is paucity of land. The unemployment survey is a poignant reminder of the industrial make-up of West Bengal, and of the dismal effects of this make-up.

A MIDDLE-CLASS RACE

Even in former, undivided Bengal, the middle-class predominated. The Bengali was, and is, educated. He had, and has, no land. He never was a farm labourer. He did not, and does not, own industry. So, the educated Bengali had to become a lawyer, a doctor, an engineer, or a clerk. The Bengalis became, and are, a race of the middle-class. Fifty-five per cent of Calcutta's inhabitants belong to the middle-class. This is not surprising.

But the other facts disclosed in the unemployment survey should lead to a re-assessment of Bengal and the Bengali.

Certain data, included in the survey, are revealing. Forty-five per cent of Calcutta's inhabitants belong to the working class. There is a large proportion of the non-Bengali element in Calcutta's industrial labour force. Even so, there are growing indications that the Bengali is increasingly becoming a manual or a skilled labourer. There are 378,400 persons seeking jobs. Of this number, 215,200 have no jobs. Others are either fully employed or partly employed.

GROWING PROLETARIAT

It is customary to argue that there is unemployment among Bengalis because they dislike manual labour, or do not have technical education to become skilled workers. Figures belie these impressions. Some 227,000 full-time employment seekers are willing to do manual work. 130,000 want skilled manual work. 71,400 possess some technical qualification, although the majority have no degree or diploma. Of the 130,000 who want skilled manual work, the preponderating majority are Bengalis. Almost all of the 71,400 persons who have some technical qualification are Bengalis.

Two facts emerge out of these figures. The Bengali has become polytechnic-conscious. But, as it happens in many spheres in Bengal, even skilled or semi-skilled labour is an over-crowded profession. Evidently, therefore, the remedy is not to have more secondary technical schools. It would be better to have fewer, but more organised polytechnics. It would be better still to have an organisation to supervise employment of the students coming out of the polytechnics in small, medium and large-scale industries.

This and the problem of "refugees" should be considered together. 20.6 per cent of Calcutta's population are displaced persons. They constitute 29 per cent of the people of West Bengal domicile who have no full-time employment, and who seek such employment. 71.5 per cent of them belong to the middle class, 28.5 per cent to the working class. It should be the

responsibility of the State to absorb the working-class population of "refugees" as manual workers, and to induce a large percentage of the middle-class population of "refugees" to become semi-skilled or skilled workers.

And, the overall problem of providing employment to those who seek manual or skilled work should be to so arrange future development of small and medium-sized industries as to facilitate such absorption. Although the rehabilitation programme involves such a plan, the West Bengal Government's scheme to provide proper secondary vocational education has yet to be finalised.

COSTLY EDUCATION

Some of the facts which unemployment figures disclose will be discussed on later occasions. Here, it is interesting to analyse the educational qualification of those who seek jobs. One-seventh of those who want jobs are illiterate; 227,000

are under-matriculantes; 17,000 are above matriculation standard, but not graduates; 15,400 are graduates. This raises the problem of the system of education. It may be faulty. But the technical or semi-technical qualification of those who seek jobs, as disclosed in the survey, indicates that the remedy does not necessarily lie in introducing a vocational bias to education.

The Bengali is over-educated. It is inevitable that unemployment will be most acute in the graduate or the post-graduate group. Nobody has yet discussed a solution to the problems of this group. Yet, it is this group which reflects a dismal aspect of Bengali society. Parents starve or stint themselves to educate their sons and daughters, only to find that the sons cannot secure jobs. This is impoverishing Bengali society. The joint Hindu family system may have delayed a social or a political revolution. But it is being postponed at the cost of pauperising Bengal and the Bengali. Nature is having her revenge.

From the London End

Formosa: The Legal Twist

THE American "two-China" solution to the Far Eastern crisis has become the subject of not inconsiderable debate in Britain—and this is not unexpected. The gravity of the problem and the threat it holds to peace is widely recognised. The trans-Atlantic pressure on British policy on this question, however, has led the Government and its apologists to take a stand that smacks of such unwholesome legalism as to suggest a virtual abandonment of all political morality. And it is political morality that is necessary above all for the real solution of the dispute.

The "cease-fire" resolution which the Chinese have been asked to accept conjures up the consequences of all those other cease fires which have been effected in the post-war years to solve international disputes. The Korean and the Indo-Chinese cease-fires have resulted in the *de facto* division of each of these countries: a North and South Korea, and a North and South Vietnam. Cease-fires have therefore come to be associated with territorial divisions—a solution which is the effect of war. The link between the New Zealand "cease-fire" proposal in the Formosa dispute and the United States

"two-China" solution is therefore clear.

The legal status of Formosa has consequently become very important. It is therefore worth examining the legal arguments so far advanced.

Formosa, it is stated, was ceded to Japan by the Peace Treaty of Shimonoseki of April 1895. The validity of this cession cannot be disputed in law. It is then stated that the Cairo Declaration of 1943 referred to Formosa as "stolen from the Chinese". This is interpreted as a mere moral condemnation of the 1895 Treaty, but that hardly affected the contractual content of the Treaty.

With regard to that part of the Cairo Declaration which provided that Formosa was to be restored to China, it is pointed out that this was, as Sir Winston Churchill put it recently, "a mere expression of common purpose" and not a binding legal commitment. This "common purpose" as an intention was reaffirmed in the Potsdam Declaration of August 1945.

The acceptance by Japan of the Potsdam Declaration and of unconditional surrender left the legal status of Formosa to be defined by the Allied Powers. The argument then

goes on that, by virtue of Article 2 of the Treaty of Peace (of San Francisco) signed in 1951, Japan renounced "all right, title and claim to Formosa". This meant that, in relation to Japan, Formosa ceased to be Japanese territory, and the other parties to the peace treaty had become the co-sovereigns of Formosa.

From this position, it is argued, General Chiang Kai-shek exercises only a delegated authority in Formosa, on behalf of those parties to the peace treaty of San Francisco who recognise his government either as that of China or at least in relation to Formosa. These states are, therefore, free agents to decide collectively the future of this territory.

These arguments have, of course, an air of legality: they all stem from the thesis that the only binding contract in international law is that which is arrived at by treaty. The conclusions of these arguments, however, bear all the signs of fantasy. It is almost impossible to understand how Chiang Kai-shek possesses a 'delegated authority' over Formosa, especially after he was driven off the mainland and the way he has been protected since then by the US Seventh Fleet. There is no clause in the San Francisco Peace Treaty which supports the Chiang Kai-shek occupation. Furthermore, the Soviet Union and China are not parties to the San Francisco Treaty; these two were parties to the Potsdam Declaration.

More important than all this is the way in which the Cairo Declaration is thrown overboard. The Declaration was that "all the territories Japan has stolen from the Chinese such as Manchuria, Formosa and the Pescadores shall be returned to the Republic of China". This is surely a little more imperative and unqualified than a mere declaration of purpose. If, however, it was merely "an expression of common purpose", then what of Manchuria, which significantly stands in juxtaposition to Formosa in the Declaration? Today there is no ambiguity about the status of Manchuria, and the parties to the San Francisco Treaty of Peace do not claim to be free agents to decide collectively on the future of Manchuria as they claim to be on the future of Formosa.

The fact of the matter is that there would have been no dispute about the status of Formosa had Chiang Kai-shek not been thrown out of the Chinese mainland, and had the Americans not decided to give him sanctuary on that island.

New Horizons

Report on the Atom by Gordon Dean, formerly Chairman, US Atomic Energy Commission. Alfred A Knopf, New York. Pp 321. Price \$ 5.

Reviewed by Reba Chaudhury

IN the words of the author, his is "an attempt to describe in straightforward and simple terms the major segments of the atomic energy programme of the United States." Having been Chairman of the US Atomic Energy Commission, the author is in a peculiarly advantageous position to describe the atomic energy programme of the USA. The book is meant for the common man, and on going through it, we feel that the labour of the author is justified. In plain and simple words, he has succeeded in describing, without divulging top secrets, the entire atomic energy programme of the USA.

Most people learnt of the American atomic energy programme on August 6, 1945, when President Truman announced to the people of USA and the world, "sixteen hours ago an American air-plane dropped one bomb on Hiroshima, an important Japanese army base. That bomb had more power than 20,000 tons of TNT. . . . It is an atomic bomb. . . . The force from which the sun draws its power has been loosed against those who brought war to the Far East." Its fierce flash illumined in stark outline the hopes and fears of mankind for the future; and its towering radio-active cloud is still hanging like a huge question-mark over the efforts of those who are striving to establish a permanent code of international morality. During the period immediately following Hiroshima and Nagasaki, there appeared in the press of the world many moving expressions of fact and fallacy about atomic energy which persist even to this day. The author says that Man crossed at that moment the threshold into the atomic age: proudly, yet humbly; hopefully, yet fearfully; confidently, yet questioningly. The *London Observer* posed the question, "Where, indeed, do we go from here?" Everybody wanted to know "What does the USA plan to do with the bomb?"

FIRST STEPS

In August 1939, a group of Euro-

pean refugee scientists living in the USA recognised the military possibilities of atomic energy and tried to interest the American Government in atomic energy programme. In June 1940, the USA initiated a small integrated atomic research programme. From this point up to Pearl Harbour the USA spent \$300,000 on atomic energy.

To determine the USA's domestic policy for the control, use and development of atomic energy, a five-man Atomic Energy Commission was appointed by the President under the Atomic Energy Act of 1946. To encourage and assist the Commission, to see that it exercised its great power prudently and wisely, a joint Congressional Committee on atomic energy was established. America's approach to post-war atom problems was defined on the home front. Meanwhile, the American position on the international front too had been set; and by the middle of 1946, an Atomic Energy Commission has been established in the United Nations and an American plan for international control developed and proposed to this Commission. This plan, like the domestic plan, relied on direct management as the only really effective means of control. The Russians considered such a plan to be an unwarranted encroachment on their national sovereignty.

Man's quest for uranium had already started. "Uranium is where you find it." The atomic energy production line embraces myriad industrial processes, ranging from simple and straightforward operations such as the grinding and crushing of ore to the transmutation of elements. What is wanted for a bomb is fissionable material which uranium can be made to produce. Uranium is available in two forms, namely, Uranium-235 and Uranium-238. The problem is to get uranium-235 which occurs in nature very sparingly.

NUCLEAR PROCESS

The process by which the transmutation of uranium is accomplished is unique in industry. It is not

a chemical process like the burning of coal or manufacture of synthetic rubber. "It is a nuclear process and takes place in a huge box-shaped pile of graphite and uranium which is several stories high and is known as a nuclear reactor."

The reaction which occurs in a nuclear reactor differs from a chemical reaction in that it involves not large particles of matter like molecules and the outer shells of atoms, but rather the hard, unimaginably minute inner core of an atom known as the nucleus, around which the outer particles revolve as planets round the sun.

Most people have no conception of how much the USA Atomic Energy Programme has grown in the last 6 years. Some idea can be had by comparing today's \$5,000,000,000 capital investment in atomic energy with \$1,400,000,000 of 1947.

There has probably been more talk about atomic weapons than about other aspects of the subject, and yet, there is probably less real understanding of what atomic weapons are, what they can do and how they affect us than there is about any other matter relating to the atomic energy programme.

In his final State of the Union message on January 7, 1953, President Truman said, "And recently in the thermo-nuclear tests at Eniwetok, we have entered another stage in the world-shaking development of atomic energy. From now on man moves into a new era of destructive power, capable of creating explosions of a new order of magnitude, dwarfing the mushroom clouds of Hiroshima and Nagasaki." The hydrogen bomb is a new factor in our atomic military equation.

There is one practical limitation on the destructive effects that can be attained on earth by explosions. This is due to the fact that the main force of any explosion travels in the line of least resistance. For a bomb explosion, this line is upward into the atmosphere. Another small ray of hope stems from the fact that the radius of the blast

damage for any kind of explosion increases at a much smaller rate than the one at which the power of explosion is raised.

GLOOMY SIDE

On the gloomy side is the fact that the hydrogen bomb can be deliberately filled with certain materials capable of being made highly radio-active by the explosion, and disseminated by it into the atmosphere and over the surface of the earth for thousands of miles in the direction of the wind.

It has been learnt from post-war tests and calculations that the area of damage resulting from an A-bomb explosion is substantially reduced in the case of underground or under-water detonations and that the lethal effect or residual radio-activity is substantially increased.

One of the basic principles of America's Atomic Energy Act of 1946 is that atomic energy should be under civilian control, and that there should be adequate opportunity for the military to follow closely, and participate in, those phases of atomic energy development which relate to military applications.

Besides being descriptive, the book also discusses many human and social problems connected with the development of atomic fission. After giving readers an insight into the military aspects of the atom, the author illustrates some possible peaceful uses to which nuclear energy can be harnessed. Probably, the most widely-discussed subject in atomic energy after "The Bomb" is "atomic power". The expression "atomic power", when used in connection with the peaceful utilisation of the atom, usually means 'heat'. Most of the energy released in a controlled nuclear chain reaction appears in the form of heat like the energy in, say, a coal fire which is a chemical chain reaction. In other words, the phrase "atomic power" is used in much the same way as "coal power" or "oil power", that is, the atom is the fuel and not something that is sent over a transmission line like electricity.

However, there are a number of striking differences:

(1) The quantity of heat produced per unit weight of fuel is vastly greater in a nuclear fire than in a chemical one. For example, 1 lb

of U-235, if burnt in a nuclear way, will release 2,600,000 times the amount of heat produced in burning 1 lb of coal.

(2) A chemical fire can exist only in an atmosphere in which oxygen is present, while a nuclear fire exists only in an atmosphere made up of incredibly small invisible atomic fragments called neutrons. A nuclear fire feeds on neutrons. But neutrons not only induce fission; they are themselves produced by the fission process. Thus a nuclear fire creates in itself the means of its continuance.

(3) A nuclear fire, unlike a chemical fire, is invisible.

(4) Unlike a chemical fire, a nuclear fire cannot be ignited until a certain minimum amount of fuel called a "critical mass" has been assembled.

In the USA, attempts are being made to produce nuclear reactors to propel submarine aircraft and large ships.

ATTAINMENT OF NUCLEAR POWER

The attainment of economically competitive nuclear power is a goal of national importance. Reactor technology has progressed to the point where realisation of the goal seems achievable in the foreseeable future.

There are certain valuable by-products of the atomic energy programme called "Radio isotopes". "Radio isotopes" have found varied uses in the diagnosis and treatment of cancer as well as of other diseases and in dealing with hyper-thyroidism and brain tumours. One of the most valuable uses of "Radio isotopes" is in gaining an understanding of the life processes of plants, animals and human beings. A very important characteristic of nuclear radiation is that it can cause sterility in animals and plants, and this fact is behind the novel use of "Radio isotopes" to control insect pests. Radio isotopes can also be used in: (1) Thickness Gauges; (2) radiography; (3) leak location; (4) tracing the flow of liquids through pipelines; and (5) safety devices.

The simplest atom in existence is that of hydrogen, which consists of but one proton as nucleus and one electron planet. The biggest and most complicated atom in nature is that of the ordinary uranium metal, which contains 92 protons and 146 neutrons bound tightly together in

the nucleus.

Most of the research into the nature of atomic nuclei is done with cosmic rays or with giant atom-smashing machines like Van de Graff generators, linear accelerators, cyclotrons, synchrotrons, betatons, cosmotrons and bevatrons. However, there is much more to the endeavour to learn about fission and to put it to work than the development of weapons and power reactors. Behind these programmes, and in support of them, literally thousands of research projects in physics, chemistry, metallurgy, biology and medicine are under way in Government laboratories, universities, and private research institutions in all parts of the country. Of all the aspects of atomic energy research, the one with perhaps the most direct effect on mankind is that of biology and medicine.

Scientists have identified the electron, the proton, the neutron and more recently, the meson. But they are still groping on the fringe of nuclear physics and its related sciences. "In the field of nuclear physics and its related sciences, we are in an area which is largely unknown, unexplored and amazingly devoid of basic information. It is incredible, but true, that much of the atomic energy programme is devoted to splitting atoms and reaping the products thereof for bombs. Yet we know very little of the nucleus of the atom we split. With all our atom-smashing paraphernalia, we have never really smashed the atom!"

BOGEY OF SECRECY

The author has also pointed out that much hush-hush about the subject is not of much practical value. As a matter of fact, we have learnt very little of the secrets of the atom and there is much which others could learn with a little bit of intelligence, perseverance and resource. Finally, the author poses the question as to whether we are doing more harm to the development of atomic science by our hush-hush attitude than we are doing good to the world by keeping our knowledge of the nucleus of the atom to ourselves only. It is admitted by everybody that all the major nations of the world have already gained access to atomic knowledge, independently of others, and as such, one has still to be convinced of the need for a bogey of secrecy in this field.

Private Agencies and Agricultural Credit

Mahesh Chand

WHAT would happen to the future of group activities if we cannot have trust and faith in individual character and initiative? In the ultimate analysis, group activities are also managed by individuals and what would happen to financing of agriculture, if no role can be left for private agencies in agricultural credit? It is easy to argue that you are likely to be less usurious if you sit together, with others over the management of what does not in the main belong to you; in other words that you are capable of managing other people's money with greater efficiency and sincerity and that when it is your own money, you are apt to be rapacious and dishonest. And this in the face of overdues in co-operatives, less patronage of the co-operatives by the borrowers as a class, red tape and inadequacy of loans sanctioned as Tacavvi!

During the discussions held on the role of private agencies in agricultural credit at the last Conference of the Indian Society of Agricultural Economics held in Allahabad, a speaker distinguished between the creditworthy and the non-creditworthy and maintained that so far as the non-creditworthy are concerned, the financing agency has either to be rapacious or bear the losses. It was suggested that private agencies should be diverted to finance the creditworthy and that institutional credit should be provided for the non-creditworthy. This implies that low rates of interest, uncertain period of repayment and bad debts are features most suited to institutional credit. But what shall be the source of funds of institutional credit? Surely, individuals will not risk their savings for such an enterprise.

STATE FUNDS

The funds, therefore, will have to come from the Government. Logic leads one to conclude that if the funds belong to the State, the risks and the losses will have to be borne by the taxpayers in particular and the community in general. So the State will have to provide the funds which will be distributed through institutions managed by individuals. This can mean either of two things. Either State funds are to be made available to the existing institutions such as co-operative societies, or new institutions—State

Corporations—should be established for the purpose.

At this stage the expression 'private agency' is interpreted to mean individual moneylenders (and bankers). The individual moneylenders may be regular moneylenders or casual moneylenders. Among regular moneylenders, some may be undertaking the function as their main occupation or as subsidiary occupation. They may belong to different economic status. A distinction of importance is that some of them are sincere and honest, who would be satisfied by an assured repayment of principal and a reasonable rate of interest; others are inclined to use unfair means to increase the rate of return on money lent out.

FOR THE CREDITWORTHY

Even if the private agency were diverted to finance the creditworthy borrowers, it would not stop the use of unfair means by the unscrupulous. What is therefore of greater significance is a suggestion that the private agency may be diverted to finance the educated borrowers. Education is the answer to the unfair means adopted by the private agencies. An educated man is bound to keep an account of his borrowings and repayments as also argue with the moneylender. Surveys should be made about borrowings made by the educated from private agencies. Moneylenders who are bent on extorting an unduly high rate of interest either refuse to lend to the educated or ask for a higher return openly. If all become educated, moneylenders will be compelled by circumstances to maintain proper accounts and issue receipts. They would find it difficult to adopt unfair means.

Borrowers, according to us, should be divided into four categories:

1. Educated and creditworthy.
2. Educated but not-creditworthy.
3. Not educated but creditworthy, and
4. Not educated and not creditworthy.

One would like to gather facts about how those who borrow from moneylenders are distributed in the four categories and what proportion of the borrowers in each category borrow from moneylenders. However, the educated and creditworthy may be organised into co-operative societies. If in any area the educated and the creditworthy do not want to

join an existing co-operative society, one important reason may be the undesirable features of the society and these should be removed. The not-educated but creditworthy may either be diverted to a good co-operative society or to honest private moneylenders. The non-creditworthy who are educated may be served at a higher rate of interest by the private agencies or the co-operatives. The last category should be given subsidies and rehabilitated at State cost. The educated belonging to this category should be diverted to some other occupation or provided with subsidiary occupation.

THE CRITERIA

In the above analysis an attempt has been made to distinguish the borrowers into four classes. The criteria of creditworthiness is not merely that one has land or property but also that one is honest and well-meaning. Even these people may be dubbed not-creditworthy by some, on the ground that the use of funds by them does not prove productive because the use they make of funds coming to their hands is based on miscalculations arising out of inexperience. If so, they need proper technical and market guidance. In fact, it is implied that all borrowers are honest and well-meaning, no matter to which of the four categories they belong.

But there may be borrowers who are creditworthy yet dishonest or unscrupulous. It is at times difficult to judge this beforehand and it is possible that expectations of honesty may be belied. There must therefore be a summary and less costly method of giving relief to honest moneylenders, so that they may realise their loans quickly from unscrupulous borrowers. The present system of justice does not ensure this as the proceedings are protracted and cumbrous.

DIVERSION AWAY FROM AGRICULTURE

It is likely, as some of the speakers at the Conference maintained, that with the large developmental and irrigational activities being undertaken in the country, the productivity of land and hence, of each earner, may so increase that both the moneylenders and co-operatives would be willing to serve those who require finance. Even so, it is not unlikely that in the face of multifarious legislation in force restricting

their activities, the private agencies may shift themselves to the financing of other economic activities or to other occupations. There are some indications of this already happening to the extent that there is no scope for secret dealings. This tendency would intensify as education spreads, if the majority of moneylenders are unscrupulous. In the circumstance, if we want adequate financing arrangements for agriculture, an alternative agency must be speedily built up. Also, since these other lines are likely to be in urban areas, there will be need for diverting urban funds to rural areas.

It is desirable that the predominant agency of agricultural credit now existing should continue to perform that function. For it has behind it experience of the 'trade'. Hence, in order to give them facilities of funds, can the moneylenders be institutionalised? The Reserve Bank may announce the facilities that it would give to certain type of institutions of moneylenders and see whether such institutions come up or not. In view of the sparse distribution of the moneylenders and the secrecy which they want to maintain with regard to their financial position, institutions of moneylenders are less likely to develop.

The points that emerge from this note may be summarised as follows: (1) people should be educated, (2) the institution of private agency must not be allowed to die out, and (3) credit-facilities should be announced for specific types of institutions of private agencies.

II

At this stage it is interesting to examine what the Rural Credit Survey Report says. In its eyes, private credit is not generally unsatisfactory but wholly unsuitable in the context of planning for larger production. Also, institutional credit other than co-operative tends to confine itself to bigger cultivators. Hence "the foremost objective of policy becomes the positive and deliberate operation of conditions in which co-operative credit will have a reasonable chance of success."

In the scheme proposed in the Report, no place is assigned to private credit though the hope is expressed that it will supplement the scheme and that in this it will be assisted by the proposed network of godowns and warehouses.

In order to appreciate—rather, judge coolly—the treatment recommended for private credit, it is necessary to mention some details of the

scheme proposed in the Report.

The first objective of the policy envisaged in the Report is to remedy the internal weakness and rectify the external maladjustments of the rural structure. Credit must be conjuncted with marketing, processing and allied economic activities in the co-operative societies. Bigger units and optimum conditions are necessary, and in addition, in any case, strength enough to withstand the competition from private sector including private trade.

The Reserve Bank is to create a National Agricultural Credit (long-term operations) Fund and a National Agricultural Credit (stabilisation) Fund. Money is to be lent out of these funds, as also otherwise, in the shape of purchase-price for mortgage debentures and short-term accommodation. The Ministry of Agriculture is to create a National Agricultural Credit (Relief and Guarantee) Fund, which may otherwise be termed a bad-debt fund. The State Governments are also to provide funds directly to the provincial co-operatives and indirectly down to the primary co-operatives, either out of borrowings from the Reserve Bank or otherwise. The Government of India and the Reserve Bank are also to provide funds for an Integration and Development Fund to be created within the proposed State Bank of India, which *inter alia* shall open branches, even at a loss, provide better remittance facilities to the co-operatives and, perhaps, hold the cash of the co-operative societies.

DIVERSION OF SAVINGS TO RURAL AREAS

Rural savings must be left in rural areas, and urban savings must be diverted to the rural areas. What has been said in the preceding paragraph also amounts to, and implies that urban purchasing power should be diverted to rural areas through monetary and fiscal measures.

Thus funds would flow in plenty, and for the asking, to the co-operatives, and co-operators are expected to dispense them freely to the right people—the medium and small cultivators, particularly—in right form and quantity, and at the right time. Loans shall be preferably in kind, related to (hence in practice sufficient to meet) the subsistence needs and estimated outlay on production and against anticipated crops—not against existing titles. There is a contradiction in loans being related to 'needs' and to anticipated crops.

There shall be State audit, supervision by apex and central banks,

and provision of trained personnel for the key posts in the co-operatives, either from cadres instituted by State co-operative banks or the State itself. The Central Committee for Co-operative Training is to organize regional centres and courses for senior and subordinate personnel, particularly bearing in mind the need to train a new type of official who will be responsive to rural needs.

TO WHOM THE ALLEGIANCE?

Here looms up the real bottleneck. To whom shall these personnel owe their allegiance? Since they shall be fixed-salary staff, shall they have incentive enough to work in the interest of the society and not in their own interest? Will it be easy to trace hands who will be responsive to rural needs? Whose voice shall prevail—the voice of the technical personnel, of the State or of the members of the managing committee? With funds flowing in freely—funds not belonging to themselves—and with arrangements for bad debts in the form of Agricultural Credit (Relief and Guarantee) Funds, what is the certainty that our villagers shall not share the funds without the keenness to repay the loans quickly and punctually?

None is against the development of the co-operative spirit, but it would be too much to vote for it by decrying private action and private credit. Incidentally, although the Report has apparently left little place for private credit, one should like to read this passage twice—"to the extent they exist, rural savings are most likely to be made available where they are most useful for rural needs" and ask oneself, "Will these rural savings be made available through the co-operatives or through private lending?"

Let us hope that in its haste for co-operatives and cottage industries, the Government will not forget to promote and protect honest private credit. Let us not forget that under planning for a mixed economy—even if we call it to be of a socialistic pattern—private credit does not play an unimportant role and cannot be ignored. It would be wrong to assert that private credit has not played a rôle in the industrial sector. In the agricultural sector, it is too much to terrorise and scare away private credit by negative legislation and then expect it to play a scheduled rôle. In view of our doubt regarding an appropriate rapid expansion of co-operatives and their efficiency, private credit must be treated in a more realistic manner and given a more positive rôle.

New Villages in Malaya

(From Our Malaya Correspondent)

IN a recent court case reported in the Penang newspapers, a junior Malay policeman was charged with receiving a bribe from a Chinese in a new village. The Chinese came back after the gates were closed and the Malay guard, it was alleged, told him that if he gave this policeman \$10, he would let him through the gates even though it was after hours. The Chinese subsequently complained to the senior police official but the Malay guard was acquitted on the ground that there was no NCO in charge of the police post and the evidence was insufficient. Whether this charge is true or not, it serves to illustrate the sort of difficulties which those in new villages have to face. In a new village, the villagers always feel that at any moment their intimate private concerns may be thrown open to public gaze by some form of investigation in which they are not directly implicated. It is certainly true that in the early days of the resettlement of Chinese into villages surrounded by barbed wires and bright lights, the purpose was that of defence against the Communist terrorists. Feelings such as this were not to stand in the way of adequate defence measures. But that this aim in itself was not sufficient was early realised by the Government although the first comprehensive directive laying down Government policy was not issued until May 18, 1953 by which time the settlement policy in the Federation had crystallised and thoughts were being given to the next step.

GOVERNMENT DIRECTIVE

The directive was that a new village can be considered as properly settled when the situation is as follows:

1. The provision of at least a modicum of agricultural land preferably just outside the wire, though in any case close at hand, for the agricultural population of the village.
2. A reasonably adequate water supply.
3. A Village Committee, or preferably a Village Council, which functions reasonably well.
4. A reasonably friendly and co-operative feeling in the village towards the Government.
5. A school to accommodate at least the vast majority of the children and adequate teachers'

quarters.

6. A village community centre.
7. A reasonably flourishing Home Guard, ie, one that has at least reached stage 3 as defined in Director of Operations' Instructions No 9 dated August 14, 1952 with an adequate village defence scheme and proper arrangements for the security of arms and ammunition.
8. Long-term land titles covering house plots and agricultural holdings.
9. Efficient perimeter wire illuminated at night in the case of Priority A villages. In these latter cases, the inhabitants should be given a chance of having their own electric light in their houses at a fixed charge.
10. Beginnings of certain activities such as Scouts, Guides, Cubs, Red Cross, etc.
11. A reasonably friendly relationship between the police and the inhabitants.
12. A place or places of worship.
13. Trees along the main streets and round the padang and school.
14. Roads of passable standard with side drains.
15. Reasonable conditions of sanitation and public health.

From this directive it can be seen that the Government was not ambitious but that its aims were fairly reasonable and possible of attainment. After all there are many villages in India which have not yet come up to this standard. But when one actually looks at the new villages themselves, one can see that, because the Government did not put these aims in the forefront at the beginning but allowed other factors to intervene, many of the new villages are bound to disappear as soon as Government pressure is relaxed.

Before going into some of these factors, it is necessary to remember that the territory of Malaya is so varied that what may apply in one district may not apply to the adjoining district. Malayan villages fall under four broad types.

SUBURBAN TYPE

Those villages which are close to large towns and where the inhabitants travel to work in the town every

day. This is especially true of many of the new villages about Kuala Lumpur. In these villages there are a large number of professional people who were only too glad to move out of the overcrowded towns and take advantage of the loans on easy terms for building houses and of the community services. These new villages are already suburbs, there is no dearth of leadership and in most of them there are already no guards nor even home guards and they are becoming what in reality they are, city suburbs.

HOMOGENEOUS TYPE

Settlers who were united in occupation, religion and language before the emergency but who were made to live together for purposes of defence. One such village is in the Dindings, consisting of people all of whom came from the same part of Fukien late in the last century. This particular village has been burnt to the ground twice by the Communist terrorists but it still retains its unity and traditions. I do not pretend that all such villages will co-operate with the Government as this village has done, but the point is that whatever the village does, it will do it together and retain its identity. I should estimate that about 10 per cent of the rural new villages are of this type. Some of the tobacco villages of the Grik Valley are of this type also.

MIXED TYPE

Villages in which all the inhabitants undertake the same occupation but are otherwise divided among themselves, as they come from different districts and do not often speak the same language. In a small number of these new villages there are Indians and Malays who have been put behind the wire with the Chinese. The majority of the villages in the area south of Ipoh in the Kinta tin mining district are of this mixed type. Although most of the tin miners are Hakkas, this is not always the case and, of the villages I visited, there were few in which I could speak to all the inhabitants.

HOW NOT TO DO IT

These areas provide a good example of the Government's failure to put first things first. The rules about settling Chinese in this area were that no villages could be built near the forests where the Communists could get at the villagers, no

"Gentlemen! we are all agreed..."

...that the advice and technical service rendered by Burmah-Shell during the past financial year, has been instrumental in reducing our operating costs and has, in some specific instances, actually cut our lubrication overheads..."
(loud and prolonged cheers!)

The fact is that Burmah-Shell have the experience and the trained technical staff to deal with any lubrication problem of any size. We can detect weak spots in your plant before they become trouble spots.

So if you have any lubrication problems on your mind, ring up your nearest Burmah-Shell office. They will send one of their technical representatives round to see you without delay. Their advice is freely given (which will draw murmurs of approval from your Chairman!) and you'll find that they are very sound people to deal with.

BURMAH-SHELL...
IN INDIA'S LIFE AND
EVERY MOVING
PART OF IT

villages were to be built on any land which at that time or in the future were likely to be used for tin mining (which is of the surface variety requiring dredges) and no villages were to be built on land already used for agriculture or rubber if it could possibly be avoided. The result of this is that most of the villages are built on tin tailings which are almost uncultivable. Even the Chinese who work the tin mines, were also farmers. One goes to village after village in which the land surrounding the village allegedly for agricultural purposes is bare and untended. Tin mines now employ fewer people than when the price of tin was high and as the tin mines are continually shifting, many of the inhabitants are out of work or turn up late on account of the long distance they have to cycle to work after the gates are opened at 6-30. All these combined with the lack of community feeling make these villages depressing places to visit. I visited three of these villages at random and found in each case that the majority of members of the village committee were shopkeepers, the one group which has voluntarily moved into new villages for purposes of trade. From their point of view, of course, the coming together of the Chinese in these villages has been a godsend.

Other villages of this type are those which make a living from small holdings in rubber or pineapple cultivation. In the case of the rubber plantations, the price of rubber has, until recently, been too low for smallholders and owing to the fact that they all live together, it is difficult to supplement their income from pigs and vegetables. The Government has put restrictions on keeping pigs inside the village and in the case of vegetables, these are likely to be stolen with no one on the property to guard it.

TYPE. 4—FORCED CONCENTRATION

New villages also came up to which all the Chinese within a certain area were just told to pack up their belongings and move. No consideration was paid to their language or to their places of origin in China. A certain amount of money was paid by the Government towards their expenses in moving house. As one might have expected, even without any knowledge of sociology at all, since there was no common feature among the people so selected other than forcible common residence and common opposition to being shifted, dissatisfaction is rife. Since most of these new villages were under very severe

pressure from their relatives and friends in the jungle on the one hand, and very severe pressure from the Government to give all the information they could about other members of the village on the other, it is not surprising that no leadership of any sort was forthcoming and the barbed wire and electric lights around the compound were found to be essential. In the course of time, however, leadership was taken up by the shopkeeper group who needed peace in order to run their businesses and gained increasing confidence in the Government's ability to protect them. At this stage, the barbed wire, instead of guarding prisoners, gradually became an excuse for the inhabitants for not helping those outside. In the early days many of the new villages had populations of over 2,000 but the Government found that these numbers were too large in spite of the saving they made possible in the provision of essential services and the present intention of the Government is to reduce all these villages to a membership of about 800.

NO LAND FOR CHINESE

Not all Chinese are found in new villages. On Penang Island there are no new villages although many Communists, and in my part of Province Wellesley, on a flat plain well away from the mountains, there are no new villages. New villages are most numerous in Johore State where there are most of the Chinese. It is here that the problem of the alienation of land to aliens (Chinese) is most acute. Whether new villages will remain after the emergency is over is very doubtful in the more remote areas, where they have been badly sited and arranged. Those near the towns and where the location is convenient, have undoubtedly come to stay. There are certain advantages in new villages. School teachers are provided by the Government so that no school fees need to be paid. Medical attention is easily available. But on the other hand, it is difficult to supplement one's income by keeping pigs or growing vegetables and one is under continual supervision. In the long run I expect that the Chinese will gradually bring pressure on the Government to provide more social services for them instead of, as heretofore, being little interested in politics and depending on their own ability to provide for themselves. If the new villages had been planned from the beginning by those competent to do so, sociologists, agriculturists and other experts and less by the hit-and-run methods of the mili-

tary and police planners, they could be regarded as a courageous attempt to solve a difficult problem. But they will not solve any of the basic problems of the Chinese.

It is well-known that even the alienation to the Chinese of the land on which the villages actually stand was only brought about by the personal intervention of General Templer with the Sultans of the states. This problem has not yet been solved nor is it likely to be, until the Chinese are regarded as permanent residents in Malaya. In two villages near where I reside, the local English plantation owners refuse to sell to the Chinese, at a reasonable price, any of the land suitable for cultivation and the Government has refused to allow the emergency regulations to be invoked to force the owners to sell. If this is so in Province Wellesley where there are no complications with the Sultans, it is even more difficult for Chinese to obtain land in the Federated Malay States.

Suburbs Across the Bombay Harbour

(Contributed)

AS SEA-SIDE RESORT

It has been suggested that if this port is developed, the lovely beaches of the area could serve as excellent sea-side resorts for Bombay. Many Bombayites already visit them as such. This is a good idea, but obviously it is not merely the absence of Mandva as an all-weather port that is preventing this from happening. The factors that go to make health resorts popular are many and some planned effort in the shape of provision of facilities and propaganda in the press is necessary for this purpose. It is apparent, therefore, that the case for the conversion of Mandva into an all-weather port is not strengthened in any way by the grandiose schemes for establishing suburbs across the harbour, though there is scope for the creation of health resorts and holiday spots at many points along the coast of the taluka.

IDEAL MARKET GARDEN FOR BOMBAY

Mandva should really be looked upon as an instrument for the conversion of the taluka into a source of food supplies for Bombay city. Vegetable gardening, fruit cultivation, poultry farming and dairying: these need to be developed in the taluka. The plan for Mandva must be linked with a plan for the development of the taluka in this way. At present, Bombay obtains its supplies of vegetables from Surat and Viramgam on the Western Railway and Nasik and Poona on the Central Railway. The trip from these places takes from five to fifteen hours. With all parts of the taluka connected by excellent motorable roads not more than an hour's distance from Mandva and with Mandva itself only eight miles from Bombay, the taluka offers excellent prospects for such development.

Such a programme would offer an excellent solution to the problems of this area. Alibag taluka is practically a single-crop area and that crop is a food crop. The rice-producing peasants of the region barely earn a subsistence living. Their low incomes from agriculture make them turn away from the soil and there is steady migration of population from the taluka to the nearby city in search of industrial employment. None of the standard commercial crops such as cotton or tobacco can be grown in this taluka. Yet it is

THE areas lying across Bombay's fine harbour have frequently attracted the attention of visionaries fired by the prospects of developing the city into a giant metropolis. The difficulties of establishing suburbs in these areas—so near and yet so far—have, however, been so many that so far expansion of the city has taken place mainly towards the north. Saket, to the north of Bombay island proper, is connected to the latter by two causeways at Mahim and Sion and the two railways passing over them have provided easy and rapid means of communication. The limits of Greater Bombay have, therefore, already been placed at Ghatkoper on the Central Railway and Jogeshwari on the Western Railway and the planned development of the area within these limits is being undertaken under the control of the Bombay Municipal Corporation.

The protagonists of the expansion of the city towards the east and the south-east across the harbour have, however, not given up their attempts to make the scheme popular. A proposal for the development of Mandva in the Alibag taluka as an all-weather port is now being pressed before the Bombay Government by the Mandva Port Committee, the Kolaba Jilha Vikas Sabha and the Kolaba District Development Board. It is suggested that such a step will make it possible to develop this taluka into a group of suburbs of Bombay.

DIFFICULTIES OF TRANSPORT

It is true that transport is the main difficulty in the way of establishing suburbs across the harbour. Earlier an attempt made by Shri Tyaji to establish a Parsi colony at Neri, even nearer Bombay, had failed because of this very difficulty. The Town Planning and Valuation Department of the Bombay Municipal Corporation, which had exaggerated the feasibility of the scheme, came to the conclusion that "the question of developing these suburbs into suburbs of Bombay hinged on the question of ensuring means of communication from Bombay to these places and vice versa in a cheap, regular and continuous manner."

The crux of the matter is that the means of communication must be cheap, regular and continuous. Con-

verting Mandva into an all-weather port may ensure the continuation of transport facilities during the monsoon, provided there are people who are willing to face the rigours of a boat journey even on stormy days. But, for a suburb to develop, it is essential that the transport services should be frequent and available at all hours. It is this factor, more than anything else that militates against the possibility of converting this area into a suburb. The failure of Uran, which has equal advantages with Alibag and does have an all-weather port, should be a warning against any facile reasoning about the prospects for Alibag.

When the Greater Bombay Plan was being drawn up, a tube railway under the harbour had been suggested. The cost of such a project was, however, found to be prohibitive as it ran into many crores on any estimate. There is little doubt that with the present shortage of resources, such a project cannot be undertaken, though it is not entirely precluded in the future. If ever it is undertaken, it will, of course, have to be combined with the planned establishment of colonies at various points along the railway route, if the economies of large traffic are to be achieved. This is not a practicable proposition, however, at the present stage.

ALL-WEATHER PORT FOR MANDVA

All this is not to detract from the merits of the case for making Mandva an all-weather port, provided the case is not based on the prospects of developing suburbs in the area. The existing pier at Rewas, at the mouth of the Dharamtar creek, is entirely unsuitable for the purpose, because it is subject to heavy silting. On the contrary, investigations carried out at Mandva by Shri S C Pastakia, a retired engineer of the Bombay Port Trust in 1949-50 at the instance of Shri B G Kher, then Chief Minister of Bombay, showed that there had been no silting in certain parts of the port since the last port charts were prepared by the Admiralty in 1882 and that there were 20 clear feet of water as a minimum under all tide conditions in certain parts of the port. More detailed surveys are necessary before a positive conclusion can be arrived at, but the cost of these will be justified in the light of the favourable results of the preliminary investigations.

only by enabling the people to commercialise their productive activities will it be possible to raise their incomes to a reasonable level.

LOCAL LEADERS SHOULD WAKE UP

Fruit, vegetables, milk, eggs, poultry and meat are what Bombay wants and Bombay is willing to pay a price for them. Alibag must take advantage of this and the leaders of the locality should concentrate on this aspect of Mandva. They should press for a rapid development of the taluka in this direction and should demand that plans should be made to ensure that this takes place with maximum benefit to the citizens of the region. A few isolated attempts have been made by educated individuals from Bombay to establish well-organised farms in the area with considerable success. But the local population has not taken to it in any measure so far.

Since the region is virgin in this respect, plans can be made to provide for co-operative marketing and processing from the very inception of the programme. In fact, such institutions should be organised initially and assisted in stimulating the acceptance of these activities by the people. It will be an interesting experiment in the conversion of a food-crop economy into a commercialised economy on a planned basis and on co-operative lines. If this is done, Mandva may be the instrument for levering up the standard of living in the taluka, while solving at the same time one of Bombay's most urgent problems. Visions of suburbs across the harbour will have to be kept aside in the meanwhile.

Groundnut Oil and Oilcake

THE Government of India have decided to release an additional quantity of groundnut oil for export through established exporters and crushers by March 31, 1955.

A quota of 10 per cent of best year's exports during any one of the four years ending March 1952, subject to a minimum allotment of 5 tons has been announced for established shippers of groundnut oil. Shippers will be given the maximum allotment to which they would be eligible on the percentage basis.

In addition, it has also been decided to give facilities to crushers to participate in the export trade. Exports by crushers will be licensed freely on shipping bills subject to a maximum allotment of 250 tons per shipper from all ports provided, however, that the crusher is able to pro-

duce a certificate from the Excise authorities showing that cess has been paid by the applicant during any one of the three years 1952, 1953 or 1954 on groundnut oil crushed by him.

It has also been decided to release a quota of 25,000 tons for export of groundnut oilcake (expeller variety). Licences will be issued freely on shipping bills for shipment by the end of March, 1955, provided the applicant is able to produce satisfac-

tory evidence of a firm contract and of freight having been booked and subject to a maximum allotment of 1,000 tons per shipper for shipment from all ports.

By a separate notification issued simultaneously the Government have imposed an export duty of Rs 230 per ton on groundnut oil cake and Rs 175 per ton on de-oiled groundnut meal (solvent extracted variety having less than 1/2 per cent oil content.)

Profits on Foreign Capital in India

K N Raj

[In his article "Model-Making and the Second Plan" which appeared in the Annual Number of this paper, Dr K N Raj had made the provocative remark that "if the present policy in regard to foreign private investment continues, the rate of growth of this 'foreign' sector within the private sector of the economy will be faster than the rate of growth of the 'Indian sector'".

As several readers have expressed surprise at his findings, confirming, incidentally, the author's remarks about the "innocence of economists, no less than of politicians, about the facts of this 'foreign' sector", despite the amount of published material on the subject, Dr Raj has given in this note the basis of his estimates together with the sources of the statistics used.—Editor.]

THE total income of companies on which tax was assessed in 1950-51 was Rs 146 crores; the total tax paid by these companies, including tax paid on behalf of the shareholders in respect of the dividends payable to them was Rs 70 crores, leaving a balance of Rs 76 crores for payment of dividends (which actually amounted to about Rs 41 crores) and for retention as undistributed profits (which can be estimated, from the above figures, at about Rs 35 crores).

From the data published by the Reserve Bank after the Census of Foreign Investments for 1948, it will be seen that the total liability in that year on account of interest, dividends and profits payable abroad amounted to about Rs 39 crores, of which interest on securities and profits of partnerships accounted for only a little over Rs 2 crores. The profits here refer to 'net' profits, which exclude both tax and depreciation provisions; in the case of securities, shares and debentures also, the liability on account of interest and dividend payable is calculated after deducting income tax. A figure of Rs 37 crores, in respect of liabilities accruing on account of foreign investment in companies operating in India, can therefore be regarded as comparable with the figure of Rs 76 crores given above, except in that the former relates to the year 1947-48 and the latter to the year 1950-51. Company profits were probably higher in 1950-51 than in 1947-48, and so the difference in the reference period cannot affect the broad conclusion that the 'net' profits and dividends payable on account of foreign investment was roughly one-half of the total 'net' profits and dividends of all companies operating in India.

Of the amount accruing in 1947-48 by way of 'net' profits and dividends, only about Rs 27-28 crores were actually remitted abroad. The foreign 'plough-back' in this year was, therefore, probably around Rs

9 to Rs 10 crores.

Since 1950-51, company profits have been rapidly increasing, as can again be seen from the income-tax data:

	(Rs crores)		
	Assessed income of companies	Total tax paid (including tax on dividends of shareholders)	Income of companies after payment of tax
1950-51	146	70	76
1951-52	200	92	108
1952-53	200	102	98
1953-54	220	96	124

There is no reason to believe that the 'foreign' share of these profits has fallen, and yet, as is obvious from the balance of payments data published from time to time by the Reserve Bank, there has been no increase in the amounts remitted abroad, which suggests that the rate of foreign plough-back in the country has been steadily going up. On a conservative estimate, it would appear that it is probably now anywhere between Rs 15 and Rs 25 crores per annum.

It is obvious that foreign companies have to go through the Capital Issues Control if they are companies registered in India and wish to expand their authorised capital, but it is not clear whether there is any form of control, other than that exercised by the Exchange Control Department of the Reserve Bank from an entirely different standpoint, over remittances by foreign firms and companies to their branches in India. (Branches of foreign firms and companies, it must be remembered, account for the bulk of foreign business investments in India.) There is reason to suspect that such remittances have not been insignificant in the last few years, probably ranging anywhere between Rs 5 and Rs 10 crores per annum.

If, to the ploughed-back profits and to the remittances to India mentioned above, we also add the new inflow of capital (eg, into the oil refineries), it will be seen that the in-

crease in foreign business investments in India between 1948 and 1953 is likely to have been well over Rs 125 crores and possibly even nearer Rs 150 crores. There is a good deal of guess-work involved in attempting such an estimate, but it should be possible to verify it soon when the results of the Census for 1953 are published by the Reserve Bank.

Lower Trend in Equities

Wednesday, Evening

Disappointing Tea Shares

For the first time in recent weeks, Tea shares disappointed Clive Street. There was no dearth of good interim dividend announcements. After a temporary easier trend in average export prices for one single week, export prices have begun to recover. Average prices at internal auctions have never faltered. Those who are competent to express opinion are unanimous that there is no possibility of any set-back in tea prices before June or July. At current prices, the yields on Tea shares may not be high. But the return on investment in Tea shares is not regarded unattractive because of higher dividend expectations.

Therefore, the reasons for the easiness in Tea shares must be sought elsewhere. It is generally believed that dividend buying of Tea shares is temporarily over. More significant is the tactical retreat of the parties who have been trying to accumulate shares in order to acquire controlling interests or managing agency rights. In the absence of such support, both Tea and Engineering shares have developed an easier trend.

Recent spurt in Tea shares may not be entirely due to this form of activity. But the rise in some selected Engineering shares in recent weeks has been mostly due to this activity. In one or two instances, the process has been completed. It may be of interest to note that, with the transfer of ownership, the shares of the company or companies concerned have shown a tendency to decline in prices.

Why Jute Shares Neglected

Jute shares have remained dull and neglected in recent weeks. This is mainly due to the growing fears that the industry is not likely to earn satisfactory profits as long as the parity prices between raw jute and jute goods remain at the present levels. Decision of Rallis to close down their Calcutta branch accentuates these fears. Strange as it may seem, jute goods prices remain firm despite the disclosure of an increase in stocks of both hes-

It would be a mistake to assume that this week's break in equities was due to ominous governmental charges in Russia, or to the implications of these changes. Neither did markets get the jitters because of the tense situation in the Formosa Straits. It would, therefore, be wrong to conclude that equities developed easiness because of fears that the replacement of M Malenkov by Marshal Bulganin would hasten a world war. Fall in equities was not due to precautionary steps that markets usually experience in anticipation of an imminent war.

Equities were falling in recent weeks. Despite a temporary effort to cheer up as Pandit Nehru, in his speech at Avadi, assured the private sector that it would have scope for expansion, stock markets had been uneasy ever since it became known that Congress was in favour of introducing a socialistic pattern of economy. This does not necessarily mean wholesale nationalisation.

But it implies effective State control over the strategic points of the economy. Industry may resent control on prices and distribution. But it resents more any policy of purposive direction by the State. It is natural that industry feels depressed that it will not have the initiative to do as it likes. It is the function of stock markets to reflect the varying moods of industry. At present, stock markets are reflecting the prevalent gloom in industrial circles.

T T K and After

In spite of the earlier emphasis by the Government on employment in preference to expansion in the organised sector of private initiative, industry had hoped that Shri T T Krishnamachari would succeed in converting New Delhi to his views. His resignation has deepened the gloom in industrial circles. He has been considered as industry's only friend in New Delhi. His decision to resign has caused fears that industry's case will now go by default. This has had a psychologically "bearish" effect on stock markets.

This is the wider background to stock market movements. There

are other immediate factors which explain the drooping tendency in equities. Stock markets are invariably influenced by budget expectations in the period preceding the budget. In recent years, the budget has always had a neutral, if not a slightly, "bullish" effect on stock markets. Investors were secure in the knowledge that direct taxation could not exceed the limits introduced in the Liaquat Ali budget.

Tax Fears

This knowledge has had a mildly "bullish" effect on stock markets at the budget time in recent years. This expectation was fulfilled. In recent years, there has been minor reductions in the level of direct taxation. This year, however, there are apprehensions about the possible recommendations of the Taxation Inquiry Commission. It is known that its recommendations will be incorporated in the coming budget. It is also known that the expanded second Five-Year Plan would involve greater mobilisation of resources.

Stock markets have reasons to be apprehensive. At the moment, there are hopes that the Central and State governments will rely increasingly on indirect taxes. Recent increases in the tea export duty will replenish the exchequer considerably. But excise duties are in a different category. It is customarily argued that indirect taxes do not affect industry. There are limits beyond which this argument should not be stretched. Industry may be able to pass indirect imports on to the consumer. But, then, the consumer can retort by staging a strike.

These fears are not entirely without foundation. But, as has been emphasised more than once in these columns, there is a brighter side to the picture. Recent Reserve Bank returns are reminders that deficit financing involves currency inflation. Deficit financing will have to be stepped-up in the coming years. And stock markets cannot ignore that the experience of the last eighteen months can be repeated as long as the same underlying influence remains in operation.

CROSS MAIDAN CHURCHGATE

sian and heavy goods during January.

SPECULATION IN 'FATKA'

To a large extent, the spurt in jute goods is due to active speculation in *fatka*. Prices of heavy goods have been soaring because of heavy speculative buying in anticipation of overseas orders. Higher stocks of jute goods at the end of January are not expected to have any major adverse effect on the prices of jute goods as long as raw jute prices remain firm.

This raises a problem with which all commentators of commodity markets are familiar. Raw jute prices are rising because this season's carry-over is not expected to exceed 376,000 bales. This estimate may or may not be correct. But it is clear that raw jute prices will continue to be firm as long as imports of Pakistani raw jute remain low. It is of interest to note that the current near-boom conditions in raw jute has coincided with the decision of IJMA to continue longer working hours.

New Arrangement for Import of Soda Ash, Caustic Soda and Raw Silk

THE procedure for canalising the imports of soda ash, caustic soda, sodium bicarbonate and raw silk has been announced by the Ministry of Commerce and Industry.

It has been decided to continue to give a small quota of 7½ per cent to established importers of caustic soda. Licences will also be issued to actual users of caustic soda to meet half of their requirements.

In the case of sodium bicarbonate, a quota of 10 per cent has already been announced for established importers. In addition, a certain quantity of caustic soda and sodium bicarbonate has been reserved for being licensed on an ad hoc basis.

Applications should reach the Chief Controller of Imports by February 15, 1955 giving information *inter alia* regarding name of supplier, source of supply and cif price, etc. Licences when issued will be subject to such conditions as may be imposed regarding distribution, sale price and profit margin.

In regard to light soda ash, im-

ports will be canalised through importer-stockists who will be required to keep buffer stocks and effect sales in a manner so as to eliminate fluctuations in prices and supplies experienced by consumers in the past. The selling organisations of Messrs. Tata Oil Mills Co Ltd and Messrs. ICI (India) Ltd, have been selected for this purpose both of whom have agreed to procure soda ash from suppliers selected by the Government on the basis of offers which are being invited by means of Public Notice. Soda ash will be stocked at convenient centres and sold in accordance with the general directions that may be issued by Government from time to time. The sale price will be fixed by Government on for Port basis and the importer-stockists will be paid remuneration for their services at the rate of 12½ per cent of the landed cost, additional profits if any on the transaction being made over to Government.

In regard to raw silk, Government have decided to canalise imports through the Central Silk Board.

Around Bombay Markets

F EARS expressed in these columns last week about the ability of Tata Ordinary to retain its isolated gains have come true. Tata Ordinary which had gained more than 10 points during last fortnight, while the majority of the shares lagged behind, lost the entire gain within a couple of days. Tata Ordinary fell from Rs 238 to Rs 226 to hover around Rs 229.

The possibility of cease-fire in Formosa served as the pretext for the easier trend. A leading industrialist is reported to have liquidated his holdings to the tune of 20,000 Tata Ordinary shares, while both Calcutta and Bombay bulls who had entered the market in the middle of last month are reported to be holding on to their purchases. The technical position in Tata Ordinary seems to have been balanced by the latest fall.

Indian Iron followed Tata Ordinary sympathetically only. In the rise also, it had followed rather reluctantly.

Textiles continued to be dull, and even low rates could not attract bulls. The reluctance to buy may be due to forthcoming budget. Fears of heavy carry forward charges in some scrips eg, Bombay Dyeing and Swadeshi, their transfer books being closed, acted as further discouraging factors for buyers. It is rumoured that Swadeshi mill has not fared well this year. Century met with good inquiry.

It was but natural that fall in the majority of the shares was not as steep as Tata Ordinary because there had been no sharp rise either.

Miscellaneous section was sympathetically easy with the market leaders, and selling pressure was very much less at lower levels.

At the moment, the market as a whole is trying to stabilise. Budget rumours have started to pour in as is usual at this time of the year. In view of budget uncertainties, it is also usual in this period for bulls and bears to lighten their commitments and consequently, the market moves both ways. Tata Ordinary is meeting good support at lower levels and if textiles show signs of revival, the support may increase.

Tata Iron Shed Gains

Thursday, Morning

Bullion Firm

BULLION continued to be firm throughout the week. Excellent offtake, troubled international situation and firm grip of the bulls on the bullion market helped hardening of rates. The rise in gold price in Hong Kong made gold touch a new high in recent months.

Carry forward charges in both gold and silver continued to be against sellers. The trend appears to be bullish. Calcutta is the chief supporter for silver.

Stocks of silver and gold in Bombay market are approximately around 2,500 bars and 25,000 tins respectively. In London, silver prices eased slightly while gold firmed up.

	Feb 2	Feb 9
Silver (Fagan)	160-13	163-13
Gold (Fagan)	91- 6	93- 1

Cotton Recovers

THE downward trend in cotton seems to have been arrested. The market recovered sharply on bear covering and moderate buying by mills. Cotton traders' hopes of some Government measures to halt the downward trend have been partially in that, further quota have been announced for the export of cotton. It is difficult to say whether the improvement will last as upcountry advices continue to be easy. It seems

Government may announce further quota, in case the market declines further.

	Feb 2	Feb 9
Cotton (May)	Rs 567-12	Rs 573-12

Oilseeds Rally

GOVERNMENT measures helped groundnut also to halt the downward trend. Allowance of further export quota resulted in bear covering and market re-couped most of the losses of the previous week. Shippers, however, regard it as unfortunate that the Ministry of Commerce and Industry should impose the condition that export should be effected before March; this may bring down foreign quotations precipitously. The trend, however, appears to be steady. London quotations were around £101 per ton for groundnut.

	Feb 2	Feb 9
Groundnut		
April-May	Rs 20-2	Rs 22-4

The steadier trend in other oilseeds helped castor seeds to rally. Profit taking and bear covering led to a partial recovery of the losses suffered last month. It is generally hoped that Government will allow further quota for exports in the event of a further fall. Moderate business is reported to have been done by shippers. Trend appears to be steady.

	Feb 2	Feb 9
Castor seed May	Rs 75-4	Rs 79-4

World Leader in Motor Oil Announces
DOUBLE PROTECTION
FOR YOUR ENGINE!

1 Twice the cleaning action!

- Double-strength cleaning agent keeps valves, rings and pistons far freer of harmful sludge and varnish than formerly possible.
- New engines operate longer at top power—old engines take on new life!
- YOU get smoother engine performance—more power—improved mileage.

2 Twice the protection against wear!

- Increased ability to cut friction—by reaching and protecting tight-fitting engine parts more quickly and completely than ever before.
- New compound in Mobiloil effectively reduces corrosive wear in stop-and-go driving.
- YOU add years to engine life—reduce overhauls and repairs—assure top economy!

NEW Double Protection Mobiloil

Formosa

TWO deductions are permissible from the developments in the Formosa Straits. One is that the recent happenings in Russia do not imply that Moscow will now pursue a more aggressive foreign policy. At and since Geneva, the Communists have shown their willingness to resolve disputes through mediation. This is one of the arguments advanced by Pandit Nehru for his belief that the chances of peace are now better. Both Moscow and Peking had accused America of aggression in the Formosa Straits. Red China had rejected the Security Council's invitation to attend its discussions on the problem of a cease fire in the Straits. But Peking had made it abundantly clear that its rejection of the Security Council's invitation did not imply that it was opposed to a mediated solution of the problem. Moscow had promptly responded to London's request to Russia to use her good offices with Peking to prevent the start of war between Red China and America. By desisting from the use of her admittedly superior air power during the evacuation of the Kuomintang troops from the Tachen islands, Red China had demonstrated her anxiety not to rush to a point from which there could be no return.

Both Peking and Washington deserve thanks for not hastening a global war. Military maniacs in both the rival blocs may be in favour of provoking a world war. But politicians and responsible military leaders in either bloc are now acutely aware of the destructive consequences of an atomic war. There is growing realisation that an atomic war cannot be fought without total annihilation. This is a compelling urge to peaceful co-existence. Only those who analyse international affairs in pre-atomic terms can fail to realise this. So far as the Western Powers are concerned, this is an argument against the policy of "peace through strength". To the very limited extent that this policy may have relevance, the Western Powers already enjoy the strength to start negotiations for peace. Throughout the "cold war", it has been evident that the Communist States have nothing to gain by provoking a world war. Peace is an essential condition for their moral conquest of the world. And the efforts of the Western Powers since the start of the "cold war" deepen the suspicion that this is what they are afraid of.

With the completion of evacuation of Kuomintang troops from the Tachen islands, diplomacy now has the time and the opportunity to play its part. There is now a *de facto* cease fire in the Formosa Straits. Thus, the essential pre-requisite for a mediated solution of the problem has now been established. Even while the Tachen evacuation was proceeding, the Communist had made overtures. Russia had made a proposal for a ten-Power Conference to discuss the Formosa issue. According to this proposal, Britain and India should be the inviting Powers; the Conference should be held either in Shanghai or in New Delhi; all the interested European and Asian Powers should be invited, although the Russian plan excludes Kuomintang from participation. Neither Britain nor India has accepted the proposal in detail. But it is clear that both accept Peking's implied demand that dis-

cussions should be undertaken by the Powers concerned, and outside the direct auspices of the United Nations. America is evidently opposed to any repetition of the successful Geneva experiment. But, by deciding not to take any further action on the original proposal made by New Zealand, the Security Council has conceded, by implication, that it will be wise to hold a Geneva-like Conference if it could further the cause of peace.

America feels aggrieved that she has not been named as an inviting Power in the Russian plan for the proposed ten-Power Conference. This is an irrelevant objection, as Russia has neither included herself as an inviting Power. America did not approve of the Geneva Conference. She is not likely to encourage the Russian proposal for a Conference outside the direct auspices of the United Nations. Britain took an active initiative in the Geneva Conference. From her tentative suggestions to the Russian proposal, it would seem that there has been a shift in the attitude of the British Government to the Geneva experiment. But this is not likely to be a main obstacle to the proposed Conference to discuss the Formosa problem. It is difficult to appreciate how the United Nations can directly sponsor such a Conference as Red China remains outside the family of nations. This, indeed, is the crux of the problem. Once Red China's right to admission to the United Nations is accepted by Washington, America loses all justification to interfere in affairs relating to Formosa. Britain is conscious of the anomalous situation. That is why she is not opposed to repeating the Geneva experiment. To assuage America, however, she insists that Kuomintang China must be a party to the proposed Conference.

Because Britain is aware of Red China's opposition to include Kuomintang China as a party to the proposed Conference, Sir Anthony Eden is inclined to the view that secret diplomacy may have a better chance than an open Conference in solving the problem. Pandit Nehru seems committed to some of the British counter-suggestions to the Russian plan. He endorses the British suggestion that Kuomintang China should be a party to the proposed Conference. But he is also aware that there will have to

be certain prior commitments and declarations by the Western Powers before Red China could be induced to sit together with Kuomintang China around a conference table. There is one essential pre-condition to such joint participation in any discussions on Formosa. It is abundantly evident that the future status of Formosa and the Pescadores will have to be determined before Red China can concede Kuomintang China's claim to participate in the proposed Conference. A definite pledge by America that she will effect withdrawal of Kuomintang troops from Quemoy and Matsu will certainly help to create conditions in which the Formosa problem could be discussed.

Here is the dilemma. Once it is conceded that Formosa and the Pescadores are integral parts of China, Chiang's occupation of Formosa becomes illegitimate, and contrary to accepted international agreements. Pandit Nehru seems to be hopeful that Red China may tolerate Kuomintang China's participation in the proposed Conference once Red China's sovereignty over Formosa is openly admitted by America. This begs the whole question.

Vedantists All

THE Vedantist who has been lecturing to the secretarial staff on the right outlook in administration has been just wasting his time. The founder father of the clan did his job so well that there is nothing left for others to do. We are all born Vedantists in this country, and as a duckling takes to water without any preliminary course in swimming, we practise the difficult art of living in two worlds at the same time, with the same inherited quantity. Others may shy at it, or trip and fall if they ever try it at all, but why should we? The Westerners are amazed; some are swept off their feet when they see us perform in a more than ordinarily difficult situation; others can hardly believe their eyes and express scepticism. The Indian mind is too agile for them, Indian thought too subtle. Indian logic, we are assured by eminent Indologists, never accepted the law of contradiction. Aristotle did, but that is their undoing.

Not even the greatest ones amongst us have lost this inborn

Once America accepts Peking's sovereign claims to Formosa and the Pescadores, she ceases to have any right or justification to enter the Formosa Straits, or to take any political or military action to protect the Chiang regime in Formosa. Once Red China's territorial claims to the Far East are conceded, Far Eastern problems are automatically solved. So far as Formosa is concerned, it implies withdrawal of the Chiang clique from the island, if need be, under the auspices of the United Nations, and the gradual integration of Formosa and the Pescadores with the mainland of China. Is America prepared to concede these claims in the interests of world peace? America seems determined to sponsor a proposal for two separate Chinas. Some of Sir Anthony Eden's recent utterances would seem to imply that his Government is not unwilling to endorse such a solution to the Formosa problem. There is evidence that any such official endorsement of the tentative American plan by the British Government will end the era of bipartisan foreign policy in Britain. Informed opinion is convinced that the American proposal is no solution to the Formosa problem.

gift. Indeed, they have preserved it and improved upon it, whichever way they might have come up: Harrow, Cambridge, Burra Bazar or Kalbadavi.

As the legislatures meet for the budget session, Government will be announcing its policy through the Governor in the States and through the President at the Centre, setting out what "My government would be doing" in each case. The opposition is girding up its loins and will howl; but in packed houses, filled up with 'yes' men, Ministries need take no note. Of course, the two worlds are there, but what of that?

The Bombay Legislature has set the ball rolling; others will no doubt pass it on and finally at Parliament House in Delhi, we will hear more about falling agricultural prices and the distress of farmers. This is the simplest thing for the Opposition to pick on. The related problem of growing unemployment cannot be played up so effectively, for statistics are difficult to come by. And nowadays, lest one should quote

some figures, one does not get that respectful hearing.

In keeping with our national virtue, true to the kindred points of heaven and home, democracy works in the legislatures while democrats are gagged. Public participation in the nation's affairs, as in the execution of the Plan, is expected to run all along the line. But the focal point where one would expect to see it at work to best advantage could be on the legislative forum, where issues are debated and policies decided upon. In the debate on the Governor's speech in the Bombay Legislative Assembly, agricultural prices were the target of attack; but by a strange party convention, Congress members kept mum on this crucial issue, and talked about everything else under the sun. The Government, therefore, will have to proceed in the matter of agricultural prices, as in everything else, without being able to profit from the experience and first hand knowledge of, or seek guidance from, the majority of the legislators who, coming fresh from their constituencies, could certainly have contributed to the discussions. What prevents them from doing so? Why this self-denying ordinance?

True, though not in the open assembly, at meetings of the Congress Legislature Party which take place behind closed doors, even Congress legislators are allowed to whisper their respective points of view, though they are not able to press them. The difference between the working of democracy and of cameralist rule is the open forum where advice is tendered and views are put forward. At the legislative party meetings, the statements that are made run no risk of being controverted; not even facts can be elicited by an open and frank discussion. The experience, knowledge and understanding of, and insight into, local problems are not entirely lost, but the value of all these is greatly reduced by a parliamentary convention which in a virtually one-party State is not only unhelpful, but can be pernicious as well.

And the debate on prices goes on, without the benefit of expert advice either. The Economic Adviser continues to publish and Treasury benches as well as others have perforce to use, his price data, knowing all the time that these are not the real ones. Do not ask why the

Economic Adviser does not put up something which he can defend and which he accepts himself? Why should he? There are two worlds, one a world of make-believe, and another of reality. Surely, he must be keeping another set of figures into which he looks now and again, if only to ease his conscience. The Finance Minister is welcome to consult it, and probably he does. But when it comes to addressing Parliament, it is the Economic Adviser's Wholesale Price Index that he parades. It will be a pleasant surprise, if he uses another and a better index in his speech when he introduces his next budget.

Likewise, the agricultural extension worker in the villages goes on preaching the virtues of improved technique, and holding forth to the cultivators on the benefits to be derived from the use of better seeds, from fertilisers and so on, not bothering that such improvements cost money and that the investment may fail to bring in commensurate returns, in view of the fall in prices, particularly if prices keep on falling. But why should he bother? Has he not also imbibed the wisdom of Vedanta that is distilled in the Bhagvat Gita? He works, but expects no reward and looks for no returns.

The highest in the land are imbued with the same spirit; they have it in a greater measure. Falling agricultural prices are welcomed in the hope that costs are coming down and in due course, forces of competition, aided by monetary discipline, if need be, will bring about a fall in the prices of industrial products also. The Planning Commission presents two faces, one to the phenomenal world, which is here and now, and the other to one which is far removed. Here and now, it is progressive decontrol; the economy is still relatively free. So, the Finance Minister can keep his faith in free economy and work for international equilibrium, while talking about a Rs 5,500-crore budget for the Second Plan, of an expanding public sector and of a planned rise in the rate of investment to whatever point the importunate socialist-minded Prime Minister may demand. And why not? The Second Plan is yet to come, we are living only in the present, which is the period of the First Five-Year Plan.

Some day, the call will come and

we will all respond like heroes. The fight is never here and now. Why, then, shrink from physical planning? Policy has always been determined, more or less, on a physical basis, maybe without the benefit of input-output tables, of American origin, but surely in some vague way, on the basis of physical balances. How else does the Commerce Ministry issue import licences, or the Development Wing decide about permits or quotas? But there is also the ultimate in reality, the face of which no one has seen nor is likely to see. Here and now, it is the world of appearance, the inner reality is hidden behind.

Weekly Notes

Gone Berserk!

EXPORT control as an instrument of economic policy has been operated by the Government of India for a number of years; so it cannot plead ignorance or inexperience. In the administration of such controls, there are always certain unsavoury features which appear to be inevitable, but these are shortcomings of the 'garden' variety—failure to act in time, susceptibility to pressure from individual or group interests, red tape which can be very confusing at times and is almost always tiring. The latest in export control, however, is quite different.

The Ministry of Commerce and Industry seems to have suddenly gone berserk. Oil seeds had been going down after the new crop began to move. Groundnuts had touched a new low in many years. Some export quotas were issued to arrest the decline, but the manner of fixing the quota was such that it brought down prices in the importing countries but produced little impression on groundnut prices here.

Now, it is very desirable that growers should get a fair price and that Government should assume responsibility for maintaining such a price. Though Government has been reluctant to commit itself and responsible ministers have made conflicting statements, there are indications in plenty to suggest that it is also the intention of the Government to maintain prices at a reasonable level. What that level is in the case of groundnuts, however, is a different matter.

The earlier announcement having failed to stop the decline in oil-seeds market, a fortnight ago the Ministry of Commerce and Industry suddenly went all out and offered export quota for 250 tons each to every oil crusher in the country who has paid cess. As there are some 7,597 oil mills in existence, according to the Central Oilseeds Committee, if all these quotas are utilised, half of the groundnut crop would be whisked away. Trade estimates put the figure of exports allowable under the recent announcement at 3,50,000 tons of oil to which has to be added another 10,000 tons allowed for shippers.

If the intention was to check falling groundnut prices, it appears to be well on the way to realisation. But the process has not been as smooth as it could have been, for the immediate effect of announcing this fantastically large quota was to bring down prices in London. At the time when the announcement was made, it was felt that the Government was indulging in a practical joke, for the exports would have to be completed within March 31 and of course so much shipping would not be available, even if the oil could be found for shipment. Things have turned out slightly differently, for shipping companies have come to the aid of the exporters and half a dozen vessels, it is reported, have been chartered to carry groundnut oil. Some 40,000 tons, on present showing, may be shipped out of the 3½ lakh tons so generously granted. Then, in due course, there will be pressure for extending the period of shipment and this will also be granted, as has been done in the case of bonus quota holders who have been given extension till June to fulfil their quota and with unvarying monotony, there will be complaints about shortage.

The end is the beginning, so far as the Commerce Ministry's experience of handling quotas is concerned.

Rehabilitation of Rubber Estates

THE price of domestically produced rubber has been raised from Rs 138 per 100 lbs for Group I fixed in October 1952 to Rs 150. Corresponding changes have been made in the prices of other grades. This has nothing to do, however, with international rubber prices, though the latter have been rising continuously for more than a year now, prices in the London market having risen up by 63 per cent during 1954. When the price of domestic rubber was fixed in 1952, it was well below the international level; it will continue to remain so even after the upward revision.

The reason for price revision is to allow an adequate margin for rehabilitation of rubber estates, particularly to help the small holders. It was estimated that after meeting the current cost of production, the statutory price fixed in 1952 would leave a margin of

Rs 6-8 for rehabilitation. As the average yield for small holders is 300 lbs per acre and as new plantings take 8 years to mature, the margin left for this purpose works out at no more than Rs. 166, as against the actual rehabilitation cost estimated at between Rs 1,000 to Rs 2,000 per acre. After the present increase, this rehabilitation allowance is expected to work out at Rs 18-8 per 100 lbs, or taking the case of the small holder, with his average yield of 300 lbs, Rs 444 per acre in 8 years. So if rehabilitation is seriously intended, something more has to be done, not only to supplement the growers' resources for meeting the balance of the cost of rehabilitation, but also to ensure that the price increment now allowed is actually utilised for the purpose for which it is intended. This calls for supervision, a workable scheme and its effective implementation.

The Rubber Board has also been reconstituted and as in the case of the Tea and Coffee Boards, it is now more an organ of Government than of the interests involved. The Board claims to have been doing extension work among rubber growers long before the Government of India thought of introducing it on an all-India scale. But with what results, no one seems to know. Why not an evaluation programme to check how best the rubber grower can be assisted to increase his yield and replanting?

As usual, the increment of prices that is expected to pay for rehabilitation has been challenged on the ground that costs have gone up and that the cost estimate taken for price revision needs to be revised upwards. How much will be actually needed for rehabilitation and how rehabilitation is to be ensured, both appear at the moment to be open questions; not so the need for raising rubber production. For, internal demand is bound to rise and rise fast, with the progressive growth of industries in the country.

Refuge in Prayer

IT seems highly appropriate that Shri Panampally Govinda Menon, the new Chief Minister of Travancore-Cochin, should have chosen to start work in a 'prayerful mood'. In a State where political fragmentation and fickle group-

ing have resulted in the succession of six Cabinets in seven years and where the general state of affairs continues to be fluid, prayer may yield better results than Ministerial initiative and enterprise. Shri Menon is no doubt reputed to belong to the 'strong man' species; but what the present situation in Travancore-Cochin appears to need is rather the acrobatic type.

The Tamil Nad Congress group that had broken away from the Legislature Congress Party may have for the time being merged itself again in the parent party; but its organisation outside the Assembly continues separate, and one does not know when the linguistic issue will flare up again in a repetition of recent history. Even if there should be no new agitation for some time to come, the aftermath of the old should be enough to cause serious embarrassment to the new Ministry. The question of the release of old agitators and the withdrawal of cases pending against them cannot be easily solved nor even brushed aside for long. If the Congress High Command was not prepared in the past to allow the Praja Socialist Ministry to deal with this problem sympathetically, as complained since by the General Secretary of the Travancore-Cochin PSP, it will call for a major feat of casuistry on the part of the present Congress Ministry to do what it would not let others do.

Then there are the controversial Land Bills, which the Congress was known to have shied at, though the Chief Minister has since been prompt to declare that their passage will be expedited. But whether they will come to be passed in a form that will meet with general approval remains to be seen. Against this cheerless background, there has, however, been one interesting development which, though not concerning Travancore-Cochin as such, may have immediate repercussions there. And that is the incipient tendency in the Praja Socialist Party or in certain significant groups within to eye the Congress with some favour in the light of the Avadi vote for a socialistic pattern of society. This may well lead to the new Ministry in Travancore-Cochin gaining strength and support from an unexpected quarter. Maybe, there is some power in prayer, after all—even when emanating from the rough and tumble of politics.

Hindustan Tools

THE Hindustan Machine Tool Factory at Jalahalli has commenced production after falling behind schedule by more than a year. It was initially expected to go into production towards the end of 1953. The date was then shifted to about the middle of 1954 on account of the delay caused by revision of lay-out and other details to incorporate improvements. The factory, which in the preliminary stage is to be limited to the manufacture of 400 high-speed lathes of 8½" centre annually, will start full production in three years, that is, somewhere at the beginning of 1958 instead of the initial date of 1955-56. The factory, it may be noted, is now not only assembling lathes from imported parts, but also fabricating some parts.

The history of machine tool manufacture goes back to the last World War when machine tool production rose from an insignificant total of 100 items to about 6,000 items. In 1947, there were 24 graded firms and 100 ungraded ones. But with the partition of the country, the industry was disrupted and its capacity reduced. The number of ungraded firms has no doubt remained at 100, but graded firms have dwindled to 16. The production, which in terms of value stood at Rs 92 lakhs in 1946, now stands around Rs 40 lakhs, meeting about 4 per cent of the total estimated requirements of the country. So far, production has been confined to simple and primary types of machine tools. And it was in view of the considerable demand for precision types of modern machine tools from essential services like Defence and Railways that Government entered into an agreement with Messrs Oerlikon Machine Tool Works, Buherle and Co, Zurich, Switzerland, in April 1949, by which the firm will provide the technical 'know-how' and experts, equipment, jig, tools, fixtures, duplicate patterns, etc. The agreement envisages the production of 900 high-speed lathes, 460 milling machines and 240 heavy duty drilling machines a year. The project, including a gear-cutting shop and foundry to be incorporated in it, was to be at the capital cost of Rs 8.37 crores, having an annual outturn of tools worth Rs 4 crores, which comes to about 40 per cent of the estimated annual requirements of the country.

It was in accordance with this agreement that the Jalahalli Machine Tool Factory was set up by Government in collaboration with the above-mentioned Swiss Company. The control and management of the factory was, however, transferred in March 1953 to the Hindustan Machine Tools Ltd, a private limited company. The Swiss firm has contributed 10 per cent of the capital, the remaining shares being held by the Government of India.

The scheme is to be executed in two stages. It is only the first stage of the scheme, costing Rs 5 crores, which is being executed now. A sum of Rs 3 crores has already been spent. While concentrating on the production of high-speed lathes in the initial stage, a part of its capacity will be gradually diverted to the manufacture of different types of lathes and milling machines. The production of different types of machine tools has come to have special significance now in view of steel expansion plans.

Small Industries Corporation

THE newly-created Department of Cottage and Small-scale Industries has taken up the implementation of the Ford Team's recommendation energetically. The institutes of technology at Bombay, Calcutta, Faridabad and Madurai should soon start functioning to suggest improvements in the technique, organisation and marketing of small-scale industries in order to better their competitive position. A Small Industries Corporation, as recommended by the Team, has already been registered as a private limited company under the Indian Companies Act with an authorised capital of Rs. 10 lakhs to be entirely subscribed by the Government of India. The Corporation has been started on a small scale, but as it gains experience, it should be possible to expand it without undue delay.

The Corporation will take contracts for supplying goods to Government and issue sub-contracts to small-scale industries. It will assist small-scale industries in manufacturing articles of the type and standard required by providing technical aid and finance, the latter either direct-

ly or by underwriting or guaranteeing loans from banks and such other institutions. Another task assigned to the Corporation, which, however, was not recommended by the Ford Team, is to secure co-ordination between large-scale and small-scale industries to manufacture ancillaries, components and other articles required by large-scale industrial units.

In the purchase of stores, for quite some time past, the Supply Department has been giving preference to small-scale producers as a matter of policy. But it has been finding considerable difficulty to farm out its orders, as reliable producers who conform to the requirements of the Department are so few. Through the present Corporation, it should be possible to make positive and planned efforts to use Government purchases as an instrument for developing small industries. The experience gained by it and the results achieved should therefore be of very great value. Indeed, should ideas in the air at the moment take shape and increasing reliance be put on existing productive capacity in the country, wherever it may be found and in

whatever form, and its capacity developed with planned assistance in order to meet additional consumer demand expected from much larger spending in the Second Five-Year Plan, the present Corporation may provide guidance, if not a model, for future development on these lines.

But before much can be done or even planning in this field can take shape, it is very necessary to carry out a survey of small-scale and cottage industries. Without a better knowledge of resources in this sector and of existing productive capacity, no intelligent planning is possible. That goes without saying. Besides, in the absence of such primary data about the magnitudes involved, the minimum investment that would be necessary for strengthening the existing capacity and enlisting it effectively for purposes of the Plan will itself remain vague.

Though a very small beginning and a belated one, the Small Industries Corporation is to be warmly welcomed. There should be more institutions of this type, and that without delay.

Our Delhi Letter**The Socialist State in Making**

WITH the Prime Minister away, New Delhi was in an expectant mood last week. Politicians and officials here do not bother about the Formosan crisis. They are anxious to know who will succeed TTK. Shri Krishna Menon is being mentioned for what they call an 'Economics' portfolio. This, however, would involve quite a lot of reshuffling. Once the Prime Minister had an idea of establishing a Ministry of Economic Affairs under his own control, with either Vijaya Lakshmi, or Krishna Menon functioning as his deputy in charge of External Affairs. Nothing is definite except that the Prime Minister will probably strengthen his Cabinet by including somebody with leftist leanings.

While the Prime Minister has these matters to attend to, he is likely to get immediately busy about the Asian-African Conference. In his absence, a secretariat has already been set up. It has formulated the aims of the Conference—closer friendship and solidarity among Asian peoples—and its agenda: colonialism and foreign interference in the internal affairs of Asian countries, danger to Asia from military alliances, racial discrimination, preservation of national culture patterns, status of women, banning of nuclear weapons, development of regional trade, etc.

GRATUITOUS ADVICE

Meanwhile, the Finance Minister has been working on his budget for the last year of the Plan. The capitalist press is trying its best to persuade, bamboozle and even frighten the Finance Minister into presenting a budget that will not deviate much from the *status quo*. The nation will be thankful to him, so says the local press, if in exercise of his high and serious responsibilities, the Finance Minister could repeat last year's budget (with, of course, revised estimates). There is even justification for "a very generous relief budget" this time. In any case, heroism is to be avoided as being both unscientific and uncharitable, at least under the present circumstances when a fall in the general price level over the year might well have caused a fall in incomes! The press refers to the fall in the prices of food articles and industrial raw materials. The naivete of this argument is not sufficiently realised, for the fall in the prices of industrial raw materials must have meant a considerable sav-

ing in the costs of production. In any case, the sharp fall in the prices of food articles has had a moderating effect on the cost of living and brought down dearness allowances substantially at a number of industrial centres. The wages bill in cotton textile mills at Ahmedabad has gone down by 18 per cent in the course of the year. While industrialists generally have to pay a smaller bill for raw materials and wages, the price index for manufactures has risen over the year from 365 to 378.

Lest the Finance Minister should follow this line of analysis, particularly when it has been reinforced by the general recommendations of the Taxation Inquiry Commission, the long-term character of the latter's recommendations has been emphasized. In any case, the slackness in the economy is more than a sufficient argument for the Finance Minister relying on other sources of development finance: loans and deficit financing. If the Finance Minister is, however, determined to impose additional taxation, indirect taxes (such as the reimposition of the salt duty at Re 1-4 per maund yielding about Rs 8 crores) will be about the best; and then, there is the whole range of consumer articles. All this stuff is being dished out, for there is a fear, against the background of the Finance Minister's recent speeches and the socialist reorientation of economic policy, that the private sector might be subjected to shock treatment in the budget to be presented to Parliament on February 28. It is really difficult to imagine that a Finance Minister—one wedded to constitutionalism and a retired civil servant at that—would subject the nation's economy to shock treatment like the late Liaquat Ali Khan. It is, however, likely that there will be some inclination to the Left, after the price that TTK had to pay for softness towards the private sector.

SOVIET STEEL PLANT

The Soviet Union appears to be in right earnest about the steel plant, for its experts, immediately after getting the Agreement through, have proceeded to the site to work on the final project plan. And the State Government has taken steps to acquire land for the purpose. Obviously this is only the beginning. With the steel agreement fresh in mind, everybody is looking for signs of increasing Soviet influence on political and social life. There is a delegation

which has returned from an appreciative tour of Soviet railways. A Soviet football team with a reputation for invincibility recently played at the National Stadium at New Delhi. There is a Soviet cultural group going about the country.

In the field of ideas also, academics are taking a course in Socialism. Recently, under the auspices of the Delhi School of Economics, Professor Oscar Lange, Rector of the Institute of Statistics and Planning, Warsaw (Poland), gave an interesting lecture on the planned economics of Central and Eastern Europe. The main conclusions of his thesis have already been accepted by the Economic Commission for Europe, which, in its annual surveys, has paid compliments to the success of the economic plans of Eastern European countries and the achievement of what practically amounts to an industrial revolution. Prof Lange dealt particularly with Poland to which he belongs. Poland has quadrupled its industrial production, as compared with pre-war levels. (This is in sharp contrast to the 'ambition' of our Five-Year Plan to achieve pre-war levels and we were astonished when our economy achieved the physical targets within three years!) Another point made by Prof Lange was that though trade was mostly state-owned or co-operative, there was a private sector with its targets and incentives within the framework of the Plan. Incentives played an important role in the nationalised and co-operative sectors too. The main achievements of the Plan in Eastern Europe were: (a) immediate full employment; (b) agrarian reforms and (c) rapid industrial expansion. The ultimate aim was the establishment of a Socialist society.

"ECONOMICS WEEK"

Prof Lange's lecture indicates how under the sextonship of Dr V K R V Rao, the Delhi School of Economics is becoming an active centre of economic thought—a much-longed-for offset to the boring snobbery of official life in Delhi. We are presently in the midst of an Economics Week. In one of his lectures, Dr V K R V Rao asked school students to save a pice each from their pocket money and contribute it towards the success of the National Plan! What did Keynes say as to what would happen if we all decided not to have dinner? What the younger generation think of those at the

From the London End

The Fourth Republic after Mr France

THE passing of the twentieth post-war government in France was somewhat obscured by the Formosa crisis, the change in the Soviet leadership and the London Commonwealth Conference. The exit of M Mendes-France is, of course, very important—it marks the end of an experiment designed seriously for the first time to take the facts of life into account. The experiment itself signified a departure from the utter unreality of the international and national policies of previous governments. It was a recognition of the fact that France could remain a Great Power only if she devoted more energy towards reviving the internal economy, rather than live on American charity. But alas! This experiment too has gone by the board before it had time to prove itself—it has gone rather surprisingly via North Africa—and once again the turmoil of 'limited' and 'unlimited' policies and coalitions afflict France.

Fate has played two tricks on M Mendes-France. The first was when it obliged him to expend almost all his time and energy on the conduct of foreign affairs, though it was to economic problems that he had long been devoted, and it was to his promise of solving them that he mainly owed the National Assembly's approval of his candidacy for the Premiership.

The second was when it brought him into office at a moment when his country had already emerged from the economic stagnation through a partial recourse to remedies that he had laid down in his plan. Eight months were to pass before M Mendes-France could lay aside the Foreign Affairs portfolio and get the chance to concentrate on the task dearest to his heart. By then, he had lost the confidence of the Assembly and was soon out of office.

There is something like a nightmare logic about the Fourth Republic. This can best be explained by tracing the rise and fall of the Mendes-France government. Mr France, as he has come to be known throughout the English-speaking world, was swept into office by an emotional wave of disgust at the Indo-China war and of course the fear that the Geneva Conference would fail. The wave receded when the Geneva cease-fire was inter-

nationally agreed upon. From July onwards, the political divisions of the Assembly came to bear on his position and power. By refusing to support the EDC arrangements, Mendes-France lost the support of the MRP group under Robert Schuman and Georges Bidault. The fundamentally reactionary character of the Assembly was becoming visible and despite all his political skill, M Mendes-France never became a master of the Assembly. When he fought for the ratification of the London and Paris Agreements, he introduced a deep and virtually unbridgeable division between himself and the more progressive forces within the Assembly. By supporting Germany's admission into NATO, he drew upon himself the irrevocable hostility of the Communists and more important than this, weakened the support of his more serious friends. His popularity in the country waned and his enemies in the Assembly now had a lever which they could apply effectively to dislodge him from office.

By October 1954, when Mr France turned his attention to internal problems and made a frontal attack on the giant alcohol interests of France, the Opposition took the offensive. When the leakage of Defence secrets was debated in the Assembly, his majority fell to 37—the Right instinctively drew itself together and by the last months of the year, the only Right-wing members who were supporting him were those who were members of his cabinet. By the time the North African question came up, Mr France was walking on parliamentary tight-rope.

If the North African debate has shown anything, it has shown the power that French imperial interests still have, to break any government—the long, bloody war in Indo-China could not have plagued the French peoples for so long, had it not been for the influence of the French imperialists in the Administration and the Assembly. On January 6, the Mendes-France government transferred the responsibility of the Algerian police to the Ministry of the Interior, thus cutting off in a physical sense the supervision of the North African police from the Ministry of Overseas Territories, a Ministry most subject to the influence of the big banking and other imperialist interests in France.

Next Mr France appointed M Jacques Soustelle, a confirmed anti-colonialist, to the Governor-Generalship of Algeria. From then on it was clear that even the Mayer Radicals would vote against M Mendes-France.

The stage was set for an open fight when the Assembly came to debate the North African question. In the debate, Mr France repeated how important it was to start negotiations with the North African nationalists and the need not to lose the confidence of the Arabs. But this was of no avail. Mr France lost the Premiership and his plans for the economic revival of his country went with him.

For the North Africans, the future is one of police terror and unremitting persecution. M Rene Mayer, the leading imperialist and the dominant figure in the debate, was brutally frank about the intentions of his group and the interests they represent. They "will not pursue a policy of weakness which led to the evacuation of Vietnam and our establishments in India". He went on to explain his principle: "... we must oppose with intransigence any policy likely to lead to concessions". When an Algerian Deputy rose to protest about the brutalities of the police in his country, over half of the deputies walked out of the Assembly. When the vote was taken, the French Assembly by a majority of 46 had elected to pursue a North African policy which M Mendes-France had described as a policy of "repression and force".

A Depressing Report

Survey of the Indian Chemical and Pharmaceutical Industry 1954, Indian Chemical Manufacturers' Association, 13 Netaji Subhas Road, Calcutta. Pp 227 + 16. Price Rs 10.

THE Survey contains a brief history of the Indian Chemical Manufacturers' Association and its activities; an exhaustive analysis of the chemical industry in India, existing as well as planned; future trend of the industry; a blueprint of the target which should be achieved at the end of the Second Five-Year Plan and a review of the Government regulations, import policy, railway freight rate and scientific research relating to the chemical industry.

Basic chemical industry, fertiliser industry, heavy chemicals industry and the synthetic organic chemicals industry have been examined in great detail and at the same time all other important chemical industries have also been well covered in the Survey. Although new industries have been set up and more are in advanced stages of planning or erection, the over-all picture of the industry as drawn in the Survey is rather gloomy. The various causes for this have been analysed in the Survey. Among them are: shortage and/or low quality of raw materials, restrictive regulations, low capital equipment per employee, unimaginative Government policy, excessive railway freight, etc. There is no doubt that restrictive regulations such as the uniform State excise laws and burdensome Central tax on salt, tea, etc, required as raw materials in the industry are a great impediment to its growth. An example of how excessive the railway freight could be is given by quoting the freight on ether which 'is an essential commodity used by hospitals and medical men, the usual indents are for a few pounds, while the railways charge a minimum freight for 20 naunds irrespective of the actual weight'. However, in the opinion of the reviewer a very important factor responsible for the sorry state of our industry is lack of proper planning. To quote from the Survey—

"On the basis of high prices on raw materials as well as energy rates indigenously produced carbide is likely to be produced at about Rs 850 to Rs 900 per ton which is at least three to four times more expensive than American carbide."

In the case of carbide industry which has come up recently these factors surely needed consideration at the planning stage. As regards lack of capital equipment and scientific research the industry should instead of depending upon the Government pool its own resources as Government participation or help may bring in new restrictions and research carried out in the National Laboratories manned by people who are not tuned to the industry may not bring out immediate results.

A very important section of the Survey is the blueprint in which target for the Second Five-Year Plan has been fixed by the Association. A notable omission in the blueprint is sulphur—a very important chemical which, according to the Survey, would be needed in quantities of 100,000 tons per year within two years. More stress should have been given in the Survey for the winning

of this material from coke ovens, pyrites and refinery wastes. It may be mentioned that the Esso Refinery at Fawley, England, would be recovering 12,000 tons of sulphur per annum by processing its flue gases. The two new refineries at Trombay would be using crude petroleum from the same region from which the Esso Refinery is drawing its supply.

There are some mistakes in the figures quoted in the Survey which are obviously not the work of the printers' devil. The number of chemical factories in India in Tables I and II mentioned on page 11 are 233 and 244 respectively in the year 1950; the actual production of sulphuric acid in 1953 is given as 109,052 tons in the table, pp 15 and 107, 796 tons in the diagram on the following page. However, these are perhaps unavoidable in a country in which statistics vary with the source of collection. On the whole, it is an excellent Survey and the Association is to be congratulated for the painstaking and exhaustive work. The Survey should 'stimulate thinking in many quarters' and help in the proper planning of our chemical industry and its development.

Managing Director

More Value, Same Bulk

Investors Encyclopaedia 1954 Compiled by Kothari & Sons, Share, Stock & Exchange Brokers, Armenian Street GT Madras.

THE *Investors Encyclopaedia* retains its slim look. But without any increase in its bulk, it continues to expand its coverage, through the judicious use of suitable thin paper. Among the features added in the latest issue is a Survey of State Enterprises which are run on commercial lines, a task attempted for the first time in a publication of this type, and undoubtedly a bold one for an investors' annual to undertake. Another is a list of managing agents, managers, managing directors and secretaries of the companies the working of which is reviewed in this volume. The feature should prove increasingly useful with the changes going on in the field of company management.

In typography, presentation and range of information provided, the publication continues to carry out improvements every year.

In compiling information of this type, the most difficult problem is to fix a deadline and to stick to it. It is easier said than done. The task becomes almost impossible if no date is fixed in advance for the publication to come out. In the present case, October 31 was fixed as the deadline and all the information which became available upto that day has been incorporated. The information compiled was therefor the latest available at the end of the year and in keeping with the usual practice, the volume could be entitled as one for 1955 instead of 1954. The fact that it is published in the beginning of 1955 should justify the use of a later year in the title though unfortunately—it is by no means the fault of the companies—the latest information in many cases relates to the balance-sheet year ending in 1952 and could not be brought up to 1953.

The analysis of the working of important groups of companies introduced last year as a supplement has proved a useful and popular feature. It deserves to be expanded. Comparability of balance-sheets is always a difficult matter but the value of the supplement would be greatly enhanced if some of the blanks in the tables, of which there are far too many, are gradually filled up. Conversion of balance sheets into a standard form runs up against obvious snags but the risks involved are par-

tially covered by the fuller and exact information about the companies tabulated in the supplement that is given in the body of the encyclopaedia.

Its standard of production and accuracy, wide coverage of the companies and the usefulness of supplementary information have made the *Investors Encyclopaedia* an indispensable book of reference for all those who have to deal with commerce, finance or industry.

Devkaran Nanjee Banking

IN keeping with the rising trend of banking profits, Dena Bank reports good progress during the year 1954. Deposits at the end of the year rose from Rs 10.37 crores to Rs 12.56 crores. The funds were profitably employed as indicated by

the rise in advances from Rs 3.64 crores to Rs 4.32 crores. Investments at the end of the year stood at Rs 5.69 crores as against Rs 4.94 crores in the preceding year. Reserve Funds have been strengthened during the year by Rs 2 lakhs to Rs 28.10 lakhs. Prudent management has yielded a profit of Rs 7.94 lakhs as against Rs 6.90 lakhs in 1953.

The income side shows an increase in interest and discount from Rs 30.47 lakhs to Rs 36.94 lakhs and in commission, exchange and brokerage from Rs 5.92 lakhs to Rs 8.16 lakhs; interest paid on deposits, borrowings, etc, have claimed Rs 3.4 lakhs more at Rs 13.73 lakhs.

The bank has not escaped rising wage spiral for the salaries and allowances and provident fund have swollen from Rs 14.84 lakhs to Rs 17.30 lakhs. It is, therefore, creditable that the Dena Bank has made a good headway despite several handicaps. The shares of the bank, Rs 50 paid-up, paying a dividend of Rs 2 per share, are currently quoted at Rs 34.

Price of Tea

K Murti

THE dizzy heights reached in the Mincing Lane auctions in recent months has drawn the attention of even the British Parliament to the high prices of tea. The Minister for Food was asked if efforts are being made to purchase the ops early this year on a long-term bulk buying contract to forestall the excessive prices now being charged the growers. Though his reply was in the negative, and the Minister reiterated the Government's policy of relying upon the efforts of private importers to meet the country's demand, the abnormally high price of tea cannot be a matter of indifference to the governments of other tea producing and tea consuming countries.

Indeed, the change that has come over the world tea situation is as spectacular as it is sudden. It was only in 1952, that the Indian tea industry was in the grip of a vicious slump: in 1953, the pendulum had swung almost to the other extreme. It should be said to the credit of the Raja Ramrao Committee that its assessment of the situation was correct. The slump in prices was a passing phase and when the heavy stocks in the United Kingdom were depleted, prices did go up. Notwithstanding the voluntary restriction of production adopted by the industry in India in 1953, growers could not implement their policy owing to adverse weather conditions in that year. Indian production in 1953 was less than that in the previous year. There was, however, a marked improvement in the quality of Indian tea. The world supply, which upto 1951 had lagged behind demand, had in 1952 outstripped demand to the extent of 64-100 million lbs. However, during 1953 the world's tea supply was estimated to be 14 per cent short of demand and was met out of carry-over. Dur-

ing 1954, demand for tea continued to go up.

INDONESIA OUT FROM WORLD MARKET

Indonesia used to be an important marginal supplier of tea to the world market in the pre-war period when her annual production was between 160 and 184 million lbs. During 1942-45, Indonesian tea disappeared from the world market. Tea plantations suffered enormous war damages, estimated at 25 per cent in Java and 35 per cent in Sumatra, with the result that output dwindled from 194 million lbs in 1941 to 10 million lbs in 1944. When tea cultivation was resumed in Java in 1947 and in Sumatra a year later, it was expected that Indonesian tea would soon reappear on the world market. However, facts belied such anticipations. As late as 1953, Indonesia produced only 81 million lbs of tea, which is only one-half of the pre-war output. There was only a small rise in 1954 over 1953.

The combined output of India, Pakistan and Ceylon in 1953 exceeded the pre-war production of these countries by over 40 per cent. The Indonesian production declined during the same period by about 56 per cent. The increase in production in other tea producing countries of the world during the above period was not appreciable. No doubt, India and Ceylon have taken advantage of Indonesia's disappearance from the world of tea. With the increase in world population and a general rise in living standards, the consumption of tea has been going up. This would mean, even with the present increased production, the current supply of Indian and Ceylonese teas to the world market would fall behind world demand.

LONDON STOCKS—THE KEY

The trend in world demand and supply is reflected in the stocks of tea held in London, since the United Kingdom is not only the world's best customer, it is also the world's clearing house for tea. Stocks in London during the last few months were at a dangerously low level. Last year's floods in North India and the London dock strike further depleted stocks in London.

Table I—Stocks in London
[in million lbs]

Year	Highest	Lowest
1933	317.1 Jan	253.2 Sept
1934	302.0 Dec	231.9 July
1939	251.3 Jan	93.7 Oct
1952	149.4 May	93.2 Jan
1953	133.5 Jan	90.8 Oct
1954	130.5 Mar	64.5 Nov

As compared with current supplies, consumption has been increasing not only in the United Kingdom and Western Europe but also in the producing countries. From 441.6 million lbs in 1933, consumption of tea in the United Kingdom declined to 347.8 million lbs in 1946. During the post-war period, however, there has been a rise in consumption which rose in 1953 to 464 million lbs. A survey carried out by the Tea Bureau among British housewives suggests that the average weekly consumption per head in 1954 has risen to 3.3 ozs from 3.1 ozs at the time of the 1953 survey.

The cumulative effects of lower output in India owing to finer plucking, low stocks and rising world consumption sent tea prices skyrocketing towards the end of 1954. The rise was not confined to Indian teas, of course; all the principal tea producing countries experienced boom conditions in 1954. The comparative prices of tea at the London

THE ECONOMIC WEEKLY

auctions given in Table II are illustrative.

It will be seen from Table II that while the prices of Indian teas increased sixfold, prices of Ceylon and Indonesian teas rose only fivefold at the November 1954 auctions, as compared with the 1938 prices. Besides the increase in demand, mounting production costs in all tea-growing areas were the principal factors contributing to the general rising trend in prices.

The prices at the Calcutta auctions show a similar tendency. While the average price of tea with export rights at Calcutta was ruling at Re 0-11-5 per lb in 1939, it rose steadily, to Rs 2-1-0 per lb in 1950. Although prices began to decline afterwards, they have recovered since 1953. The rising price trend in the London auctions, together with the dislocation of the transport system in the plantation areas in North India, gave a fillip to Indian tea prices which started attaining new levels in 1954.

REGULATION OF EXPORTS

Under the International Tea Re-

gulation Scheme, the four leading producers, viz, India, Pakistan, Ceylon and Indonesia, have agreed to limit their exports as also the expansion of their acreage under tea. The Agreement has provided for what are called "standard export figures" for the four countries as follows: India 348.2 million lbs, Pakistan 35.0 million lbs, Ceylon 251.6 million lbs, and Indonesia 173.6 million lbs. For the season, 1954-55, the countries have agreed to limit their exports to 135 per cent of the standard export figure which in the case of India would amount to nearly 470 million lbs.

Apart from the over-all ceiling factor fixed on exports, there is another factor which tends to have a restrictive effect on exports from India, viz, the Government's anxiety to keep the domestic market supplied with its full requirements of tea, so that sufficient tea might be available to the Indian consumer at a fair price. The annual consumption of tea in India is likely to be between 170 and 200 million lbs, and if the full quota of 470 million lbs of tea was to be allowed for export

without, at the same time, overlooking the domestic market, Indian production should be of the order of 640-670 million lbs. Although in 1954 the Indian crop is bigger than that of the previous year, it is quite unlikely that it has still a long way to go before it reaches the level of 670 million lbs. Increasing foreign demand together with the fear that exports might be restricted in case of a fall in the total outturn in India recently sent tea prices, as well as the prices of export quota rights, skyrocketing. Table III gives the trend in the prices of North Indian and South Indian teas since 1933.

EXPORT QUOTA RIGHTS

The question of tea prices is also related to the recent wave of speculation for acquiring export quota rights. Under the Indian Tea Control Act, every producer of tea receives an allotment of export quota, calculated on the best crop year basis of the estate, and these rights are transferable. It appears that while a large number of producers have utilised their export quotas and their export shipments are held up

for want of quotas, certain other producers have not produced, or not produced enough, and they have sold their licences to traders who have paid as much as Rs 1-8 per lb. The result of the speculative buying of licences by non-producing interests is that if producers with surplus stocks want to export their teas, they have to buy the quotas at fantastic prices which means that the producers get the world tea price only after deducting the price of export rights.

A controversy was on in the latter half of 1954 among tea interests as to the efficacy of the system of quota rights. Fluctuations in tea prices and trading by dealers and speculators in quota permits are not new features. They caused particular concern recently only because of the very high price to which quotas rose. In the ad hoc com-

mittee's report on tea, it is stated that "during 1949, quota at one period was fetching 4 annas a pound; some years back, we were told, quota was selling at 10 annas. Two annas is a common price."

INDIAN TEA DRINKER PROTECTED

The quota system is a necessary evil. It protects the Indian consumer from fluctuations in world prices. With prices returning to the normal level, speculation in quotas is bound to decline. Indeed, the recent release of an additional quota of 2.5 per cent of tea on the basis of the standard export figure, bringing the total Indian exports to 457.9 million lbs in 1954-55, brought down quota prices early this year.

The latest additional release of tea for export has resulted in the price of the commodity for internal consumption hardening, since the

quantity available for the domestic market will be reduced to that extent. The oversea buyer may be prepared to pay a higher price, and consumer resistance in Britain to rising prices may not be considerable up to a limit, because tea still continues to be cheaper than other beverages. The Tea Bureau's Consumer Survey in Britain (1954) sums up the reaction of consumers to price increases in these words: "The majority (84 per cent) of housewives are aware of recent increases in tea prices, but so far, this has had no apparent effect either on the frequency with which tea is made or on its strength." However, in our anxiety to market our teas abroad at higher prices, we should not lose sight of the potential Indian consumer who is being slowly but steadily led into the tea-drinking habit.

How banking serves the COIR INDUSTRY

PC-438 (A)

INDIA is the world's chief producer of coir and coir products, her yearly output being around 130,000 tons. More than half this output is exported, earning about ten crores of rupees in foreign exchange. The coir industry, which is exclusively South Indian, is concentrated in Malabar and Travancore-Cochin, and employs over six lakhs of workers.

Banking has greatly helped in the rapid growth of this industry. The facilities and guidance of a good bank, such as the availability of ready funds when needed, and the collection of dues in any part of the country, are an essential part of good organisation in the coir industry.

We at Palai are proud that so many leading coir goods manufacturers of South India employ the complete banking service we offer.

Current Accounts — Demand Drafts — Telegraphic Transfers — Investments — Letters of Credit — Bill Collection — Deposits — Loans & Overdrafts — Confidential Credit Reports, etc.

If you have business interests in the South, it will pay you to open an account with us. Our 25 branches are strategically located, 23 in important South Indian business centres and two in Delhi and New Delhi; and we have correspondents in all important Indian cities. We offer a fully comprehensive banking service at each office

Our clients can make deposits at any of our correspondent banks, situated in all important Indian towns, and have the amounts credited to their accounts at any of our branches.

PALAI CENTRAL BANK LTD.

Head Office: PALAI — TRAVANCORE

A LEADING BANK IN SOUTH INDIA

Recent Trends in Soviet Budget

M S Bhatia

THE budgetary system of the Soviet Union is different in many ways from the system prevailing in Western democracies. The Soviet budget is a consolidated central pool, comprising the budgets of the Union, Republics forming the Union, and local authorities. The revenue yield of the Union, however, forms a main part of the total. As in other federal governments, there is division of economic, political and social functions among the various governments. Article 14 of the Soviet Constitution reads as follows:

"The jurisdiction of the USSR as represented by its highest organs of State authority and organs of the Government covers:

- Establishment of the national economic plans of the USSR;
- Approval of the single State budget of the USSR as well as of the taxes and revenues which go to the all Union Republics and local budgets;
- Administration of banks, industrial and agricultural establishments and enterprises and trading enterprises of all Union importance;
- Direction of monetary and credit system;
- Raising and granting of loans."

The development of light industries is the responsibility of the federal units (Republics) and local governments. Expenditure on education, public health and other social and cultural services is shared by the Union and republic governments. Defence expenditure and the financing of national economic activities and heavy industries are the functions of the Union Government. The administrative expenses of the various authorities are borne by the Union Government. The function of tax collection is entrusted to the republics but in return they receive unconditional grants-in-aid from the Union. The surpluses and deficits of State-operated enterprises are accounted for in the federal budget. Large-scale enterprises are the complete monopoly of the Union Government. Prices of the commodities produced by the State monopolies are fixed according to national economic needs.

Capital investment in USSR is undertaken only by the State as there are only two economic sectors, the State and the household; a private industrial sector of any consequence no longer exists.

GROWING IMPORTANCE OF STATE BUDGET

In USSR, the State participates substantially in the collection and distribution of national income. More than 70 per cent of the national income passed through national budget in 1950, compared to only 42.9 per cent in 1931. An increasing share of the national income is thus going through the State budget. Except for consumption expenditure, a part of working funds and capital expansion of heavy industries, capital expenditure of non-socialized enterprises, all other items of income and expenditure are included in the Soviet national budget.

In recent years, the budget session of the Supreme Soviet has become more and more informative and a considerable volume of statistical data is released nowadays but frequent changes in method of tabulation make comparison with previous years difficult. Except for the unchanging Finance Minister, Mr Arseny Zverev, no other top-ranking leader used to participate in the budget discussions formerly. But in the last few years, particularly after the death of Stalin, top Soviet leaders like Khrushchev, Mikoyan, Kaganovich and Malenkov have been taking part in the budget debate and have provided in the course of their speeches comprehensive political, economic and statistical information. Mr M

Malenkov who resigned from Prime Ministership during the last budget session on the ground that his agricultural policy had failed, has further enhanced the importance of the budget session. The increased participation of the Soviet leaders in the budget session would have been better appreciated by economists and financial experts elsewhere, had less emphasis been given to propaganda while giving out statistics.

TURNOVER TAX

From Table I it may be seen that by far the largest source of revenue in the Soviet Union is the turnover tax which contributed 246.9 billion roubles in 1952; 243.6 billion roubles in 1953; and 234.3 billion roubles in 1954. The yield of the turnover tax is gradually decreasing, following the reductions in retail prices and increases in prices paid by the State to agricultural producers. In 1945, the yield from turnover tax accounted for 45.1 per cent of the total revenue but in 1954, its share went down to 40 per cent. Mikoyan says that retail prices in 1954 are 25 per cent below 1950 level but the decrease in the yield of turnover tax is more due to inaccurate method of calculation. Turnover tax is not levied as a percentage of wholesale or retail price; it is the difference between the factory wholesale tax-free price and retail price, or a fixed sum. In order to soften its regressive effect, there are more than 2,500 different rates of the turnover tax. It is imposed on almost all consumption articles. It has been estimated by A Yugow that the turnover taxes on food products account for three-fourths of the total yield of this

Table I—Revenue of the Soviet Union

(billions of roubles)

	1952	1953	1954
Turnover tax	246.9	243.6	234.3
Deduction from profits	58.5	70.3	92.8
Direct taxes	47.4	46.1	45.7
Loan revenue	36.3	17.3	15.9
Social Insurance Fund	21.9	23.2	24.7
Increase in Savings Banks balances	4.5	12.0	10.0
Other revenue	82.2	127.2	149.1
Total	497.7	539.7	572.5

tax. In the hands of the USSR authorities, it is a powerful weapon not only of fiscal, but of economic and social policy.

PROFITS OF STATE ENTERPRISES

The profits of the State enterprises were planned to reach a record total of 111.5 billion roubles in 1953; they actually accounted for 70.3 billion roubles only. The shortfall was due to failure to reduce costs in a number of important sectors of the economy. In 1952 and 1954, the yield under this head was 58.5 and 92.8 billion roubles, respectively. The Finance Minister of the Soviet Union explained that productivity in timber haulage was still some 4 per cent below pre-war, despite increased mechanization and that planned costs of construction of electricity generation, of manufacture of building materials, and in the food processing industry were considerably exceeded and that half of the coal mines did not fulfil productivity plans in 1953. These were responsible for a shortfall of 31.2 billion roubles in planned profits from State enterprises in 1953.

INCOME TAX IN THE SOVIET UNION

The principal direct taxes in the USSR are income tax and the agricultural tax. The rates of taxes on income rise progressively with rising incomes, but they also vary according to professions, i.e., workers, artists, engineers and professors. Individual enterprises have to pay a higher rate of income tax in comparison to socialized enterprises. Bachelors and childless couples have also to pay at a higher rate than heads of big families. Those who are exempted from military training have similarly to pay a higher rate.

FALL IN DIRECT TAXES

Agricultural tax is some percentage of the gross profits of the collective farms which is paid by the members of the collective. Direct taxes contributed 47.4 billion roubles in 1952 to the national budget. In the year 1954 it yielded 45.7 billion roubles. This downward trend in the yield of direct taxes is associated with reductions in the tax rates on the private plots of peasants which was one of the features of agricultural reforms in 1953. Mr A Nove says "the taxes had been deliberately set so high that they were forcing millions of peasants to dispose of their livestock and restrict savings". The yield

from the agricultural tax declined in 1954 to 4.23 billion roubles from about 10 billion roubles in 1952. The loss in direct taxes resulting from agricultural reforms had been estimated at 4.1 billion roubles; the actual loss exceeded estimate by two billion roubles. In order to safeguard the interests of collective farms, financial and other penalties have been imposed on individuals who fail to produce the required output. The minimum output which a peasant is required to produce has also been reduced in order to satisfy the discontented farmers.

CAPITAL RECEIPTS

The Soviet budget is not divided into capital and revenue budgets and the capital budget is mixed up with the national budget. Receipts from loans not accounted separately amounted to 36.3 billion roubles in 1952 and 15.9 billion roubles in 1954. Loans are of several

kinds. Firstly, there is mass loan which is raised compulsorily from all citizens. Secondly, there is lottery loan on which no interest is paid but a few lucky bond holders can be given 3 per cent interest if luck favours them. It is a voluntary transaction. Holders of lottery bonds can sell their bonds freely. Loans are also received from State enterprises and saving banks, as obligatory quota, as these institutions are required to hold Government bonds as a part of their funds. Total receipts from loans decreased from 36.3 billion roubles in 1952 to 15.9 billion roubles in 1954. The prices from the last few years are falling, therefore it was not thought advisable to raise loans since they had to be paid back in due course at their face value.

The Social Insurance Fund yielded 24.7 billion roubles in 1954 compared to 23.2 in 1953 and 21.9 in 1952. The revenue of this Fund is received from State enterprises as contributions, proportionate to their wage payments. Dr N Jasny estimated that this Fund amounted to 9.6 per cent of the total wage payments in 1952. The percentage of the wage bill that goes to it varies according to the branch of economy concerned. Though hitherto only whole-time employees of the State could be benefited by this Fund, about a million of tractor-men who were part-time workers in collective farms were included in the list of beneficiaries in 1954.

'Other revenue' includes premia received from insurance and the income of the machine tractor stations (MTS). Insurance is of two kinds, that for life and old age—this is obligatory—and endowment and other forms of insurance. The yield of the unspecified items increased from 82.2 billion roubles in 1952 to 149.1 billion roubles in 1954. 'Other revenue' included 6 billion roubles in 1952 from MTS. MTS service is provided to collective farms for which they are charged. It is

expected that the yield of MTS will increase because of increase in the volume of work and increase in the service rates. Taxes are levied on producers' co-operatives and collective enterprises. The yield of these taxes was 9.3 billion roubles in 1952. The collective farms have to pay taxes on their gross income. Local taxes and levies which consist of taxes on land, buildings and Kolkhon markets amounted to 7.2 billion roubles in 1951 (*Rural Taxation in the USSR* by Nove). Mr Plotnikov estimated that other tax revenue which also includes registration fee, fines, confiscated property and unclaimed postal packets received from these resources 13.5 billion roubles in 1949. Perhaps because foreign trade of the USSR is itself meagre, revenue from customs is insignificant.

INVESTMENT IN INDUSTRY

Turning to expenditure, it will be seen that the amount of allocation to national economy has been going up since 1952. In 1954 it amounted to 216.3 billion roubles while in 1952 and 1953 it was 178.8 and 180.5 billion roubles respectively. This item is composed of expenditure on investment, stock increase in the economy, subsidies, MTS outlay and experimental work. In the year 1954 expenditure on MTS rose to 30.8 billion roubles from 2.6 billion roubles in 1953. This was due to the extra expenditure on labour and extension work undertaken by MTS. The investment plans could not be fulfilled during the last few years. In 1953 construction plans could be executed to the extent of 85 per cent of the total estimated. The investment on heavy industry during the last few years has increased substantially and there has been a striking increase in the investment in light industry. Marshal Bulganin, the new Prime Minister, addressing the combined budget session of the two chambers of the Supreme Soviet on the 9th this month, said that the

heavy industry "which has developed by three and a half times since before the war" would be developed further. Heavy industry accounted for 90.5 billion roubles in 1954 and 81 billion roubles in 1953, while light industry could attract investment of 14.0 and 7.6 billion roubles in 1954 and 1953 respectively. In the years 1953 and 1954 the expenditure on the construction of houses amounted to 19.4 and 25.5 billion roubles, respectively.

Expenditure on cultural and social development has also increased substantially. This includes expenditure on education, health and social insurance, and social security. Out of the total expenditure of 141.4 billion roubles in 1954 under this head, education and health accounted for 67.2 and 29.3 billion roubles, respectively. The outlay on social security and social insurance amounted to 44.9 billion roubles in 1954 compared to 42 billion roubles in 1952.

Defence expenditure amounting to 100.3 billion roubles in 1954 accounted for 20 per cent of the total expenditure. Following reduction in prices and transfer of items of research from defence ministry to other ministries, the defence expenditure decreased in 1954 from the previous years. Due to the increase in international tension, however, the amount budgeted for defence for the year 1955 is higher at 112.1 billion roubles. Expenditure on atomic energy research, it is interesting to note, has been charged to the Ministry of Education.

Table III—Budgetary Position

Year	(billion of roubles)		
	Total revenue	Total expenditure	Surplus
1952	497.7	460.2	37.5
1953	539.7	530.5	24.9
1954(B)	572.5	562.8	9.7
1955(B)	589.6	562.9	26.7

Both revenue and expenditure of the USSR have increased substantially in recent years, as can be seen from Table III. While revenues have risen by 91.9 billion roubles from 1952 to 1955, expenditure estimated in 1955 budget exceeds that of 1952 by 102.7 billion roubles. The Soviet Union always seems to have surplus budgets though the surplus in 1954 amounted only to 9.7 billion roubles, while in the earlier years it never fell below 24 billion roubles. The reduction in surplus in 1954 has been due to increased expenditure on social services and developmental outlay.

Table II—Expenditure of the Soviet Union

	(billion of roubles)		
	1952	1953	1954
Allocation to national economy ..	178.8	180.5	216.3
Social and cultural expenditure ..	122.8	128.8	141.4
Administration	108.6	109.0	100.3
Defence	14.4	14.3	13.9
Loan service	6.8	9.8	10.5
Other expenditure	28.8	72.4	80.4

Social Welfare and the Plan

(From A Correspondent)

AT one stage, the need for building up the national economy from the village upwards was being emphasised, that accent has not been so evident in recent discussions on planning. The village and the villager and their prosperity and progress have an enormous bearing on national economic progress as a whole. This has been recognised and acknowledged in the Community Projects programmes and in the national extension service programme, and perhaps it will be argued and it is quite possible too that these schemes which are already there will take ample care of the village and rural welfare problems.

Nevertheless it is essential that the greater emphasis that is currently being put on industrialisation should not divert interest from the rural sector. The impact of industrialisation will be mainly on the urban areas and the increase in incomes which it is expected to produce will benefit mainly the industrial workers and others employed in industrial, commercial, transport, communications and other lines of business connected with industry. It does have an indirect bearing on the life of the villager—particularly the landless labourer—in that it may induce the landless labourer to migrate to the town in search of employment on higher wages if he finds the village does not offer him similar or equal opportunities. The agriculturist will benefit also, again indirectly, as some of his basic requirements like fertiliser or steel and iron or cement, will become available to him more easily than before, following the expansion of these industries.

At a particular stage in the determination of plans and targets for the second Five-Year Plan, the needs of the rural and urban areas, the needs of agriculture and industry and the relationship between large and small-scale industries will have to be examined with a view to bringing about a close co-ordination—if not integration—between the two areas and fields of development. Such co-ordination should have as its main objective the prevention of the migration of village talent and the village population generally to the urban areas, by seeing to it that the villages themselves provide ample opportunities for the utilisation of local talent in gainful employment. The employment prospects in the rural sector

will have to be vigorously canvassed in this connection.

RURAL WELFARE WITHOUT LAND REFORM?

In considering the problems of the second Plan, there is also the need—or should be—for simultaneous and continuous consideration of the problems of land reforms. Apart from the political aspects of the problem, there is ethical and moral justification for land reforms, including the imposition of a ceiling on land holdings, which can fill the vacuum created by the abolition of zamindari and other estates. The peasantry's benefits from zamindari abolition will be neutralised if further reforms regarding land are not undertaken by the state governments.

The Planning Commission has this matter already on the tapis and high priority is being given to land reforms like ensuring permanency and fixity of tenures, moratorium on agricultural debts and imposition of an agricultural income tax in some of those states in which estate abolition has become an accomplished fact. Land reforms are also an indispensable factor in the furtherance of the rural welfare programmes under the community development and the national extension service schemes, in so far as they would enthuse the villagers in general and the smaller agriculturists and tenant farmers in particular, to participate actively in local development works. Rural welfare and tenancy reforms, it is increasingly evident, cannot be separated.

SOCIAL WELFARE SERVICES

Lastly, there is the series of problems of social welfare and social services which require to be examined in connection with the formulation of the second Five-Year Plan. There is a general feeling that, while the first Five-Year Plan has made a notable contribution to placing social welfare problems in the picture, those problems had not received the attention which their importance deserved. The need for making a larger provision for social welfare activities, which should be at least twice if not thrice the amount appropriated for them in the first plan (that is to say, about Rs 1,500 crores out of the proposed outlay of Rs 5,000 crores) as well as for co-ordinating the activities now scattered in a num-

ber of Government and state departments and ministries, is incontestable.

WANTED: A PANEL OF SOCIAL SCIENTISTS

Social welfare work should go hand in hand with field surveys in the field of social welfare, social research and provision of more extensive welfare services, and the existing official agencies should be enabled to extend their helpful hand in this respect. Just as a panel of economists has been constituted to advise the Planning Commission in respect of economic planning, the appointment of a competent advisory committee of social scientists to assist in the formulation of schemes and programmes in this field is an imperative need. The Central Social Welfare Board can profitably extend its activities to cover assistance to various institutions and schemes for benefiting the socially vulnerable and defenceless sections, which are not already being covered in its programmes.

STRESS AND STRAIN

Social welfare problems arising out of the stresses of increasing industrialisation and progressive disintegration of the traditional pattern of rural and community life, are of paramount importance as also the problems of backward communities like the Scheduled Tribes and Castes and the backward classes. The beggars, the destitutes, the socially defenceless and maladjusted are among the groups which demand special attention if measures for raising the standards of living are to have any real meaning and permanent effect. The raising of the standard of life of these groups should be regarded as an important and integral part of the measures for raising the standards of living of the population as a whole. The socially backward, the socially unadjusted or mal-adjusted, the delinquent and the socially weak have to be brought up in the social scale and enabled to find their place in the structure of national life, from which social and economic inequalities and injustices are being progressively eliminated.

PROBLEMS OF WELFARE

The interdependence of social welfare problems and economic problems is apt to be overlooked, and indifference in the sphere is apt to

“Cornering” of Shares

Wednesday, Evening

RECENT developments on the Calcutta Stock Exchange are true to type. Equities are drifting downward from the fear that the budget will raise the tax load. Experts are warning investors not to take any interest in stock markets before the budget. Buyers are scarce. Weak holders are liquidating. That is why, equities are gradually registering lower levels.

Tax fears prevail. But there are reasons to believe that the current phase of the stock markets is not entirely a reflection of ‘budgetitis’. It is, of course, obvious that an increase in taxation in the Central budget will have a further adverse effect on stock markets. It is equally clear that equities will rebound upward, if tax fears do not materialise. But it is, perhaps, not yet widely realised that equities may not reach the peak levels of the third quarter of 1954 even if the Central budget does not disclose any increase in the tax load. Basically, the current phase of the stock market is a reflection of the re-defined Congress aim of ensuring a socialistic pattern of economy.

Tea Auctions

To come to details, Tea shares are lower because of the uncertain and erratic trends in recent tea auctions. For the second week in succession, prices have been lower at export tea auctions. Internal tea auctions remain irregularly buoyant. But the realisation is growing that the peak of export prices and of demand has already been reached for this season. That is why, Tea shares are falling. Even so, there is occasional support for some selected Tea shares. This may be partly due to dividend considerations, but it seems to be a reflection mainly of, what is popularly known as, cornering of shares.

No such influence is visible in operation in Jute shares. These shares are going down because everybody is agreed that, at current high prices for raw jute, the industry cannot undertake simultaneous business in raw jute and jute goods with any profit. As raw jute prices rise, jute goods tend to move up. As jute goods prices rise, doubts arise whether exports will be maintained. From output data for

January, it would seem the industry is trying to resolve the dilemma by restricting output. This is a debatable recipe.

Legal Loophole

In and around Lyon's Range, the most lively topic for discussion now is the ethics or unethics of cornering of shares. Many shares were cornered during and immediately after the war. That was how foreign capital was disinvested. Then, as now, the monetary authorities did not deem it proper to exercise control over these operations. Transfer of ownership to Indian hands was initially welcomed. Later, the realisation dawned that it was unwise to effect such change of ownership at fantastically inflationary costs.

About three years ago, a related operation was initiated. It had more than one objective. Some managing agents in Calcutta manage too many companies. Since the publication of the Report of the Committee on Company Law Reform, it became known that the managing agency system would be re-adjusted. Some parties started buying shares of companies managed by some managing agents in order to acquire controlling interest in some of the better conducted companies.

To prevent such activities, the Government introduced legislation which required previous sanction for transfer of managing agency rights and ownership. Some of the companies' shares are now being, to use a popular though not accurate terminology, cornered on the argument that the amendment does not debar change of managing agents or company ownership if the new party or parties put the management of the company in the hands of a director. Evidently, this loophole is being exploited.

Director-Manager

From current discussions on the subject, it would seem that confusion is widely prevalent. What the Government's proposals relating to managing agents are, are not known clearly. It is, however, known that the Government is in favour of substantial modifications in the managing agency system. This should have discouraged the recent activ-

ities of some parties to acquire managing agency rights. It is argued that these activities are thriving because the law does not prevent any transfer of ownership or of managing agency if the change involves replacement of managing agents by director-managers.

This is a legal loophole which will have to be filled in. It will be recalled that the Company Law Reform Committee not only made certain recommendations relating to the managing agency system, but that it also suggested certain readjustments relating to the appointment and rights of directors. It will not be difficult for some of the present managing agency houses to bypass the law by perpetuating the present arrangement through appointment of family members or managing agency partners as directors of the various companies concerned. This is an aspect which will have to be seriously considered by the Government.

Strange Logic

Apart from these wider issues, an interesting episode may now be discussed. Shri B N Chaturvedi, President of the Calcutta Stock Exchange Association Ltd, has gone on record in defence of cornering of shares. One lives to learn. One had to live to witness the current phase of stock market activity in Calcutta, to know that the President of a reputed Stock Exchange like the Calcutta Stock Exchange Association finds nothing wrong in cornering of shares.

His explanation is ingenious. “Experience shows that, in most cases,” he argues, “shareholders benefit in that they obtain a better price than the prevailing one for equities which have been cornered.” On this reasoning, the President of the Calcutta Stock Exchange would seem to favour the activities of all “bull” gamblers or syndicates. Here, the question is not whether Calcutta's experience is that new managing agents have managed the cornered companies better than the replaced agents.

The basic problems that are involved have been discussed in an earlier issue of this journal. But it is strange logic that there is nothing wrong in cornering of shares, as,

ment will necessarily involve something of the latter.

REGIONAL DISPARITIES MUST GO

One last point may be mentioned in conclusion. It is that in the context of the geographical and topographical vastness of India's territory, a uniform pattern of either the planning or implementation of development projects cannot be regarded as easily attainable, even if it may be desirable. Problems and conditions differ with states and regions, and while attempting to fit them into a common pattern, their existence will have to be recognised and provided for. Thus in South India, the pressing need is for land reforms, and for utilising the vast natural resources of the region for economic development. Potentialities of an economic revolution lie imbedded in the effective utilisation of the lignite deposits, extending over a 100 square mile stretch of territory in South Arcot district, for generating life-giving power.

In the Andhra and Hyderabad states, the construction of an irrigation project by which the perennial waters of the rivers Godavari and Krishna can be harnessed for extend-

ing irrigation and cultivation is a matter of top priority. The mineral resources of this area, of which no precise estimate exists now, should be exploited and utilised as part of the national plan.

Again since the exploitation of the country's physical resources should have as its principal goal the advancement of the happiness of human beings and since social solidarity and community feeling have a vital bearing on the success of economic planning, another problem in the South which demands attention is the easing of social tensions. The deepening of these tensions among communities and castes is a distressing fact, which obstructs co-operative endeavour for social or economic progress, and have to be strenuously fought and eradicated. The path to that desirable goal should be through ameliorative agrarian and economic measures which alone can remove the root cause of social and economic disparities.

The conclusion to which what has been said above points is that planning on a regional and state basis should form an integral part of national planning and that an adjustment of both objectives and schemes in these two spheres is indispensable.

bring its retribution by acting as a retarding agent to the progress aimed at. The first five year plan has spelled out the various problems of social welfare and relief to the socially weak and distressed, and has recommended the establishment of an autonomous social welfare board to implement the initial measures needed in that connection. These measures should be expanded and integration of social welfare with economic welfare measures has to be worked out in the second Five-Year Plan. The need for such integration is inherent in the basic fact that in both spheres the private sector has a vital role to play side by side with the public sector and that in both of them comprehensive, all-out and co-ordinated action, as distinct from action on individualised items or problems or isolated treatment of the different problems, is demanded if lasting results are to be achieved.

Far and away, the most significant consideration in drawing up the second Five-Year Plan, and in fact planning in general, will be the techniques that are adopted in achieving the twin objectives referred to above. It is probably too early to prescribe targets in specific fields, but when they are decided upon, they will have to be not in isolation from the financial and physical resources that are available or can be developed and mobilised even while the plan is being implemented in its different segments. It will also have to be based on public co-operation in general, and the co-operation of the particular section of the people affected by a particular programme. To enlist such co-operation, the expert advice of social scientists will be invaluable. The motives that stimulate men to purposeful activity are not listed in government files.

The political factor has to be constantly kept in view, and it cannot be forgotten that any wide divergence between targets fixed and actual accomplishment will produce most unfavourable reactions, which may upset the democratic apperception. Apathy and indifference will have to be fought with these weapons—increased employment, both urban and rural, a rapid increase in industrial and agricultural production through provision of necessary incentives for it and reduction of inequalities in incomes. This last mentioned objective is best achieved through a process of levelling up of the incomes of those in the lower income brackets and not by a levelling down of those in the higher income brackets, though the process of adjust-

ultimately, it is the cornerer alone who is likely to suffer. It cannot be overemphasised that cornering of shares is an activity which is not necessarily identical with an attempt to acquire a controlling interest in a company. Complex problems arise out of attempts to oust the existing managing agents. But cornering of

shares, as such, is a stock market activity which should be discouraged.

Admittedly, more than one motive is involved in the recent move of block buying of shares on the Calcutta Stock Exchange. It has some relation to issues of bonus shares.

But one must confess one's surprise at hearing arguments which imply that if the company concerned does not capitalise its reserves, some enterprising party has the right to make an attempt at cornering the shares concerned so that shareholders can benefit. This is strange logic indeed!

Budget Fears

Thursday, Morning

BOMBAY Stock Exchange which was very steady till last Friday, suffered a sharp decline on Monday. Steels lost all they had gained in the previous month and all the sections suffered notable losses. Subsequently, however, the market steadied at a slightly higher level on bear covering and scattered support for steels.

Consistently discouraging behaviour of Textile shares was the chief factor to cause tired bull liquidation and speculative short selling. Budget fears and rumours further created nervousness and confidence was shaken.

The subdued working of the Textile section for the last four months has checked bullish activity in steels. Slow offtake in the cloth market, and the recent award on labour bonus have raised doubts about the future profits in textiles. The doubts have been confirmed by the results of some of the prominent textile units such as those of the Brady group who have cut their dividends. Lower profits are apprehended for Kohinoor and Swadeshi also. All this has discouraged new buyers.

At the moment, the market is thick with rumours about higher excise duties on cloth, and so no big support is likely to come before the budget is out. After the budget, the situation may change as the outlook for Textiles does not seem to be so gloomy as is thought now. Exports in textiles are conti-

nuing to be satisfactory and there is every reason to believe that they would continue at a reasonably high level. Some of the cotton mills are likely to issue bonus shares if no surcharge is proposed in the budget. The issue of bonus shares may change the outlook for textiles.

From the table of fluctuations during this week, it will be seen that Scindia, Premier Construction and ACC have maintained their values while the market as a whole declined. Selling pressure in Scindias was totally absent at low levels and this is worth noting. ACC made up lost ground on the news that the company will undertake the manufacture of capital goods in conjunction with a British firm. Banks and gilt-edged ruled steady. Delivery of Tata Ordinary at the last settlement amounted to 12,495 shares.

Free Imports of Gold Demanded

BULLION which initially displayed a strong tendency eased at the end of the week. Profit taking by Calcutta operators caused notable decline in gold. Selling pressure in silver was absorbed by short covering and on balance, prices did not decline, as compared with the previous week-end quotations, although the gains during the current week were completely wiped out. The fall, however, seems to be a technical one, and the tendency is steady.

All-India Bullion Traders' Con-

vention which met in Bombay last Sunday passed many resolutions, two of which are important—(1) Protest against amendment to Sea Customs Act, by which the burden of proof in case of smuggled goods is to lie on the accused and (2) Demand to remove the ban on import of bullion imposed in 1947.

Export Quota No Help

LAST week's notification announcing further export quota did not help the cotton market recoup its losses. Initial gains were wiped out by tired bull liquidation and upcountry advices continued to be weak throughout the week. As mills were buyers at lower levels, there was selling pressure at such levels. The tendency is quietly steady.

Shippers are Happy

STEADY conditions were witnessed in groundnuts and the undertone appears to be firm. Shippers were happy as they could overcome the difficulty of shipping groundnut oil before March, thanks to the co-operation by shipping lines. This led to brisk advance in groundnuts, but the top gains were lost on profit taking.

London quotation for groundnut oil which had earlier eased to £96 per ton, rose to £100.

April-May	22- 5	22- 7

Castor seeds market moved both ways on alternate bouts of short covering and liquidation of long positions. Steady to firm conditions in other oilseeds, however, helped to keep short selling in check. Traders hope that export duty on castors will be removed at the time of the budget. The tendency is steady, and moderate shipping business is reported. Foreign quotations were unchanged.

Edited by Sachin Chaudhuri, printed by him at Western Printers & Publishers, 15 and 23 Hamam St., Bombay 1, and published by him for The Asian New Age Publishers Ltd., from Noble Chambers, Parsee Bazar Street, Bombay 1. Business Manager: A. Fernandes.

- 1916: Goodyear supplied the longest Conveyor Belt for a 735 feet centres conveyor at Zenith Furnace Co.
- 1920: Goodyear made first vulcanised splice with steam vulcanizer.
- 1924: Goodyear developed Electric Vulcanizer, eliminating mechanical splice.
- 1925: Splice Vulcanization enabled Goodyear install the world's longest belt 2,434 feet centres at H. C. Frick Coke Co.
- 1938: Goodyear supplied the world's longest belt installed at Grand Coulee Dam with 4,745 feet centres.
- 1940: Goodyear installed belts for world's longest over-land conveyor system at Shasta Dam; Conveyor length 9.6 miles.
- 1948: Goodyear supplied second longest over-land conveyor system at Bull Shoals Dam. Conveyor length approximately seven miles.
- 1949: Goodyear installed world's longest single flight Conveyor Belt of steel cable construction, total length of conveyor 10,960 feet centre to centre at Weirton Coal Company's Mine, West Virginia.
- 1950: Goodyear installed world's highest single flight lift belt for Chicago-Wilmington & Franklin Mine — total lift 868 feet.
- 1954: Goodyear developed and installed first Speedwalk belt at Hudson & Manhattan Railroads, Eire in Jersey City to unload and load 10,800 people per hour commuting to and from the city.
- We are pleased to announce that in accordance with Goodyear's world wide expansion policy, we can offer you conveyor belting manufactured in India in the quality that is expected of a product bearing Goodyear's name.

President's Address

SOME of the observations with regard to the Second Five-Year Plan contained in the President's Address to the joint session of Parliament are worthy of note. That greater emphasis is to be laid on the capital goods industries, on the provision of employment and on a reorientation of the educational system during the next Plan—these are neither fresh revelations, nor sensationally new. But as a firm statement of policy in these matters, they are welcome. In view of the controversy that centres on physical budget and studies relating to the preparation of such a budget, the definite emphasis on capital goods should help clear the air. It is the reference to creation of more employment that will raise great hopes, especially when it is read with the great importance attached by Government to the growth of cottage and small scale industries, both from the point of view of production and of giving employment. But the hopes raised are not sustained by a clearer enunciation of Government policy on this important matter. In fact the address is silent on the steps that are being taken or are under contemplation for the realisation of these aims, beyond the statement that four regional institutes of technology are being established with a view to modernising the techniques in these industries. This, as is well known, is in pursuance of the recommendations of the Ford team of experts who reported on the subject some time ago.

Apart from the modernisation of cottage industries or adoption of improved techniques on an extensive scale, which can be attempted only at a later stage, the fuller exploitation of the production capacity of such industries at their present level of technology will itself require a careful and exhaustive study of physical resources, such as those of raw materials and transport. This has to be immediately taken on hand, if the oft-repeated assurances of Government regarding promotion of cottage and small scale industries are to carry conviction. Indeed, in no part of the economic field have past professions and current practice been at greater variance. From the Prime Minister downwards, every one has talked about cottage industries, but what has been done in these seven years of Congress Government? True, a number of boards have been set up, some financial grants have been made to the State Governments, emporia have been opened in selected cities and expensive shop sites scoured for them. In the press and on the platform as well as through publicity films, the same monotonous propaganda has been carried on and certain catch phrases repeated *ad nauseum*. But even in terms of expenditure incurred, the attention paid to cottage industries will not compare with that given to any other pet schemes of Government. Surely, this is not an indication that such industries are being given a high priority or any priority at all in the scheme of things.

Before anything worthwhile can be done to tackle the problem of cottage industries, a beginning has to be made somewhere and could there be a better beginning than the collection of basic data and sorting out of such data, classification being the first step in knowledge? No

Weekly Notes

"Ship Indian"

SCINDIA has made a great contribution to Indian shipping. The history of Indian shipping and the history of Scindias were one and the same until the other day. Indeed, one may put it the other way and say that the Scindias made the history of Indian shipping. Not that Scindias want to rest on their laurels—far from it, but one would have liked Shri Dharamsey Khatau to linger less on the past and look more to the future. After all, Scindias have a very big programme of expansion that they have taken on hand. A better appreciation of the magnitude of this programme has impressed the stock exchange. Reports about poor working of the company during 1953-54, pin-pointed in the apprehension that dividend might be passed over, had led to a sharp drop in the quotation of Scindia from Rs 22-10 to Rs 15-8 within a period of four months. That the fears were not groundless was proved by the balance sheet and yet Scindias rallied on the stock exchange and rallied in a remarkable manner in a falling market when all the other scrips were tumbling down. They rallied with increasing appreciation on the part of investors of the magnitude of the programme of expansion that has been taken up by this doyen of shipping companies, and the earnest already given of its eventual implementation.

Scindia can and does speak for Indian shipping. This is what the public expected from its Chairman Shri Dharamsey M Khatau and the Chairman's speech which runs into 32 pages of print can justifiably claim to be not only the guide book for Indian shipping, but a charter. The Scindia chief charters the course. "Ship Indian" is the gospel. Fifty per cent of the overseas trade and cent per cent of the coastal trade is the legitimate and fair target for Indian shipping. The battle for coastal trade has been won. The struggle ended only in 1952-53. So Shri S N Haji, the "Father of Coastal Reservation" who introduced the first Bill for the purpose in the Legislative Assembly in 1928 can lay down his charge having fulfilled his task, after 35 years of devoted service to Indian shipping.

The fight for overseas trade, however, has hardly begun. For as Shri

Khatau points out, despite the much advertised expansion of her merchant fleet in recent years, India still does not have adequate tonnage to carry a fair proportion of her overseas trade and the pity of it is that such spare as is available, is not being utilised fully. As against the accepted target of 50 per cent of her own trade which is the legitimate share for the shipping of any country in the world, the tonnage that India plies in overseas trade is not enough even to carry 6 per cent of such trade. From 6 per cent to 50 per cent is a long way to go, but there is no stopping on the way, and that is the destination.

Worse still, Indian shipping has been worsted, in its initial onslaught on this closely preserved territory. Quiet a few zonal conferences which control the trades between ports in the India, UK/Continent sector have not, despite representations from Indian companies, admitted them as members. This results in uneconomic working of Scindia and other Indian vessels operating in this sector. They cannot carry intra-port traffic. The wide distance between India's actual share and the legitimate target to be attained also measures the distance that is to be covered before shipping can be a considerable foreign exchange earner.

Domestic Issues Facing Shipping

"SHIP INDIAN" has not been accepted as a principle, far from being made into a practice, even by the Government of India, and the Scindia Chief's suggestions that all indents for import made by the Government, or public bodies should, as a matter of course, be carried in Indian bottoms will be widely endorsed. The same principle should be incorporated in all trade agreements negotiated by the Government with other countries.

The heavy incidence of port charges, notorious delay in the loading of ships following decasualisation of dock labour, the hinderance to ship-cum-railway traffic caused by the liability of paying sales tax at two points, are matters that demand immediate attention. So do certain features of taxation that specially affect shipping. The inability to build up adequate reserves

to replace old ships at much enhanced cost, however, is not special to shipping alone—it is part of the general problem of replacement faced by all industries. Shipping companies engaging in overseas trade, however, suffer from a particular disability which virtually deprives them of the benefit of relief from double taxation to which they are otherwise entitled. That India-built ships should cost more is again a serious handicap. Equally taxing on such companies is the present method of payment which compels them to lock up their capital for purchase of ships which take so long to complete.

There may not be the same unanimity about the economics of tramp shipping that the Scindia Chairman offers for general acceptance. Here expert opinion differs. There are times and situations when tramps are obviously good investment. Chartering of tramps has its points; elasticity of operations vs rigidity of liner traffic can be debated.

It is in regard to the position of the Indian shipping companies inter-se, that the situation is more controversial, such as in the matter of their respective shares of the coastal trade. Is coastal trade to be regarded as a nursery or is it a nursing home also for the grown-ups, who may return battered from their adventures far afield? Whether the operation of a shipping company can be stabilised only by balancing home trade against foreign trade is again an issue which will be fiercely debated. Open to no such controversy, however, is the future of Indian shipping and the place of Scindias in it.

Slow Coach Building

COACH building has been on the cards ever since rehabilitation of the railways came up for serious discussion after the war. The proposal for setting up a coach-building factory was accepted in 1951-52. Chittaranjan was first mentioned as the proposed site for the factory and the *Explanatory Memorandum on the Railway Budget for 1951-52* had the following entry under this head.

"Coach Building Factory at Chittaranjan—It is proposed to construct a Coach Building Factory at an estimated cost of Rs 3.8 crores. Rs 50 lakhs have been provided in 1951-52 programme."

In subsequent budget statements, the entry appears under the head of "Integral Coach Factory at Perambur"; the estimated cost for the factory and the approximate cost incurred year by year has been given as follows:—

Year	(in lakhs of Rs)	
	Anticipated cost	Expenditure incurred
1951-52	380	6
1952-53	379	78
1953-54	373	144
1954-55	466	388
1955-56	734	228

The progress of the factory can be judged only from the progress of expenditure. But there is one unique and very creditable feature about Perambur. While, as in other Government projects, the cost estimates have gone up from year to year, whether because prices of materials have risen or because the plan of the factory itself had to be expanded has not been explained, the Railway Minister has all these years stuck to the end of 1955-56 as the approximate date for the factory to go into production. In view of this consistency on the point, one has to accept his statements at its face value that progress has been "according to schedule". No earlier date had been promised for the completion of the factory and no explanation had therefore to be offered why the time table could not be adhered to.

In his last budget speech, the Railway Minister repeated his assurance that construction was proceeding according to schedule and that procurement of machinery for the factory has kept pace with it. But while reaffirming that the factory was to go into production in 1955-56, he modified the earlier promise to the extent that the annual production will have to be "phased", from 20 coach shells in 1955-56 to 350 in 1959-60. So, after production begins, it will take the factory another five years to attain its full capacity.

Apart from imports, production of passenger coaches within the country has been considerably increased, from 120 coaches in 1946-47 to 479 coaches in 1950-51 and 806 in 1953-54. The Railway workshops are turning out many more coaches than before and the possibility of further expansion of their coach-building capacity is being examined by the Workshop Reviewing Committee. But even after all that, the annual requirements of coaches being put at 1,157 in the first Five-Year Plan period, and this demand being likely to increase substantially with expan-

sion of railways, until Perambur steps into the breach, no balance can be struck between passengers and coaches and overcrowding in trains will remain a permanent feature. To wait till 1959-60 for Perambur to get into full production appears to be too long a period to wait. Is coach-building a much more complex and difficult problem to handle than the building of locomotives? Members of Parliament casting their eyes about for a question to ask, might consider tabling this one.

Storm Over Tea

IN his well meaning attempt to pacify irate housewives in Britain who are pretty sore about soaring prices of tea, the Prime Minister of Ceylon has landed himself in a pretty mess. He had blamed the trade for pushing up prices, but quite inadvertently, it seems, he had also mentioned offhand a price which he said should be a reasonable price. Mincing Lane retorted by putting the blame squarely on the Ceylon Government for raising the price of tea by raising the export duty on it and made fun of him by starting its bid on the following day at the price mentioned by Sir John Kotelawala. This, of course, only raised a round of laughter. What people in Ceylon said about their Prime Minister is unprintable.

Though earlier, the Food Minister had told the House of Commons that the British Government had no intention of interfering with tea prices, a Labour peer brought up the issue in a poignant manner by urging the Government in the House of Lords to start a campaign to make the British people drink less tea. Indeed Lord Kalverly, the Labour peer, went so far as to suggest that the Prime Minister should ask all Government departments to stop the habit of having 'elevenses'—drinking tea at 11 a.m.

Considerable feeling has been worked up in Britain over the high prices of tea. Blenders and retailers have come out as angels by professing to withhold a price rise which they were on the point of announcing in order to help the consumers. This, they say, would mean a loss of 8d to a shilling per lb of tea that is sold in retail. But they sportingly offered to bear this loss in the hope that the Government would take note and that the hint would not be lost on Mincing Lane. Actually, after all these hulla-baloo, auction prices in London have come down but whether this is a tempo-

rary decline or not, would be known only in the next few months when shipments of India are seasonally slack.

Backward—Even in Crime

INDIA lags behind the civilised West even in cognizable crime. The incidence of such crime per 1,00,000 of the population in this country is only 165 according to the Secretariat of the International Criminal Police Commission, as compared with 1,342 in UK, 1,322 in USA, 1,484 in France and 2,992 in West Germany. The next backward country in this respect is Turkey where the incidence is 246 per 1,00,000 of the population. The figure for Japan, in keeping with its progress in other spheres is, relatively high, in fact, higher than in UK, USA or France. It is 1,605 per 1,00,000.

But why is crime against property so low in this country? Is it because the Penal Code is extremely severe on crime against property and less so in the case of crime against person? In respect of theft, India's figures are the lowest in the world. This may be as much due to the rigours of the law as to the efficiency of the police; but the point will not be cleared unless statisticians work out the incidence of theft recorded as against theft committed. Whether it is simple theft or serious theft, the figures are telling, the incidence of the former being 69 in India against 911 in UK and 986 in USA.

It is only in wilful murder that India holds her own against the rest of the world, the incidence of such murders being 2.9 per 1,00,000 of the population as against 0.8 in UK and 2.0 in West Germany. Whether wilful murder means premeditated malice or not, the subject must engage the serious attention of social scientists. On a superficial reading, the figures suggest that the economic and social transition through which the country is passing has not created such problems of adjustment for the individual as to provoke anti-social activities coming under the law. It may be that the pace of change is taken to be higher than what it is; but the higher incidence of wilful murder also suggests the reaction of an unsophisticated mind to a situation which it is not able to handle objectively. Suicide unfortunately does not figure in these records. It would probably be a better index to social adjustment than any other. But it may be that for the police in every country it is not a problem of serious concern.

Save your heirs the burden of

CRIPPLING ESTATE DUTIES

If you are a landlord, industrialist, or other large estate-owner, in the event of your death, have you considered what difficulties your heirs will have to face if they do not have ready cash to pay the death duties on your estates? It can mean either forced realisation of assets, or sale of business or property, or surrendering of assets and property to Government. For Death Duties have to be paid before legal possession of your estates can be obtained by your heirs!

To help you help your heirs, the Bombay Mutual has evolved a scheme whereby it becomes easy for you to provide your heirs with the necessary cash to enable them to take possession of their rightful inheritance without hardships.

Established 1871

NAS 116-53

Chief Agents: Mohan Sons & Co., 125 Manekji Wadia Building, Mahatma Gandhi Road, Bombay; M. C. Shah & Co., 54, Gandhi Road, Ahmedabad.

ESTATE DUTY POLICIES DELIVER ESTATES INTACT

The Bombay Mutual Estate Duty Policies are designed to prevent the disintegration of your estates in the event of your death, and to enable your heirs to take possession without incurring heavy liabilities. The following are the chief advantages:

1. The amount of the Estate Duty Policy is available immediately on the death of the policy holder—no tedious and irritating legal and other formalities are required.
2. The amount of the Estate Duty Policy is free of Estate Duty.
3. The premiums on these policies rank for income-tax abatement, subject to the usual limitations.
4. It prevents the disintegration of property in the event of the heirs being unable to provide the amount of Estate Duties on their own.
5. In the case of claims arising under these policies, policy moneys would be considered for payment direct to the Estate Duty Authorities.

TEMPORARY ASSURANCE

Under Section 9 of the Estate Duty Act 1953, gifts made within a period of 2 years prior to the death of the donor are liable for Estate Duty.

This risk of death within 2 years of making gifts can be adequately covered by a two-year Single Premium Temporary Assurance Without Profits Policy.

How Are Our Railways Faring?

HOW are our railways faring? They are the largest nationalised undertaking not only in this country, but also in the world on this side of the Iron Curtain. What is more, apart from natural curiosity about the undertaking itself in which so much public capital has been sunk and on which depends the smooth working of other industries and agriculture as also the future development of our economy, people have more than a detached interest in the operation of railways. The service rendered is more or less uniform and of the same quality. And more people come into contact with it than with any other single undertaking. Railway travelling and litigation are believed to be the only pastime of the rural population. Therefore, few are left out of its operations. There may still be a few villages which are tucked away at the back of beyond whose residents have never in their lives seen a railway train or travelled in one. But their numbers must be dwindling fast.

So everyone wants to know something about the railways, on what scale they have been operating, at what rate the services have been expanding, and at what cost. Are we getting full value for our money in the colossal capital investment on railways? Is there any measure for judging progress such as a layman can understand?

The public are certainly welcome to have a look at the working of the railways. The Railway Board is not secretive. The full budget is presented to, and discussed by, Parliament. There are white papers for those who want more exhaustive information. There is the annual report by the Railway Board, of which the latest issue now available is for 1952-53. But some time must elapse before all the returns can be put together and an exhaustive account presented.

The layman's understanding of this mass of data, however, is a different matter altogether. The impact on his mind of accounts of ton miles of goods moved, millions of passenger miles carried, total train miles run, gross earnings and working expenses is not unlike that produced by the reactions of the seven blind men of the fable sizing up an elephant. What do all these add up to? Are our railways getting the

best out of their existing resources; and if not the best, what percentage of the attainable total if the latter were to be expressed by a figure? In the case of industrial production we may not know, but we think we know, what the existing capacity is, and to what extent this capacity is being utilised in any one year. In respect of agriculture, we roughly know how much the yield has been per acre. Those who are attracted by such problems may look up the yields of other countries, figure out how our performance compares with the best of other countries and then detect the obstacles that stand in the way of our improving the yield and of ways of removing them. But in the case of railways there are no such ready reckoners.

Now such a statement may be dismissed as tendentious, if not as a downright travesty of truth when so much data is being published and so much trouble taken to make such data easily understandable to the meanest intelligence through charts and diagrams.

True, the railways have been among the very first to have an Economic Adviser all to themselves; and since last year, they have had the services of an Efficiency Bureau which must be working for the benefit of those who need such data as the number of hours that a railway wagon is on the move and the number of hours that it is standing idle, the ton mile per goods train, traction per locomotive and so on. Moreover, the railways, too, have had the Five-Year Plan and are going to have the second Plan for which a Planning Cell is being organised this year. Would it not be too much to ask for more?

At the risk of being considered importunate or worse, the honest layman must still confess his ignorance and express doubt. The aggregate figures do not tell everything. More passenger train miles run, or the impressive figure of locomotives contemplated or actually turned out from Chittaranjan or Telco may have their significance; but to the 3rd and Inter Class passenger who had only the other day to balance himself precariously on a miscellaneous heap of luggage, with end of a steel trunk projecting dangerously from the bunk overhead and the sleepy head of a fellow-passenger resting on one of his shoulders and

the leg of a sleeping passenger dangling on the other, will hardly be comforted by these figures. Safety of life and limb, sitting accommodation and the minimum of convenience such as a reasonably clean lavatory and free access to it, would any day be preferable to him than fans in the compartment or retiring rooms at wayside stations and better station buildings. What is the state of overcrowding in Inter and 3rd Class compartments? Is there a measure for it which can be readily conveyed in terms of the actual experience of such passengers? If there is one, a non-expert study of railway reports, however diligently pursued, does not reveal it. The Railway Minister refers to everything else, but not to this crucial figure.

To the layman, not familiar with the complexities of accountancy, the financial statements appear to be exhaustive enough. But to those who know something of the technical problems of railway operation, operational data such as shunting miles (unproductive engine miles) either in absolute figures or as a percentage of total engine miles and the statistics of locomotive or wagon usage are deceptively irregular. From these operational statistics one gathers no trend; so one cannot say whether efficiency has been going up or down in a significant manner.

It is no concern, of course, of the Financial Commissioner of Railways who signs the explanatory memorandum to the railway budget to say anything about the technical efficiency of railway operation; but it is rather surprising that the Railway Minister should leave it out altogether. So until some time next year, we will not know how these things worked out in 53-54, and we will have to wait for another year to know how the performance of the current year compares with that of previous years.

To put it rather crudely, the public has a right to know before all this money is sanctioned for capital development and buying more rolling stocks and the like, what effort is being made to get more out of existing equipment. In other words, how much more traffic can be moved, with what little extra investment? There is no criterion readily available to judge how well whatever development funds are sanctioned can be apportioned between rolling stock

and expanding line capacity, for example, or among various segments of railway operation to get optimal results?

To begin with, there is the condition of railway tracks. Fast engines and soft tracks do not yield optimal returns. To buy expensive high-powered engines to haul slow trains does not appear on the face of it to be the best possible use of resources; and yet considering what one hears about the condition of tracks and the rate at which arrears of track maintenance are being worked off, the analogy that readily comes to mind is that of using race horses to draw goods wagons. It is possible that the situation is not as bad as all that; high-powered locomotives may not be used to speed up trains but they may draw many more wagons. It would be useful to know if that is so.

Then there is the question of full utilisation of rolling stock. By adding more sidings to existing tracks, so that trains may be moved quicker, by increasing the capacity of marshalling yards and effecting such other minor improvements, with a comparatively smaller investment than is needed to increase rolling stock, the idle hours both of engine and of goods wagons can be appreciably reduced.

The striking example of increased traffic without a commensurate increase in rolling stock was provided during the war years when Americans took over Assam-Bengal Railway and increased its carrying capacity far beyond what Indian railway authorities had considered feasible or practicable. This was done largely by introducing the follow-on system in place of the usual method of signalling on Indian railways, viz, that of passing a train only after a clear signal has been obtained from the next station. Whether or not a significant improvement in traffic can be obtained by changing or improving the present signalling system at comparatively small cost, is a question that occurs to the layman, to which again the Railway Board has not thought fit to provide an answer. In fact, even a cursory glance at the list of publications of the Railway Board highlights the conspicuous absence of studies on traffic problems and economics of railway operation in contrast to the plethora of studies on engineering and other technical problems.

Faced with the study of traffic problems in this inadequate manner, the lay mind finds it quite incompre-

hensible how the Railway Board fixes its targets and plans development. To begin with, there is no measure of the volume of traffic that is waiting to be carried and is not able to get transport. True, bottlenecks are reported and attention is focussed on some of them as in the movement of coal traffic or transshipment of metre gauge traffic between north and south. The Khandwa-Hughli line, taken up last year, is an instance in point; so are the works sanctioned or in progress during the current financial year for stepping up the movement of goods wagons in Mogulsarai from a daily average of 1500 to 2000. There are doubtless many others, but it would help us understand the situation better if against the investment in this direction could be put the results expected from such investment in such a manner that costs could be weighed against advantages.

In a way, the planning of railway development follows its own line. No more than a general growth factor need be assumed for giving cogency or precision to such a plan. After all, there is such a thing as a general rate of growth of population, of production and of movements of men and goods. But how is the planning for railways related to the general plan of development, either the First Five-Year Plan or the Second? Are traffic requirements related uniquely or in any predictable way to the targets that are set for the industrial and agricultural sectors? Is the growth of passenger traffic which the railways are presumably trying to provide for in advance taken as an independent variable that follows a standard rate of growth, or is it sought to be related in some way to the increase in money incomes aimed at in the Plan? Clearly for specific projects included in the Plan, such as the establishment of Steel Plants, more specific data must be available.

If railway rates have to be what traffic can bear, what decides the fate of new railway lines to be laid, doubling of track or expansion of line capacity? Is it the pressure of traffic crying to be carried, or does the final decision depend on public agitation for a new line and the technical feasibility of construction which is, after all, an engineering problem. The lack of a measure for weighing alternative uses of resources or the deliberate disregard of such a measure, where one is available, is seen at its worst in the case of passenger amenities. Here, many things are done with an obvious eye to publicity—sure eye on the main chance, if you like to put it that way—with

complete disregard of the superiority of the one with respect to another, real or fancied, and the real benefits of the uses themselves.

To be fair, however, one must confess right at the beginning that there is a hiatus in the psychological or objective estimation which cannot be removed. As a railway passenger, one may appreciate the allocation of Rs 3 crores for passenger amenities, however much one may differ about the right uses of this large amount. But how to weigh the relative merit of these 3 crores against 4 crores proposed to be allocated for the building of staff quarters? Those who have experience of long-distance travel by 3rd class train on particular routes belong to a different world from those who work on railways as menials or subordinate members. Here, the blind man examining the tail of an elephant is trying to relate his experience to those of others who had been feeling the trunk or the leg or the tusk. But about the use of amenities, something can be said without any fear of contradiction: the allocation of a part of these funds to a use, which the railways have not yet thought of, can greatly augment the value of the benefits provided. This is in the matter of social education. Amenities can be usefully combined with some measure of education to the passengers, specially the lower class passengers. This would be cheaper than vestibule cars, more easily understood as corridor trains.

If over-crowding is a matter for railways to handle, the discomfort and inconvenience of over-crowding can be greatly reduced if a sensible arrangement is made for the transport of passengers' luggage. No trip to the continent or even to the Soviet Union by railway teams, financed at the cost of railway passengers, can possibly bring alleviation, because in no other country have people to carry so much stuff, such as one's own bedding, for example. Past experience does not justify the hope that much can result from exhortations to passengers to carry less luggage or to put such luggage in the brake van. The arrangements for weighing and booking by brake van have to be greatly improved, but even this will not be enough since passengers on Indian railways carry so much load. Something far more convenient and practical has to be thought of such as fixing suitable racks at the end of the compartment or providing receptacles at convenient distances, specially on long-distance trains.

There are others, of course, where the railway service cannot be held to be at fault. The public have to co-operate, but such co-operation has to be developed by intensive training of a sort that comes under social education. In recent years, in pursuit of the laudable intention of providing better passenger amenities, at least the larger stations have provided bathing arrangements in the convenient form of rows of cubicles; but many of these cubicles are being used not for bathing, but as lavatory. That may be because enough lavatories are not being provided or because of the insanitary habits of the bulk of passengers.

Soap is as good as earth for washing one's hand and the use of twigs is just as hygienic as tooth brush, if not better. But in addition to wrappers, banana leaves and leavings from foods, if earth is piled up on the floor and muddy water thrown all over the place and ablutions are performed in the compartment, in preference to the lavatory, with demonstrative expectorations and audible gargling, surely, the railways cannot do anything about it except to teach and then, insist on the adoption of practices less troublesome to

other passengers.

Visitors to China pay glowing tributes to social education on the railways, of the passengers being told every two minutes over the microphone what to do and what not to do, of the aseptic cleanliness on railway trains and platforms. While the prospect of the microphone screeching at one all the time may not be liked by all, surely, some less irritating means could be found which, let us hope, would be equally effective in ensuring minimum decencies in railway travel.

I-Ching, the last of the Chinese pilgrims visiting India who left a substantial record of his tour, carried back with him glowing tales about our excellent hygiene: the use of earth for washing one's hands, and the clean lavatory arrangements then common in the country. That was in the 6th century AD. Alas, those hygienic observances will continue, much to the discomfort of many railway passengers, and what can the railways do about it except to tell the people that soap will do just as well, that every passenger who wants to keep clean should carry a piece of soap or better still, provide some soap themselves, and if necessary add

that the use of soap has also the sanction of the Shastras.

Anyway, it is not enough to put up a Board to say that the railways provide special staff to assist passengers. Shri Lal Bahadur Shastri has to think out an elementary scheme of social education, if the amenities now being provided are to serve the purpose. This is a long overdue measure. Gandhiji is on record as saying, "It needs a heroic effort to eradicate age-long insanitation". He was thinking of the village. Village sanitation, he said, is a vital part of village work and is as difficult as it is important, and the village worker who is not a successful scavenger cannot fit himself for village service. Neither can Lal Bahadurji run the railways successfully if he is not prepared to take upon himself this task enjoined by Gandhiji on the village worker. After all, India lives in the villages and the villagers also use the railways. In his budget speech, the Railway Minister devotes a paragraph to Khadi, but planting this emblem of purity on the Class IV staff will be a joke so long as cleanliness on the railways remains conspicuous by its absence.

The Parliament Opens

Wednesday, Evening

IT is really strange that the two outstanding events of the last two days—the President's opening address at the Joint Session of Parliament on Monday and the Railway Budget presented to Parliament on Tuesday—should have fallen flat on the public. The President's report on the state of the Republic, his Government's recognition of the People's Republic of China and its right to Formosa, the Pancha Sheela (the five principles of co-existence), the menace of the Hydrogen Bomb and a somewhat bald reference to the priorities of the second Five-Year Plan—threw little light on the past or on the future.

The President's address has become something of a routine matter. The common people, not interested in Parliament or President, came out to see the colourful procession, in which the head of the State goes out in a grand manner, preceded and followed by sawars in red and gold. This is now beginning to pall, and to some extent even to irritate the people, because of its association with the British Raj. It was only to be expected that the President of the common people would do away with this pomp, and a period of eight years was considered as sufficiently long to end these jarring reminders of the Viceregal period. It is said that the President and the Prime Minister have been anxious to end the show but for its adverse effect on employment! What will happen to the hordes of these people (and their families) whose only job for all these years has been to dress colourfully and to salaam! But didn't the Prime Minister say in his autobiography that work is only calling to be done? Can't these people be fixed up in some purposive occupation? Meanwhile, however, this yet 'Ma Baap' Government can't afford to throw these people on the streets. So let them remain with their dresses, their families and their horses and continue to pay their respects to the rightful successors of sovereign authority!

'BAG OF TRICKS'

Like the President's speech, the Railway budget presented to Parlia-

ment yesterday, broke no bones, nor made any. It is no use going over the railway statistics here, for these have been widely published all over the country. The reception to the railway budget has been somewhat cold. In one of the local papers, it is described as a bag of tricks. Really that is too much, for it is quite innocent—"innocent of ideas". It shows how we are still thinking in terms of "the values of '39"—small concessions and a little rationalisation. It is hardly realised here in New Delhi that people will not be satisfied with mere financial concessions: holiday tickets or an anna off platform tickets, etc. People are longingly looking for a real change that would make the railways, the people's railways. The departments of Government are not yet thinking in a big way and a sense of priorities is lacking.

The Prime Minister's arrival in New Delhi on Thursday last was an event of greater importance than either the President's speech or the Railway budget, which shows that he really constitutes the locus of sovereign power. Without him, Government was like a circle without a centre, if you can imagine one. It was quite a sight to see him being met by the President with a rose in hand, and a whole procession of beaming Ministers, whose careers and destinies depend on his will. How these 'colleagues' of the Prime Minister looked anxiously for his alternating smiles and frowns, is indicative of the beginning of a new, though strange, kind of dictatorship. It reminded the present writer of an article Pandit Nehru wrote on himself anonymously in the *Modern Review* some years ago. Writing in the third person, Pandit Nehru said in that article that though he might pretend, he had not in him the makings of a fascist (this is from memory). Since his arrival, the Prime Minister has been busy with Cabinet meetings, dealing with matters, big and small, which were awaiting attention in his absence. He has also delivered some speeches about the international situation and how to implement the Socialist resolution on the domestic front. In his opinion, the Formosan crisis, while sufficiently serious, will not

lead to an actual conflagration. Being humble by nature, he did not take any credit for pouring oil on the troubled waters of the China Sea.

It appears he has still his fingers on all the background moves being made for tackling this delicate situation. The Prime Minister has his due place in developments in the Middle East also. Probably there is a feeling in some circles that the Government of India is looking on complacently on the efforts of Pakistan to build up an Islamic bloc in the Middle East. The Turkish President is at the moment on a visit to Karachi. It will be recalled that our Prime Minister met Col Nasser on his way to India. This was preceded by a conference between Marshal Tito of Yugoslavia and Col Nasser on the Suez Canal. If you link it up with Marshal Tito's visit to India and Burma that preceded these conferences, you will have reason to believe that we are not lagging behind in the diplomacy that is attempting to build a house of cards on the sands of the Arabian desert. And then, are not preparations being made for the Asian-African Conference, which will bring together the peoples of these two continents and pit them against the colonial diplomacy of the Western Powers attempting to bolster up the defunct regimes of the Middle East?

BAIT FOR INDIA?

The SEATO Powers are meeting at Bangkok and at the time of writing, the principal figures are flying over or around this sub-continent for the conference. Incidentally, an interesting report has been received here from Pakistan that this conference is likely to debate the possible admission of Communist China to the United Nations, provided it accepts that position without permanent membership of the Security Council; and in order to attract India within the defence organization of the SEATO, India may be offered the fifth permanent seat on the Security Council! We shall, of course, not join any bloc of powers—truth to say, a third bloc, neutral yet active, has already emerged—but if this materialises,

IT-9468

we shall be hitting two birds with one stone, securing China's admission to the United Nations and bagging the permanent seat for ourselves. The Prime Minister deserves it.

On the home front, the Prime Minister seems to be anxious to see that the Avadi Resolution on building up a Socialist society is implemented in some manner, immediately if possible. At the meeting of the Congress Parliamentary Party on Sunday last, he is reported to have remarked that that resolution was "passed in all earnestness, faith and sincerity and not for catching votes". Probably certain moves in this direction will follow the passing of the 4th amendment to the Constitution. At this party meeting, the Prime Minister also referred to the entry of Pandit Pant into the Central Government and described him as a tower of strength to the party and Government.

SOME KITE-FLYING

Incidentally, one does not know how the talk has revived of Shri Morarji Desai joining the Central Government to strengthen it. Probably the Central Government will be all strength then. But will Shri Morarji strengthen it in the Socialist direction? The speculation, however, appears to be a sort of kite-flying, attempted in connection with the return to New Delhi of Shri TTK. He came, saw the Prime Minister and went away on the same day. The main purpose of his visit seems to be that the Prime Minister, born gentleman that he is, wanted to part from his colleague in a friendly manner. At the interview, TTK is reported to have insisted on an integration of the Ministries of Commerce and Industry and Production with himself at the head of the combined Ministry in the interest of proper economic co-ordination. The Prime Minister is going to consult his colleagues about the change. If there is logic in integrating these two Ministries, then there is no sense in keeping apart the Department of Economic Affairs from a combined Ministry of Economics, with Labour as a subordinate office. We have, however, not reached this state of rationalisation in Governmental thinking. We are only anxious to rationalise large-scale industry without trouble, if possible.

This brings us to the really vital issue that hangs on the 4th amendment to the Constitution. It pro-

poses to make Parliament and State Legislatures the sole arbiters of compensation. This omnibus Bill has provisions concerning conditions in which the State may acquire land, set limits to holdings, take over the management of property, transfer undertakings and modify rights in public utilities. Frankly speaking, the Congress Party is against it. But what can the Party do, when every one of its members craves for the patronage of the Prime Minister and longs to become a Deputy Minister or at least a Parliamentary Secretary? As things are, it will not be long before almost every one of them will have a post of some sort or another, of higher or lower grade. After all, we have to prepare for Socialism and these great gentlemen of the business world, expecting the private sector to dry up with the expansion of the Socialist State, must be trained to man positions of responsibility in the new regime. How truly this fits into the Marxian analysis would be obvious only to the academic man, but the developments are interesting and we are on the road to Socialism.

Apart from these developments, New Delhi has been otherwise busy. There has been a conference of Chief Ministers desiring more powers for themselves. A beautiful flower show was held at the residence of Maulana Azad and a dance recital of the Triveni school at the Sapru House. Dr Helen Keller has arrived. A powerful personality, she is a reminder of what sheer spirit can achieve against all the disadvantages of the material environment. She made a close and affectionate study of the Prime Minister and the President and her presence reminded us of the problem of the two million blind among us. The Government of India proposes to start a full-fledged institute for the blind at Dehra Dun, with kindergarten, primary schools, training centre and workshop.

KEYNES PLAYED OUT?

Amidst all these happenings, however, the most interesting were the concluding lectures of Mrs Joan Robinson of Cambridge at the Delhi School of Economics. These dealt, in a broad way, with the economic theories of Marx, Marshall and Keynes regarding the nature of capitalism. Mrs Robinson emphasized the propagandist element, particularly in the theories of Marx and Keynes. She warned students

THE ECONOMIC WEEKLY

to beware of the deceptive faculties of the economists. In her opinion, facts had knocked out the bottom of the Marxian theory—the facts of rising real wages and the attachment of the proletariat in Western democracies to capitalist methods of production and standard of living. She emphasized the limitations of the Keynesian theory; and though she did not say so explicitly, she clearly meant that the Keynesian theory had been played out. She did say in so many words that in its application to the economies of underdeveloped countries, Keynesian economics was plain nonsense. For a time, in her opinion, Marshall's theory of capitalism as a beneficent force over a long period, has been borne out by facts.

Dr V K R V Rao, who presided over these two lectures, said that the conclusions of Mrs Robinson's thesis amounted in a practical way to this, that Capitalism was a system that had succeeded and was likely to last with beneficent results in the Western world, but in backward economies, Socialism was the only practical method of achieving rapid development. This was, in his opinion, an argument in favour of co-existence. It is difficult to say whether Mrs Robinson agreed with Dr Rao's conclusions. It must, however, be considered a very significant fact that the academic lectures of Mrs Robinson, delivered in the University of Delhi—quite a world by itself and distant from official and business places—should have been so well attended not only by young boys and girls but by busy officers, business men, the clergy and others from almost every walk of life. Not long ago it was difficult to gather persons in any large number except for seeing an actress. Here was an academician using technical terms and dealing with intricate economic and political problems, being listened to by packed audiences overflowing into the corridors of the university. It must, of course, be confessed that besides the faculty of rigid economic analysis, Mrs Robinson has a sweet voice and an extremely witty way of presentation.

LEFT INTELLECTUAL

Kingsley Martin, of the *New Statesman and Nation*, has been here and spoken the international situation. A man of marked sincerity and firmly held convictions, he attracted the *elite* to a packed hall at Sapru House. The ideas

THE ECONOMIC WEEKLY

presented are those with which we have long been familiar, as readers of the *New Statesman and Nation*. Unfortunately, the delivery was disappointing, though he spoke with obvious zest and humour. He said that the Americans are bluffing and the Russians playing a calculated game, as on a chess board. There was, of course, a contradiction in what he said, for while he seemed opposed to American diplomacy (and hitching the wagon of Britain to the rising star of Pandit Nehru), it was clear from his speech that the Russians could not be made reasonable except by a threat of war such as has been persistently presented by the Americans during the last few years.

Then the hoteliers have met in an international conference inaugurated by our Vice-President. Unfortunately, I am so allergic to all exhibitions of snobbery that I have not been able to read the many pages that have appeared about this Conference in the local press, much less attend its deliberations and feasting which were held at a place just across the road.

Following the Chinese exhibition, has been the inauguration of the Soviet Arts and Crafts Exhibition at the permanent premises of the Indian Arts and Crafts Society. This is really an impressive exhibi-

tion, probably the most beautiful exhibits being the oil paintings on boxes of papier mache. These, of course, contain the portraits of famous Communists both in Russia as also abroad (Saifudin Kitchlew among them). But most of them are without political significance, being the portraits of Russian poets and artists.

In the basement of the All-India Arts and Crafts Society building a different ideology is being presented. The MRA (Moral Rearmament) has organized a photographic exhibition, mostly portraits of principal statesmen with their statements in support of moral rearmament. MRA also staged "The Real News" at Sapru Hall on Feb 25. But none of them attracted many people. How is it that Moral Rearmament makes no appeal to the younger generation but Soviet art does? The Soviet Exhibition of Arts is to be followed by a Hungarian exhibition. We are being treated really in an ample measure to the artistic traditions and possibilities of the People's Democracies. The Communists are employing other methods too. On February 22, Czechoslovakia presented to the Prime Minister a model of a four-seater plane. Officers of the Chinese Embassy visited the Delhi Legislative Assembly and were entertained

by its New Chief Minister.

IDEAS IN THE AIR

This letter would not be complete without a mention of some brilliant ideas now in the process of gestation here. There is a proposal to municipalise cinema theatres in the State of Delhi. An MP desires that we should raise a memorial to the great poet, Kalidasa. Government is contemplating the setting up of a Central Planning Authority which would turn Delhi into a Greek City State. The Ministry of Housing, in collaboration with the Community Projects Administration, has prepared a blue-print for changing the very face of the six-lakh villages that constitute India. Not all these proposals and ideas will succeed in passing the test of the survival of the fittest. In the meantime, people are waiting for the budget (the people's budget) to be presented on Monday next, and expectations vary between a mountain in labour bringing forth a mouse and the emergence of a full-blooded Socialist state. Meanwhile, the budgets of some of the principal States have appeared with large deficits on revenue account to be made up presumably by Central grants and loans on the capital side. Not many are conscious—few even among the economists—that a revolution is currently taking place in Federal finance.

MMC

revolving flat cards

are now being extensively used
in Textile Mills in India.

Outstanding features

1. Five distinct setting points, used singly or in combination, to control setting to .001 inch.
2. Johnson bronze bearings, for cylinders and doffers. Roller bearings to cylinder; ball bearings to doffer and ball bearing comb box also provided as optional equipment.
3. Ball bearings to lick-in pedestals.
4. Self-lubricating 'O-lite' bearings at several locations.
5. William's patent stripping motion for flats.
6. Drop lever with new disengaging handle.
7. Fluted lap roller with positive gear drive from feed roll helps uniform feed of lap at the back with minimum possible stretching.
8. Cards can be geared for any production in a mill organization.

Letters to the Editor

German Recovery and the German Worker

MAY I correct a howling error committed by your London correspondent in his otherwise admirable study of the German economy which appeared in your Independence Number, August 15, 1954? If the correspondent seriously believes that subjective opinions and objective facts must of necessity be blended together, he is of course entitled to the right in question. There is little to be done about it except to be very guarded in swallowing any arguments so presented hook, line and sinker. This applies to your correspondent's statement—nowhere proved or even attempted to be proved except in the trivial sense of state-aid to export industries—that the idea of the sensational German recovery as being based fundamentally on the "free market economy" is a myth.

But what about the obviously false statement that the living standard of the German workers has been going down? Mark well, the correspondent does not say that the rate of increase in real wages is very small or that the national wage-bill has in relative terms retained a constant percentage share. This is the stand which nearly all the important German trade unions took and take now—and one which I for one support. But it simply is not true that there has been any deterioration in the living standards of the German industrial or other workers. Taking 1938 equal to 100, the Real Weekly Earnings of Industrial Workers was a bare 83 in 1949; it rose to 106 in 1951; but in August last year, it was 126. This is computed by dividing the weekly wage index by the consumer price index. The real wage indices would thus be greater, had Labour Cost-of-Living index-series been used as the divisor.

If your correspondent has any other figures, I, as a keen student of the present German economy, shall be grateful to have them. My figures are taken from the *Handbook of Economic Statistics* prepared monthly by the Commercial Attache Division, Office of Economic Affairs, HICOG, Bonn. There are also a host of other German statistical sources, but I cite this one, as being in English, it is easier for non-German speaking economists to consult.

Lastly, your correspondent does not mention as a very essential part of the West German "miracle"—

its magnificent achievement in absorbing over 13 million refugees and displaced persons from the territories of Germany annexed by Poland or ruled by the Communists. There is, of course, the seasonal high unemployment, especially due to the stoppage of house-building activities. But, in general, the rate of unemployment has been reduced to about 4.6 per cent of the labour-force.

I do not want to sound malicious, but really your correspondent should consult the relevant authorities before committing himself to paper... Coffee-house discussions are another matter.

'Far East'

I MOST emphatically disagree with the suggestion in your editorial comment on my letter that "the United Nations went to war in Korea at the incentive, stimulus or spur of America". America was responsible only for putting the case before the Security Council. Had she not done so, Britain or another member would certainly have taken the initiative. America has no more votes on the Security Council than any other represented nation and thus the responsibility for what followed lies equally between all the nations who voted—including India.

The United Nations went to war on the recommendation of the Security Council and it will be recalled that Russia and her friends, in the classic political blunder of the age, had previously staged a walk-out on some other issue and were thus not on hand to veto the vital vote. Otherwise the resolution for action in Korea would never have survived. The United Nations could never "go to war" at the incentive of one nation alone. Mine was not a "quibble over words" as you choose to put it but a quarrel over the misrepresentation of facts in order to suit your editorial platform.

Referring to the second part of your comment, I agree that the British Labour Party opposes America's Formosa policy. But the degree of opposition varies from the moderation of Attlee to the extremism of Bevan and the fact that these and other Britons disagree with certain aspects of America's foreign policy does not mean that they all

THE ECONOMIC WEEKLY

endorse an entirely opposite view. Moreover, were the Labour Party in power they would doubtless forget election-eve vote-catching and pursue a more responsible foreign policy as they did when the Conservatives were in opposition.

By coincidence, the day following your publication of my analogy between Neville Chamberlain's folly and today's co-existence, the *Sunday Standard* in reviewing Viscount Templewood's new book *Nine Troubled Years* made the following comment: "Some of the cherished beliefs and statements of Chamberlain appear so much like those of Pandit Nehru, that an Indian reader of this book will be irresistibly drawn to a comparison between Nehru's policies and those of Chamberlain, and will ask himself anxiously whether the same fate awaits Nehru. The issues of war and peace that face the world today are so much akin to those of 1936-40 that it would be worthwhile for us to analyse the reasons for Chamberlain's failure and the flaws in his policy."

the production of guided missiles, nothing is said about the defence against enemy ejected missiles.

"A POINT OF NO RETURN"

The conclusion is inescapable that Britain's and NATO's defence plans are based on nothing more than the "knock-out blow" or "push-button" mentality. On this mentality also rests the framework in which the army is to operate. The conventional use to which armies are put are, in current thinking, only appropriate to cold war tactics. The army is now to be armed with atomic weapons—in this capacity, however, it increases the risk of spreading local conflict into a general war. If full atomic power is used in a small conflict, world war must be the outcome. Field-Marshal Montgomery is not dismayed. He said, "We have reached a point of no return." The road to a fully armed world is being trodden with some abandon and peace lies precariously in the balance. And yet, the White Paper speaks with an alarming naivete that the search for a disarmament scheme will continue side-by-side with the manufacture of H-bomb and other modern weapons of warfare.

THE ECONOMIC WEEKLY

From the Calcutta End

West Bengal's Second Five-Year Plan

DR B C ROY's budget speech as West Bengal's Finance Minister should have been interesting had he not stopped where he did. The economic problems of West Bengal were set out with admirable brevity but a Finance Minister cannot get away with a mere statement of the problem. It is his business to formulate a solution to the problems. Dr B C Roy did not even make an attempt to devise a solution. Probably, he will retort that the problem baffles solution. He will not be wrong. It is difficult to be optimistic about West Bengal's economic future.

Finance Ministers of States, one should have thought, have been deprived of one of their pet themes. Since the incorporation of the Deshmukh Award in the Finance Commission's report, the States Finance Ministers are not so aggressive as before on the issue of allocation of resources between the Union and the units. But they still clamour for a larger share in the pooled, and poolable, resources. Dr B C Roy repeats his last year's emphasis on the two financial paradoxes which impede progress. One is the paradox between wealth and the taxing power of the State. West Bengal is an urban, industrial State. Enormous wealth and income are generated within the State. But West Bengal does not reap the whole benefit. New Delhi takes a lion's share of the taxes on income and profits. There is that much less available to the State to finance plans for improving its economy.

Not only West Bengal, but all the States demand more resources. If New Delhi will not let them have their legitimate shares in the taxes on income and profits, they claim more Central aid to finance their development projects. West Bengal Assembly has passed a non-official motion seeking aid from the Centre to create and foster "industrial estates" in the State to solve unemployment. "Industrial estates" are to be developed in Durgapur and Kalyani. Readers of this page will not be unfamiliar with the tussle between Calcutta and New Delhi on the West Bengal Government's plans for industrialisation.

Bengal is the home of Permanent t. Many learned disserta-

tions have been written on its merits and demerits. At the time of its imposition, it was a burden. Gradually, with economic improvement, that load became lighter. Landlords grew rich. Bengal became the home of agricultural aristocracy. This may explain Bengal's rich tradition, culture and literature. But this also explains Bengal's relative poverty. This is, perhaps, all that an educated adult need know about this Permanent Settlement controversy. Zamindari abolition will, incidentally, augment the State's land revenue. That could have been done by abolishing the Permanent Settlement. There are many who are inclined to the view that zamindari abolition is a social and psychological necessity.

ZAMINDARI ABOLITION

But its economic advantages should not be over-emphasised. In partitioned Bengal, in West Bengal, the economic advantages of zamindari abolition are negligible. Scarcity of land is a major economic fact of West Bengal. Because the land-man ratio is so low, even zamindari abolition will not benefit the State much. West Bengal has the highest ratio of land utilisation. Cultivable waste land is scarce. There is already the problem of deforestation. Money is being spent on afforestation of waste land. Afforestation efforts should be speeded up. But all this means that there is not enough land to go by.

Here are some elementary data. After the implementation of the Estates Acquisition Act, 3.9 lakh acres will be available to the Government for distribution among the owners of uneconomic holdings. There are 8.65 lakh families who own less than two acres each. If the areas released through the operation of the Estates Acquisition Act are distributed to these uneconomic holders, the average size of their holdings will not increase by even half an acre. Seventy per cent of the owner-cultivators will still have uneconomic holdings. So, zamindari abolition is no solution to the problem of rural unemployment.

LAND IS SCARCE

Land cannot absorb more people. Here, the main problem is to help those who are dependent on land

to be on a subsistence level. This is where cottage industries come in. Rural, cottage industries must be developed, along with land reforms and improvements, to stimulate rural economy. Such a simultaneous plan for improvement is not only expected to solve rural unemployment, but is also recommended to check the population movement away from the village to the town and from the town to the city.

Dr B C Roy's statement of the economic problem, as well as his suggested solution, is based on three premises. Land is scarce. So the problem of unemployment must be solved through industrialisation. Small-scale cottage industries are to be encouraged with two objectives: they will create a balanced rural economy and help to provide a temporary solution to unemployment. Large-scale organised industries are to be expanded simultaneously to provide lasting employment and economic progress. No exception will be taken to this statement of the economic problem, as well as to the suggested solution of unemployment.

Dr B C Roy has emulated Shri Chintaman Deshmukh in supplying quantitative details about the unemployment problem in his State. He relies on the unemployment surveys undertaken by the State Statistical Bureau for his estimate that the unemployed employment-seekers in West Bengal number 10.1 lakhs. The annual net increase in the employment-seeking population is estimated at 1.2 lakhs. During the second Five-Year Plan, therefore, the problem is to create jobs for 16 lakhs of people. Almost the whole of this employment will have to be in the non-agricultural sector.

On the assumption that the average income per head in the non-agricultural sector is Rs 1,000 per year, employment of 16 lakhs of people will generate an income of Rs 160 crores. On the input-output estimates assumed by Shri Chintaman Deshmukh, in one of his discussions in Parliament on the objectives of the second Five-Year Plan, Dr B C Roy concludes that Rs 700 crores of additional investment will be needed to generate an income of Rs 160 crores.

There are many non-Bengalis employed in West Bengal. Some of the expenditure will have to be incurred in foreign countries. Taking into consideration these two aspects Dr B C Roy concludes that Rs 1,400 crores will have to be invested to create full employment conditions in West Bengal in the second Five-Year Plan. Calcutta, New Delhi and the private investor

will have to assume collective responsibility to solve this stupendous problem.

It is where Dr B C Roy leaves that the problem becomes interesting. In the budget speech, he did not disclose the detailed plans for solving the problem. These plans are still at the blueprint stage. Many are sceptical whether the West Bengal Government's or the

Planning Commission's tentative plans for full employment will, or can, materialise. But even sceptics will concede that "the multi-purpose schemes like the Ganga Barrage, or the industrial projects like the Durgapur Coke Oven Plant, etc, are not mere attempts at a diversification of the economy of West Bengal, but are matters of life and death to her".

From the London End

The White Paper on Defence

WAR under thermo-nuclear bombardment would be a struggle for survival of the grimmest kind... all should realize the magnitude of the disaster war would bring." That being a basic premise in the White Paper on Defence Policy published this week-end (February 18), it would have been expected that some concrete measures for the international control of nuclear weapons would be suggested as a logical step towards avoiding the threat of war. But no, Britain is to become the third great power to manufacture the hydrogen bomb. Its possession, says the White Paper, is a deterrent to war. This alone is the "way to peace". This type of argumentation is not new. In 1950 the world was given to understand that the 'peace through strength' policy of the West would require a systematic process of armament and military alliances. In the five years that have passed, armament expenditure has been pushed up at a rate unparalleled in peace-time and today, when one would have expected that the "position of strength" attained would have been such that peace may be negotiated, the world is still presented with the "urgent need" for German rearmament and increased possession of thermo-nuclear weapons.

TOP PRIORITY TO AIR POWER

Britain's defence spendings during 1955-56 will amount to an estimated £1,537.2 million. This is £102.7 million less than the estimate for 1954-55. The allocation between the services of these budget estimates is given in the following table:

Allocation to Services

	(£m)	1955-56	1954-55
Admiralty		347.0	367.0
War Office		484.0	561.0
Air Ministry		540.4	537.0
Supply Ministry		147.5	151.0
Defence Ministry		18.3	23.9
		1,537.2	1,639.9
Less US aid		43.0	85.4
Net cost to UK		1,494.2	1,554.5

It will be seen that the Air Ministry is to get the largest share of the estimated expenditure. This follows from what the White Paper describes as "strategic air power being the primary deterrent" to any would-be

aggressor. The main deterrent is the Royal Air Force whose primary task now is that of building up the V-bomber force with its nuclear potential. Apparently the first squadrons of V-bombers would be in commission this year.

Except for the allocation to the Army, no substantial change in expenditure is estimated for the Navy or for the Supply Ministry. The Navy is being supplemented with a number of heavy carriers though its conventional role is not disturbed; the White Paper considers the Navy to be essential for sustaining the country's foreign policy (this smacks of Gladstone's "gun-boat diplomacy") and for supporting the strategic reserve.

"OFFENSIVE" DEFENCE

The two most important aspects of Britain's defence policy, that of civil defence against nuclear warfare and production of nuclear weapons, are given some consideration in the White Paper. Should the current cold war be converted to a hot war, the primary task of pure defence would rest on the RAF. The expansion of Fighter Command has been completed; orders have been placed for air-guided weapons; the proportion of all-weather, radar-equipped fighters, are to be increased. A projected Mobile Defence Corps trained in fire fighting and rescue is under consideration. This corps is to serve as the link between the public and the armed forces. Deep shelters are planned and alternative ports are being constructed. Finally, reserve stocks of essential commodities are being built up. With regard to the H-bomb, the actual production has been reached and this achievement has apparently been accomplished independently of what the Americans have been doing.

The planning envisaged in the White Paper conforms closely to that agreed by NATO. Some three months ago Field-Marshal Montgomery had said in categorical terms that he wanted "... to make it absolutely clear that we at SHAPE (NATO's supreme planning staff) are basing all our operational planning on using atomic and thermo-nuclear weapons in our defence". The British authorities, having set their teeth into such a system of military planning, have to a large extent only

established the "offensive" aspect of defence. Their planning of pure defence—in particular, civil defence—remains insignificant, if considered in relation to what thermo-nuclear weapons can in fact do. Field-Marshal Montgomery himself in the same address claimed that "there is no sound civil defence organisation in the national territory of any NATO nation" and added that unless such security exists, "a nation will face disaster in a world war, since the home front will collapse."

HOME FRONT LEFT EXPOSED

It would seem utterly illogical that the military heads both at SHAPE and London should base all their operational planning on action which by any view leaves the home front exposed to the risk of collapse from enemy retaliation. Yet the statesmen of the NATO powers at their meeting in Paris last December and now the White Paper endorse this planning policy.

If we examine the actual civil defence preparations, it will be seen how appallingly inadequate they are against the known effects of H-bomb explosions. Rescue and fire fighters organised in a unit are utterly irrelevant to the magnitude of their task. On the subject of shelters, the White Paper can only plan for areas on the fringe and outside the circle of devastation by blast and heat by the H-bomb explosion. There is some talk of population dispersal, but consideration of the existence of concentrated centres like London, Birmingham, Manchester and so on, show how unhelpful this measure can be.

There is, of course, the attention which is given to interception of enemy aircraft. Fighter command is being strengthened and new equipment of various types is being installed. But even here, there can be little confidence. For, to avert the catastrophe Field-Marshal Montgomery had in mind, air defence would need to attain almost 100 per cent effectiveness at the outset and this is hardly conceivable. The most optimistic estimate of interception is about 25 miles. In any event, as the military commentator Liddel Hart recently pointed out, there is "no means in existence or in prospect of intercepting atomic missiles". While the White Paper speaks of Britain's own progress in

(Continued on page 284)

Not really. Everything has gone wrong with the village this morning. The rice mill has packed up. Perhaps the chukkiwalla left his fuel tank uncovered overnight, or he may have been fiddling about with the injector. (You'll never get him to admit it!) At all events, smoke is coming out everywhere and life in the village has almost come to a standstill.

GOOD MORNING BOKTARI !

It's on occasions like this that the engineer from Burmah-Shell's Technical Service enters into the nerve centre of Indian life. He takes his coat off and gets down to work. He's seen many rice mills and other machinery in his travels, and he's developed an uncanny knack of getting to the bottom of fuel and lubrication problems.

If you have your problems—large or small—ring up your nearest Burmah-Shell office (or contact the local representative) and ask for our Technical Service. You'll find them very sound people to deal with.

BURMAH-SHELL... IN INDIA'S LIFE AND EVERY MOVING PART OF IT

Imperial Bank Compensation

Shashikant V Shah

THE scheme for nationalisation of the Imperial Bank has reached a very advanced stage and there is no point in arguing the pros and cons of such a policy. The possibility was first hinted at in 1948 by the late Shanmukham Chetty, the then Finance Minister. Strong objections to the proposal were voiced by both the later Finance Ministers Dr John Matthai and Shri C. D. Deshmukh at one time or another. But that is now ancient history and we need not spend time discussing it.

The proposal took concrete shape when the Rural Credit Survey Committee recommended the creation of a State Bank of India by amalgamating some State Banks with the Imperial Bank. Government accepted the recommendation and decided to take over the management and control of the Imperial Bank in the first instance.

Naturally, there arises the question of paying compensation to the existing shareholders. Government has indicated that it intends to take the average stock exchange value of shares over a period of time as the basis to determine the amount of compensation.

In order that compensation be just and fair, it must satisfy two requirements: (1) Compensation should be equal to the value of the assets taken over, and (2) the person to whom compensation is paid should remain as well off as before in terms of income after his assets are acquired. It is possible that both the criteria may not be satisfied simultaneously as in a case when the value of the assets may have risen while income may have remained stationary or even declined. But in that case, the benefit should go to the owner of the property rather than the State.

STOCK EXCHANGE VALUATION

Now let us see how far the stock exchange valuation basis satisfies the above requirements. Superficially, the solution is simple and an attractive one. However, this arrangement assumes in the first place that buyers and sellers know all the relevant facts. Unfortunately, in view of the obscurantist policy of the directors of Imperial Bank,

this is not so; stock exchange prices are based on what the directors have chosen to show of asset values and earning power. It is common knowledge that the bank had considerably understated in its annual accounts both its earning power and asset values. In doing so the directors acted quite sincerely in their belief that they were serving the interests of the investors by adopting such a course. As things have turned out, however, their action may result in a considerable loss to the investors.

Financial conservatism, highly praiseworthy in itself, has prevented any but a token amount of the profits from becoming reflected in dividends and consequently in share prices. The Chairman of the Imperial Bank in his speech at the annual general meeting of the shareholders in 1951 had observed:

"After full consideration of the accounts your Board has decided that there was justification for a more liberal distribution to shareholders and accordingly, the dividend for the six months ended the 30th June last was declared at the enhanced rate of 16 per cent per annum thus restoring in full the cut imposed in 1931." (Till that time the dividend was 14 per cent per annum.)

Voluntary dividend limitation has been scrupulously observed to further reinforce the innate conservatism of the directors. No one need infer that the progress of the bank during the period was negligible. The Imperial Bank is an ever-growing institution but because of the directors' policies, this progress has failed to be reflected in the market value of shares.

NOT A FAIR PRICE

Further, given the essential data for the assessment of a fair price, the argument in favour of market price of shares as a basis of take-over is valid only in a non-political market where prices are governed by purely economic considerations. However, in the case of the Imperial Bank the threat of nationalisation has been hanging like a Damocles' sword ever since 1948 and the stock exchange prices were never free from this fear. Moreover, the

bank was obliged by an agreement with the Reserve Bank to open a certain number of branches and convert Treasury offices into agencies where Reserve Bank had no branches. This was an added burden since most of these branches and agencies had to be worked at a loss. No doubt, the bank was paid an annual lump sum and enjoyed the right to use vast sums of Government funds interest-free, but these hardly compensated for the losses incurred by the opening of such unremunerative branches, especially when the cost and charges structure of the banks had got hopelessly out of alignment owing to the various labour awards. Given such risks, it is a proven fact that the investor over-rates them by demanding too high a yield.

BRITISH TUC REJECTED MARKET VALUE

Again, at the market price, only marginal buyers and sellers will be willing to exchange their holdings. To adopt this value as a basis of compensation is therefore manifestly unfair. Before concluding the arguments against adoption of stock exchange prices as a basis for compensation I would like to quote some extracts from the Report of the Trade Union Congress (UK) to the 77th Annual Congress held in 1945. They are as follows:

"(a) Market Value of Shares and Stocks:

This basis has the superficial advantage of providing easily ascertained figures whether taken as the quotation on one particular day or as an average of quotations on a number of days. It has however, serious objections... stock exchange quotations are only indirectly connected with the real value of any undertaking to the community. They are the price level at which there is a rough balance at any particular time between those holders who are prepared to sell and people who are prepared to buy in the light of their separate anticipations of income and capital appreciation during the period for which they wish to hold the shares or stocks. Such quotations may include capitalised estimates

of ability to exploit monopoly or subsidy conditions and on occasion can be manipulated. Moreover, stock exchange quotations can be affected by the official money policy of the country."

These are revealing remarks, coming as they do from a body that is all for nationalisation and State control.

INCOME NOT A SATISFACTORY BASIS

The shares of Imperial Bank occupy a unique position in that they have always been considered as near-gilt-edged and are widely held by widows, minors and trusts who look for a steady income and security of capital. If stock exchange value of shares are used as a basis for compensation, the incomes of many widows, minors and trusts will decline precipitately. It is on this ground that the Bombay Shareholders' Association has argued for compensation on the basis of income as adopted in case of nationalisation of Bank of England. This would satisfy the second requirement of our basis for just compensation, but not the first. As stated earlier, with considerable ploughing back, dividends have been voluntarily limited at levels which were considerably lower than that warranted by the profits of the bank. This method of compensation would not allow the shareholders to participate in the assets of the bank that have been built up at their expense.

VALUATION OF ASSETS—ONLY FAIR BASIS

The only satisfactory basis is, therefore, the valuation of assets taken over by Government. Indeed, this is not without a precedent because only recently the Air companies were taken over on this basis. In UK Coal and Road Transport have also been acquired on this basis. Shareholders are fighting shy of recommending this procedure after their disappointing experience in the case of Air companies. The valuation has taken almost two years and it is not over yet. Till such time, the funds of the shareholders will remain frozen. In order to avoid such difficulties, an interim compensation provision could be made as was made in UK when coal mines were nationalised. This would be infinitely better than adoption of the crude and unjust method of stock exchange valuation as the basis of valuation.

There is little point in working

out the asset values attaching to Imperial Bank shares from balance sheet figures, although even on such calculations stock exchange valuation will be found to be far lower. The least that the Imperial Bank can do is to come forward and give out the full facts about its assets. It can call in independent valuers

to value these assets. This will be of considerable help in future when stock exchange prices are made the basis of compensation.

Let not the shareholders find that the massive pillars of the Imperial Bank symbolising security are made of clay.

The Story of the Indian Press

Reba Chaudhuri

THE Press Commission had many things on its hands; to prepare a history of the development of journalism in India was not among its terms of reference. Nevertheless, it felt that such an account would help its deliberations by providing a background to the enquiry. Hence this handy volume of 287 pages, compiled on behalf and under the direction of the Press Commission by Shri J Natarajan, Editor of *The Tribune*.* Among the appendices to the Press Commission Report, there is varied fare, a sample survey of newspaper readership, a one-man survey of the quality of news reporting in the Indian Press, in the style of reportage, but spoiled somewhat by too many missing issues of the papers that are supposed to be studied and so on. The volume on history is not such fancy fare. It is a useful compilation, albeit a little staid and fills a gap since there is no other up-to-date account available today.

The volume records in brief the origin of the Press in India, its trials and tribulations, Government patronage as also the repression it had to face. To provide a background to the Press Commission Enquiry, it presents a concise survey of developments both in the English language and Indian language Press. The evolution of the Press has been very closely connected with national awakening in this country, so much so that up to pre-Independence days, the history of the Press can hardly be separated from that of the social reform movement and Nationalist movement.

TRIBAL ORIGIN

Taking the functions of the Press to be those of conveying Government policies to the public, keeping Government informed of public needs and reactions to Government policies, and keeping Government and the public informed of events, the author takes back his story to primitive times and to meetings of the tribal society which developed the method of modifying or ampli-

fying policies and of making the "will of the chief known to the tribe as well as of ascertaining the will of the tribe as a whole".

In a later era historical evidence shows the ruler making his will known to the people through edicts and proclamations. Another concurrent development was the agency whereby the ruler acquainted himself with activities which threatened in time to develop into a challenge to his authority. News letters from ministers, news writers and secret service men were also an early institution which kept the ruler regularly informed of developments in various parts of the country and among different classes of people.

In the Moghul period, news-writers were appointed to various administrative units in their territory, and were charged with the function of sending reports to the headquarters of the administration. The East India Company also requisitioned the services of news-writers for the same purpose as Moghul emperors.

THE FIRST NEWSPAPER

The first attempt to start a newspaper in Calcutta was made in 1776 by Mr William Bolts who had resigned from the Company's service earlier that year after censure by the Court of Directors for private trade. The notice of his intention to embark on the enterprise made it known that he had "in manuscript many things to communicate which most intimately concerned every individual", and this naturally gave rise to alarm in official quarters. He was directed to quit Bengal and proceed to Madras and from there to take his passage to Europe. For the next twelve years, no attempt was made to emulate Mr Bolt's example. In 1780, James Augustus Hicky started the *Bengal Gazette* or the *Calcutta General Advertiser*, in the first issue of which he introduced himself as "the late printer to the Honourable Company". Hicky's *Gazette* specialised in the exposure of the private lives of Company servants. This soon landed Hicky in trouble.

SUCCEEDING VENTURES

The ventures that followed were

promoted by men who benefited from Hicky's bitter experience. In 1780, Messrs B Messink and Peter Reed published the *Indian Gazette*. Four years later followed the *Calcutta Gazette*, published under the direct patronage of Government, and in the following year, came the *Bengal Journal* and a monthly, the *Oriental Magazine of Calcutta Amusements*. With the *Calcutta Chronicle* which was published in 1786, there were four weekly newspapers and one monthly magazine published from Calcutta within six years of Hicky's maiden effort. The new editors trod warily the trail which Hicky had blazed for them. The first newspaper in Madras, the *Madras Courier*, came into existence in 1785 as an officially recognised newspaper, founded by Richard Johnson, the Government printer. It continued without a competitor till 1795, when R Williams started the *Madras Gazette*, followed a few months later by the *India Herald* which was published without authority by one Humphrey who was arrested for unauthorised publication, but escaped from the ship on which he was to be deported to England.

Censorship was first introduced in Madras in 1795 when the *Madras Gazette* was required to submit all general orders of Government for scrutiny by the Military Secretary before publication. Free postage facilities were withdrawn, and on both newspapers protesting, it was decided to impose the levy at the delivery end. Bombay's first newspaper, the *Bombay Herald*, came into existence in 1789. The *Courier*, which was published a year later, carried advertisements in Gujarati. The *Bombay Gazette* was published in 1791, and the *Bombay Herald* was merged into it the following year, being officially recognised for purposes of official notifications and advertisements in the same terms as the *Madras Courier*.

ANXIOUS FOR OFFICIAL FAVOUR

In Bombay and Madras, newspapers do not seem to have come into conflict with Government in this early period. On the contrary, they were anxious to earn official recognition and to enjoy official favour. In Bengal, however, the

* Report of the Press Commission, Part II, History of Journalism. Compiled by Shri J Natarajan, Editor, *The Tribune*. Manager of Publications, Delhi, 1954. Pp. 287. Price not mentioned.

291

position was different, and in 1791, William Duane who, in partnership with Messrs Dimkin and Cassan, acquired *Bengal Journal* and became its editor, walked straight into trouble by publishing the rumoured death of Lord Cornwallis who was then campaigning in the Maratha War.

In more than one sense, the turn of the century marks the end of a phase in journalism in India. During this period, there were no Press laws as such. If the person intending to start a paper was already *persona non grata* with Government or with influential officials, he was deported forthwith. If a newspaper offended and was unrepentant, it was first denied postal privileges; if it persisted in causing displeasure to Government, it was required to submit in part or entirely to pre-censorship, if the editor was 'incorrigible', he was deported. Another aspect of journalism in India during this period was that the journals contained material exclusively of interest to, and relating to the activities of, the European population in India. The early newspapers were started by ex-servants of the Company who had incurred its displeasure and their columns were devoted to the exposure of the evils and

malpractices of the time. The general features of the Press during this period were:

(1) The first newspapers were started by disgruntled ex-employees of the Company, and they were aided and abetted by servants of the Company who used these newspapers for the furtherance of their personal rivalries and jealousies.

(2) The circulation of newspapers published in this period never exceeded a hundred or two hundred; hence there was hardly any danger of public opinion being subverted.

CONTROL OF THE PRESS

The bureaucrat of efficiency, Lord Wellesley, imposed rigid control on the Press. There was difference of opinion at the highest level both in India and in London as to what the official attitude towards the Press in India should be. The provocation for issuing the regulation came from the Editor of the *Asiatic Mirror* who published some estimated figures, giving the strength of the European and native population. Strangely enough, the seven newspapers in Calcutta complied without demur. But soon it was found that newspapers were not submitting to pre-censorship with any regularity. Consequently, other restrictions were

imposed on the Press and all public meetings were banned by order of the Governor-General in Council (April 9, 1807). The rigid restrictions imposed on the Press led to the publication of a spate of pamphlets which bore neither the name of the author nor that of the printer. Some significant developments took place in the field of newspaper publication between 1813 and 1818. The first newspaper published by a native, Gangadhar Bhattacharjee, the *Bengal Gazette*, lived only for a year. In 1818, John Burton and James secured permission to publish a newspaper under the name of *Guardian*. The Serampore missionaries started three journals: *Dig Darshan*, a monthly magazine in Bengali, *Samachar Darpan*, a weekly Bengali paper, and *Friend of India*, a monthly periodical in English, followed two years later by a quarterly of the same name. *Samachar Darpan* continued publication till 1840. Press censorship was abolished by a regulation issued on August 19, 1818, and the responsibility for excluding matters likely to affect the authority of Government or injurious to the public interest was left to the Editors themselves.

(To be continued)

From the Chair

The Scindia Steam Navigation Company Limited

Extracts from the Speech of the Chairman Shri Dharamsey M Khatau
at the 35th Ordinary General Meeting of the Company held on Wednesday,
23rd February 1955, at Scindia House, Ballard Estate, Bombay.

UNFORTUNATELY, the over-all working result during this year has not been as satisfactory as that of the previous year; this has been due to a lower level of freight, poorer liftings of cargo, and lesser tonnage employed in some of the trades. On the Coast, the rates for the carriage of salt in 1954 were reduced by Rs 3 per ton, for cement by about Rs 2 per ton and reductions had also to be made in the rates for several items of general cargo. In the Adjacent Trades, where freights depended on open-market conditions, the rates at which freight was earned were lower during the year than in the previous year.

So far as our tonnage position is concerned, five 7300 dwt cargo ships are under construction for us in the Visakhapatnam Yard. I must mention at the start that the quality of the ships built at Visakhapatnam is in no way inferior to those built abroad. In fact, foreign experts have opined that they compare favourably with those built in foreign yards.

As regards operating expenses, while expenditure has remained more or less at the same level as in the preceding year in the case of most of the items, there was a noticeable increase in marine dues, stevedoring and transshipment expenses and particularly in repairs, because of extra expenditure incurred in providing passenger comforts as per Deck Passenger Committee's recommendations accepted by the Government.

As sanctioned by the Extraordinary General Meeting of the shareholders held on the 29th March 1954, the share capital now consists of shares of Rs 20 each fully paid instead of Rs 15 per share.

Over Rs 3 crores stand invested at present in a form that brings practically no return to us. I refer to our investments in the shares of The Eastern Shipping Corporation Ltd, and Hindustan Shipyard Ltd, and to the amount due from Government of India in respect of payment for the Shipyard. Further, the payments made by us to Messrs Hindustan Shipyard Ltd on account of steamers under construction, which, as on the 30th June 1954,

amounted to over Rs 216 lakhs, have been locked up for abnormally long periods owing to considerable and continuing delays in the delivery of the ships. Thus, it will be noticed that over Rs 5 crores of our resources bring us no return.

As regards Scindia Workshop Ltd, this subsidiary company has enabled us to carry out repair work on our ships at reasonable costs. The old Workshop is being modernized in accordance with the advice of experienced experts.

Coastal Coal

Gentlemen, as you know, the carriage of coastal coal is the mainstay of coastal shipping. Government have indicated in recent months their willingness to divert larger quantities of coal cargo to the sea-route; but they have at the same time been pressing for reduction in freight rates as a condition precedent to doing so. In this connection I wish to emphasise that it is the carriage of substantial volume of cargo at an economic rate of freight and not merely the volume of cargo, that would enable the coastal shipping to stabilize and develop further.

The current sea rates, as a matter of fact, are not high or unreasonable and it is necessary, in the interest of the recognized objective of assisting the shipping industry by diversion of more coal to the sea-route, to increase at least some of the rates of freight on coastal coal. In this connection, it will be recalled that soon after World War II the British Government paid during 1946-50 a Coastal Shipping Subsidy of about £450,000 a year to 14 Coastal Companies under their Freight Equalisation Scheme in order to prevent diversion of cargo from sea transport to the less expensive but overburdened inland transport system.

Rail-Sea Co-ordination

This brings me to the allied question of rail and sea co-ordination. The Merchant Navy has always formed an integral part of a Nation's Transport. If the shipping companies are to contribute their share in building up the Merchant Navy, there should be cargoes available for

lifting at paying levels. The Coastal Conference have been pressing the Government to co-ordinate the two modes of transport by suitable adjustments in rail rates, arrangements for through bookings, etc.

This subject of rail-sea co-ordination has moreover a wider application. The use of preferential rates on Indian Railways for cargoes meant for or coming from overseas, if they are shipped by national tonnage, provides an elastic method for securing its legitimate share in the carriage of our Overseas Trades. I therefore trust that Government will be good enough to explore this avenue for encouraging Indian Shipping. In such an investigation the shipowners will be prepared to play their part.

Owing largely to immigration restrictions in Burma, the traffic on Madras/Rangoon passenger service has been falling from year to year. As against 32,000/35,000 passengers carried in 1948-49, passengers carried in 1954 were about 10,000. There is also a heavy decline in the movement of cargoes between the two ports. Thus this service continues to be a losing proposition. We have approached the Government for adequate assistance that would enable us to cover the losses and earn a reasonable margin of profit. Unless a reasonable solution can be evolved, we shall be compelled to stop this service altogether.

Indian Coastal Conference

Gentlemen, I informed you at the last meeting about the growing malpractices on account of which we decided to resign from the Indian Coastal Conference.

On a pressing appeal by other members of the Conference we agreed to withdraw our resignation and to give a trial to a machinery for prevention and detection of irregular practices. I am glad to say that the Coastal Conference has therefore recently appointed a Committee to evolve a suitable pooling arrangement under which Member Lines would be entitled to carry their respective quotas of the coastal trades. Under a well-conceived quota system with provision for deterrent

penalties, there would be no restriction on legitimate expansion of tonnage; it would also ensure observance of Conference rates and practices, thereby promoting healthy development of national shipping on the Coast.

Charters on the Coast

In the purely Coastal Trades Indian shipping companies have already reached a position where they can fully cope with all coastal traffic with their own tonnage. We therefore welcome the decision reached at the last meeting of the Consultative Committee of Ship-owners held in November 1954 that no foreign chartered vessel should be allowed to operate on the Coast from 1st April 1955 except that any charters which have already been sanctioned would be allowed to run out their unexpired periods. While in the present conditions it would be necessary to continue to permit chartering for Adjacent and Overseas Trades, the ships chartered for this purpose should not be allowed to operate on the Coast except only for the purpose of positioning a chartered ship between one voyage in the Adjacent or Overseas Trade and another such voyage. Further, the substitution of owned tonnage transferred to an Overseas Trade by chartered tonnage on the Coast should not be permitted as it would defeat the basic purpose of coastal reservation.

Tonnage in Adjacent Trades

As regards Burma-India and Burma-Ceylon Trades, at present Indian companies are entitled to carry only 50 per cent of these trades, the remaining 50 per cent being catered for by non-national lines. In this connection, it is important to note that the Union of Burma Shipping Board is already operating two large ships specially designed for the carriage of rice and coal. Ceylon also has begun to develop its own shipping. We fully appreciate the aspirations of our neighbours to build up their own national shipping and we welcome their entry into these trades. It is only in the fitness of things that the cargoes emanating from or terminating in India, Burma and Ceylon, should be carried increasingly in the national bottoms of these countries to the mutual advantage of all of them. Trade relations between India and Pakistan are an important feature of our West Coast trade. I therefore hope, particularly in the prevailing more cordial atmosphere of today, that these relations will improve to our mutual advantage.

Tankers

It is a well-recognized fact in transport economics that a national fleet is incomplete without its appropriate quota of tankers. The question has now assumed particular importance in view of the fact that three oil-refineries are being established in the country. As India possesses no oil-wells so far, this question has a two-fold aspect: (1) the carriage of three million tons crude oil from overseas to the refineries, and (2) the movement of about a million and a half tons of refined products along the Coast of India. Not only no provision has been made for India's participation in the carriage of crude oil to her shores but, for the thirty-year period of the agreement the oil companies have been given the right to operate their own or chartered tankers on the Coast in spite of the fact that the coastal trade of India has been reserved for national ships. However, it should not be difficult with good-will on both the sides to modify the terms of the agreement entered into with foreign corporations and, when that happens, the Government should hand over the operation and management of two coastal tankers they propose to buy to a company operating along the Coast with a view to forming a nucleus of a tanker fleet and its expansion in due course.

India/U.S.A. Trade

We were compelled to pull out of the India-USA cargo service during the year under review, as we found that the voyages performed during the year showed unsatisfactory results, with no prospects of improvement.

India/U.K.-Continent Trade

Ships withdrawn from the India-USA Service have been diverted to the India-U.K.-Continent trade. Notwithstanding abnormal delays, with the employment of the full number of 12 ships which we are at present entitled to employ in this trade, we were able to consolidate our position by suitable programming of our vessels.

I shall now refer to certain handicaps the Indian Lines experience in normal trading operations by being denied membership of some of the Conferences. You may be surprised to learn that, while our vessels loading on the Conference berth for UK-Continent can accept cargo, say, at Calcutta for Colombo or Aden, they cannot accept export cargo from Colombo to UK-Continent ports. Similar is the position in the trade from UK to Aden, UK to Colombo,

etc. This restriction affects the economic working of our vessels. We are pursuing this matter with the Conferences concerned and I only hope that they will see the reason and force behind the Indian Lines' contentions and redress their longstanding grievances at an early date.

A further and a more important restriction which comes in the way of Indian Lines providing a much more efficient service in this trade arises from their being limited to employing not more than 12 vessels. We thus have no rights similar to those enjoyed by our non-Indian colleagues. In this connection I may inform you that the Cargo Preference Act recently put on the Statute Book of the USA and legislative measures adopted by quite a number of countries in the Middle East and of the South and Central Americas in the year adequate cargoes emanating ensure to and from their respective countries to and from sub-rail shipping. In view of this position, I hope that the progressive realisation of our claim for 50 : 50 share in the India-U.K.-Continent trade left in the hands of our other confreres conferences.

Liaison for Government Cargo

Now that national lines provide number of established services between India and many other countries, it is essential that these lines should be able to provide space for all cargoes ordered from other countries by or on account of various departments of the Union and State Governments and semi-Government or Government-controlled bodies or Corporations. All such cargoes should, for the purpose of shipping arrangements, be canalized through one central co-ordinating agency, which should be established under the Director-General of Shipping.

India/U.K. Passenger Service

The TSS "Jal-Azad" and TSS "Jal-Jawahar" were withdrawn from this popular service for reasons mentioned in my speech last year. The Scindia Company has long experience and reputation in operating a number of passenger services on the Coast and in Overseas routes and they have operated this particular service at considerable sacrifice. It is our sincere hope therefore that, should Government at any time decide to resume this service with new vessels, their operation and management will be entrusted to this Company. The same remarks will apply

in toto to any vessel that Government may wish to put into the Haj Service in future.

An attempt is made in some quarters to misinterpret the objective of Coastal Reservation, and it is suggested that old established companies should progressively go out of the coastal trade. Such a concept of the coastal reservation policy is entirely unwarranted, as it ignores the historic background of the long struggle put up, at considerable sacrifice, by Scindia with the co-operation of other National Lines to achieve this objective under which new-comers find themselves safe in home waters. The coastal sector must therefore realise that it is protected from foreign competition while the overseas sector has the Damocles' Sword of a rate-war all the time hanging over its head and has often to face the unequal competition of tramp tonnage. The Coastal waters must always remain the sheet anchor of Overseas tonnage.

Tramp Ships

There is recently apparent in some shipping circles an interest in tramp tonnage as a basic constituent of a well-planned national mercantile marine. The utility of this approach will be realised if the history of the subject is borne in mind. Tramps were no doubt an important section, almost 50 per cent, of British tonnage before the first World War. Tramp tonnage which had already fallen to about 30 per cent of British tonnage in 1935 was reduced in 1953-54 to about 15 per cent according to the annual report of the Chamber of Shipping of the UK. Germany, Italy and America, have made no special efforts to develop their tramp tonnage. It is thus abundantly clear that it would be prejudicial to an early growth of a national marine if India today proceeded to encourage tramp tonnage as a matter of definite policy, particularly as bulk cargoes of coal and ores, regularly shipped from India, are generally low-rated and their normal destinations are countries from which we do not obtain dry cargo in substantial quantities.

Second Overseas Corporation

It is reported that the Government are considering the launching of a second Shipping Corporation. Properly conceived, it should help in adding to our mercantile marine; otherwise it might set the clock back. We would therefore urge Government to take the shipowners into their confidence by discussing the scheme with them prior to its finalization.

Floating Staff

We are glad that the Government of India, foreseeing an expansion of the Merchant Navy, reorganized the system of training with a view to turning out a larger number of persons for service in the Merchant Navy. The result has been that at present there is no dearth of duly qualified navigating officers and engineer officers in the lower grades. The position as regards engineer officers in the higher grades is also fairly satisfactory. This has enabled us to send a number of engineer officers to Germany for training and practical experience in diesel machinery before they are placed on the diesel vessels which will shortly be added to our fleet.

Unfortunately, however, owing to an unusually large number of navigating officers in the higher grades having been attracted to shore employment in the port and pilotage services, we are suffering from an acute shortage of such officers. In this connection, I wish to appeal to the authorities concerned to revive, in common interests, the healthy convention that was established during the last War but which has ceased to be operative, whereby officers in such an essential service should be recruited only after obtaining the consent of their previous employers.

Dock Labour Situation

Ever since the introduction of the scheme of Decasualization of Labour—introduced in Bombay in 1952, in Calcutta in October 1953 and in Madras in 1954—labour output has kept deteriorating continuously. Indeed the Dock Labour Board Scheme lays it down in specific terms that the primary function of the Board is to take measures, *inter alia*, for "ensuring the full and proper utilization of dock labour for the purpose of facilitating the rapid and economic turn-round of vessels and speedy transit of goods through the port". The facts speak otherwise. The receipt of benefits of minimum wages, attendance fees, leave, etc, the cost of which is borne initially by the stevedores but ultimately by the shipowners and consumers, has been answered only by a deliberate reduction in output by resort to "go slow" tactics. The output has been reduced to almost half, and in some cases even less. Nor are the immediate employers, i.e., stevedores, in a position to control the worker, because the daily worker has under the Scheme ceased to be the direct employee of the stevedores. You would better appreciate the enormity

of the loss involved by the following example. An average loss of about five days on account of poor discharging and loading operations in a round voyage—by no means a high figure in the present conditions of labour in various ports—would amount in the case of Scindia fleet to an aggregate loss of the order of 800-900 voyage days or equivalent of 2½ vessels. In other words, these delays result in a virtual immobilization of 2½ vessels, the maintenance cost of which would approximate to over Rs 20 lakhs. Government have at last realized the gravity of the labour situation and have appointed an Enquiry Committee to report on the working of the Decasualization Schemes. We await the recommendations of this Committee and hope that they will remove the difficulties encountered by all concerned.

Prospects for the Current Year

As regards the future, I wish I could make an optimistic forecast for 1954-55; but disturbing tendencies which characterized the working of the year under review have unfortunately continued into the current year. Labour costs are still rising; delays in ports still continue. Our operating difficulties increased considerably owing to the entire shipping on the West Coast—be it Coastal or Overseas—experiencing the worst of a continuous heavy monsoon. The dock labour having refused to handle ships calling at Mormugao and Diu, the cargo-cum-passenger services to and from these ports had to be suspended, which will considerably affect the earnings during the current year of this Line as well as those of Bombay Steam Navigation Co (1953) Ltd. In the various trades liftings of cargo have shown no advance on the previous year. Whatever increase we had in our liftings of Burma rice for India has been achieved at heavy cost. Our tonnage position will not improve until almost the end of the current year when two diesel vessels out of the five we have ordered will be received from the Vizag Yard. The main factor to offset these adverse circumstances is the fact that the downward tendency in freight rates has now been arrested. In the Overseas Trades from early February an increase of 10 per cent has been made in freight rates. As regards labour and port delays, it is hoped that, as a result of measures following the enquiries now in hand, improvement will begin to show itself before long. Neither will fully offset the losses already incurred due to various adverse circumstances mentioned above.

Taxation Policy

I wish to deal with certain important questions of taxation policy which seriously affect the replacement and expansion of shipping. In the case of shipping, new capital equal to about four to five times the pre-war costs has to be found for replacement of old ships and for additions to the fleet. This is rendered particularly more difficult by the high rates of taxation and the manner in which some of the provisions of the Income-tax Act operate.

In 1946, Section 10(2) (vii) of the Income-tax Act was amended. By this amendment, the sale-proceeds and the amount realized from underwriters for marine mishaps are being taxed. The shipping industry in particular has been hard hit by this amendment by the very nature of its assets and business. In shipping, unlike other industries, there is a higher frequency of accidental total loss and of disposal of fully depreciated ships. It is therefore imperative that shipping be exempted from the operation of this clause subject to the amounts realized from sales or from underwriters being utilized for further acquisition of tonnage.

The only provision that has so far been made in order to assist expansion of industry is to allow Initial and Double Normal Depreciation in respect of new assets. And, in the case of shipping, they are allowed on secondhand ships also. This concession, however, does not give any real relief because it merely defers the payment of the tax to a future date. In respect of shipping, this so-called concession acts adversely, particularly to those operating in the Overseas Trade. Nearly 50 per cent of the freight and passage earnings directly accrue or arise abroad and taxation of profits so accrued abroad by the Governments of countries concerned cannot be avoided or resisted. It is, of course, true that under Section 49(D) of the Income-tax Act, unilateral relief from double taxation in India is available. However, such unilateral relief is denied to the shipping companies because, due to Accelerated Depreciation Allowances, the assessable profits in India are nil and will continue to be nil for several years to come. During these years, Indian shipping companies will continue to pay taxes on profits which have accrued or arisen in foreign countries without receiving any corresponding relief in India. The payment of these taxes will be a dead loss to the shipping companies. Further, in the hands of the shareholders the dividend is

not grossed up and the shareholders with lower incomes are deprived of their refunds. This, in a nutshell, is the problem the shipping industry has to face at present where the concession acts most harshly. Representations made to the Central Board of Revenue to make this concession optional have been turned down on legal grounds.

In the United Kingdom and other maritime countries shipping is given favoured treatment in the matters of taxation. As a matter of fact, the Indian National Steamship Owners' Association have represented to the Taxation Inquiry Commission the question of granting Investment Allowance on UK lines and I do hope that the Finance Minister in his next Budget proposals will grant such an Investment Allowance to the industry in general or, at any rate, to the shipping industry by way of an exception.

Tonnage Programme

I wish to take this opportunity of referring to the question of pricing of the ships built by Messrs Hindustan Shipyard Ltd for Indian shipowners. So far, the price charged to Indian shipowners for ships built at Vizag has been based on the UK parity price. However, the UK parity price, at present, is higher than the price ruling on the Continent and elsewhere for comparable ships. In my view, therefore, if the Shipyard is to develop fully and secure good business in the future, it is only proper that Indian shipowners should be charged a price that compares favourably with the price ruling in the most competitive country at the time when the order is placed. I am sure this suggestion of mine will be considered quite fair and will receive sympathetic consideration of the Government. It has also to be remembered that the time taken for building a ship at Vizag Shipyard is much longer than in the UK and the Continent, with the result that our moneys are locked up for a considerably longer construction period.

The total finance required for the 10 fast ships is estimated to be about Rs 10.5 crores. Your Directors have decided to provide, from the Com-

pany's own resources, approximately half of this amount for financing the entire cost of the 5 diesel ships under construction at Vizag and to the extent of 15 per cent of the cost of the other 5 ships that will be built abroad. The balance of the finance required, estimated at about Rs 5¼ crores, will be raised by taking a loan from the Government. I am glad to inform you that the Government have decided to give us the loan at 2½ per cent per annum. The loan in respect of each ship will be repayable in 10 equal instalments, the first of which will fall due at the end of the third year from the date of delivery of the ship. I wish to thank the Government for providing assistance in this manner for financing new tonnage.

After our modernisation programme outlined above has been implemented, we shall have a total fleet (excluding our B S N Line ships) of about 2,14,000 G R Tons consisting of 37 ships for the requirements of our various trades. The present is the opportune moment to review the progress which your Company has made since the termination of the War. Assuming that our fleet will be modernised according to plan, its growth during the post-war period of ten years can be seen from the table below.

Thus over a period of eleven years, new capital to the extent of nearly Rs 20 crores will have been invested in additions to and modernisation of our fleet, out of which only about Rs 5.5 crores will have been borrowed from Government. I have no doubt that this is an achievement of private enterprise of which any Company may well be proud.

The Scindia Company, from its very start, has shown daring enterprise and forthright initiative at a time when, under the domination of foreign rule, there was nothing but opposition not only from alien interests but also from the then Government of India itself. This enterprise and initiative we were able to put forth because we knew that we could always rely upon your co-operation and encouragement, particularly when we were fighting single

handed to establish national shipping in this country. The economic history of India records the fact that in an era of crippling losses when British shipping interests offered to buy your shares at four times the market value, you stoutly refused to barter away national independence for mere cash. At immense sacrifice, your Company fought its way in the carriage of the Burma rice trade, the coastal passenger and the Haj trades. Not only did it go to the rescue of Indian passenger-carrying companies on the East and West coasts of India but, on the West Coast, it "Indianised" the non-Indian company which was fighting the entry of Indians in its domain. We were also largely instrumental, at sacrifice to ourselves, in the promulgation of the Bhor Award which enabled the small Indian companies on the West Coast to survive then and to prosper later. In an age when the concept of Indianisation was just beginning to manifest itself, the Scindia Company was not merely owned and controlled but also managed by Indians. The part that we played in the days of the alien Government in making the principle of Coastal Reservation popular among the public and in securing its acceptance by the Legislative Assembly, came to fruition on the establishment of the National Government. Before the establishment of the Indian Mercantile Marine Training Ship "Dufferin", the Scindia Company used to provide facilities for the training of Marine Officers and Engineers. It is the pioneering efforts of your Company that has brought into existence the National Shipbuilding Yard at Visakhapatnam. Soon after World War II, it carried the flag of Indian shipping in the Overseas trades by starting the services to U S A in 1947 and to U K and the Continent in 1948. We have been the pioneers in establishing a passenger line on the international route between India and the United Kingdom. As you will doubtless recall, this was the first service operated by the Company with our first steamer, s s "Loyalty" and later resumed with our T S S "Jal-Azad" and T S S "Jal-Jawahar". We are also carrying a large number of passengers between India and East Africa and India and Malaya as Managing Agents of the Eastern Shipping Corporation, Ltd. In the sphere of insurance allied to shipping, it was at our instance that in 1952 there was established in India the Hull Insurance Market to which the Government have since diverted all hull insurance of Indian Shipowners. Finally, we have now a programme of reaching the target

of about 2,15,000 G R T by 1956-57. These vignettes from the history of the Scindia Company I have given here, not in any attempt at self-praise, but only to show how that history is resplendent with the courage, perseverance and self-sacrificing devotion to the country that have characterised the shareholders of the Company from its early days. Reflecting the appreciation by Mahatma Gandhi of Sheth Narottam Morarjee as combining "patriotism with commercial ambition", the Company and its shareholders have played a prominent part in laying the foundations and helping the development of the Indian Mercantile Marine which, it is hoped, at the end of the second Five-Year Plan, will exceed one million gross tons—a record of which you, forty thousand shareholders of the Scindia Company, representing private enterprise, can well be proud.

Gentlemen, before I close my address, I wish to express our thanks to the Ministry of Transport, the

Director-General of Shipping and his Secretariat, for their assistance and advice at all times. In the very sad and untimely demise of the late Mr N M Buch, the last Director-General, we have lost a good friend of Indian Shipping. He brought to bear on his work his considerable experience as an administrator and took keen interest in the problems of Indian shipping.

I also wish to express our appreciation of the manifold services rendered by Shri S N Haji who retired from service in June last and by Shri N Dandekar who is no longer with the Company. Shri Haji may rightly be called the 'Father of Coastal Reservation' as he sponsored the Coastal Reservation Bill in the Indian Legislative Assembly as far back as 1928. During his association with the Company, Shri Dandekar showed outstanding and versatile ability and devotion to duty in all fields of our activities. Both these officers have served your Company truly well.

Finally, I should like to mention that the Management, the Officers and staff, both ashore and afloat, and the agents of the Company at various ports have discharged their responsibilities diligently and efficiently in spite of adverse conditions that prevailed during the year. To them all I wish to convey the thanks of the Shareholders and Directors.

Railway-Shipping Co-ordination

"Needless to say, it is essential to promote maximum co-ordination among the various means of transport and this matter is already engaging the attention of the Transport Ministry which has constituted a Study Group. Railways are also represented on it. As the Study Group might take some time to produce its report, I have considered it desirable to examine one of the aspects shortly.

"I refer to the possibility of co-ordination between the Railways and the coastal shipping in order to promote the development of the latter on sound lines. I intend setting up shortly a Committee in order to examine certain specific suggestions that have been put forward. The Committee will also undertake a comprehensive examination of the comparative costs of operation on competitive routes by rail and by sea and advise on the steps to be taken to promote transportation by coastal shipping of commodities which are specially suited to this type of transport."—Shri Lal Bahadur Shastri.

Dull and Listless

Wednesday, Evening

FOR the second week in succession, the Calcutta Stock Exchange continued to be under the influence of the budget. Investors are out of the market. Even speculators are reluctant to enter into fresh commitments. There is not much of selling pressure. But, in the absence of support, the market has developed an irregularly lower trend. By all current indications, dull conditions are likely to prevail until the presentation of the budget by the end of this month.

Fears about increased taxation persist. But there are reasons why equities are not declining further. For one thing, the belief is spreading that the Central budget may not include proposals for higher direct taxation, but that it will contain proposals to increase indirect imposts. From the prevailing mood of the market, it would seem that equities may move up if the Central budget does not raise the level of direct taxation.

There are some other reasons for the subdued optimism in the market. It is evident that TTK's resignation has not yet been accepted. Stock markets do not endorse the interpretation that TTK has left New Delhi never to return there. Market circles are inclined to the view that Pandit Nehru may persuade TTK to continue to be a Cabinet member in order to assuage industry. All this may be wishful thinking. But this is what the stock markets are hoping.

TTK and Equities

To appreciate why TTK's membership or otherwise of the Union Cabinet should be of so much interest to stock markets, it is necessary to recall recent history. TTK is regarded as a friend of industry. He is known to be in favour of private enterprise. According to reports, one of the reasons why he had tendered his resignation from the Cabinet was his support for the Birla steel plant at Durgapur, which was rejected by New Delhi. It will be recalled that equities never looked up since it became known that New Delhi was opposed to the Birla iron and steel proposal for Durgapur. This was interpreted to mean that the Government was opposed to expansion of

the organised sector of industry.

A few days ago, TTK went to New Delhi, at the request of Pandit Nehru, to discuss the whole situation. There are reports in market circles that Pandit Nehru is not unimpressed with TTK's arguments. If TTK finally stays on in the Cabinet, it will be interpreted by market circles as a triumph for private initiative. Industry suspects the Finance Minister to have acquired socialistic leanings. It, therefore, hopes that TTK will remain in the Cabinet to counterbalance the Government's avowed aim of introducing a socialistic pattern of economy.

Nor are stock markets unduly alarmed over the President's Address to Parliament. Investors will welcome the assurance that capital goods industries will be developed and expanded. This is interpreted to mean that, in the interest of temporary employment, cottage industries will not be over-expanded at the cost of heavy industries. Current stock market steadiness is a part reflection of this belief among industrial circles.

Tea Corners

Besides these influences, there are other factors which are responsible for the comparative steadiness in Tea shares. Interim dividend announcements continue to be a sustaining influence. It has been in operation for more than a month. As long as this influence remains in operation, bargain-hunters will remain interested in Tea shares. This is a part explanation of the occasional spurt in selected Tea shares.

Interested buying, in order to acquire controlling interest in tea companies, continues unabated. Evidently, the authorities do not seem inclined to discourage such transfer of ownership or of managing agency rights in rupee tea companies. This has fostered an interesting argument. To such block buying of shares, the main objection is that it involves transfer of ownership in companies at unduly inflated levels. Tea prices and Tea shares have gone up appreciably. Even so, the prospects are not supposed to be gloomy.

One argument is that the rise in Tea shares has not yet discounted the rise in tea prices. The relative increase in the latter is advanced as

an argument that those who are buying Tea shares today are not paying an unduly high price. Maybe. What of the future? It is argued that neither London nor internal tea auction prices are likely to decline in the near future to levels which will make current purchases of Tea shares uneconomic. There is something in these arguments.

Jute Parities

Jute shares remain neglected. It becomes increasingly evident that the industry cannot make much profit by buying raw jute at current prices and selling jute goods at prevailing market rates. There is not the least shadow of a doubt that the statistical position in relation to raw jute is extremely "bullish". This means that raw jute prices are not likely to decline appreciably in the near future.

If raw jute prices do not go down, jute goods are not likely to move down. But, even at the current prices for jute goods, the American demand is not heavy. Burlap consumption in America to date is rather poor. American off-take is not likely to improve unless the prices of jute goods decline. But jute goods prices are not likely to fall as long as raw jute prices remain steady to firm.

These factors explain the stalemate in Jute shares. It is clear that Jute shares will not rise even if equities in general move up after the budget. Not only the immediate future, but long-term prospects also do not seem optimistic to investors. This, perhaps, explains why there are not many attempts by interested parties to acquire controlling interests in jute companies.

For ECONOMY & COMFORT USE

THE INDIA ELECTRIC WORKS LTD
6 SIR PHIROZSHAH MENTHA ROAD FORT BOMBAY

Not Unnerved

DALAL STREET moved both ways during the week to close on steady-to-firm note. The week commenced with hopeful outlook following the announcement by the Union Minister of Production of the Second Five-Year Plan target for iron and steel at 6 million tons. Steels tried to recoup last week's losses, but textiles again pulled back the trend, following the Government's notification revising classification of exportable cotton textiles according to the average count. Hitherto, the count of yarn was the only criterion for classification. This revision would result in extra duty of 10 per cent being charged on the cloth which used to be exported free of duty due to the loophole in the old classification.

At first this news had a bearish effect on the textile shares. But the fact that these shares are already placed at low levels and the revision of the classification is not going to affect tangibly the overall export position accounted for scattered bear covering and halted the downward drift in textiles.

Thereafter the market remained more or less steady throughout the week, and on the last day, ie, Wednesday, market ruled firm following the purchase of about 1,000 Tata Ordinaries by one of the reputed brokers. Favourable rumours regarding the budget also helped the sentiment. Entire section followed the rise in steels. Calcutta advices also were much better. Textiles not only partially re-couped the previous week's losses but showed some definite signs of resistance at lower levels.

Among Miscellaneous Section, Scindias were in demand on hopes of a favourable speech by the Chairman. They changed hands at Rs 16-3-6 from the week's low of Rs 15-11. However on Wednesday the Chairman made a speech which the market is likely to take as discouraging. The current year's working has not improved yet. But the expansion plan—modernisation of India-UK fleet and the plans for augmenting tonnage—should help in toning up the long-term outlook. The share has already lost more than 30 per cent of its value from the peak of 1954. It is also about Rs 4 below the revised paid-up capital of Rs 20. Technically it seems that

most of the adverse factors have been discounted around present levels.

The market has begun sizzling in the pre-budget warmth. The ensuing budget is perhaps going to be the most exciting one after Liaquat Ali's. While the Liaquat budget came as a bolt from the blue and caught the market unawares, this time the market is bristling with expectations of all sorts. And for very sound reasons, too. There is first the statement of the Finance Minister that he would implement at least some of the measures recommended by the Taxation Enquiry Commission—a factor which is obviously bearish. Then there is the Avadi resolution on the Socialist Pattern. More bearish. So what? Again and again, ministers of the cabinet rank as well as others have been assuring the private sector that they have no reason to be bearish. And TTK, the darling of the private sector, is making a spectacular re-entry, evidently on his own terms. This is a pretty bullish factor. But above all, it has to be remembered that 1955-56 is the last year of the First Five-Year Plan; and the Congress is facing the General Election in 1956. If the Five-Year Plan were to make any impression on the public, the tempo of spending has to be so high as to make up for all the slackness of the past years. No wonder there are rumours of a 500 crore deficit financing. If this were to be true, nothing could be more bullish. By and large, the budget appears to be bullish. But then one never knows!

Bullion, Cotton and Oilseeds

Bullion market eased further during the week on slackening of demand, and enforcement of special margin. Bombay Bullion Association on Monday decided to enforce special margin in view of the unhealthy speculative manipulated rise. Bulls in both the metals will have to pay Rs 7 per tola on gold and Rs 500 per bar of silver. This led to un-loading to some extent, but most of the long positions seem to be unchanged from the fact that they paid the margin of about Rs 41 lakhs in silver and Rs 11 lakhs in gold! Payment of the margin resulted in halting the decline as these bears were eager to cover. On balance, though rates show

some decline, the market ruled steady.

	Feb 16	Feb 23
	Rs as	Rs as
Silver (Fagan)	163-10	163-1
Gold (Fagan)	92-4	91-6

The cotton market ruled very steady during the week. In view of the budget, transactions were not big but the general sentiment was distinctly better. Low tenders in maturing February contract and acceptance by ETCA of the principle of fixing room-rates on the basis of spot market, completely discouraged short-selling. All these factors and higher ready quotations (about Rs 60 per candy higher than forward) caused scattered support and rates tended to harden. Commitments, however, were moderate. The gap between May and February widened to about Rs 40 in view of the thin tenders in February Contract. This gap had one time narrowed down to even position last month.

August contract is likely to commence after the Bye-Law is changed to implement the above mentioned proposal regarding room-rates.

	Feb 16	Feb 23
	Rs as	Rs as
Cotton—May	573-8	579-12

Quietly steady conditions prevailed in groundnut as operators had to adjust their business in view of the budget. There was moderate enquiry from UK, Burma, Hong-kong for groundnut oil. Shippers did some business, but experienced some difficulty as regards shipment. Groundnut arrivals were slightly smaller and upcountry advices were steady. Foreign quotations were more or less unchanged.

	Feb 16	Feb 23
	Rs as	Rs as
Groundnut	22-7	21-15
April-May		

Dull conditions prevailed in castors also as in other oilseeds. The market is trying to stabilise at around current levels with the hope that export duty will be totally abolished in the coming budget. There was no significant news during the week to affect the trend either way. Evening of positions by speculators caused both way movements. Sentiment was steady at the close and minor shipping business was reported. Foreign quotations remained around previous week's rates.

Nehru May Get Away With It...

THE budget incorporates some of the recommendations of the Matthai Commission; it also shows an attempt to make up the arrears in the first four years of the Plan; but in both directions the changes are token rather than material. The recommendations of the Matthai Commission are reflected in two significant changes, the attempt at rationalisation of the structure of direct taxes and incentive for new investments in industry in the shape of a developmental rebate. Quantitatively, neither is a factor of any considerable magnitude to affect the budgetary totals. Avadi is not in the picture at all.

Shri Chintaman is no longer an outsider to the Congress who has been called in because of his expert knowledge to guide the financial affairs of a Government run by the Congress Party. He has been Congressman for the last three years and he is as much a Congressman as any other. It is for the Congress Party members therefore to get him to explain why as Finance Minister of a Congress Government, he has not yet sought to give any effect to the declared policy of the Congress in these matters. The same token recognition could have been given to the Avadi resolution that he has given to the recommendations of the Taxation Enquiry Commission. The answer could well be and probably is that there was no time for it. But it only puts off the question.

The decision is postponed and nothing is said about the compatibility of the Avadi resolution with the findings of the Matthai Commission. But are the two compatible?

The Constitution promises many things to the people. There are specific directives to Governments at the Centre and in the States to give effect to these broad aims as and when practicable. The pattern of life that the Constitution has in mind is clearly laid down—employment for all, education within a measurable period of time and progressive equality in distribution. The Taxation Commission had to keep all these aims in view and had, at the same time, to find the necessary funds for development, the pattern of which had been laid down in the Five-Year Plan. It is no use asking how far these aims are compatible with one another or even to ask if a tax system that is calculated to promote production tends to increase rather than diminish inequalities; if it does, which is to be given precedence, greater production or more equitable distribution? It appears the Taxation Commission firmly set its face against countenancing the possibility of such a conflict. On the contrary, it appears to have been impressed more by the conspicuous differences in consumption standards than by the disincentives to production in higher taxation. It also rejects the commonly accepted, but unproven, assumption that there have been large shifts in income between urban and rural areas as a whole.

While to the Matthai Commission "it is clear that there is justification for some increase in Indian taxation", it is not clear on a cursory glance at the voluminous report that the "deepening and widening of the coverage of the Indian tax system" which the Commission recommends could ever produce the resources required for the develop-

ment which the Planning Commission has clearly in mind. There are obvious limits set by the existence of a large non-monetised sector. Less tangible, but even more deterrent perhaps, are the limits to people's willingness to bear the burden of taxes, which it must be said to its credit, the Matthai Commission never loses sight of, set by efficiency in administration and economy in public expenditure; another, administrative efficiency in the enforcement of taxes. "The knowledge of wide-spread tax evasion undermines morale, puts a heavy strain on tax compliance by the honest tax payer and undoubtedly impairs taxable capacity". Even if these limits are assumed away, the Commission is far from confident that purely fiscal measures can deliver the goods. If this is its feeling about the First Five-Year Plan, how much more unsure the Commission must be for the implementation of a more ambitious Second Plan that is in the offing? Physical controls not being within its terms of reference, the Commission mentions hopefully about the possibility of employing surplus agricultural labour in capital formation through Community Projects and National Extension Service. It would be unrealistic, however, it concludes, to rely on this source, for the main part needed is increase in investment. Alteration of property relations being equally outside its purview, the Commission has no means of putting the fat of the land in the service of industry. One cannot very well blame the Commission for not doing what it was not asked to do.

Shri Chintaman does not, of course, rush in where Matthai feared to tread. Indeed he has passed on the cap to the Matthai Commission and whether it is praise or blame that is given to his budget proposals it should rightfully go to Dr John Matthai. There is, however, one departure, and that is in regard to deficit financing. Dr Matthai and his colleagues have sought to underline the need for minimising the role of deficit financing, especially in the longer period following the first Five-Year Plan. There are all the stock arguments about deficit financing giving rise to a false sense of prosperity and leading to erosion of capital ultimately. Shri Chintaman does not, of course, take a diametrically opposite position; but being a fairly recent convert to the view that heavy indirect taxation could be as iniquitous as

deficit financing, he has less hesitation in using that weapon than formerly. True, the economic situation has made it easier for him to change his mind. Yet, knowing that having stepped up outlay in one year, bringing it down the next year would be politically impossible, he has gone as far as he could in respect of the budget deficits in 1955-56. In other words, his minimum appears to be a sight ahead of that of the Matthai Commission. While the Commission envisaged a deficit of Rs 320 crores for the Centre and States together, Shri Deshmukh has gone all that way in his budget alone.

If in the matter of deficit financing Shri Chintaman has strayed from the strait and narrow path, in everything else, he continues to follow precedence with due solemnity and punctiliousness. Since the Matthai Commission's general atti-

tude is similar, he is in the happy position of following precedence and the Commission at the same time. His fifth budget runs true to form and has not departed even in the minutest detail from the first. It would not be fair to put the blame on him; it is precedence which he finds so difficult to depart from.

There was a rare moment of illumination during his budget speech when the Finance Minister so far forgot himself as to mention that there are two questions, one of finance and the other of administration. But did he say anything about financial administration? Of the storm in a tea cup which had been raised over the paralysing hold of the Finance Ministry on the Government departments, or the failure of the administration to spend the sums that had been allotted by Parliament? Not a word. Shri Deshmukh has been prudently silent.

Andhra Answers Dulles

COMMUNISTS have lost the battle of Andhra. Their defeat in the Andhra elections is all the more ignominious because of their impressive success in the southern States in the last general elections. In Madras, they secured sixty-one seats in the last general elections. Andhra was then a part of Madras. Of the total number of seats captured by them in Madras, forty-one were from Andhra alone. Of the latter again, thirty were from the Circar districts of Kistna, Guntur and Godavari. Even in these Communist pocket districts, they have suffered abject defeat in the elections this time. Andhra Desa will no longer be suspect as the potential Yeoman of India. New Delhi can take comfort from this legitimate deduction of the Andhra elections. Political commentators will be tempted to draw many hasty conclusions. But it would be unwise to ignore some of the false premises on which a possibly proper conclusion is now being based.

If Congress won the last general elections on the split vote, Communists, too, benefited from the multiplicity of parties contesting the elections. Congress fought the last general elections in Madras State as a disunited and divided party. Congress vote in that State was split among Congress, KMP and the other pro-Congress splinter groups. Communists exploited this disunity within Congress to their advantage.

Congress has been wiser by experience. It has contested the first general election in the new-born Andhra State as a united party. Congress entered into an electoral alliance with KLP and Praja Party to fight the first general election in Andhra Desa. Communists were, thus, denied the tactical advantages of many-cornered contests. Congress fought the last general elections in Madras State without many Congress stalwarts. It was not so this time.

Food shortage was acute in Madras State at the time of the last general elections. Communism thrives on adversity. Communists were alert in exploiting the food crisis to their advantage during the first general elections. Rajaji had the political insight to appreciate this basic economic fact. He initiated the campaign for food de-control. At his initiative, the experiment of food de-ratation was first started in Madras. Food has now been de-ratoned throughout the country. Foodgrains are now available at cheaper prices.

Irksome controls and queues no longer irritate the people. Communists cannot exploit food grievances any more. For the election victory in Andhra State, Congress should be grateful to Rajaji, the late Janab Kidwai, and, above all, to good monsoons. Not only food, but the general economic situation has improved considerably since the last general elections. Economic progress under the first Five-Year Plan has deprived

the Communists of the strongest weapon in their armoury. As the people have gathered confidence in democratic planning, they have voted Congress in preference to Communists.

If Rajaji made the first hit against the Communists in southern States, Pandit Nehru delivered what looks like a knock-out blow by re-defining the economic aims of Congress at Avadi on the eve of the Andhra elections. It was as diplomatic of Panditji to flaunt socialism as the aim of the Congress on the eve of the Andhra elections as his playing up of a Master Plan on the eve of the last general elections. PSP can claim credit that it represents the mind and spirit of India in advocating Socialism. Results of the Andhra elections are clear reminders to Communists that India prefers Socialism to Communism. PSP may resent that Congress has mastered the technique of flying under false colours. But Congress cannot be blamed if Panditji succeeds in convincing the people that he is sincere in his determination to implement the re-oriented Congress policy of ensuring a socialistic pattern of economy.

Elections cannot be won by political parties with ideas which the people reject. But ideas alone cannot assure election victories to parties. Organisation counts. If Rajaji and Panditji are responsible for the moral prestige of Congress, it is fortunate in having able members who are aware of the supreme importance

of party organisation. Congress and CPI are the two best organised parties. Both marshalled all their moral and organisational talents for the battle of Andhra. To fight the elections, prominent politburo members went to Andhra to maintain the Communist stronghold there. Even while Panditji was telling the voters of Andhra that economic improvement in democratic India was much more impressive than that in Communist China, the Congress Working Committee, the national executive of Congress, deputed its ablest organiser to supervise the elections in Andhra. Shri S K Patil, President of the Bombay Pradesh Congress Committee, had established his reputation as an organiser by making Bombay the home of Congress since the 'thirties. It was Shri Patil who broke the war-time Communist hold on Bombay's people and workers through tactics as subtle and ruthless as those adopted by the Communists. Credit is due to Shri S K Patil for repeating his Bombay performance in the crucial Andhra elections.

It is clear why Communists have lost the elections in Andhra State. Congress unity and economic improvement have deprived them of their tactical advantages. With the creation of Andhra Desa as a separate linguistic State, CPI has lost popular appeal as the only party strongly in favour of linguistic States. Dismal developments in Travancore-Cochin must have encouraged the people to vote Congress in order to avoid the

consequential chaos of an unstable government. It is evident that the people of Andhra have voted Congress so that the infant State can achieve progress under a stable government. Congress may have won the elections. But it remains on trial. As it tries to form the Cabinet, it will experience the first hurdle. It will then be known whether the electoral alliance is a marriage of convenience. Congress could not have formed the provisional government in Andhra without Sri Prakasam's consent and leadership. There is speculation about Sri Prakasam's future. He is too old. But he is still popular. Any attempt to oust him from leadership will provoke party factions and personal jealousies. There is a possibility of a fight for power between the two ambitious Reddis. Caste is perhaps the most evil influence in Andhra politics. These are issues which will, no doubt, be duly considered by the Working Committee in its post-election directives to the Andhra Congress. There may be another source of friction. Andhra Praja and Krishakar Lok are entitled to representation in the Cabinet by virtue of their electoral alliance with the Congress party. Care will have to be taken to make the new Cabinet duly representative of the coalition parties. It would be a tragedy if Congress loses Andhra even after winning the elections. CPI is hoping that caste and personal rivalries in Congress will still enable it to influence Andhra politics from side-wings.

Weekly Notes

State Budgets

THE States that have issued their budgets so far, all propose to spend more; but with the single exception of Madras, none of them are proposing any new taxes. Bombay is an honourable exception in that it shows a small revenue surplus. All the others have left their deficits uncovered. Even in the case of Madras, only a part of the deficit will be covered by the flat surcharge of 2 annas in the rupee on land revenue proposed in the budget as also on irrigation water rates and the 5 per cent tax on the sale of cheaper varieties of cigarettes. West Bengal retains its lead in the matter with a deficit of Rs 17.12 crores on revenue account as against UP's deficit of Rs 5.5 crores and Orissa's Rs 1 crore, but partly makes up the deficit from the surplus of Rs 9.74 crores on capital account.

Lack of uniformity in the presentation of State budgets, however, makes analysis difficult and comparison hazardous. Much of the time is wasted by the Economic Division of the Planning Commission nowadays in finding out how the States are faring in the matter of development expenditure and how far they are sharing their burden of the Plan. The Union Finance Minister, it may be recalled, has proposed a uniform pattern of budget for States and the Centre, demarcating precisely revenue and capital items. Charity should begin at home. Does it hold a promise that the Central Budget will be first made intelligible before the States are asked to conform to it?

The deficits which the State budgets leave uncovered—what do they really mean? The figures are mystifying, but since there can be no spending unless there is money to spend, and the State Governments do not print currency notes on their own, expenditure estimated in excess of revenue may mean one or more of three things: (1) Ways and Means advances from the Centre; (2) Loans to be raised from the open market by the State Governments concerned; and (3) revenue from fresh taxes to be raised in the course of the year. Now for the first, obviously there are definite limits. The States cannot go on getting Ways and Means advances indefinitely any more than clients

can get overdrafts from their banks. At what point this check comes into operation, the public have no means of knowing; but past experience suggests that according to the standing of the State, the persuasive power of its Chief Minister and his ability to raise hell in Delhi, this limit can be stretched. About States' borrowings from the open markets, there are similar limits. These two are the usual features of States' finance; a new factor this year is the Matthai Commission, the hopes it held for them and aspirations to which the Commission might direct their efforts. They must have been acquainted with the broad lines of the Matthai Commission's recommendations. Nevertheless, it provided some justification for waiting, to see the lie of the land more clearly before taking any decisions about new taxations. And also grounds for hope, since State budgets must have been drawn up largely on the basis of the grants and loans given by the Centre last year. If more was to come, it could only be known after the budget proposals had been presented by the Centre. Among the State Finance Ministers, Dr Jivaraj Mehta made it clear that the Bombay Government might issue supplementary demands later in the year. More State Governments may follow this lead.

Millowners Protest

COTTON mills are much agitated, not so much over the increase in excise duty proposed in the budget, as over the change in the classification of cloth that goes with it. Hitherto excise duty has been collected at progressively diminishing rates on the four varieties of cloth, superfine, fine, medium and coarse. This classification, the Finance Minister maintains, no longer conforms to the current consumption habits. What he proposes, instead, is division of cloth into two classes, according to the fineness or the count of the yarn used, viz, superfine, which will have to bear a duty of 2½ annas per sq yd and all the others, which will pay at the rate of one anna per sq yd. More than the change in classification, the substitution of area for the linear measure is the bone of contention. Now, the width of superfine varieties of Dhoti and Sari is much bigger than those of fine, medium or

coarse. Tastes differ. On this side, at least, finer Dhoti runs to 50 inches or more in width; in Bengal, the preference is usually for 44 inches; in Bihar, there is a market for Dhotis of 42 inches or even narrower widths. In the case of Saris, however, the general preference is for a bigger width. Now, when the duty is based on length, it is one thing: it is the same whether the width is 36 inches or 54 inches. When duty is charged per square yard, though the rate of duty remains the same, for superfine dhoti of 54 inches width, it means 62.2/3 per cent increase. This is at one extreme, but the average increase would not be below 33½ per cent. Millowners are busy working out the statistics; they are certain that the Finance Minister is quite wrong in his estimate of the increased revenue that will come from this source. It would be definitely Rs 14 crores or more, instead of Rs 9 crores, the figure estimated in the budget.

Now, there may be compensation in the reduction of export duty on coarse cloth from 10 per cent to 6½ per cent *ad valorem*. To what extent would it offset the burden of higher excise duties on the mill industry? This is anybody's guess at the moment, but since the export market for cloth is no more homogeneous than it is for other manufactures, and it is not every mill that is in a position to tap this market, a realistic appraisal of the situation would not hold out much promise. Mills which are in a position to sell in export markets are already doing so, and to their fullest capacity. The diversion of production is hardly possible for the other mills—the smaller units, high cost and inefficient ones. And if what one hears is true, these mills are not earning profit margins that can pay for higher excise duty, and since they cannot change over to exports, they will have to close. This may be a good thing in itself, but it will have consequences which Government may not be willing to face. Finally, whether it is realistic or not, there is more than a touch of cynicism in offering concession in export duty on coarse cloth which is made wholly from Indian cotton, and can find a market abroad only because the cotton grower is prevented from getting a competitive price. Indian cotton is still well below the world parity.

Landslide in Andhra

Our Andhra correspondent writes:

WITH more than half the results of the Andhra elections having come in, post-mortems have begun. The defeat of the Communists at the polls was not unexpected and even the possibility of a landslide had been occasionally mentioned. The most optimistic of Congressmen, however, had allowed at least 30 seats for the Communists and they are naturally pleased to see their estimates go awry. The causes of the Congress victory were undoubtedly the forging of a united front thus isolating the Communists, the organizational skill of Shri S K Patil, the popularity of Pandit Nehru and the fine impression created by Shri Dhebar, in that order. The alliance of the KLP, Praja and Congress parties prevented the splitting of the anti-Communist vote. In 1952, it would be remembered, the Congress was in a somewhat similar situation to what the Communists are in 1955. Even today, on a final counting, it would be seen that the votes polled by the Communists, as a percentage to the total poll, are not far short of what they were in 1952 but in 1952, the anti-Communist vote was split and they came through victorious. In most of the central Circars districts, the fight has been particularly close and might well have gone the other way though it is also undeniable that there has been a definite swing, not so much to the right, but certainly away from the Communists.

Among the other factors that may have made for the Communist reverse are the comfortable food position even in the Rayalaseema areas and the existence of an Andhra State for in 1952 the Communists certainly exploited the delay in the creation of the State. Another was, one cannot help thinking, that they overplayed their hand from excess of confidence. The constant reiteration of their impending success, their attacks on the Indian Constitution and personal reference to Pandit Nehru certainly did not help the party. Neither did the promise of five acres of wet land for every landless agricultural labourer when there was not enough land to give even half an acre, dry or wet. The statistical absurdity of it was exposed and admitted; but it did not help.

Now that victory has almost been won, how long will the Congress

coalition hold? The chances of the Congress party alone emerging with an absolute majority are fairly bright. Should that happen, the bargaining strength of the KLP and the Praja Party (already distraught with the defeat of its leader, Shri Viswanathan) would correspondingly suffer and, all in all, this would be a good thing as the Ministry would not feel obliged to submit to considerations of political expediency rather than principles the way it had been doing formerly. The question, however, is how far there will be unity within the Congress

ranks themselves. Shri Prakasam remains a problem and even if the question of leadership is decided against him, there is every indication of the rivalry between the Gopala Reddi and Sanjiva Reddi groups. One can only hope that whoever takes over the reins, Andhra will be allowed a period of clean, honest and stable administration. The electorate have given the democratic parties a second chance and should they fail them this time, the Congress humpty dumpty would have a big fall and not all the king's horses could put it up again.

MARTIN BURN LIMITED

NOTICE

The Ninth Ordinary General Meeting of the Shareholders of Martin Burn Ltd. will be held on Tuesday, 29th March, 1955 at 12 Noon at the Registered Office of the Company, 12, Mission Row, Calcutta, to transact the following business:—

- (1) To receive and adopt the Directors' Report and Audited Balance Sheet and Profit and Loss Account for the year ended 30th September, 1954.
- (2) To declare a Dividend and Cash Bonus.
- (3) To elect a Director.
- (4) To appoint Auditors for the current year and to fix their remuneration.

SPECIAL BUSINESS:

(as a Special Resolution): That the Articles of Association of the Company be altered in manner following:—

The following proviso shall be added at the end of Article 150(6):

"Provided however that any Manager appointed under this Article who is also a Director of the Company shall not exercise the power to make calls on shareholders in respect of monies unpaid on shares in the Company, borrow monies except within the limits previously fixed by the Directors at a Board Meeting, make loans except within the limits previously fixed by the Directors at a Board Meeting or invest the funds of the Company except within the limit and upon such investments previously fixed and specified by the Directors at a Board Meeting and further provided that every such investment made by the Director/Manager shall be subject to confirmation by the Board of Directors at the first meeting held after such investment."

The Ordinary Share Registers of the Company will be closed from 22nd to 29th March, 1955, both days inclusive.

By Order of the Board,

CALCUTTA,
4th March, 1955.

A. G. GIDLEY,
Secretary.

NOTE—The Dividend and Cash Bonus, if sanctioned, will be paid on or after 22nd April, 1955 to those Shareholders so entitled whose names appear in the Company's books on the 29th March, 1955, or to their mandatees. No application for dividend warrants will be necessary.

Let Us have More Paint

THE whole of India could do with a fresh coat of paint. It would brighten drab households, lengthen the life of materials, bring a little cheer to one and all, perhaps stimulate the desire for a better life in many. It would, in short, help us all along the line. The hard hearted planners, however, do not look upon it this way. They draw a sharp distinction between constructional activity that goes to domestic houses and others. The former makes life easier no doubt, but it contributes nothing directly to future production; so it is a luxury which a poor underdeveloped country should indulge in, if at all, in small doses. So no brighter homes in the first or second or perhaps even in the third five years. Paints that lengthen the life of machinery and equipment, however, belong to a different category. Labelled 'industrial', paints have the blessings even of the flint skinned planners.

Now more than the shabbiest of small towns, or any other city, Calcutta needs a fresh coat of paint. Because of some reason or other, which has never been fully brought out, discussed and rectified, building of residential houses in Calcutta is discouraged in a larger measure than that in any other city. The rent act that is in force in Calcutta prevents house owners from getting a return from rents comparable to that in Bombay, for instance. It is not merely a matter of accountancy but of grave social import. The Chief Minister of West Bengal can, with impunity, indulge in his constructional megalomania and build skyscrapers for his Government, but he knows that Opposition would get at him if he were to appear to be partial to landlords. Building suffers in consequence, but who cares? The treasury bulges with rent deposited by tenants who go to court and question the fairness of the rent charged. Rent cases drag on, meanwhile the West Bengal Government has a useful addition to its cash balances, never too large, and use of tidy sums for next to nothing.

This is by way of a preface, to stress the point that Calcutta is the obvious centre for paint manufacturers to meet and it is meet and proper that it should be the headquarters of the Paint Federation. There is or was a rival body representing similar interests. Calcutta's superior claim should not only be upheld; no other association should be allowed to come in the way and thus divert attention

from the main issue.

The Federation met on the 23rd of the last month, to be precise, to air its grievances. In his address Mr G J M Dyer, the retiring Chairman, brought out forcefully what appears to be the common complaint of many of the industries. There is, to begin with, "the policy"—or the lapse from it—"whereby Government negotiated for supplies outside the public tender system, and even on occasions, in respect of items for which public tenders had actually been issued." Then there were the irritating delays through all the successive stages of Government purchases—delay in testing samples at Government Test House; delay in finalising acceptances of tenders; delay caused by negotiation of extended delivery dates, which, in turn, was caused by the previous delays; and, finally, delay in Government's payment of bills which, needless to say, bottles up manufacturers, dealers and their suppliers and gently pickles them. All these complaints are common to most of the industries and have been taken up by the Associated Chambers of Commerce. The Paint Federation had, in common with other organisations, submitted their recommendations to *blanc fixe* the Stores Purchase Committee and are hopefully awaiting its report.

But it is not all a tale of woe. Mr Dyer noted the great improvement in import trade procedure during the year. This is in the matter of centralising the issue of import licences, which means that manufacturers are now all treated alike and there is less delay in the issue of licences. The industry has received special attention from the Finance Minister, after Mr Dyer spoke, in the shape of a 10 per cent excise duty. The budget proposals, however, also contain some tariff concessions which may help the paint industry in the matter of getting its raw materials cheaper. In the list of such concessions are dyeing and tanning substances, gums, resins, plumbago and graphite. To the ignorant, many of these names sound as if they may have something to do with paints and varnishes. Of course, the Federation will know. There is however one snag here which again is common to all importers of all raw materials of industry—Imperial Preference, which prevents the Government from allowing duty free imports of such materials unless they happen to come from Britain. In the case of dye

THE ECONOMIC WEEKLY

stuffs, unfortunately, many of them do not. The paint industry may be in the same boat.

There is another point raised by Mr Dyer which again is of common interest to industries which have or are hoping for an export market, *viz.*, the draw-back of import duties on raw materials which go to the manufacture of exports. India-made paints do have an export market. In principle, needless to say, there is not the slightest justification for withholding rebate of import duty paid on raw materials which are used for making the paints that are exported. But difficulties of administration, the villain of the piece, here as elsewhere, come in the way. The complaint that the operation of sales tax in inter-state trade be-devils the sales organisations is, of course, not special to the paint industry. But it is no less irksome because it is universal. The Matthal Commission devotes considerable attention to these problems and let us hope, some day, these would be straightened out.

Of the complaints special to the paint industry, one is that of Bombay's refusal to toe the line in the matter of weights and measures. Alone among the States, it sticks out for the Imperial gallon. Members sell their products all over India, and how much inconvenience is caused can be well imagined if one State insists on all sales being made in a different measure. The other, namely, the sharp reduction in the issue of licences for Lithopone, is however somewhat controversial when we are trying to build up a Titanium Dioxide industry in the country. The matter is currently before the Tariff Commission and in a way *sub judice*. Here, again, let us hope that the knotty problem of *blanc fixe* and Lithopones would be solved in a manner which would enable white paints to be manufactured in this country in sizable quantities, without impeding heavily the growing use of paints. Customers have to be re-educated to this end, wherever there is scope for substituting indigenous for imported raw materials; it would be good to see the Paint Federation taking a lead in this matter. If they do, it will considerably strengthen the Federation's case against continued imports of finished paints when these are readily available from manufacturers in this country. It does not say much for the vigilance of the Ministry of Commerce and Industry that the Government departments should be the principal offenders in this respect. Is "Buy Swadeshi", then, only for the public and not for the Government?

THE ECONOMIC WEEKLY

Our Delhi Letter

Deshmukh and Socialism

Wednesday, Evening

THE most important—though, in retrospect, not the most sensational—event during the week, was, of course, the presentation of the Budget to Parliament on Monday afternoon. For several days, the temperature had been much higher than normal. But on the budget day, the sky was cloudy. The weather was rather gloomy when Shri Chintaman Deshmukh entered the Lok Sabha and it started to drizzle a little when he began his budget speech. There appeared to be little excitement, however, as if people inside and outside Parliament knew what was coming. The diminutive Shri Chintaman entered the House almost unnoticed. For almost the first time, nobody seemed to notice the entry of the Prime Minister either. This was not his pigeon, so probably he thought. But where was the room for socialism if not in fiscal operations and the associated economic policies of Government? In the eyes of many, Pandit Nehru has acquired almost a Palmerstonian character ("a tory at home and a liberal abroad").

As things have turned out, however, Shri Chintaman remains the Finance Minister of the country in his own right and with his own philosophy. As we sat listening to his speech, a friend remarked that this was Deshmukh's last speech. I quoted to him the opening words of one of his predecessors, Sir Archibald Rowlands, who had said that he was delivering his first budget speech in the hope that it would be his last. This, however, was all wishful thinking. If TTK can stage a come-back, why should Shri Deshmukh have to go? His competence and integrity have won him universal respect even among his bitterest critics, though it is a moot point whether his civil service philosophy might not crack under the exacting demands of a socialist state. Incidentally, I might remark that the even tenor of his budget speech for 90 minutes, which might well have been a gruelling experience to another man of his age, spoke significantly of the placidity of his mind. The budget speech certainly did not sound like a swan song.

It is not necessary to go over the details of the budget proposals, for these have been widely reported.

The immediate reactions in markets have not been unfavourable; Indian Irons, which has now taken the place of Tata Deferreds as the most speculative scrip on the stock exchanges, rose sharply, despite fluctuations. The capitalist press has calculated the several bull points in the new budget and come to the conclusion that the cards are weighted in favour of bulls. They expect that big business will share in the prosperity that will follow rapid and large injections of purchasing power. The amount of Rs 9 crores by way of additional direct taxation was too small a price for deficit financing of the order of Rs 320 crores. There is general relief in big business circles, for they openly confess that the imposts on higher individual incomes could well have been heavier.

The middle class curses the tax proposals, for the clerk would have to economise on his lunch or walk both ways to the Secretariat or save on his children's milk or schooling for there is very little margin in his budget out of which to meet the new burdens. The reaction of the working classes would naturally be cynical, for didn't Ricardo say in the House of Commons that the labourer would get dry bread in one case and dry bread in the other?

BOMBAY BUDGET THE BEST

The Bombay budget has on the whole been well received here as the best of State budgets. With a surplus on revenue account, both in the current year as well as for the budget year, it is almost unique among the State budgets with maximum reliance on the State's own resources. Bombay is likely to exceed its target of Five-Year Plan expenditure, though slightly. Nearer home, the Delhi budget released simultaneously with the Union budget got almost lost. But one feature stands out: the State of Delhi is going to spend 50 per cent of its revenue on education.

Incidentally, recent developments in ministry formation in the Delhi State, which created a lot of trouble and brought all the party giants including the new Home Minister into the picture, have settled down in a rather curious manner. All the four contestants, who talked of high principles, have been accom-

modated in the Cabinet with a redistribution of portfolios, including the position of the Speaker. This reminds me of an interesting passage in Romain Rolland's *The Soul Enchanted*: "... Thieves talk of principles; then they come to an agreement: 'You rob to the right and I rob to the left and let there be no more talk of principles.'"

DEBATE ON PRESIDENT'S ADDRESS

The debate in Parliament on the President's address has been extremely interesting, with, of course, the Prime Minister as the principal figure in the debate and Krishna Menon as his foil on almost the Shakespearean model. Cross-examined by the Communists, the

Prime Minister was at his best, particularly with regard to the definition of a socialist state. He refused to commit himself to any kind of formal, specific or detailed definition. It is interesting to piece together the gems of the Prime Minister's speech. "... We certainly aim at what we have called a welfare state. I can go a step forward. We aim at an egalitarian society. ... The first step is to think correctly ... our economic thinking has to be refashioned in our nuclear age in terms of nuclear power ... it is a distant picture of a happy society of every one having opportunities and no one dominating the other. *I am afraid that kind of society is not going to come in my life-time.* When we talk of socialism, we must have more and more social control of the major sources of production. There again we are not thinking frankly of land coming into the public sector. It will remain in the private sector, though we are thinking there in terms of co-operatives. We want to gain economic progress and all that through peaceful democratic processes. I am sure we can do it not because of any theoretical arguments but simply because I am sure of the Indian people."

With regard to the international situation and the foreign policy of Government, the Prime Minister was equally forthright, "... At the present moment Formosa is in the possession of Marshal Chiang Kai-shek supported by a great power. That is the fact of the situation. What is to be done about it? I am astonished at the way Africa is being treated. ... We have no intention of turning Communists. But at the same time we have no intention of being dragooned in any other direction—we propose to go along the democratic path." These last words were apparently addressed to the Communist benches, but the Prime Minister was looking across the continent of Asia to Bangkok. There the SEADO Council members were meeting with their military and economic advisers; but it is not without significance to the developing diplomacy of the Prime Minister that at the concluding session of the SEADO Council, it adopted a resolution greeting the Asian-African Conference meeting in Indonesia on April 18. Mr Dulles strongly supported the resolution! It is not far-fetched to connect all this with the fact of Mr Stassen's presence here. It is a

tribute to the foreign policy of the Prime Minister that we are not seekers of foreign aid at Washington, but Washington itself has come down to us to ask how best it can be of help in financing a large-scale development programme.

FILM SEMINAR

Delhi, as usual, has not been without its cultural activities. In fact, the most exciting event has been a film seminar with Devika Rani as the lady of the piece. Quite a number of producers, exhibitors, actors and actresses have read 'papers', as we call them in the academic world, on the various aspects of film life in relation to the community and the state. Then Shankar, the famed cartoonist of *Shankar's Weekly*, has brought the children of various nations together

and exhibited their artistic talents and traditions. With Delhi as an international centre and the various Embassies and High Commissions attached to the Government of India, opportunities are many, and Shankar has exploited them with effect. He has the art of combining international goodwill with a prudent mixture of business and pleasure.

The week closes with a significant arrival, that of Sir Anthony Eden this evening at 7-35 pm. With Mr Stassen on the economic front and Sir Anthony Eden on the political, the defences of Pandit Nehru will be severely exercised and his liberal socialism exploited to the full. These great men have their allies at New Delhi; but the less said of them, the better; and it is time to close.

Halting the Boom

SOME two months ago, the *Times* in an editorial comment on the economic situation spoke of the "trap to be avoided." It referred to the primacy of investment as the "nation's axiom" and that no large concessions be given to the consumer. Should such concessions be made, explained the *Times*, the trap-door to disaster would be opened. In fact, as recent events have shown, the trap-door has all along been standing ajar—being gradually pushed open by a combination of economic circumstances to the point where the Conservative Government has had to resort to measures applicable, in terms of ordinary thinking, to only crisis situations. The only material difference between the crisis measures of 1951-1952 and that of 1955 is that quantitative import restrictions have not been applied. And yet, we are being assured both by the *Times* and the Chancellor of the Exchequer that "the economy is fundamentally stronger than at any time since the war" and that the severity of the monetary measures adopted are merely designed to avert "an unhealthy situation."

THE BACKGROUND

It is well to look into some of the features of the current situation to assess the purpose of the crisis measures. The year 1954 was a year in which full employment was accompanied by a marked decrease of controls. By the turn of the year many economic commentators described the economy as being at "full stretch." Industrial production and the volume of business both at home and overseas were larger, and personal spending reached record levels. What was less familiar was the marked upturn in national savings. In this favourable situation, certain typical boom strains began appearing. The growth in industrial output increased the demand for coal, steel, electricity and imported materials. Coal output failed to rise as much as it had been hoped and imports had to be brought in to supplement local supplies. Steel output established a new record but here again extra supplies had to be imported. Imported materials though lower for the whole year began rising from July last to new heights in the last month. Imports of non-ferrous metals, chemicals, petroleum, pulp and paper all rose in 1954, and in some instances sharply, to support the

growth of output by the user industries.

DEMANDS BY AND ON INDUSTRY

It is clear that in so far as supplies to industry were concerned, local sources proved inadequate and the country had to resort to increased imports. The output of industry was large—something like 6 per cent above that of 1953. But bottlenecks had begun to appear. The rate of increase in output fell from 7 per cent (over the previous year) in the first quarter to 4 per cent in the fourth quarter. The rise resulted mainly from higher output in metal goods, oil refining, paper and chemicals. There were smaller increases in the output of the textiles, leather and food industries.

Turning next to the demands on industry, the most important development has been the growth of the home market. Home demand was taking about three-quarters, and exports only a quarter of the rise in industrial output. Personal consumption (in volume) in the first three-quarters of 1954 was about 3 per cent above that of a year earlier. The quantity of household durable goods consumed (largely by hire purchase) rose by as much as 7 per cent. About 376,000 new cars were sold in 1954 on the home market, an increase of about 3.5 per cent over 1953. Exports as a whole increased by about 5 per cent over the previous year; there was, however, a levelling off of shipments in the last four months.

These heavy demands on industry had their necessary effects on costs, prices and profits. Wage rates were something like 4 to 5 per cent higher on an average in 1954 compared to the previous year, and a number of wage claims still remain outstanding. Import prices were about 4 per cent higher in February 1955 compared with a year earlier and wholesale prices (other than food) increased by 3½ per cent in the same period. With regard to profits and dividends, the *Economist* calculated the rise to have been 11 and 18 per cent respectively. Retail prices as shown in the retail prices index were about 4 per cent higher in February this year: the general level of food prices alone was nearly 8 per cent higher. The pressure of competition in export markets left British export prices unchanged over the past year.

There remain further two other major demands on industry, which are sizable by any measure. Industrial investment rose rapidly in 1954 largely due to the incentives created in the last Budget and the booming internal market. Factory building data show big increases in approvals, starts and completions in the past year. Machine tool orders, a good guide to future investments in plant and machinery, have been rising steeply and expansion programmes have been announced by a considerable number of firms. The other demand on industry has also been significantly large. Public investment in electricity generation, house-building, armaments, railway re-equipment, atomic energy research have all been considerable.

PROSPERITY TO SPECULATION

This brief review of the economy over the past year shows up the dangers of inflation which were implicit in the demands upon industry and of the leakage of some of the demands into imported materials. By the turn of the year, the "trap-door" dangers had become very real. It was made worse by two other features, the first of which is characteristic of that situation when prosperity is converted into a boom: speculation. The other was the pressure on sterling on the foreign exchanges and the alarming discounts at which non-dollar area held sterling was being dealt with in the free markets of Europe.

The speculative fever which took hold of the stock exchange in London, though not to be compared with that of 1929, was in any event alarming. A widespread movement away from gilt-edged securities on to equities was the order of transactions on the exchanges. The *Financial Times* index of equity share prices rose from 131.1 at the beginning of January 1954, to 197.5 at the beginning of February 1955, while that of gilt-edged securities rose from 90.4 to 101 in the same period.

Coupled with the speculative fever in dealings in stocks and shares, the financing of other trade transactions was increasing—mainly on the basis of bank credit. The curve of credit expansion which had levelled off in August and September last, resumed its upward course into the new year. According to the *Banker* the impetus to the credit expansion had mainly come from the private sector

of the economy. But among its necessary effects was the liquidity in the money market leading to a decline in Treasury Bill discount rates and hence in some drying up of the flow of foreign short-term funds to London: a cause for the pressure on sterling on the foreign exchange market. Between January and December, the Treasury bill rate fell from 2.12 per cent to 1.75 per cent while in New York, the Treasury bill rate rose from 0.71 per cent to 1.17 per cent.

The expansion in bank credit was accompanied by large scale hire purchase transactions. The *Economist* has estimated that hire-purchase, as a form of consumption, totals something more than £400 millions. Its inflationary content in an economy already fully-stretched is equivalent to an increase in stocks financed by bank credit. What is more alarming is the fact that much of the hire-purchase goods are of a durable type which could be otherwise exported. Businessmen and traders have greater incentive to sell to an easy-going home market than worry too much about finding export markets for their goods. This is all the more so if they find credit conditions easy for the financing of their hire-purchase sales to the home market.

GLUT IN STERLING

All the foregoing are gravely serious in themselves, but when they begin to spill over and so affect the balance of payments it is then that the real crisis appears. Apart from the fact that the terms of trade have turned in an unfavourable direction, exports have not kept up with the higher level of imports. More than that, there has been some flight of short-term capital from London and the exchange market has, as a consequence, been faced with a considerable glut of sterling only to be cleared by the Exchange Equalisation Account maintaining as it does, the official lower exchange rate limit. The gold accumulations in the first half of 1954 have already been wiped out by the unfavourable turn of events in the last four months.

Confidence in sterling had been shaken. Non-Sterling Area residents with balances in London were liquidating these balances in various ways—some of them sufficiently mysterious to remind one of the practices that preceded the 1949 Devaluation crisis. Transferable Account sterling was offered in the free markets of Zurich, Paris and New York at a rate equivalent to £1 = \$2.71 and the illegal shunting of sterling area pro-

ducts to the dollar area against transferable account sterling (obtained at the above rate) had once again become profitable.

MONETARY, NOT PHYSICAL CONTROL

These pressures led to what had been termed a "warning increase" of Bank rate by ½ per cent at the end of February. Apparently, the warning did not have the desired psychological effect. The situation did call for more drastic measures and Mr Butler has now responded with some semblance of toughness. The policy changes effected, however, go a long way towards exploding the "prosperity in freedom" myth which the Conservatives hoped would be their election cry.

Bank rate was pushed up by 1 point to 4½ per cent—the highest level in 23 years. Along with it, restrictions on hire-purchase have been ordered. The Capital Issues Committee has been revived and commercial banks have been instructed to withhold credit facilities for hire-purchase. Finally, the Exchange Equalisation Account is to enter the free exchange markets to purchase transferable-account sterling against dollars in order to bring the free market rate into line with the official rates of exchange.

The London markets—shares, money and exchanges—were thrown into utter confusion by these measures. Their severity had brought home the crisis complexion of the situation. Share values dropped by

From the Calcutta End

Taxation, Deficit Financing and Unemployment

WEST BENGAL'S educated, unmarried, middle class seems surprised at Shri Chintaman Deshmukh's assumption that every earning, able-bodied man in India is a married man. Raising of tax-exempt slab for income-tax for married persons is welcomed as an attempt to introduce "dependent" allowances. But the lowering of tax-exempt slab for bachelors is resented as the assumption that every person paying income-tax is a married person is not generally true so far as West Bengal is concerned.

BACHELOR TAX

Throughout West Bengal, there are many such persons who remain bachelors just because they cannot afford marriage. Provision for "dependent" allowances is one thing.

as much as 15 per cent. The money market after being "in the Bank" for four consecutive days devoted itself to nothing else but adjusting its own discount rates. The foreign exchanges have eased more out of confusion than out of any confirmed reversal of previous trends. It has since been reported that a general rallying in the markets has taken place but it is still too early to judge the deeper effects of these changes and to say whether the steps taken would be adequate to meet the demands of the situation.

The situation is bound to affect the next Budget. When, at the end of January, Bank rate was raised by ½ per cent, it was generally suggested that a bit of tightening was necessary to cover tax concessions which the Government was to make in what was considered to be an election Budget in April next. The gravity of the situation and in particular the traitorous course which trade has taken coupled with the currently committed level of rearmament expenditure, however, affords little opportunity for the next Budget to serve election purposes. Had the present measures included the reimposition of physical controls (over imports and distribution), there may have existed some margin of safety on the basis of which the expected Budget surplus of £250 million (for 1954-55) could be given back to the public in the form of tax concessions. But alas! not even this may now be possible.

But to impose a tax on bachelors in a country like India, is a quite different matter. This seems to be the main reaction of the average educated, lower income-earning Bengali to Shri Chintaman Deshmukh's tax proposals.

Students of public finance are aware of the circumstances in which deficit financing is justified. But West Bengal's Assembly members disapprove of deficit financing. Shri Chintaman Deshmukh will endorse some of the points raised by Opposition members in their criticism of the West Bengal budget. In many States, deficits are mounting. Pundits are aware of the criticism that the States have not mobilised their resources as envisaged in the Plan. This has been a constant theme of the Union Finance Minister.

UNEMPLOYMENT

But this is not the main point raised by West Bengal's Opposition members. They are concerned that deficit financing is not creating employment. Unemployment is an all-India problem. It is most acute in West Bengal. Deficit financing is supposed to help solve unemployment. Shri Chintaman Deshmukh admits that unemployment has not been solved by deficit financing. West Bengal's Opposition members claim that West Bengal is going bankrupt through deficit financing without any alleged benefits from bankruptcy. Dr B C Roy will, no doubt, retort that, in West Bengal, industrial expansion does not increase employment. Factory employment in this State is decreasing. This is a statistical fact.

Criticism of the Congress Government by any party member is rare. Sarojini Naidu's daughter created a sensation in criticising the Congress Government's atrocities in Hyderabad in Parliament a couple of years ago. She was forthright in her admonishment. She said things which were not quite unknown about events in Hyderabad since Telengana, about nepotism, inefficiency and factions of the Hyderabad State Congress about the miserable state of affairs in that State since Congress took over. Shrimati Meera Datta-Gupta, a Congress member of the West Bengal State Assembly, is not as outspoken or severe in her criticism. But one cannot recall any other Congress member, in Parliament or in any State Assembly, to be as critical of the Congress Government as Shrimati Datta-Gupta since Shrimati Naidu's strictures on the Congress Government in Hyderabad.

STATE UNDERTAKINGS

With some of Shrimati Meera Datta-Gupta's remarks, Dr B C Roy will be in agreement. Shrimati Datta-Gupta echoes Dr B C Roy's complaint about the paradox between wealth and taxing power in this State. She made a passionate plea for a more liberal system of allocation of resources between the Union and the units. This is an issue on which all are agreed. But it is an issue which has been debated for the last thirty years without any decisive or satisfactory conclusion. Everybody is agreed that the States will have to devise new sources of taxation.

Revenue from State undertakings is one of them. Many States have undertaken many business enterprises. In many States, such enterprises are not only not profitable, but are being

run at a loss. State enterprises must pay tax. These undertakings must be run on a profit basis. When Sir Jeremy Raisman first elaborated the possibilities of utilising State enterprises as revenue-earners, he was widely criticised for expressing such cynicism as Finance Member to the Government of India. Today, with public corporations and growing State activity, these ideas are commonly accepted.

No eyebrow is now raised at the suggestion that State undertakings should make profits. This is conceded as a legitimate means of indirect taxation. But State undertakings do not seem to be profitable enterprises. Many such State enterprises are incurring losses. Private initiative regards this as proof positive of its superior efficiency. In some States, in West Bengal, for instance, the Government seems to foster the impression that there is nothing much wrong with State undertakings incurring losses. Some synthesis, it is clear, is needed between this service concept and the policy of utilising State undertakings as feeders to the fisc.

UNSPENT ALLOTMENTS

Shrimati Datta-Gupta, a veteran educationist, raised a point which has become a feature of public finance in this country in recent years. New Delhi cannot spend the amounts budgeted for. Thus, the actual amount of deficit financing is well below the budget estimates. Nor can West Bengal spend the budgeted expenditure on education, agriculture, health or refugee rehabilitation. These are the major problems of West Bengal today. Many will enthusiastically echo Shrimati Datta-Gupta in her sincere surprise that in a State like West Bengal the amounts annually budgeted for these departments cannot be spent.

In her criticism of the budget, she raises a point which is a partial answer to her main argument, as well as an emphatic reflection of some of the evils in this State. She is in favour of a re-allocation of resources between the Union and the units. It is apparent that she justifies her plea on the argument that State resources are inelastic. This is true. With the exception of sales taxes, all the other State resources are inelastic. But is West Bengal exploiting sales taxes properly?

BOMBAY VS CALCUTTA

Figures quoted by her are revealing. Bombay's annual business turnover is estimated at Rs 450 crores.

Bombay's annual collections from sales taxes are Rs 20 to Rs 25 crores. West Bengal has a higher annual business turnover. But her collections from sales taxes do not exceed 25 per cent of Bombay's receipts from this source of taxation. Facts that can be deduced from these figures are revealing. A comparison of income-tax receipts from West Bengal and Bombay seems to confirm the facts which sales tax statistics indicate.

There are two possible deductions. One is that business morality in West Bengal is not as high as in Bombay. Income-tax evasion is alleged to be widely prevalent in this State. Through one's casual association with business circles, one gathers the impression that taxes are meant to be evaded. Income-tax experts earn fabulous amounts. One gathers that sales tax experts are now minting money. This leads to the second possible deduction. Can it be that the tax-gathering machinery in West Bengal is more inefficient and loose than in Bombay? Thieves cannot thrive if police are alert. Both the possible deductions seem relevant.

INVEST IN INDIA'S FUTURE

Matthai Gospel of Taxation

THE Report of the Taxation Enquiry Commission, issued along with budget papers, is a massive document of three volumes, dealing with all aspects of the system, structure and rates of taxation, development finance and capital formation, taxation as an instrument of social and economic policies, etc.* It goes into minute details over the collection and administration of individual taxes: the income-tax, the sales tax, land revenue and even local taxes. It is obvious that a document of this size and importance can be subjected here only to a preliminary examination.

The circumstances under which the Taxation Enquiry Commission was appointed may be briefly examined. Finance Ministers of the post-war period had been harassed in the performance of their functions by the needs of a fast-expanding administration and developing economy and the extremely limited resources with which they had to operate the system. Almost all current resources were exhausted by the normal demands of administration and defence. State Governments were crying out for larger outlays on health, education, irrigation and the like. The political pressure of vested interests limited the scope of direct taxes and the suffering of the middle class during war and inflation added to the unpopularity of the whole range of indirect taxes. The Finance Ministers did not know where to seek additional sources of finance.

DEMAND FOR DEVELOPMENT

With Independence, the demand for rapid economic development became insistent from all classes of people and the masses. But who was to foot the bill and how was it to be footed? Deficit financing was the easiest answer, but how long and how far? It must be confessed that apart from the question of economic competence, political questions were involved because of differing approaches to problems of social development, and no Finance Minister had the courage or political capacity to take the necessary decisions. The Prime Minister insisted on rapid economic development and the framing of ambitious plans, but he did not claim to know the answers to the many technical questions involved, the principal one being that of financing the process of development. Then there was the necessity to sift the whole ground that had been covered here and abroad, both in theory and practice. We had our last Taxation Enquiry Commission in 1924, and during these 30 years, the economy, as also the polity, has undergone a complete transformation. Some fundamental thinking was necessary for the world abroad had gone through the Keynesian revolution in public finance and economic policy. The doctrines of the *General Theory*, far from being considered revolutionary, had become part of the new orthodoxy. Keynes is, in fact, the new god of American economics; and his gospel guides the US Treasury and the Federal reserve system. How far were we to modify our system of taxation in accordance with the vast modification of doctrine that had taken place, and the tremendous demands of our economy? This required fundamental thinking.

* Report of the Taxation Enquiry Commission 1953-54. Vol I, pp 216, Statistical Appendices, pp 217-334. Vol II, Taxes on Income, pp 368, Statistical Appendices, pp 369-446. Vol. III, Sales Tax and other State Taxes, pp 458. Statistical Appendices, pp 459-517. Published by Ministry of Finance (Department of Economic Affairs), Government of India. Price not mentioned.

Then our economy had been subjected to serious and prolonged inflationary pressure from 1943 right up to 1951, when deflationary pressures started working. Naturally, therefore, Government took the opportunity of appointing the Taxation Enquiry Commission, including in its terms of reference the examination of the use of taxation as an instrument for dealing with inflationary and deflationary situations. Further, our economic system, already almost grotesque in its inequities, had been completely distorted by prolonged inflationary pressures, already referred to, and the mass of the people had been subjected to extremes of suffering. There was need of introducing a suitable measure of equity in the system. The Taxation Enquiry Commission was, therefore, asked also to examine the suitability of the present system of

taxation for reducing inequalities of income and wealth. Associated with this was the technical examination of the incidence of Central, State and local taxation on various classes of people and in different States. The whole system of taxation was to be rationalised and developed as a positive and effective instrument for development and equity. The was the main job of the Commission, and it must be said that it has been competently performed.

PAINSTAKING RESEARCH

Apart from the analytical aspects of the Report, even from the point of view of quantity and quality, the factual data that have been brought together and the amount of research done are commendable in themselves. The Commission surveys the whole background of change since the last Taxation Enquiry Committee reported in 1925. There is no space here to deal with the progressive evolution of the Police State into the Welfare State, that it is now our goal to build up. The policies and functions of Government have undergone a sea change. Certain old taxes, the liquor excise, the salt tax and land revenue, have either disappeared or lost their traditional importance. There has been a great development of income-tax and excise duties on the domestic manufacture of consumer goods, sales tax, etc. On the expenditure side, we have a programme of development on lines laid down by the Planning Commission in their First Five-Year Plan, and more such plans of an ambitious order are to follow. Additional resources have to be found. Actually, the real tax burden on the community as a whole has remained unchanged, the national income and public revenue and expenditure each having increased 4 to 4½ times in money terms since the war. The slow response of the tax system to the demand for larger resources has led to a growing gap between governmental revenues and expenditure; this gap must be filled in an equitable manner, and in a manner which must be consistent at the same time with basic elements in any programme of development. The system has, of course, become more elastic and somewhat more progressive than it was in the pre-war period; yet a lot more has to be done in all directions to secure to the State

the resources it requires for a fast-developing economy. There is now a community of interests between the Central and the State Governments, as co-sharers in the more elastic sources of Central revenues, from which State Governments also receive substantial grants.

CHARACTER OF EXPENDITURE

Though the Commission was concerned with taxation as such, it could not ignore the fact that the character and distribution of public expenditure modified the economic effects of taxation. In fact, elsewhere in the Report, the Commission points out that a wise, beneficent and progressive system of public expenditure might well raise both the capacity as well as the willingness of the people to pay taxes. The Commission suggests the appointment of high-powered bodies to deal with the system of expenditure, as taxation has been dealt with by the Commission itself. It has been undergoing what may be called chaotic changes owing to the pressure of circumstance, and there is the need both for fundamental as well as for factual analysis. Non-development expenditure is still substantial. Taking a broad picture of the current public expenditure of all Governments in India (1953-54), the Commission points out that out of each rupee of the total expenditure, nearly ten annas are spent on non-development purposes and the remaining six annas, almost equally divided between social services and economic development. This, however, does not take into consideration what has now developed into capital account. Capital outlay of Governments in India was relatively small before Independence, owing to the restricted role of Government in economic development and social welfare. The total capital outlay is now rising rapidly, and in course of time may well overshadow non-development expenditure which, in the opinion of the Commission, ought to be kept as low as possible. In the long run, this increasing development expenditure is likely to increase the taxable capacity of the people. At the moment, however, the role of public expenditure in the Indian economy is somewhat modest. Estimated at Rs 1,170 crores for 1953-54, the combined expenditure of the Central and State Governments and local authorities forms only 11 per cent of the probable level of national income. Apart from this low proportion, the

system of expenditure has little significance for social welfare.

MEASURING THE INCIDENCE

The Commission has tried to tackle in a spirit of humility, but with real competence as far as it can be done, the difficult and somewhat intractable subject of the incidence of taxation. In spite of the mass of theoretical and practical difficulties associated with the subject, the material analysed by the Commission is substantial, while the conclusions are valuable for fiscal purposes. The Commission estimates that indirect taxes absorb 3.6 per cent of *per capita* total expenditure and amount to 5.7 per cent of the total cash purchases. The average incidence of Central excise duties in relation to cash expenditure has been worked out at 1.5 per cent. On the whole the conclusion of the Commission is that the rural classes, for various reasons, were escaping their fair share of taxation. In 1950-51, land revenue, as a proportion of the gross value of agricultural output, was only one per cent, and of the net value, 1.2 per cent. Taking the income-tax and the land revenue together, the Commission comes to the conclusion that the tax system is distinctly progressive only for the urban groups with expenditure levels over Rs 300 a month. It is not so in the case of similar groups in the rural sector except in certain States where there is an agricultural income-tax at fairly steep rates. Hence, there is greater room for increased taxation of higher rural incomes. Though the Commission has warned that its general review of the incidence of taxation is not perfect and should therefore be treated with caution, a detailed reading of the Report shows that it is about the best that could have been attempted in the present state of theoretical knowledge from the data that are available.

The Commission then proceeds to consider the requirements, of the development programme. Apart from such generalities as the need for fruitful co-existence of the public and the private sectors and the need to attain the maximum practical rate of investment in the public sector consistently with the maintaining and strengthening of incentives in the private sector and the necessary infringement of capital formation on consumption standards at least in the short period, the

THE ECONOMIC WEEKLY

Commission, in dealing with the problem of raising resources in the most equitable manner, has handled it with great realism as well as in a progressive spirit. There is, of course, no escape from some draft being made, in the opinion of the Commission, on the additional incomes from economic development accruing to the low income groups. To some extent, the money burden of increasing the tempo of development could be eased by mobilising the saving potential existing in real terms in the rural sector in the form of disguised unemployment through voluntary labour for local works, community development, etc. But this, as also the marginal savings of low income groups, could hardly furnish the resources needed for development.

WIDE GAP IN RESOURCES

The planned expenditure of the Centre and the States for 1955-56 (in respect of which the Finance Minister presented his budget to Parliament) on a residual basis amounts to Rs 792 crores. The Commission estimates the gap in internal resources, after allowing for possible improvement in revenue and borrowing and foreign assistance, at Rs 320 crores. This is, however, the figure of deficit estimated by the Finance Minister for the Centre alone. As for the second Five-Year Plan, which is still in the process of gestation, the Commission's estimates can only be taken as token figures. In fact, if these figures are taken literally, they would create a gross misunderstanding, for, as such, planned expenditure would decline from Rs 792 crores in 1955-56 to Rs 600 crores for 1956-57 with a consequent diminution in the gap in internal resources on static assumptions. This, however, is not a material point, for the history of the last four years has proved that the resources budget of the Planning Commission is the plainest nonsense and has no relation to facts. A budget has to be made and so it is made, for how could the Ministry of Finance work in a vacuum? Truth to say, the basic defects arise from the vacuum of judgment and not from lack of statistical material for making forecasts as to possible estimates of resources. These financial resources are a 'function', to use sophisticated jargon, of a fast-changing economic situation, and more significantly, of the rate and quantum of development.

THE ECONOMIC WEEKLY

This brings us to the views of the Commission on the vexed question of deficit financing. "From the point of view of the very short period and that too in the immediate future, there is perhaps a case for a certain measure of deficit financing, though certainly not of the magnitude indicated by the gap between the existing resources and planned expenditure." This may be considered as a broad judgment on the recent budget proposals of the Finance Minister. He can, of course, lay flattering unction to his soul by the Commission's remark that on the most favourable assumptions regarding production trends, deficit financing of the order visualised for one or two years might not upset the stability of the economy. It has, however, to be confessed that for the short period the Commission has really no alternative to offer except to leave the gap uncovered. From the long-term point of view, however, the Commission has warned that deficit financing could not attain a quantitatively significant magnitude in a country like India without danger of inflation and of speculative elements gaining ascendancy and distorting the pattern of development and retarding capital formation itself.

FOUNDATIONS OF TAX POLICY LAID

With regard to the long period, the Commission has valuable suggestions to offer and the broad lines of a sound and progressive tax policy that it lays down, will guide the budgets of the Central and State Governments in future. Its conclusion that the problem of equity can no longer be left to the automatic functioning of economic and social forces and its emphasis on the fact of an *appreciable* degree of *avoidable* inequality in incomes and wealth will be widely welcomed. More effective tax enforcement and additional taxes on luxury consumption and widening of the taxation of wealth and property provide possible means for the reduction of inequalities. But if any considerable addition has to be made to public revenues, some contribution must come from the mass of people through taxes which have a wide base. This is the justification of the new excises. Above all, there is the imperative need for raising the volume of taxation. Indian tax revenues are seven to eight per cent of the national income and this proportion is lower than in many countries, including some in South-East Asia. In the opinion of the Com-

mission, there is a presumptive case for holding that Indian taxation on the basis of its existing structure and rates does not fully tap the taxable resources of the country and that there is justification for some increase. Even so far as the capital account is concerned, it is desirable to cover at least a part of it through taxation. It has, however, not been suggested by the Commission that the development programme should be wholly financed by taxes.

CEILING ON INCOMES

We now come to what probably is the most radical suggestion of the Commission—a ceiling on incomes. The Commission refers to the wide disparity in consumption levels, which has a demoralising effect on the masses. In the opinion of the Commission, the disincentive effect of higher taxation on the will to work on the part of higher income groups has been generally exaggerated. Even with the present high rate of tax the range of inequality between the disposable incomes of the few and the many is wider in India than in many countries with lower rates of taxation on higher incomes. In the opinion of the Commission, it is necessary to have a ceiling on personal incomes on the basis of a reasonable multiple of the *per capita* income or family income. The multiple might well be 30 of the prevailing average family income. The Commission does not suggest the ceiling for immediate implementation, but nevertheless it considers it important that Government should strive for it by stages and in a realistic manner and as part of an integrated approach along several directions.

The Commission has also considered certain additional forms of taxation such as an annual tax on total wealth at a low rate as a complement to income-tax; but while these suggestions may be of use in the future, the Commission does not recommend them for immediate adoption. In the opinion of the Commission, additional sources would be found in an increase in the rates of income-tax partially offset by some reduction in the corporation tax, with additional reliefs for savings and investment, an increase in excise taxes, increase in non-tax revenue through adoption of suitable price policies, moderate land revenue surcharges, increase in the rates and extension of the territorial coverage of the agricultural income-tax, a more extensive adoption of

property taxation and taxes on transfer of property by local bodies and a widening of the coverage and in due course increases in rates of sales tax. These, however, are matters of detail. They have been dealt with exhaustively by the Commission and cannot for reasons of space and time be treated here.

AS A CORRECTIVE TO INSTABILITY

With regard to the correcting of inflationary and deflationary pressures the Commission has rightly arrived at the conclusion that the possibilities of the Indian tax system as a corrective for deflation are limited. But for checking inflation, it has possibilities. These matters, however, lie really beyond the taxation system. When such pressures develop, it is the whole fiscal and monetary mechanism which goes into operation and mere changes in taxes cannot go far.

On the whole, in thinking out a suitable and progressive fiscal machinery for an active and high-level economy, based on welfare conceptions, the Commission has arrived at conclusions which will play an important role in shaping the budgets of the future for a decade, if not for a generation.

Administrative and Defence Expenditure

THAT increase in administrative expenditure is a necessary adjunct to a programme of planned economic development is conceded, but only reluctantly. Even the official attitude towards the rising levels of expenditure on general administration as well as in the different departments used to be somewhat apologetic. True, these were explained in terms of the rising tempo of development, but it was not easy to demonstrate to the critical tax-payers that administrative expenditure could be causally related to the level of development expenditure that could be attained and/or that an explanation of the shortfall in the latter could be found in the inadequacy of the former. Attention was often focussed elsewhere while looking for the reasons for the short-falls that were in fact holding up the progress of the country.

In his introduction to the last Progress Report on the Plan, Shri V T Krishnamachari, Deputy Chairman of the Planning Commission, analysing the reasons for the slow progress of expenditure on the Plan, made the highly significant statement that, "In several cases, the administrative arrangements necessary for an expanded development programme were not put through early, and it was discovered that the spending capacity of various departments was limited by the level of expenditure in the past and the rate at which the additional personnel needed could be put into position." It is a warrantable inference from the budget estimates under civil administration that greater emphasis is being given to adequate administrative arrangement than when the Plan was formulated.

While rising administrative expenditure is expected to precede rather than follow, and, in any case, to keep pace with increased tempo of development activity, how to make sure how much of it is necessary for development and how much is avoidable waste? That a considerable increase in efficiency can be achieved without any corresponding increase in expenditure, if organisational changes were made on the one hand and changes in attitudes on the part of the staff took place on the other, has never been denied. There is, however, no tangible measure how far the increases in administrative expenditure are caused by genuinely needed expansion of the administrative services. The Explanatory Memorandum does explain the main reasons for any substantial increases but apart from taking such

statements on trust, it is not possible to read into these figures any justification.

Throughout the first four years of the Plan, administrative expenditure has shown a rising tendency, but evidently this was considered as something that could not be avoided rather than something that was essential and even desirable. The figures below for certain selected heads show that rising trend is particularly evident since 1952-53, but that the increase this year is much greater than ever before. This suggests that Shri V T Krishnamachari's statement has found its logical reflection in the programme for expanding the administration that has been undertaken this year. While this is true in general, it is not true in every case. A substantial increase can also be found between the years 1952-53 and 1953-54 in certain departments eg Ministries of Education, Commerce and Industry.

The bulk of increase, it may be noted, is accounted for by the larger development expenditure in the final plan year. The major increases, compared to revised estimates for 1954-55, are under Education Rs 7.3 crores, Agriculture Rs 5.05 crores, Scientific Departments including research schemes) Rs 2.21 crores, Medical and Public Health Services Rs 1.96 crores, Village and Small Scale Industries Rs 2.23 crores, Rural Development Rs 1.5 crores and Tribal Areas Rs 1.46 crores. By far the largest increases, it will be seen, are under education and agriculture. The large increase under education is mainly due to the provision of Rs 10

crores for grants to the States for basic, social and secondary education, as against Rs 8 crores in 1954-55 budget, and Rs 3.5 crores to University Grants Commission.

Although defence expenditure shows an increase of Rs 4.66 crores over the revised estimates 1954-55, it is actually Rs 3 crores lower than the budget estimate for the year. The short fall in the revised estimate of Rs 7.6 crores is partially due to economies effected in the Army, but mainly because the expansion expected in Air Force could only be partly realised. The Defence Budget, however, continues to follow the same pattern as in earlier years, a steady fall in Army expenditure and increase in expenditure on Navy and Air Force. Most of the increase in the budget over the revised estimate is under Air Force. As against a fall of Rs 1.48 crores under Army, there has been an increase of Rs 1.09 crores under Navy and Rs 3.71 crores under Air Force. It may be noted here that though the total expenditure on defence remained relatively steady, expenditure on the Air Force has more than doubled since 1952-53.

The capital expenditure on defence is estimated at Rs 22.38 crores against Rs 13.09 crores, revised estimate for 1954-55 which is lower than the estimate for the year of Rs 17.75 by Rs 4.66 crores. So, of the increase in capital expenditure of Rs 9.29 crores, only Rs 4.63 crores are for normal expansion programme and Rs 4.66 crores are carried forward from the previous years.

Incentive Taxation

THE changes in taxation proposed by Shri Chintaman Deshmukh in his budget for the last year of India's First Five-Year Plan are quite obviously determined less by the Avadi Resolution of Congress than by the Matthai Report. The changes follow a pattern which one should expect in a country in which the programme of planned economic development being implemented provides for an expanding state sector and for public expenditure as a crucial factor in the process of economic change but in which the private sector continues to occupy an important place.

In such a pattern, stimulation of private industrial investment, particularly in specified industries, is achieved through specific tax incentives which are likely to achieve results commensurate with or even much more than in proportion to the loss in revenue to the exchequer. At the same time, the general level of taxation is slowly raised to meet the needs of the expanding state sector of the economy and the higher responsibilities of the State involved in the implementation of a programme of planned economic development and social welfare. As anticipated also, increases in both direct and indirect taxation find a place in such a pattern, together with a rationalisation of the tax structure so as to reduce inequalities and raise revenues, and fill in loopholes making for "legal" evasion.

NO GENERAL CONCESSION

The question of tax incentives for industrial development has been under discussion both in this country and abroad since the end of the war. The withdrawal of wartime Excess Profits Tax and later of the Business Profits Tax which had been imposed under the Liaquat Ali Budget, the reduction of super-tax rates and other adjustments made from time to time have had this objective in view. These changes have failed, however, because they were too general in nature and operated in a negative way. Their greatest disadvantage lay in the sharp loss of revenue they caused without achieving comparable results. This was because the concessions they made were general and applied to all, irrespec-

tive of whether the recipients made any effort to save and invest more.

In recognition of this fact, subsequently, higher initial depreciation allowances on new equipment were offered as more specific incentives. These did have some effect for a period of time, but later industrialists in all countries where they were introduced came to recognise that they only postponed the day of reckoning, that higher depreciation allowances initially would only hasten the day when no allowance would be available as the equipment had become fully depreciated for tax purposes. A better incentive effect could be produced by treating expenditure usually classified as capital as current and therefore, deductible from revenue for income-tax purposes. The Pakistan and British budgets had both introduced changes based on this principle into their tax systems last year, though the change in Pakistan at any rate was not very far-reaching.

SELECTIVE ASSISTANCE

Under the British budget last year, a tax-free allowance was made available against part of the cost of investment in certain types of assets, mainly new production capacity including building and equipment. In the Pakistan budget, there were two concessions of this type, though both were much more limited in scope. It was provided, first, that expenditure on the construction and maintenance of schools and hospitals for the benefit of employees, provided the service was given free, should be made deductible as current business expenditure. Such a provision is likely to encourage labour welfare measures and also help in establishing institutions of this type in a country in which these are very limited in extent. Second, capital outlay on scientific research connected with the business of the taxpayer was also to be treated as current business expenditure.

DEVELOPMENT REBATE

The concession made by the Finance Minister of India is based on the same principle, but is highly favourable to all new enterprise and in fact goes much further even in principle. "I propose," says Shri Deshmukh, "to allow a development rebate of 25 per cent of the

cost of all new plant and machinery installed for business purposes instead of the present initial depreciation allowance of 20 per cent." He further adds, "for purposes of ordinary and double depreciation allowances, this rebate will not be taken into account." The combined effect of these statements is that total depreciation allowances of 125 per cent of the cost of new plant and equipment will be allowed over a period of years of which 25 per cent will be allowed during the first year and either ordinary or double depreciation allowances during subsequent years, which by themselves will total up to the full value of the new plant and equipment. In other words, 25 per cent of the capital cost will be treated as a current cost during the first year, when no depreciation allowances will be given, and yet this amount will be treated as a part of the capital cost in subsequent years for calculation of ordinary or double depreciation allowances.

The significance of the new proposal lies in the increasing dissatisfaction with the system of higher initial or double depreciation allowances which augment the returns from industry for a time only to cause a sharp worsening of the position after the entire allowance has been utilised. In recognition of this fact most firms in fact created special taxation reserves from their surplus profits, the fact that these could be used in the meantime providing an interest-free loan to the firm for a few years. The revaluation of the asset after the full utilisation of depreciation allowances could no doubt provide some relief from this situation, but the complications inherent in it have made the Taxation Enquiry Commission recommend its withdrawal. The new proposal will, therefore, mean a genuine benefit to firms that go in for installation of new plant and equipment and by leaving larger profits in their hands will increase their capacity to finance still further expansion. In the alternative, provided the funds are not dissipated in dividends, it will leave larger working capital with the concern from owned funds, not for a short period only but permanently. This proposal is undoubtedly welcome to all industrialists who are

planning new investment in conformity with the planned expansion of the private sector of industry.

CARRY FORWARD OF LOSSES

Another proposal which should encourage new enterprises and expansion of existing enterprises relates to the right to carry forward business losses. New enterprises have sometimes to pass through long periods of losses in the initial stages. Even in subsequent stages, profits are likely to be low for some years, so that all the losses suffered could not be offset against profits gained, if any, within a period of six years. The facility of carrying forward losses indefinitely should prove highly attractive to new projects of expansion. The proposal for a "tax holiday" for six years for certain industries of national importance has not been accepted by the Government as yet, but is under consideration.

Among the changes proposed in

The New Tax Proposals — II

Direct Taxes

A LARGE number of changes in both direct and indirect taxes have been proposed in the current budget, apart from those which are meant to act as incentives for rapid industrial development in the private sector. In view of the need for increasing resources to finance development expenditure, it is not surprising that these changes generally involve a stiffening of the tax system, though reductions have been made for certain categories of cigarettes and a new principle has been introduced in deciding the exemption limit in income-tax.

In view of the controversy about the relative places of direct and indirect taxes in the tax structure of a developing country with a mixed economy, it is interesting to note that there are increases in both, and this is undoubtedly justified. The increases in direct taxation are not substantial. But that they have been made, although there was a persistent demand for reductions, is due to the recognition by the Mat-thai Commission that, "the disincentive effect of higher taxation on the will to work of the higher income groups is generally highly exaggerated." Particularly in view of the specific incentives offered for new investment, it is not consider-

indirect taxes, there are also a few which are likely to benefit specific industries. "Subject to the margin of preference being maintained, wherever this is bound by agreement," import duties on dyeing and tanning substances, gums and resins plumbago and graphite are being completely abolished, "in accordance with the Government's general policy of a gradual remission or reduction of duties on essential raw materials." It has also been proposed to reduce the export duty on cotton cloth by $6\frac{1}{4}$ per cent as a measure of assistance to the maintenance of the competitive position of the Indian cotton textile industry in world markets. These changes together with the increases in import duties on certain items like zip fasteners and tiles of earthenware, which are not expected to bring in much revenue, are expected to result in a total loss of revenue of Rs 50 lakhs.

One proposal which the Finance

Minister did not mention in his speech but is contained in the Finance Bill relates to donations for scientific research. By this proposal, allowable expenditure would include any sum "paid to a scientific research association having as its object the undertaking of scientific research related to the class of business carried on, and any sum paid to a university, college or other institution to be used for scientific research, research in social science or statistical research related to the class of business carried on". This differs from the Pakistan proposal given above since here donations to certain institutions will become tax-free, whereas capital expenditure on research schemes within the concern itself will not be treated as current expenditure. Nevertheless, this should encourage scientific research in the country in particular by not penalising donations to independent institutions thus fostering their growth.

time to reduce the inequality of income and wealth existing in the country and this is a legitimate object of tax policy, even if it did have some disincentive effect on private investment or the desire to work on the part of the rich, particularly since it is laid down as one of the Directive Principles of State policy in the Constitution. This is apart from the fact, that any adverse effect on capital formation could be offset by capital formation taking place in the public sector, which would be quite in keeping with the "socialist" professions that are being made in the country.

The first change proposed in the income-tax introduces for the first time in the Indian income-tax system the principle of recognising the difference in the circumstances of different tax-payers earning the same income. The principle of differentiation is based on the civil condition of the tax-payer. It is proposed that the tax-exempt slab of Rs 1,500 should be raised to Rs 2,000 for married persons and reduced to Rs 1,000 for unmarried persons. The Finance Minister pointed out that this was the first move in the direction of evolving a suitable scheme of family allowances. The difficulties in planning such a scheme for a country like

India and the greater difficulties of implementing it in practice have so long been an excuse for not trying to resolve them at all that the Finance Minister must be congratulated for taking a step in that direction, without waiting for a full scheme to be drawn up.

The existing differentiation between earned and unearned incomes for tax purposes does no doubt take into account the source of the income on the grounds of equity. Now this is proposed to be adjusted, so that no differentiation is made on this basis at the higher levels of earned incomes. The earned income relief is to be reduced on incomes in excess of Rs 25,000 by Rs 200 for every Rs 1,000 of incomes about this level until the entire allowance of Rs 4,000 is wiped out at an earned income of Rs 45,000. This is probably a recognition of the fact that an increasing proportion of incomes at higher levels is now earned and the loss in revenues to the State resulting from the relief at these levels is likely to be considerable. The main argument in favour of such a relief has been the many advantages property holds for its possessor apart from the unearned income that flows from it. Now that the Estate Duty offsets these advantages, there is no need to provide such a relief for earned income at higher levels. This could be the only equitable argument in favour of withdrawing a concession that has been in existence for so many years.

While the first of the two changes discussed above will cause a loss to revenues, presumably because of the larger proportion of married persons among tax-payers, the second will obviously earn more revenue.

Two further steps follow in the same direction. The first relates to income-tax while the second to the super-tax. By breaking up the Rs 5,000-10,000 slab into two at Rs 7,500 and raising the rate on the second slab by six pies to two annas three pies, an additional revenue of Rs 1.35 crores is expected. The rate of tax on the next slab Rs 10,000-15,000 is also raised by three pies to yield an additional revenue of Rs 85 lakhs. For the super-tax, the minimum level has been reduced from Rs 25,000 to Rs 20,000 and the slabs readjusted to yield an additional revenue of Rs 5.75 crores.

Two other minor changes have

been made. First, the rebate for life insurance premia has been raised from one-sixth of income with a maximum of Rs 6,000 to one-fifth with a maximum of Rs 8,000. Corresponding increases have been made for Hindu undivided families. This proposal is obviously meant to encourage saving and more particularly to channel it through institutional investors, so that such savings may be more freely available

Table I—Rates of Income-tax

(i) The rates and surcharge on different slabs of the total income of every individual who is married and every Hindu undivided family will be:

	Rate (in the rupee)	Sur- charge*
On the first Rs 2,000	Nil	Nil
On the next Rs 3,000	9 pies	1/20th
On the next Rs 2,500	1 a 9 p	"
On the next Rs 2,500	2 as 3 p	"
On the next Rs 5,000	3 as 3 p	"
On the balance	4 as	"

(ii) The rates and surcharge on different slabs of the total income of every individual who is not married and every unregistered firm or other association of persons will be:

	Rate (in the rupee)	Sur- charge*
On the first Rs 1,000	Nil	Nil
On the next Rs 4,000	9 pies	1/20th
On the next Rs 2,500	1 a 9 p	"
On the next Rs 2,500	2 as 3 p	"
On the next Rs 5,000	3 as 3 p	"
On the balance	4 as	"

* As a proportion of the rate specified in the previous column.

The New Tax Proposals — III

Indirect Taxes

IN any scheme of taxation in a developing economy, indirect taxes have an important place. They enable the State to extract revenue from classes of people from whom it would otherwise have been difficult to obtain any revenue at all, a consideration which becomes highly important when the vast majority fall into that category. True, indirect taxes tend to reduce to some extent the steepness of progression in the system of taxation as a whole, but some degree of progression can be introduced even into indirect taxes by suitable selection of commodities and grading of rates, so as to affect the rich more than the poor.

The selection of the commodities

either for the private sector or the Government. A loss of Rs 25 lakhs in revenue is anticipated through this measure. Second, Hindu undivided families consisting of four or more members entitled to claim partition will have an exemption limit of Rs 12,600 for tax purposes and for payment of the surcharge on the income-tax, the exemption limit has been raised from Rs 14,400 to Rs 21,600. This concession, again, will tend to reduce the inequitable burden of taxation as it falls on large Hindu undivided families. At the same time, evidently no deliberate attempt is to be made to break up such families by pressure of heavier taxation, whether such a step is otherwise considered desirable or not.

Table II—Rates of Super-tax

The rates and surcharge on different slabs of total income of every individual, Hindu undivided family, unregistered firm and other association of persons will be:

	Rate (in the rupee)	Sur- charge*
On the first Rs 20,000	Nil	Nil
On the next Rs 5,000	1 a	1/20th
On the next Rs 15,000	3 as	"
On the next Rs 10,000	5 as	"
On the next Rs 10,000	6 as	"
On the next Rs 20,000	7 as	"
On the next Rs 20,000	8 as	"
On the next Rs 50,000	9 as	"
On the balance	9½ as	"

* As a proportion of the rate specified in the previous column.

on which excise duties, for instance, are to be levied and the rates at which they are to be imposed is undoubtedly a matter of primary importance. There is little doubt that there would be some tendency to reduce the consumption of the taxed commodity, though this would depend upon the elasticity of the demand for the product. That this can be the object of levying the tax or at least one of its objects is evidence of the dangerous implications of indirect taxation for the industries concerned, apart from the burden they impose on the consumer.

The raising of the excise duty on sugar from Rs 3-12 to Rs 5-10 per cwt has as its object such a reduction in consumption. This is evident

from the Finance Minister's reference to the large increase in consumption of sugar in recent years and the considerable expenditure of foreign exchange caused thereby. "The increase in duty", says Shri Deshmukh, "may also have the effect of discouraging consumption to some extent". The additional revenue is estimated at Rs 5 crores.

In the case of matches, again, the change proposed in the structure of excise duties is in pursuance of the policy of the State to encourage medium-sized and cottage group of match factories. This has been achieved through an increase in the margin of preference accorded to such concerns, eg from one anna to two annas per gross boxes (40s). These changes will result in a total loss of revenue of Rs 50 lakhs, but of this Rs 20 lakhs will be borne by the States.

In the case of cigarettes, there is a readjustment of the relative impact of the excise duty on different classes of cigarettes, with the abolition of the surcharge on cigarettes valued at between Rs 10 to Rs 15 per thousand, while the loss is recouped through an increase in the surcharge on cigarettes valued at between Rs 40 and Rs 50 per thousand. It has been suggested by the Taxation Enquiry Commission that such a change will rectify certain anomalies in the existing rate structure. This may be true but the change may also have something to do with the problems being faced by Indian tobacco in recent years and the low production of cigarettes in the country caused presumably by low consumer demand.

Certain changes have also been made in the structure of excise duties levied on cotton textiles. These changes have evoked considerable opposition from the textile interests in the country and their case deserves fuller examination.

The new excise duties imposed are also highly significant from many points of view. The case for the new duties may be presented in the Finance Minister's own words: "I feel myself," he says, "that an expansion of revenue from excises is, in the context of our requirements and also in the pattern of industrial development, inescapable and that we shall increasingly have to look to the products of organised industries in the country which have grown up under the shadow of protection, both for bringing in additional revenues and replacing the loss of Customs duties resulting from the replacement of imported manufactured goods by indigenous production".

This argument suggests first that a continuous process of import substitution is going on in the country and that in consequence, import duties are likely to fall in importance in the country's revenues. If import substitution is taking place rapidly, this should suggest that national income is rising. If the accepted beliefs with regard to import propensities in a developing economy are correct, imports should show a substantial rise as a result and therefore no fall in revenues from import duties should be anticipated. It is true that during 1953-54, the value of imports fell rather than rose, and even the volume index of imports shows a fall. This is in the face of a rise in the national income, according to our rather inadequate estimates. But too much reliance should not be placed upon the results of this particular year, particularly in view of the possible distortions in the economy produced by the sharp fall in prices since the boom period of 1951.

The reference to 'organised industries which have grown under the shadow of protection' as the right objects of taxation through excise duties on their products carries with it a ring of elemental justice. Having gained from protection accorded by the State, these industries should in turn contribute their share to future industrial development of the country by way of excise duties. A moment's thought might raise doubts about the equity of the principle that has been laid down in this way by the Finance Minister. In effect, the principle means that the consumers who have borne the burden of protection accorded to an industry through high import duties will be called upon once again to bear the burden of higher excise duties, once the industry has developed fully. Ultimately, the burden would thus lie on the same group of consumers who would thus be in a "Heads I win, tails you lose" position, once an industry is protected to ensure its development. This argument may not be flawless, but it must have some weight in the selection of the industries concerned.

The Finance Minister has proposed a ten per cent *ad valorem* duty on the factory production of a number of commodities of this category, —woollen fabrics, sewing machines, electric fans, electric lighting bulbs, electric dry and storage batteries, paper (excluding newsprint) and paints and varnishes. These excise duties are expected to yield Rs 4 crores in revenue. As the imposition of these duties is not meant to worsen the position of the industries

vis-a-vis their foreign competitors, the margin between import and excise duties will be kept equal to the existing rates of import duties through the levy of countervailing import duties at the same rate as the excise duty, where necessary. All the changes in excise duties discussed above are expected to bring in a net additional revenue of Rs 17.7 crores.

While the major changes in indirect taxation have been made in relation to the excise duties, there are also a few changes in customs duties. The abolition of import duties on certain raw materials and the reduction of export duty on cotton textiles by 6¼ per cent have been discussed elsewhere.

The other change is made in the export duty on tea. It is well-known that a specific tax tends to become onerous during periods of falling prices, while its incidence tends to become progressively lighter during periods of rising prices, which in the case of tea is relevant at the present stage. But difficulties of valuation, as auctions also take place in London, made *ad valorem* tax administratively impossible. The Finance Minister has, as a compromise, devised a slab system with varying rates at different prices. The prices for determining the rates are to be those determined from time to time as correct prices and duly published as such. An element of arbitrariness can hardly be avoided in such a procedure and administrative delay in announcing new prices may cause some hardship to traders or losses to the State, but it is the best that can be done under the circumstances. No additional revenue is expected to result in the current year. Tea interests will have to say what is the impact of the actual rates laid down for the different slabs.

Post-Budget Spurt

Wednesday Evening

THOSE who were watching rapid up-and-down fluctuations in equities on Clive Street on the budget night must have been surprised at Dalal Street's behaviour that night. Clive Street was quick to respond to Shri Chintaman Deshmukh's budget. Clive Street did not interpret it as a rich man's budget. But the Calcutta Stock Exchange was right in jumping to the conclusion that the budget proposals were framed to provide a psychological stimulus to industry.

It was on this interpretation of the budget that Clive Street started moving up as the radios in brokers' offices boomed out the various tax proposals one by one. It was at this juncture that Clive Street paused in bewilderment as trunk telephone calls came pouring in about near-panic conditions in Dalal Street. Clive Street paused once again in its upward journey to enquire what could be the cause of Dalal Street's funny behaviour.

Middle Class Hit

Those who claimed some familiarity with Dalal Street's make-up tried to argue that any budget proposal which was likely to affect the cotton textile industry might, justifiably, have a "bearish" impact on Dalal Street. This explanation was considered sensible, but only for a few minutes. As Dalal Street continued to slump, Clive Street paused again to re-consider its attitude to the budget. Could it have been that Clive Street had missed some of the crucial tax proposals in the budget? Or, was Clive Street wrong in its interpretation of the fundamental facts of the budget?

Through repeated anxious trunk calls, it transpired that Dalal Street did not agree with Clive Street's interpretation of the budget. Dalal Street brokers started reading textbook lessons in economics to their Clive Street colleagues. Middle class was the backbone of stock markets. The budget had heaped more burdens on this investing class. That particular group in this class—the Rs 7,500 to Rs 10,000 group—which was the mainstay of stock markets had been hit hardest. A surcharge had been imposed on income-tax.

These were the arguments which

Dalal Street brokers offered in explanation of the slump in Dalal Street that night. Dalal Street argued that personal income-tax had been raised; that, therefore, the flow of investible funds would be choked; that, with the impeded investment flow, the market would be starved of resources. These are unexceptionable arguments. But those who have some acquaintance with Dalal Street must express surprise that Dalal Street could ever be so theoretical as to ignore the background factors to the budget.

Tragedy of Errors

Dalal Street has since revised its opinion about the tax proposals. Here, a tragedy of errors may be told. One could not discover whether Dalal Street or Clive Street fabricated that interpretation of one particular budget provision relating to dividend distribution. There is a budget proposal which imposes a 25 per cent super-tax on undistributed profits, if a company has not distributed 60 per cent of the profits as dividend. This is a highly controversial proposal. It is rather obscure.

But it was funny for stock markets to jump to the conclusion that this proposal meant a tax on future bonus shares. This was one of the reasons why equities lost all the gains made earlier during the budget session on Monday. It would be wrong to assume, again, that Tuesday's renewed spurt was due to the interpretation that this proposal meant that the Government was in favour of higher dividend payments.

It would be risky to discuss this proposal, in the absence of more detailed explanation. From the budget speech, it would seem that it is the Finance Minister's intention to apply this proposal to private companies. One thing is clear. It could not be that New Delhi is in favour of indiscriminate dividend disbursements. That would be a policy which is against even elementary principles of company finance. Recent cornering attempts at Calcutta make this issue topical. Ultra-conservative dividend policies may have encouraged recent cornering attempts on the Calcutta Stock Exchange. But to go to the other extreme of suggesting that there should be financial provisions to compel larger dividend disbursements is, of course, quite another matter.

No Tax on Industry

Reasons for the post-budget improvement in equities may now be discussed. Admittedly, the middle class, the investing class, has been hit hard. Admittedly, too, the proposed increase in excise duties will affect this class heavily. With the proposed surcharge on income-tax, the argument relating to the effect of higher personal income-taxes on the flow of investment is not entirely invalid. But there is the other side of the coin.

Shri Deshmukh may have been unduly harsh on the middle, investing, class. His budget may not be correctly described as a rich man's budget. But it is right and proper to interpret his budget as one for industry. Development rebates now proposed are higher than the existing depreciation allowance. Industry will now be allowed to carry forward business losses indefinitely. Neither of these two proposals will mean much ultimately. But it is certainly good news that, to take the budget at its worst, Shri Deshmukh has not imposed any fresh burden on industry.

Market Psychology

This was where Dalal Street went wrong on the budget night. Equities had been falling since last October, on fears that the tax burden on industry would be raised heavily. Stock markets were prepared for fresh tax burdens. But the tax proposals in the budget are not heavy enough to keep the stock markets depressed. This is what happens when tax proposals impose fresh burdens which are below market expectations. It is strange that Dalal Street could ignore, even for a few hours, this well-known and well-established pattern of stock market behaviour.

So far as tax proposals are concerned, the stock markets are almost where they were at the end of last September. There were other reasons why equities were falling since last October. Emphasis on expansion of capital goods in the President's Address and TTK's continued presence in the Cabinet are the real reasons why stock markets have been moving up since the presentation of the budget. If Shri Deshmukh's tax proposals are below market expectations, his estimated deficit financing is welcomed in market circles.

Dalal Street Wants More of This Socialism

THE Finance Minister has presented the 'Socialist Budget'; and the common man's reactions have been most effectively expressed by the headline in a daily paper 'Socialist Budget Hits Common Man'. It is really amusing to look back—what a scare was raised at Avadi! And such looking back is both permissible and pleasant, for market operators, now that the Communists have been routed in Andhra and Congress has won a victory much beyond its own expectations. It is reassuring to the private sector that Shri Chintaman Deshmukh's 'Socialist Budget' should be immediately followed by the Congress victory at Andhra.

Whether the Socialists (Heaven knows who are all the ones that wear this label) are satisfied with the budget or not, it is beyond doubt that the private sector is mighty pleased with the budget and feels that if this is socialism, why not more of it? It is interesting to come down to brass tacks, what are all the socialist proposals in the budget? There is, first, the most striking evidence of socialism in the lowering of the super-tax exemption limit from Rs 25,000 to Rs 20,000. Along with it, the tax rate for incomes Rs 7,500 to Rs 10,000 has been raised from 1½ anna to 2½ annas. Evidently the upper middle class elements are subject to higher taxation. Good. Some levelling down of higher incomes. As against this, there is also the attempt to level up the net incomes of the lower middle class. The tax exemption has been revised at the bottom. While those with incomes of Rs 4,200 and above continue to bear taxation, if they are married, the first Rs 2,000 of their income (net of earned income allowance) is tax free; hitherto it was Rs 1,500. Bachelors, however, presumably because their need for 'legitimate' spending is low, are given an exemption of only Rs 1,000. Further relief is being given to the lower middle class by increasing the rebate allowed for payment of premia on life insurance policies and subscriptions for recognised provident funds—from the existing limit of one-sixth of income subject to a ceiling of Rs 6,000 to one-fifth with a ceiling of Rs 8,000. All this is definitely welcome in so far as the low income groups are subject to

lesser strains of taxation. This is socialism all right. But beyond this, there is nothing else to be commended as socialistic in the Budget. That does not matter. A beginning has been made, however 'feeble' it may be, and that too at the right point—the middle sector. One should suppose that the right approach to minimizing the inequalities is to start with the middle income groups and first close up the gap between the lower and the upper middle class, so that we have just one middle class.

Let us now turn to analyse why business sector is rightly pleased with the Budget. For ultimately it is the reaction of this sector which is most important in a mixed economy. Well, they have sufficient reasons to be jubilant. First, they frankly expected something worse, what with Avadi and Khandubhai and Nandaji. The very fact that the budget was not as bad as they thought it would be, there is a big sigh of relief. Secondly, with all the measures of raising the taxation of the upper-middle income range, and even after the systematic withdrawal of the earned income allowance, reducing it to zero at the level of Rs 45,000 and above, the net effect on the plutocrats has not been anything serious. For, on an average, the highest income earners (one lakh and a half and above) used to pay out 70 per cent of their income by way of direct taxation; now they may have to pay about 73 per cent. After all a 3 per cent rise is nothing to kick about when you know that you are in for more and more socialism. Then, there are a variety of concessions for business units. There is now the facility of carrying forward losses indefinitely. There is no taxation of bonus shares. And above all, there is the developmental rebate of 25 per cent, which has been pointed out that if, for example, the Tata Iron and Steel Company incur a cost of four crores towards setting up a new plant, then it can right away credit one crore to the special development fund and thus save about Rs 43 lakhs in taxation to the shareholders.

Now how about the investor-speculator, or better still, how about the pure and simple speculator?

Whatever his earlier impulse, he has come out a convinced bull. No wonder that it is being freely tipped in Dalal Street that Tata Ordinary will touch Rs 300, the ACC Rs 200 and so on.

What a stir there was in the budget session of the Bombay Stock Exchange last Monday evening—last year, there was scarcely a ripple. The violent swings witnessed in the budget session, however, were due more to the operation of technical factors than to the budget proposals themselves. On the eve of the Budget, the general feeling was one of certainty that it was going to be a bright Budget, this year; there had been a lot of public buying and the market was extremely buoyant. When the budget proposals came through, one Bombay Bull started liquidating his holdings. Excise duty on cloth led to speculative selling. All this made the market nervous and caused all round selling orders. Within half an hour, prices tumbled down like a pack of cards. Tata Ordinary lost more than Rs 10. So did Bombay Dyeings, Centurys, Kohinoors. National Rayons provided an exception and after rising steeply, closed higher than the pre-budget session. Scindias and Premier Construction were steady.

The Budget has turned out to be much better than anticipated. Subsequent behaviour of the market proves this, as within two days after the budget steels, cement, etc, made up all their losses and some of them have registered sizeable advances. Textiles are lagging behind due to the heavy impost of excise duty; but they are already rated low and there is less selling pressure at lower levels. If the agitation against excise duties that is now going on succeeds in gaining even a slight relief, there will be a sharp rally.

Cements have met with keen inquiry on investment account. As Rayons have been left out from excise duty, National Rayons are being bought up avidly.

Bulls in steel are very strong and in the last settlement, a Calcutta Bull is reported to have taken delivery of about 10,000 Tata Ordinary. Against this, the old Bear is still short, about 125,000 in Tata Ordinary and 100,000 in Indian Irons.

Budget Estimates—An Assessment

THE Central Budget for 1955-56 was awaited with more eagerness than in the past few years for several reasons. It was the first budget after the Taxation Enquiry Commission made its recommendations; and it was the last under the first Five-Year Plan. In the half year preceding the presentation of the budget, the establishment of a socialistic economy for India had become the declared objective of the Congress and the Government.

What the Finance Minister has said about the budget is simple enough. At 1954-55 levels of taxation, there would be in 1955-56 a shortfall of about Rs 30 crores in the revenue account. This is due not to any shrinkage in revenues but to an enlargement of Government expenditure, especially development expenditure. Total expenditure of what might be called the development departments amounts to Rs 96.0 crores in 1955-56 (Budget) as compared to Rs 61.8 crores in 1954-55 (Revised Estimate). As is well-known, not all of this would be development expenditure in the sense of outlay directed towards provision of additional benefits and services, but the bulk of it might be. Purists might object to treating such outlay on a par with normal administrative or consumption expenditure of Government. That, however, is a different issue. What is relevant here is the fact that additional taxation resorted to could all be justified as necessary for financing the development programme. Indeed, if Shri Deshmukh had accepted fully the philosophy of the Matthai Commission, he could have gone further and budgeted for a surplus in the revenue account. Such a step would have also lent substance to the Government's professions of advance towards a socialistic pattern, by putting the claims of Government on the country's resources first.

The tax proposals and their implications have been commented upon elsewhere in this issue, and we need not dwell on them here. In any event, the bulk of development expenditure is covered in the capital account of the budget, and the revenue surplus finances little of that. To form a judgement on the Government's development programme for the coming year, one has to probe into the capital account, which is a supreme example of the art of window-dressing prac-

tised by accountants. What items in that account represent real outlays and what items mere book transfers, only the pundits of the Budget Division in Delhi can say. However, a rough differentiation between financial transfers of various kinds and real outlays aimed at acquisition of goods and services for purposes of Government investment may be attempted and this is set out in the accompanying table.

A word about the procedure followed in this table. As will be observed, all capital receipts are taken *net*, except repayment of loans to Government. This automatically places on one side Government payments which are of a contractual or sporadic nature and therefore not subject to trend factors, and which, in a manner of speaking, may be called non-developmental. It also highlights the relative importance of certain sources of finance for meeting capital expenditure. The items covered under 'Capital Disbursements' would then indicate very roughly the elements which involve an exchange of Government money for goods and services. The reason for including Central Government Loans to State Governments and others under this head is that these are meant to be spent on building up real assets in the public or private sectors.

Turning now to the figures themselves, on the capital receipts side, the one stable element is the item 'Small Savings and Unfunded Debt.' This has gained in importance with the passage of years, and in 1955-56 (BE) accounts for as much as Rs 68 crores—or nearly the same as net receipts from long-term loans. Long-term borrowing for 1955-56 is lower than in the current year not only because of larger maturities but because a smaller credit is taken for gross borrowings. This follows inevitably from the unusually heavy floatation resorted to in 1954. Of the other items, 'Depreciation and Reserve Funds' are more or less certain to reduce rather than add to financial resources of Government, in view of the larger withdrawals that the Railways are likely to make from their depreciation and other funds. Finally, there is the intriguing item "Other Deposits and Advances". This covers a variety of accounts, the nature of each of which is shrouded in mystery. How exactly receipts into and payments out of

these accounts are related to known factors in the economic situation, nobody can tell. Consequently, it is impossible to say whether the estimate of this item is reasonable or not. As shown in the budget, net receipts from this source fall from Rs 49 crores in 1953-54 to Rs 22 crores in 1954-55 (RE) and rise sharply to Rs 79 crores in 1955-56 (BE). The Explanatory Memorandum dismisses this summarily by stating that "the large increase in the budget is due mainly to anticipated sale proceeds of evacuee property and the increase in foreign aid, during that year (1955-56)". The latter of these is fairly easily reckoned; it is expected that in 1955-56, there will be a net credit of Rs 12 crores to the Special Development Fund (from TCA aid, aid and sale proceeds of wheat received under the Colombo Plan, etc.) as compared to a net withdrawal of about Rs 27 crores in 1954-55 (RE). But the credit for sale proceeds of evacuee property is perhaps a book adjustment; where exactly this figures in the budget statement is difficult to see; one suspects this is part of the 'Suspense Accounts', which are responsible for astonishingly large net receipts. Net receipts shown under 'Suspense' amount to Rs 44 crores in 1954-55 (revised) and Rs 33 crores in 1955-56 (budget). One can understand the large figure in 1954-55, since some of the receipts in the last few months can be estimated only broadly and therefore cannot be posted to appropriate accounts. But to follow the same procedure in regard to the budget estimates is, to say the least, misleading.

Turning now to the expenditure side, the surprise factor since the last budget is the large increase in outlay on 'Schemes of Government Trading'. There was actually a receipt from Trading in 1953-54. But both in 1954-55 (revised) and 1955-56 (budget) large payments are envisaged. In 1954-55, however, the major part of this constituted amounts paid to State Governments; and to that extent, they will have helped the capital accounts of the recipient States. Not much information is available regarding the outlay envisaged for the budget year.

The Government's 'Development Outlay', taking both the direct outlay and Loans to State Governments, shows a big increase. This

is not unexpected, considering the short-falls in expenditure under the Plan during the period so far. It is, however, difficult to match the budget figures with data in the Plan and see what the five-year total for the Centre would be. One has to wait until the Planning Commission reclassifies the budget data in its next Progress Report. Broadly, however, the position is as follows: the revised outlay under the Plan for the Central Government was Rs 1,330 crores for the five-year period. Of this, only Rs 445 crores had been spent in the three years 1951-54, leaving Rs 885 crores to be spent in the two years 1954-56. These figures are inclusive of the railways capital programme, exclusive of current depreciation charges. Now, the railways' outlay under the Plan could be taken roughly at Rs 51 crores in 1954-55 (RE) and Rs 82 crores in 1955-56 (BE). Taking these figures out from the two-year total, we have about Rs 750 crores to be covered in the revenue and capital accounts of the Centre. As mentioned earlier, there is considerable doubt about development outlay in the revenue account; the Planning Commission had put this at Rs 53 crores in the 1954-55 budget estimates. Even if we assume that this has been more or less achieved in 1954-55, and that in 1955-56 (BE) it would be about Rs 25 crores more, the total would come to about Rs 125 crores, leaving an outlay of Rs 625 crores to be met in the Centre's capital account. It should be added that all these outlays are exclusive of Central assistance to States in the form of grants and loans. However, looking at the accompanying table, it will be observed that 'Development Outlay' for 1954-55 (RE) and 1955-56 (BE) including the outlay on displaced persons, aggregates about Rs 275 crores, on a rough estimate. In other words, it seems more than likely that the five-year outlay of the Central Government under the Plan will fall short of the target by about Rs 325 crores, or by over 25 per cent.

Despite the shortfall, it is estimated that there will be an overall deficit of Rs 208 crores in 1954-55 (RE) and of Rs 318 crores in 1955-56 (BE). These are to be met wholly by issue of Treasury Bills. There are two points worthy of note in this connection. For the current year, *ie*, 1954-55, it is estimated that Rs 220 crores of Treasury Bills will be issued. The increase in outstanding Treasury Bills since April

1954 is, in fact, of the order of Rs 55-60 crores, which means that between now and end of March 1955, Treasury Bills outstanding will have to increase by over Rs 150 crores. Put mildly, this is highly improbable, and when the accounts for 1954-55 are prepared, the actual deficit will very likely turn out to be much less than in the revised estimates.

Arising from it, it would seem that unless something unusual happens in 1955-56, the expansion of Rs 340 crores in Treasury Bills may also not come about. True, the Government can no longer draw down its cash balances. Even so, actual deficit of Rs 340 crores would mean a doubling of the actual deficit likely for 1954-55, and that takes some doing.

Budget of the Government of India, 1955-56

	1953-54 (Accounts)	1954-55 (Revised)	1955-56 (Budget)
(in Rs crores)			
I. REVENUE RECEIPTS	416.0	451.1	490.5
(i) Tax Revenue	366.0	398.1	427.8
(ii) (i) as percentage of total	87.0	88.2	87.2

Of all of Pandit Nehru's approaches, his approach to business men is the best; it illumines and resolves all disputes. Every year, at the annual meeting of the Federation of Indian Chambers of Commerce and Industry, Pandit Nehru treats his audience in the same manner. He leads them up the garden path and leaves them bewildered at the end, so that business men go back to their work having delivered themselves of their orations and Panditji also goes back satisfied that he has regained the loyalty of the private sector which, in between the two meetings, had shown disturbing signs of wavering, if not of deserting or slipping away. When it is a question of rationalisation, he gives them a harangue on ultra-modern techniques, far in advance of what the Indian industrialists know, of harnessing atomic energy to the service of industry and so on. For the present, here and now, however, there was to be no change. This year he invited them to the exhilaration of new thought but did not produce any himself, beyond the Avadi resolution. And that resolution, he left with the comforting thought, had substantially narrowed the area of disagreement. To put it more positively, Avadi has widened the area of agreement, making the public and private sectors joint partners in the great enterprise of building up the country.

The business men who had assembled had many thoughts in their minds. Shri B M Birla had drawn up a full list of the things which public enterprise could usefully do in the next few years and it was a list guaranteed to keep the public sector busy. That was not the main issue, however. For though business men had many things on their minds, what was pinching them most was the budget. It was not only of immediate concern, but if it showed the way the tax system was going to develop, it was more than a matter of passing interest. As Shri B M Birla put it pointedly, the issue was simple and straightforward. Was private enterprise to develop the country? In that case, where was it to get the resources from? Was the tax system going to be framed in such a manner that savings would be left to the people which they could risk in investment and thus expand production? Ceiling on incomes, extraction of savings through the tax system, all these meant less and less was to be left with the people for investment; and therefore, the responsibility for development had to be taken over more and more by the State. The evils of State capitalism have never lacked eloquent expositors and Shri B M Birla did not give a bad account of himself in this role.

Now this is precisely the question to which on a cursory reading of the Matthai Report one does not find a clear answer. Perhaps the Matthai Commission did not have enough facts at their disposal, on the basis of which they could offer an answer. The scope for widening and deepening the tax structure, they have nowhere clearly examined against the pool of resources available for investment; the extent of the resources that can be released through restriction on consumption and the possible extent of such restriction that can be effected by taxation are related questions to which also they do not offer a clear answer. True, the Commission describes the right tax system for the

CENTRAL RAILWAY

FULL PARTICULARS FROM STATION MASTERS

country as one "which would increase the resources for investment available to the public sector with as small a diminution as practicable of investment in the private sector." But what that point is cannot be ascertained without a much more precise quantitative assessment of available resources than the Commission was in a position to attempt.

Of the relative importance of the two sectors, about which so much has been said, it would be useful to remember some elementary facts. One is given by the National Income Unit. The net output of Government enterprises in the years for which national income has been computed was only 2.7 per cent of the net domestic product in 1948-49; by 1951-52 it had risen to 3.1 per cent. True, this is only the bench mark, the starting point; it says nothing about

the future scope of expansion. Consider, now, the organisation of industrial enterprises in the public sector and the possibilities of expansion. Parliamentary Government is government by amateurs at the top. This applies to ministers who need only be gentlemen with a modest fund of common sense. So far as the actual administration is concerned, the civil servants are experts and the amateurs at the top are helped and guided by these experts in their normal functions. But when the functions of the Government extend beyond that of civil administration, the principle of having an amateur at the top is extended vertically downwards. And so, whether it is steels, or fertilisers, telephone equipment or machine tools, it is the amateurs who rule the roost. Besides, not only the personnel, but the organisation is also the same well-tried

administrative one, which, however effective in its own proper place, is hardly the one to stand the test. This, by itself, puts a severe limit to expansion and the Federation can draw some legitimate comfort from the thought that the administrative framework of public enterprise is their dependable ally, whatever the people at the top might say or think. It need not seek any other ally, from sectors of foreign capital, for example, which they are now so eager to woo.

True, this is taking rather a static view of the situation. Government may yet form a managerial cadre, and given time and opportunity, the amateurs may acquire the experience and become industrialists in the same manner as traders turn industrialists, either overnight, or in a couple of generations. But no beginning has yet been made in that direction.

Built-in Stabilisers at Work

THE full text of the Economic Report of the US President, transmitted to Congress on January 20, 1955, is now available. Its analysis of the recession of 1953-54 has considerable interest for economists. This is their "latest encounter with the business cycle". Though its intensity and duration—a mild, long-drawn-out recession followed by a slow process of recovery—greatly disappointed those who profess to read omens in charts and diagrams, the latest data on the present state of the US economy, and forecasts of its short and long-term trends, may enthuse flagging spirits. The Council of Economic Advisers, who have drawn up this Report, have worked out the growth potential of the US economy up to 1965. It is a little difficult to comment on the US Economic Advisers' judgment regarding the growth trend of their economy, but their projection of the increase of the gross national product from the current annual level of \$360 to \$500 billion or more (at 1954 prices) between 1960 and 1965 is not without interest, for the coming generations will share directly and indirectly in the prosperity of that order. While emphasizing the need for resilience in Governmental policies in order to moderate fluctuations, the Council emphasizes that it is the business of Government to foster long-term economic growth and not to be concerned with imparting an immediate upward thrust

to the economy. Another point of interest in the Report is organization: the functioning of the Council of Economic Advisers as an integral part of the Federal Executive.

What exactly happened in the US economy during the period under review? The recession started about July 1953. The downward trend persisted till March 1954. During the next five months or so up to August 1954, conditions were more or less stable at the low levels of preceding March. Then recovery began, and by the end of 1954 the recovery of industrial production had made up half of the preceding decline. The points at issue are: (a) how a decline of \$24 billion in inventory and Federal expenditure (second quarter '53 to third quarter '54) caused a contraction of only \$14 billion in the gross national product with no change in the disposable personal income in spite of a sharp fall in industrial production (10 per cent) and over-all employment (4 million); (b) why the recession had no spiralling effect on the domestic economy of the US, and the non-dollar world not only stood firm, but in parts actually made an advance on preceding levels? A part of the explanation for all these developments lies, of course, in what is described as a state of confidence. The principal lesson sought to be imparted from this the latest business cycle is that governments can, if they are so minded, prevent a

recession from developing into a depression. The explanation, therefore, of the points at issue lies in the monetary and fiscal policies of the US Government. In the UK also, the budgetary and bank rate policies were given a sharp, anti-depression turn. Almost all countries (except India) reduced their Bank Rates.

The Federal Reserve System reduced its rediscount rate from 2 to 1½ per cent, and by a series of reductions in reserve requirements, accompanied by sizable open market operations, made a larger money supply available at attractive rates. Between end-1953 and end-1954, the supply of money increased by \$4.1 billion, compared to an increase of only \$1.5 billion during the preceding year. There was a net increase of over \$10 billion in the loans and investments of the commercial banking system. This expansion of commercial bank assets was accompanied by, and to a considerable extent facilitated, increased flow of funds from financial institutions into public and private construction, which largely sustained economic activity over the year.

In the purely fiscal sphere, the built-in stabilizers of Roosevelt's New Deal era were of great help. The decline in personal incomes derived from production amounted to \$4.4 billion (at an annual rate) between July 1953 and July 1954. In the meantime, unemployment insurance and other social security

payments to the public increased at the rate of \$2.2 billion. The automatic reduction of tax payments resulting from reduced incomes and the cut in tax rates effected in January 1954 added another \$3 billion to personal incomes. On the whole, therefore, personal incomes during the period of recession in fact increased—by more than a billion if the increase of \$300 million in dividend payments is taken into consideration. Corporate income declined by \$7.4 billion during the period under review, but the reduction of taxes that automatically accompanied the decline in income, coupled with the removal of the EPT, reduced the tax liability of corporations and thus offset the greater part of the reduction of corporate income. The corporations actually increased their dividend payments by \$300 million.

A point of importance, which should not be overlooked, is the fact that the increase in purchases by State Governments and local authorities offset to some extent the decline in the outlay of the Federal Government; at least in the first phase of recession. If the particularly adverse effect of the recession on labour incomes has not been sufficiently brought out, neither is it emphasised how slight and negligible has been the recovery in the levels of employment compared to the preceding decline. In fact, between March and August 1954, when the economy otherwise exhibited signs of stability, employment continued to decline. In certain sectors, mining and transportation, it worsened even in the period of recovery.

It is an interesting point for analysis that investment income increased markedly during the downswing and continued, of course, to increase during the upswing. Another point that emerges from these statistics is that the fall in employment would have been still greater but for a sizable decline in the hours of work. The year 1954 closed with an over-all level of employment at 60.7 million, exactly the same as a year ago. Nevertheless, a modest recovery in the US economy is apparent. That the Council of Economic Advisers has felt encouraged to recommend the immediate raising of the minimum wage from 75 to 90 cents an hour is itself an indication of the underlying strength of the economy.

How far is economic progress

likely to be sustained? In the opinion of the Council, both the material and psychological factors are peculiarly favourable to economic progress. Industrial production has been on the upgrade. The rate of inventory liquidation has sharply abated; rebuilding of inventories in certain lines has commenced and is likely to grow. The expansion of State and local expenditure might more than offset any further decline in Federal expenditure. Home building will continue to mount for some time. New firms are being established at an increasing rate. A new national highway system is likely to push up economic activity in many directions. In the course of the current year (1955), the economic situation may therefore be expected to continue to improve; and it is reasonable to expect that the output within the coming year will approximate the goals of "maximum employment, production and purchasing power" envisaged by the Employment Act of 1946. The Council has, however, warned against continued economic recovery being jeopardised by over-emphasis on speculative activity.

As for the long-term future, the Council has laid down a programme for sustained economic progress: a policy "designed not merely to foster growth, but to foster a rate of growth that can be sustained." The Council first considers fiscal policies for economic expansion. Here, of course, it does not go beyond 'prudent finance': balancing of the cash budget to prevent possible resurgence of inflationary pressure and raising of the Federal debt limit to allow the Executive some room for manoeuvre. The second item in the long-term programme—assisting new and small business—does not really go beyond the 1953 Congress Programme for helping business concerns of small size to get adequate finance, a fair share of Government procurement contracts and competent counsel on management, production and marketing problems. The Council's emphasis on research, development work and experimentation is equally commonplace. In its recommendations for strengthening economic ties with other countries, the Council does not go beyond the recommendations of the Randall Commission "... gradual and selective revision of our tariffs through the tested method of international negotiation." It does recommend a certain strengthening of the programme of technical and

other assistance to economically under-developed countries, but the emphasis is on an expanded flow of private international investment. Here it breaks new ground by its suggestion to establish an International Finance Corporation as an affiliate of the International Bank for Reconstruction and Development.

It is in building the floor of personal and family security that the Council really makes certain very important suggestions. It recommends the extension of Federal unemployment insurance to 4.4 million employees of State and local authorities and also to firms employing less than four persons. Further, weekly benefits should be sufficiently high to provide the basic necessities. From the standpoint of the economy, benefits should be sufficient to enable the unemployed to maintain a substantial part of their customary expenditures, thereby minimizing the spread of unemployment.

Weekly Notes

Indian Textiles and Lancashire

THE British Labour Party has been unwise in making an issue of Indian cloth exports to UK. It is not difficult to imagine their chagrin; the Tories have pulled down brick by brick the structure of the textile industry, that the Labour Government had raised. The Liverpool Cotton Exchange, an eyesore to Labour, a gambling den that employed casual labour, which they had closed down, has been functioning again. The Raw Cotton Board is gone, private profits are playing havoc with men's lives and Lancashire is no longer the leading cotton textile centre of the world. Well, the world changes and it is quite some time that Lancashire has ceased to lead; why pick on India?

The arguments for and against Indian textile imports have been threshed out over and over again, there is nothing new to add. India has not invaded the British cloth market; textile imports from India are merely replacing imports from other countries; a large part of these imports is providing employment to Lancashire in processing grey cloth, adding value to it by British labour and selling it at a much higher price. India has removed quota restrictions on imports of British textiles; the import duties are still high, but these are not specially directed against Britain, which continues to enjoy a sizable preference. Finally, there is the charge of subsidy paid by India in the shape of supplying raw cotton at prices below world parity.

With an American expert here right now investigating the market for "butter oil", studying consumer preference, keeping quality of ghee and the flavour which Indians like, it is amusing to find the President of the British Board of Trade taking up cudgels on behalf of India and pointing out that world parity itself is of American make. He also pointed out that many British exports enjoyed this kind of subsidy in the shape of concession prices for coal and steel. What is difficult to understand is how could Labour so far forget itself as to equate textile imports into Britain to British export of textiles to India? What about British engineering exports and Imperial Preference?

Better Outlook for Sugar

SUGAR has often been in the news and each time because something or other has gone wrong with the sugar industry and consumers have not been able to get sugar at a fair price. Shri Ajit Prasad Jain, as the Minister for Food and Agriculture, is now responsible for the conduct of this industry and maintaining the country's supply of sugar. It is, therefore, more than a little amusing to find the Minister say:

"The sugar industry is, moreover, one of the finest examples of regulated industries in India. The sugarcane grower has been assured a minimum economic price and the industrialist a reasonable profit, while the interests of the consumer are looked after by making sugar available to him at a reasonable price. There are sometimes conflicts of interests between the cane-grower and the mill-owner. Occasionally, the consumer complains of high rates. But, by and large, the harmony which has prevailed in the sugar industry serves as an example for other industries."

One wonders how many, even in UP, will accept the Food and Agriculture Minister's assessment of the industry.

For some time past, sugar has not been much in the news. The programme of imports which the late Janab Kidwai launched in a big way has maintained free availability of sugar, though at a fairly high price. The Government holds a whip hand on sugar prices because sugar is imported only on Government account, but does not use it for imported sugar is sold at a price much higher than the landed cost. After the budget announcement that the excise duty on sugar would be raised from Rs 3-12 per cwt to Rs 5-10, the movement of sugar prices indicated that the rise could not be passed on to consumers. The Government has come to the rescue of the sugar mills by putting up the price of imported sugar by a rupee per maund.

Of course, if the present prices are maintained, the Government forecast of 30 per cent increase in sugar production during current season may not only come true but may actually be exceeded. The forecast for sugar production this year is 13 lakh tons compared to

10 lakh tons last year. But imports are expected to be reduced by 2 lakh tons. The gulf remains.

If the level of internal consumption of sugar for the past two years continues, and it bids fair to stay, production will have to be substantially increased, the acreage under sugarcane will have to be expanded, yields stepped up as well as manufacturing capacity expanded; these are all in the second Plan, but the situation at the manufacturing end of the industry is not yet either clear or certain. High prices, restricted consumption and continued imports may be a way out, but it is certainly not the most desirable nor the best possible in the circumstances.

A Pretty Kettle of Fish!

THE case for the extension of excise duties to a wide range of articles needs no further justification than that of obtaining funds for development. But when to pure revenue considerations, restriction on consumption is added as a desirable social objective, one begins to wonder whether the principle could be extended to paper, of all things—for excise duty on paper is obviously a tax on knowledge—or to sewing machines, which gives employment of a very desirable kind to a class of persons, destitute women among others, who can claim special treatment on their own rights. Among the new excise duties proposed, those on woollen fabrics, sewing machines, electric fans and bulbs, if not dry batteries, and certainly on paper, could be hardly justified.

If revenue is the object, there is a case for excise duty at a low rate over a wide range of products; but the list selected by the Finance Minister and the rates he has chosen are not the best one could conceive for the purpose. It offends against the principle of the just sharing of burdens, that the burden on the middle class should be duplicated; and the rate is not so low that one could dismiss it as a minor impost not restrictive of consumption either in the case of paper or sewing machines. Again, if restriction of consumption is also an object—it must be an inevitable consequence, whether intended or not, when the duty is as high as 10 per cent—how could it be applied to industries which are unable to reduce costs

because demand is still so inadequate, as in the case of sewing machines?

Now the Finance Minister has also justified the extension of excise duties on the supposed ground that yield from import duties are going down with the substitution of domestically produced goods for imported goods, and that domestic industries established under the shelter of protection should now bear a greater tax burden. Now there is an obvious fallacy involved in this, but as the Finance Minister is fond of repeating this argument, what we said about it in the budget number may be worth repeating here.

In effect, the principle means that the consumers, who have borne the burden of protection accorded to an industry through high import duties, will be called upon once again to bear the burden of higher excise duties, once the industry has developed fully. Ultimately, the burden will fall on the same group of consumers who would thus be in a "Heads I win, tails you lose" position, once an industry is protected to ensure its development.

Frankness any day is better than dubious and sophisticated argumentation, and no one can quarrel with the Finance Minister's new excise duties "the collection of which is unlikely to involve any major administrative problem", except to those on whom the duty falls. Now administration can be viewed from opposite viewpoints; it means one thing to the administrator and quite another thing to the person on the other side of the counter. Paint manufacturers certainly do not agree that theirs is an industry in which the imposition of excise duty does not create any major problems.

Joint emergency sessions of the Paint Federation and the Indian Paint Manufacturers' Association, held in Calcutta nad Bombay, had this to say:

"From all sides, opinion was unanimous that Government could not possibly have fully appreciated the difficulties inherent upon the recovery of this duty, subject to the regulations and controls, under the Central Excise and Salt Act 1944, within the complicated structure of the paint industry and its outlets. Possibly only this industry has to produce such a wide and truly diverse range of products for so many different groups of consumers

(Government, industry, the bazaar and the domestic user) and incidentally, sell under three systems of measurement: by weight, and by OM and Imperial Gallon capacities. The *ad valorem* approach is not suited to this complicated marketing structure. It was agreed it will prove essential to evolve a much more workable and equitable system, based possibly on tonnage and volume. Above all, it was

essential to resolve immediately all misunderstandings and uncertainties of interpretation so that production and distribution can be resumed without delay."

Paint manufacturers' stocks have been impounded, production and distribution have entirely stopped. This much about excise duty on paint not involving any major administrative problem!

Two Voices

ON Tuesday, Sir Anthony Eden informed the House of Commons that he was not pessimistic about the situation in the Far East. On the same day, his "opposite number" in America, Mr Dulles, warned Red China that America would not desist from the use of tactical atomic weapons in the event of any new aggression. There is a significant difference in the tone and purport of these two speeches, which emphasise the divergence of views between Britain and America on Far Eastern problems.

Sir Anthony was congratulating both Washington and Peking for exercising restraint. He noted with satisfaction that, under the restraining influence of America, Kuomintang raids on the Chinese mainland had ceased in the last few days. He praised Peking for not provoking any armed conflict in the Formosa Straits by not taking any military action against the Kuomintang-occupied offshore islands of Quemoy and Matsu. He expressed the opinion that Communist China's membership of the United Nations and the Formosa issue could be discussed in an international conference provided there was a cease fire in the Straits and the Kuomintang withdrew from the coastal islands. In an aggressive broadcast address to Americans, Mr Dulles stressed that nobody should get away with the impression that

"our (America's) love of peace means peace at any price".

From these two speeches by the British and the American Foreign Ministers, the divergences between Britain and America on the Far East emerge clearly. Britain is willing to discuss the future status of Formosa in an international conference. America seems committed to upholding the Chiang regime in Formosa and the Pescadores. Mr Dulles is ambiguous about the future of the offshore islands. Sir Anthony is emphatic that the offshore islands, including Quemoy and Matsu, should belong to Communist China. Britain is willing to make certain legitimate concessions to Red China so that there could be cease fire in the Formosa Straits. America is reluctant to concede any of Red China's claims. Washington issues a threat to Peking that if Red China does not accept America's terms, America is prepared to use the maximum force she can mobilise to force Peking to accept a dictated peace.

There is nothing new in Mr Dulles's emphatic implication that America is determined to use tactical nuclear weapons to deter aggression. For the Far Eastern region, the Theory of Two X was enunciated some time ago. It implies that minor acts of aggression should be retaliated with minor military action in areas which may in-

THE ECONOMIC WEEKLY

clude strategic positions within the enemy country. In the event of massive aggression, America would retaliate promptly with double force and with weapons, which would include atom bombs. There has been a stiffening of America's attitude in recent months. Until recently, America had an open mind about the use of atom and hydrogen bombs in the event of war. She has now let it be known that the use of no weapons, conventional or otherwise, are to be debarred in the event of aggression.

Budget Estimates—A Correction

IN the article 'Budget Estimates—An Assessment' published last week, it was argued that a shortfall of Rs 325 crores, or over 25 per cent, in the Central Government's outlay under the first Five-Year Plan was likely. This is erroneous, since certain Loans and Grants given to State Governments—such as loans for the multi-purpose river valley schemes, loans and grants for rehabilitation, industrial housing, community projects, national extension service, local works, etc.—which are included in the 'Five-Year Plan Outlay' of the Central Government, have been left out in our calculation of development outlay by the Centre during 1954-55 and 1955-56. If allowance is made for these, shortfall will be of the order of Rs 125 crores or about 10 per cent only. The error is regretted.

THE ECONOMIC WEEKLY

Letters to the Editor

German Recovery and the German Worker

A Reply

I REFER to the letter of Mr Freddie A Mehta appearing in the issue of February 26, concerning my review of the West German economy in your Independence Number. Insofar as I am able to understand Mr Mehta's letter, three points appear to be made about my treatment of the subject: (a) that I committed a "howling error", (b) that my assertion about the West German recovery being based on the free market economy as being a myth is unproven; and (c) that my argument about living standards of the German workers having deteriorated is false. I shall briefly consider each in turn.

With regard to the first, Mr Mehta does not refer concretely to anything in my despatch which by any stretch of imagination could be considered as a "howling error". I have re-read the despatch but fail to detect anything there which could conceivably fall within the category of howlers. Maybe Mr Mehta had in mind the points (b) and (c) above when he used this term—if this is so, then I suggest that he takes some care before employing such irrelevant and unbecoming phrases as this. This is not the only case where such phrases are used, but more about this later.

Next, Mr Mehta suggests that I have not proved my assertion that the free-market basis for W Germany's recovery is a myth, except in the "trivial sense" of state-aid for exports. Mr Mehta being the "keen student" that he is could have read my despatch with more care—had he done so he would have seen the explicit treatment given to the re-emergence of German industrial trusts, the tendency towards concentration of banking activity and the complete breakdown of the Allied "decartelisation" policy in the past year. I have referred in some detail to the dominating position of the Guetch-offmertschnette and more particularly the Mannesman combines in the steel and coal industry. I could have gone further by showing the extent to which price-fixing arrangements have made nonsense of any talk of "free market prices" in the West German heavy industry. And yet Mr Mehta conceives my assertion as being unproven.

He goes further to suggest that the state aid given to German exports is "trivial". While I do not want to make charges with the same abandon and flourish as he does, I do get the unfortunate impression that he is ignorant of what has been going on in W Germany. To show how far from trivial the matter of state-aided exports are, I could quickly refer to the matter of tax concessions that operated in favour of exporters. Up to 1954 German exporters were allowed various allowances on their taxable income in respect of their export turnover; these allowances amounted to about 4.5 per cent reduction in actual tax paid by exporters and this allowance applied to about 60 per cent of German exports. The combined marginal effect of remissions, refunds, deductions and tax-free reserves could be as high as 9½ to 10 per cent of home market prices thus placing the German exporter in a more competitive position. The Federal German Finance Minister estimated the loss of revenue from these allowances to amount to DM 460 million or about 4 per cent of German finished goods exports. The British Government did not consider these export subsidies to be "trivial"—they complained, and most bitterly so, to the International Monetary Fund and as a result of these British pressures, German export subsidies were withdrawn as from January 1955.

With regard to the importance of export-credits as a form of state aid to German exporters, I have written lengthily in various past despatches on how these types of credits enable German exporters to take up large long-term contracts and thus win back for Germany many markets. These are not "trivial" matters—they show how far the State has been able to intervene in economic fields, despite all the talk of the "free-market economy".

The last point of Mr Mehta's is a more substantial one. I admit that I have provided no data to support the contention that there has been a deterioration in the living standard of the German worker. This contention, for what it is worth, is largely founded on personal observation arising from my periodic visits to Germany. But more than that I would prefer Mr Mehta to take a more serious look at my despatch, especially

the section under the sub-title "Financing of Investment". I show there that the level of German civilian consumption is low compared to other Western countries. Further, I examine productivity-wage rate data from published sources and show that between 1952 and 1954 (August) productivity per working day rose by 9 per cent (which takes into account the absorption of refugee labour), while wage rates for all operatives rose by only 1 per cent. Compared with the rise in productivity, the figures show that the standard of living of workers has remained about stationary.

Mr Mehta pleads that he does not want to be "malicious". I do, however, think that employing such phrases as "coffee-house discussion", "unguarded", "consulting relevant authorities before committing himself to paper" do reveal a malicious intent which, to say the least, is most unbecoming and unnecessary. This is all the more so when his contentions can be so easily exposed.

Your Correspondent.

London,
March 4, 1955.

Imperial Bank
Compensation

MY attention has been drawn to a factual error in my article 'Imperial Bank Compensation' which appeared in your last week's issue. When the Air Companies were nationalised, the principle of compensation adopted was the book value of assets and not the market value. I regret the error. The argument, however, is not at all affected thereby and I still maintain the stand taken in the article.

Gospel According to Deshmukh

AFTER the high expectations about the budget, the reaction produced by the actual performance in the capital is one of bathos. With Chambers of Commerce, from all over the country, showering bouquets on the Finance Minister and the stock exchanges responding bouncingly to the expected shower of Rs 320 crores and a bonus (development rebate) of 25 per cent to all engaged in the socially necessary task of industrial reconstruction and development, Shri Chintaman Deshmukh has been at pains to evaluate for his 'colleagues' of the Congress the unknown quantity of socialism in his budget equations. After all, these politicians are not seasoned in the art of political economy. Shri Chintaman was able to convince them that his budget would prove a great leveller and not many more than a hundred persons out of a population of 370 million would be having a net (of tax) income of a lakh of rupees. As the budget proposals have made a beginning with rates of income tax; and a ceiling on incomes and surcharge-cum-deposit schemes are in the offing, we must be on the way to a socialist paradise. Some others like Dean Swift may find it a little difficult to understand economists, for in their arithmetic two and two, instead of making four, might well make zero! In any case, we have now a socialist state in the making with a socialist Prime Minister and a would-be socialist Finance Minister. "No doubt, the Finance Minister would gradually go that way (the socialist way) as he should"; so said the Prime Minister at the Federation meeting on Saturday last.

FEDERATION ANNUAL SESSION

The annual session of the Federation of Indian Chambers of Commerce and Industry reminded me of the old days when the Viceroy used to address the Associated Chambers of Commerce at Calcutta. The scene has now shifted to New Delhi and the Prime Minister, as representative of a sovereign people, has taken the place of the Viceroy. Of course, there are quite a number of other differences too. In place of the awe and grandeur of the old days, there is now "a lot of talk-

ing." After all, this is a people's democracy with a close liaison between business and Governments, determined to build up the economy by co-operative effort! This is the impression one got at the meeting of the Federation last week. Shri B M Birla spoke well. After all, just as Government has its economists, so has business. Both can and do hire hacks to write fine essays for them. Here are a few gems from Shri Birla's speech, "We do not seek political power. Our passion is not wealth. We want to carry on our business to the best of our ability. Ours is not an esoteric circle, not a closed caucus. . . . It is through our initiative and enterprise that the material well-being of the people has been progressively improving." The shades of Marx! After all this, can one help remarking that the best propagandists of the Communist Party in this country are the Ministry of Finance and the Chambers of Commerce!

EMBASSIES AS AGENCIES OF BIG BUSINESS

Shri B M Birla suggested to the Prime Minister that our Embassies abroad should become agents of Big Business and in this connection, highly commended the services of an old comrade of the business line, Shri G L Mehta, who represents this country in the United States. I think the logic of it is that the Prime Minister, instead of relying for personnel on the civil service, should invite suitable nominations from the Chambers of Commerce. I am not exaggerating. Shri Birla did say so very plainly, "If some of our other embassies have business men associated with them, it will considerably help our industrial expansion." We must make the best use of business talent—one of our scarce resources—and give it incentives in the private as well as in the public sector. The people—the people need no incentives. They must work hard and produce. . . . There is, however, one point in Shri Birla's speech which deserves thinking over. He advocated "a new approach to consumption in contrast to the premium on austerity as in the past." This is almost Keynesian. Circumstances may well arise when savings, instead of helping capital formation, may well

have a contrary effect. But that is yet to be. In any case, Shri Deshmukh's deficit financing will take care of such a situation.

THE NEED FOR SPEED

The Prime Minister spoke—and spoke well. Once for a change, he did not get angry. He did not shout at private enterprise, nor express his disgust at cocktail parties, as he did on the last occasion. He was full of Avadi and Socialism and the need for speed: ". . . The devil is behind us and we have to progress rapidly. It is not a question of some people or a few individuals progressing, but 360 million (we are really 370 and shall soon be 400 million) people progressing and our taking them along. . . ." This was all very nice to hear. Business men, in their heart of hearts, take a cynical view of it. They have come to believe that if the Prime Minister is allowed (?) to talk freely and they all shout for socialism—and discover it in the Budget speech and its deficit financing and its excise duties—they will be able to eat the cake and have it too. Andhra has buried Avadi in any case. Didn't Harold Stassen congratulate us on our success in Andhra? If our performances keep to this pattern, he will recommend us to Ike and Dulles; for soon after leaving Delhi, he said at Karachi that though Pakistan had a high priority with his FOA and the State Department, we were among the friendly countries!

CONGRESS HIGH COMMAND

Almost simultaneously with the Federation, the Congress Working Committee met at Pandit Nehru's house. To the discerning eye, there was much in common between the meetings of the Federation and the Congress Working Committee. At both, there was talk of 'Avadi Socialism', the Taxation Enquiry Commission's suggestion of a ceiling on incomes, etc. Quite frankly, these gentlemen of the Congress (including Deshmukh) and Business have been quite frightened by the suggestion of a ceiling on incomes and a surcharge-cum-compulsory deposit scheme, which would not leave any one of them more than Rs 25,000 for personal consumption.

They had never suspected Dr John Matthai and Deshmukh of such radicalism. So the Congress Working Committee debated the proposition and it was talked out.

INDUSTRIAL TRUCE FORGOTTEN

There was Shri Tripathi's Avadi Resolution limiting private incomes to the Prime Minister's salary, even with regard to firms which did not pay a living wage. It has been forgotten that more than seven years ago, in December 1947, Government and employers solemnly pledged themselves to, and signed, what is called the Industrial Truce Resolution—that if labour kept the peace, they would push through legislation and machinery for the establishment of a fair wage. Labour has kept the peace; man days lost through industrial disputes have gone down from 12 to 3 million; but fair wage legislation has not materialised. So business has really nothing to bother about either the proposed ceiling on incomes or the living wage. The Congress now desires to purify itself, and that is what mainly concerned the Congress Working Committee at its last meeting. This reminds me of what Dr Trone, the great planner who was invited by the Prime Minister to study our economy, said when he came here. Obviously the words were addressed to the Prime Minister himself: "If you cannot organise the country, others will." Fortunately the Prime Minister—and he alone—is conscious of the immediate necessity for change. To quote again from his Federation speech, ". . . We must move in that direction and move fast. The people cannot wait long."

ACTRESS'S LAMENT

These are obviously serious matters. Delhi had also its light moments. The Film Seminar closed with Nargis complaining that with 18 hours a day, the actresses were the hardest worked. Jehovah's witnesses had a four-day conference here and they have promised us a world society within this generation. Debonair Eden and his charming wife—so the Prime Minister called her at the State banquet at Rashtrapati Bhavan—have come and gone, leaving behind a trail of sweet diplomacy. As Sir Anthony flew from Bangkok to London, we heard four voices—one from Bangkok, another at New Delhi, a third from the Middle East and the fourth from the Mother of Parliaments in London. Not without justification, Sir

TO THE 'SLAUGHTER HOUSE'

Political life at New Delhi might next week take on a somewhat serious tinge, for the Lok Sabha is going to begin discussion on the Constitution (Fourth Amendment Bill) on March 14—the first step to socialism—and a whip has gone round that all members of the Congress Party must be present throughout the debate. The poor sheep are being driven—slowly, of course—to their slaughter. This brings us back to the Federation meeting, for the Federation has opposed the proposed amendments to Article 31-A of the Constitution and also proclaimed that the Matthai Commission recommendations run counter to the evolution of a tax structure which will help capital formation and development of productive enterprise. This is surprising—has any one of them read the Report, assuming that they can?—for these have in fact been the paramount considerations with the Commission, which has given them a priority even over equity. If the masters are not so learned, is it not the duty of their clerks to read out things to them?

Colonial Currency Issues

THE Colonial Office has now authorised the various Colonial Currency Boards to apply for permission to vary the cover for issues of Colonial Currency. This change, by no means revolutionary, is the result of a considerable amount of discussion that has been taking place about the true meaning and implications of Colonial-held sterling balances. Between 1950 and 1954, these Colonial-held balances rose from £735 millions to £1,189 millions. Various prominent commentators, and among them Professor Arthur Lewis, have conceived of these balances as being in the nature of forced loans to Britain.

The contemplated changes can best be explained against the existing system of Colonial Currency issues. The system in the various colonies is by no means uniform. But in one way or another, Currency Boards have been set up in the territories or in London for particular territories. In Hong Kong, however, a complex of Government departments and local commercial banks operates as if it were a formal Currency Board. In certain areas it has been found convenient to group some territories together for currency purposes. The East African Board operating in London covers Kenya, Tanganyika and Uganda.

The issues of all local boards are linked with sterling under the Colonial Sterling Exchange Standard. The rates of exchange between a Colonial currency and sterling and the right of converting one into the other are determined largely by law. The local Currency Boards are therefore merely automatic money-changers: they issue legal tender locally on demand against deposits of sterling in London, they hold this sterling in cash or sterling securities and they pay it out again on demand against local coin or notes paid in. They have no discretion in the matter. Constitutionally the rate of exchange is fixed in London by the Central authorities. The quantity of money can be increased only by depositing an equivalent increase in sterling in London; it can be decreased only by an equivalent redemption in sterling in London. The Colonial authorities have no independent monetary policy. And as the legal tender basis is fixed in

this way, it also follows that strictly, the local banks can have no independent credit policy. This is particularly true where local production is on a full cash basis, but it is more qualified where the banks themselves have engaged in local investment. The Colonial inhabitants usually have little opportunity to increase the velocity of circulation in view of the character of their economies.

From this it is clear that changes in the quantity of money and credit in the Colonies are fundamentally a function of the balance of payments. An export and payments surplus increases in equivalent measure the local quantity of money and *vice versa*.

The reserves of the Currency Board are therefore nothing less than the sterling balances standing in their name and in each case these reserves are equal to the actual value of the legal tender issued locally. In fact some Currency Boards aim at holding assets equal to about 110 per cent of their liabilities. In the case of the West African Board, reserves have varied between 108 and 116 per cent of currency liability. In general, a cover of 100 per cent is a statutory minimum. These reserves are required by law to be maintained in sterling or in certain sterling securities *except the securities of the Colony itself*.

The essential argument against this system is that the local inhabitants of the Colonies, to obtain currency, are compelled to invest abroad a part of their export receipts, accepting in return paper (or coin) titles which circulate as local currency. The local producers whose output is exported become holders of additional currency. So long as they continue to hold it, it is they who are financing the currency expansion. The income from exports constitutes a claim on imports. While currency is held in circulation that claim is not enforced and thus the holders of the currency are in effect lending abroad in sterling.

The fact that the Currency Boards are allowed to invest their assets in the UK and other sterling securities only, and not in their domestic securities, show, further, that the Colonial sterling balances are employed to a greater degree towards the financing of long-term economic development programmes

in Britain itself. Over 90 per cent of the investments of the Currency Boards are in UK securities—the issue of which are concerned with the raising of investment funds for the United Kingdom itself.

These unassailable arguments have raised the eyebrows of many who in a tolerant kind of a way considered Britain's Colonial economic policy to be liberal and well-meaning. Now come the new proposals of the Colonial Office. Their origin goes back to the 1947 Southern Rhodesian Currency Board arrangements. The Government of S Rhodesia—a "self-governing Colonial Administration", demanded that the currency issue authority covering its territory should possess powers to use its reserves for the development of the territory. It was therefore decided to grant powers to the S Rhodesian Currency Board (whose activities were to cover N Rhodesia and Nyasaland as well—the current central African Federation) to invest up to 10 per cent, 7 per cent and 3 per cent of its reserves in the local stocks of the governments of S Rhodesia, N Rhodesia and Nyasaland respectively.

The new proposals of the Colonial office are to extend these Rhodesian arrangements to other colonies as well. The Colonial Secretary has now informed various Colonial Governments that he would be agreeable, "in principle and subject to review of the individual circumstances of each territory" to the transfer of a "small part" of their currency funds from sterling investments into locally issued securities.

The most noteworthy feature about this proposal is its inauguration of a "small" fiduciary issue of currency in the Colonies. Maybe such a small issue will stimulate local money markets and the self-financing of some economic development. Many will now say that the proposal suggests a welcome change in Colonial policy. The changes however do not go to the heart of the problem, *ie*, the compulsion on Currency Boards to maintain the larger part of their assets in London and their being made impotent to adjust monetary circulation to offset the sufferings that come from the frequent fluctuation of incomes of primary producers in the Colonial territories.

Unemployment and Refugees

BOMBAY is bountiful. But Calcutta resents its reputation as a cosmopolitan city. Gujratis and Maharashtrians are Bombay's major inhabitants. Since partition, many Sindhis have migrated to Bombay. There are Parsis. And, of course, there are the Iranis and Irani restaurants. There are Goans who speak Konkani. Bombay may be cosmopolitan in the sense that it is, or rather was, until the linguistic controversy started, nobody's city. But it is not a multi-racial city in the sense in which Calcutta is, and always has been.

Bengalis regard Calcutta to be their city. There is a considerable Marwari population in the city. There are many Marwaris who regard Calcutta as their home town. Peshawaris seem to be doing well in this city. They are money-lenders. They always travel first class in trains. There are populous Chinese districts. Calcutta's Chinatown is divided in its loyalties. Some are pro-Chiang. Some are pro-Peking. They, allegedly, have feuds occasionally. Both the groups have their newspapers.

MULTI-RACIAL CITY

Calcutta's Anglo-Indian community is large. It has lost its privileges, but not its aggressiveness. Its female population earns livelihood as stenographers, telephone operators or office secretaries. But these professions are no longer the exclusive preserves of the female Anglo-Indian population. What the male Anglo-Indian population does for a living is anybody's guess. A casual observer would not be wrong if he presumes that frequenting cinema houses is its major occupation. There is an influential Armenian community. Where Thackeray was born, there is now an Armenian college. Some of them are hoteliers. All of them seem to be rich. They also seem to be a sport-proud people.

Calcutta may be a multi-racial city. But Bengalis behave as if the city belongs to them. They don't mind if the Armenians maintain a church or a college. They don't bother if the Chinese population treat the Chinatown as their extra-territorial jurisdiction. They want to monopolise West Bengal's politics. Except the newspaper business, they don't own industry. They are content to remain as journalists, clerks, lawyers, professors and doctors. Marwaris are not interested in the professions in which Bengalis specialise. They are

industrialists, traders or speculators.

Recently, Marwaris have made attempts to enter West Bengal's politics. Dr B C Roy has two Marwari colleagues in his Cabinet. There are some Marwari members of the West Bengal State Assembly. There is antagonism between Bengalis and Marwaris. As there is no clash of occupational interests, it is difficult to know why there should be mutual hostility between Marwaris and Bengalis. It should be possible for these two communities to co-operate with each other to their mutual advantage.

UNEMPLOYMENT CURE

That is what Shri Murarka, a Marwari Congress member of the West Bengal Assembly, thinks. He joined the Assembly debate on the budget to express his views on unemployment in this State. This was the main issue discussed during the budget debate. Everybody agreed that the problem was assuming alarming proportions. Dr B C Roy had elaborated a 1,400-crore second Five-Year Plan in his budget to solve unemployment. All the Opposition members were agreed that the budget plan was not feasible.

It was at the intermediate stage of the budget debate that Shri Murarka rose in the Assembly to prescribe his recipe for unemployment. It was simple. He agreed that all the business undertakings in this State should be compelled to employ Bengalis only. West Bengal's manual, unskilled labour force will always have a considerable non-Bengali population. But Shri Murarka argued that his prescription will cure educated middle class unemployment. This is the main problem in West Bengal. Shri Murarka's plan will, of course, not solve the problem.

But the incident that happened as Shri Murarka ended his speech in the Assembly was, and is, symbolic. Immediately after Shri Murarka concluded his speech, many prominent members from all the Assembly parties congratulated him, a Marwari, for saying what he had said. It may sound parochial for a Bengali to say that employment in this State should be an exclusive monopoly of Bengalis. But when a Marwari says it, one realises the miserable state of affairs in this State. There is no other State in this country which employs as many people who do not belong to the State as West Bengal does. And yet, West Bengal is

widely condemned for its parochial outlook!

There has been a revived inflow of East Bengal Hindus since October last. There are many reasons for this resumed exodus. But one of the reasons reflects this dismal episode in all its poignant aspects. Scheduled caste Hindus are in a majority among those who have been migrating to Calcutta since October. They are coming because, in July last, the authorities here had issued a circular that those who did not come to West Bengal before December 31, 1954, would not be regarded as refugees.

Scheduled caste Hindus were wooed by the Muslim League in pre-partition days. But they seem to have been abandoned by the ruling party in Pakistan since partition. It has been suggested that they are coming to Calcutta because of the false impression that each refugee will receive Rs 820 to Rs 3,500 from the rehabilitation authorities. Despite efforts by the Indian Commission in Eastern Pakistan, such false reports seem to have gained wide currency. This pecuniary consideration may have aggravated the recent inflow of refugees.

DISMAL STORY

But there are other aspects to this resumed exodus. Scheduled caste Hindus are a virile community. They are of the earth, earthy. They may have grievances against caste Hindus. But they belong as much to the soil of East Bengal as caste Hindus. Even during the Great Exodus, they did not leave their homes. Let officials stress the monetary motives behind their present exodus to Calcutta. But those who know them know they are trekking to West Bengal so that they do not lose the last opportunity to call themselves, and be known as, Indians.

And why emphasise the pecuniary motives behind the exodus? Only wooden-headed officials will fail to appreciate their simple and sincere faith in the humanity of the people of India. Their lot is harder than those of middle class caste Hindus who are still in East Bengal. Discriminatory practices are affecting all sections of the Hindu population of East Bengal. Can the poorer scheduled caste Hindus be blamed for trying to find out if they can settle in India? How could anybody be so perverse and cruel as to distort their simple, inherent belief that they have the right to shelter and rehabilitate in India?

Probable Size of the Next Five-Year Plan

(Contributed)

IT is proposed in this article to estimate the probable size of the second five-year plan on the basis of the performance of the Indian Economy during the first five-year plan period.

From available statistics it appears that the national income has increased during the second and the third year of the plan at an average annual rate of 2.5 per cent. It is assumed here that this rate would be maintained during the last two years of the Plan. In Table I, we have calculated the national income on this assumption for the Plan period.

From the third progress report of the Planning Commission, we get the statistics regarding public investment and private investment in the organised industrial sector for the first three years of the Plan. On the basis of the past performance, we assume that public investment would not exceed Rs 450 crores during the fourth year and Rs 600 crores during the fifth year. Regarding private investment in the organised industrial sector, we assume that in each of the last two years of the Plan it would be of the order of Rs 68 crores and thus would reach the target of Rs 233 crores at the end of the Plan period.

No statistics are available regarding private investment in agriculture, unorganised industrial sector, residential construction, trade, etc. However, substantial investment seems to have taken place in agriculture and residential construction. We assume that this investment has been of the order of Rs 100 crores each year during the first three years of the Plan and that it would continue at the same rate during the last two years.

On these assumptions, the investment-income ratio, as would be seen from Table I, would increase from 4.2 per cent in 1951-52 to 7.7 per cent in 1955-56, giving an average ratio of 5.6 per cent for the five years and 5.9 per cent for the last four years of the Plan. The average ratio of external assistance to national income has been a little less than 0.5 per cent during the first three years of the Plan.

The average investment-income ratio of 5.9 per cent and the 2.5 per

cent average annual rate of increase of income during the period 1952-56 would give us a capital-output ratio of about 2.3.

ASSUMPTIONS REGARDING THE SECOND PLAN

It seems perfectly safe to assume that the investment-income ratio could be raised from 8 per cent in 1956-57 to 12 per cent in 1960-61. This would give us an average ratio of 10 per cent during the five-year period. The average capital output ratio would tend to be greater than 2 as about 30 to 40 per cent of the total investment during the second five-year plan would be in industries, and a large part of it in heavy industries. However, in view of sizeable unused capacity in large number of industries and the probable significant rise in agricultural production as a result of the completion of big irrigation schemes by the end of 1955-56, it seems reasonable to assume that this ratio would not be greater than 2 during the second five-year plan period.

PROBABLE SIZE OF THE SECOND PLAN

On these assumptions, national

income would increase at an average annual rate of 5 per cent during 1956-57 to 1960-61 and total investment would be of the order of Rs 5,800 crores (Table II). On a very conservative estimate, the external resources left over after the completion of the first five-year plan would be of the order of Rs 300 crores. Hence we could easily have a total investment programme of more than Rs 6,000 crores during the second five-year plan period.

If we take account of the depreciation allowances accumulating in the economy during this period, a part of which could safely be used for investment purposes, this magnitude could be further increased by a few hundred crores of rupees. Moreover, income might increase at more than expected rate as a result of the completion of big irrigation and other schemes and the unused capacity in a large number of industries. This more than expected increase in real income would tend to bring down prices. Deficit financing could safely be resorted to in these circumstances, thus raising the

Europe Between the Wars

A Study in Economic Change

Hannan Ezekiel

IF economic history is to serve any purpose, it must not be merely a narration of a sequence of events in time but must attempt to analyse the inter-relationships between these events, to establish causal connections and to study their significance for subsequent developments in the same and related fields. On the one hand, therefore, economic history must be a study in the application of economic theory to concrete events and on the other, in the induction of principles from their complex interrelationships. How far such a study can yield results of wider significance depends naturally upon the region, sector or period covered, but in some cases, in spite of the limited applicability of the conclusions, the study might be highly valuable because of the techniques employed and the masterful analysis contained in it.

The study of inter-war Europe carried out by Prof Ingvar Svennilson under the auspices of the Economic Commission for Europe represents the best elements in genuine economic history.* 1914 marked a turning point in the development of the economy of Europe if not of the world. The rapid expansion of the previous decades had been followed by a period of slow growth or contraction. The impact of the war and the political and economic changes resulting from it had contributed to this in no small measure. The checks to long-term progress exercised by the war formed only part of the factors operating in that direction, but "it is evident that the consequences of the loss in momentum may very well have exceeded the more direct effects of the war".

Prof Svennilson covers a wide canvas. With broad sweeps of his brush, he traces the economic changes that occurred in the European economy during this critical period

in its history and analyses the factors governing them in the perspective of long-term economic development. At the same time, principles governing economic change are derived from the course of events and an attempt is made to contribute something to the theory of development, particularly by attempting a synthesis of the theory of the trade cycle and that of long-term growth. The period studied is one of intermediate length, a highly complicated period illustrating vividly the problems that arise in a discussion of this type.

The volume opens with a theoretical outline of "The Process of Economic Growth". Here are presented the elements of that theory, in the light of which the significance of the developments studied later may be grasped. The contributions to the theory of growth by the author are also presented in this chapter though no attempt is made to demarcate the one from the other.

At the outset, the separation of cyclical variation and long-term changes by mechanical statistical devices is rejected as contrary to the approach to the problem. The study proceeds on the assumption that an increase in the capacity of an economy to produce appears in boom periods and is based on a comparison of successive boom periods. Recognising the influence of national frontiers and industrial sectors, special attention has been paid to the study of individual industries and also "to the timing of industrial development in various countries, and in this connection to the spread of new technology from one country to another".

In the preliminary analysis of the theory of economic development, Prof Svennilson starts from Cassel's "uniformly progressive state", covers the Malthus model as one form and the Marshallian expanding economy as the other form which this theory takes under different assumptions; all three are equally valid in different circumstances. When the level of investment is introduced into these

models, its complex interrelationships with the level of output have to be taken into consideration. But output, labour and capital equipment cannot be treated as homogeneous totals, particularly when there is technological change, and therefore simultaneous expansion and contraction of different industries may take place so that "even in an economy without an increasing total there may be a large derived demand for capital goods".

It is at this stage in the analysis that Prof Svennilson presents a theory of long-term growth on lines similar to Schumpeter's business cycle theory. Transformation occupies a significant place in it and it is studied within a framework of varying width—of individual industries, of local areas, of countries, of the world economy. Prof Svennilson insists that the relationship between transformation and economic growth is one of mutual interdependence. Investment, employment, output, growth, transformation—these are the principal elements in his theory. Other variables "may also be included in the theory and some factors may have to be regarded as external in relation to the closed system of causal relations." Schumpeter's innovations form a part of this transformation process but have a less important place than Schumpeter himself has given to it.

Changes in relative costs and prices constitute one set of factors influencing transformation, but growth factors may themselves react on it. Thus, "the modernization of capital equipment and of the whole structure of an industry will proceed more rapidly, if the industry is expanding." In view of the significant position given in this theory to the process of transformation, these and other factors influencing it are examined in some detail. The influence of the resistance to transformation offered by old capital is also considered. Since modernisation proceeds rapidly in an expanding industry through the installation of modern equipment in the new or expanding units, "the efficiency of an industry increases

according to the rapidity of its expansion". If a period of rapid expansion is followed by one of stagnation, physical stagnation would be accompanied by a deterioration of the financial position of the industry concerned. In an economy with slow long-term growth, there is a comparatively large number of stagnating industries which lag behind in modernization and efficiency, tend to store up labour, which could have otherwise been transferred to other growing industries and thus hold back the transformation of the economy as a whole as well as general economic growth.

A slow growth of population will be accompanied, for any given growth in national output, by a greater dispersal in industrial rates of growth. The emphasis will be on a rise in individual incomes and differences in income elasticities for various products will hit a certain number of stagnating industries severely. The strong resistance to transformation in these industries may make them depressed industries, thus slowing down the economic growth of the country.

The chapter also examines the relation of long-term growth to business cycles and the interrelations between national rates of growth. In this connection, attention is drawn to the cumulative character of the movement in any particular direction, the various forces acting and reacting upon each other. Through the forces of international competition, a country with stagnating industries will ultimately find itself facing a slowing-down in the rate of growth. This may continue for long periods. But in compensation to this, there will be the possibility of transferring knowledge and ideas which will assist underdeveloped countries to jump intermediate stages and avoid the competition between old and new capital.

It is in the light of this well-developed theory of growth and stagnation that the problems of inter-war Europe are studied. In 1913, Europe had gone through several decades of rapid expansion, but industries were concentrated in a few countries of north-western Europe, the three leading ones being the United Kingdom, Germany and France. With half the population, these countries accounted for more than seven-tenths of Europe's industry. The predominance of coal in

this region, when coal was the major source of energy, explained this development. Agriculture, however, still occupied more than two-fifths of the European population.

The three major countries were highly self-sufficient in industrial products and traded relatively little with one another, but together they occupied a dominating position in the world market for manufactured articles. They dominated intra-European trade also, and the smaller national centres of industry, each highly specialised, were dependent on the three big powers and on each other for their supplies of industrial products. Their imports from overseas were financed mainly by their exports to these three powers and particularly to the United Kingdom. They also depended on these countries for their supply of capital. The organisation of industries was, therefore, oriented in all these countries, as well as the big powers, to the export markets: that is why textiles were so important. Capital goods industries were also highly important.

The first World War profoundly upset the balance of this system. It came as a heavy external shock which brought about a number of significant political and economic changes. The consequences of the loss in momentum may very well have exceeded the more direct effects of the war. The dislocation in the distribution of resources between different industries which appeared in agriculture, shipping and the steel industry released cyclical processes whose effects can be traced throughout the period.

Applying the theoretical principles developed earlier, the study classifies into three groups the changes that called for a transformation of the European economy:

First, the revolutionary character of technological changes that had been proceeding since the turn of the century and had been accelerated during the war called for a second revolution in the organisation of agriculture, industry, distribution and the economic system as a whole.

Second, the relationship of Europe with the rest of the world had altered drastically and the world overseas was becoming more independent of Europe as a source of supply of manufactures and especially of some traditional types of export products. This change in

the international setting of the European economy could be seen in a stagnation in the volume of world trade, a change in the commodity composition of this trade and an increase in the competition from overseas industrial powers. All these were in marked contrast to the trends in operation during the preceding decades.

Third, the centre of population growth shifted to the east and south of Europe. The countries in these regions being under-developed, "could not be expected to supply from their own resources the capital needed for their industrialization without great hardship to the consumer". With declining emigration, "the problem arose of combining capital and technical skill from the more developed parts of Europe with man-power from the less developed European countries". This problem was, therefore, of a regional character, complicated by the need for adjustment to new national frontiers. It was in the east, where population growth was now most rapid, that the greatest territorial changes had taken place. These new national frontiers meant that natural resources such as coal, oil and hydro-power were split up in a new way amongst a large number of countries. Also "complementary industries, which had arisen as integrated parts of large economies, had now to be adjusted to a new and narrower national framework".

The report considers that the "long-term trends in this period can be regarded as largely determined on the one hand by adjustments which were a result of these changes, and on the other by the obstacles to a rapid and complete adjustment to the new conditions of economic growth".

That the obstacles were not in fact overcome in many cases is quite evident. The resistance of old capital to modernisation, the influence of reduced rate of growth on the establishment of the new industries necessitated by the new pattern of world trade, and in particular the difficulties of the textile industries,—all hampered the process of transformation. The failure to bring about a rapid transformation "must evidently have tended to reinforce the stagnation tendencies in European production". But this, in turn, tended to reinforce factors that caused further stagnation. Thus the author finds "a closed circle of causal relations leading from European stagnation *via* the volume of

demand for primary goods, their terms of trade, the industrialization of less-developed countries and the demand for various types of manufactures back to the rate of growth of European economy".

The existence of a "dollar" problem was hidden in this situation. It took the form of a general weakening of the balance of payments, resulting in a "disintegration" of the European economy through the defensive steps to meet the situation taken by the different countries.

The national frontier-cum-population problem needed a far-reaching change in economic policies. In fact, "a more far-reaching division of labour between the countries of Europe could have taken place only if the big countries which still dominated the European economy had also adapted themselves to the altered circumstances". Their inability or unwillingness to do so encouraged economic nationalism on the part of the smaller countries, some of which managed to expand through the medium of autarchic policies whilst others stagnated or contracted in turn, strengthening the general tendency towards stagnation in the European economy.

Having posed the problem of transformation and shown how far the countries failed to solve it, the study proceeds to show how this failure reacted upon and, in turn, was reacted upon by other forces tending towards growth and stagnation.

Pursuing this analysis, Prof Svennilson proceeds to a more detailed survey of actual developments in Europe during this period, the main findings of which are summarised in a separate chapter. There is also a detailed study of "Population, Industrialization and Urban Settlement". Some of the conclusions of this chapter should occasion considerable thought here in India today where the problems are similar to those faced by eastern and south-eastern Europe during the inter-war years—a growing population but low incomes, and hence inability to overcome stagnation tendencies rapidly. In view of the important place that agriculture continued to occupy in the European economy, and in particular, the sharp shift in the terms of trade against agricultural commodities, a careful analysis is attempted of "The Agricultural Background". The central place in industrial development occupied by energy in its various forms finds a

recognition in a chapter on its uses in the region. A separate chapter is devoted to the steel industry, which is studied in the light of long-term changes in steel output and exports. "Other industries" covered in a separate chapter are cotton, rail and road transport, motor industry, ship building, cement and the chemical industry. A detailed study of "Structural Changes in Europe's International Trade" is followed by an analysis of the "Main Elements in National Growth". This last chapter makes a statistical study of the growth of output, investment and exports together with a comparative study of their inter-relationships.

It is clear that only more thorough country-wise and industry-wise studies can fill in the details of the picture that emerges from the discussion and Prof Svennilson does not claim to have drawn a complete picture. The wider implications of the changes in Europe also can be grasped only when a more comprehensive study of world economic changes is made. But the broad pattern that emerges is adequate to justify the theoretical technique employed in the study. The author has himself admitted the need for caution in the acceptance of the theoretical framework as adequate for use in all circumstances. Even for the more limited purpose in hand of explaining economic development in the European economy, it suffers from the disadvantage inherent in singling out important factors or forces as being significant enough for the purpose. Frequently, the aggregate action of a large number of apparently unimportant factors may prove to be sufficient to cause otherwise unexplainable changes. They may, thus, explain why countries in apparently similar circumstances have travelled along different paths.

Nevertheless, Prof Svennilson has done pioneering work. The very character of the problems that he has studied, the wide area and the variety of economies that he has covered make it impossible to go into greater detail. That from a mass of details and conflicting facts he has been able to select the most significant elements and draw a coherent picture is a credit-worthy achievement. Further work will no doubt have to be done. The conclusions of the present study will have to be integrated, for instance, with those of other work, such as the study of development problems in Southern Europe contained in the *Economic Survey of Europe for*

1953. The major task has, however, been completed by the publication of this volume.

The theory of long-term development built up by Prof Svennilson should help us understand the present problems of Europe also, for if that theory assisted in explaining development in the past, it should be able to analyse the present and show what policy is necessary for the future. It should also be of assistance in understanding the problems of those countries which are on the threshold of economic development. Prof Svennilson's work in that respect stands on a par with the work of Nurkse and other economists who have presented their thoughts on problems of development in recent years. This is so, even though that has not been his objective. Indeed Prof Svennilson's work is the more interesting because it is presented in the context of concrete problems.

The ECE has been carrying out a large number of research studies in European problems. The present work was entrusted to an independent expert, Prof Ingvar Svennilson of the University of Stockholm and was financed by the Rockefeller Foundation.

The Story of the Indian Press

Reba Chaudhuri

(Continued from page 292 of issue dated February 26, 1955)

ABOUT this time two dominating personalities appeared on the scene—James Silk Buckingham and Raja Ram Mohan Roy, —who were destined to play a significant part in the fight for the freedom of the Press. Both attracted the staunchest supporters from among their countrymen and at the same time provoked the bitterest antagonisms. Buckingham edited his paper, *Calcutta Journal*, fearlessly till 1823 when he was deported. Raja Ram Mohan's incursion into journalism was only to propagate the truth and have it tested in the light of discussion. His conception of freedom of the Press was freedom to pursue the truth and to evolve a way of life proved by the test of reason.

VIEWED WITH FEAR

Raja Ram Mohan's paper and the progressive Indian Press were viewed with apprehension in official circles, while newspapers which favoured the orthodox point of view did not attract the same measure of hostile attention. Almost simultaneously with Raja Ram Mohan's newspaper, a powerful orthodox Hindu Press came into being which opposed social and religious reforms at every stage throughout the nineteenth century. James Silk Buckingham, more than any other single person, by a tireless campaign against the restrictions and censorship imposed on the Press, convinced many eminent minds in England and in India of the useful function which a free press could perform by an exposure of the lapses of the administration and by criticising its policies. Governor-General John Adam passed an ordinance in December 1823 which required that all matters to be printed in a press or to be published thereafter, except shipping intelligence, etc, should be printed and published under a licence from the Governor-General in Council. The application for a licence should give all the details regarding printer, publisher, proprietor, etc. Among the newspapers whose writings were cited in justification of these regulations was Ram Mohan's *Mirat-il-Akbar*. The paper was restrained in its language and constructive in criticism, but dealt with a variety of subjects including

social and administrative evils and critically examined the British policy both in India and Ireland. With the extinction of *Calcutta Journal*, the *John Bull* and *Hurkara* took up the controversy of the freedom of Press.

LORD BENTINCK'S ENCOURAGEMENT

John Adam's regulations were the fore-runner of the Vernacular Press Act of 1878 which both in conception and its application drew a clear distinction between the two sections of the Press. Following the Press regulations, the Indian-owned Indian language papers seemed to have kept clear of political topics for about seven years. In July 1824, C J Fair, Editor of the Bombay Gazette, was hauled up for casting aspersions on the Supreme Court and asked to furnish a security of Rs 20,000. As he was unable to do so, he was deported. During this period, though liberal concessions were allowed to papers published by the Serampore missionaries, only nominal concessions were given to Indian-owned Indian language newspapers. Lord Bentinck's assumption of Governor-Generalship was marked by a significant change in the attitude of the Government towards the Press in general and the Indian language Press in particular. Bentinck saw the obvious advantage of newspapers published in Indian languages pursuing freely social controversies, and of generally relaxing the restrictions on all sections of the Press in the interest of efficient administration. He extended facilities to newspapers, and between 1831-1833, nineteen newspapers came into existence. A noteworthy development at this time was that both Bengal and Bombay started official gazettes, the Bombay Government Gazette and the Calcutta Gazette. In Madras about this time two newspapers were started, one in Tamil and the other in Telugu. In N W Provinces, a Hindi journal and an Urdu journal were successfully launched under Government patronage.

In 1867, an act for the regulation of printing presses and newspapers, for the preservation of copies of books printed in British India and for the regulation of these was passed to replace the Metcalfe Act XI of 1835. In this Act were incorporated all the provisions of the Metcalfe Act which

dealt with printing presses and newspapers and later came to be known as 'The Press and Registration of Books Act'. After this it was amended by Act X of 1890 and by Acts III and X of 1914 and it was further modified in 1952 and 1953.

VERNACULAR PRESS ACT

Meanwhile, Government was becoming increasingly uneasy about the attitude of the Press generally and its relation with Government. It was particularly apprehensive of the Indian language press as preparations for the rebellion of 1857 were made with the use of seemingly harmless words and symbols. In 1878, the Vernacular Press Act was passed with a view to having better control over newspapers published in Indian languages, in spite of the representation made from all the Indian presses concerned. A deputation on behalf of the Indian Press Association waited upon the Viceroy under the leadership of Surendranath Banerjee. But it was all in vain. The gagging Act of 1857 was a much milder piece of legislation than the Press Act of 1878.

The Vernacular Press Act was repealed in December 1881 under the enlightened regime of Lord Ripon. The Nationalist movement since 1883 gave an impetus to the development of the Press in India. As a matter of fact, it is very difficult to distinguish the development of the Press and important events in this respect from the crucial events and developments of the Nationalist movement.

A number of Press Laws and restrictions were enforced and placed on the statute book from time to time. After the establishment of the Indian National Congress, there were sections 124A and 153A of the Penal Code enacted in 1898. There was also section 565 of the Indian Penal Code. Four new measures were enacted between 1908-1913, namely, the Newspapers (Incitement to Offences) Act of 1908, the Press Act of 1910, the Prevention of Seditious Meetings Act of 1911 and the Criminal Law Amendment Act of 1908. There was also the Official Secrets Act as amended in 1903.

DEFENCE OF INDIA ACT

In 1914 the enactment of the Defence of India Act added to the restrictions imposed on the Press.

The Press Association of India in a memorandum on the operation of the Press Act of 1910 stated that nearly 1,000 papers had been prosecuted under the Act. The total amount of securities and forfeitures which went into the hands of Government during the first five years of the Act was nearly Rs 5 lakhs according to another official return made in 1918. Over 500 publications were proscribed under the Act. The Defence Act Rules in India were not merely used for war purposes, but also for all political purposes so as to carry out the policy of the Indian Government in regard to repression of political agitation or free public criticism of its normal acts and methods of administration in India.

PRESS EMERGENCY ACT 1931

When Gandhiji started his Salt Satyagraha in March 1930, the peace between the Press and Government, which had been maintained for nine years, snapped. A Press Ordinance was issued, reproducing the stringent provisions of the repealed Press Act of 1910, on January 4, 1932. Simultaneously with Gandhiji's arrest, the earlier Press Act of 1930 was amplified in the form of the Criminal Law Amendment Act of 1932. The struggle for freedom passed through many vicissitudes between 1932 and 1946. There were intervals, though brief, of understanding between Government and the Congress. Throughout this period, however, the Press Emergency Act of 1931 remained in force and was applied with greater or less severity according to political circumstances. The record of prosecution in the 15-year period exceeded the one under the 1910 Act. Well over a 1,000 newspapers were victimised in Bombay, Bengal, Delhi, Madras, Punjab and UP.

WORLD WAR II

When World War II broke out in 1939, the Government of India under the Defence of India Act armed itself with the power of pre-censorship of material published in the Press relating to certain matters. The penalty of imprisonment was extended to five years; the Official Secrets Act was amended to provide a maximum penalty of death or transportation for the publication of information likely to be of use to the enemy. The Press Emergency Powers Act was also similarly amended. When Congress adopted the 'Quit India' resolution in 1942, a fresh notification was issued under Rule 41 of the Defence of India Act. Defence of India Rules directly aimed

at the suppression of all news relating to Congress activities. The notification was withdrawn after consultation with the All-India Newspaper Editors' Conference which gave an assurance that newspapers would observe certain voluntary restraints in the matter of publication of news regarding the 'Quit India' movement organised by the Congress.

An account of the development of the Press would be incomplete without a reference to unauthorised and cyclostyled news-sheets which were circulated from time to time. Some were published when press restrictions resulted either in the closing down of newspapers or in newspapers being compelled to exclude the news of the national movement from their columns, while others were underground publications even in normal times. At one time, instructions were communicated by means of writings on walls and streets. In 1930, the promulgation of a Press Ordinance made the printing of Gandhiji's Young India impossible, and it was issued in cyclostyled sheets.

When in September 1946, a popular interim Government was installed at the Centre, almost immediately, the extensive powers for the control of the Press assumed by the Government of India under the Defence of India Rules came to an end. However, in 1946-47 many of the Provincial Governments were compelled to resort to Ordinances to bring the communal situation under control. These Ordinances were subsequently replaced by emergency legislation by the Provincial Governments.

PRESS LAWS ENQUIRY

In March 1947, the Government of India appointed an enquiry committee to report on Press Laws in force in the country. The committee made certain recommendations. The more important of them are:

- (1) The repeal of Indian States Protection against Disaffection Act, 1922, and the Indian States Protection Act, 1934.
- (2) The repeal of the Indian Press (Emergency Powers) Act, 1931.
- (3) The repeal of Foreign Relations Act and the enactment in its place of a more comprehensive measure on the basis of reciprocity.
- (4) The modification of section 124A of the IPC and the exclusion, by explanation, of the application of section 153A, to the advocacy of peaceful change in the socio-economic order.
- (5) Section 144 of the Criminal

THE ECONOMIC WEEKLY

Procedure Code should not be applied to the Press.

(6) All action taken against the Press in the exercise of emergency powers should be preceded by consultation between the Provincial Governments and Press Advisory Committees or similar bodies.

THE PRESS UNDER THE CONSTITUTION

With the adoption of the Constitution in January 1950, the Government of India was confronted with a new set of problems in regard to the Press. Certain newspapers against which action had been taken successfully appealed to the High Court and the Supreme Court which overruled the action of the Executive on the ground that they were ultra vires of Article XIX (2) of the Constitution. This Article laid down that 'Nothing in the sub-clause (a) of clause 1 of the Article (which guaranteed the right of freedom of speech and expression to all citizens) shall affect the operation of any existing law in so far as it related to, or prevent the State from making any law regarding, libel, slander, defamation, contempt of court or any matter, which offends against decency or morality or which undermines the security of, or tends to overthrow, the State'. The Government of India amended Article XIX of the Constitution in the face of the strong opposition of the All-India Newspapers Conference. The same year the Press Objectionable Matters Act was passed.

NEWS AGENCIES

When the Vernacular Press Act was passed in 1878, a Press Commissioner was appointed to give information to the English-owned and edited Press. His function was later widened to enable him to deal with the language Press too. Some of the English language papers like the Statesman, Englishman and Indian Daily News pooled their resources together and brought into being the Associated Press of India with Buck and Coates as its first directors. As K C Roy was refused a directorship, he formed a rival organisation, the Press Bureau, together with Shri Usha Nath Sen. Roy's genius threatened to develop the Press Bureau into a serious rival, and he was offered a directorship on the Associated Press of India. The influence of K C Roy in the development of the modern Indian newspaper has been tremendous. Though he was never an editor, his genius for the shaping of news have proved a more potent factor in bringing Indian journalism up to date according to Western notions than that of any

THE ECONOMIC WEEKLY

editor in the previous four decades. In 1913 K C Roy started the Indian News Agency—a news bulletin of about two typed pages foolscap supplied at the rate of Rs 60 per copy to leading civil and military officials. The Indian News Agency continued till 1947.

The Reuters Agency was started by Julius Reuter as a carrier-pigeon service on the continent and it developed into a telegraphic news service based on London in 1858. On matters relating to India and the service to and from India, Reuters was subject to strong official influence both in London and in Delhi. The Associated Press of India was later on taken over by Reuters, which was essentially a British concern. Reuters and the Associated Press were very much under official control. The news of non-co-operation and civil disobedience was kept down to the barest minimum in the early 'twenties, and eminent Indians in politics and business felt that on controversial matters like the rupee ratio, etc, their views were not adequately carried to London, and this led to the establishment of the Free Press of India News Agency.

In 1933 the United Press of India News Agency was started in Calcutta by Shri B Sen Gupta. In 1948 the newspapers in India joined hands and formed the Press Trust of India with the object of establishing a co-operatively-owned internal news agency.

There are at present two news services operating in India on a country-wide basis, the Press Trust of India which subscribes to Reuters World Service and the United Press Trust of India which, by an agreement with the Agence France Presse, gives a service of foreign news to its subscribers in India.

The first press association was formed in 1891, after proceedings had been instituted against the Bengali newspaper Bangabasi with the object of "improving the tone of the native Press and preserving moderation in the discussion of public questions". In 1915, five years after the rigorous enforcement of the Press Act of 1910 despite individual protests by political leaders and newspaper editors, the Press Association of India was formed for the defence of the interests of the Press in general, and protection against undue encroachment upon its liberties by legislation and executive action. In the early 'twenties, a number of journalists' associations were formed at the principal centres of newspaper production, notably in Bombay and Calcutta.

After long negotiation, the Indian and Eastern Newspaper Society was

formed in 1939, to act as a central organisation of the Press of India, and to promote and safeguard common business interests. Independent of the Indian and Eastern Newspaper Society, but nevertheless from it, developed the All-India Newspaper Editors' Conference in 1940. The All-India Newspaper Editors' Conference was an outcome of the efforts of some members of the Indian and Eastern Newspaper Society who were alarmed by the comprehensive pre-censorship order in respect of news relating to the Satyagraha movement passed by Government in the closing months of 1940. The Indian Federation of Working Journalists came into existence in October 29, 1950. The Federation has also kept a vigilant eye on all matters affecting the rights of the Press and of working journalists.

A perusal of this report leads one to the conclusion that the Indian Press is today subjected to more stringent Press regulations than it was in pre-Independence days, bar-

ring, of course, the war periods. In a free and democratic country, why should such restrictions be imposed on the Press in the name of safeguarding the infant democracy, when the existence of a vigorous and independent Fourth Estate is the real guarantor of a true democracy? At times one feels that these stringent Press regulations are promulgated with a view to safeguarding the interests of the present administrators. To quote Ratnavali, an old newspaper of Bengal, "The King of England is not in charge of government; the people make a king of their own, as in Bengal an earthen pot is put up and worshipped." In the same way, the present administrators of the country are not in charge of government, but are put up there by the people of India and as such they must not try to stifle the popular voice by introducing various Press regulations in the name of safeguarding the interests of the people.

You probably haven't got any weak spots in your lubrication arrangements—but it's always nice to be sure, especially when it doesn't cost you anything. Burmah-Shell Technical Service can do this for you, and you can rely on our engineers to trace weak spots before they become trouble spots... trouble spots before they become danger spots.

how to find

Not only that—very often they can help you cut down your lubrication bill. Our people spent a fortnight recently at a mine. After a thorough survey they found that by oil

a weak spot

reclamation, regular schedules and operator training, a reduction of 10% in the consumption of lubricants could be achieved. That's the sort of thing that any factory manager would like to know.

Ring up your nearest Burmah-Shell office and ask for the Technical Service Department. You will find that their advice is freely given and that they are very sound people to deal with.

BURMAH-SHELL...

IN INDIA'S LIFE AND EVERY MOVING PART OF IT

A Typical Deshmukh Budget

(Contributed)

THE budget presented to Parliament on February 28 by Shri Chintaman Deshmukh has had on the whole, outside the stock exchanges, an unfavourable reaction. The increase of nearly Rs 38 crores (over revised estimates) in excise duties compared to an increase of less than Rs 8 crores in corporation and income-taxes, makes it naturally unwelcome to the people. To the economist, an uncovered deficit of Rs 318 crores, to be financed entirely by borrowings from the Reserve Bank, cannot but cause acute concern. At the same time, he cannot help feeling that if the real effort of government falls short of what is indicated by the increase in the volume of central expenditure from Rs 940 crores (revised estimates for 1954-55) to Rs 1,131 crores for 1955-56—the revenue and capital accounts taken together—the economy may face a severe recession. As usual, the economists are divided and their influence on the budget, whether inside or outside the government must from its content be judged as negligible. The most disappointed, however, will be the intellectual socialists who expected that in accordance with the Avadi Resolution and the post-China statements of Pandit Nehru, a first step, however small, might be taken towards a socialist reorientation of fiscal policy. These expectations were, however, bound to be disappointed for they were based on an unrealistic appraisal of the philosophy of the civil service, which has sized up its new political masters and permits them to shout slogans provided they do not disturb the real equilibrium of power.

POLITICAL FRAMEWORK OF FISCAL POLICY

A fiscal policy has to operate within a given political framework. In this framework, the civil service constitutes the sovereign authority. Its ideas and its economics count, not the techniques of the economists, nor the wishes of the people. Shri Chintaman Deshmukh, though a member of the Cabinet and also of the Congress Party, is really the head of the civil service. The rule of the civil service is that everything must be routinised. In fact, from a broad point of view, given the Five-Year Plan and the Report of the Taxation Enquiry Committee as the

major premises, Deshmukh's budget proposals follow almost like the conclusion of a syllogism. Even the Report of the Taxation Enquiry Commission was not needed to cover the wide extension of the excises. The Five-Year Plan calculations were enough to give us the desired level of expenditure and the gap to be covered by resort to central bank finance. Given a summary of the Five-Year Plan, any one could have drawn up Shri Deshmukh's budget a year ago. It is the budget of an accountant and not that of an economist. Despite all this talk about the philosophy of the Five-Year Plan, it is not yet sufficiently realised in the Ministry of Finance that the budget is not merely a fiscal operation with implied monetary reactions, but a framework within which the mass of the people will earn and spend their incomes, seek gainful employment and contribute towards the productivity of the economic machine.

SATISFACTORY TO WHOM?

Shri Deshmukh described the economic conditions during 1954 as generally satisfactory. For whom were they satisfactory, except for speculators in the stock-exchanges, where values went up over the year by over ten per cent? The economic conditions could not be described as satisfactory to the agriculturists, who made a massive contribution to agricultural production but were rewarded according to economic principles by lower prices. The increases in the output of the principal industries—cotton textiles, cement and steel—were in fact very slight. An additional two hundred million yards of cloth (offset by larger exports) for a population now approaching 400 million is negligible by any standard. The only real and substantial improvement in the supply position is in the agricultural sector. However, welcome, it is not due to the economic craftsmanship of Shri Chintaman Deshmukh. In fact the tempo of industrial development has been slow—rather too slow—that was the very considered judgment of the IMF Mission which visited us not long ago.

PASSIVE REACTION

As for the downward adjustment in the price level, to which the Finance Minister referred, Govern-

ment's policy decisions have a tendency to wait on developments. The Ministry of Finance has not yet developed the fiscal mechanism as an active stabilizer of prices. The increase in money supply due to the expansionary factors in the domestic situation has been more or less a passive reaction of central banking authorities rather than part of an active and rational policy.

The broad stability in the balance of payments is also more a fortuitous result of the variations in the prices of internationally traded commodities and in their demand and supply position than of any calculated move on the part of Government. In fact, in the Five-Year Plan, the absorptive capacity of the economy was to be increased by a planned deficit in the balance of payments, which was to increase, as the tempo of planned expenditure went up.

CALCULATIONS GONE WRONG

The course of events has been entirely different. While it is true that the economic situation has improved, it is also true that all the economic calculations of the Plan have gone wrong. The budgets that Shri Chintaman Deshmukh has been presenting to Parliament during all these years are, therefore, a mere jugglery of figures. The improvement in the economic situation is more due to the automatic working of economic forces internally and externally—more due to *laissez-faire* than to planning. In spite of all the improvement that has taken place, however, the economic situation can hardly be described as satisfactory with growing unemployment. The Finance Minister himself confessed to a possible deterioration in the employment situation, though he tried to take cover behind the qualitative and quantitative indeterminacy of the problem. Government is yet in the stage of diagnosing the problem. We shall surely find the remedy after the patient is dead. It does not seem to be sufficiently realised that the future of democratic processes is at stake with the persistence of large scale unemployment.

SERIOUS SHORTCOMING

A serious shortcoming in the Finance Minister's survey of the economic situation was the failure to take note of the persistence of high

rates of interest. With the call money rate at Bombay at $2\frac{1}{2}$ per cent and at Calcutta at 3 per cent, the *bazar* rates for *bona fide* business would certainly be prohibitive. It may well be asked whether there is an intimate connection between the raising of the bank rate in 1951 and the subsequent persistence of high rates of interest and increase in the volume of unemployment and speculative activity.

With regard to the future, which the Finance Minister did not go into, it might be safely concluded that the assumption underlying the budget proposals, with an uncovered deficit of Rs 318 crores, is that the supply position would continue to be satisfactory. Yet the preliminary forecasts for foodgrains that are available indicate broadly that we may not be favoured with bumper supplies as during the last two years or so. The fall in acreage under the principal foodgrains compared to the previous year, as shown by the first forecast for 1954-55 given below may show which way the wind is blowing:

Rice	-7.7
Jowar	-2.4
Bajra	-5.5

Another fact that we might consider in judging the budget proposals is that the registered unemployed with employment exchanges, who constitute only a fraction of the vast number of unemployed in this country, have recently passed the all-time peak-level of six lakhs.

A BROAD SURVEY

With this background, we may attempt a broad survey of the overall fiscal estimates for the year that will end this month and the budget year which commences on April 1, 1955. The following summary table gives a picture of the Union Government's budget on revenue and capital accounts for the current (1954-55) and budget (1955-56) years.

(In crores of rupees)

	1954-55	1954-55	1955-56
	Budget	Revised	Budget
Revenue Account:			
Revenue	451.7	451.1	490.5
Expenditure	467.1	456.1	498.9
Deficit	15.4	5.0	8.5
Capital Account:			
Receipts	433.1	501.5	662.7
Disbursements	406.6	484.1	632.4
Surplus	26.5	17.5	30.2

Surplus on capital account (and in fact, a large part of the receipts on capital account) is a managed

surplus with treasury bills as the main filler and an entirely guess figure for market loans. For the current year, the Finance Minister had taken credit for Rs 78 crores on account of new loans; the revised estimates come to over Rs 160 crores mainly on account of the success of the $3\frac{1}{2}$ per cent National Plan Loan, 1964. The next budget assumes a new market loan of Rs 125 crores, but its floatation will depend upon conditions in the capital market. But to these and other details of the capital account, we shall come back later. Two facts stand out, one, of course, fortuitous but historic—coincidence of the budget and revised estimates for receipts on revenue account; and the other, material and substantial—the extraordinary increase in the volume of Central expenditure. Taken along with the increase in the expenditure of State Governments, it may well amount to a very sizable figure, and be not without its impact on levels of economic activity. A third important factor—popularly known as deficit financing—which is not clear from the summary table given above, will also be an important causal factor affecting levels of activity, incomes, employment, prices, etc.

A WARNING

While we should all welcome a continuing state of buoyancy in the economy, particularly if it is to be associated with a larger volume of employment and production, it is almost universally agreed (outside the stock exchanges) that deficit financing is the least satisfactory method of stimulating the economy. The IMF Mission and the Taxation Enquiry Commission have both warned against resort to deficit financing on any scale. It is against this background that the new taxation proposals of the Finance Minister must be judged. Taken all in all, they cover less than Rs 22 crores out of the overall deficit of Rs 318 crores. Out of these Rs 22 crores, Rs 5 crores are to be obtained from the enhanced excise duty on sugar and Rs 9 crores from the higher duty on cloth; Rs 4 crores from new excises through the levy of a duty of ten per cent *ad valorem* on woollen fabrics, sewing machines, electric fans, bulbs, batteries, paper, paints and varnishes; slight alterations in the income-tax and adjustments in earned income relief and super tax may well bring another Rs 8 to 9 crores. There are other adjustments also such as raising of the tax exemption slab from Rs 1,500

THE ECONOMIC WEEKLY

to Rs 2,000 for married persons; but these are quantitatively unimportant.

These new tax proposals cannot be judged on theoretical grounds. The Finance Minister has sought a justification for these proposals in the Report of the Taxation Enquiry Commission. Fortunately or unfortunately, the voluminous reports of the Commission are like Adam Smith's *Wealth of Nations*, on which another Finance Minister, with a different philosophy, might well have reversed the relative proportions of income-tax and excise duties in his budget proposals. It is true that the Taxation Enquiry Commission has proposed an extension both of indirect as well as direct taxation, but its broad approach can well be judged from its radical recommendation of a ceiling on incomes, which has to be secured of course by stages and after careful thought. At least, a token beginning could have been made in this direction.

INCAPACITY FOR EXPENDITURE

Against this background, the budget for 1955-56 probably violates the spirit underlying the recommendations of the Taxation Enquiry Commission. The Finance Minister has sought to take away nearly Rs 38 crores (as compared to revised estimates) from the incomes of the people, when he really ought to have added to these incomes. It has, of course, been argued in some quarters that deficit financing is likely to increase the incomes of these classes. This is a point for consideration, though the experience of the War period shows that these deficits go to swell profits and unearned incomes. In any case, the political and economic situation is sufficiently fluid for a suspension of judgment with regard to the main issues involved; and the position may not turn out to be either as good or as bad as is foreshadowed by rival schools of thought, for during the last four years of the Plan, there is one fact that stands out: the incapacity of the Central Government to incur expenditure, as will be seen from the following table of the Central Government's capital outlay:

(In crores of rupees)

	1954-55	Budget	Revised
Industrial development	24.1	15.0	
Aviation	3.3	2.9	
Ports	5.3	3.6	
Civil Works	25.1	15.7	
Defence Capital outlay	17.8	13.1	

THE ECONOMIC WEEKLY

This has been the story throughout the four years of the Plan; the failure of Government in employment-creating investment projects. The Central Government could easily invest in civil works, another Rs 100 crores without a serious draft on foreign exchange or the availability of real scarce resources. Similarly, the country could—though not probably without difficulty in terms of equipment and technical personnel—invest a like amount in defence equipment. So it is not the large deficit that should frighten the people or economists, but the poverty of Government in terms of organization and thinking capacity.

The broad pointers to the amount of deficit financing in this country would be the Reserve Bank's holdings of rupee securities and Central Government balances. Between mid-February 1954 and mid-February 1955, the Reserve Bank's holdings of rupee securities have gone up by only Rs 24 crores and the deposits of the Central Government have gone down by Rs 35 crores. Now, how are these figures to be explained with reference to the deficits indicated in the budget and the provision for treasury bills? The budget for the current year took a credit of Rs 250 crores for treasury bills. The actual increase is now estimated at Rs 220 crores. The total outstanding Government of India treasury bills on March 31, 1954 was Rs 335 crores. By February 18, 1955, the figure rose to Rs 387 crores—an increase of Rs 52 crores. By March 31, 1955, according to budget papers, the outstanding treasury bills will rise to Rs 555 crores, an increase of Rs 168 crores between the 18th of February and the 31st of March 1955. This will presumably be effected by book adjustments with State Governments. If so, the position in respect of the quantum of deficit financing involved appears extremely confused in the papers put out by the Ministry of Finance.

MATERIAL FACTOR

There is further confusion resulting from the fact that the public holds part of the treasury bills. As far as figures are available, such public holdings declined by Rs $3\frac{1}{2}$ crores between March 31 and December 31, 1954, whereas the total outstanding increased by about Rs 15 crores, which means that the Reserve Bank holdings of Government of India treasury bills increased in the first nine months of the

current fiscal year by only Rs 19 crores. Even when considered in the context of a decline in Government balances, it may be asked whether the quantum of deficit financing and the associated increase in money supply are not being materially exaggerated.

These, however, are matters of pure mechanics. The material factor is the immediate and substantial creation of new employment opportunities. To this, it must be confessed, the budget of Shri Chintaman Deshmukh makes no significant contribution.

NEW INDIA STORIES FROM LIFE 2

'My advice saved this boy's future!'

Years ago, I persuaded my good friend and neighbour to take out an insurance policy. He thought I was being fussy, when I brought up the question of his son's education. His son was just six months old then!

Ten years later, my friend was struck down in the prime of life. A sudden heart attack, and he died almost at once. I took over the guardianship of his son.

Today, the boy is studying to be an engineer. The New India Life Assurance Policy his father invested in has paid for his education. And imagine my feelings, for indirectly I had ensured a successful future for the son of my friend.

An insurance policy taken out now
may one day stand
between you and disaster.

Post-Budget Spurt

Wednesday, Evening

STOCK market speculators are intelligent people. They are more conscious of political trends and developments than the voters of Andhra. Unlike Andhra's voters, they never seriously believed in Avadi. They did not sell equities on apprehensions that Congress would be serious in its implementation of a socialistic pattern of economy. Equities were declining since October last because of fears of increased taxation. As budget proposals were less severe than market expectations, equities began to improve after the budget.

It would not be quite right to say that stock markets were not at all afraid of the re-defined Congress aim of ensuring a socialistic pattern of economy. But the budget proposals have removed fears on this account also. Stock markets have interpreted the budget proposals to mean that there is no indication of Congress honouring its pledge to base the economy on a socialistic pattern. This is the second reason why equities have been moving up since the presentation of the budget.

More Indirect Levies

As current discussions on the budget proposals seem to confuse issues, it is necessary to state the facts emphatically. There has been a slight increase in personal income-tax. But, for most of the brackets, this increase is offset by the raised exemption limit and the higher income-tax rebate on life insurance premium. There has been a relative increase in indirect taxation. Increased indirect taxation may impinge harshly on the middle class. But it is now widely conceded that the argument about the retarded investment flow because of the increased burden on the middle class can be exaggerated.

With time available to investors to study, at least, the summary report of the Taxation Enquiry Commission, they are happy to discover that their worst fears have not materialised. Some of the Commission's recommendations have yet to be implemented. But the major suggestions have already been incorporated in the Central budget. And, as it happens with stock markets, equities have been bouncing since the market came to know the actual burdens that are to be imposed on industry and the people.

Once-For-All Relief

On second thoughts, stock markets have realised that the proposed

development rebate is not deferred taxation, but a once-for-all tax rebate against development outlay. This is the British system. And the same system and the principle have been incorporated in the Central budget. There is certainly a difference. And the difference is in favour of industry. This is one of the reasons for the sustained spurt in equities since the budget.

It is, however, arguable that much should not be made of the budget proposal that business losses should be allowed to be carried forward indefinitely. If a business concern is not able to offset its losses within six years, the period of carry-forward now allowed, it is not likely ever to recoup its losses. But in one respect the budget proposal relating to off-setting of losses is good for industry and the investor. It is now proposed that speculative losses should be allowed to be set off against business gains. This is a "bull" point for stock markets.

No Bonus Tax

Clive Street has another special reason to be satisfied with the Central budget. It was drooping because of fears that bonus issues may be taxed. No such proposal has been included in the budget. Clive Street has noted with satisfaction the Taxation Enquiry Commission's remark that no tax should be imposed on bonus issues. It may now be presumed that the applications now pending before the Controller of Capital Issues should be dealt with promptly.

It is not without significance that Tea and Engineering shares have been prominent since the budget. Many tea companies are expected to issue bonus shares. Some engineering companies are also expected to capitalise reserves. There are two possibilities. Those companies which are under-capitalised but do not propose to issue bonus shares will continue to attract the attention of cornerers. It is anticipated that cornering attempts will be revived.

Two Possibilities

Like the first, the second possibility is equally "bullish" for the stock markets. If the companies feel inclined to issue bonus shares, the cornering attempts may be discouraged. Indeed, issuing bonus shares is one of the ways to foil the attempts of cornerers. But it is clear that, in anticipation of a bonus issue,

the share concerned moves up. Whatever be the future trend so far as this market aspect is concerned, Clive Street is secure in the knowledge that it is bound to be "bullish" in its repercussions.

Stocks of Jute Goods

Despite these "bullish" possibilities, Tea shares turned rather flat this week on fears of consumer resistance in Britain. Export auction prices in London have declined in recent weeks. In Calcutta, too, prices have tended to decline in export auctions in the last few weeks. Average export prices have fallen even in the current week. But Calcutta auction reports disclose that export demand is picking up. And, it is the export demand that counts in the long run.

There are reasons why Jute shares remain hesitant. For the second month in succession, stocks of jute goods with the mills in Calcutta show an increase during February. There is, therefore, statistical evidence that jute goods are not being sold as fast as these are being manufactured. Mounting stocks of jute goods have some relation to the current prices for jute goods. Since the release of February stocks data, there has been a slight fall in the prices of jute goods. But it is clear that prices will have to fall much more before demand improves.

(Continued from page 342)
investment-income ratio. Investment could further be increased if the average size of the foreign aid available exceeds 0.5 per cent of the national income.

Because of all these reasons, it does not seem unreasonable to assume that the size of the Plan could be further increased by Rs 500 to Rs 1,000 crores. The magnitude of total investment thus could be anywhere between Rs 6,000 to Rs 7,000 crores.

However, even assuming that the investment-income ratio would not exceed 10 per cent and that the capital-output ratio would be 2, the per capita income would increase by more than 3 per cent per annum and we could have full employment of labour within less than 15 years, assuming that 25 per cent of the total working force is unemployed at present and that the size of the working force increases at an annual rate of 1.25 per cent.

Peculiar Behaviour

Wednesday, Evening

BECAUSE of the Holi festival, no business was transacted on Tuesday and on Wednesday the market was officially closed. Hence the week to be covered is really a short one, from Thursday to Monday.

During the week, steel and cement made further gains on consistent bull support and bear covering. Lower carry forward charges in steel accounted for a sharp rise on Monday when Tata Ordinary touched Rs 243, a new high since September last. Calcutta advices were very firm and Indian Iron also registered a steep rise and touched Rs 35-14.

In the miscellaneous section ACC gained about Rs 7 on continued investment enquiry. Scindia, National Rayon and Premier Construction were steady.

Cotton mill shares, however, remained weak. The high rate of excise duty on cloth proposed in the Budget and discouraging reports of some of the leading mills kept buyers aloof. There were, however, occasional though mild recoveries, following short covering.

Among the latest reports of Cotton mills that have come in, Century show a decline of Rs 10 lakhs in earnings, profits of Standard Mills are also down by a similar amount and that of Gokak by about Rs 2 lakhs. The reports of some of the Ahmedabad Mills, however, are satisfactory. Among them are Arvind, Saraspur and Ashok.

Centurys, however, proved to be an exception. Considerable bull

activity was witnessed in this share, and a prominent broker is reported to be consistently buying up Centurys with the intention of acquiring a grip on them.

Carry forward charges in some of the leading textile shares show that their technical position is very healthy. Any stimulating news can cause a rally. This is very significant since a rumour is already afloat that the excise duty proposed will be reduced.

Among cash scrips, New India met with scattered support on news of excellent business.

On balance, the market is behaving in a rather peculiar fashion. Since mill shares form the majority of those on the stock exchange list, their consistent discouraging behaviour cannot be overlooked.

Any trend either bullish or bearish can only be followed when the market as a whole moves in that particular direction. Since September last, as pointed out in these columns more than once, Textiles have invariably moved in the opposite direction to steels and other shares. This can be seen easily if any of the tables of September or earlier is compared with recent tables. When Tata Ordinaries were around Rs 240 in September, Bombay Dyeing were around Rs 500 and Kohinoors around Rs 345, while currently they are around Rs 470 and Rs 315 respectively. No one expects to see textiles move every time in step with steels, but some sympathetic movement should be there.

* cum-div 8as

† ex-div.

In steels, Calcutta bull operators' grip continues to be strong. As the Budget is out, and the old Bear is still short, the present bulls are in an advantageous position. The old Bear is reported to be short in Tata Ordinary by about 1,25,000 shares and in Indian Irons by about 1,00,000 shares! He is short in the true sense of the word, as he does not have these shares in his possession. All this and the general outlook show signs of further rise; textiles alone are pulling back the market. If for any reason textiles look up, the bullish tempo will gain strength.

Bullion and Cotton

DURING the last fortnight, bullion gained handsomely, especially silver, which touched a new high for many months at Rs 168-4.

Poor stocks, and strong Bull grip by the Calcutta operator made bears nervous and there was hectic short covering. The hope of the bear that the bulls may not pay the margin were shattered when they paid about Rs 50 lakhs. The carry forward charges in silver were Rs 3 against sellers.

Gold section moved up, but the rise was moderate. There is less manipulation in gold. The carry forward charges were about Re 1 against sellers. The tendency is firm, but it is difficult to judge when there is a manipulation.

	23-2-55	9-3-55
	Rs	Rs
Gold Fagan	91-6-0	93-1-6
Silver Fagan	163-1-0	167-14-0

During the fortnight ending 9th, there was a heavy fall in cotton. Excise duty on cloth was the chief reason for the downward tendency. Heavy arrivals in Madhya Pradesh made the bulls nervous and the market lost confidence. The announcement that export of cotton yarn will be allowed did not have any effect as the stipulations for export were very rigid.

Heavy excise duty on cloth kept mills aloof from buying. Weakness in castors further depressed sentiment.

The cotton market is keenly awaiting some Government measure to halt the downward trend in cotton prices.

Price Support in Reverse

DESPITE contradictory statements and a reluctance to commit itself to a general principle of price support, which is understandable when Government does not have the administrative organisation, godown capacity or storage arrangements to give effect to it, there has been no reason so far to doubt that Government is concerned about agricultural prices falling too sharply or too low and that it is also prepared to do what little it can to arrest the fall. A policy of selective and limited support to foodgrain prices has frequently been advertised; whether it has been actually applied in practice or not, is more than one can say. For Shri Ajit Prasad Jain repeated in the Lok Sabha this week also that Government would generally support wheat prices at Rs 10 per maund and that "it was already considering purchase of wheat at that price for specified periods in selected centres in case price declines below that level". The restrictions on wheat movements between the three weak zones, the Northern, Western and Eastern, have now been abolished with the self-same end in view.

In the case of rice, for which the crop has been smaller this year, the wisdom of allowing exports may not be apparent at first sight, but considering the comfortable stock position and the imports from Burma, the priority given to the need for maintaining prices at a reasonable level appears to be justified.

If in the case of food grains, intentions are good but action halting, what is one to say of the commercial crops, where the means adopted have uniformly defeated the good intentions? The same floor price has been retained for sugar cane but whether it will be maintained in practice or not still remains to be seen. To prevent unsaleable stocks from depressing prices, the export of gur has been freely allowed but within a specified date line whereby hangs a tale. It has been done in the case of all oils and oilseeds. Exports have been liberalised, fresh quotas have been announced but whether the liberalisation of exports has achieved the purpose for which it was intended, it is by no means too early to ask. True, considering the handicaps Government has to face in the matter of applying price support on any considerable scale, one may well ask how far it can go without inviting speculators to help themselves. This is broadly true, but not quite.

Delhi no longer wants to trade on its own. It has persuaded itself, nevertheless, that it can succeed in speculation. Its motive has been to keep the market guessing. It claims to know what the surplus in individual oilseeds or oils is, how much of it can go out of the country without disturbing the domestic market. So it switches on the green and red lights as it likes. The consequences have not been favourable for the markets. Prices have slumped instead of being gently supported by a regulated pull from exports. Acting on the principle that speculative support is most effective when it comes in sudden spurts, the Commerce Ministry sets a deadline for exports which is self-defeating for the simple reason that shipping cannot be arranged within the specified time. This does not help to firm up prices. On

Annual Subscription Rs. 24.
Foreign Rs. 27.

the contrary, a sudden rush to contract sales abroad merely brings down foreign prices. Since sales can rarely be put through without freight being booked, nor can they be negotiated successfully until licenses have been issued, withholding of licenses until shipping bills have been obtained and endorsement on shipping bills which are made valid only for 7 days, makes the business of exporting a matter of hit and miss. If price support is the object, less ingenious and more helpful methods are necessary. It is high time that the Commerce Ministry took a look at what it has done and mended its ways.

If in the matter of food grains, the policy is halting, and in the matter of commercial crops, over ingenious, what is one to make out of the following announcement that appeared in the last issue of the Food Bulletin, the official publication of the Food and Agricultural Ministry?

"A trial consignment of 500 tons of American Ghee for which negotiations are taking place between the Indian Government and the US Government, is expected to reach India during July and August. It is understood the financial aspects of the proposed deal are being scrutinized by the Government of India. The Trial consignment is intended for consumption mainly in Bombay, Calcutta and Madras, where cow ghee is sold at high prices because of heavy demand. The imported ghee, which will be the product of cow's milk, is expected to find favour with housewives in these cities. It is understood that the consignment is being offered at concessional rate." The transaction will be on Government-to-Government account, the payment to be made in rupee. The purchase price will remain in India substantially, if not in full, in a special fund to be jointly operated by the Government of India and the Technical Co-operation Mission for expenditure on approved schemes of development within the country.

As regards distribution, the consignment is proposed to be sold in separate lots by Government in public auction, subject to a minimum reserve price. Retail sales will rest with the normal trade channels.

Elsewhere in this issue, in an article entitled, "American Agriculture Surplus and India", the US offer is dismissed as likely to turn out to

be a damp squib. Parliament often behaves like dumb driven cattle. Surely if the above report is correct, it should at least stick up at least for those who keep cattle and help them to feed the cattle.

TEA POWER for industry

'Time study' in industry has shown that better results are achieved by the introduction of rest pauses during work, and rest pauses become more effective if the workers are provided with tea. For tea not only conquers fatigue, it promotes a new power—the tea power—in the worker to work with enhanced vigour and drive.

The Tea Board maintains a free "canteen service" to offer assistance to employers in opening new and reorganising existing canteens for their workers. So far the Board has opened and organised 2057 canteens all over India.

The Fourth Amendment

THE reference of the Constitution (Fourth Amendment) Bill to a Select Committee of Parliament this week has focussed attention on the problems involved in amendment of the Constitution. There are many in the country who are sincerely worried about the readiness of Government to propose such amendments. As the Constitution represents the fundamental law of the land, they consider, quite naturally, that it should not lightly be touched. When four amendments to the Constitution are proposed within such a short period, there is just ground for feeling that the Constitution is being tampered with to suit the convenience of Government. If the American Constitution has had such few amendments during its long life, even though it was not at all comprehensive and could not possibly have taken into consideration many of the circumstances which arose only later, why, it is asked, should it be necessary to make so many changes in the Indian Constitution, which is so comprehensive in its coverage and the framers of which could so easily have visualised all the circumstances that prevail today?

Strange as it may seem, the need for amendment arises from the very comprehensiveness of the Indian Constitution. In the United States, the courts were left free to interpret the Constitution in favour of the expansion of governmental powers in most circumstances by assuming doctrines such as those of police power and eminent domain. As a result, specific amendment of the Constitution became unnecessary, the interpretation given by the judiciary alone being adequate to serve the changing needs of society. Profiting from the experience of the working of the United States Constitution, the Indian Constitution-makers incorporated provisions into the Constitution which were in fact added in the United States only by judicial interpretation. This has resulted in a comprehensive Constitution embodying fully the views of the Constituent Assembly with regard to the powers of the State that follow, for instance, from the doctrine of police power and eminent domain. As these powers are elaborated in the Indian Constitution, the judiciary tends to apply them strictly in relation to the specific provisions and

sees no need evidently to assume the need for additional powers for Government which could otherwise be justifiably derived from general doctrines.

The tendency is in fact to interpret the provisions in the Constitution in favour of the citizen, a tendency which is strengthened by the phraseology of the Constitution. Many of the powers of the State are specified merely as exceptions to the rights of the citizens rather than the other way about. How this view has influenced the decisions of the judiciary can be seen from almost every important judgment of the Supreme Court or the High Court in cases involving interpretation of the Constitution and in particular the Chapter on Fundamental Rights. Thus in his judgment in *D Shrinivas vs Sholapur Spinning & Weaving Co*, referring to the fundamental rights, Justice Mahajan emphasised that "... the purpose of these articles is to declare the fundamental rights possessed by the citizens or other persons residing within the Union rather than to declare the rights of the State as against them." And a little later, in connection with Article 31, he refers to "the comprehensive provisions of the saving clause of the article", evidently as making it unnecessary to except, on any general principle, cases not specified.

The crucial question which arises out of the proposed fourth Amendment, the Bill providing for which has been referred this week to Parliament, is whether it is correct to assert, as Pandit Nehru did in the course of his speech, that "... the ultimate authority to lay down what political or social or economic law we should have is Parliament and Parliament alone; it is not the function of the judiciary to do that." On balance, it has to be admitted that this is so. Ultimate decisions on such matters cannot be permitted to be made in a democracy by a body of people who, however eminent, are unresponsive to the wishes of the people and not responsible to them in any way. Faith in democratic methods of government requires faith in the legislature as representing the people. No doubt there must be sufficient liberty to propagate different views among the people and by

obtaining their support to supplant the existing members of the legislature and the executive. But the legislature must not be bound to the dictates of a judiciary on matters which are essentially matters of policy.

The present amendment is in recognition of this principle but arises out of judicial decisions which have made it very doubtful whether Government would be able to implement programmes in furtherance of its declared policy. The amendments proposed, which relate mainly to Articles 31 and 31-A and 31-B, have been made necessary by the Supreme Court judgment in the *Sholapur Mills* case quoted earlier. The question before the Court related to the interpretation of clauses (1) and (2) of the Article 31 in the light of clause (5) which is a saving clause.

Clause (1) of Article 31 provides that "No person shall be deprived of his property save by authority of law", while clause (2) provides that, "No property ... shall be taken possession of or acquired for public purposes under any law ... unless the law provides for compensation for the property taken possession of. ...". The question was whether the "deprivation" of clause (1) was the same thing as the "taken possession of or acquired" of clause (2) or whether the former term was a genus of which the latter were a species. The Supreme Court held that they were the same thing. The combined effect of clauses (1) and (2) would then be that when a person is to be deprived of his property in any form, it must be (a) by law, (b) for a public purpose and (c) the law must provide compensation and either specify the amount of compensation or the principles on which this was to be determined. In deciding this, the Court relied upon the existence of a saving provision in clause (5), and held that the only exceptions to the operation of clause (2) were provided in this clause. The Court also decided further that where all the incidents of ownership had been acquired, this amounted to the acquiring of ownership itself.

To meet the situation created by this decision which might make nugatory all the legislation for control of industry passed or contem-

plated by the Government, the main change proposed is the addition of clause (2A) which runs as follows:

"where a law does not provide for the transfer of the ownership or right to possession of any property to the State, it shall not be deemed to provide for the compulsory acquisition or requisitioning of property by the State notwithstanding that it deprives any person of his property".

It is interesting to note that none of the amendments makes any provision for rectifying the situation created by the decision in the West Bengal Land and Planning Act

Case by which compensation became a justiciable issue. Though it had originally been proposed that by a suitable amendment it should be made clear that the compensation would not be justiciable, the Bill itself does not contain any such general provision, though the impression appears to be that it does. Pandit Nehru himself in explaining the detailed provisions of the proposed Article 31-A says that this list was "not necessary because once you define that Parliament is going to be the judge of compensation, the manner and quantum of it, it is not necessary to have that

long list." But there is no provision in the Bill by which Parliament or the legislature concerned will have the last word on the question of compensation. The omission is inexplicable.

What has been done is to propose a new Article 31-A, which specifies a long list of subjects relating to which social welfare legislation, which could be challenged, exists, or is on the anvil or is planned, which would not become void notwithstanding the provision of Articles 14, 19 or 31. This article will come into effect retrospectively from the commencement of the Constitution.

Weekly Notes

Mechanisation of Cotton Growing

WHY is cotton always white? Why not red, blue, green, or mauve? Not to speak of plant breeders, even amateur gardeners often produce roses and other flowers in new colours by cross-grafting, cross-fertilisation of pollens and other methods well known even to non-professionals. Yet cotton of a colour other than white has been a *rara avis* and like the blue rose, or the black tulip, coloured cotton appears to have defied the arts of the plant breeder. Much interest was, therefore, aroused at one time when Soviet experimental stations claimed to have produced cotton in different natural colours. Nothing further has been heard about it. The Indian agricultural team which visited the Soviet Union last year saw many things but no cotton of any colour other than white.

What catches people's fancy is not always what is most important, either from the point of view of utility or of science. But is coloured cotton such a *rara avis* after all? In the early days of the khadi movement, brown coloured khadi was very popular as material for kurtas, because it did not have to be washed every day. It looked somewhat like khaki, though its colour, a dull brown, was less dull and more pleasant to the eye than the drab pale brick and sickly green colour of khaki. It was common knowledge in those days—this knowledge was not culled from any scientific literature on the subject—that Comilla in East Bengal used to grow this variety of cotton in limited quantities. This growth, however, was neither natural nor a freak of nature. The green bolls started

white and then turned brown; whether it was a plant disease or some other factor that was responsible for this dis-colouration, only experts who have made a special study of this cotton will be able to say. The result was not unpleasing; but it was nothing very wonderful either. In any case, why bother, since developments in dyeing have reached a stage that should be a despair of the plant breeder? Synthetic dyes, for instance, or even synthetic perfumes, for that matter, can produce results beyond the reach of nature. Coal tar blends can produce perfumes more enchanting than any rose that ever bloomed in Basra.

In their first flush of enthusiasm, Soviet botanists may have thought of many things, but now their agronomists have firmly settled down to mass production and mechanisation. Startling progress has been made, not in growing blue or red cotton, but in growing good cotton, not as good as Egyptian perhaps but as good as or better than American and in growing it in ever larger quantities and in lands where no cotton was grown before. The degree of mechanisation achieved in cotton growing is equally startling; it has, from all accounts, surpassed American techniques. For even today, mechanical pickers in the Southern States have far from replaced hand picking. For many decades, machine pickers have been in use in the States. They have also been constantly improved but they have not yet quite succeeded in producing the trick. Hence the survival of the small farmer, of the employment of agricultural labour on the cotton belt.

Soviet scientists seem to have attacked the problem from a different angle. Instead of trying to further perfect pickers, they set to work on the cotton plant itself, because cotton grows as a shrub, with many branches, and pickers cannot get at all the bolls. Even today the pickers in use on the collective farms do not collect all the bolls; men have to follow the pickers and collect the remaining ones. But the proportion of bolls that the pickers get at is steadily increasing; the cotton plant is being 'trained' to grow without so many branches; and mechanical trimmers are being employed for trimming the plants for the purpose. There are over 30 types of machines at the disposal of cotton growers and cent per cent mechanisation of cultivating, picking, cleaning and drying of cotton is to be introduced in the collective farms in the next two or three years. The pickers this year, a Tass agency message reports, will be able to collect 92 per cent of the mature bolls at one go.

Another device is being introduced on a large scale—square pocket cotton planters, equipped with a pocket making device so that seeds and fertilisers can be simultaneously introduced into the soil. It is useless to go into the statistics, of the hecta-acres on which cotton is being planted and one or other of these devices is being introduced.

Taken together, impacts on the minds of the Indian team of all this mechanisation was impressive. And the members of the team were not so many innocents abroad; some of them had seen cotton growing in

the States not so long ago.

For the Indian cotton grower, needless to say, all this does not mean a thing. His salvation lies in plant breeding and the simpler aids to cultivation.

New Names for Old

INDIA is surely in the throes of a social revolution—and in keeping with the best traditions, it is a permanent revolution. Hardly has the nation completed the all-important task of re-naming towns, streets and by-lanes, removing the stink of alien association, and incidentally reviving considerable popular enthusiasm in geography—hardly has this task been done when a new and more far-reaching transformation appears impending. As in almost all other things, the initiative in this matter also came from the Prime Minister himself. In one of those sudden moments of inspiration that are natural to him, the Prime Minister suggested that he would like to relieve himself of his prefix 'Pandit', as it tended to set him apart from the populace. Few could have suspected at that time the revolutionary potentialities of that little gesture. It was almost forgotten until Shri S N Agarwal leapt into the limelight last week with the self-denying proclamation that he too be allowed to sail under an abbreviated banner. Casteism and all symbols of caste had to go in new India—and could one begin better than by foregoing one's caste honorific? And off into the scrap-heap went another label—Agarwal, a suffix, this time.

Others had been watching the unfolding drama, and among them was Shri T T Krishnamachari who could not but have been feeling a little dull after his return to Delhi. Here was a chance not only to wave the blues away, but also to keep newsmen contented and deal a mortal blow to casteism into the bargain. If newsmen know where to look for news, TT perhaps knows how news is made; and anyway it was not long after Shri Agarwal had set the nation thinking of a new line of sacrifice in these days of tightened belts that Shri TT, not to be outdone in self-abnegation, came out with the hint that a Commerce Minister, by a shorter label like 'T T Krishnan' or even 'T T Krishna', could sound as good, and perhaps a little more businesslike. The ball of anti-caste drive has been set rolling, and one

waits with bated breath to see titans like Shri C Rajagopalachari dwindling to Shri (Raja?) Gopalan or even Shri Raja, (it is, in this particular case, a difficult issue between democracy and the old order) Shri Chintaman Deshmukh to just Shri Chintaman and Shri Govind Vallabh Pant to Shri Govind. Meanwhile, a few like Shri U N Dhebar and Shri S K Patil may blossom into irreconizable entities like Shri Uccharangrai and Shri Sadoba. But that cannot be helped. A revolution has its surprises. Saturnine spirits delight in the thought that revolutions eat up their young—here is cheating history of its unfair prize, by a change of name!

The Logical Conclusion

THE question is if one can rest content with dropping caste suffixes or prefixes. Panditji has been declaiming against parochialism or local patriotism and, of course, against communalism with as much fervour as against casteism. And a number of names, particularly in the South, have topographical tags attached to them which can reasonably be said to provoke feelings of a parochial nature. So the next stage in this revolution over names will naturally have to concern itself with this aspect. Shri Radhakrishnan may have to drop his Sarvapalli and Visvesvaraya not only his 'ayya', but also his Mokshagundam, reducing himself in the process to Shri Visvesvara. While there is much to be said for this process of streamlining on the ground not only of eliminating caste and such other anti-social appellations, but also of economy of expression, convenience

of enunciation and even considerations of grace and beauty, a likely result of it is bound to cause considerable perplexity. With the distinguishing marks of suffix and prefix removed, most of the names will boil down to those of a select pantheon composed of Rama and Krishna and their namesakes.

Again, if the battle against divisive forces is to be waged to its bitter end, may it not be said that most of our names smack of association with a particular creed, be it Hinduism, Islam or Christianity? And can anyone say that communalism is less dangerous than casteism? Indeed, the fact of the matter is that there can be no mere tinkering with names. The shedding of a suffix here or a prefix there may do for a beginning. But sooner or later, there will have to be a wholesale jettisoning of old names and the adoption in their place of new ones that have not the slightest tinge of casteism, parochialism or communalism for that matter—names that are aseptically secular and sufficiently colourless. If one remembers aright, they used to do something like that in Russia in the early years of the revolution, drawing upon the nomenclature of metals and the like for human christening or re-christening. Maybe, we too will have to follow that example. Or maybe, because of the sheer immensity of our population, we shall take refuge in mere numbers, each citizen being honoured with a number in some convenient order on birth. And in one respect at least, that will put us ahead of all other nations in the world, however progressive they might have been in the past and may deem themselves to be at present.

National Income, India and Pakistan

THE Central Statistical Office, Karachi, has published its estimates of National Income of Pakistan for the four years from 1949-50 to 1952-53. The estimates are on the basis of current prices. Presumably because of the difficulties of computing a general price index for the two wings of Pakistan taken together, revaluation of National Income in terms of fixed 1949-50 prices has not been attempted.

Apart from the usual difficulty of computing the money value of income originating from the non-monetised sector, which has an even greater importance in Pakistan than

Wednesday, Evening

in India, the estimates are otherwise also based on incomplete data. Hence only a limited significance can be attached to them. The temptation, therefore, to compare the relative contribution of different sectors to the national income in India and Pakistan should better be resisted. It may only be noted that agriculture contributed during these four years 60 to 61 per cent to the total national income of Pakistan while in India, the share of agriculture is estimated at around 50 per cent. On the other hand, mining and manufactures accounted for 6.0 to 6.7 per cent of the total income in Pakistan while in India, their share has been estimated at 17.3 per cent of the total.

It may also be noted that the income in Pakistan originating from Government increased progressively from Rs 80.8 lakhs in 1949-50 to Rs 104.8 lakhs in 1951-52 and subsequently fell to Rs 103.2 lakhs in 1952-53. Also significant is the increase in the estimated income originating in large scale manufacturing from Rs 107.2 lakhs in 1949-50 to Rs 117.6 lakhs in 1952-53; the contribution of mining similarly increased from Rs 2.13 lakhs to Rs 3.70 lakhs.

A notable feature of these estimates is the marked effect of price

fluctuations on per capita incomes. At current prices, the capita incomes in Pakistan for the four years work out to Rs 225, Rs 226, Rs 239, and Rs 233. If fall in per capita income for 1952, it is to be hoped, was entirely the effect of price change.

The Finance Minister of Government of India gave out in the Lok Sabha last week the latest estimates made by the National Income Unit as follows: the estimated per capita income of India for the years 1951-52, 1952-53 and 1953-54 at current prices was Rs 274.5, Rs 267.4 and Rs 283.9 respectively while the per capita income for these years at 1948-49 prices was Rs 251.7, Rs 258.1 and Rs 266.5 respectively.

In comparing these figures with those of Pakistan, it should be borne in mind that the Pakistani estimates are in terms of the Pakistani rupee. Even so, it is curious that the per capita income in India at current prices registered a fall of Rs 7 between 1951-52, ie, from Rs 274.5 to Rs 267.4, as against a fall of Rs 6 in the per capita income in Pakistan from Rs 239 to Rs 233. General evidence suggests a sharper fall of prices in Pakistan; how then to explain this exactly proportionate fall in money incomes?

Pakistan's National Income by Industrial Origin

LIFE FIRE MARINE ACCIDENT ETC..

Branches throughout India

A MILD sensation was caused here as elsewhere by the Nagpur incident. The Prime Minister has pooh-poohed it, but it has cast some reflection on security arrangements; and there is whispered recollection of that fateful day when a desperado got at Mahatmaji. Of course, Panditji himself is to blame for having risen to power on the wave of popular enthusiasm; and then being personally allergic to all forms of snobbery, he hates security arrangements. But there is great social concern in the preservation of his life. The recent incident has only deepened the affection that the masses bear unto him. They know that he will stand by them in all circumstances and that his party henchmen are only birds of prey and passage.

But what is to be done when a man is cast in the heroic mould? He treats life as a grand adventure in which there is no room for meanness or pettiness. He is the only man who has followed Gandhiji's advice that a Minister—a Prime Minister, particularly—should occupy his chair lightly and not tightly! This was the advice given by the Mahatma to Ministers who met him in 1937 in connection with the acceptance of office under the Government of India Act of 1935. Of all the world's statesmen, including those of the Big Powers, he alone does not care for the highest job in the State. These sentiments come naturally at a time when there has been a foolish attempt to attack him.

INTERESTING SPECTACLE

One realises how much the Prime Minister has come to occupy the stage at Delhi when he is out. Parliament was in fact empty without him. It was like a coffee house at lunch time with a few stragglers talking like ghosts without life in them. With his arrival, the debate became lively and even duds began speaking brilliantly! Before I deal with the Parliamentary debate on amendments to the Constitution, there is a point that occurs to me. I must mention it—lest I miss it—though it reverses the chronological order. When the debate in the Lok Sabha closed on the motion of

the Prime Minister to refer the Constitution (Fourth Amendment) Bill to a Joint Committee of the Houses, it was a sight to see not only Members of the Congress and PSP, but also of the Communist Party walking into what may be called the Prime Minister's lobby. Pandit Nehru has achieved 'Left consolidation', which was the dream of Netaji Subhas Bose.

Now to the debate, which marks a turning point in the social history of this country. Hearing the Prime Minister was an intellectual treat. Whoever said that the Pandit is a defunct lawyer? This is an idiotic remark. Even for a lawyer, he was very good, though he humbly described himself as a layman. He made a masterly analysis of the Constitution and of the functions of the Judiciary and Parliament and described how the whole mechanism had to function in terms of desired social ends. From another angle, the Prime Minister appeared like a craftsman—or should we call him a surgeon?—sharpening his instruments before he commenced his operations? He was sure of his job, the manner of doing it and the end! There was no nonsense about it. But there was deep anxiety in him to carry along with him, as persuasively as possible, but nevertheless powerfully and decisively, all the co-sharers in political life and the whole mechanism of government to a concrete accomplishment of the socialist ideal. He wants to see the Amendments through at the budget session itself. The Joint Committee has been asked to report by March 31.

APOLOGETIC START

The Prime Minister began apologetically, justifying changes in the Constitution, as they were. Flaws had appeared in practice. Now they had had actual experience of the working of government, whereas at the time of drafting the Constitution, they had "the mere theory of it". There was no justification for circulating the Bill to elicit public opinion. The public had already been given full opportunity to consider it. Even with regard to the Select Committee, the Prime Minister made it clear that it was just

formal: "We certainly approach the Select Committee with certain firm opinions of ours in regard to the basic provisions of this amendment to the Constitution. But if any of the suggestions that have been made or that might be made, keep that firm principle intact and improve drafting, then certainly I hope the Select Committee will adopt that" (Italics mine). If we did not know the man, this would appear dictatorial. It really is, but of the Platonic type. In fact, any close analysis of the working of parliamentary life in new India—I have no knowledge of the States, but I am told on good authority that the standards are at most places lower—shows clearly that but for the masterly handling of the Prime Minister, this infant democracy would have, exactly as Plato described it in his Republic, descended into a mobocracy, with the so-called leaders of the people fighting over loaves and fishes.

The Prime Minister said in the course of the debate that the purpose of the Amendment was to restore sovereignty to Parliament in social and economic matters as was the intention of the Constitution and to limit the judiciary to purely judicial functions. He even went further and advised the Supreme Court to fit into the new scheme of things and not to obstruct social change through mere legal quibbling. This is what he clearly meant, though his language was marked by extraordinary courtesy, humility and caution. But he left none in doubt about his attitude: "... the ultimate authority to lay down what political or social or economic law we should have is Parliament and Parliament alone; it is not the function of the judiciary to do that." There was, however, no question of by-passing the Supreme Court. In fact, this very Amendment proved that Government had accepted the Supreme Court's interpretation of the Constitution and it had therefore come to the House for correcting the error in the original draft.

There was no question of expropriation. Compensation would continue to be paid in case of compulsory acquisition, but the manner

and quantum of compensation would be determined finally by the legislature. On the other hand, any alteration, modification or extinguishment of the right of property by regulatory laws, as was actually the case with regard to Sholapur Mills—here, the Prime Minister was rather bitter—was not tantamount to compulsory acquisition and would therefore be differently treated. The Prime Minister then digressed and spoke straight from his heart: "... speaking for myself, I can imagine or conceive of a thing whereby in the case of a slum no compensation might be necessary or desirable." Coming back to the principal point in the debate, the Prime Minister made an important distinction based on the deprivation of property rights in the case of individuals and changes in property rights due to what he called "social engineering".

This is somewhat of an original contribution to economic and political philosophy and to the law of the Constitution itself: "... Now, there are two types. One is compensation to an individual for depriving him of his individual property for a specific purpose. Now, that stands on a separate footing, in my view, from some social scheme, of social reform, some social engineering or the like. ... In the case of normal land acquisition, the normal laws prevail and the normal full compensation is given, but where all this affects a much larger sphere, the social sphere, then we have provided differently. If you are aiming, as I hope, we are aiming—and we repeatedly say we are aiming—at changes in the social structure, then, inevitably, you cannot think in terms of giving what is called full compensation. Why? Well, firstly, because you cannot do it. Secondly, because it would be improper to do it, unjust to do it, and it should not be done even if you can do it ... if we are giving full compensation, well, the 'haves' remain the 'haves', and the 'have-nots' 'have-nots'. ... It cannot be done, if you have to think not only of the type of property, but the history behind it, the social consequences behind it. ... The object is not to expropriate, the object is not to injure anybody; the object is a positive object, to bring about a social change for the benefit of the largest number of people doing the least injury to any group or class."

This is not Marx but Bentham. The Prime Minister then began

quoting from the Directive, but non-justiciable, Principles of the Constitution and pointed out that its very text makes it "the duty of the State to apply these principles in making laws". The Prime Minister referred pointedly to one of these Directive Principles, according to which "the State shall, in particular, direct its policy towards securing that the citizens ... have the right to an adequate means of livelihood." This is the next stage in the socialist millennium of the Prime Minister.

BUDGET DEBATE

The Rajya Sabha has been discussing Shri Deshmukh's Budget. The debate is yet to begin in the Lok Sabha. In replying to the points raised in the Rajya Sabha, Shri Chintaman was more democratic in approach than usual. He was more witty too, though some of the jokes were not edifying. Referring to the charge of the Deputy Leader of the Communist Party that it was a highwayman's budget, Shri Deshmukh remarked that coming as it did from a member of the Communist Party, it almost sounded like a term of appreciation. His references to "loose budgeting" were hardly convincing; and his ideas of balancing only the revenue budget and leaving the capital budget uncovered showed a most superficial acquaintance with Keynesian economics. Probably the Finance Minister has yet had no time to go through the voluminous Report of the Taxation Inquiry Commission, for the Commission has insisted that capital budget too be covered. The distinction between recurring expenditures being financed by current tax proceeds and 'essentially productive expenditure' by loans (from the Central Bank?) is not only archaic, but dangerous.

This is absolutely contrary to the positive recommendations of the Taxation Inquiry Commission. For implementing the Plan, the Commission is of the opinion that the community must be as highly taxed as possible under the circumstances—it is, in fact, too lightly taxed at the moment—and that the only limiting factor could be the adverse effect on capital formation. It recommends new excise and emphasises that the adverse effect of direct taxation on incentives is highly exaggerated. It is really surprising that the Finance Minister should have been at this stage so ignorant

THE ECONOMIC WEEKLY

of the contents of a document which is supposed to guide him in his fiscal policies. But it is a democracy; Shri Chintaman is a member of the Congress Party; and he has ambitions. He has really changed since he joined Government as successor to Dr John Matthai. He was then all for rationalization, particularly in the administration, and orders actually went out for general retrenchment of surplus staff in Government departments. Quite curiously, the Ministry of Home Affairs, with its tradition of the British regime, came to the rescue of the would-be unemployed with the argument that Government would be handing over free recruits to the Communist Party and ultimately the cost of it all might prove to be greater than the economy! So the poor sheep were saved from slaughter.

DIFFERENT LANGUAGE

Now Shri Chintaman speaks a different language: "... we must ... remember that at the present moment, anything that results in retrenchment of surplus staff is likely to create more problems than it solves. I am certain that if an economy committee went into the matter they will find that we are carrying X per cent in the Ministerial and the Class IV staff as surplus. ... I have myself an open mind on the question, but I greatly fear that the result of any inquiry such as that suggested by the Taxation Inquiry Commission, would inevitably be the recommendation for overall cuts in establishment, which would be difficult to implement, particularly in the present context of unemployment." This is all very good, but I cannot help saying that though Shri Chintaman is speaking a different language, his basic philosophy has not changed. And here too, he seems to have missed the real spirit behind the Taxation Inquiry Commission's recommendation of an Expenditure Inquiry Committee. It is not in that mechanical sense that the Commission has criticised public expenditure.

Surplus staff can be looked at from two viewpoints. It may be surplus in an absolute sense, which is absurd, or in a relative sense, which is usually the case. Staff becomes surplus because of the lack of organisational ability. There is plenty of work calling to be done, even as it is. It is clear we require another Nehru at the Ministry of Finance.

THE ECONOMIC WEEKLY

From the London End

The Fate of Mr Bevan

DEVELOPMENTS on the British Labour front are still unfolding themselves and it is likely that by the time this despatch appears in print, some of them would have taken final shape. That an explosion has taken place within the Labour Party, however, is clear. When Mr Attlee presents the frightful choice, as he is reported to have done,—"It's Bevan or me", it does bring to a head the four-year-old dispute in Labour's policy and leadership. To remove for all time the central cause of disunity in the Labour movement would be a drastic surgical operation. That such an operation may kill the Movement is also a possibility, though, of course, it is quite another matter.

To say that the Bevan poser whether the opposition would support thermo-nuclear retaliation in the event of an act of aggression in which only conventional arms were employed, caused the explosion is to simplify the circumstances of the current rupture in the Labour Party. It is unfortunate, as it was confusing to Mr Bevan's supporters, that the issue in the last round of the Commons' defence debate was made to depend on this very poser. Equally unfortunate is the impression given in the popular press that the rupture is the result of "a clash of personalities" in the struggle for the "eventual leadership of the Labour Party." From a very narrow viewpoint, this may be true. But what appears equally true is the fundamental difference between the two groups in the Party on broad questions of policy. In an historical context this group relationship and its corresponding policy differences are nothing less than a reflection of an inner-party struggle for a Right or a Left policy.

The Bevanites are by no means a cohesive group. Their members appear to have been drawn together more by political instinct than by a clear unity of views. In the current rupture, the Bevanites find themselves all over the place: Messrs Crossman and Wigg supporting the Atlantic Alliance; Messrs Freeman and Acland plumping for independence and neutrality and Mr Bevan himself, in the final phase, standing up against thermo-nuclear warfare, but only in a conventional arms war. It is this confusion in the Bevanite ranks that the Shadow Cabinet's resolution hopes to exploit.

Despite differences, however, the

Bevanites do possess an underlying Left policy and it is well to work out what the Left position really amounts to in terms of foreign policy—a field where the group differences take their most extreme form. A re-reading of Mr Bevan's speech in the Commons shows that there is a thesis, which all the other Bevanites repeated in one form or another. At the risk of over-simplification, this thesis could be summarised as follows: The decision to manufacture and possess the H-Bomb is put forward by the Government and the Official Opposition as an instrument of policy—the policy being deterrence. But, says Mr Bevan, the reality of the situation is that the instrument is the policy itself. "Instrument" and "policy" are indistinguishable and to speak of "deterrence" and "positions of strength" is plain political humbug. In other words, the H-Bomb is a matter of foreign policy and not of defence and if that is the case, it must be clear that there can be no basis for negotiations with the Soviet Union. Such a foreign policy is opposed by most of the Bevanites.

This position of the Bevanites, and in particular of Mr Bevan himself, is claimed to be valid on two grounds. In the first place, Britain has become absolutely committed to waging war with nuclear weapons, if war has to be waged at all, in view of her membership in the Atlantic Alliance. This makes British foreign policy less independent and thus less flexible for the pursuit of negotiations, compromise and a settlement with the Soviet Union. Sir Winston Churchill had already intimated the extent to which his plans for high-level talks had been vetoed by the Americans. Secondly, say the Bevanites, the policy of "negotiation through strength" has proved to be worthless because the "instrument" has come to govern "policy". Sir Winston had intimated that America and its allies were stronger than Russia and yet it remains a fact that negotiations have not been carried out.

What, then, is the Bevanite alternative? There can be perceived a common denominator in the varying viewpoints of its members. In an article in the *New Statesman* John Freeman has put the position as follows:

"Mr Bevan says in effect: 'Negotiate with the Russians now, while there is still time'. Cross-

man and Wigg say: 'One supreme effort ... to find a basis for peaceful co-existence'. Here surely is near agreement".

It is "negotiation now" that all the Bevanites want.

What of the Labour Party? It is now clear that the Attlee leadership had hoped for a quick withdrawal of the parliamentary whip on Mr Bevan and thus create a *fait accompli* before the rank and file woke up to the situation. Mr Bevan's indisposition—due to an attack of influenza—had averted this and already some constituency Labour Parties have made representations against the intended expulsion. But from the reported determination of the Attlee leadership to carry out the expulsion, it is clear that only the wholesale rejection of this course and thus of the leadership by the Labour MP's will save the situation.

All the circumstances suggest that the intentions of Labour leadership are thwarted by bad tactical calculations. The General Election is not far-off and the process of expulsion from the Parliamentary Party to the National Conference would subject the Party to unrelenting turmoil for some six months or so. More than that, those who think that expelling Mr Bevan would restore the Party's health reveal "an astonishing ignorance of the rank and file". It appears more likely than not that the crowds will continue to back Mr Bevan against German rearmament and nuclear strategy, whether he is thrown out into the wilderness or not. If Mr Bevan is expelled, will the other Bevanites follow him as Sir Richard Acland has done before being asked? This must remain largely uncertain until the Parliamentary Party meets next week, but, maybe here too Mr Attlee has miscalculated. The words of John Freeman, who left the Labour Government with Mr Bevan in 1951, writing in the *New Statesman*, are potent:

"With the present paralysis of leadership we should be innocent if we believed that the Movement as a whole does not seek guidance and initiative from the Left. And we should be innocent too, if we believed that ... the Left can function without Mr Bevan".

Can this mean that a new political party will arise from the expulsion if carried out?

Is Market Research Worth the Money?

F R Iraqi

THE general scarcity, experienced during the war and post-war years, has long been over and normal economic forces have come into play once again. And with it, competition has become keen, particularly in consumer goods. A new factor has appeared on the scene, since it is now the declared policy of the Government that not only industry, but the products of industry must bear a progressively heavier burden of taxation. Customers had already become selective. So, if business had to adjust itself from a seller's to a buyer's market, today, squeezed in between consumer resistance on the one hand, and the tax gatherer on the other, businessmen will have to think out new ways of meeting the changed and changing situation. In the good old days, one could sell in the days of prosperity, and cut overheads and retrench in times of recession. That won't do any more. The Industrial Tribunal will not let you do it.

Under such conditions what role marketing can play has to be seriously assessed and tested by the Indian business. It is no secret that research, whether social or technical, has not yet acquired its rightful place in the world of Indian business. On the contrary, in many quarters, research is considered as idle luxury, a decorative appendage of big business houses. Expenditure on research, whether on marketing or on techniques, may be gradually allowed when money is flowing in; but it is the first to be pruned the moment prospects turn down.

Again, market research is different from technical research. While the results of technical research, the latest techniques can be 'imported' and applied with little modification, knowledge of internal markets cannot be gained from abroad, at least, not directly. Even the technique and methods of market research have to be modified in order to suit the local conditions. And to be of any use at all, market research must be conducted on the spot.

GETTING THE BASIC FACTS

Can commercial research make any worthwhile contribution to the industry in India? Can industry afford to spend money on it? Would the returns be worth the money? Opinions differ on these questions. Many of our business magnates and founders of big business of today

rely very largely upon a hunch that a particular product would sell and that this or that method would sell it. We have evidence of their success in the continued existence of these businesses but we have few reminiscences of the failure; organizations which failed in their infancy because they were started on a wrong estimate of demand, based on incomplete information, rarely leave behind any visible evidence.

Wherever he operates and in whichever trade he enters, an industrialist requires some basic and reliable information. The most important of these are the size of market, its trend, the relative importance of his product as compared with those of his competitors and the composition of the market by the type of product. No manufacturer can start production without giving due consideration to these facts. Whether he depends on a trained marketing research man for finding out these basic facts or employs his own horse sense, the fact that he does employ the technique of marketing research in one way or the other is indisputable. How thoroughly the market has been surveyed and the prospects for his product analysed will determine the fate of the manufacturer.

REASONABLE CHANCE

In modern business the marketing research represents the difference between a reasonable chance of success on the one hand and unpredictable results on the other. Today, radio manufacturers are faced with a minor slump in the market. The post-independent period witnessed a mushroom growth of radio factories or assemblers; the market was flooded with certain types of radio sets which happened to be in good demand at one time. But now as the supply has exceeded the demand, the manufacturers are left with unsold stocks. They have tried to meet the situation as best as they can by offering enormous discounts and entering into cut throat competition. But can price cuts push up sales? Not beyond a point. And that point is soon reached. The economic condition of consumers has to be considered, their prejudices and preferences. They could have avoided this situation had they analysed the market capacity, position of different competitors and consumer preferences and biases. Forecasting of demand is a tricky business. But with the careful application of research, potentiality

of any product can be estimated to a reasonable extent. The major contribution of marketing research is that it supplies the facts which can help the manufacturer to avoid mistakes, assess the strength of his competitors, know consumer preference and very often prevent considerable sums of money being spent needlessly.

WHAT RESEARCH CAN DO

Marketing research studies the needs and preferences of the users and consumers of merchandise and secures such information which would guide the factory to produce more saleable goods and also investigate market possibilities of the development and improvements suggested by the production department. It studies the market trend and prepares the industry for any change which might be occurring in the pattern of consumption of the population. It also guides distribution and advertising. The greatest contribution of marketing research is that it supplies valuable information of the activities of the competitors. It gives information regarding consumer sale, movement of retail stocks, retailers' purchases and their sources, live distribution in the shops, price discounts and trade displays. Value of such data cannot be overemphasised. Only if the relative position of competitive products is known can the real standing of any product in the market be assessed.

Market research can also be used in export trade to find out what one could make and supply at a price suitable to the consumers of the countries concerned. Study of export markets has its own technique, but it is not very different. If one is conversant with market research in home market, one can adopt the same methods to export fields just as one has to adjust one's products, packages and advertising to those same markets.

A CONTINUOUS STUDY

Marketing research should not be regarded as an once for all investigation, to be conducted only before launching a business or to investigate the undercurrents when sale problems knock on the door. Market research should be accepted as a continuous study. Market trend which forms an important aspect of market study, is dictated by the consumer. There is a continuous shift

in consumption pattern, which is affected by economic conditions, fashion, education and intensive advertising. In order that a manufacturer may not be caught unprepared, a constant eye must be kept on the market trend. For instance, a small team of investigators may be employed to call on shops and take stock of the products they are investigating as well as that of competitors' products. After a couple of months, they should go round again and take details of the stock and invoices. Provided that the sample is accurate, a true picture would be obtained of what is moving into the shops and what is moving out.

NOT OVERWORKED

It is usual for field workers engaged in market research to complain about the non-co-operative attitude of dealers or the public. There is ground for such complaint. To satisfy the curiosity of an investigator is a thankless job. Few would like to be bothered. Many take it as an intrusion on their private life. Some may even suspect the motive of the investigator. But don't we make a great issue of it? From my own experience I can emphatically say that these difficulties can be easily overcome and that they are by no means

peculiar to this country. The right man, with the right attitude and at the right time can certainly win the co-operation of the consumer or the dealer from whomsoever he requires information. Our townfolk have not been pestered over much by market investigators to put them on their guard and there are many who would willingly oblige. Even the returns to mailed questionnaires issued in India are usually much higher than in other countries, despite the free gifts often offered in USA and UK to the party interviewed. Moreover, one or two refusals should not discourage the investigator.

From the standpoint of cost, market research may be considered an expensive item, but certainly it is not a luxury. It is worth the money, since it provides knowledge of a kind which is important to the successful marketing of most products, provided always that the cost is kept within reasonable limits. If it were unprofitable, then obviously so many of the large firms making use of market research would not continue to do so. But it would be wrong to think that market research is a fancy item of expenditure which only big business houses can afford. It is necessary, even for businesses of a modest size.

Companies with crores of rupees can certainly afford to have extensive market research, but whatever the size of the business, market research is necessary in some form or other. Like many business operations it could be elaborate in its sphere of investigation or could be designed on simpler lines that would give the essential information upon which to act with a reasonable degree of assurance. For example, a small firm can select an intelligent girl from amongst the staff, instruct her in the technique of interviewing, supply her with a proper questionnaire and send her out amongst housewives to see what she can find out.

Moreover, many of the advertising concerns engage trained research personnel, who can give such services to their clients. It is for businessmen and advertisers to make proper use of their services. True, advertising consultants may not be able to give continuous service to the clients. But periodic consumer surveys can well be undertaken by them. The small and medium sized manufacturers' organizations may entrust their market research projects to their advertising agencies while big business houses may have their own research department, with trained staff under an expert director.

World Bank Plan for Jamaica

R K Hazari

MANY of the British Colonies have invited World Bank experts to survey their respective economies and draw up a programme of development for them. The latest are Nigeria and British Guiana. A World Bank Mission visited Jamaica during March and April 1952 at the request of the Governor of the Colony. Though it is quite some time that it submitted its report and its 10-year development programme, it is interesting to note that in the general elections held in Jamaica in January this year, the Jamaica Labour Party, the party then in office which, despite its name, is more to the right than the People's National Party which won, fought the election on a programme based largely on the development plan drawn up on the lines recommended by the World Bank Mission. It may be noted that the Jamaica Labour Party which lost the election believes in the encouragement of private enterprise, subject to certain principles and at the same time, it works for an increase in workers' wages, while its opponent, the People's National Party which won, has a comprehensive liberal programme including suggestions for a planned agricultural industry and the first steps towards a welfare state. Both the parties aim at self-government. But that is quite another story.

The first problem that the leader of the People's National Party, Mr Norman Manley, a former Rhodes scholar and distinguished West Indian lawyer, will have to face is the attempt of the Colonial Office to limit the immigration of Jamaicans into Britain. Paradoxically enough, it is the conditions which drive out West Indians from the island which helped the Socialists to defeat the Jamaican Labour Party which is labour only in name. The People's National Party has also a big development programme, particularly for the island's backward and neglected agriculture. But the World Bank programme favouring private enterprise is not likely to find favour with it. This is, however, only by way of introduction. Let us now get down to the report.*

*The Economic Development of Jamaica. Report by a Mission of the International Bank for Reconstruction and Development. Published for the Bank by the Johns Hopkins Press, Baltimore. Pages 288. Price \$5.00.

The report of the World Bank Mission to Jamaica sets out to dispel the gloom that had settled on this largest of the British Caribbean islands, with a density as high as 314 persons per square mile. Jamaica, incidentally, is familiar to demographers as one of the few underdeveloped countries, which has a long record of fairly reliable population data. The island has succeeded in nearly halving its infant mortality rate during the course of this century and has also attained a comparable improvement in the death rate. Famous for her sugar and rum (and rumba), Jamaica's most pressing problem for some time has been chronic unemployment which the IBRD estimated at about 15 to 20 per cent of the labour force. This unemployment is all the more remarkable because nearly half of her farms are between four to twenty-five acres. The Report does not mention how this unemployment has been disguised, nor like other IBRD Reports does it give the historical background to this state of affairs. The present acuteness of the problem is evidently the cumulative result of history, because from 1943 to 1950 the national income has increased at an annual rate of 4 per cent, thus keeping pace with population growth, though admittedly, employment has not expanded *pari passu* with production, due to the small scale of farming and perhaps a little rationalisation in whatever industry that does exist.

The Mission refused to be cowed down by these formidable problems and set great hope by Jamaica's large and diverse agricultural resources, variety of rainfall, satisfactory underground water resources and possibilities of further developing the tourist industry together with bauxite mining. The main solution, it found, lay in agriculture, not in mining or industry. Indeed, the Mission felt that industry had only a limited possibility because of the small size of the home market and relatively high labour costs. It emphasised that productivity needed to be increased in crops produced for the home market, which accounted for two-thirds of the area under cultivation, though sugar and rum made up nearly one-half of exports in 1950 and bananas contributed another 15 per cent. It recommends a

greater use of fertilizer—practically all of which is at present consumed by sugarcane and banana farms, for both crops as well as pasture. Production of fertilizers should not be difficult because the island has large deposits of gypsum and phosphates. To stimulate the growing of livestock, the Mission recommended a programme for the improvement of pastures and a rise in prices of beef. The Report, however, does not explain how the use of fertilizers is to be made economic for home crops. It appears, nevertheless, that the island economy would be benefited from greater attention paid to food crops.

Soil erosion, caused by deforestation, bad cultivation and growing of maize on hillsides has worked havoc in the past, with the result that forests now have only 17 per cent of the total area, when three centuries ago, they covered virtually the whole of Jamaica. A re-afforestation programme is recommended together with other soil conservation measures. The latter are in any case essential because hillside cultivation cannot be reduced, far less abandoned, as only 20 per cent of the land is flat. Proposals have also been made for irrigation and reclamation projects, largely to benefit small holders. The World Bank Mission also lays its finger on a sore spot when it points out that as much as one-third of the agricultural land is under annual tenancy; wasteful exploitation and absence of incentive to improvement are inevitable in the circumstances. It suggests taxation of land on the basis of unimproved rather than improved values, to give additional incentive to development. In order to capture the imagination of the people—the Mission is convinced that "timid half-measures will not solve Jamaica's problems"—development should be launched in a big way with a complete aerial and ground survey as a basis for proper planning of land use.

Deploring the number of agencies which approach the farmer for agricultural improvement, the report suggests the co-ordination of all effort through a Land Development Corporation, practically autonomous of the government. The IBRD's zeal for autonomous corporations is, of course, well known. But in the context of Jamaica's subsistence

farming, this suggestion is significant for two reasons—(1) agricultural extension through farmers' societies in Jamaica has a long history and it is supposed to have made good progress and (2) it is the confusion created by different agencies approaching the peasant that led our Planning Commission to evolve the Community Project. One would have liked the Mission, therefore, to investigate such other alternatives as the Indian type of Extension Blocks, or improving the farmers' societies which are perhaps cheaper as well as capable of arousing more public co-operation. But the latter is a virtue very difficult to inculcate in any backward country. In a non-self-governing territory, it must be much more difficult. But since such co-operation is in any case essential for the admittedly optimistic programme suggested by the Mission, there is some justification for experimenting with Extension Blocks.

It is in many ways symptomatic of industrial conditions in underdeveloped countries that industrial wages in Jamaica have risen faster since 1946 than in Britain and that Jamaican labour unions are controlled by rival political parties. Industrial strife, however, has abated since employers have come to tolerate organised labour.

The transport capacity of Jamaica is considered broadly sufficient by the Mission, though the Railways are operating at a low level of efficiency and have never been able to cover their debt charges and between 1946 and 1952 did not even cover their operating costs. An increase in fares and freights which are unduly low has been recommended.

The Mission has the usual things to say about the 'bookish' education imparted in Jamaican schools and the attitude to manual work such education fosters. A markedly literary, instead of a technical bias in education, however, as in other economically backward countries, is due to the lack of demand for vocationally trained people in adequate numbers. Technical education is not impeded so much by social attitude as by the absence of industrial development to absorb trained men, inadequacy of facilities for the necessary training as well as the financial difficulties of parents. 'Bookish' education is the cheapest and the only one available in most cases. In other words, the fault lies not so much in the

educational system *per se* as in the social and economic milieu.

Jamaica, however, shows distressing symptoms of psychological tension which is not entirely explained by chronic unemployment and poverty; the island has more patients in its mental hospitals than in all other hospitals put together. Unless for some special reason there are more hospitals in Jamaica to take care of minds in distress than of ailing bodies, which is unlikely, this extraordinarily heavy incidence of mental diseases shows a lack of social adjustment which must be unique for underdevelopment countries which are often blessed with stabler, and therefore more satisfying social and family relations.

The total development programme drawn up by the Mission, which has been fully phased out from year to year, amounts to £34.5 million, to be allocated as follows:

	£
Agriculture	13.7
Railways (Capital investment)	0.7
Harbours	0.08
Airports	1.2
Land Survey	0.7
Industrial development (incl. sugar mill, loans and technical service)	5.6
Rural Housing and water supply	3.5
Urban Housing	2.0
Education (Capital outlay)	4.4
Health (Capital outlay)	2.7
Total	34.5

The period of maximum concentration of investment would be from 1955-56 to 1958-59. The Mission lays particular stress on not allowing the provision for social services to outstrip the available resources or to divert them excessively from other channels.

In anticipation of possible financial difficulties in achieving an increase of 75 per cent in the national income within a decade from 1952, the Mission also put forward a Maximum and Minimum Programme. It is against raising direct taxes which already contribute 25 per cent of the public revenue, and suggests a greater recourse to indirect taxation. Loan financial expenditure is expected to, raise debt charges from 5 per cent of revenue in the base year to only 7.4 per cent of estimated revenue at the end of 10 years. An indication of the institutional progress already attained in Jamaica is pro-

vided by the ability of insurance companies, building societies, banks, and crop insurance and price stabilisation funds of some agricultural groups to contribute slightly less than half of the projected borrowing if they are properly roped in, the remaining being expected from the UK.

The process of economic growth in underdeveloped countries has been generally accompanied by the rise of plural economies which while not entirely disconnected nevertheless remained unintegrated. Food shortages, balance of payments difficulties and a reduction in international capital movement have now rendered it necessary to look after the 'economic interior' too and align it with available knowledge and techniques. These shortages and difficulties are to some extent blessings in disguise, offering new and pressing challenges, and inviting creative responses. The IBRD Report on Jamaica would have served its purpose well, if its programme provided a framework for these responses.

American Agricultural Surplus and India

AMERICAN farm policy has two sides to it. It protects the American farmer by assuring him a minimum price for his produce, guaranteeing him fixed real income in terms of the things which he buys and so on. It does not always work out that way in fact. Realised net income of all farm operators from farming in 1953 was 7 per cent less than in 1952, and 13 per cent less than in 1951. And the purchasing power of this income was less in 1953 than in any year since 1940. But maintenance of agriculturists' income is the idea behind price support. This is done in the first instance at the cost of the American taxpayer, or the national economy, put it whatever way you like. The Commodity Credit Corporation, with unlimited capital, buys up from farmers at fixed prices whenever farm produce in the open market falls below support price. It may not always buy, for the farmers may not want to sell. Price support in that case would mean that agricultural produce or dairy products would move into loan stocks. The farmer will get his price just the same, but he will keep a lien on his produce in case the market subsequently moves up.

Following this policy during the past few years, the Commodity Credit Corporation has acquired huge stocks of all sorts of agricultural produce and dairy products. When the world was short of almost everything at the end of the war, it was not for industrial products alone that the rest of the world was dependent on the US. It was equally dependent on the US for cotton and wheat to mention the principal ones, particularly cotton, in which US is by far the biggest exporter. At the time, the fate of the world depended on American farm policy in the matter of both food and clothing, particularly clothing, because the rest of the world had to go naked if America chose to maintain too high a price for cotton, which she did.

These agricultural surpluses however cannot go on accumulating indefinitely. After all, even America has a limit for paying farmers for things which are not saleable at the market price. With the improvement in world production of agricultural commodities in the last few years and the falling trend of prices after the Korean boom, the production outlook for many of the commodities has changed for the better. This has aggravated the problem of the disposal of surplus American stocks such as those which are now

being held by the CCC. So when America suddenly reversed her policy and decided to dispose of her surplus stocks in world markets at below the support prices maintained at home, agricultural countries, specially those dependent on agricultural exports, had to sit up and take notice. In his Foreign Economic and Trade policy statement in last September, the US President declared:

"1. The world supply and demand situation in agricultural products requires in the interest of the general welfare, an orderly and gradual liquidation of our surpluses. Such a policy, arrived at with the full knowledge of friendly nations, would go far to eliminate fear arising from uncertainty.

"2. The United States cannot be satisfied with the position of holding its own supplies off the market and accumulating surpluses while other countries dispose of their entire production. Accordingly the United States will offer its products at competitive prices. At the same time, the United States will not use its agricultural surpluses to impair the traditional competitive position of friendly countries by disrupting world prices of agricultural commodities.

"3. The United States will seek in co-operation with friendly countries to utilise its agricultural surpluses to increase consumption in those areas where there is demonstrable under-consumption and where practical opportunities for increased consumption exist or can be developed in a constructive manner. The United States will attempt to utilise such opportunities in a manner designed to stimulate economic development in friendly countries and to strengthen their security position.

"4. The United States recognizes that movement of goods in foreign trade is dependent upon the enterprise of private business—foreign and domestic. In implementing these policies with respect to agricultural commodities, the United States Government will seek to assure conditions of commerce permitting the private trader to function effectively."

Subsequently, these policies were incorporated in the statutes passed by the Congress concerning dollar aid; the disposal of US agricultural surplus was henceforth to be made a part of whatever economic assistance the US gave to other countries. At the end of March 1954, US

Government stocks of surplus agricultural produce amounted to over \$6,200 million and they were still going up fast. The CCC, reversing its previous policy, started to sell many commodities abroad at world market prices which were far below US export prices. Mark the word "world market prices"; it means prices ruling at a time when American supplies had not been on the scene at all. Naturally, therefore, the reaction of agricultural countries changed from one of concern to consternation, as disposal of US farm products began in a big way. The stocks at the end of March 1954 with the CCC were as follows:—

Stocks held by Commodity Credit Corporation

	as on March 31		
	1952	1953	1954
(Million United States dollars)			
Wheat	503	1,126	2,183
Maize	651	819	1,292
Cotton seed oil	5	98	184
Linseed oil	60	55	20
Flax seed	4	14	57
Butter	—	64	222
Cheese	—	15	129
Milk	5	22	95
Tobacco	202	227	275
Cotton upland	62	322	1,306
Cotton linters	2	31	56
Wool	—	67	81
All others	237	206	329
Total	1,731	3,066	6,229
Total excl cereals	505	1,095	2,616

The reaction of agricultural countries to the implied threat to their home as well as export markets was pin-pointed in the proposal put up by Argentina for the formation of a body inside the FAO for 'International Action for the Defence of World Markets for Primary Commodities'. As the GATT is the body to investigate, review and regulate, if not to adjudicate cases of export subsidy, it is natural enough for the agricultural countries or member-countries with substantial interest in agriculture to represent their cases before the GATT when it met to review the Agreement. In the representation made by Canada, for instance, it was pointed out that

"The Agreement should recognize more fully and effectively the damage that one country can do to the trade and production of other countries by means of export subsidies and other artificial aids to its exporters. In particular, we believe

that the Agreement should clearly limit the use of export subsidies".

Australia went a step further and suggested that

"The GATT should not only impose an obligation on exporting countries to refrain from using export subsidies or disposing of surpluses in a manner harmful to other exporters, but should also require importing countries to take steps to protect the interest of third countries against subsidized goods disrupting their markets."

"The GATT should also provide safeguards governing the entry of surpluses into world trade and ensuring that subsidized goods did not obtain more than a fair share of world trade."

The Australian Government did not consider that domestic subsidies of agricultural and other commodities were necessarily harmful to world trade. It considered, however, that such subsidies should be subject to some kind of control similar to that operating on tariffs and quantitative restrictions and that the GATT should have a provision which "would make possible the development of effective principles and procedure for consultation and action on commodity problems".

The New Zealand representative made no secret of the fact that

"His Government was disturbed, however, by certain trade developments which tended greatly to lessen the value of the GATT and which, if maintained, could undermine its structure as to render it futile."

This is the background against which has to be reviewed the more recent developments in the matter of disposal of American surplus produce. The US Government, which approved a 50 per cent increase in the tariffs on Swiss watches to protect the American watch industry, and which also at the same time talked freely about "free trade" is reported to have decided to sell on world market 10 million lbs of butter out of the stocks with the Commodity Credit Corporation on a "best bid" basis by scrapping its minimum price programme.

It may be recalled that hesitant attempts on the part of the US Government to sell butter in the recent past brought forth a storm of protest from Denmark, Holland, New Zealand and Australia and the US Government was accused of attempts to "dump" American butter outside. Being forced to put this proposal in cold storage, the USA next seriously thought of selling dairy products to USSR. When

it realised that the chances in this regard were not bright, it sent out "ghee" experts to India to study the Indian ghee market, as not much opposition was to be expected from the leading dairy countries like Australia to this particular enterprise. But what about Indian farmers' interests?

According to reports, price of American ghee will be roughly half of that at which Indian ghee is available. The internal purchase price for butter offered by US Government to American farmers is about 58 cents per lb. Taking the cost of conversion (from butter to ghee) at 4 cents a pound, this ghee is expected to be sold in India at 25 cents per lb. In other words, the US Government will be subsidizing to the extent of about 40 cents per lb.

Now about the ghee prices in India. Granting that good and unadulterated ghee is rarely available in urban markets, it cannot be denied that ghee prices have already shown a marked decline in the last 3 years as is evident from the table below.

It is against the falling prices of ghee that the American offer of selling ghee at subsidised rates will have to be viewed. If it were some industrial product, there would be a hue and cry about American attempts to "dump" in the Indian markets, but as it is only an agricultural product, some of our people think that it will (1) conduce to the health of the nation, (2) lead to new wide-spread understanding of American goodwill, (3) cause a desirable expansion in consumption which had been curtailed due to high prices, (4) be a graceful gift, which will rule high in many acts of unparalleled generosity on the part of America to nations in need, and (5) make a noteworthy contribution to a better diet for India.

Moreover, among farm products, dairy products are not believed to be of a magnitude that may seriously disrupt world trade. That the Indian market has not been seriously perturbed by the proposal of ghee import from America under the less familiar but less alarming name of 'Butter Oil' is perhaps because the

magnitude involved is not considerable and producers of ghee are small and scattered. The possibility must also be reckoned with that the American offer may after all turn out to be a damp squib. In the first place, it still remains to be demonstrated that America is actually prepared to sell its ghee at sacrifice prices. The contrary, in fact, appears to be the case, for according to a report emanating from Washington Pakistan has agreed to take 4 million lbs of American butter at a negotiated price of 50 cents per lb. This is equivalent to a price of Rs 2-12 per lb of ghee. Moreover, consumer resistance in the past against Australian ghee and the extreme dependence of ghee sales upon local tastes and preference make the prospect of heavy sales of the American product uncertain.

For the first time, after many years, thanks to the improvement in the agricultural situation and the declining trend in agricultural prices, ghee is again reappearing in the market and is becoming more readily available. This will of course please everybody except perhaps the manufacturers of Vanaspati. But it will be hoped that improvement in supplies will not be nipped in the bud by subsidised exports from America at cut-rate prices.

Actually, if a part of the American assistance has to be taken in the form of surplus produce, the obvious choice should be cotton. If such cotton is to be used for manufacture of cloth for export markets, there may be some protest. But in that case India would be in the same boat with the other textile exporting countries and since all 'friendly' countries would be free to avail of the American offer, there would be no valid ground for discrimination against India. In any case, in a matter like this, guidance will have to be sought from international agreements. In view of the considerable stir created by the threat of large-scale dumping of American surplus, agreement on the trade policy to be adopted in respect to such surpluses both by exporting and importing countries should soon be sought on an international level.

The Kohinoor Mills Company Limited

Speech of the Chairman, Mr E D Sheppard, delivered at the Sixteenth Ordinary General Meeting of the shareholders of the Company, held on March 17, 1955.

Gentlemen,

I expressed the hope when I last addressed you that wiser counsels would prevail all over the world and some lasting agreement would be reached among nations for the preservation of world peace. During the course of the year we saw the end of the war in Indo-China and, once again, India was in the forefront of those who were attempting to bring about an armistice in this war-torn area. When finally an armistice was signed, a three-nation committee was set up under the Chairmanship of India to undertake the onerous task of partitioning of the country, evacuation of contending forces, repatriation of prisoners-of-war and general rehabilitation. Once again it has been proved that the Indian Army is second to none in its impartiality, its discipline and its efficiency in dealing with difficult situations. It would seem, however, that we are not yet free from the attentions of the many-headed hydra of war as no sooner was Indo-China relieved, than trouble started between the two Chinese governments, and the People's Army has started its offensive against the Nationalist Chinese government in Formosa. The world situation is again explosive, and it is to be fervently hoped that this issue will be localized and will not evolve into a wider conflict. The Prime Minister of India along with others is sparing no effort to bring about a peaceful solution of this vexed problem.

Nearer home I am afraid the situation remains a stalemate. Despite meetings between the Prime Ministers of India and Pakistan the setting up of Joint Commissions, etc, the problem of an understanding between these two neighbours eludes solution. There is little improvement in trade between the two countries, and they still go their several ways, with a consequent strain on both their economies.

INTERNAL IMPROVEMENT

At home, during the course of the year, there was a definite improvement in economic conditions and, after many years, India achieved self-sufficiency in food with the consequent abolition of rationing all over the country. There has been a pro-

gressive fall in the prices of food-stuffs but, unfortunately, this fall has not been reflected in the cost of living index compiled by the Government of Bombay. This is difficult to understand.

A plentiful monsoon saw the end of the bogey of electric power rationing. Furthermore, after years of deliberation, the Government of Bombay at last gave the green light to Tatas for the erection of the second half of their thermal power station of 100 MWS at Trombay. The commissioning of further sets in the Government/Railway Power House at Kalyan has further eased the situation and, at the present time, power is fairly freely available for all normal expansion of industry. Early this year, the Government also started work on their Koyna Hydro Electric Scheme, and it would now seem that, for some years to come, at least Bombay will not again be handicapped, as it has been in the recent past, by a shortage of that essential for economic growth and expansion—the watt. In the wider context, the first Five-Year Plan is nearing completion and the second is getting under way. With the setting up of major industries like Steel and Chemical Works, Oil Refineries and the development of river projects, India is making a start towards its goal of economic and industrial self-sufficiency.

EXPORT AND EXCISE DUTIES

Turning now to the Mill Industry, conditions during the year under review were not quite so good as in the previous year. Although a fairly satisfactory demand for cloth and yarn continued, there was a definite downward tendency in prices and this became more marked towards the end of the year. The off-take from your Mills was as good as could be expected in the circumstances, and they also had their fair share of the export trade where the demand continued to be good. The export duty on coarse counts continued throughout the year but has recently, under the new budget, been reduced to 6¼ from 10 per cent. This should improve the demand for export, but Government have seen fit to enhance the excise duties for local consumption. Whereas, before there were four categories, superfine, fine, medi-

um and coarse, these have been reclassified into two, superfine and others. The duty on superfine remains at 2½ annas, fine goes down from 1½ annas to 1 anna, coarse and medium are enhanced from 6 pies to 1 anna. The duties previously leviable on the linear yard will henceforth be applicable to the square yard. The effect of these changes is very serious, they would cost your Company Rs 8 lakhs per annum, and the Millowners' Association is sparing no effort to persuade Government to revise their policy and reduce this extra impost levied on your industry. The additional excise of 3 pies per yard for the development of the handloom industry continues. It would also seem that the policy of Government is to ban or, in any case, to restrict the installation of extra loomage, although they are prepared to sanction increases in spindleage.

Apart from the additional levies on the textile industry the budget proposals are of unusual severity especially in regard to direct personal taxation. I recall that two years ago, Mr Butler, the Chancellor of the Exchequer, in presenting his budget to the House of Commons, after referring to the "numbing" effect of excessive direct taxation, said "We must banish the hopeless feeling that extra effort is not worthwhile". He then proceeded to reduce the rate of income-tax. The progress made by the United Kingdom since then is a clear vindication of the policy of alleviating direct taxation and the concessions then given have most certainly paid good dividends.

FINANCE MINISTER'S PROPOSALS

Unfortunately in India the recent proposals of the Finance Minister have brought "the hopeless feeling" to business executives all over the country, and indeed many may be excused for wondering whether any effort is now worthwhile.

You all know the story of the man who killed the goose that laid the golden egg. In the context of those embarking on new ventures it now seems that the Government of India is proposing to strangle the gosling before it can reach the stage of laying an egg at all!

Let us hope that the Finance Bill

will emerge from the Select Committee with at least some incentive restored to honest industrialists to develop and expand their undertakings so that India may enjoy the benefits of increased production and employment.

I would like to mention one point of very great interest to you all. Very recently, the Appellate Tribunal of the Industrial Court awarded an extra 5 per cent to mill labour on the bonus paid to them in respect of the year 1952. This has cost the industry a sum approximating Rs 50 lakhs. Furthermore, the Tribunal has also enhanced the rate of dearness allowance payable in the following manner:

Between CLI 325/335	5%
" " 336/350	7½%
Above " 350	10%

This measure will cost your Company Rs 8 lakhs and the industry approximately Rs 2 crores per annum, as long as the index figure remains above 350.

COST OF LIVING INDEX

In this connection I would refer you to the remarks I made earlier in the speech. Although the rates of most commodities have declined sharply, the Bombay City cost of living index has even at times increased. To take a comparison, until recently the DFA in Ahmedabad was about Rs 20 higher than in Bombay, but in the last few months it has gone considerably below the Bombay level. I for one cannot see any reason for this increase in Bombay City alone and hope that Government will institute a searching enquiry into the method of compiling this index figure.

As regards prospects for the future, I do not look for any marked change as far as your Company's affairs are concerned. The new Excise rates and the increased dearness allowance will of course reduce the potential profits to some extent. On the other hand, your Mills remain in a strong financial position and with the programme of modernisation and rehabilitation nearing completion, the benefits which it is hoped will be derived therefrom should soon become apparent. I would mention here that the limit of development has now been reached in the present Mill premises and if it is decided that further expansion is desirable in the interests of your Company, then additional property will have to be acquired.

This will require careful consideration and one cannot escape the feeling that should the level of profit rise, then the lion's share will fall to

the predations of Industrial Courts and that Excise enthusiast, the Finance Minister.

Before I conclude, I know you would wish me, on behalf of you all, to thank all the staff both at the Mills and in the Head Office for their hard work throughout the year. That so much erection and re-arrangement of machinery could have been carried out without loss of production indeed calls for congratulations.

Our Selling Agents have served us well in a difficult year and deserve our gratitude.

Decline in Automobile Registrations

BATTERY dealers from all over India met in a three-day conference in Calcutta which concluded on February 25.

Addressing the conference, Mr H R Gregson, General Manager of Chloride & Exide Batteries (Eastern) Ltd, said that it was only during the last war that manufacture of storage batteries was first undertaken in India on any considerable scale.

In the 10 years since, the industry's installed capacity and annual output had steadily increased. There were in 1954 some 20 manufacturing units with a total production of about 1,80,000 units.

Some very specialised types of batteries were still imported but Mr Gregson said that efforts were being made to manufacture these progressively.

The Indian industry's principal problem today was its dependence on imports for its raw materials, although processing of these was being increasingly done within the country.

Battery makers, however, were seriously concerned over the fact that the number of new vehicles registered each year in India was tending to decline. Mr Gregson hoped, however, that when the Indian automobile industry had overcome its teething troubles, sales would follow a rising curve in keeping with the country's general development.

As the Conference concluded before the budget was out, it could not possibly have anticipated the problems that arise from the imposition of an excise duty on batteries. In its main emphasis on automobile registration as the prime mover of the industry, the Conference was undoubtedly right.

Jute Industry Takes Stock

(From a Calcutta Correspondent)

OPTIMISM, tempered with an adequate appreciation of the difficulties that lie ahead, marked the Chairman's address at the annual general meeting of the Indian Jute Mills' Association at the Bengal Chamber on Thursday. This is Mr Gardner's second address as Chairman and his swan-song. He leaves India before long, as the firm whose destinies he controlled passed into the hands of the Bangurs last year. I was a trifle surprised that he did not strike a note of sentiment. But then I remembered he was an Englishman, and that too in the jute industry.

The year 1954 was marked, said Mr Gardner, by the industry winning back some of the ground that it had lost in the disastrous reverses which have occurred at intervals during the last five years. The considerable expansion of world demand enabled the industry to increase its working hours successively and raise them to 48 hours per week for the first time since March 1952. Without exception 1954 witnessed in all the overseas markets of the industry a degree of prosperity and increased trade and production which surpassed anything experienced since the artificial boom conditions produced by the Korean war. Another significant development of the year was the partial removal of the restrictions on free purchases of jute goods which had affected some of the industry's important markets, although a modified form of control still lingers in the UK and Australia.

The main shipment feature of 1954 as compared with 1953 was the marked recovery in respect of sacking which totalled 4.3 lakh tons as compared to 3.24 lakh tons in the previous year, while there was a slight fall in the export of hessian from 3.88 lakh tons to 3.7 lakh tons caused by a corresponding fall in exports to the Argentine. That country still represents, however, a most satisfactory stabilising factor in India's exports to overseas markets.

The industry today is in a better economic position to the extent that its productive capacity and its labour are somewhat more fully employed, but Mr Gardner was careful to point out that they had still very far to go before the whole of the very

considerable remaining productive capacity was employed. At this point he struck a note of warning, that the industry may not succeed in maintaining the present working levels if the increased offtake of 1954 conceals a degree of restocking which would mean that demand would recede later as consumption took place from stocks rather than from current purchases. In any event, he said, market trends should be studied with vigilance for experience in 1954 showed how important it was to act quickly and decisively if it appeared that production was running seriously ahead of demand.

Stressing the vital importance to the industry of an adequate supply of raw jute Mr Gardner referred to the uncertainty with which the mills have had to grapple since the fatal day when instead of drawing their raw material from what was almost a hinterland they had to "import it from a foreign country". It would not do to retort that there are many industries in other parts of the world which depend on raw materials from foreign sources; the jute industry grew up with its raw material in its back-yard for over nine decades.

The difficulties of the industry in maintaining present markets and the ominous growth of jute manufacturing capacity in foreign countries were also reflected in the year's working. The trend towards greater economic independence in the manufacture of jute goods is daily gathering momentum. This tendency is particularly marked throughout the East which for such a long period has been a consistent buyer of a substantial quantity of our heavy goods. The Association has received information of the planning or construction of jute mills in Egypt, Iraq, Iran, Burma, Thailand and the Philippines. It received most valuable information about the near Eastern countries as a result of the visit paid by an official delegation led by Shri M P Birla to this area at the end of last year. It is also reported, although a confirmation is yet to be received, that manufacturing capacity in the Chinese Republic is also being augmented. But perhaps the most potent source of competition is Japan which is in a particularly favourable position to supply jute goods to the most

important West Coast markets of the US because of lower freights and labour costs. Indian goods have suffered in competition. The industry in Pakistan continues to make steady progress and as soon as a substantial capacity is in operation, Pakistan mills will present stiff competition with all the advantages that a closed domestic market offers.

That the industry should do all it can to meet the situation need hardly be emphasised, but Mr Gardner also suggested that the industry should receive every assistance from Government to meet this development. He mentioned in this connection three lines of attack: assuring a larger and better supply of raw jute, the installation of modern equipment and the retention of costs at realistic levels bearing in mind the productive efficiency of India's rivals in other countries.

Mr Gardner was full of praise for the valuable work that the Association's delegation to the United States had done in reassessing the market there. Their report was a "most valuable document", which has improved the industry's understanding of that market. The delegation is also reported to have made certain very interesting and positive proposals for new uses and adaptation of jute goods. Work has been started on these and Mr Gardner was confident of valuable results accruing from the research which is now in process. It must be recognized that with a few exceptions, the expansion of our trade along traditional lines is unlikely in such highly developed markets as the United States.

Mr Gardner is succeeded by M P Birla as the Chairman and D P Goenka succeeds Mr Walton as Deputy Chairman of the Association.

* * *

Trouble in the Calcutta docks looked like flaring up seriously on Monday. That evening the shipowners and stevedores suspended all loading and unloading operations with the exception of coal ships and ships discharging salt. Hasty conferences were held between the employers and workers, the West Bengal Government and the authorities of the Calcutta Port Commission.

On Wednesday the shipowners and stevedores commenced work-

ing on three steamers with police protection. It is reported that there have been a few instances of violation of terms on the part of the employers. Fortunately, however, such cases are not being exploited by interested parties to produce a stoppage of work. They are to be dealt with in a constitutional manner through the good offices of the Regional Labour Commissioner.

The dispute originated with tally

Around Bombay Markets

Steady to Firm

Thursday, Morning

AFTER mid-week drop due to heavy profit taking especially in steels, market recovered smartly at the end around previous week-end quotations.

About 25,000 Tata Ordinaries were liquidated and the share lost about 7 points. Century also met bull liquidation. Thereafter market recovered partly on replacement buying. News regarding Commerce Ministry taking charge of Steel Industry caused renewed bull support and the market recouped most of the losses at the end. The undertone is firm.

Calcutta advices were very firm, and Indian Iron met bull support. The Calcutta bull who is long in Tata Ordinary is reported to have taken delivery of about 5,00,000 Indian Irons in Calcutta.

Textiles, though their performance was not very encouraging, behaved better than before. Under

clerks and the workers demanded that these clerks be extended the benefits of the scheme of decasualization which other categories of labour are enjoying. Dr Roy is understood to have assured them that he would discuss the matter with the Chairman of the Calcutta Port, and if he failed to get a satisfactory solution there, he would then move the Ministry of Labour in New Delhi during his forthcoming visit there.

the present circumstances, even this improvement has some significance.

Directors of Bombay Dyeing announced their decision not to issue bonus shares. The results of Bombay Dyeing were also disappointing. All this discouraged fresh buyers in Bombay Dyeing. Against this, the firm tone of Ahmedabad textiles and possibility of cut in excise duty helped to keep textiles steady and called forth some bear covering.

At the end of the week, Kohinoor attracted modest bull buying and this share which has behaved discouragingly for the last four months showed a definitely better tendency.

Century which had shot up sharply last week, met heavy selling. There was scattered support for Tata Mills on rumours of a higher dividend.

In Ahmedabad, textiles are very firm due to satisfactory reports by the leading mills. Ambica has rais-

ed its dividend by Rs 2 to Rs 20. Calico has decided to issue bonus share at the rate of one for every ten.

In the Miscellaneous section, Associated Cement was lower on profit taking, after last week's marked rise.

National Rayons were steady. Reports of National Rayons issuing debentures discouraged fresh buyers at higher levels. Their dividend announcement is keenly awaited.

Premier Construction also met profit selling and shed top gains. Scindias and Tata Chemicals were steady.

Walchandnagar have announced higher dividend by Rs 2 at Rs 16. This share has been promoted to the forward list on Bombay Market. BIC shares behaved strangely when there was sharp rise of about a rupee. Some Calcutta speculator is reported to be buying heavily. BIC has recently announced nominal dividend of one anna.

On balance, the market displayed steady to firm tone at the end.

Jobbers Suspend Business

BOMBAY Bullion market after touching new high level in silver at 166-8 (Chaitra) remained closed since last Monday on jobbers suspending business.

Bullion Board's refusal to apply margin on new Chaitra delivery created a great stir, and there has been a lot of agitation against this. For the Bullion market this sort of suspension is nothing new. On Wednesday, nominal kerb quotations were around Rs 165-12 for silver and Rs 92-12 for gold.

New Low for Years

DURING the week under review cotton touched a new low for years at Rs 546. Delay in excise duty cut, consistent weak advices from up-country and mills keeping aloof from buying, pending the outcome of industry's representation to Government regarding excise duty, all caused nervousness and there was heavy selling pressure. Even lower rates could not attract new buyers. Thereafter market recovered partially on short covering. Traders are keenly awaiting some Government measures to halt the rot.

Technically the market is over-sold and is likely to rally further on bear covering.

Alkali and Chemical Corporation of India Limited

Speech of the Chairman, Mr N D Harris, at the Eighteenth Annual General Meeting of the Company, held at Calcutta on March 10, 1955

Gentlemen,

"The audited accounts and Directors' report for the year ended 30th September, 1954, have been in your hands for some time and, with your permission, I propose to take them as read.

"The working of the Calcutta factory at Rishra was satisfactory throughout the year, and I propose to give you a brief review of the operation of its separate units.

"The extensions to the chlorine and caustic soda plant were completed satisfactorily during the previous year, thereby providing greatly increased production capacity. The total production capacity for chlorine throughout India has, however, temporarily overreached consumption and, because of keen competition, it has not been possible to use the capacity of our plant to the full. Nevertheless, sales of chlorine were reasonably satisfactory. We had no difficulty in disposing of all the caustic soda manufactured.

NEW OUTLETS FOR CHLORINE

"We are giving much thought to finding new outlets for chlorine, in particular for the manufacture of other products. The hydrochloric acid plant, a consumer of chlorine, has recently been operating at its maximum output and the maximum quantity of chlorine is also being used in the benzene hexachloride plant. Extensions to these plants will be considered, if desirable, as well as the manufacture of other products. A small plant for production of zinc chloride was installed during the year.

"In my speech last year, I mentioned that the crude benzene hexachloride (BHC) plant had not fulfilled our expectations, but I am glad to report that we have overcome our initial difficulties and full rated production has now been achieved. As a result, the Tariff Commission's recent recommendation that your Company should use its full capacity for the manufacture of benzene hexachloride has already been implemented. Despite keen competition, the high reputation enjoyed by our 'Gammexane' formulations, particularly our 'Gammexane' water dispersible powder, has assured us of a good demand.

The insecticide market is extremely competitive and each year new factories are planned for their manufacture. I mentioned to you last year that Tatas were putting up a BHC plant which is expected to be in production this year. The Government DDT plant, located at Delhi, will shortly begin to produce and another Government DDT plant is under consideration. Both are so planned as to permit their initial yearly capacity of 700 tons being doubled.

PAINT PRODUCTION

"The paints unit has worked well and production has been maintained at a high level to meet the increasing demand. We have had to meet keen competition, but 'Duco' and 'Dulux' have earned a high reputation in the market and the technical service our selling agents are equipped to render gives us a substantial advantage. Our technical advisers, Imperial Chemical Industries Limited, have given us every assistance in maintaining a high degree of plant efficiency and we are grateful to them. Consideration is being given to increasing the capacity of the existing plant.

"Our varnish plant was completed during the year and meets most of our requirements. We have also put on the market, under licence from American Chemical Paints Company, a full range of metal pre-treatment products. These products are used for treating metallic surfaces before the application of paint to ensure a clean surface and with it good adherence. We have also constructed a paints development laboratory to study technical problems connected with this industry.

"The technical service station erected by our selling agents, Imperial Chemical Industries (India) Limited, has proved invaluable and customers have made full use of the facilities offered.

"You will remember the sale of our Khewra alkali works in Pakistan was completed in 1953, and this year's accounts are the first without Khewra sales.

NET PROFIT SLIGHTLY BETTER

"The previous year's accounts

included the sales from the Khewra factory for eight months of that year which accounts for the lower turnover this year. Despite the lower turnover, the net profit of Rs 8,37,316 is slightly higher than last year's figure of Rs 8,14,151, a result which may be regarded as satisfactory. With the addition of the balance brought forward from the previous year of Rs 1,03,311 there is a balance available for distribution of Rs 9,40,627. There is no liability to taxation for the year, due to initial allowances on the new plant installed, but a sum of Rs 3,00,000 has been transferred to reserve for deferred income-tax liabilities. The dividends on the preference shares for the year absorbed Rs 1,55,000 and the Directors recommend the payment of a dividend at the rate of 6 per cent on the ordinary shares. This will leave a balance of Rs 1,13,627 to be carried forward.

"During the year Mr Edward Martley, General Manager of the Rishra Factory, resigned from the Board on his retirement from service. Mr Martley was connected with the Rishra Factory since the formation of the Company and was largely responsible for building it. Mr P M G Hutton was appointed an Additional Director.

"The Directors retiring by rotation are myself and Sir Biren Mookerjee and my colleagues on the Board recommend our re-election. Mr P M G Hutton ceases to be a Director under Article 113 and is recommended for re-election. A resolution seeking your permission to Mr Hutton occupying a position of profit under the Company is also being put to you for your approval.

"The Auditors, Messrs Lovelock and Lewes, also retire and you are requested to reappoint them for the current year at a fee of Rs 6,000 which is the same as that for the previous year."

The report and accounts were adopted. Mr N D Harris, Sir Biren Mookerjee and Mr P M G Hutton were reappointed Directors. The Auditors, Messrs Lovelock and Lewes, were reappointed.

Code of Fair Trade

A CODE of fair trade which all countries could accept without any mental reservation and therefore with respect and observe in practice has long been recognised as essential, if world trade has to develop freely and all countries are to benefit from it equally. Such a code is still a far distant objective. Concluding their deliberations that have been going on for the last four months at Geneva, the contracting parties have produced a draft for regulating trade and tariffs. It now awaits the acceptance of individual countries. Meanwhile, the *status quo* will be maintained. The contracting parties to the GATT have agreed to extend the life of the present agreements to the end of 1957, after which the revised agreement will come into operation.

The existing arrangements are themselves a temporary make-shift. When problems of world trade came to be discussed at the end of the war and some order was sought to be restored in what was a state of chaos, international economic relationship had been so far disrupted that no country could be expected to get back to normal, until the damages of the war had been substantially made good and the breaches repaired. So all the countries decided to retain the crutches until they were in a position to discard them. Prolonged use of crutches, however, has not strengthened the injured limbs; quotas and restrictions have created vested interests and guided developments along lines from which in many cases no return is possible.

This concession to the abnormal situation existing at the end of the war did not imply, however, that it was a question of merely getting back to the pre-war norms. This was not the case, for the pre-war norms were far from those of free and fair trade. On the one side there were the free traders who stood to gain by free trade. On the other side were ranged the rest of the countries who saw in the continuation of free trade nothing but a perpetuation of their inferior economic status, if not subjection. The case for the countries which were industrially undeveloped, had come to be recognised long ago. This was, however, not the only obstacle to free and fair trade. Far greater obstacles than protection of individual industries were the measures adopted by so many of the countries in the inter-war period to insulate their domestic economies from the unfavourable impact of deflationary or other disturbing forces that were transmitted through foreign trade and payments. These measures had been multiplied, reinforced and systematised after the war.

Mutual interest in the development of world trade, therefore, neither appeared to be axiomatic nor has it been accepted as such by the trading countries. On the contrary, the unequal bargaining strength of the industrially advanced and the economically backward countries which produced only raw materials had divided the world on the issue of free and fair trade. With growing appreciation in recent years that uneven rates of development in different countries are themselves an impediment to trade, and a potent cause of balance of payments difficulties, the necessity of measures to help development of the countries which are relatively backward has now been recognised and formally

Annual Subscription Rs. 24.
Foreign Rs. 27.

incorporated in the revised agreement.

When the charter for world trade was drawn up at the end of the world war, it was also proposed to set up an International Trade Organisation to act as a court for the enforcement of the code of fair trade. The proposal was not accepted among other reasons because it would have brought the high and mighty as well as the lowly ones under the jurisdiction of some world authority in which the former might not always be able to dominate.

In the absence of such a body to regulate world trade, the countries which believed in international action set about the business by mutual negotiations. This was done within the framework of a general agreement. The purpose of such negotiation was not to free trade of tariffs and restrictions all at once—this was clearly impossible—but to proceed by stages towards this objective.

So long as currencies are not convertible, there is a general provision for restrictions on the ground of balance of payments. The prolonged review of the General Agreement on Tariffs and Trade in the light of the past seven years' experience of its working, however, has led to a clear recognition that under-developed countries may need

such restriction even when convertibility of currencies has been restored. They would be free to control imports by quotas, if necessary, in order to conserve their foreign exchange earnings for the development of their respective economies. They will also be given considerable latitude to continue or impose quota restrictions for the protection of their nascent industries, but with the prior approval of the Organisation for Trade Co-operation, the new body that is proposed to be set up.

Quota restrictions for maintaining vested interests by countries which are fully developed, however, also get the same indulgence from the GATT reviewers. While other countries have been conceded a temporary waiver for five years from the obligation to eliminate quota restrictions, those imposed by the USA under the terms of its Agricultural Adjustment Act have also been allowed a waiver, but this is not a temporary waiver for a fixed time limit of five years, though it will be subjected to an annual review.

Imperial Preference which has survived seven years of GATT, will be lopped off if the revision eventually gets through, and retained only in the case of imports from the colonies. This has been allowed in view of the special responsi-

bility of the United Kingdom towards its colonies which depend largely on its markets. These rights, it is further qualified, will apply only in cases where the industry or branch of agriculture of the colony would be benefited but no industry or agriculture in the UK or any other country.

In the case of export subsidy however, the negotiations did not appear to have produced large results. The dumping of American agricultural surplus which raised a chorus of protest from so many of the Dominions as well as Argentina and other agricultural countries and the strong representation made on their behalf has not yielded in any better than the imposition of an obligation on the contracting parties, not to use export subsidies on primary produce "so as to obtain for themselves more than a fair share of world trade". In the case of non-primary products, which do not affect the US, however, the contracting parties are more firm; in their case, no new or increased export subsidy would be permitted.

The stand taken by India on behalf of all under-developed countries has been vindicated. But all the concessions made in the revision are not for the weaker countries. The draft code has to pay a price to gain an acceptable compromise.

Bombay Cost of Living Index Misbehaves

THE strange behaviour of Bombay cost of living index, its persistent stickiness when the cost of living index has been going down in other industrial centres within the State and outside, and particularly, the inverse movement of the food group in the Bombay index to that of other centres, all this has long mystified those who have followed this index during the last one year and a quarter. And which employer can afford to be indifferent to the movements of this index, since on it depends the amount of the dearness allowance which has to be paid to industrial workers? By drawing attention to it in his speech at the last annual meeting of the Kohinoor Mills, Mr Sheppard has rendered a distinct service, not only to the millowners, but to all those who have been confounded so far by this apparently inexplicable disparity of the Bombay cost of living index with the others and who look for some sense in figures. His demand that Government should "institute a

searching enquiry into the method of compiling this index figure" will, therefore, be widely endorsed.

After derationing of food grains, the index suddenly shot up by several points in June last year, when open market quotations for rice and other cereals were substituted for the controlled prices. This happened because not only were a new set of prices adopted for food grains, the composition of food grains and the relative importance or weights given to different cereals was also altered. During the period of rationing, the consumption of food grains could not be assumed to be the same as in the base year which for this series is the year ending June 1934. For measuring month to month changes in consumption, the actual monthly offtake of different cereals was estimated and the index was computed accordingly. After rationing ended, the offtake of different cereals was no longer easy to obtain and the Labour Department, therefore, reverted to the weights of the base year. The logic

of this procedure may appear to be strange; but it appears that this is what happened.

It may be suspected that the index as currently constructed gives a larger weightage to rice than is justified by present standards of consumption, that the quality of rice for which the prices are taken differ widely from those of the base year and since price of quality rice has not fallen, the Bombay index stays put while the indices of the other centres, based on larger consumption of cereals other than rice, prices of which have fallen a good deal, show a commensurate fall.

There have also been some subsequent refinements in the Bombay index which might have further distorted it. Changes in the pattern of consumption are not always easy to incorporate in such an index. An instance is the disappearance of *patni* from the household budget of industrial workers of the present day. It continues to figure as one of the components in

the food index; some other prices are being used for it—whatever the choice, it is bound to be arbitrary—which certainly do not tally with the present day facts. Then, again, the Bombay index has its usual quota of false and fictitious prices as a cursory glance at the price sheets will show. For example, in the latest issue of the *Labour Gazette* which is for February, under the sub-group 'clothing', the prices taken for dhotis, are quotations for September 1952, those for sarees and shirting are for April 1953, and the quotation for khans,

not a negligible item since it is given a weight of ten in this sub-group, goes as far back as April 1949.

Such attempts at refinements may partially explain disparate movements as shown below:

While in the past 15 months, the cost index for Ahmedabad and Sholapur have fallen by 70 points and 45 points respectively, it is only since last November that Bombay has registered a fall of 9 points. It will be noted that until November, compared to the same month

a year ago, the Bombay index had not changed at all, while Ahmedabad had moved down by 53 points and Sholapur by 39 points. Again, from September, from which month the Bombay index has shown a slight fall, the fall has been only of 12 points as compared to a fall of 26 points in the case of Ahmedabad and 10 points for Sholapur; but in the case of Bombay it is a fall of 12 points on 364, that is, not even 4 per cent as compared to a fall of 10 per cent in the Ahmedabad index.

As consumption habits have changed so much since household budgets were last studied, the case for a fresh family budget enquiry and compilation of a new set of index numbers would appear to be unanswerable, particularly when the attempt to maintain continuity lands the computers into refinements which merely distort the series as well as destroy all comparability. A fresh start, however, would inevitably raise the question of consolidating dearness allowance with basic wage, a disputed issue on which agreement would be difficult to secure. There would be no disagreement, however, that the Bombay cost of living index should be looked into; it is high time that something was done to make a more sensible use of this very well established branch of statistical studies.

Weekly Notes

Rivers Award for Indian Sociologist

THE award of the Rivers Memorial Medal this year to Prof M N Srinivas of the Baroda University does not, of course, confer international status on Indian social scientists for the first time. Prof Srinivas himself had the distinction of lecturing at Oxford and had also been invited to the Manchester University as a Senior Research Fellow in Social Studies. But it is probably for the first time that such high recognition has been won by an Indian sociologist for field work.

The Rivers Memorial Medal commemorates a great anthropologist, the late W H R Rivers and the previous recipients of this major award have been such internationally famous figures as Malinowski, Radcliffe-Brown, Raymond Firth and Evans-Pritchard. Rivers, it may be recalled, carried out a field study of the Todas of the Nilgiris at the beginning of this century and the work for which the Council of the Royal Anthropological Institute of Great Britain has made the award, as mentioned in their citation, is the field study of the Coorgs which Prof Srinivas carried out in 1940-41 and the Coorgs live only a 100 miles from the Todas as the crow flies.

The *Economic Weekly* has special reason to be gratified for Prof Srinivas has been closely associated with this paper right from the beginning and has been responsible for planning the series of village studies which has been appearing in these columns and getting contributions for the series from trained sociologists who had done actual field work in India. The warm reception that has been extended to this series and the interest it has aroused, not only in the rank of professional sociologists but also among those who have perforce to take a greater interest in the Indian villages, speaks eloquently for the success of the series. The West Bengal Government has undertaken to bring out these studies in book form. The publication has eagerly been awaited for many months now, but it has been delayed because of pressure of work in the Government press. It is now expected to come out shortly. Orders for this book and enquiries may now be forwarded to the Development Department of the Govern-

ment of West Bengal, Raj Bhavan, Calcutta.

Prof Srinivas, however, is continuing the village series in this paper and a couple of contributions from his students at the MS University of Baroda have appeared in recent issues. More will follow in due course and as before, contributions are sought from and some have been promised by field workers in the various parts of the country.

No Expansion of Mill Production

AN appraisal of the net effect of the tax changes on the cotton mills could not have been expected from the Chairman of the Kohinoor Mills. The reduction in export duties, proposed as a partial offset to the excise duty, applies only to medium and coarse varieties. Kohinoor Mills produce mainly fine stuff. Mr Sheppard's complaint about the excessiveness of the excise duties in the budget proposals have since been met, and though he violently differs from one of the contentions of the Matthal Commission, viz, that the disincentive of higher taxation is generally exaggerated, the working of the Kohinoor Mills is a happy confirmation of the Commission's other contention that well conducted concerns have been able to carry out replacement of plant and equipment, despite taxation and depressed conditions in the capital market. Kohinoors maintain a strong financial position and have been able to put through a substantial programme of modernisation and rehabilitation which is nearing completion. In the circumstances, one must have every sympathy with Mr Sheppard that the Kohinoors, in spite of their ability and willingness to do so, are not allowed to instal more looms and expand production of cloth.

This is a sacrifice called from the progressive units in the industry in the larger interests of the country since it is now the undeclared policy of the Government, and also the idea behind the Second Five-Year Plan which is being acted upon in advance, to check further expansion of organised consumer goods industries. Mills which are in a position to divert more of their production to export markets or to produce exclusively for export should legitimately be entitled to

especial consideration in this regard, for a concession made in their case would be quite consistent with the general purpose of the plan. It is a little illogical, though, that the Congress should be sold to handlooms and yet oppose high excise duty on mill-made cloth, however much the mills may be thankful for such small mercies.

Left High and Dry

INDIA and perhaps also a large bit of the curious world around has been denied the grand spectacle of a sadhu, Dorahawa Baba, reputed to be more than a hundred years old, climbing down from his tree-top perch for the second time in 30 years to confer the title of 'Brahma Rishi' on our philosopher-statesman Vice-President, Dr S Radhakrishnan. Earlier, the Vice-President had agreed to accept the title, though not without a murmur of modesty that he was not wholly worthy of the honour. Great preparations had been made for the occasion; and if reports speak true, 50 richly-caparisoned elephants, 101 priests and a countless number of the ageless sadhu's followers were to mingle in a mighty ovation to the would-be 'Brahma Rishi'. Then suddenly came the stunning news that Dr Radhakrishnan had changed his mind and that the sadhu might not after all take the trouble of descending from his lofty abode to honour a mere mortal—anyway, not until he should pick on a new candidate for his saintly beneficence.

All this may be deemed past history in this fast-moving age; but the question remains: Why did Dr Radhakrishnan refuse the title? Could it be that his initial hesitancy, due to modesty, grew in intensity as the days passed? Or was it the surname-shedding fashion set by Shri S N Agarwal and Shri T T Krishnamachari that came in the way? May it be that when other worthies were trimming even their original names to suit the prevailing ideological wind, Dr Radhakrishnan could not bring himself to indulge in the extravagance of adding to his name or creating a new caste of Brahma Rishis? But if this was what weighed with the Vice-President, it is a pity, for what with half a dozen new castes already created by the institution of titles and honours by the State, there

would have been no serious danger to the concept of social equality in a title conferred by a sadhu surveying the worldly scene from a dizzy altitude. And the pity of pities is that if in the process of refusal the sadhu has been denied the rare exercise of a descent to reality, the world has been deprived of the stimulus of a soul-lifting scene. The sadhu is addicted to high places; why should the commonalty be robbed of a chance of mingling with the high?

Handicap of Strength

THOUGH it may be facetiously claimed that the unanimous election of Shri B Gopala Reddi as leader of the United Congress Party in the new Andhra Assembly augurs well for the State, it is doubtful whether it actually betokens the future trend of events. The first round has been won by the Congress High Command, thanks primarily to the pressure or, to put it more politely, the power of persuasion that it could exercise over the two rival candidates for the leadership, Shri N Sanjiva Reddi and Shri T Prakasam, so as to keep them out of the field of contest. The Congress President, Shri U N Dhebar, has lost no time in paying his compliments to both of them, congratulating the one on his 'gracious gesture' and appealing to the other for his 'blessings', lest they should change their mind. Meanwhile, Shri Sanjiva Reddi, obviously with his gaze fixed on the future, has had no hesitation in lauding his own gesture as a 'magnanimous' one—"I chose to be magnanimous and gave up my claims for leadership"—and the octogenarian Shri Prakasam, no longer in a position to be prodigal of time, has been fretting and fuming with ill-concealed fervour. When the new leader of the Party and his two rivals separately or in combination will be locked in combat again, is more than can be foreseen; and neither is there any knowing at this stage whether Shri N G Ranga, chief of the KLP now merged in the Congress, may not also choose to jump into the fray, creating further complications all round.

Apart from these purely personal factors, the United Congress Party, even more than its label suggests, is not only an alliance of political parties as such, but also a sort of 'hold-all' of not so compatible territorial and communal groups which have already started bargain-

ing for representation in the new Cabinet. For the time being, Shri Gopala Reddi has managed to rig up a team of sorts; but it is clear even at this stage that it will have to be enlarged to accommodate a number of claims that might have been deferred now, but cannot be rejected. With Pandit Nehru reportedly against the expedient of expansion to muffle discordant voices, Shri Reddi will certainly have a hard time of it trying to promote contentment in his Party ranks. And if discontent breaks out in a big way, it may be that Shri Prakasam is too old to take advantage of it; but this cannot be said about Shri Sanjiva Reddi, who is likely meanwhile to get into a strategic position, nor about other potential leaders who may be biding their time. The United Congress Party has been preening itself on its huge majority in the Assembly; but in the fissiparous atmosphere of Andhra, given to fierce individualism, the

very largeness of its size and the heterogeneity of its composition might prove to be the undoing of the Party.

Standing on the Head!

THAT in the industrialised west, output has been expanding faster than capital in recent years, or in other words, the marginal productivity of capital has been going up is not a matter of speculation, but a question of fact, on which one has to rely on statisticians. Mr Colin Clark has found that it is so. One explanation of this high marginal productivity is purely technical,—the presence or emergence of a combination of those factors which give rise to what used to be called 'increasing returns' in industry, increasing external economies resulting from larger social capital. Another is the progressive widening of the market. Marginal doses of capital can be applied to the strategic points and co-operant factors can be used to the best advantage. Division of Labour being limited by the extent of the market, profitability of investment depends on the scope for carrying division of labour a step further.

Apart from technical factors that set a premium on new investment at strategic points, there is continuing expansion of demand. Existence of demand is nowadays sometimes regarded as a part of external economies. It also explains profitability of investments and high marginal productivity. This is much more apparent in the USA, in the demonstrative consumption and increasing standard of living. Keeping up with the Joneses, going in for new gadgets, better and bigger cars each year, television sets and dish washing machines, all these maintain the demand for fresh capital at a steadily expanding rate and the domestic market continues to imbibe fresh capital with the same steady appetite with which some people are supposed to consume beer. Is it any wonder then that blue chips on Wall Street should go on yielding 6 to 7 per cent while earnings per dollar are even higher?

To the lay observer, this is the ready and an adequate explanation of the enormous appetite that the American economy has displayed in recent years for absorbing fresh capital. Economists might add to it US tariff policy, high level of Government expenditure and even

3 wishes of a Shikari

PSMM-673A

the large volume of foreign aid which combine to maintain the marginal efficiency of capital so high. Critics of American monetary policy may also enter a caveat that right from its inception, the Federal Reserve has gone its own way with the result that bond and money rates in US have always been higher than those in Britain.

But Britain, too, has her sheltered markets in the colonies and has always been looking for soft spots here and there; for strategic and other reasons, the city still manages to scrape together some capital for investment overseas. Specially favourable scope for colonial investment apart, the appetite of British industry to absorb capital has shown no sign of abating. Hence British Chancellor's concern for keeping demand for investment at home under check.

Given these high marginal returns in UK and USA, how on earth can one expect capital to flow out from these countries in a steady stream to fertilise the under-developed and capital hungry countries abroad where marginal returns, in the present state of their development, are far from attractive? This must be at the root of the conspicuous and persistent tardiness of the flow of private capital from UK and USA during all these years. The desirability of the flow has been stressed as much as the scantiness of the flow has been lamented. The need for investment in the poorer half of the world and the exhortation on the part of the well-meaning people, both in Britain and USA, that private capital should flow out have both been stultified by the high marginal productivity in Britain and USA.

From this premise of high productivity, Mr Colin Clark in a talk on "The Declining Importance of Capital" in the Third Programme of the BBC drew the conclusion that advanced countries can now do with less capital and that they should, therefore, invest in India and other under-developed countries where, on his own showing, the minimum returns would be much lower. If medals were awarded for parading economic statistics, *The Economist* suggests that Mr Colin Clark would be a much decorated veteran, though in interpreting them, he sometimes seems to stand on his head. People in the under-developed countries will heartily agree.

Larger US Assistance for Asia

WHEN Mr Harold Stassen, the US Foreign Operations Administrator was in Delhi, it did not look as if he had come to conquer or even that he had anything up his sleeve. His was one of those routine visits of which Delhi has ceased to take any notice. And not only the newsmen but, as the saying goes, those closest to the Finance Ministry had no idea that America was going to produce a Marshall Plan for Asia. The Economic Adviser's Office had its hands full doing the secretarial work for the forthcoming Afro-Asian Conference. It could switch over, of course, to investment co-efficients necessary to step up the national income of South East Asian countries to whatever target might be set, and within the given number of years. This it could do much more readily than unravel the complex economic relationship among all these countries, for which the needed data are inadequate or non-existent. To work out estimates according to models, with various stated assumptions, is so much easier. But the fact of the matter is that it was not asked to do any such thing.

American move for massive economic assistance to Asians for raising production rate by 30 per cent in 8 years—but why 8, and not 5 or 10?—make head line news. To say that it has taken the average newspaper reader by surprise is not necessarily to be cynical about it or to mistrust the news item as mere speculation or worse, but to state the bare fact. Foreign assistance for the development of underdeveloped economies has been discussed *ad nauseum* for the last 10 or 12 years. It has not come up on the scale necessary to create an impression of the desired magnitude. It is not at the moment a subject under serious discussion. Does Stassen's statement change all that?

True, the President's economic report to the Congress did devote considerable attention to the flow of American capital abroad. But it was largely on the well known lines of tax concessions on private investment abroad, and the only new suggestion it had was that of setting up an international corporation to facilitate such investment. It did not try to answer the question why on earth an American should send out his money for an uncertain 6 per cent or less, when he can earn

more on Wall Street or in Latin America.

To put the fairest interpretation on Stassen's statement, it is enough to say that the State Department has always been more liberal than the Republican Party, that the Administration is not the Congress and therefore what it thinks and wants to do is not always what the Congress thinks and wants to do. The points to be noted in Stassen's proposal are that the appropriation to be recommended to the Congress is to be a much bigger one but it is to be made up of economic and military aid, that larger appropriation is recommended for the Asian countries situated like an arc stretching from South Korea to Afghanistan. It is not clear yet whether what Stassen wants is an economic counterpart to SEATO.

Whether US wants aid to come in a big way or not, Asia is determined to go ahead. It is good to know that Stassen returned from his tour with the conviction that the countries of Asia, through their own self-help programmes and the intelligent use of whatever aid they have received are laying a firm foundation for a successful development effort. A significant difference in Stassen's proposal, however, is the emphasis on Government aid. The President's report was largely concerned with freer movement of private capital; the latter is now relegated to a secondary place or rather, it comes in only at a later stage, to take over from Government aid. The magnitude of American assistance required by these countries is rightly made dependent on the relative prices of raw materials but not so rightly on the flow of private US capital.

Preferred method of financing probably will take the form of long-term, low interest loans, repayable largely in local currencies. This is believed to be the most effective means of stimulating the kind of basic development the Asian countries need, in contrast to the rapid reconstruction the Marshall Plan spurred in industrialised Europe. Grants also may be used, but chiefly when a loan would impair the credit standing of a recipient nation.

Technical co-operation will be an important part of the Asian programme, whatever shape it may take. Much of the aid will be handled on a bilateral basis. But such existing channels as the Colombo Plan may also be utilized.

Our Delhi Letter

Socialism and Unemployment

Wednesday, Evening

BY his budget speech in the Lok Sabha, Shri Chintaman Deshmukh raised a veritable hornets' nest. Almost the whole House was at him, particularly for the total absence of any socialist bias in the budget proposals. Shri Chintaman, however, remained unconvinced and bravely retained the monopoly of having discovered a very substantial and significant element of socialism in his budget proposals. Quite a number of politically-minded people inside as well as outside the House have, however, been uncharitable enough to ascribe a certain measure of opportunism to the great Finance Minister. They felt that there was a subtle irony in his concluding remark: "... Our objective is an equalitarian, egalitarian and progressive society." Why was Shri Deshmukh so emphatic? How did he manage to pick up the words 'egalitarian' from the Prime Minister's speech in Parliament and 'equalitarian' from his Chandigarh speech and combined these with his 'progressive' element into a rather high powered phrase—too strong for the philosophy he practises? To these matters, however, we shall return presently.

WHERE ARE THE LOANS?

With falling agricultural prices and growing unemployment, the House apparently was in a somewhat angry mood. The recent report of the Director-General of Resettlement and Employment that the number of registered unemployed in the country have passed the six lakh mark aggravated to a certain extent the feeling in some parts of the House. Shri Chintaman's reaction, while more conciliatory—he announced certain concessions in respect of the cotton excises and withdrawal of the excise duty on sewing machines—was really less democratic in handling the House. In fact, he exhibited signs of irritation and cried out against the *simhas* to the right of him and *simhas* to the left of him, to the front and to the back of him, much like the Russian lady, who cried "germs, germs, germs" when surrounded by a crowd of *muzhiks*. There was hardly any *muzhik* in the House, but who were the *simhas*? The first Parliament of the Indian Republic has hardly ever

exhibited any leonine fury. In fact, the only character the Houses of Parliament have uniformly displayed is a sheep-like docility in the presence of the Great Master, Pandit Nehru.

EMPLOYMENT, BRICK BY BRICK!

In his references to the problem of unemployment, the Finance Minister repeated his old doctrine about the First Plan being devoted to capital formation, from which it followed that the unemployed must wait for the Second Plan. But if the economics of the First Five-Year Plan have gone all wrong, where is the guarantee about the soundness of the Second Five-Year Plan to be drafted by the same economists who made all the miscalculations of the First Plan? In any case, the question is being repeatedly asked inside and outside the Parliament, "Why should the unemployed have to wait?". Much of the talk of capital formation, it is being increasingly suspected, is merely to confound the issue. There is growing impatience with the Deshmukh philosophy of "building up new types of employment, *brick by brick*" (italics mine).

There were references to China in the budget debate in the Lok Sabha. It is curious, however, that the members spoke about all the other achievements of China in a somewhat exaggerated manner, but made no reference to China's solution of the problem of unemployment. The major achievement of all communist countries has been a complete and effective solution of the problem of unemployment—which has been the principal attraction for the masses. Shri Deshmukh's comparison between India and China is interesting and significant: "... in the system they (the Chinese) have elected to operate, starting from backwardness as a result of many historical incidents, they are bound to make a better showing in the beginning than we can". This appears to be a somewhat unwarranted concession to communist doctrine. In fact, if Shri Deshmukh could be converted to the view that there is no economic justification for the existence of unemployment, particularly in an under-developed economy, and that while other eco-

nomic problems (production and productivity) might take time, there is no real obstacle to the immediate creation of full-employment conditions, our achievements, at any time, would far surpass those of the Chinese.

RUSSIA MUCH IN THE PICTURE

There were also references to Russia in the budget debate. Both, the members of the House as well as Shri Chintaman Deshmukh, however, got into a medley of errors. There was really no point in saying that direct taxation in Russia was only ten per cent, the overwhelming part of the Soviet budget being financed by a heavy turnover tax at source. But the way that Shri Chintaman Deshmukh dangled some price data, without any reference to money incomes, to say the least, exhibited a crudeness and lack of perception that one does not like to associate with a Finance Minister with his background. Either he is badly advised or he does not care to check up his information. He referred to prices in Russia and proudly claimed that a pair of shoes in this country did not cost Rs 150 as in Russia and an overcoat, Rs 2000. To quote these prices without any mention of income levels is grotesque misrepresentation. He ought to have added—I do not know, if he or his advisers know it—that the average wage in the Soviet Union works out to Rs 750 or even more—this calculation is based on a very conservative estimate and may even be out-dated—as compared to about Rs 100 in Bombay and Rs 60 in Calcutta. These are obviously rough figures but they do decisively indicate the incomparability of prices.

There have been other political references to Russia during the week. The Prime Minister also referred to the Soviet Union in his speech at Chandigarh: "... Russia (has) made remarkable progress during the last 20 or 25 years but the methods adopted by it were different from ours. *It is not our path and nor, I hope, will it be. Russia does not have a democratic system of government...* Many of the freedoms which the people enjoy in India are lacking there..." (italics mine). It is clear that this speech is likely to be misunderstood. These references, while well

intentioned, were not equally well-advised. While the Prime Minister is fully entitled to have his own political philosophy, the preaching of it has necessarily to be limited by political considerations. Not that we should be afraid of the Soviet Union, or of the United States, but in the world in which we live it would be worse than folly to make enemies. In fact the outstanding achievement of Pandit Nehru's foreign policy has been that we have been making friends with almost every one and trying to take the fangs out of our enemies.

Incidentally it occurs to me—this, of course, is frankly cynical—that the Indian Embassy in Washington would make capital out of Pandit Nehru's speech. The record of this Embassy has been one of unmitigated failure. Whatever our politics, our representation in Washington should be stronger than it has been. If we could afford a Radhakrishnan for Moscow and a Panikkar for China, we could well have afforded a man of equal eminence and comparable political philosophy and learning for the United States. It appears only correct that the Americans should be as well informed of Pandit Nehru's liberal philosophy as of his socialism, but the foreign services are now becoming a monopoly of the ICS, who will see that a safe man goes to Washington.

There was a third reference to Russia—this time by Dr Ambedkar in the Rajya Sabha in connection with the constitutional amendments. Of course it was natural to expect that these references would not be complimentary, but despite the violence of his phrasing which takes away much from the value of his speech, the points that Dr Ambedkar raised are really important and need to be carefully thought over. He said that he could not understand the theory of no compensation unless, as in Russia, State undertakes the responsibility of giving employment to every one and providing every one with the necessities of life and "of feeding, clubbing, housing and scrubbing the citizens". The language used by the learned doctor may not exactly be scholastic but the point Dr Ambedkar makes, however, needs examination, as also his judgment that peasant proprietorship would be the cause of ruination in the country.

The delegation of civil servants and businessmen—co-existence in

practice—has come back from the GATT conference at Geneva after a six months' gala time. Immediately came out a statement by one of them, patting himself and his colleagues on their backs for the grand achievement of reorienting—not regretting, that was the British phrase—the GATT to suit the economies of under-developed countries. We can now go ahead, so goes the official statement, with our Five-Year Plans according to schedule. How long will it take the Government of India to realise that the mechanics of international trade, not, of course, without their importance and significance for a developing economy, have to be geared to the purposes of planning? They surely do not have the importance which is given to them. With the Randall Commission recommendations as the basis of the US foreign economic policy and the attitude of the US Government, as exemplified in the case of Swiss watches, the future of the proposed international trade organisation does not seem as bright as our representatives have made it out to be.

NEWSPAPER SOCIETY'S BUILDING OPENED

Newspaper owners had a grand meet for the opening ceremony of their new building in New Delhi. In his opening speech, the Prime Minister rightly went at them; "I find that our newspapers are very

eloquent on political issues but remarkably timid when social and economic issues come up . . . Indian newspapers have yet to make a serious effort to reach the *broad masses of the people*" (italics mine). Of late, there is some evidence of a leftist swing in the phraseology of the Prime Minister, but it is quite probable that I am seeing more meaning in it than it contains. Judging from the speech of the President of the Indian and Eastern Newspaper Society, it appears that the Prime Minister's speech was totally lost on them.

The newspaper proprietors want the Press Commission's Report to be scrapped, for its implementation would bring disaster! Disaster to whom?—to the owners, to the working journalists or to the newspaper readers? It was really funny that the President should have said that the Press Commission was not representative of the press. Was not Chellapathi Rao of the *National Herald* a member of the Commission? There was, of course, no representative of the vested interests, but apart from the fun of it, it is really tragic that these people are in no mood to adjust themselves, as the Prime Minister has been advising them repeatedly—in fact, *ad nauseum*—and they will go under. But why weep over the fate of people who are determined to go along the road away from glory.

From the Calcutta End

Prosperity of the Tea Industry

Wednesday, Evening

LAST week the Indian Tea Association had its 74th Annual General Meeting. That makes it a couple of years older than even the Indian Jute Mills Association whose Chairman's address I had occasion to report in the previous issue. But Mr Mackay Tallack's speech at the Tea Association did not give the slightest impression of age—this is something to be proud of, and which the jute mill people unfortunately could not achieve. Both by his spoken word as well as his personal bearing Mr Mackay Tallack radiated confidence. He was fully aware of the difficulties and problems of the tea industry but looked even more fully conscious of its ability to meet the challenge that they presented.

For some months now the prosperity of the tea industry has been reported often in these columns but an unequivocal assessment of the factors that have produced this seeming prosperity is not yet in sight, just as much as the 1952 crisis can still evoke considerable differences of opinion and heat.

OUTPUT INCREASED WITH DEMAND

At the beginning of his speech, the Tea Association Chairman agreed that 1954 had seen considerable increase in demand in almost all countries of the world. Contrary to the general belief, however, the production of tea in 1954 was also greater than in 1953, and it would seem from the purely statistical angle that production in fact kept pace with consumption. But then the trouble is that there is an enormous time-lag between the manufacture of a pound of tea and its arrival at the grocer's shop. This time-lag does not matter when demand is stationary, but it becomes of immediate significance when demand shows a rapid increase and stocks are dangerously depleted.

FACTORS SLOWING DOWN SUPPLY

Certain other factors were also at work in 1954. For example, buyers feared that the Government of India would not release as much tea as the International Agreement allowed. Actually Government did make a steady release of quotas but the anxiety continued, and prices rose accordingly. Then there were

the floods in the Dooars. The Assam Link was seriously breached and was out of action for over three months. This breakdown in the normal lines of communication inevitably disrupted the despatch of tea from the gardens, and added greatly to the anxieties of the markets. Even more dangerous, said Mr Mackay Tallack, was the shortage of foodstuff in the gardens, and of supplies essential to manufacture, notably furnace oils. To make good these shortages the industry turned to air transport—

"It is difficult to pay adequate tribute to the pilots who, operating in times of deplorable weather condition, and on air strips all of which had been affected by the monsoons, and one of which had been partly washed away, managed to keep the gardens and their labour forces supplied with essentials until the floods subsided, and until surface transport was able to resume. In these difficult monsoon months, *Jamair* pilots made 803 emergency trips and I am glad to have this opportunity of expressing my admiration."

The ITA Chairman also paid a handsome tribute to the River Steamer Companies who carried record cargoes to and from the gardens.

LONDON STOCKS DANGEROUSLY LOW

The London dock strike had also no mean role in sending tea prices to the levels to which they rose. Ever since the last war, stocks of tea in London have been considerably below the levels considered normal before 1939. In November 1954, however, as a result of increased consumption and the dock strike, stocks fell to about 60 million lbs when a level of 100 million lbs was generally regarded as a very low figure. Buyers were desperately anxious to acquire tea lest they should run out of supplies. Their anxiety communicated itself immediately to the Calcutta market as well. Before the year was out, another obstacle to the speedy despatch of tea was contributed by the 'go slow' movement in the Calcutta port.

Regarded in the light of these

more or less extraneous influences on the tea markets, Mr Mackay Tallack remarked, with perhaps a momentary touch of bitterness, that the prosperity of the industry "in which people believe so much more fervently than they did in our adversity" will prove less permanent than is generally expected.

SKYMASTER FOR COUNTRY LIQUOR

The Tea Association Chairman drew the attention of his audience to the fact that while the real wages of the workers have risen by 125 per cent during the last seven years, there are aspects of this increase which have caused the industry considerable disappointment. The consumption of liquor has increased enormously in the tea districts, and though the official explanation is that illicit distillation has been checked, the industry does not share that optimism. There has been a 42 per cent increase in consumption in Lakhimpore and 45 per cent increase in Sibsagar during 1954. One particular country liquor shop near Doomdooma is reported to have shown a 600 per cent increase in consumption since 1945, and it is an open secret that a Skymaster was chartered to take country spirit to an area which was running short of supplies.

Mr Mackay Tallack pointed to another disturbing feature, *viz*, that with higher wages the workers tend to limit their day's work. In a recent discussion in Calcutta it was urged on behalf of the workers that the wage for the morning's work should be increased so that workers would not need to work after mid-day. There has been in the Dooars a resolute attempt to secure a 4-hour day, and to gear the work performed during that period to the speed of the slowest worker.

With a touch of humour, Mr Mackay Tallack said that he realised that there are cynics who reach for the salt cellar whenever businessmen talk of the national interest, but he remained of the opinion that it was against the national interest for wage increases to be frittered away on unworthy objects, and for a handful of malcontents to be allowed to interfere with the vast bulk of the workers who are

still prepared to do an honest day's work.

The tea industry is reported to be accelerating the process of Indianisation, and has prepared a five-year plan of recruitment which Government has accepted. This plan envisages the filling of vacancies with a three or four to one proportion of nationals to non-nationals. The number of vacancies, however, is less than is generally imagined. The prejudice against service in a tea garden is lessening and Mr Mackay Tallack said that he felt gratified to be

assured by one candidate who understood that there were "several quite respectable people" working in the tea industry.

* * * *

INFLUX OF REFUGEES CONTINUES

The West Bengal Government as well as the Government of India are becoming daily more concerned at the fresh influx of refugees from East Bengal. This seems to upset all the plans that the two Governments had jointly worked out to rehabilitate the refugees.

It is reported that the bulk of the refugees coming in now belong to the community of Nama-Sudras—the semi-prosperous cultivating class. They are fast losing their source of livelihood in East Bengal and, what is more, are in constant fear of being exposed to the outburst of communal frenzy. The political situation there is none too happy, with the unsettled relationships between the Krishak Praja and Awami League. It has been seen in the past that disturbances between political parties often involve communal riot.

From the London End

Economic Interdependence in the Soviet Bloc

THE *Economic Survey of Europe* in 1954, just released to the public, is another sprightly and first-rate document from the UN Economic Commission for Europe. The Commission's comments and forecasts all bear the stamp of reasoned caution while its recommendations carry considerable supporting and convincing analytical data. The particular virtue of the current *Survey* is the information provided on various special problems of the European economy. The more interesting of these studies are those which deal with economic relations between members of the Soviet Bloc. This despatch aims to review this part of the *Survey* with the purpose of assessing the Soviet view on the relation between rapid economic development and international trade and specialisation. The economies of South-Eastern Europe have all along possessed the character of under-development. Their importance in international trade before World War II arose from the fact that they were important producers of foodstuffs and other primary commodities for export to the more advanced countries of Western Europe. With the ascendancy of Communism in the post-war period, however, the considerable emphasis placed on balanced economic development had for a time reduced their importance in intra-European trade. In 1953-54, there appeared to have been some changes in basic economic policy, which gave the impression that recognition was now being given to questions of comparative cost advantage and international specialisation. The ECE's *Survey* considers these new attitudes and policies and their

implications. Unfortunately, the study was published just before the more recent changes in Soviet and Hungarian economic policy.

The ECE's study of economic interdependence in the Soviet Bloc deals with developments in the "Eastern World Market" the emergence of which was heralded by J V Stalin in his *Economic Problems of Socialism*. It has always been difficult to understand the Communist argument that imperialist expansion was the result of a search for markets where production surpluses could be disposed. It has become all the more difficult when we find the following passage in Stalin's work:

"... it may be confidently said that the pace of development (in the Soviet Bloc) it will soon come to pass that these countries will not only be in no need for imports from Capitalist countries, but will themselves feel the necessity of finding an outside market for their surplus products."

In any event, the development of the new market is now a fact, and trade over an ever-widening area of products is taking place together with a high rate of national development.

Steps towards re-moulding the trade pattern of East European countries appear to have been taken in 1947, when a number of broad bilateral agreements on economic assistance and co-operation between the USSR on the one hand, and Bulgaria, Czechoslovakia and Poland on the other, were concluded. Technical Assistance and the supply of equipment and credit for

rapid economic development were a feature of these agreements. The development of a separate market in the sense described by Stalin had apparently taken a more formal and collective character with the creation of the Council for Mutual Economic Assistance in January 1949. These were subsequently strengthened by some co-ordination of national development plans among the countries concerned, and in this way a degree of specialisation in each of the economies was introduced.

According to the ECE, the Soviet Union had between 1937 and 1953 increased its trade with countries in the Eastern world market by some 5000 per cent. In the same period, Soviet trade with Western Europe had remained stationary, and that with the overseas countries of Asia and Latin America had increased by some 200 per cent. Similarly, the trade of Eastern Germany, Czechoslovakia, Poland, Hungary, Rumania and Bulgaria, have all been reorientated towards serving the Eastern world market. A basic change in the distribution of the trade of this area has taken place.

Although the actual mechanics of balancing of trade still remain based on strict bilateralism, a considerable growth has taken place in the provision of credit facilities covering the delivery of industrial equipment and raw materials and foodstuffs to each other, as also in the provision of credits in the form of gold and foreign currency. It would appear that USSR has remained the most important creditor nation in the area. Poland's vast plans for the

development of engineering production, and of the establishment of large steel plants, is based on credits from the Soviet Union. Two large equipment credits have been granted to China by the Soviet Union, and it appears that countries like Eastern Germany and Czechoslovakia, each of which are highly industrialized, are participating in an important way in the economic development of the Chinese mainland and the more backward areas of South-Eastern Europe.

Certain fundamental changes in the commodity pattern of trade are also recorded in the *Survey*. Trade is no longer confined to the traditional exports of raw material and foodstuffs against manufactured imports. Each of the countries concerned buy from each other mechanical equipment, heavy engineering products, consumer goods and foodstuffs, and it would appear that the trade in machinery and equipment plays what the *Study* calls an "impressive part in the Eastern world market". Something like one-third of the total exports moving within this group of countries is composed of machinery and equipment. Countries like Poland and Rumania—traditionally agricultural countries—are exporting machine tools and heavy industrial equipment to the Soviet Union and import grain in return.

Such an impressive interchange of goods must necessarily call for a revision of the traditional autarchic policies of Communist countries. Some revision appears to have taken place, though the aim of balanced economic development has not been abandoned. The ECE found that increased attention was being given to "comparative costs of production and to the benefits of greater international specialisation" and apparently production for export is assigned new importance in discussions on the allocation of investment funds. But the advantages to be gained from specialisation are superseded by the general desire to complete quickly the plans for balanced economic growth. Thus trade and specialisation is likely to become more and more important for each of the economies as soon as the plans for heavy industry are completed. "This approach," notes the *Survey*, "if not pushed to the extreme, can offer very great advantages in that it does not allow economic development to be blocked as frequently happens in some other countries."

The specialisation of production where it currently exists in the Eastern world market is regarded as temporary, in view of the fact that it originates largely from natural conditions. But these are being changed, and some examples of this are given. In the second half of 1954 agreements for the co-ordination of light industries, largely consumer goods, were concluded between Czechoslovakia and Hungary, Czechoslovakia and Eastern Germany, and Hungary and Eastern Germany. In the chemical industries, East Germany and Poland made a special agreement for the former to specialise in products derived from brown coal and the latter for products derived from hard coal. Further, the aim to secure increased benefits by way of specialisation is being manifested in the co-ordination of economic programmes, starting at the beginning of next year, when Eastern Europe as a whole will inaugurate new long-term plans timed to coincide with their next Five-Year Plans.

The increased emphasis on trade within the Eastern world market

arises from "the advantages which it offers of greater specialisation" at higher levels of economic activity. This does not appear to imply any weakening of the area's basic aims of national industrialisation and balanced economic growth, but rather to emphasise, as the ECE puts it, "the effort to promote the attainment of these objectives through closer attention to the question of relative cost and efficiency." The benefits from trade in such a context would be a function of the degree of co-ordination between the national planning of each of the countries concerned. And here, as shown above, some progress has been made towards achieving this co-ordination. While the full benefits of this co-operation in the Eastern world market must await the future, an element of uncertainty has been introduced into all this in view of the current drastic redirection of Soviet and now Hungarian economic planning. It is not easy to guess how trade within the area will be affected by the new emphasis on heavy industry.

Economic Stability Through Collective Absorption of Losses

R M Mitra

THE Avadi session of the Indian National Congress has set the stage for future economic progress in India. Indian economy will be geared to conform to the "socialistic pattern" of growth and expansion. The decision has been announced with a flourish which has disturbed the sedate leaders of trade and industry. Questions are being anxiously asked if private investments will be taken over by the State and misgivings are being expressed whether centralised control and ownership will not atrophy initiative which is an essential prerequisite for advancement—technological or organisational.

In the welter of confusion caused by the new proclamation of faith, an important question seems to have received scant attention. Does 'socialism' represent a precise economic concept? Is socialism a carefully considered regimen of applied economic science; or is it a creed of piety? Is there any well recognised economic doctrine to enlighten the path to socialism; or is there any organised economy functioning to guide socialistic endeavour?

DOCTRINES OF SOCIALISM

It has been said that socialism is a process of "polarisation of society" into a few owners of means of production and many workers, resulting in an organisation in which employees themselves are their collective employers. It is a pity, that though the various socialistic doctrines have concerned themselves so much with the devising of means and elaboration of the case for socialism, the institutional end sought to be achieved has often tended to be indistinguishable from the means advocated or the 'desiderata' preached. Even when some of the doctrines do not lose sight of the objective of collective ownership of productive wealth, they do not provide any consistent pattern of an organisational set-up. There are socialists who would wind up the State; some will tolerate the State and others will use and build on the State. These differences do not even follow any group-line. In the same group of Utopian socialists, Saint-Simon's bitter opposition to politicians reconciles itself with the existence of State, Louis Blanc

actively utilises the State; but Fourier would extinguish it. Saint-Simon's "regime administratif" (administration of things) and Louis Blanc's "Peoples' workshops" are designed not to be incompatible with the concept of State, while Fourier's "Phalanstere" (a self-sufficient economy with people working in a co-operative manner) would liquidate the State. Similar antithetical approach is reflected in the attitude of the Social Democrats who build on democratic evolution of State as against that of the Syndicalists in whose estimate a man is a worker and not a citizen and is primarily a producer, if incidentally a consumer also. The concept of collective ownership seems to have assumed so many different shapes, that one might be tempted to conclude that the dominant note of socialism is its "protean character".

NO COMMON PROGRAMME

An analysis of the case for socialism shows that the 'desiderata' intended to be served through achievement of socialism, are equally varying in character. Saint-Simon is anxious that inefficiency should be eliminated through the creation of a socialistic society; Fourier bewails the sufferings of workers uprooted or displaced by Industrial Revolution and wants to establish socialism mainly to remove inequity. Means to attain socialism, also, vary between the methods of 'inevitable crisis' (Karl Marx), conscious and continuous combats (Rosa Luxemburg) and slowly developing strategy (Social Democrats *qua* Fabians). It seems clear, that "socialism", whether viewed as an organisational concept, or the socio-economic gains to be expected, or the means to achieve, or an amalgam of all these elements, has not yet acquired any definitive connotation, however powerful it may be as a slogan. It is disturbing, therefore, that while socialism has no common programme of action, it threatens to be used to strengthen the influence of a common danger that is developing in almost every form of economy now in existence, however different they may be in other respects.

GROWING EXECUTIVE CONTROL

Sufferings from dislocation and losses from unequal competition for

markets have been an inescapable accompaniment of the changes that are being brought about by industrial and technological development. It is being increasingly recognised that technical efficiency and large and more efficient production will not bring about economic progress unless stability of employment and stability of market are ensured, and the productive system is shielded against unregulated competition and alternate bouts of wild activity and freezing despondency. Present-day economic planners have, therefore, been assigned the task of forecasting, as far as they can, economic disequilibrium, that may accompany or arise from future developments in the fields of production, distribution and consumption; and further of evolving mechanisms to prevent the emergence or to neutralise the effects of disequilibrium. Some sort of planning, whether in the form of *ad hoc* adjustments or a systematic and deliberate process, has been in operation for the last half a century in almost every country with an organised economy. Though State socialism in Germany whether under monarchical or Nazi totalitarianism varies from that in democratic Australasia, and though State socialism, Russian communism and private economy (or democratic socialism?) of the USA and England, differ in essential particulars, a significant but ominous development, however, characterises almost all of them. It is the common trend towards more comprehensive and rigid control by the executive organ of the State of the economic forces of supply, demand and price. It is for the business leader to realise that this trend, if unchecked, may slowly take away the substance of ownership, by

whichever name the economy in his country may be known, and whether 'socialism' succeeds in growing into a consistent system or not.

SOCIALISTIC TRENDS IN INDIA

A study of the socio-economic developments in India discloses that while the political bias is toward gradual elimination of the private sector, the apparent social motive is removal of inequity, if not inequality. The political approach is illustrated by the announcement of the decision to nationalise or socialise the Imperial Bank, and the social trend is reflected in the recent speech of Shri Deshmukh in defence of his 1955-56 budget. The Finance Minister is reported to have held that his budget conforms to the desired "socialistic pattern", because it aims at removing disparities in income. The legislative powers of the State already are, if indirect, sufficient to bring about complete de-thronement of the private sector. The further measures that are under discussion (including amendment of the Constitution) seem only an accentuation of emphasis, and not really a closer approximation to the latent political goal of disappearance of the private sector. But the confusion created by the mixing up of the political and social motives has unfortunately inaugurated a policy of "muddling through".

It is time, therefore, that a real heart-searching was undertaken and further thought given to the objective goal and practicable measures, and less energy was spent on a debate about whether our goal and methods should be called socialistic or capitalistic, or by any other flamboyant or prosaic name. It should be possible to agree that economic progress may be affected by private exploitation on the one hand and destruction of initiative on the other, according as the economic organisation is privately owned and controlled or publicly owned and controlled; but both the forms of ownership may be thwarted by the common difficulty of regulating or "educating" demand to equate supply, not only in statistical measures of quantity or value, but also in terms of individual satisfaction of 'economic want'.

and also lead to either destructive anarchism or exploitory or tyrannical dictatorship. Again, mass ownership which tries to effect a physical equalisation of demand and supply, will fail to provide that satisfaction to the individual consumer in terms of his 'economic want'. Unregulated and unprotected individual ownership will, on the other hand, lead to scramble for markets with recurring dislocation and periodical disruption of marginal units of production resulting in distressing unemployment.

It is not, therefore, the ideological patterns which may provoke excited feelings of either admiration or hostility, that will prove competent to deal with the real dangers. A realistic appreciation of the practical measures which Roosevelt initiated in the USA and which have succeeded in making American banking failures a forgotten chapter of history, may perhaps indicate the way.

A system in which the competitive structure of private enterprise is preserved, but which provides for collective absorption of individual losses and disturbances, seems to be taking shape in the USA. The regulative function of the State is to consist in determining and enforcing the method of absorption of losses, and the protective function to consist in arranging merger of the units of production which have been battered by competition. While the private sector is expected to pay the price for stability and opportunity of continued functioning, it is not to be burdened with continuance of uneconomic units, nor is the consumer to be called upon to undergo the torment of reducing himself to the status of a cog in the wheel of production, without the right to satisfy those human impulses which remain vital though profaned by the vulgar name of "economic want".

too much on

lubrication?

Believe it or not, we don't try and sell gallons and gallons of oil when we advise a textile mill on lubrication problems.

We sell quality, not quantity. We aim to sell the right quantity of the right grade of a quality oil which is designed to do the job and to last longer.

The test—physical and chemical—we carry out—machine by machine—determines the consumption of oil and we recommend the minimum quantity of oil consistent with efficient lubrication.

Economy is the watchword in our investigations. Recently in Bombay we carried out tests on ring spindle oils used by a local mill. Result: nearly double the oil change period was advised.

Can we help you to meet the rising costs of production by a free analysis of the oil requirements of your plant?

BURMAH-SHELL... IN INDIA'S LIFE AND EVERY MOVING PART OF IT

reorganise the existing co-operatives and start new co-operatives and village councils on a nation-wide scale. Social centres should continue as citizens' advice bureau, as protectors of their civil and economic rights, to educate the farmers about their social responsibilities, and as social service agencies for the disabled, handicapped and the under-privileged and of such other activities as would improve the life of the community. Co-operative societies and village councils cannot replace social centres which are people's organisations to make better use of their leisure and improve the quality of their life generally. The activities of these centres may change according to the state of development of the people and the nature of services rendered by the state. But "even in a country so all-of-a piece as Great Britain a distinguished social thinker like William Beveridge finds wide social aims which even today can best be explored and advanced by groups independent of Government. This is the burden of his—Voluntary Action—a report on methods of Social Advance." (*Communities for Better Living*—Dabir-Harper.) This should be much more true of Middle East countries which need strong voluntary societies to inspire the farmers with an urge for undertaking community responsibilities.

FINDINGS

1. Social centres were organised in Egypt from the year 1939. They filled the gaps left in the services of different Government departments, eg, supply of seeds and fertilisers and of credit to the farmer, medical relief and preventive health work, etc.
2. Neither state expenditure on a large, centralised and high-grade superior officers' cadre nor on provincial staff is justifiable for rendering various technical services under a special department, when other state departments already exist for providing these services.
3. The objective of the social centres is to arouse mass enthusiasm to assume community responsibilities, and train leaders for running community institutions. The programme of the centres has neither been formulated nor implemented from these points of view, though some success in these directions is bound to result when a number of committees function and when small local collections are made from the public.
4. The tests for the successful working of social centres are their

ability to raise funds, to make maximum use of local resources, to promote self-help, and take advantage of state technical aid. A minimum contribution has not been made obligatory for the centres. As compared to state aid, local contribution is insignificant. Development of local resources through crafts has not been a success, as no organisation was set up to supply credit, raw materials and equipment, and market the products. Self-help is best promoted through co-operative societies but the workers of the centre had no contacts with the latter except unofficially. Either owing to the inefficiency of the departments, or want of proper co-ordination, technical aid from Agricultural and Co-operative Departments has not freely flowed to these centres. The Health Department did not consider social centres as their own to be fostered.

5. The organisation of the centres by a state department, their control by a superior staff different from that of rural departments, their administration by a paid staff on the spot (not that of the centres but of the Fellah Department), financial grants from the state far in excess of local contributions, and erection of imposing buildings mainly at the cost of the state have weakened their sense of community responsibilities, lost for them the co-operation of the Rural Department, and transformed them into semi-state projects.

6. The agricultural graduates who are the social workers appointed by the Fellah Department have little opportunities to utilise their capacities for agricultural development but are engaged in activities as health, literacy, sports, youth clubs, etc, which might as well be done by a staff with lesser qualifications. These graduates should be absorbed in the Agricultural and Co-operative Departments or as secretaries of co-operative societies.

7. Nurses belonging to the social centres can do better work under the Health Department.

8. Social centres should be restored to their old voluntary status instead of being established by the state, financed by the state and controlled by a state staff. Rural reform societies show more community spirit. The federation of such societies will be a better organisation for promoting community spirit.

9. With the growing expansion of Rural Department and the strengthening of co-operative societies and

village councils, social centres can enter on their legitimate tasks. They can play a great part in awakening the farmers to the importance of combined action in protecting themselves against the profiteering of private banks and trade, and an awareness of civil rights in their daily life and work. They can represent public needs to the authorities concerned. They can continue their present activities, eg, management of kindergarten and primary schools, recreation and youth clubs. They can render social assistance to the needy. They can educate the farmers in their rights and responsibilities as members of co-operative societies and village councils.

10. Grants for social centres in the future should come from the departments concerned but only those centres which are non-political in character and are not dominated by political parties should be entitled to such grants.

11. The administration of state technical aid should be reorganised. Departments such as co-operation should be brought under the Ministry of Agriculture, a council should be formed consisting of the heads of the departments concerned with rural life in order to co-ordinate the activities of these departments at the state and provincial level; and a similar advisory council of non-officials and non-official institutions should also be formed with the same end in view. An extension staff working through agricultural co-operatives, and a co-operative department to supervise and direct credit, supplies and sales of co-operatives, and an independent evaluation and audit section to review agricultural extension and co-operative activities will provide the necessary technical aid to the farmer. The Health Department should have a sufficient number of nurses for village dispensaries and sanitation staff to look after environmental sanitation.

12. The immediate need is the provision of trained workers as secretaries of agricultural co-operatives and village councils. The former will be a cadre under the agricultural bank and the latter under a central federation of provincial councils. Every village should have a village council and an agricultural co-operative society. Community organisers should be provided in adequate numbers to reorganise the existing co-operatives and start new co-operatives and village councils throughout Egypt.

INVEST IN INDIA'S FUTURE

The Central Bank of India Limited

Speech delivered by the Chairman, Sir Homi Mody, at the Forty-fourth Ordinary General Meeting of the Bank held on March 25, 1955

"THE operations of banks in India," observed Sir Homi Mody, Chairman of the Central Bank of India, Limited, in the course of his speech at the Annual General Meeting of the Bank on March 25, 1955, "recorded a substantial improvement in volume during the year 1954. Total deposits of scheduled banks averaged Rs 887 crores in 1954, as compared with Rs 853 crores during the preceding year, but they were still below the peak of Rs 990 crores attained in 1948. Demand deposits showed an improvement of Rs 16 crores as compared with the previous year, while Time deposits maintained the continuous rise witnessed since 1948. The average amount of bills and advances of scheduled banks during the year was Rs 532 crores, as compared with Rs 508 crores in 1953."

Economic Position

Sir Homi pointed out that the economic position in India, following the general pattern in the US and Britain, had shown a further improvement during the year under review. "The food deficit," said Sir Homi, "which necessitated at one time considerable imports involving heavy commitments of foreign exchange, was practically wiped out and controls were lifted. Side by side with this, a substantial recession in food prices took place, and that has posed a somewhat difficult problem, but if the deficit financing envisaged in the Budget materialises, it is bound to arrest the decline in prices, and may even lead to inflationary pressures."

Referring to the substantial improvement in industrial production, Sir Homi observed that in several industries the targets fixed under the Five-Year Plan had been achieved or exceeded. A number of new enterprises had been started and both in the public and private sector, substantial improvements were recorded. Inland and foreign trade were also at a higher level than in the previous year.

Commenting on the employment situation which had continued to cause anxiety, Sir Homi said that the malady was deep-seated and short-term remedies were not likely to provide anything more than a

palliative. He felt that only by large scale expansion of production and distribution would it be found possible to reduce it to manageable proportions.

Company Law Amendment

Sir Homi then commented on some of the measures vitally affecting the future of industrial development in this country initiated during the year. He first referred to the Company Law Amendment Bill. The changes proposed in the Select Committee stage of the Bill were very drastic, and they would in effect mean not the reform of the Managing Agency System, but its total elimination in due course. He hoped that when the Report of the Select Committee was published and the full implications of the measures proposed were appreciated, industrialists and investors alike would make an organised effort to press their views before Parliament and see that their case did not go by default.

The Constitutional Amendments, now before Parliament, presented a very alarming picture, said Sir Homi, and he felt that steps should be taken to ensure that Parliament was not left in any doubt with regard to the reactions of the public which is affected towards measures which would largely do away with the Fundamental Rights secured to the citizen under the Constitution. "Section 31 of the Constitution," he continued, "relating to compensation for acquisition of property, had been framed after prolonged and anxious deliberation, and nothing has happened, in my opinion, to warrant the drastic curtailment of the rights which holders of property enjoy in every other free society."

Budget Proposals

Although the Budget presented to Parliament did not come under a review of the events of the past year, Sir Homi felt that it was impossible to avoid a reference to it. "While the Development Rebate of 25 per cent which the Finance Minister has proposed should be of undoubted benefit to industry, the proposals for direct taxation in respect of the middle and upper income groups can be understood only if it is the declared policy of

Government to eliminate the savings from which investment capital is created and to destroy all incentives. The Report of the Taxation Enquiry Commission contains some very radical suggestions, calculated still further to cripple the capacity of the entrepreneur to perform his functions. Some of the recommendations already find a place in the Finance Bill now before Parliament, and if the process goes any further, I cannot but think the economic development of the country will be seriously jeopardised."

Improvement in Business

Turning to the Directors' Report and Statement of Accounts for the year, Sir Homi stated that the total gross earnings of the Bank showed an increase of nearly Rs 30 lakhs, but that due to substantial increase in expenditure, the ultimate net profit for 1954 was only Rs 1,38,000 more than in the previous year. He pointed out that the increase during the year under 'Interest paid on Deposits, Borrowings, etc' and 'Salaries and Allowances, etc' shown on the Expenditure side of the Profit and Loss Statement, accounted for nearly Rs 25 lakhs.

Sir Homi next dealt with the Item relating to Interest on Deposits, Borrowings, etc, which showed an increase of nearly Rs 10 lakhs. "This was on account of the continuance of the high rates required to be paid on Deposits, particularly on Call and Short Term Deposits. There are no signs of any appreciable diminution of such rates in the near future. In this connection, you will appreciate the Bank has to maintain its long standing connections with its valued constituents and cannot afford to forego Deposits and let business pass to other Institutions."

Sir Homi also stated that the Establishment Charges increased by nearly Rs 15 lakhs, more than two-thirds of which was accounted for by the emoluments of the Clerical and Subordinate Staff.

Balance Sheet

Referring to the Balance Sheet, Sir Homi said, "On the liabilities side you will see that the figures of Deposits show an appreciable increase compared to the previous

Size of the Next Five Year Plan—An Amendment

(Contributed)

WHEN the note on "Probable Size of the Next Five-Year Plan" which appeared on March 12, was prepared, I did not have with me the provisional estimates of national income for the years 1951-53 of the National Income Unit. Now I have got these estimates as published in the Report of the Taxation Enquiry Commission.

These estimates are up to the year 1952-53. For the year 1953-54, the Taxation Enquiry Commission has made its own estimate in terms of current prices. I have converted this estimate into 1948-49 prices. From these estimates, it will be found that the real national income has increased at an average rate of about 4.2 per cent per annum during the first three years of the Plan. I have projected this rate of increase for the last two years of the Plan, and have thus obtained the national income figures.

I find that I had underestimated 'other private investment'. I now take it at Rs 200 crores per annum during the Five-Year Plan period. Perhaps it was greater during the first two years and smaller during the third and the fourth year of the Plan.

Table I gives the figures regarding national income, investment etc., for the years 1950-56. We find that the average capital-output ratio would be about 1.34:1 and the average investment-income ratio, 5.6 per cent. Allowing for some under-estimation of investment, the average capital output ratio would be 1.5:1. This low ratio is partly the result of the utilisation of unused capacity, eg, in textiles, and the more than expected increase in agricultural production as a result of favourable monsoons.

For the reasons given in the earlier note, it is assumed that the average capital-output ratio for the next Five-Year Plan period would be 2:1 and the average investment-income ratio would be 10 per cent. On these assumptions, the feasible size of the next Five-Year Plan has been recalculated below. Thus amended, the total volume of investment in the Second Plan would be about Rs 6,600 crores (Table II). For the reasons given in the previous note, this figure could be raised to about Rs 7,500 crores.

Table I (Rs Crores)

	(1) National income at 1948-49 prices	(2) National income at current prices	(3) Public invest- ment	(4) Private invest- ment in organised industries	(5) Other private invest- ment	(6) Total invest- ment (2) to (4)	(7) Invest- ment income ratio (6) as % of (2)
1950-51	8,850	9,530

Motor Vehicles in India

ACCORDING to information given in the Lok Sabha, 1,55,234 privately-owned automobiles, 38,728 buses and 91,125 trucks are plying in the various States of India. The following table gives the number of private cars, buses and goods vehicles taxed in the various States during the last quarter of the financial year 1952-53:

State	Private cars	Buses	Goods vehicles
Assam	4728	1317	4577
Bihar	6783	1417	3978
Bombay	37315	4511	15061
Madhya Pradesh	4500	1277	3460
Madras	23227	6128	9319
Orissa	2097	656	2110
Punjab	2865	1413	3004
UP	10112	3975	6119
West Bengal	27278	8425	25918
Hyderabad	7090	1343	3110
Jammu & Kashmir	260	496	1212
Madhya Bharat	2081	541	903
Mysore	5590	1063	1630
PEPSU	1500	802	763
Rajasthan	4959	2112	2916
Saurashtra	1966	445	1530
Travancore-Cochin	3438	1612	2131
Ajmer	1040	126	198
Bhopal	321	80	347
Delhi	7135	490	1586
Other States	940	492	1535

year; the aggregate total was higher by Rs 6 crores.

"The increase in Bank's business in 1954 is further reflected in higher figures under the heads 'Bills Payable', 'Bills for Collection' and 'Acceptances, Endorsements and other Obligations'.

"On the Assets side of the Balance Sheet, I would refer you to the item of Investments. At every suitable opportunity endeavours have been made to reduce our Investment Portfolio so that the proceeds realised therefrom may be utilised in other channels like Advances and Bills yielding a higher return. Securities of the Central and State Governments and other Trustee Securities accordingly stand reduced by nearly Rs 2,30,00,000. Under other heads, such as Shares, Debentures and other Investments, there have been increases of a few lakhs, with the ultimate result that the grand total shows a reduction of Rs 1,20,00,000.

Investments

"At the end of 1953, the difference between the Book Value and

the Market Value of the Bank's Investments stood at Rs 3,13,00,000. The difference has since come down to Rs 2,41,00,000. It has been our constant anxiety to see that the gap is narrowed and we hope that the profits of the Bank in future years would enable the Directors to set apart larger amounts. In the year under report, it was not found possible to transfer to the Bank's Investments a larger sum than Rs 15,00,000."

Sir Homi then called the attention of the shareholders to the Item relating to the Advances and Bills business of the Bank which on the closing date showed an aggregate increase of a little over Rs 2 crores and 85 lakhs, including a rise of over Rs 1 crore and 9½ lakhs under the heading of "Moneys at Call and Short Notice"; the average during the year stood at a still higher figure.

Bonus

Sir Homi regretted that after making the necessary Appropriations which were no more than required in the present circum-

stances, the ultimate available surplus in the hands of the Directors did not permit the provisions of a higher Bonus to the Staff than one-twelfth of the Basic Salary earned by each member during the year. In this connection, he repeated what he had said last year, that if the position had warranted it, nothing would have pleased the Board better than to have sanctioned a larger amount by way of Bonus.

At the conclusion of his speech, Sir Homi thanked all those engaged in the service of the Bank. "The Managing Director, Mr Captain," said Sir Homi, "has not spared himself in the performance of his duties; he is carrying a burden which has become particularly onerous in the times through which we are passing. Mr Karanjia, Manager, Branches, and Mr Cooper, Secretary, have heavy responsibilities which they are discharging to the entire satisfaction of the Board. To them, and to all other members of the Staff, as also to the local Committees at the various centres, I desire to convey our grateful thanks."

Indo-US Agreements on Fertiliser Supply

AN operational agreement was signed between India and the USA providing for US assistance for a project for augmenting fertilizer supply in India. It is proposed to acquire about 44,000 tons of fertilizers for which the US contribution is \$4 million. The Government of India's contribution for this joint project amounts to Rs 12 lakhs which will be used mainly for meeting internal costs of handling and transportation.

The fertilizers imported under this project will be sold to cultivators in India. The Ministry of Food and Agriculture shall be responsible for the general administration and execution of the project. Procurement of the fertilizers for the project shall be by a procurement agency of the Government of India, or otherwise as may be agreed upon by the US Technical Co-operation Mission and the Government of India.

The Foreign Operation Administration will furnish such specialists as are mutually agreed by two Governments subject to the availability of personnel and funds for such purpose.

Earlier, an agreement was also signed between the two Governments for procuring fertilizers for purposes of demonstration in India. Under this agreement, India would be able to import about 14,500 long tons of different types of fertilizers. The total estimated joint cost of the acquisition and distribution of the fertilizers is \$1,151,000 constituting US contribution, and Rs 28,31,000 which will be contributed by the Government of India.

Textiles Pick Up

Thursday, Morning

AFTER many a week, Textiles fared better on Bombay Stock Exchange during the period under review. They were being neglected recently due to many reasons explained before in these columns such as fall in profits, labour award, etc. Moreover, they were subject to bear selling, and there was also some 'hedge' selling. Many a bull in steels often hedges his holdings by selling textiles. All these factors naturally made the technical position of textile shares healthy and this was clearly noticed in the last settlement carry forward charges.

Last week better Ahmedabad advices caused some activity in textiles and this week Government's announcement of a reduction of excise duties on coarse and medium varieties contained in the budget proposals led to considerable short covering and bull buying. Kohinoors, especially, were well supported by influential parties, and this one time favourite once again came into limelight. Bombay Dyeings also met moderate support. Centurys which had recorded sharp rise a fortnight ago, more or less maintained their value. As against this, Swadeshis once again displayed weakness on rumours of lower dividend.

Steels were very steady this week and movements were confined within narrow limits. Better sentiment in textiles helped smooth absorption of profit taking. The volume of trading in steels, however, during the last days, was significantly low. Indian Iron shed their top gain on big profit taking in Calcutta—the undertone, however, remained steady.

Among the Miscellaneous section, Bombay Burmahs were in demand on rumours of further compensation. Dividend for Premier Construction was announced at Rs 7 per share, and it was up to the market's expectation. The share however shed its top gains on profit selling. National Rayons, Scindias and Tata Chemicals were very dull. Indian Coppers were slightly better on firm advices from the copper market.

The closing tendency of the market generally was steady with firm undertone, but two factors are worth some attention. First, at higher levels in Tata Ordinary, which is the centre of speculation in the market, volume was very thin. Secondly, in the recent rise public participation has been mostly absent. In fact, the second factor is largely responsible for the first.

In bullish activity of a major type, public always comes in, and the tempo gathers momentum. During the spectacular rise in last September, public participation had reached a record since 1947. Without any public interest, the present working of the market appears to be like a sort of tug of war between two strong parties.

The 'Old Bear' continues to carry his huge short sales—and the Calcutta Bull, together with another local Bull, has a sizeable long position. In the absence of public participation, the tussle may continue as both the sides are very strong. The bulls however are in an advantageous position due to such factors as bright prospects for the steel industry, big deficit financing, but the most important of all is the factor that the Bear has no actual shares to deliver! But, then, there is always a danger of other investors dis-investing at higher levels and if this happens, the Bear's position may turn out to be equally advantageous.

The market is being currently controlled by a few big speculators and as such, no real trend can be judged. If left to find its own level, and there is public participation, the market should prove ideal for investors and traders. This is possible however if both the bulls and the "Bear" reduce their position to normal, which at present is certainly abnormal.

Trading to be Resumed in Bullion

Trading continued to remain suspended during the week. However, it may be resumed within a day as the decision to impose margin on new Chaitra delivery has been taken. Margin is quite big at Rs 500 per bar of silver and Rs 7 per tola in gold on commitment of more than 50 bars of silver and 2500 tolas of gold.

The announcement of a cut in excise duties for coarse and medium varieties of cloth induced some activity in the cotton market but the initial small gains were wiped out, due to tired bull liquidation. At present the downward trend seems to have been arrested, but cheerfulness is conspicuously absent. There are rumours of further export quotas; this may bring some relief. Spot advices are again dull after initial improvement.

MORE CRORES FOR PROSPERITY

NEW INDIA CELEBRATES ITS SILVER JUBILEE YEAR: The Company signalled its 25th year of life business by underwriting a record new business of Rs. 43 crores and more, in the year 1954.

NEW INDIA'S RECORD:-

During 1954, the Company wrote New Life Business of about Rs. 12 lacs daily, as against Rs. 5½ lacs in 1953 and Rs. 2¼ lacs in 1947. Thus, the NEW INDIA has recorded the most dynamic progress achieved by ANY Life Insurance Unit ANYWHERE in the world.

For this magnificent record, the Company expresses its deep gratitude to the public for their co-operation, and to its Field Force.

IMMENSE POTENTIAL :

And yet, more and more crores can be harnessed to the nation-building tasks. For, there is an immense potential for the growth of Life Assurance in India —AT LEAST 10 TIMES MORE. The NEW INDIA, in keeping with its unique record, is pledged to contribute

its utmost to the progress of Indian Life Assurance.

DEDICATION :

The Company's trained representatives have dedicated themselves to bring to every hearth and home in the country a Life-belt of Security. We invite you to avail of their expert advice and services.

Insure with the **NEW INDIA** and participate in the Prosperity and Strength of our World-wide Organisation.

Deficit Financing—Price Stabilizer?

THE budget envisaging a deficit of around Rs 320 crores for the current year and of Rs 210 crores for the financial year that is just over, has set many people speculating about the likely effects of the consequential increase in money supply with the public. The general belief seems to be that deficit financing would be beneficial to the economy as a whole; furthermore, it is expected to have a favourable effect on the demand for, and therefore the prices of agricultural commodities. Should this come about, it will save the Government the bother of working out a complicated system of price-supports to protect agricultural incomes.

Whether deficit-financing will obviate the need for agricultural price-supports is a question that needs careful analysis of the processes through which Government spending is transformed sooner or later into demand for agricultural products. With the existing statistical data, such an analysis of money flows is not possible; one's appraisal of the likely ramifications of deficit financing has therefore to be of a rudimentary character, based on variations in the more important of the monetary indicators.

Between 1950-51 and 1952-53, very special factors caused a decline in money supply with the public. The subsequent increase has been considerable, though not so large as to outpace the increase in domestic production. To the rise in money supply since the end of 1952-53, deficit-financing also has contributed, but in what precise measure, it is difficult to say. For a proper evaluation of it, we have to have, besides the draft on accumulated cash balances, the net increase in Government indebtedness to the Reserve Bank. Since this is not readily available, one can do no more than speculate on the basis of published figures regarding Government cash balances and changes in Reserve Bank holdings of rupee securities.

Recent changes in the components of money supply with the public, and in the principal factors affecting it, are given in the table on page 415, where the latest available data on money supply, relating to last Friday of January 1955 are compared with those for last Fridays of March 1952 and March 1953 respectively. The elements 'below the line' in that table do not fully explain the variation in money supply; but they do account for the bulk of it, and contain what may be termed the main 'operational' reflectors.

Clearly, the decline in Government balances has been marked in the recent past. Whether this is a fair enough measure of the impact of Government spending on domestic purchasing power is difficult to say. One has to correct the cash balance change by the net payments to Reserve Bank for sterling and net security transactions between the Reserve Bank and Government. Between March 1953 and January 1955, foreign assets of the Reserve Bank increased slightly; but this was the net result of a balance of payments surplus on private account and a Government deficit on its external account. Further, the Reserve Bank's holdings of rupee securities fell by about Rs 38 crores, and that of the scheduled banks increased by Rs 47 crores in the same period.

Annual Subscription Rs. 24.
Single Copy Rs. 27.

Whether the discrepancy between the two indicates Reserve Bank purchases of securities from Government, it is not possible to say. In other words, from the available figures, not much can be said about the exact magnitude of the internal deficit of the Government.

Nevertheless, while one might argue that the change in cash balances is not a correct index of deficit-financing proper, one cannot gainsay the fact that there has been some deficit financing. Presuming that, the manner in which the several items in that table have varied is of considerable interest. Currency with the public has increased appreciably, and this supports the view that some at least of the fall in Government's deposits must have been due to cash payments. But there is also the significant fact of the increase in deposits. Between March 1953 and January 1955, deposit money increased by Rs 45 crores and time liabilities of scheduled banks by Rs 39 crores. Since the bulk of the former consists of demand liabilities of scheduled banks, there was obviously an increase of nearly Rs 80 crores in the total deposit liabilities of scheduled banks.

There are two ways in which one might read a significance into these figures. It might mean, in the first place, that Government payments in cash or by cheque added pretty quickly to the resources of banks, and enabled them to add to their investments and advances. Secondly, it might be that the resources of banks improved on account of a private surplus in balance of payments, while Government deposits fell as a result of sterling purchases. In either case, the conclusion seems inevitable that Government payments accrued to sectors which are closely connected with the banking system or to external agencies. This more or less automatically excludes a direct relation between Government draft on cash balances and currency in the rural sector.

Admittedly, this is stating the position more definitely than is warranted by the figures. But overstatement is often necessary to provoke re-examination of some beliefs which are commonly held because they are so comforting. One such is the acceptance of the thesis that Government has only to expand its outlay in order to stimulate currency circulation, and that this will

affect the deposits position only after a considerable time-lag. There are two advantages in taking such a position. Firstly, by association of ideas, an expansion in currency circulation is deemed to benefit the classes which transact in cash rather than through cheques—to wit, the agricultural and lower income groups. Secondly, since a time-lag for the secondary expansion of deposit money is presumed, the question of monetary management is simplified. All this is upset if the actual state of affairs is the other way round; that is to say, if Government spending quickly affects bank credit, and the resources of currency users are enlarged only after a time-lag, through spending by those who resort to bank advances.

All this has a bearing on the question of agricultural prices, to which we referred in the beginning. Larger spending by Government in the coming year will mean more employment, directly or indirectly, and an increase in the national wage-bill. The precise proportion and the areas in which it increases, will depend on the labour-intensiveness and the location of the Government projects. That apart, such an increase will make only a marginal change to the total demand for food—since even those who are unemployed consume food

at somebody's expense. Much of the greater part of the additional wages will probably be devoted to the purchase of things other than food. Where large townships arise as a result of big Governmental projects, there will be considerable facilities for satisfying such demands, and the flow of money back to the non-agricultural sector starts. One can visualise a situation in which this increased demand for "urban" products sets in motion a series of adjustments which in course of time lead to higher wages in urban areas, higher prices for cash crops, reallocation of productive resources in the agricultural sector and a consequential upward effect on food prices. But this is both far-fetched, and undesirable—in as much as higher food prices would be a corollary to stagnant or restricted production.

The trouble with all this is that making deficit-financing of development expenditure perform the functions of a price-stabilizer assumes a certain measure of income-elasticity in the demand for agricultural products, and quick adjustments in prices and outputs to changes in effective demand. If this assumption is open to doubt—as indeed it seems to be—the Government has to make up its mind whether or not agricultural prices ought to be directly supported.

Towards Avadi

WHAT is the future pattern of society that is envisaged by the Matthai Commission? And what are the steps through which, over a period of years, the transition is to be effected from the present to the future? It is well to remember before seeking an answer to these questions that the Matthai Commission did not have the Avadi resolution before it, and therefore the directive for a gradual evolution of a socialist pattern of society was not included in its terms of reference. Even a careful reading of the report will not elicit a direct answer to these questions, though the character of the society that the Matthai Commission has in mind can be inferred by examining its recommendations and fitting them together. For the purpose, there are two points of reference which can serve as cross-checks to one another. The first is of individual incomes, the second is the taxation of companies.

The Commission appears to be guided throughout by the assumption that there is no guarantee that money left with individual earners or recipients of incomes will be necessarily invested. It does not therefore proceed to estimate the probable surplus in excess of consumption requirements of the different classes of income receivers. Now if this view is correct, namely that recipients of income are not to be left with much "disposable" savings, whatever investment takes place would be either in the public sector or it would be channelled through institutional investments. This explains the Commission's concern for corporate savings on the one hand and the allowances given for insurance and provident funds on the other. To take the latter first, one-fifth of the income up to a maximum of Rs 8,000 is allowed free of tax, provided it is saved in the form of contributions to provident fund or life insurance. This

is a fair limit for all but the highest range of incomes. In fact it is more than likely that except at the higher brackets, where super-tax begins to operate, this limit to tax free incomes will not be fully utilised.

In the case of corporate profits, the Commission is concerned both about the necessity and the desirability of conserving profits for purposes of expansion and development. While impressed with the necessity of fostering corporate savings, the Commission is equally impressed by the fact that by this means alone, capital for industry cannot be created to an adequate extent. Ever since the days of the Colwyn Committee, which went into this question at the end of the first world war, the limitations of corporate savings as a means of augmenting industrial capital have been well recognised. The erosion of capital caused by increased cost of replacement has been examined by the Commission. As a result of this examination, the Commission was convinced that the difficulty of replacement has been over-stated and that in reality, industries have been able to achieve a substantial measure of replacement in the last few years. And finally, that the rate of profits, taking the industries as a whole, has not at all been low. On the contrary, it has worked out on an average at 8 per cent of the capital and reserves, the shareholders' equity, which can be considered fairly high in an under-developed country.

The judgment about the relative adequacy of the rate of profits is open to question, if its basis is a comparison with the rate of profits in other and much more developed countries. Capitalists themselves would invite a comparison with other countries in the earlier stages of their development and not with the current rate of profits in developed economies. A capital-hungry country, they maintain, cannot build up its capital assets except through profits. And if company profits are accepted as the major source of capital formation, the case for a higher rate of profits would not, in their view, call for any special pleading.

The Matthai Commission, however, does not accept this contention. As has already been mentioned, it proceeds on the assumption that disposable savings either in the hands of individuals or of corporations cannot be relied upon

to be ploughed back in toto into investment or investment of the sort required for development. They would leave too wide a scope for increase of consumption. And the Commission has been determined to restrict the scope of further consumption as a primary postulate in its examination of the tax problem. Its attitude to corporate savings can therefore be justified, not on the ground that a liberal tax policy will necessarily leave the door open to freer consumption but on the ground that such liberality would be misplaced; even though it results in capital formation, it will not be formation of the right kind of capital.

This attitude to corporate profits stems from the Commission's survey of the present state of industrial development. The industries that have been developed so far are largely consumer goods industries; in the next phase, the priority is not for the further development of such industries but for heavy industry in the first place and a number of new, if lighter, capital goods industries. Accumulation of savings with the existing consumer goods industries will not benefit the growth of the capital goods industries of the kind that are necessary for a fuller and more rapid development of the economy. To the extent that consumer goods industries may have scope for the development of allied or subsidiary industries, the case for limiting corporate savings in them would not be self-evident. But since the scope for such development is in any case limited and exceptional rather than general, broadly the Matthai Commission's conclusions will be accepted.

If the Matthai Commission is distrustful of individual investment and it is not convinced that corporate savings can play a considerable role in finding the capital for new industries, what then is the significance of the concessions they offer for promoting the development of new industries in the shape of a developmental bonus on the one hand and carrying over of losses for an indefinite period on the other? If new industries are started, they will be encouraged with so many concessions. But how can new industries be started if all disposable savings have been appropriated in one way or another? A searching inquiry on this point brings out the basic assumption of the Matthai Commission about the

character of development it has in mind. The strengthening of the public sector through taxation and through channelling of savings via the institutional investors, carries with it its own implications.

The conclusion is therefore inescapable that though the Avadi resolution was not in the terms of reference, it has influenced the deliberations of the Matthai Commission. Indeed on a re-reading of the report, it is possible to see in it the first steps, however tentative, to the transition that Avadi sought to embody. How did it happen? Did coming events cast their shadows before or was it that the Matthai Commission was so close and receptive to the ideas then in the air that it could give shape to them and even crystallise them in concrete terms? The Commission was asked to lay down the main lines of a tax policy which the country could follow in the forthcoming period of development. What the pattern of development was, had been fairly clear to the Commission. It was not therefore surprising that the Commission should address itself to the main task and not be hidebound by its terms of reference. Except that it was not free to go into the problems of land and property relations generally, it has been able to fulfil the task creditably. If it has not taken a broad view, it has certainly kept its gaze steadfastly on the future and succeeded in giving a preview of the shape of things to come.

Weekly Notes

Fourth Amendment

THE Select Committee on the Constitution (Fourth Amendment) Bill, whose report was presented to Parliament this week, has filled in the gap in that bill to which attention was drawn in these columns. Clause (2) of the amending Bill has now been altered to provide that no law providing for the acquisition of property "shall be called in question in any court on the ground that the compensation provided by that law is not adequate". Compensation, in other words, becomes non-justiciable. Though of course the law concerned must still provide for compensation, its quantum will now be left entirely to the decision of the legislature.

This is a desirable change in general. The danger remains, however, that legislatures might be less than just to different classes of property owners in acquiring property for public purposes or that the principles they lay down in a particular Act may work unjustly in practice. Where the legislature deliberately decides to give a particular group of property-owners less than adequate compensation, the problems that arise are of a different character. But where the injustice is incidental, resulting from a looseness in the framing of the legislation, some remedy should be available to aggrieved parties now that the courts are debarred from considering the question. It is obvious that injustice of this type might arise in many different ways and unless some arrangement existed for a review of these cases, perhaps by the legislature itself, innumerable cases of injustice would arise from which there was no appeal.

Fathering Obligations on Others!

SOME fundamental questions remain. The main justification for the amendment in Pandit Nehru's eyes lay in the Directive Principles of State Policy, which though non-justiciable, "are nevertheless fundamental in the governance of the country." "How can you give effect to these principles," he asked, "if the current interpretations of the Constitution by the Courts are accepted?" Pandit Nehru felt that there was "an inherent contradiction in the Con-

stitution between the Fundamental Rights and the Directive Principles of State policy." Many would agree with him, but would demur nevertheless that the Supreme Court can be blamed for it.

In interpreting the Fundamental Rights, the Courts may and do take the Directive Principles into consideration and even try to adopt an interpretation which will not, as far as possible, conflict with them. But where such a conflict is unavoidable, it is the Fundamental Rights that must prevail in law and not the Directive Principles whatever Pandit Nehru may feel about it. Besides, the Directive Principles are statements of objectives and while subscribing to them, one need not accept any particular path to their achievement. It can also be argued, as it was by Justice Bose in the Sholapur Case that, "The production of essential commodities and the employment of labour are matters for the State and statutory bodies to handle. . . . They cannot evade their own duties by fathering their obligations on others who are not responsible for carrying on the affairs of the State."

If the legal interpretation of the Fundamental Rights appears to leave no effective path towards the achievement of the desired ends embodied in the Directive Principles, this is a challenge to the ingenuity of the leaders to develop suitable techniques that are legal under the Constitution or to amend the Constitution suitably. Pandit Nehru was right in a sense when he said that it was up to Parliament to "make the Fundamental Rights subserve the Directive Principles of State Policy." That is what the proposed amendments try to do. One may agree that the wide powers that will be given to the legislatures in this way may be misused is a risk that must be taken in a democratic State, but the risk must be reduced at least by a clear pronouncement that the State will not try to evade its own duties by fathering its obligations on others.

Bankers' Complaint

IF the present rising trend in bank deposits continues—all indications are that it will—the problem which has plagued the Indian Banks Association all these years may

eventually solve itself. High establishment costs and the fear that they may be still higher before they have seen the last of the Bank awards, give the members no peace since they have also to pay so much more to get deposits. Establishment charges are under the tender care of the Government. The only alternatives are either a ceiling on deposit rates or higher rates on advances. Whatever the step, all banks must move together.

At the annual meeting of the Association, this hardy perennial cropped up as usual. Shri Pranlal Devkar Nanjee who lays down his charge after years of devoted service as the Chairman, discussed various possibilities of meeting the all-round increase in costs. It was necessary for the banks to raise interest rates on their advances wherever possible, he said, but saw little possibility of their being able to do so. One may suspect that his heart was really not in it. He would not like to raise the other charges either. A third alternative he suggested, namely, that the Reserve Bank may allow scheduled banks to keep securities of equal value as their statutory balances, may be original but it is unhelpful, as it goes against the basic principle of liquidity. So he comes back to the old and vexed question of ceiling on deposit rates.

The Association which Shri Pranlal has done so much to build up during these years, fully represents the scheduled banks. It can influence only a section, though a very important section, of the money market. The exchange banks are not in it, neither is the Imperial Bank, at least organisationally, however valuable the services its Managing Director may have rendered to get the banks to agree to a ceiling on deposit rates. Though all attempts so far have failed, it is difficult to see why they should have. Call money rates cannot have much effect on the volume of deposits. The lenders in the call money market do not belong to the general body of depositors. The depositor at the margin, the man who can be induced to put his money with the bank rather than keep it in his cash box, is not likely to be found among them. Why, then, allow the call money market to disturb the even tenor of banking operations?

The Crux of the Coal Problem

THE coal industry would be able to meet the bill and raise production from the present 36 million tons a year to 50 to 60 million tons, whatever be the amount required for the Second Plan, provided colliery owners are assured that there would be no nationalisation in the near future and provided also that transport is supplied in full measure. This was the gist of the speech of Shri Jayantilal Ojha, Chairman of Indian Mining Federation, at the annual meeting of the Federation held in Calcutta early this week. Exploitation of new fields being reserved to the public sector, the assurance wanted by Mr Ojha is for the collieries which are already under operation. There is also a third condition attached by Shri Ojha, viz, that the price structure should be so fixed as to leave a reasonable margin of profit.

Nationalisation of collieries not being on the cards, the first condition is already met. It is transport, therefore, that is the crux of the problem. If adequate transport is not provided, production cannot be increased, for coal raised but not moved, is coal lost. Stocks accumulated at pitheads not only deteriorate fast and are exposed to the risk of destruction by fire—Raniganj coal is particularly susceptible to spontaneous explosion—they mean so much capital blocked.

The president of the Indian Mining Federation also gave an estimate of the additional transport that would be required to move 5 million tons of coal a year—650 wagons a day with corresponding increase in the number of locomotives, track and junction facilities and so on. All these and more must already be in the next Five-Year Plan for railways, but Shri Ojha was particularly anxious that increased demand for coal by railways and by industries in the public sector should not impinge on the supply of wagons for the collieries. He suggested that such priority consumers should own their own wagons, so that other users of coal may also get their supplies.

By the time the new steel plants begin operations, the situation that led to the pegging of metallurgical coal would have changed completely and collieries producing metallurgical coal may have to be given additional incentives to step up rather than be forced to hold down their production and the need for washeries would be keenly felt. For setting up washeries, the industry looks to the Government.

Apart from the increased requirement of coal that would follow the expansion of industries, Shri Ojha stressed a point that is often missed, viz, the need for expanding the consumption of coal as a deliberate measure to help agriculture and to ensure better utilisation of our

natural resources. Wider use of coal as fuel will slacken the pace of deforestation and thus help soil conservation. It may also help agriculture in another way—but that is only a distant possibility—viz, by preventing the use of cow-dung as fuel and encouraging its use as a manure. On what a scale the denudation of forests is still going for supplying fuel is rarely realised. But Shri Ojha did not suggest the possibilities of cost reduction by which means alone wider use of coal can be ensured. If coal is to substitute other fuels, it has to be cheaper, not only at the pithead but at the consumers' end.

All but Finance

THERE has been much talk lately of associating local bodies with the execution of the proposed Five-Year Plan and of developing them into effective instruments of local self-government besides. The Bombay Government seems to have taken this talk fairly seriously; anyway, Shri Y B Chavan, Minister for Local Self-Government, Bombay, moving an amendment to the Bombay State Panchayats Act at the current session of the State Assembly, has promised the introduction of comprehensive legislation to enlarge the functions, duties and powers of village panchayats in the State so as to enable them to play an active part in the development programme of the future. It must be said to the credit not only of the Bombay Government, but also of other State Governments that since the advent of freedom they have not been chary of conferring new responsibilities, functions and even powers of a sort on panchayats and other local bodies. While it has cost these Governments little to delegate such powers, it has surely been of much assistance to them in escaping blame for inaction or inadequate action in the countryside, so much so that the shrewder of the local bodies may not be so unwilling to part with some of the responsibilities they have been made to shoulder—without adequate finance, or even adequate scope for raising such finance.

To all appearance, the present Bombay amending Bill does seem designed to meet this very problem. The Bill proposes to raise the grant of land revenue to village panchayats from the present proportion of 15 per cent to 25 per cent; and in the course of the debate, the Minister indicated his readiness to raise it still further—to 30 per cent. By itself this does sound very generous; but when set against the fact that with this proposed increase in land revenue grants, the payment of statutory grants on account of the salary and allowances of panchayat officials will be discontinued by Government, a part of the truth reveals itself. The picture becomes clearer when one realises that land revenue depends on unpredictable factors like the monsoon and that actually panchayats have been getting more by way of statutory grants than land revenue so far.

In other words, the resources that the panchayats will have in future for shouldering greater responsibilities, performing more functions and playing what has been called an effective role in developmental work may be not only less than what they command now, but also more uncertain. No wonder that spokesmen of the Opposition, the only ones that can speak out their minds on the floor of the Assembly, have been so critical of the Bill.

Much no doubt can be said for spreading the panchayat movement throughout the State, as the Minister proposes to do, and for yoking local initiative and enterprise to the task of development. And it may be the feeling of Government, and it is a right feeling, that if volunteer labour is to be sought for any public undertaking, it can be done best in the local sphere, where the givers of voluntary service stand to benefit immediately and directly from the result of their sacrifice. But what is apt to be overlooked is that the proper organisation and effective utilisation of even voluntary service, not to speak of technical guidance and supervision, requires a permanent, official agency—an indispensable core of authority and administration—that has to be paid for. Some of the panchayats seem unable to afford this even now, with dependable grants from Government. What their position will be when made to rely on an uncertain source of income can well be imagined. Responsibility and power, without the means of discharging the one or exercising the other to the good of the people, can be most disillusioning. And in the very process of multiplying panchayats in the State and loading them with new functions and extensions of authority, Government may well create conditions inimical to the success of these institutions. Impotent agencies and empty shells of authority tend only to provoke ridicule. And a hard-headed peasant's ridicule can be deadly in its effect. Government would therefore do well to pause and think whether wisdom lies in adding to the number of panchayats in the State and their obligations rather than in ensuring more resources to the ones that already exist and putting them on a sound and unassailable basis.

THE ECONOMIC WEEKLY

The panchayat system has the authority of tradition and the sanctity of centuries behind it, which may not be so much the case with other agencies of local self-government, particularly urban. So in reviving the panchayats, the aim should not be so much to long for the glory of numbers in competition with other States as to strive for lasting qualities of efficiency and effectiveness in these institutions, so that they lose none of their traditional sanctity and authority. The dream of active little village republics forming the base of the free Republic of India, with responsibility and power distributed over as wide an area as possible, is an inspiring one. But from the way some of the States are going about the task, all that is likely to result is a useless conglomeration of superfluous bodies, cluttering the countryside and perhaps even slackening the pace of national development.

The Season of Meetings

CALCUTTA meets in March. India is a seasonal economy and to add to the business of the busy season, the busybodies have their various Association annual gatherings during the day-time, and try to forget their cares—later in the evening.

This Wednesday the Indian Engineering Association met for its annual meeting and Mr Chatterton of Martin Burn, the Chairman, had a few frank remarks to make on the Government's much publicised programme and targets of steel making. He thought that they could discount the "most optimistic" pronouncement that the capacity of the steel industry in India could be raised to 6 mn ingot tons by 1961 as completely impracticable. Much had been heard of German and Russian plants, and more recently of a similar British offer. Mr Chatterton said that he appreciated that little could be made public at the time that delicate international negotiations were in progress. The engineering industry feels, however, that it should be consulted at a relatively early stage if it is the Government's intention that a substantial part of the fabrication work for the steel plants was to be undertaken by indigenous concerns. If all the schemes that one reads about in the papers were to be taken in hand almost all at the same time, a good proportion of such fabricating work which could, in the normal course of things, be manufactured in India, would then have to be imported. The implication of this is not limited merely to the extra foreign exchange which would be necessary for such imports. It would also mean that the engineering industry would not be geared simultaneously with the increase in the country's output of steel to utilise the additional steel that may be turned out. Steel is not produced as an end in itself. It is the raw material of the engineering industry and if the latter cannot utilise the raw material, the steel capacity, if achieved, would lie idle.

Mr Chatterton estimated that approximately 2 mn tons of steel was being currently consumed in India. There is an unsatisfied demand which it is difficult to estimate, as a period of scarcity tends to inflate demand. He felt that it was obviously unrealistic to pro-

vide for 6 mn tons, treble the present usage, as secondary industry would not have the capacity to absorb this amount by 1961. It would be more realistic, according to him, to plan for 3 mn tons by the end of 1961 and to phase the programme so that the building of capacity beyond this, and the growth of secondary industry, would proceed simultaneously.

To increase steel making capacity to 3.5 mn tons would require 0.2 mn tons of buildings and plants which could be made in this country with a saving estimated at a minimum of Rs 30 crores in foreign exchange. To undertake this programme would require the employment of 8—10 thousand men for 3 years so that it was worthwhile making the effort to ensure that planning was not undertaken beyond the capacity of the industry to produce or to absorb.

Mr Chatterton discussed the problem of machine tools industry, one of the mainstays of engineering. He pleaded that this industry is essentially a field for private enterprise. The shortage of adequately trained workers as well as trained supervisory staff was stressed by him. This shortage would adversely affect any rapid industrial effort.

On the same day that the Indian Engineering Association met, the zamindars had the annual general meeting of their club—British Indian Association. In another two weeks' time, zamindari will have gone from West Bengal. The British Indian Association was at one time a powerful and glamorous body. The zamindars, or rather the predecessors of some of the present zamindars, perhaps paved the way for the Government's acquisition of their landed properties. As far as Bengal is concerned—I am not competent to express an opinion on the zamindars of other States although they would perhaps not be found wanting in these qualities—large numbers of the relatively better placed zamindars contributed very substantially to the cultural and educational movements of the State. I do not have figures to quote but it is well-known that a large number of educational institutions spread all over this State and some of the most important of these in Calcutta itself owe their origin and sustenance to the munificence of the zamindars.

In the written and oral statements submitted to the Floud Commission over a decade ago, a number of such instances are mentioned. But the institutionalists would point out that the days when zamindari served a useful purpose are over. Yes and no. The Chairman's address, read out by the Secretary, pointed out that the rationalization of the tenure system in West Bengal would not usher in progress and prosperity. The lot of the common man would not be improved by the legislation enacted or proposed. Taking the Land Reform Bill to be the Government's last word on the subject so far, it is noted with dismay that the reduction in *khas* agricultural holdings that intermediaries might suffer as a result of acquisition would not necessarily benefit private farmers but might well lay the foundations of state farming—with all its concomitant evils of regimentation of production, wastage of public money and slavery for numerous agricultural workers. Look out for the writing on the wall!

The meeting-phobia caught on certain other sections as well. The bus-men met and caught the State bus. Dr Roy has promised to employ the DPs of the Syndicate buses when State transport spreads and takes over hitherto un-nationalised roads.

On Thursday afternoon the tailors of Calcutta met—in a procession this time. They demand weekly holidays, minimum wages and various other minimum amenities. We live in an age of minima and maxima. That is why a prominent fire-fighting equipment is called "minimax". It can be used for fire-eaters as well.

Delhi in Doldrums

Wednesday, Evening

WITH the budget fireworks over, it has been a rather dull week at Delhi. The Prime Minister has had—very deservedly—a somewhat easy time, engaging in such pleasantries as a telephone talk across the sub-continent with Prime Minister U Nu at Rangoon. Asia is emerging as a living entity. How curious, historically, that we could talk to London before we could speak to Rangoon! U Nu himself came down to Delhi on a private visit, and the Prime Minister presented him with a sapling from the Buddha's Tree of Enlightenment. This reminds me that U Nu was just preceded by Prince Nordam from Cambodia, who had also come here on a pilgrimage. Buddhism appears to be politically on the upgrade, and is being used rather subtly to bolster up the doctrine of co-existence. Buddhist activity in Delhi, with which resident missions of Asian countries are actively associated, has been visibly increasing in recent times. The Prime Minister, who normally maintains a correct, secular attitude, misses no opportunity to associate himself with Buddhist pilgrimages and relics.

PEOPLE'S PLAN

While the Prime Minister had a relatively easy time at Delhi, he burst into revolutionary fervour at Allahabad. He wants the second Five-Year Plan to be a people's plan, to be actually drawn up by them at the Gram Panchayat level. This idea he had put forward earlier too. It is strange that the Planning Commission did not follow it up. The Plan is being drawn up by the same people who bamboozled us into accepting the economics of the first Five-Year Plan. Speaking to the people of his constituency at Machli Saher, the Prime Minister promised to provide employment, adequate food, clothing and housing to the common man in the second Five-Year Plan. What a pity that this great man has no able lieutenants to execute his ideas. This is not a mere talking point, but may well prove to be a tragic fact of history that the Prime Minister lacked men of equal calibre and zeal around him. Is Jaya Prakash Narain not available, now

that he has abandoned the PSP and gone after the mirage of *Bhoodan*? Why can't the Prime Minister call him to become Minister for Economics?

Anyway, the interest (for the Prime Minister) might well shift from the domestic front, for, as this is being written, news of trouble has been coming in from Saigon, where we have international responsibilities as 'Chairman' of the Supervisory Commission. The Prime Minister must be at it across both continents, contacting peace-makers and pacifying trouble-makers, for his heart really burns for the common man in every land; but it is clear—probably not very clear to him—that without strength on the domestic front, it might all prove illusory, with belligerents using our neutrality for what it is worth and ultimately proceeding to a show-down of arms. These are possibilities of which sufficient cognizance has not been taken by the Prime Minister and his 'tin' advisers.

PLEA FOR SANSKRIT UNIVERSITY

Shri Chintaman Deshmukh has been keeping himself busy outside Parliament. Few people know that he is a great Sanskrit scholar. He often indulges in quotations from the scriptures in support of his economic doctrines. This time he spoke 'purely' in Sanskrit at the Akhil Bharatiya Sanskrit Sammelan. He spoke for an hour in Sanskrit, and I had the same feeling—it is a sacrilege to attempt such a comparison—as Swami Vivekanand had when he visited Madras (before going to the Chicago Parliament of Religions) and was astonished to find women coming out and speaking to him in Sanskrit. Shri Deshmukh put forward a strong plea for a Sanskrit University. He envisaged the possibility of its occupying a place in the main stream of the nation's life. For once at least, I am in complete agreement with Shri Deshmukh's ideology, for we need a language with a depth to sustain our culture; and unfortunately Hindi is not that language. Sanskrit embodies the best of our philosophy, which, without our knowing it, has

been the main sustaining force behind the remarkable survival of India from the tragedy of a thousand years of foreign misrule!

In Parliament, in the absence of the real heroes, Shri Ajit Prasad Jain occupied the stage. One feels abashed at the intellectual level to which we descend, as we come down from the Prime Minister—and may I add, the Finance Minister—though there is a rather awkward gap between the two. Shri Ajit Prasad Jain read out a school-boy's essay, comparing and contrasting the economies of India and USA and aiming at the conclusion that we need not—we cannot—make any very serious effort at stabilising agricultural prices. Some economic adviser seems to have fooled him completely. This tribe of economic advisers is developing into a peculiarly venal species with a subtle political bias in their mental make-up. No knowledge of economics, not even character, is essential to make an economic adviser to the Government of India. Anyway, I learnt a new phrase: "... the agricultural economy of the United States is essentially one of surpluses. In our case, it is an economy of adjustment."

PROBLEM OF LANGUAGE

What does this mean? Why don't these people speak a language which they can understand? I think, it should not be optional, but mandatory for most of these people at least Ministers—the Prime Minister can speak fine Hindi and the Finance Minister, even fine Sanskrit—to speak in Hindi or Urdu. Shri Ajit Prasad's economics was awful. At least, one can understand and even appreciate the economics of Shri Deshmukh. What really is wrong with him is his social philosophy.

News from Pakistan has been rather disturbing. Commenting on the Procedure Plan of June 1947, which brought in Pakistan, the present writer had said that Pakistan would become a fascist State. Is this coming true? I hope not, for that would be another tragedy in the life of the Indo-Pak sub-continent.

First Anniversary of the London Gold Market

IT is now a full year since the London gold market was reopened. Up to March 20 last year, the Bank of England had been the sole dealer in gold at the fixed official buying rate of 248 shillings per fine ounce for bar gold, and 58 shillings per sovereign. On that date, the Bank issued a notice (under the provisions of the Exchange Control Act 1947), the first paragraph of which read thus:

"The Bank of England will discontinue the publication of buying prices for gold as from the 22nd March, 1954, when the London gold market reopens."

On Monday, March 22, at 10-30 am, representatives of six bullion firms which had last met to fix the price of gold on September 1, 1939, again assembled for that purpose. At this meeting, the price was fixed at 248s 6d per fine ounce, as compared with 160s at the previous meeting.

The reassembly of the representatives of the bullion firms after a gap of fifteen years must have been more than a mere price-fixing meeting. The passage of events over the past fifteen years would no doubt have been recalled by the six men, though the fact that gold had emerged unscathed from all this turmoil must also have been a matter of not inconsiderable satisfaction to all of them.

Nobody expected the market to resume functioning on the same lines as before the war. The £ sterling was not convertible and in view of this, it was understood that some limitations on the full freedom of the market would be necessary. What these limitations were had also been set out, though somewhat tersely, in the Bank of England's notice—the control over the market's activities was concerned not so much about who would be permitted to buy and sell gold as with the type and kind of currency against which the market would be allowed to trade. Residents of the sterling area could buy gold only on the production of a licence, in which case payment in resident-account sterling was accepted. All other dealings were, by the nature of things, confined to US dollars either in its sterling counterpart of "American-account sterling" or as

"registered sterling", which could be acquired by non-sterling and non-dollar residents against sales of dollar balances or from previous sales of gold. Although forward dealings in gold were not allowed, in order to facilitate the sales of newly-mined gold, the Bank of England gave permission for such gold to be purchased at the date of despatch from the country of origin or whilst in transit.

NARROW RANGE OF PRICE VARIATION

In the comparatively short period during which the resurgent London gold market has been operating, it has become clear that in matters of technique and business finesse, nothing had been lost by the fifteen-year adjournment. It is to be noted, however, that between 1945 and 1954, many London houses, under special permission of the Treasury and, at times, on behalf of the Treasury, had handled a large proportion of the movements of gold resulting from official gold transfers. This no doubt assisted in the quick revival of the market. The official limitations on the freedom of the market had, however, proved to be a serious handicap, particularly on the volume of turnover. Buyers of gold not possessing dollar currency or its progeny—registered sterling, have continued to direct their business to the various centres abroad with free exchange markets. One of the welcome features of the past trading year has, of course, been the extent to which the facilities of the London market have been used by the

Central Banks of various countries. When the decision was taken to reopen the London market, it was generally thought that there was nothing in the new arrangements which would either increase or diminish the demand for gold for hoarding purposes. This estimation proved to be largely correct. The dollar price during the year varied only within the modest limits of \$35 and \$35.12. After allowing for the change in the gold premium and other variations in the sterling-dollar exchange rate, the highest and lowest sterling quotations for gold were 251s 7½d and 248s 3½d per fine ounce respectively. As long as the United States is prepared to buy gold at \$35 per fine ounce, this must continue to provide the minimum price expressed in sterling.

RUSSIAN GOLD IN LONDON

Supplies of gold to the market came largely from two sources: the Soviet Union and the Union of South Africa. The greater part of South Africa's output of newly-mined gold was sold to the South African Government, and most of this in turn was consigned to the Bank of England as its agents for sale in the London market at prices ruling from day to day. The permission granted to South African producers to sell gold on their own account was withdrawn when the London market opened.

The year opened with gold being quoted in Continental centres at a price of \$35.20 to \$35.30 per fine ounce, but pressure from Russian

sales gradually forced these prices down until they reached \$35 per fine ounce. It was at this point that the London market was reopened. The opening price of 248s 6d per fine ounce remained steady for a period and then moved downwards to 248s 3½d (which is equivalent to \$34.95 per fine ounce). The second quarter of the year was particularly active for the London gold market—buyers from the Near and Far East maintained a steady level of demand, and there was, of course, some Central Bank buying. In April the price moved up, but variations were not wide. In London, the market quoted a price of 248s 3½d, which was somewhat lower than the spread of the dollar price of \$34.95 and \$35.15. These discrepancies persisted until the end of June, and it is clear that the differential in the prices in these two centres was mainly occasioned by the strength of sterling on the foreign exchange markets.

The third quarter of the year witnessed some fall in the market's turnover. The pressure on sterling on the foreign exchange market was beginning to be reflected in the price for gold. Between August and September, the price rose steeply from 248s 10d to 251s 5½d. In the same period, the dollar price rose only slightly (from \$35.04 to \$35.11). This downward trend in the market's turnover persisted into the last months of 1954 and well into the new year. The price of gold in terms of dollars steadily fell, but, in view of the weakening tone of sterling on the exchange market, the sterling price continued to rise. By the end of December, the London price was as high as 251s 7½d compared with the dollar price of \$35.04½ per fine ounce.

One of the great uncertainties in the London market has been the supplies from the Soviet Union. In March and April of last year, considerable quantities of gold were offered on the London market from that quarter, and it was hoped that this source of supply would become a permanent feature of the dealings in London. But this hope has not been realised, and it is believed that some Russian supplies have been finding their way into the free markets in Continental Europe. This may be the reason for the decline in Continental demand in the latter months of 1954 and in the first two months of 1955.

THE FUND CONDONES OR BLESSES?

It is surprising that the International Monetary Fund has not made any public comment on the reopening of the London market. They have certainly reported the event in their latest annual report, and have also reviewed the operations of the London gold market in their report on exchange restrictions, but they have not clarified their views on this very important event. The aim of the IMF since its inception has been to conserve the available supplies of gold for purely monetary purposes. In attempting to achieve this object, the IMF has all along requested its members to ban the sales of gold at a premium over their official price. In practice, this policy has not met with any sustained support from those member-countries who are producers of gold. Since 1948, a number of gold-producing member-countries had evolved schemes whereby they could place the whole or a part of their production in the international free market whilst at the same time maintaining some formal support for the IMF's policy. The United Kingdom, however, has always given loyal support to the

THE ECONOMIC WEEKLY

IMF in this matter, and, in accordance with the Fund's earlier request, the Bank of England, in a regulation published in 1947, had banned the London houses from taking part in gold dealings at premium prices. The decision to reopen the London gold market now surely marks an important step towards the abandonment by the IMF of its efforts to deny non-monetary buyers access to the world supplies of gold.

PRICE CHANGE NOT EXPECTED

Unlike previous years, there has been little talk about an increase in the price of gold in the past year. Violent controversy had raged for a number of years in and outside the IMF on whether the Americans should push up their official gold price in order to solve the problem of shortage of gold for monetary purposes. It is difficult to say whether the supporters of this view have changed their mind, but they have not been vocal in the past year. South Africa, the doughtiest of fighters for a higher gold price, has partially solved its problem of high gold production costs by converting a number of high-cost-producing mines to the production of uranium ore.

THE ECONOMIC WEEKLY

Review of the GATT

B N Ganguli

THE press *communiqué* issued by the Secretariat of the General Agreement on Tariffs and Trade on the review of the Annual Agreement is a somewhat cryptic document, and it became more cryptic when it appeared in condensed form in the newspapers. And yet it is an important document the contents of which require to be clearly understood by the public, if public opinion has to express itself on policy decisions which will be eventually taken by the Government of India. The following comments, which are based on the press *communiqué* and not on the authenticated text of the agreed changes in the draft, are offered in the hope that they may lead to clear a misunderstanding of what is supposed to have been achieved at Geneva.

It may be explained that the GATT includes (1) a basic code of commercial conduct and (2) the tariff schedules including the negotiated rates of duty. The GATT was due to expire with effect from July 1, 1955, unless it was extended for a further period. There was, therefore, opportunity for rethinking, on the basic principles of commercial conduct and also for renegotiation of the rates of duty.

CONFUSING ELEMENTS OF CURRENT SITUATION

Thinking on tariff matters is essentially pragmatic. It was, therefore, expected that the change in the international economic situation since 1947 would influence GATT review at Geneva. The emergence of buyers' markets and actual or threatened gluts, particularly in the commodity markets, in spite of increase of productivity in certain commodities; threatened inflationary pressures in some countries accompanied by stagnation in particular branches of agriculture and industry in other countries; frantic efforts of under-developed countries to step up industrial production; minimisation of balance of payments deficits and actual conversion of deficits into surpluses; the prospect of currency convertibility emerging and receding from time to time—these were the confusing elements of the current economic situation which made it

extremely difficult for the contracting parties to face up to the task of revising the GATT in a forthright and thorough-going manner.

The current international economic situation is conducive to the development of defensive attitudes to trade in many ways. It is, therefore, an achievement to secure a kind of *status quo* or standstill arrangement, with necessary adjustments to meet obvious difficulties which some nations have faced under the existing provisions of the Agreement. The basic liberal objective of "substantial reduction of the general level of tariffs and other charges on imports and exports" has no doubt been reiterated; but the contracting parties have thought fit merely "to recommend the convening of a tariff conference when it is felt that progress in that field is possible". The language of this recommendation makes it very clear that the climate for the pursuit of a liberal ideal of trade policy is not congenial at the present time.

STEPS TAKEN AT GENEVA

What has, then, been achieved at Geneva? Before answering this question let me state the concrete steps which have been taken. First, as regards that part of the GATT which embodies a code of commercial conduct, certain changes have been agreed to. They are included in Protocols which are now open, for acceptance by the legislatures of the contracting parties, till the beginning of the next GATT session in October 1955. In the meantime the existing unamended Agreement remains in force. Secondly, if the contracting parties agree, the tariffs will be stabilised at the existing levels and the assured life of the tariff schedules will be prolonged from July 1, 1955 to December 31, 1957, provided that parties will be authorised "to renegotiate during the bound period rates of duty if they find they must modify or withdraw some of them". A new provision for the automatic extension of the assured life of the tariff schedules in the future, by periods of three years, with freedom to modify or withdraw tariff concessions (mostly at a price), has also been recom-

mended for acceptance by governments.

Let me deal, first, with the power to re-negotiate rates of duty, during the bound period. This is a matter of vital concern to India. The lower rates of tariffs on certain commodities, to which we had agreed in 1947 do not suit us today, because India has begun to produce these commodities and it may be necessary to protect the industries which manufacture them. Under the existing GATT procedure, a relief from tariff binding has to be negotiated. Reduction of duty on other items has to be offered as a price for the specific relief. Agreement with countries substantially interested in the export of commodities on which we seek relief from tariff binding has to be reached. This takes time and is not an easy process. Re-negotiation of all tariff schedules at Geneva might have given us more latitude and better bargaining power and enabled us to review the tariff schedule as a whole in the context of our altered economic situation. It is clear that nations at Geneva did not want to throw everything into the melting pot. The outcome of US participation in fresh tariff negotiations was, to say the least, extremely uncertain. It was, therefore, perhaps expedient to reach a standstill agreement. But I must say that the procedure now laid down for modification of a tariff concession which is bound under the Agreement, may create difficulties for India. We have to offer compensation for raising bound rates of duty. We have to reach agreement with the exporting country concerned. If there is disagreement the latter may appeal to the contracting parties who, if they think that the compensation is inadequate, will permit the applicant country to extract a price by withdrawing a concession which we enjoy.

There is one aspect of this standstill arrangement which may be noted. Each party retains the right to decide whether or not to engage in negotiations for the lowering of tariffs, or to participate in a future tariff conference when the climate for lowering of tariffs is more congenial. This merely underlines the fact that forces of protectionist reaction are quite powerful today.

RETHINKING ON THE CODE

I shall next comment briefly on the trend of rethinking on the code of commercial conduct embodied in the GATT.

The agreement on quantitative restrictions will give obvious satisfaction to the main supporters of such restrictions in India and elsewhere. Although the objective of eliminating quota restrictions not justified by balance of payments reasons is upheld, yet the utility of this piece of defence mechanism in the context of currency convertibility (which is assumed to be round the corner) is recognised. The only safeguards recommended are 'review', and 'annual consultations.' In a way the position is more logical than it would be otherwise. If farm products can be subject to quota restrictions on the ground of 'serious injury', there is no reason why on the same ground industries cannot be protected by quotas. Nevertheless, lip-service has to be paid to the principle of eliminating quotas. And so there is the aspiration expressed in terms of laying on a country the obligation to eliminate quota restrictions "over a comparatively short period of time not exceeding five years". In this connection, I may refer to a small gain which exporters of farm products have secured with regard to the drastic operation of section 22 of the US Agricultural Adjustment Act. Under this Act, imports must be restricted whenever they interfere with a price-support or similar agricultural programme. The quotas can be made far more restrictive than they appear by selection of a low base period. Hence foreign exporters are kept in continual uncertainty as to the possibility of sales in the US market. It appears now that exporters facing such difficulties, can rely on the negotiation procedure and consultation.

IMPORT CONTROL FOR DEVELOPMENT

Supporters of quantitative restrictions in India will be gratified to learn that "balance of payments considerations" have now been interpreted broadly to take care of the situation arising out of the heavy import demand of countries industrialising at a reasonably fast rate. I hope that it is now clearly understood that conservation of foreign exchange over a period of time brought about through selective control of imports, if necessary by

means of import quotas, would be treated as a legitimate policy in the case of countries like India.

TARIFF PROTECTION

The review of the GATT also reveals a welcome change in the attitude towards the unorthodox methods of import restrictions other than the orthodox ones, viz, tariffs and subsidies. In a previous article contributed to the *Economic Weekly* (November 6, 1954), I had myself, for example, shown that a mixing regulation may, in certain circumstances, be a much better method of protection. Tariff protection given to industries in the early stage of their development must be flexible, and the choice of any particular method or a combination of methods in the interests of expansion of both production and consumption is a matter which should be left to the good sense of a country. It is very good that prior approval of the contracting parties is not now required for the use of import restrictions, other than tariffs and subsidy, provided that no bound rates of duty are involved and also provided that any contracting party that is adversely affected by the change will have the right to withdraw a substantially equivalent concession granted under the Agreement. In this case also freedom has been purchased at a price.

US FARM BLOCK WINS

On the subject of subsidies also, the previous attitude of condemnation has now been replaced by one of "limiting the harmful effect of export subsidies". The obligation not to subsidise export of primary products so as to obtain "more than a fair share" of world trade is recognised. But it is clear that disposal of surplus American farm products at less than competitive prices is treated as an exception, ostensibly on the ground that such disposal is "designed to expand consumption of these products". If other primary countries are adversely affected, the only safeguards are the procedure of "consultation with the principal suppliers", "orderly disposal" and the vague promise of "avoidance of injury to the interest of other contracting parties". There is here complete victory for the American Farm Block. It appears that a working party of the GATT has outlined a convention which might govern international action in the field of international trade

THE ECONOMIC WEEKLY

in primary products. But no action can be taken before the US Congress has studied the proposals, the nature of which has not been disclosed.

ANTI-DUMPING LEGISLATION WANTED

It has been discovered that soft attitude to export subsidies in the case of primary products can no longer be reconciled with export subsidies designed to boost up exports of non-primary commodities. It has, therefore, been decided to freeze the *status quo* for the time being, so that "no new or increased export subsidies would be permitted". The GATT countries will decide before the end of 1957 whether subsidies should be banned or whether the standstill arrangement should be extended for a further period. I have pleaded elsewhere for the enactment of Indian legislation providing for anti-dumping and countervailing duties on the basis of Article 6 of the GATT and also incorporating the American version of the "serious injury" clause authorised by GATT (cf my article, *India and the GATT*, *Commerce, Annual Review*, 1954). In view of the existing position, enactment of this piece of legislation, which is long overdue, must not be delayed any longer.

THE NEW ORGANISATION

It is suggested that the contracting parties should establish the *Organisation for Trade Co-operation* (OTC), rather than the proposed *International Trade Organisation* (ITO). The details of the constitution of this organisation were not given in the *communiqué*. But its functions are stated to be (1) to administer the GATT, (2) to sponsor tariff negotiations and (3) to serve as a forum for discussion. These seem to be on the lines of the recommendations of the Randall Commission on US Foreign Economic Policy. The Commission wanted this organisation to "sponsor multilateral trade negotiations", "recommend broad trade policies" to member countries and to "provide a forum for consultation regarding trade disputes". The GATT in the amended form in which it is open for signature during the next few months, contains perhaps more than what may be interpreted as "broad trade policies" in the USA, although there is no doubt that GATT has been sufficiently "dogged" to be acceptable to a large majority of countries.

THE ECONOMIC WEEKLY

Industrialists Want More Consumption

PRODUCTION is only the beginning, consumption is the end. But the end is the beginning also. This is the starting point of the *Draft Note on the Second Five-Year Plan* that has been issued by the Federation of Indian Chambers of Commerce and Industry as well as the keynote. "The basic impulse for economic growth can only come with the ability and willingness of the people to consume." It would be wrong therefore to underestimate the driving force of the propensity to consume; indeed, the propensity to consume is the prime mover of the economic system. The climate for additional investment, not only in consumer goods industries but also in producer goods, says the *Draft Note*, depends very much on the rate at which consumption is rising.

The sufficiency of purchasing power is thus a pre-requisite of industrial expansion. The first aim of planning is defined as one of securing for the population, within as short a time as possible, the elementary requisites of life, such as food, clothing and shelter, and also a minimum of civic amenities. India is an agricultural country and yet a large proportion of its population does not have enough food and a still larger proportion does not get the right kind of food. Why? Primarily because of the lack of purchasing power. What is purchasing power, then? Nothing but money in the hands of the people to spend. How are people to get the money to spend? Through investments; of course, disbursements made by Government as well as by industry. From this point, however, the pristine simplicity of the Plan begins to get a little complex. The investment proposed in the next five years adds up to Rs 7,200 crores, as against the target of Rs 2,100 crores for the *First Five-Year Plan*, of which no more than Rs 1,800 crores are likely to be realised in part. The breakdown is shown in the table.

Of this total, some Rs 300 crores are the cost of re-equipment and hence the net investment would be of the order of Rs 7,200 crores.

COMPROMISE FORMULA

Though consumption is both the end and the beginning, investment on the production of consumer goods is not the same as investment

on social services and the like, which does not add to the flow of consumer goods within a fairly short period. To be logical, investment on heavy capital goods must also be included in the category of unproductive expenditure in the short period. The note, therefore, suggests that those items of investment, which are expected to increase rapidly the output of consumer goods, can be deficit financed, but the rest of the budget must be balanced, either by tax or by genuine borrowings from the public. In other words, one can take out from the Central and State budgets developmental expenditure which can either help utilise unutilised capacity or increase productivity or production in agriculture or industry within a short time. This latter can be financed by creating money without much danger of inflation; not so the other items. Investments, which are thus safe from the point of view of inflation, should be carefully selected. This compromise formula is not offered as a substitute for fiscal discipline; nevertheless, it should set the ceiling to non-productive expenditure that can be incurred for the promotion of a Welfare State.

Again, the safe limits of deficit financing in general are carefully laid down. These will depend on the scale of the deficit, the purpose for which it is used, the extent to which additional incomes created by the outlay are mopped up and return to the exchequer, the effectiveness of the investment in bringing about an increased flow of consu-

Investment in Second Plan

	In Rs crores
Industry	2,000

Roads	400
Road transport ..	1,000
Ports & Harbours ..	100
Shipping and Civil Aviation	90
Communications ..	135
Power	400
Irrigation & Agriculture, including rural industries	1,200
Social Services and Housing	1,550
Small-Scale Industries, urban	250
Total	7,475

mer goods and the period taken for this flow to emerge, the behaviour of money wages in response to such initial rise in prices as may be there and the success of the measures undertaken to prevent a rise in the price of basic necessities. The limit will also depend on the propensity to import in relation to exports.

TOTAL EMPLOYMENT

The magnitude of the aggregate investment proposed, it will be noticed, roughly agrees with the figures that have already been put forward. Also noticeable is the emphasis on the employment potential of such investment. Taking the rate of population growth at 4.5 millions per year and of labour force at 40 per cent of the total, the annual increase in labour force works out at 1.8 million, for whom jobs will have to be found to prevent a net deterioration in the employment situation. This calls for 9 million jobs. The total employment resulting from this investment is estimated at a higher figure of 10 million or a little more, so that not only new job seekers can be absorbed, but also some of those who are without employment now. This will, incidentally, reduce the proportion of earning dependents to the total of the working population from 30 per cent, as at present, to 25 per cent. The breakdown of additional employment is as follows:—

Agriculture	nil
Mining & factory	17
Small enterprises	18
Railway Communications ..	11
Banking, Insurance, Commerce and Transport ..	14
Professions	7
Government service	8
Domestic service	6
Total	170

Of the employment potential estimated here, only that for the first two and perhaps also for the third can be worked out on the basis of known investments—employment ratios *ie* from actual experience. The note, however, assumes that for every additional hand employed in industry, 6 to 7 will find employment in trade, communications etc. On what basis this assumption has been made is not stated anywhere.

That the main slant in the Second Plan will be on industry has been accepted on all hands. Where the Draft Note makes a departure from the usual thinking on the subject is in its emphasis on consumer goods industries as the major provider of employment as well as the main lever for raising the standard of living. This is done on the ground that industrial employment itself creates other avenues of employment at the ratio of 1:6 and further, that being more productive and efficient, it provides larger earnings. A special provision is made for small-scale urban industries as feeders to, or beneficiaries from, organised industry; but village industry is on the whole given a minor place in the Plan and the investment on it, if any, is lumped up with agriculture and community development. The investment proposed to be allocated to this item is not set out separately.

WHY CONSUMPTION IS LOW?

How is consumption to be increased? In the short period, in any case, the supply of consumer goods is 'given', in the sense that its supply is limited by the production and investment in the past. By putting money in the hands of the people, it may be possible to increase the money demand for such consumer goods as are available, but it is not possible to increase consumption. Larger consumption would be possible only if more consumer goods were produced and larger supplies brought on the market. This calls for increased production and not only increased purchasing power in the sense of money in the hands of the people. It is not necessarily making simple things complex to say that purchasing power can be increased only by increase of production.

What the Federation has in mind, therefore, is the belief that higher prices automatically call forth larger supplies. This may well be the case, but only under certain conditions. Higher prices may raise the profitability of production if wages and costs do not increase in the same proportion; even so, for an increase in agricultural production will be required increased investment in the shape of seeds, fertilisers, pumps and agricultural implements, irrigation and so on. Again, increased demand for other kinds of consumer goods will, in the first instance, mean only a higher price for such goods. If, at the same time, con-

sumer industries can be supplied with additional equipment, raw materials etc, only then the production of these goods can be increased; not otherwise. Those who look only to the investment aspect of the problem, therefore, give priority to savings. Failure of effective demand as an obstacle to production represents a very special situation.

HARD WORK

Therefore capitalists and hard-headed economists have extolled in the past the virtues of hard work which keeps down costs and of abstinence which augments the supply of capital rather than the quantum of consumption. Indian industrialists seem to have moved far and thrown off all inhibition in the matter of consumption. But surely, all of them do not subscribe to this view? Only the other day, the President of the Indian Tea Association lamented the wasteful extravagance of labour in tea gardens, their lack of thrift, and the tendency to indulge in conspicuous consumption.

Perhaps if the Federation had to think of raising capital for industry from the share market and also wanted the Government to raise loans from the same source for the

programmes they envisaged for the public sector, they could not have shed their inhibitions so readily. It is only on the assumption that Government will shoulder the responsibility of finding money for development that they can afford to be so generous.

Then again, an increased demand for consumer goods may raise the profitability of production on these lines. It may also create a favourable climate for the production of capital goods since the expansion of consumer goods industries will create a demand for all sorts of capital goods. But what about the consumer demand seeping to foreign markets and strengthening the propensity to import? This naturally they would like to control rigidly—not only the import of consumer goods but also that of many capital goods, the manufacture of which they consider to be within their competence. If the question of providing capital for industry is skipped over, the problem of development can be reduced to that of controlling the imports of some commodities on the one hand and ensuring the import of others such as heavy equipment and machinery on the other.

Post-Korean Trends in Western Europe

Economic Survey of Europe in 1954. Economic Commission for Europe, Geneva, 1955. Pages 315. Price 17s 6d. Available from Oxford Book and Stationery Company, Scindia House, New Delhi.

THE annual economic surveys published by the Economic Commission for Europe have come to be awaited with interest, for apart from throwing considerable light on economic developments in the region, they represent excellent studies in economic analysis. It has also become the practice for the Survey to combine analysis of the major developments of the past year with consideration of more long-term issues. Last year the survey took up the problems of southern Europe, "an area whose development has generally been retarded." This year, there are two chapters which may be regarded as sequels devoted to the problems of regional disparities within countries and in particular, to the problems largely of a regional character faced by France. The longer-term perspective was provided by the independent study by Prof Ingvar Svennilson, "Growth and Stagnation in the European Economy," reviewed in this journal last month (March 12).

These broader studies are in addition to the examination of the year's events. From one point of view, it is to be regretted that such broader studies are published as parts of the annual surveys. They deserve to be brought out as separate monographs and would receive greater attention in that case from students of economic problems all over the world. The interest of these studies extends far beyond that of the specific problems of Europe. The analysis, the causal relations traced and the policies discussed would be found extremely useful by many who may have no special interest in the problems of Europe. Besides, separate publication of such studies would certainly have made the task of the reviewer easier. As it is, the chapters on regional problems in Europe cannot be studied here.

MARKED RISE IN INDUSTRIAL PRODUCTION

For Western Europe, the Survey focusses attention on the marked rise in industrial production taking place in 1954 in practically every country of Europe, an expansion which "was accompanied and to

some extent conditioned by a considerable increase in the volume of foreign trade". That the American recession was on during this period made this all the more remarkable, particularly because the upswing in western Europe occurred without any renewed balance-of-payments difficulties.* The pronounced weakening in the European markets for coal and steel at about this time had also created a feeling of pessimism about the future of the European countries and in any case, as the Survey points out, "The general impression was that, after the Korean boom, western Europe with the notable exception of Western Germany had entered a period, not of outright downturn, but rather of protracted stagnation in economic activity."

Actual events did not confirm this impression. The Survey traces the developments in the West European economy since the Korean war to set the events of 1954 in their proper perspective. The Korean boom, it finds, was followed in Europe, "not by a period of general stagnation but rather by a series of distinct though overlapping setbacks stretching more or less from the middle of 1951 until early in 1953, in some sectors even until the spring of 1954." These setbacks were followed by the upswing of 1954.

The two main movements of the post-Korean period are the textile slump 1951-52 and the recession in the capital goods industry 1952-53. The setback in the coal and steel markets of 1953-54 is to be examined independently as it was less influenced by the factors stemming from the Korean crisis.

DIVERGENT MOVEMENTS IN DIFFERENT SECTORS

The period from the middle of 1951 to the middle of 1952 was peculiar. "The economies of Western European countries appeared to be suffering from a curious sort of schizophrenia," says the Survey, "parallels to which are difficult to

* The Survey was completed before Britain raised her bank rate.

find in other periods: a pronounced depression in one large industrial sector coinciding with boom conditions and shortages in most others." These facts can only be explained in terms of "an interaction between long-term structural factors pertaining to the textile industry and shorter-term cyclical influences." Events in the industry show that till the middle of 1950 the textile industries were saved from the doldrums only by special and temporary stimuli to demand. The Korean war actually induced a considerable upswing in production and thus "laid the foundation for an all the more serious crisis when at last the adjustment of output to normal demand became inevitable". That explains also why the textile industry faced the crisis first, when others were still favourably placed: the long-term trend of the industry in Europe was one of stagnation. The limited extent of the recovery since 1952 is offered as evidence of this long-term trend, and it could be supplemented by the fact that in spite of a general upswing in 1954, the output of textiles increased far less than the average and actually declined in some countries.

RECESSION IN ENGINEERING INDUSTRIES

The recession in the output of the engineering industry appeared to have begun at a time when the textile slump had reached its trough, though from the fragmentary information available, the Survey suggests that "the decline in demand for the products of the engineering industry occurred a considerable time—about half a year—before the final output was affected". This could have been due to the existence of a time-lag between demand and output changes caused by the existence of well-equipped order books.

Why did this recession appear at this time? The Survey argues that it was "a reaction after the preceding boom during which there had been a general tendency to hasten the execution of economic plans, though the sterner monetary policies may have had something to do with it also. The influence of trade

cannot be eliminated and in particular, it is argued that the recession in some countries was partly caused by "the greatly increased flow of products from the West German industry into European markets".

The remarkable fact was that the recession in the engineering industry was not accompanied by a decline in steel production. During the twelve months from the middle of 1953, however, "at a time when the steel-consuming industries appeared to be again on the upturn, steel production in the Continental countries of Western Europe suffered a decline more general and more pronounced than that of 1949", lasting until the spring of 1954. These movements in steel output are, according to the *Survey*, "not to be primarily explained by changes in steel consumption". Specific speculative forces appeared to have been at work: the inauguration of the European coal and steel community and the fear of American recession are mentioned as among the factors influencing such speculation. The coal market was influenced by similar factors though the recession in coal lasted for a somewhat longer period than it did in steel.

INSTALMENT BUYING OF DURABLE GOODS

The end of the recession in the steel industry was naturally determined to a considerable extent by increasing production in the steel-consuming industries which counteracted the influence of speculative forces operating in the opposite direction. "One of the notable features of the present upswing in Western Europe is the great increase in purchases of durable consumer goods." Motor cars, furniture, electrical appliances, and other durable household goods were swept by a wave of consumer buying during 1954. Much of this was financed by means of consumer credit and the possibilities for the European economy of this development may not be unlike those in United States. Some of the sales represent pent-up demand, which for various reasons had to wait until 1954 before it could be satisfied. But the principal factor on the demand side could more accurately be stated to be the rise in the level of real income. At the same time, in some countries of Western Europe "the volume of expenditure on durable goods has tended to increase more rapidly than real disposable in-

come". All this is consistent both with the essentially "luxury" character of these goods and the development of consumer credit facilities and instalment buying for financing purchases.

LESS DEPENDENCE ON RAW MATERIAL IMPORTS

One aspect of this development has particularly disturbing implications for the underdeveloped countries. This was that "the expansion of the durable goods sector took place with very little increase in imports of primary goods from the underdeveloped countries overseas". Prof Svennilson had drawn attention earlier to the increasing trend within the chemical industry for the replacement of the natural raw materials imported previously from the underdeveloped countries, by synthetics produced within Europe ("Growth and Stagnation in the European Economy"). The present *Survey*, therefore, considers the position in the durable goods industry "as one more indication that the long-term trend of demand in Europe and the United States—towards services and durable goods—is to make the economically richer part of the world less dependent on imports from the poorer part". (italics mine.)

The significance of this statement for the underdeveloped countries of the world is not difficult to follow. It foreshadows a long-term tendency towards a worsening of the terms of trade of these countries with consequent reductions in real incomes and standards of living. It must, therefore, occasion considerable thought in these countries and the Economic Commission for Asia and the Far East should examine its implications from the point of view of the countries of this region. For one thing, it makes even more urgent the achievement of industrialization by these countries and a substantial change in the pattern of world trade.

TRENDS IN CONSUMER DEMAND

The *Survey* considers that in 1954 this tendency helped to prevent adverse repercussions on the balance of payments of Western European countries and "in this sense it could be welcomed as a favourable implication of present trends in consumer demand". This may be true for the very short period, but the authors of the *Survey* might note with profit the comments of Prof Svennilson on the implications of a shift in the terms of trade

THE ECONOMIC WEEKLY

against the underdeveloped countries during the inter-war period for the countries of Europe. European countries have everything to lose from a fall in the real incomes of the people with whom they trade and even from a failure of their real incomes to rise as rapidly as their own.

That the present upswing is based on an expansion of the durable consumer goods industries suggests some other implications for the future of the European economy which are discussed in a short note. The danger is that cyclical waves of the pattern that have long been a problem in the United States may develop in Europe and "European countries may in the future have to face similar problems of short-term vagaries in the rate of personal savings". Attention is also drawn to the change in the character of the building industry in recent years, which instead of being a major cyclical influence, "has become a major factor in economic stabilization." A more detailed study of these new trends would be desirable and will find a place perhaps in next year's *Survey*.

US RECESSION AND EUROPE

The *Survey* then turns back to an explanation of why expansion was able to take place in Western Europe in spite of the American recession and that, too, without any balance of payments difficulties. "In fact," it says, "the course of industrial production in Western Europe has not tended to follow very closely that in the United States, neither as regards the amplitude of the swings nor as regards their timing."

For this particular recession, the usual dangers to Europe from decreased imports by the US and increased competition from her exports, the possibility of falling prices of raw materials directly affecting European producers of such raw materials and the psychological contagion of a depressed mood, all failed to operate. As a result, the American recession failed to create balance-of-payments difficulties in Europe. Two particular circumstances helped. "One was the fortunate circumstance that the cyclical situation in the middle of 1953 was sufficiently different in the United States and in Europe to prevent the spread of a generalized attitude of bearishness." The other was large and increasing American

THE ECONOMIC WEEKLY

disbursements abroad on defence account. The lessons of this for Europe hardly need to be stressed, but only one point may be made: the dollar problem has not disappeared, it has only become disguised.

THE OTHER EUROPE

In relation to Eastern Europe, the *Survey* contains mainly an elaboration of the discussion contained in the *Survey* for 1953. "A substantial improvement in standards of living," says the *Survey*, "is foremost among the objectives of policy assigned by the Eastern European countries for the present phase of their economic development." This change in priorities may have been reversed recently, but the *Survey* proceeds to examine how far events during 1953 and 1954 substantiated in practice the policy statements made. Till 1953, certain policies were followed, particularly when plan revisions became

necessary in 1951, which affected the character of the industrial structure of these countries. An unbalanced growth was fostered in two ways. First, "there was a lack of correspondence between the output of basic materials and the needs of the industrial superstructure, which resulted in inefficient use of capacity and waste." Second, and more important, in most of these countries, the consumer was "actually suffering a reduction in his standard of living, which threatened to become cumulative unless an effort were made to restore agriculture".

INVESTMENT STEP DOWN

The new policy introduced in the middle of 1953 was based on four decisions: stabilization and even reduction of the volume of investment; change in the output pattern of heavy industry to make available more durable consumer goods and housing; devotion of a larger

proportion of investment resources to agriculture and light industry, with suitable changes in the output of heavy industry to produce more agricultural tools and machinery; and emphasis on obtaining consumer supplies from abroad, whether within the Communist bloc or not, in exchange for output produced easily within the countries. These four decisions were to some extent *ad hoc* responses to the problems of the day but did show a common pattern. The *Survey* admits that, "how much total consumption is expected to expand as the combined effect of the changes described and what the extent of the re-allocation of resources to consumption will be cannot be foreseen." It makes a country by country study of the operation of these decisions and the actual changes taking place in industry and in agriculture. A separate chapter is devoted to economic developments in the Soviet Union.

How banking helps the OILSEEDS INDUSTRY

OILSEEDS and oil-bearing nuts are grown on more than 25 million acres in India, of which almost half lie in the South. From oilseeds we get cooking oil, paints and varnishes, lubricating oil and soap.

The growing of oilseeds and the extraction of oil forms a major industry in South India. Banking has greatly helped the growth of the oilseeds industry. The facilities and guidance of a good bank, such as the availability of ready funds when needed, and the collection of dues in any part of the country, are an essential part of good organisation in the oilseeds industry.

We at Palai are proud that so many leading concerns connected with the industry in South India employ the complete banking service we offer:

Current Accounts — Demand Drafts — Telegraphic Transfers — Investments — Letters of Credit — Bill Collection — Deposits — Loans & Overdrafts — Confidential Credit Reports, etc.

If you have business interests in the south, it will pay you to open an account with us. Our 25 branches are strategically located, 23 in important South Indian business centres and two in Delhi and New Delhi; and we have correspondents in all important Indian cities. We offer a fully comprehensive banking service at each office.

Our clients can make deposits at any of our correspondent banks, situated in all important Indian towns, and have the amounts credited to their accounts at any of our branches.

PC.784 (A)

PALAI CENTRAL BANK LTD.

Head Office: PALAI, TRAVANCORE

A LEADING BANK IN SOUTH INDIA

Life Business Reaches New Peak

(From Our Insurance Correspondent)

THE Indian Life Insurance Companies and Life Departments of Indian composite offices have good reasons to hasten the announcement of their new business totals for the last year. In most cases, substantially increased figures have been disclosed for ordinary life insurance and in many instances, records have been established in respect of individual companies. When accounts for 1954 appear, it will be interesting to note the other aspects of the increased business, viz, premium income, expense ratio, etc. New schemes and improved publicity methods are undoubtedly drawing the attention of the public to life insurance, and once interest in this unique form of protection and thrift is created, the field staff can be depended upon to secure completion of the contracts. Better bonuses declared last year by New India and other insurers and relaxation in the relief from income tax on life insurance premiums proposed by the Finance Minister will act as further incentives to the public to go in for more insurance. If the best results are to be obtained, then the agents and field workers must be trained and offices must give full support to the field force. This, we are glad to note, is being increasingly appreciated by the Indian Insurance Companies.

The table alongside gives the figures of new life insurance business of 30 Indian Insurance Companies for the years 1953 and 1954. It shows that new business of the companies listed has recorded a rise from 30 per cent to 90 per cent compared to the previous year. The total new life insurance business of Indian insurance companies for the year 1954, it is now estimated, may exceed Rs 250 crores sum assured as against Rs 137.5 crores in 1953.

If these estimates are realised—they may well be exceeded—the business recorded in 1954 will not only be the record for any year; even more striking would be the sharp increase, recording the biggest jump in business in any one year in the history of Indian life insurance. Some of the possible reasons for this improvement, from the narrower point of view of insurance business itself, have been men-

tioned above. They would well repay a study for it would be of great benefit to those engaged in the insurance business to have a clear idea, derived from an analysis of facts, of the relative importance of the different factors operating within their field of business.

The growth of life business has now assumed proportions which may invest it with a wider significance also, as a sensitive indicator of variations in money incomes and of the changing pattern of savings and investments. This is suggested by the year to year variations in new sums assured in the recent past. They were as follows:

	(Rs crores)
1950	139.5
1951	147.9
1952	146.7
1953	154.5
1954	250.0*

* Estimated.

If a growth factor is assumed,

the fall in 1952, a year of economic recession, would stand out more prominently. On the other hand, taking the broad trend from 1950 onwards, the business recorded in 1953 should be considered as normal. By the same token, the jump in 1954 must be regarded as extraordinary, that cannot be accounted for by the normal growth factor. What is the explanation? Has there been a substantial increase in money incomes? Or in employment of the type that increases life business, eg, in the ranks of the white-collared employees or is it the effect of falling prices which has increased the saving margin of the insuring class while their money incomes remained unchanged? In the interest of their own future business, insurers should analyse new business in terms of different types of insurers. It would be worthwhile for the Life Association to study these wider aspects of life insurance business.

Falling Prices in Total Perspective

I D B

THOUGH unable to find a valid explanation and an effective remedy for it, Government is naturally worried about the continuing fall in prices. At first and for quite a long time, the explanation offered was that the fall was seasonal, and that it would automatically correct itself. Also, that the fall was not without its advantages, for the associated decline in the cost of living would give long needed relief to the middle classes. That the fall is seasonal or self-corrective, it is no longer possible to maintain, for there is no season which lasts continuously from April of one year to March of the following.

The fall in prices has been almost continuous (with spells of stability) from April 1954 to March 1955. Quite curiously, the Finance Minister still maintains the second and consequential part of the seasonal hypothesis that the fall would, over a period, correct itself. True, "when the storm is long past, the ocean will be calm again" but "in the long run we shall all be dead". But with Shri Deshmukh's economics, we might well blow up in the short period, specially under the pressure of Pandit Nehru's ideas.

The danger is real, for when ideas are being pumped in at a fast rate and the economy shows no signs of absorbing them, a blow up is almost inevitable. The dilemma therefore of falling prices and rising unemployment on the one hand, and growing development expenditure and rising money supply on the other, has a deeper social significance than the mere mechanics of price variation.

Now what has exactly happened? Let us look broadly at the official indices of prices. With wide variations, the general level of prices declined by about 13 per cent from mid-April 1951 to mid-April 1953. While the fall since then is the subject matter of the present analysis, the preceding fall is of material importance in the general perspective of economic policy and the very serious disturbance in parity as between agricultural and industrial prices, for almost the entire incidence of the decline in prices has fallen on the agricultural classes, while the manufacturers and operators on the stock exchanges have actually gained substantially. For the time being we are concerned

with the overall fall in prices of 13 per cent between mid-April 1951 and mid-April 1953 and the theory then and subsequently put forward that a rising development expenditure would be a sufficient and efficient corrective, particularly in respect of the adverse effect of falling prices on the volume of employment. This thesis was put forward in the Draft Outline of the Five-Year Plan, presented in July 1951 and subsequently repeated by the Finance Minister in his speeches inside the Parliament (particularly the budget announcements) and outside. The major promise of the Draft Outline was the continuance of inflationary pressures, which constituted the main inhibiting factor to the expansion of the development programme.

This is the point to emphasise: the continuance of inflationary pressure during the Five-Year Plan period from April 1951 to April 1956. On what basis was this assumption made? By July 1951 when the Draft Outline was presented to the country, the Korean War boom had definitely broken and there was serious fear of deflationary pressure in international markets. This actually materialised, as by the end of 1951 the prices of internationally traded commodities had fallen by 15 to 30 per cent. The rigidities of the Indian price structure due to eight long years of war, inflation and controls, constituted a resistance to deflationary pressure for a while, but the raising of the Bank Rate in November 1951 and subsequent international economic developments precipitated almost a crisis. For soon afterwards the Indian price level collapsed sharply by as much as 15 per cent within six weeks from the end of January to the middle of March 1952. Against this background, it is strange that the thesis of the continuance of inflationary pressures was repeated in the final draft of the Five-Year Plan, which was issued as late as December 1952. This gross misjudgment of the economic situation contains the explanation of the dilemma of rising development expenditure and

falling prices. The development programme was very narrowly conceived and was unlikely in any case to have a significant effect on the economy as a whole. In fact, money supply with the public, as defined by the Reserve Bank, has actually diminished from nearly Rs 2,000 at the commencement of the Plan to about Rs 1,850 at the beginning of 1955.

It is against this background that the recent fall in prices has to be judged. The official index of prices (year ended August 1939 = 100) declined, with wide variations, from 462 (April 14, 1951) to 404 (April 17, 1954). By June 1954, it went down further to 378. This was followed by a period of broad stability (a gentle and an almost imperceptible rise in prices) upto the beginning of September, when the index touched 385. Then the fall was resumed and by the middle of March, with a halt during the first fortnight of February, we reached the level of 356 (March 12, 1955). Thus more or less continuously, the general index of prices has fallen from 404 to 356 (a fall of nearly 12 per cent) from the beginning of April 1954 to the middle of March 1955. It is clear that the seasonal hypothesis cannot hold good any longer. In any case the following summary table should dispose of it.

Table I

	Jan to April	April to Aug	Aug to Dec
1952	falling	stable	stable
1953	rising	rising	falling
1954	stable	falling	falling
1955	falling		

Let us look at the economy from another angle. An analysis of the supply position shows that the major cause of recent economic developments has been an unexpected and unusual abundance in the agricultural economy. The summary table of agricultural output below gives a broad but clear impression of what has happened.

(To be continued)

	1950-51	1951-52	1952-53	1953-54
Foodgrains in m tons	50.0	51.1	58.1	66.0
Cotton in m bales	2.9	3.1	3.1	3.9
Jute in m bales	3.3	4.7	4.6	3.1
Groundnut in m tons	3.4	3.1	2.9	3.8
Sugarcane in '000 tons	5.6	6.0	5.0	4.6

INDUSTRIALISTS WANT MORE CONSUMPTION

(Continued from p 424)

The Federation does not challenge the wisdom of the Industrial Policy statement. It, therefore, leaves open the question of how heavy equipment is to be obtained—whether by imports or manufacture by the public sector. If the latter, then Government will necessarily have to alter priorities and deprive the private sector of machinery and equipment for expansion until such time that it is able to produce them. Foreign exchange is crucial either way and the Federation does not appear to consider it to be so.

The employment potential of industry that it has assumed—and the Federation makes no secret of its preference for consumer goods industries—will not be questioned. In fact, there will be general agreement on it. It is the multiplier effect of industrial employment assumed by the Federation which is open to challenge. For the six-fold expansion of employment that they have assumed will follow the direct employment in industry is not only open to challenge but is completely disproved by present-day facts and past experience. A cursory glance at the table of occupational distribution in the last census will show how fantastic the assumption is; so would a comparison with the occupational distribution in earlier years, say in 1931. True, the percentage distribution of population by livelihood categories given in different census reports is hardly comparable; and no definite conclusion can be drawn from their comparison. But making due allowance for such a lack of comparability, the proportion of industrial and other (non-agricultural) employment claimed by the Federation is definitely ruled out.

Category	1931	1951
Agriculture & mining	71.2	73.0
Industry	16.3	13.0
Commerce	6.0	6.1
Transport	1.7	2.0
Public force and administration	1.2	2.6
Professions and liberal Arts	1.6	1.9
Domestic service	2.0	1.4

Total 100.0 100.0

It is curious that the Federation, with all its resources, has not attempted a computation of the financial resources for the Plan. But if

but the supply of consumer goods to match this demand will not materialise because (1) imports of capital goods on the required scale cannot be paid for and (2) a commensurate rate of saving cannot be attained. The result will be naked inflation.

A more effective means of augmenting the supply of consumer goods and of expanding employment at the same time will have to be found. The solution has to be sought elsewhere—in augmenting the capacity of village industries and in conserving foreign exchange for building up heavy industry, in the first instance, so that at a subsequent stage without further drain on foreign exchange, the country may produce automatically the capital equipment and machinery it requires for raising the efficiency and technique of production in the cottage sector. That will call for a different kind of planning than the one the Federation has put up.

Around Bombay Markets

AFTER a spell of buoyancy, Bombay Stock Exchange suffered all round losses at the end of the week. Tata Steel Ordinary had earlier touched a new high since last September at Rs 246 on consistent bull support on suggestions of higher retention price for the Company and Government loan on favourable terms. Thereafter, a very influential circle of brokers supposed to be well-informed sold heavily. Discouraging attitude of Government towards Tata's expansion plans is said to be the chief reason for these sales. Despite this reverse, the local bull is believed to be confident that retention prices would be raised soon. The bout of selling, however, has changed the tone from one of buoyancy to that of diffidence.

Local professional bulls continued to lend support at every fall, but public has kept aloof. Towards the end, a sizable block of shares was purchased by a couple of brokers and market observers believe that the old bear has covered part of his sales, while some say a new bull has entered the market.

Textiles were steady—earlier in the week, but gave away at the end under tired liquidation pressure and absence of fresh buyers. Discouraging dividend by Swadeshi mills of Rs 8 further aggravated the weakness.

Among Miscellaneous issues, Bombay Burnah, Premier Construction and ACC lost their almost entire gains of last fortnight. National Rayons were also easy. Scindias were dull. Tata Chemicals dropped by almost a rupee on heavy unloading by bulls.

The general tone is depressing. If it is true that the old bear has covered part of his sales in Tata Ordinary, and should be chosen to cover his entire short position hereafter, technically the market is likely to become vulnerable. Covering of sizable short sales and continuance of big long position is certain to discomfort big bulls if they continue their position unchanged. The situation would have been different had the public been participating, but of that there is no evidence. In the absence of public participation, market movements mean nothing but a trial of strength between few big speculators. Genuine investors will find it difficult to judge the market when it is controlled by professionals.

All-Round Losses

Cotton

COTTON continued to be easy throughout the week due to a complete absence of buyers. Delay in announcement of export quota made the bulls nervous and once again rates touched Rs 548. Arrivals in Hyderabad and Gujarat continued to be heavy. The tone is distinctly hesitant. EICA has at last amended the most disputed bye-law removing disparity between spot and ready. This bye-law is effective for new August delivery.

Cotton May	23-3-1955 Rs 556-12	30-3-1955 Rs 549-0
------------	------------------------	-----------------------

Bullion

IMPOSITION of margin has at last served its purpose. Bullion market re-opened last Thursday and after an initial rise, gave away under selling pressure and top gains were lost. The Bombay Bullion Board has decided to allow trading in Vaishakh and Jeth settlements, simultaneously. All these measures are certainly discouraging for bullish activity and bulls may find it difficult to manipulate the market as before.

End of an Era...

MOUNTAIN peaks have to be viewed from a distance in order to get a proper measure of their height and a full sense of their grandeur. But when Winston Churchill lays down the reins of office, the immediate reaction on the public mind in Britain and elsewhere is that an era has ended. In these words is summed up a judgment that does not have to wait for the verdict of history. The reasons are not far to seek. Churchill's life is not just one hour of crowded glory; into his four score years he has packed several lives each of which, by itself, would find a place in history. There are so many Churchills and each of them has lived so fully and so much in the public; so much has been written about them and so much has he written about himself that it is difficult to stop them from passing in a parade on this occasion—the none-too-bright lad who disappointed his father's hopes and was sent to Sandhurst because, not being good at Classics, he was not thought clever enough to be sent up for the bar, the young subaltern in Bangalore who wangled a place in the regiment that went into action in Waziristan and pulled strings in London to get himself shifted to the Sudan along with an expedition, the press correspondent covering the Boer war who hit the headlines by getting captured and then escaping, the free-lance journalist who strode into politics, the turn-coat who deserted the Tories to turn Liberal and was later welcomed back into the party, the First Lord of Admiralty who was responsible for the Dardanelles disaster, the busybody who helped White intervention, and then the sulking fighter against the Nazis biding his time, who got his chance in the end, the hero of the second World War whom his own people threw out after the War had been won, his subsequent come-back and now the retirement.

The images form themselves, flicker and fade away in succession, but some of the focal points stand out and will not fade—his clumsy fall while jumping ashore when he first landed in India as a subaltern, the boyish exuberance of the cavalry officer, who tripped and fell while charging the hordes of opponents, his ringing words "We shall fight by land and by sea . . .", the promise of nothing better than blood, sweat and tears, the victory salute with two uplifted fingers, the portly figure with a bowler hat and cigar visiting Londoners in bombed-out air shelters; the political eclipse he suffered after victory and the stoicism with which he took his defeat. Recurring in all the images is his indomitable spirit, his zest for living, his audacity, mastery over words, the verve and vigour of a man of action whose lips had been touched with the fire from the altar.

No one will deny that Churchill had courage and vision. No one has delighted more in battle. But vision and blind spots—he had so many of them, India was not the only one—how do they go together? Sworn not to preside over the dissolution of the Empire, Winston Churchill saw large chunks of the Empire slip away. Today, uneasy peace reigns in the colonies, the Kikiyus are still being hunted down, British Guiana continues to be in revolt and in the very first elections

in Malaya, the winning party has staked its claim for independence!

Another strange combination in Churchill's make-up is his twin inspiration from Marlborough and the Mississippi, the one through an ancestor whom he made into a hero and the other from his mother, who was an American. The last defender of the British way of life,

as he understood it, had American blood in his veins.

Courage is of many types and this fearless fighter yet shied from an adventure into ideas. His historic vision looked into the past, but could not penetrate into the future. There are two types of figures in history, those who initiate, others who wind up. Both

have their grandeur and a place in history, but those who wind up are not the makers of history: they are its inheritors and pensioners. It is idle, therefore, to ask on whom Churchill's mantle falls. Such figures in history depart, leaving no successor. They do not fare forward; for them the voyage had ended before it had begun.
